About This Guide

Purpose

The *Simba Impala ODBC Driver with SQL Connector Installation and Configuration Guide* explains how to install and configure the Simba Impala ODBC Driver with SQL Connector. The guide also provides details related to features of the driver.

Audience

The guide is intended for end users of the Simba Impala ODBC Driver, as well as administrators and developers integrating the driver.

Knowledge Prerequisites

To use the Simba Impala ODBC Driver, the following knowledge is helpful:

- Familiarity with the platform on which you are using the Simba Impala ODBC Driver
- Ability to use the data source to which the Simba Impala ODBC Driver is connecting
- An understanding of the role of ODBC technologies and driver managers in connecting to a data source
- Experience creating and configuring ODBC connections
- Exposure to SQL

Document Conventions

Italics are used when referring to book and document titles.

Bold is used in procedures for graphical user interface elements that a user clicks and text that a user types.

Monospace font indicates commands, source code, or contents of text files.

Note:

A text box with a pencil icon indicates a short note appended to a paragraph.

! Important:

A text box with an exclamation mark indicates an important comment related to the preceding paragraph.

About the Simba Impala ODBC Driver

The Simba Impala ODBC Driver is used for direct SQL and Impala SQL access to Apache Hadoop / Impala distributions, enabling Business Intelligence (BI), analytics, and reporting on Hadoop / Impala-based data. The driver efficiently transforms an application's SQL query into the equivalent form in Impala SQL, which is a subset of SQL-92. If an application is Impala-aware, then the driver is configurable to pass the query through to the database for processing. The driver interrogates Impala to obtain schema information to present to a SQL-based application. Queries, including joins, are translated from SQL to Impala SQL. For more information about the differences between Impala SQL and SQL, see [Features](#) on page 61.

The Simba Impala ODBC Driver complies with the ODBC 3.80 data standard and adds important functionality such as Unicode and 32- and 64-bit support for high-performance computing environments.

ODBC is one of the most established and widely supported APIs for connecting to and working with databases. At the heart of the technology is the ODBC driver, which connects an application to the database. For more information about ODBC, see *Data Access Standards* on the Simba Technologies website: <https://www.simba.com/resources/data-access-standards-glossary>. For complete information about the ODBC specification, see the *ODBC API Reference* from the Microsoft documentation: <https://docs.microsoft.com/en-us/sql/odbc/reference/syntax/odbc-api-reference>.

The Simba Impala ODBC Driver is available for Microsoft® Windows®, Linux, Solaris, AIX, and macOS platforms.

The *Installation and Configuration Guide* is suitable for users who are looking to access data residing within Impala from their desktop environment. Application developers might also find the information helpful. Refer to your application for details on connecting via ODBC.

 **Note:**

For basic configuration instructions that allow you to quickly set up the Windows driver so that you can evaluate and use it, see the *Simba ODBC Drivers Quick Start Guide for Windows*. The Quick Start Guide also explains how to use the driver in various applications.

Windows Driver

Windows System Requirements

The Simba Impala ODBC Driver supports Cloudera Impala versions 1.0.1 through 2.10.

Install the driver on client machines where the application is installed. Each machine that you install the driver on must meet the following minimum system requirements:

- One of the following operating systems:
 - Windows 7, 8.1, or 10
 - Windows Server 2008 or later
- 100 MB of available disk space
- Visual C++ Redistributable for Visual Studio 2013 installed (with the same bitness as the driver that you are installing).
You can download the installation packages at <https://www.microsoft.com/en-ca/download/details.aspx?id=40784>.

To install the driver, you must have Administrator privileges on the machine.

Installing the Driver on Windows

On 64-bit Windows operating systems, you can execute both 32- and 64-bit applications. However, 64-bit applications must use 64-bit drivers, and 32-bit applications must use 32-bit drivers. Make sure that you use the version of the driver that matches the bitness of the client application:

- `Simba Impala 1.2 32-bit.msi` for 32-bit applications
- `Simba Impala 1.2 64-bit.msi` for 64-bit applications

You can install both versions of the driver on the same machine.

To install the Simba Impala ODBC Driver on Windows:

1. Depending on the bitness of your client application, double-click to run **Simba Impala 1.2 32-bit.msi** or **Simba Impala 1.2 64-bit.msi**.
2. Click **Next**.
3. Select the check box to accept the terms of the License Agreement if you agree, and then click **Next**.
4. To change the installation location, click **Change**, then browse to the desired folder, and then click **OK**. To accept the installation location, click **Next**.

5. Click **Install**.
6. When the installation completes, click **Finish**.
7. If you received a license file through email, then copy the license file into the `\lib` subfolder of the installation folder you selected above. You must have Administrator privileges when changing the contents of this folder.

Creating a Data Source Name on Windows

Typically, after installing the Simba Impala ODBC Driver, you need to create a Data Source Name (DSN). A DSN is a data structure that stores connection information so that it can be used by the driver to connect to Impala.

Alternatively, you can specify connection settings in a connection string or as driver-wide settings. Settings in the connection string take precedence over settings in the DSN, and settings in the DSN take precedence over driver-wide settings.

The following instructions describe how to create a DSN. For information about specifying settings in a connection string, see [Using a Connection String](#) on page 57. For information about driver-wide settings, see [Setting Driver-Wide Configuration Options on Windows](#) on page 21.

To create a Data Source Name on Windows:

1. Open the ODBC Administrator:
 - If you are using Windows 7 or earlier, click **Start**  > **All Programs** > **Simba Impala ODBC Driver 1.2** > **ODBC Administrator**.
 - Or, if you are using Windows 8 or later, on the Start screen, type **ODBC administrator**, and then click the **ODBC Administrator** search result.

 **Note:**

Make sure to select the ODBC Data Source Administrator that has the same bitness as the client application that you are using to connect to Impala.

2. In the ODBC Data Source Administrator, click the **Drivers** tab, and then scroll down as needed to confirm that the Simba Impala ODBC Driver appears in the alphabetical list of ODBC drivers that are installed on your system.
3. Choose one:
 - To create a DSN that only the user currently logged into Windows can use, click the **User DSN** tab.
 - Or, to create a DSN that all users who log into Windows can use, click the **System DSN** tab.

 **Note:**

It is recommended that you create a System DSN instead of a User DSN. Some applications load the data using a different user account, and might not be able to detect User DSNs that are created under another user account.

4. Click **Add**.
5. In the Create New Data Source dialog box, select **Simba Impala ODBC Driver** and then click **Finish**. The Simba Impala ODBC Driver DSN Setup dialog box opens.
6. In the **Data Source Name** field, type a name for your DSN.
7. Optionally, in the **Description** field, type relevant details about the DSN.
8. In the **Host** field, type the IP address or host name of the Impala server.
9. In the **Port** field, type the number of the TCP port that the Impala server uses to listen for client connections.

 **Note:**

The default port number used by Impala is 21050.

10. In the **Database** field, type the name of the database schema to use when a schema is not explicitly specified in a query.

 **Note:**

You can still issue queries on other schemas by explicitly specifying the schema in the query. To inspect your databases and determine the appropriate schema to use, type the `show databases` command at the Impala command prompt.

11. In the Authentication area, configure authentication as needed. For more information, see [Configuring Authentication on Windows](#) on page 11.

 **Note:**

The default configuration of Impala requires the Simba Impala ODBC Driver to be configured to use the No Authentication mechanism.

12. Optionally, if the operations against Impala are to be done on behalf of a user that is different than the authenticated user for the connection, type the name of the user to be delegated in the **Delegation UID** field.
13. To configure client-server verification over SSL, click **SSL Options**. For more information, see [Configuring SSL Verification on Windows](#) on page 16.
14. To configure advanced driver options, click **Advanced Options**. For more information, see [Configuring Advanced Options on Windows](#) on page 17.

15. To configure server-side properties, click **Advanced Options** and then click **Server Side Properties**. For more information, see [Configuring Server-Side Properties on Windows](#) on page 19.
16. To configure logging behavior for the driver, click **Logging Options**. For more information, see [Configuring Logging Options on Windows](#) on page 19.
17. To test the connection, click **Test**. Review the results as needed, and then click **OK**.

 **Note:**

If the connection fails, then confirm that the settings in the Simba Impala ODBC Driver DSN Setup dialog box are correct. Contact your Impala server administrator as needed.

18. To save your settings and close the Simba Impala ODBC Driver DSN Setup dialog box, click **OK**.
19. To close the ODBC Data Source Administrator, click **OK**.

Configuring Authentication on Windows

You must determine the authentication type your server is using and configure your DSN accordingly. The Impala server supports the following authentication methods:

- [Using No Authentication](#) on page 11
- [Using Kerberos](#) on page 12
- [Using Advanced Kerberos](#) on page 13
- [Using SASL User Name](#) on page 15
- [Using User Name And Password](#) on page 15

You can specify authentication settings in a DSN, in a connection string, or as driver-wide settings. Settings in the connection string take precedence over settings in the DSN, and settings in the DSN take precedence over driver-wide settings.

 **Note:**

In addition to authentication, you can configure the driver to connect over the Secure Sockets Layer (SSL). For more information, see [Configuring SSL Verification on Windows](#) on page 16.

Using No Authentication

For this authentication mechanism, you do not need to configure any additional settings.

 **Note:**

The default configuration of Impala requires the Simba Impala ODBC Driver to be configured to use the No Authentication mechanism.

To configure a connection without authentication:

1. To access authentication options, open the ODBC Data Source Administrator where you created the DSN, then select the DSN, and then click **Configure**.
2. In the **Mechanism** drop-down list, select **No Authentication**.
3. If the Impala server is configured to use SSL, then click **SSL Options** to configure SSL for the connection. For more information, see [Configuring SSL Verification on Windows](#) on page 16.
4. To save your settings and close the dialog box, click **OK**.

Using Kerberos

If the Use Only SSPI advanced option is disabled, then Kerberos must be installed and configured before you can use this authentication mechanism. For information about configuring Kerberos on your machine, see [Configuring Kerberos Authentication for Windows](#) on page 23. For information about setting the Use Only SSPI advanced option, see [Configuring Advanced Options on Windows](#) on page 17.

To configure Kerberos authentication:

1. To access authentication options, open the ODBC Data Source Administrator where you created the DSN, then select the DSN, and then click **Configure**.
2. In the **Mechanism** drop-down list, select **Kerberos**.
3. Choose one:
 - To use the default realm defined in your Kerberos setup, leave the **Realm** field empty.
 - Or, if your Kerberos setup does not define a default realm or if the realm of your Impala server host is not the default, then, in the **Realm** field, type the Kerberos realm of the Impala server.
4. In the **Host FQDN** field, type the fully qualified domain name of the Impala server host.

 **Note:**

To use the Impala server host name as the fully qualified domain name for Kerberos authentication, in the **Host FQDN** field, type **_HOST**.

5. To allow the driver to pass your credentials directly to the server for use in authentication, select **Delegate Kerberos Credentials**.

6. In the **Service Name** field, type the service name of the Impala server.
7. If the Impala server is configured to use SSL, then click **SSL Options** to configure SSL for the connection. For more information, see [Configuring SSL Verification on Windows](#) on page 16.
8. Optionally, in the **Transport Buffer Size** field, type the number of bytes to reserve in memory for buffering unencrypted data from the network.

 **Note:**

In most circumstances, the default value of 1000 bytes is optimal.

9. To save your settings and close the dialog box, click **OK**.

Using Advanced Kerberos

The Advanced Kerberos authentication mechanism allows concurrent connections within the same process to use different Kerberos user principals.

This authentication mechanism is supported only when the driver is configured to handle Kerberos authentication using MIT Kerberos:

- MIT Kerberos must be installed on your machine.
- The Use Only SSPI option must be disabled. For more information, see [Use Only SSPI](#) on page 83.

When you use Advanced Kerberos authentication, you do not need to run the `kinit` command to obtain a Kerberos ticket. Instead, you use a JSON file to map your Impala user name to a Kerberos user principal name and a keytab that contains the corresponding keys. The driver obtains Kerberos tickets based on the specified mapping. As a fallback, you can specify a keytab that the driver uses by default if the mapping file is not available or if no matching keytab can be found in the mapping file.

 **Note:**

- For information about the schema of the mapping file and how the driver handles invalid mappings, see [UPN Keytab Mapping File](#) on page 81.
- For information about how the driver searches for a keytab file if the keytab mapping and default keytab file are invalid, see [Default Keytab File](#) on page 70.

To configure Advanced Kerberos authentication:

1. To access authentication options, open the ODBC Data Source Administrator where you created the DSN, then select the DSN, and then click **Configure**.
2. In the **Mechanism** drop-down list, select **Kerberos**.
3. Choose one:

- To use the default realm defined in your Kerberos setup, leave the **Realm** field empty.
 - Or, if your Kerberos setup does not define a default realm or if the realm of your Impala server host is not the default, then, in the **Realm** field, type the Kerberos realm of the Impala server.
4. Optionally, if you are using MIT Kerberos and a Kerberos realm is specified in the **Realm** field, then choose one:
 - To have the Kerberos layer canonicalize the server's service principal name, leave the **Canonicalize Principal FQDN** check box selected.
 - Or, to prevent the Kerberos layer from canonicalizing the server's service principal name, clear the **Canonicalize Principal FQDN** check box.
 5. In the **Host FQDN** field, type the fully qualified domain name of the Impala server host.

 **Note:**

To use the Impala server host name as the fully qualified domain name for Kerberos authentication, in the **Host FQDN** field, type **_HOST**.

6. In the **Service Name** field, type the service name of the Impala server.
7. Select the **Use Keytab** check box.

 **Note:**

If the check box is not available, make sure that MIT Kerberos is installed on your machine.

8. In the **User Name** field, type an appropriate user name for accessing the Impala server.
9. Click **Keytab Options** and then do the following in the Keytab Options dialog box:
 - a. In the **UPN Keytab Mapping File** field, specify the full path to a JSON file that maps your Impala user name to a Kerberos user principal name and a keytab file.
 - b. In the **Default Keytab File** field, specify the full path to a keytab file that the driver can use if the mapping file is not available or if no matching keytab can be found in the mapping file.
 - c. To save your settings and close the dialog box, click **OK**.
10. If the Impala server is configured to use SSL, then click **SSL Options** to configure SSL for the connection. For more information, see [Configuring SSL Verification on Windows](#) on page 16.
11. Optionally, in the **Transport Buffer Size** field, type the number of bytes to reserve in memory for buffering unencrypted data from the network.

 **Note:**

In most circumstances, the default value of 1000 bytes is optimal.

12. To save your settings and close the dialog box, click **OK**.

Using SASL User Name

This authentication mechanism requires a user name but not a password. The user name labels the session, facilitating database tracking.

To configure SASL User Name authentication:

1. To access authentication options, open the ODBC Data Source Administrator where you created the DSN, then select the DSN, and then click **Configure**.
2. In the **Mechanism** drop-down list, select **SASL User Name**.
3. In the **User Name** field, type an appropriate user name for accessing the Impala server.
4. Optionally, in the **Transport Buffer Size** field, type the number of bytes to reserve in memory for buffering unencrypted data from the network.

 **Note:**

In most circumstances, the default value of 1000 bytes is optimal.

5. To save your settings and close the dialog box, click **OK**.

Using User Name And Password

This authentication mechanism requires a user name and a password.

 **Note:**

This authentication mechanism should not be used with an Impala configuration that does not have LDAP enabled.

To configure User Name And Password authentication:

1. To access authentication options, open the ODBC Data Source Administrator where you created the DSN, then select the DSN, and then click **Configure**.
2. In the **Mechanism** drop-down list, select **User Name And Password**.
3. In the **User Name** field, type an appropriate user name for accessing the Impala server.
4. In the **Password** field, type the password corresponding to the user name you typed above.
5. To save the password, select the **Save Password (Encrypted)** check box.

! Important:

The password is obscured, that is, not saved in plain text. However, it is still possible for the encrypted password to be copied and used.

6. If the Impala server is configured to use SSL, then click **SSL Options** to configure SSL for the connection. For more information, see [Configuring SSL Verification on Windows](#) on page 16.
7. Optionally, in the **Transport Buffer Size** field, type the number of bytes to reserve in memory for buffering unencrypted data from the network.

 **Note:**

In most circumstances, the default value of 1000 bytes is optimal.

8. Optionally, to use SASL to handle authentication, select the **Use Simple Authentication and Security Layer (SASL)** check box.
9. To save your settings and close the dialog box, click **OK**.

Configuring SSL Verification on Windows

If you are connecting to an Impala server that has Secure Sockets Layer (SSL) enabled, you can configure the driver to connect to an SSL-enabled socket. When using SSL to connect to a server, the driver can be configured to verify the identity of the server.

The following instructions describe how to configure SSL in a DSN. You can specify the connection settings described below in a DSN, in a connection string, or as driver-wide settings. Settings in the connection string take precedence over settings in the DSN, and settings in the DSN take precedence over driver-wide settings.

To configure SSL verification on Windows:

1. To access SSL options, open the ODBC Data Source Administrator where you created the DSN, then select the DSN, then click **Configure**, and then click **SSL Options**.
2. Select the **Enable SSL** check box.
3. To allow self-signed certificates from the server, select the **Allow Self-signed Server Certificate** check box.
4. To allow the common name of a CA-issued SSL certificate to not match the host name of the Impala server, select the **Allow Common Name Host Name Mismatch** check box.

5. To specify the CA certificates that you want to use to verify the server, do one of the following:
 - To verify the server using the trusted CA certificates from a specific `.pem` file, specify the full path to the file in the **Trusted Certificates** field and clear the **Use System Trust Store** check box.
 - Or, to use the trusted CA certificates `.pem` file that is installed with the driver, leave the **Trusted Certificates** field empty, and clear the **Use System Trust Store** check box.
 - Or, to use the Windows Trust Store, select the **Use System Trust Store** check box.

! Important:

- If you are using the Windows Trust Store, make sure to import the trusted CA certificates into the Trust Store.
- If the trusted CA supports certificate revocation, select the **Check Certificate Revocation** check box.

6. To save your settings and close the SSL Options dialog box, click **OK**.

Configuring Advanced Options on Windows

You can configure advanced options to modify the behavior of the driver.

The following instructions describe how to configure advanced options in a DSN. You can specify the connection settings described below in a DSN, in a connection string, or as driver-wide settings. Settings in the connection string take precedence over settings in the DSN, and settings in the DSN take precedence over driver-wide settings.

To configure advanced options on Windows:

1. To access advanced options, open the ODBC Data Source Administrator where you created the DSN, then select the DSN, then click **Configure**, and then click **Advanced Options**.
2. To disable translation from ODBC SQL to Impala SQL, select the **Use Native Query** check box.

Note:

By default, the driver applies transformations to the queries emitted by an application to convert the queries into an equivalent form in Impala SQL. If the application is Impala-aware and already emits Impala SQL, then turning off the translation avoids the additional overhead of query transformation.

3. To enable the driver to successfully run queries that contain transaction statements, select the **Enable Simulated Transactions** check box.

 **Note:**

The transaction statements are not executed, because ODBC does not support them. Enabling this option allows the driver to run the query without returning error messages.

4. To enable the driver to return SQL_WVARCHAR instead of SQL_VARCHAR for STRING and VARCHAR columns, and SQL_WCHAR instead of SQL_CHAR for CHAR columns, select the **Use SQL Unicode Types** check box.
5. To have the driver automatically attempt to reconnect to the server if communications are lost, select **Enable Auto Reconnect**.
6. To have the driver restrict catalog queries to the current schema when no schema is specified, or when the schema is specified with the wildcard character %, select **Restrict Metadata with Current Schema**.
7. To handle Kerberos authentication using the SSPI plugin instead of MIT Kerberos by default, select one or both of the check boxes under the **Use Only SSPI** option:
 - To configure the current DSN to use the SSPI plugin by default, select **Enable For This DSN**.
 - To configure all DSN-less connections to use the SSPI plugin by default, select **Enable For DSN-less Connections**.
 - To configure all connections that use the Simba Impala ODBC Driver to use the SSPI plugin by default, select both check boxes.
8. In the **Rows Fetched Per Block** field, type the number of rows to be fetched per block.
9. In the **Socket Timeout** field, type the number of seconds after which Impala closes the connection with the client application if the connection is idle.

 **Note:**

Setting the Socket Timeout value to 0 disables the timeout feature.

10. In the **String Column Length** field, type the maximum data length for STRING columns.
11. In the **Async Exec Poll Interval (ms)** field, type the time in milliseconds between each poll for the query execution status.
12. To save your settings and close the Advanced Options dialog box, click **OK**.

Configuring Server-Side Properties on Windows

When connecting to a server that is running Impala 2.0 or later, you can use the driver to apply configuration properties to the server.

! Important:

This feature is not supported for earlier versions of Impala, where the SET statement can only be executed from within the Impala shell.

The following instructions describe how to configure server-side properties in a DSN. You can specify the connection settings described below in a DSN, in a connection string, or as driver-wide settings. Settings in the connection string take precedence over settings in the DSN, and settings in the DSN take precedence over driver-wide settings.

To configure server-side properties on Windows:

1. To configure server-side properties, open the ODBC Data Source Administrator where you created the DSN, then select the DSN, then click **Configure**, then click **Advanced Options**, and then click **Server Side Properties**.
2. To create a server-side property, click **Add**, then type appropriate values in the **Key** and **Value** fields, and then click **OK**. For example, to set the value of the MEM_LIMIT query option to 1 GB, type **MEM_LIMIT** in the **Key** field and then type **1000000000** in the **Value** field.
3. To edit a server-side property, select the property from the list, then click **Edit**, then update the **Key** and **Value** fields as needed, and then click **OK**.
4. To delete a server-side property, select the property from the list, and then click **Remove**. In the confirmation dialog box, click **Yes**.
5. To configure the driver to convert server-side property key names to all lower-case characters, select the **Convert Key Name To Lower Case** check box.
6. To save your settings and close the Server Side Properties dialog box, click **OK**.

Configuring Logging Options on Windows

To help troubleshoot issues, you can enable logging. In addition to functionality provided in the Simba Impala ODBC Driver, the ODBC Data Source Administrator provides tracing functionality.

! Important:

Only enable logging or tracing long enough to capture an issue. Logging or tracing decreases performance and can consume a large quantity of disk space.

The settings for logging apply to every connection that uses the Simba Impala ODBC Driver, so make sure to disable the feature after you are done using it.

To enable driver logging on Windows:

1. To access logging options, open the ODBC Data Source Administrator where you created the DSN, then select the DSN, then click **Configure**, and then click **Logging Options**.
2. From the **Log Level** drop-down list, select the logging level corresponding to the amount of information that you want to include in log files:

Logging Level	Description
OFF	Disables all logging.
FATAL	Logs severe error events that lead the driver to abort.
ERROR	Logs error events that might allow the driver to continue running.
WARNING	Logs events that might result in an error if action is not taken.
INFO	Logs general information that describes the progress of the driver.
DEBUG	Logs detailed information that is useful for debugging the driver.
TRACE	Logs all driver activity.

3. In the **Log Path** field, specify the full path to the folder where you want to save log files.
4. If requested by Technical Support, type the name of the component for which to log messages in the **Log Namespace** field. Otherwise, do not type a value in the field.
5. In the **Max Number Files** field, type the maximum number of log files to keep.

 **Note:**

After the maximum number of log files is reached, each time an additional file is created, the driver deletes the oldest log file.

6. In the **Max File Size** field, type the maximum size of each log file in megabytes (MB).

 **Note:**

After the maximum file size is reached, the driver creates a new file and continues logging.

7. Click **OK**.
8. Restart your ODBC application to make sure that the new settings take effect.

The Simba Impala ODBC Driver produces two log files at the location you specify in the Log Path field, where *[DriverName]* is the name of the driver:

- A `Simba[DriverName]_driver.log` file that logs driver activity that is not specific to a connection.
- A `Simba[DriverName]_connection_[Number].log` for each connection made to the database, where *[Number]* is a number that identifies each log file. This file logs driver activity that is specific to the connection.

If you enable the `UseLogPrefix` connection property, the driver prefixes the log file name with the user name associated with the connection and the process ID of the application through which the connection is made. For more information, see [UseLogPrefix](#) on page 88.

To disable driver logging on Windows:

1. Open the ODBC Data Source Administrator where you created the DSN, then select the DSN, then click **Configure**, and then click **Logging Options**.
2. From the **Log Level** drop-down list, select **LOG_OFF**.
3. Click **OK**.
4. Restart your ODBC application to make sure that the new settings take effect.

Setting Driver-Wide Configuration Options on Windows

When you specify connection settings in a DSN or connection string, those settings apply only when you connect to Impala using that particular DSN or string. As an alternative, you can specify settings that apply to every connection that uses the Simba Impala ODBC Driver by configuring them in the Windows Registry.

 **Note:**

Settings in the connection string take precedence over settings in the DSN, and settings in the DSN take precedence over driver-wide settings.

To set driver-wide configuration options on Windows:

1. Choose one:
 - If you are using Windows 7 or earlier, click **Start** , then type **regedit** in the **Search** field, and then click **regedit.exe** in the search results.
 - Or, if you are using Windows 8 or later, on the Start screen, type **regedit**, and then click the **regedit** search result.
2. Navigate to the appropriate registry key for the bitness of your driver and your machine:
 - If you are using the 32-bit driver on a 64-bit machine, then browse to the following registry key:
`HKEY_LOCAL_MACHINE\SOFTWAREWow6432Node\Simba\Simba Impala ODBC Driver\Driver`
 - Otherwise, browse to the following registry key:
`HKEY_LOCAL_MACHINE\SOFTWARE\Simba\Simba Impala ODBC Driver\Driver`
3. For each connection property that you want to configure, do the following:
 - a. Right-click the **Driver** subkey and then select **New > String Value**.
 - b. Type the key name of the connection property, and then press **Enter**.

For example, to specify the authentication mechanism to use, type `AuthMech`. To verify the supported key name for each driver configuration option, refer to the "Key Name" column in the description of the option in [Driver Configuration Options](#) on page 66.
 - c. Right-click the value that you created in the previous steps and then click **Modify**.
 - d. In the Edit String dialog box, in the **Value Data** field, type the value that you want to set the connection property to and then click **OK**.

For example, to specify the Kerberos authentication mechanism, type 1.
4. Close the Registry Editor.

Configuring Kerberos Authentication for Windows

Active Directory

The Simba Impala ODBC Driver supports Active Directory Kerberos on Windows. There are two prerequisites for using Active Directory Kerberos on Windows:

- MIT Kerberos is not installed on the client Windows machine.
- The MIT Kerberos Hadoop realm has been configured to trust the Active Directory realm, according to Cloudera's documentation, so that users in the Active Directory realm can access services in the MIT Kerberos Hadoop realm.

MIT Kerberos

Downloading and Installing MIT Kerberos for Windows 4.0.1

For information about Kerberos and download links for the installer, see the MIT Kerberos website: <http://web.mit.edu/kerberos/>.

To download and install MIT Kerberos for Windows 4.0.1:

1. Download the appropriate Kerberos installer:
 - For a 64-bit machine, use the following download link from the MIT Kerberos website: <http://web.mit.edu/kerberos/dist/kfw/4.0/kfw-4.0.1-amd64.msi>.
 - For a 32-bit machine, use the following download link from the MIT Kerberos website: <http://web.mit.edu/kerberos/dist/kfw/4.0/kfw-4.0.1-i386.msi>.

 **Note:**

The 64-bit installer includes both 32-bit and 64-bit libraries. The 32-bit installer includes 32-bit libraries only.

2. To run the installer, double-click the `.msi` file that you downloaded above.
3. Follow the instructions in the installer to complete the installation process.
4. When the installation completes, click **Finish**.

Setting Up the Kerberos Configuration File

Settings for Kerberos are specified through a configuration file. You can set up the configuration file as an `.ini` file in the default location, which is the `C:\ProgramData\MIT\Kerberos5` directory, or as a `.conf` file in a custom location.

Normally, the `C:\ProgramData\MIT\Kerberos5` directory is hidden. For information about viewing and using this hidden directory, refer to Microsoft Windows documentation.

 **Note:**

For more information on configuring Kerberos, refer to the MIT Kerberos documentation.

To set up the Kerberos configuration file in the default location:

1. Obtain a `krb5.conf` configuration file. You can obtain this file from your Kerberos administrator, or from the `/etc/krb5.conf` folder on the machine that is hosting the Impala server.
2. Rename the configuration file from `krb5.conf` to `krb5.ini`.
3. Copy the `krb5.ini` file to the `C:\ProgramData\MIT\Kerberos5` directory and overwrite the empty sample file.

To set up the Kerberos configuration file in a custom location:

1. Obtain a `krb5.conf` configuration file. You can obtain this file from your Kerberos administrator, or from the `/etc/krb5.conf` folder on the machine that is hosting the Impala server.
2. Place the `krb5.conf` file in an accessible directory and make note of the full path name.
3. Open the System window:
 - If you are using Windows 7 or earlier, click **Start** , then right-click **Computer**, and then click **Properties**.
 - Or, if you are using Windows 8 or later, right-click **This PC** on the Start screen, and then click **Properties**.
4. Click **Advanced System Settings**.
5. In the System Properties dialog box, click the **Advanced** tab and then click **Environment Variables**.
6. In the Environment Variables dialog box, under the System Variables list, click **New**.
7. In the New System Variable dialog box, in the **Variable Name** field, type **KRB5_CONFIG**.
8. In the **Variable Value** field, type the full path to the `krb5.conf` file.
9. Click **OK** to save the new variable.
10. Make sure that the variable is listed in the System Variables list.
11. Click **OK** to close the Environment Variables dialog box, and then click **OK** to close the System Properties dialog box.

Setting Up the Kerberos Credential Cache File

Kerberos uses a credential cache to store and manage credentials.

To set up the Kerberos credential cache file:

1. Create a directory where you want to save the Kerberos credential cache file. For example, create a directory named `C:\temp`.
2. Open the System window:
 - If you are using Windows 7 or earlier, click **Start** , then right-click **Computer**, and then click **Properties**.
 - Or, if you are using Windows 8 or later, right-click **This PC** on the Start screen, and then click **Properties**.
3. Click **Advanced System Settings**.
4. In the System Properties dialog box, click the **Advanced** tab and then click **Environment Variables**.
5. In the Environment Variables dialog box, under the System Variables list, click **New**.
6. In the New System Variable dialog box, in the **Variable Name** field, type **KRB5CCNAME**.
7. In the **Variable Value** field, type the path to the folder you created above, and then append the file name `krb5cache`. For example, if you created the folder `C:\temp`, then type `C:\temp\krb5cache`.

Note:

`krb5cache` is a file (not a directory) that is managed by the Kerberos software, and it should not be created by the user. If you receive a permission error when you first use Kerberos, make sure that the `krb5cache` file does not already exist as a file or a directory.

8. Click **OK** to save the new variable.
9. Make sure that the variable appears in the System Variables list.
10. Click **OK** to close the Environment Variables dialog box, and then click **OK** to close the System Properties dialog box.
11. To make sure that Kerberos uses the new settings, restart your machine.

Obtaining a Ticket for a Kerberos Principal

A principal refers to a user or service that can authenticate to Kerberos. To authenticate to Kerberos, a principal must obtain a ticket by using a password or a keytab file. You can specify a keytab file to use, or use the default keytab file of your Kerberos configuration.

To obtain a ticket for a Kerberos principal using a password:

1. Open MIT Kerberos Ticket Manager.
2. In MIT Kerberos Ticket Manager, click **Get Ticket**.
3. In the Get Ticket dialog box, type your principal name and password, and then click **OK**.

If the authentication succeeds, then your ticket information appears in MIT Kerberos Ticket Manager.

To obtain a ticket for a Kerberos principal using a keytab file:

1. Open a command prompt:
 - If you are using Windows 7 or earlier, click **Start** , then click **All Programs**, then click **Accessories**, and then click **Command Prompt**.
 - If you are using Windows 8 or later, click the arrow button at the bottom of the Start screen, then find the Windows System program group, and then click **Command Prompt**.
2. In the Command Prompt, type a command using the following syntax:

```
kinit -k -t [KeytabPath] [Principal]
```

[KeytabPath] is the full path to the keytab file. For example:

```
C:\mykeytabs\myUser.keytab.
```

[Principal] is the Kerberos user principal to use for authentication. For example:

```
myUser@EXAMPLE.COM.
```

3. If the cache location KRB5CCNAME is not set or used, then use the `-c` option of the `kinit` command to specify the location of the credential cache. In the command, the `-c` argument must appear last. For example:

```
kinit -k -t C:\mykeytabs\myUser.keytab  
myUser@EXAMPLE.COM -c C:\ProgramData\MIT\krbcache
```

`Krbcache` is the Kerberos cache file, not a directory.

To obtain a ticket for a Kerberos principal using the default keytab file: **Note:**

For information about configuring a default keytab file for your Kerberos configuration, refer to the MIT Kerberos documentation.

1. Open a command prompt:
 - If you are using Windows 7 or earlier, click **Start** , then click **All Programs**, then click **Accessories**, and then click **Command Prompt**.

- If you are using Windows 8 or later, click the arrow button at the bottom of the Start screen, then find the Windows System program group, and then click **Command Prompt**.
2. In the Command Prompt, type a command using the following syntax:

```
kinit -k [principal]
```

[principal] is the Kerberos user principal to use for authentication. For example: MyUser@EXAMPLE.COM.

3. If the cache location KRB5CCNAME is not set or used, then use the `-c` option of the `kinit` command to specify the location of the credential cache. In the command, the `-c` argument must appear last. For example:

```
kinit -k -t C:\mykeytabs\myUser.keytab  
myUser@EXAMPLE.COM -c C:\ProgramData\MIT\krbcache
```

Krbcache is the Kerberos cache file, not a directory.

Verifying the Driver Version Number on Windows

If you need to verify the version of the Simba Impala ODBC Driver that is installed on your Windows machine, you can find the version number in the ODBC Data Source Administrator.

To verify the driver version number on Windows:

1. Open the ODBC Administrator:
 - If you are using Windows 7 or earlier, click **Start**  > **All Programs** > **Simba Impala ODBC Driver 1.2** > **ODBC Administrator**.
 - Or, if you are using Windows 8 or later, on the Start screen, type **ODBC administrator**, and then click the **ODBC Administrator** search result.

 **Note:**

Make sure to select the ODBC Data Source Administrator that has the same bitness as the client application that you are using to connect to Impala.

2. Click the **Drivers** tab and then find the Simba Impala ODBC Driver in the list of ODBC drivers that are installed on your system. The version number is displayed in the **Version** column.

macOS Driver

macOS System Requirements

The Simba Impala ODBC Driver supports Cloudera Impala versions 1.0.1 through 2.10.

Install the driver on client machines where the application is installed. Each machine that you install the driver on must meet the following minimum system requirements:

- macOS version 10.9, 10.10, or 10.11
- 100 MB of available disk space
- iODBC 3.52.7 or later

Installing the Driver on macOS

The Simba Impala ODBC Driver is available for macOS as a `.dmg` file named `Simba Impala 1.2.dmg`. The driver supports both 32- and 64-bit client applications.

To install the Simba Impala ODBC Driver on macOS:

1. Double-click **Simba Impala 1.2.dmg** to mount the disk image.
2. Double-click **Simba Impala 1.2.pkg** to run the installer.
3. In the installer, click **Continue**.
4. On the Software License Agreement screen, click **Continue**, and when the prompt appears, click **Agree** if you agree to the terms of the License Agreement.
5. Optionally, to change the installation location, click **Change Install Location**, then select the desired location, and then click **Continue**.

 **Note:**

By default, the driver files are installed in the `/Library/simba/impala` directory.

6. To accept the installation location and begin the installation, click **Install**.
7. When the installation completes, click **Close**.
8. If you received a license file through email, then copy the license file into the `/lib` subfolder in the driver installation directory. You must have root privileges when changing the contents of this folder.

For example, if you installed the driver to the default location, you would copy the license file into the `/Library/simba/impala/lib` folder.

Next, configure the environment variables on your machine to make sure that the ODBC driver manager can work with the driver. For more information, see [Configuring the ODBC Driver Manager on Non-Windows Machines](#) on page 37.

Verifying the Driver Version Number on macOS

If you need to verify the version of the Simba Impala ODBC Driver that is installed on your macOS machine, you can query the version number through the Terminal.

To verify the driver version number on macOS:

- At the Terminal, run the following command:

```
pkgutil --info simba.impalaodbc
```

The command returns information about the Simba Impala ODBC Driver that is installed on your machine, including the version number.

Linux Driver

Linux System Requirements

The Simba Impala ODBC Driver supports Cloudera Impala versions 1.0.1 through 2.10.

Install the driver on client machines where the application is installed. Each machine that you install the driver on must meet the following minimum system requirements:

- One of the following distributions:
 - Red Hat® Enterprise Linux® (RHEL) 6 or 7
 - CentOS 6 or 7
 - SUSE Linux Enterprise Server (SLES) 11 or 12
- 50 MB of available disk space
- One of the following ODBC driver managers installed:
 - iODBC 3.52.7 or later
 - unixODBC 2.3.0 or later
- All of the following `libsasl` libraries installed:
 - `cyrus-sasl-2.1.22-7` or later
 - `cyrus-sasl-gssapi-2.1.22-7` or later
 - `cyrus-sasl-plain-2.1.22-7` or later

 **Note:**

If the package manager in your Linux distribution cannot resolve the dependencies automatically when installing the driver, then download and manually install the packages.

To install the driver, you must have root access on the machine.

Installing the Driver Using the RPM File

On 64-bit editions of Linux, you can execute both 32- and 64-bit applications. However, 64-bit applications must use 64-bit drivers, and 32-bit applications must use 32-bit drivers. Make sure to install and use the version of the driver that matches the bitness of the client application:

- `simbaimpala-[Version]-[Release].i686.rpm` for the 32-bit driver
- `simbaimpala-[Version]-[Release].x86_64.rpm` for the 64-bit driver

The placeholders in the file names are defined as follows:

- *[Version]* is the version number of the driver.
- *[Release]* is the release number for this version of the driver.

You can install both the 32-bit and 64-bit versions of the driver on the same machine.

To install the Simba Impala ODBC Driver using the RPM File:

1. Log in as the root user.
2. Navigate to the folder containing the RPM package for the driver.
3. Depending on the Linux distribution that you are using, run one of the following commands from the command line, where *[RPMFileName]* is the file name of the RPM package:

- If you are using Red Hat Enterprise Linux or CentOS, run the following command:

```
yum --nogpgcheck localinstall [RPMFileName]
```

- Or, if you are using SUSE Linux Enterprise Server, run the following command:

```
zypper install [RPMFileName]
```

The Simba Impala ODBC Driver files are installed in the `/opt/simba/impala` directory.

Note:

If the package manager in your Linux distribution cannot resolve the `libsasl` dependencies automatically when installing the driver, then download and manually install the packages.

4. If you received a license file through email, then copy the license file into the `/opt/simba/impala/lib/32` or `/opt/simba/impala/lib/64` folder, depending on the version of the driver that you installed. You must have root privileges when changing the contents of this folder.

Next, configure the environment variables on your machine to make sure that the ODBC driver manager can work with the driver. For more information, see [Configuring the ODBC Driver Manager on Non-Windows Machines](#) on page 37.

Verifying the Driver Version Number on Linux

If you need to verify the version of the Simba Impala ODBC Driver that is installed on your Linux machine, you can query the version number through the command-line

interface if the driver was installed using an RPM file.

To verify the driver version number on Linux:

- Depending on your package manager, at the command prompt, run one of the following commands:

- `yum list | grep SimbaImpalaODBC`
- `rpm -qa | grep SimbaImpalaODBC`

The command returns information about the Simba Impala ODBC Driver that is installed on your machine, including the version number.

AIX Driver

AIX System Requirements

The Simba Impala ODBC Driver supports Cloudera Impala versions 1.0.1 through 2.10.

Install the driver on client machines where the application is installed. Each machine that you install the driver on must meet the following minimum system requirements:

- IBM AIX 5.3, 6.1, or 7.1
- 150 MB of available disk space
- One of the following ODBC driver managers installed:
 - iODBC 3.52.7 or later
 - unixODBC 2.3.0 or later

To install the driver, you must have root access on the machine.

Installing the Driver on AIX

On 64-bit editions of AIX, you can execute both 32- and 64-bit applications. However, 64-bit applications must use 64-bit drivers, and 32-bit applications must use 32-bit drivers. Make sure that you use the version of the driver that matches the bitness of the client application:

- `SimbaImpalaODBC-32bit-[Version]-[Release].ppc.rpm` for the 32-bit driver
- `SimbaImpalaODBC-[Version]-[Release].ppc.rpm` for the 64-bit driver

[Version] is the version number of the driver, and *[Release]* is the release number for this version of the driver.

You can install both versions of the driver on the same machine.

To install the Simba Impala ODBC Driver on AIX:

1. Log in as the root user, and then navigate to the folder containing the RPM package for the driver.
2. Run the following command from the command line, where *[RPMFileName]* is the file name of the RPM package:

```
rpm --install [RPMFileName]
```

The Simba Impala ODBC Driver files are installed in the `/opt/simba/impala` directory.

3. If you received a license file via email, then copy the license file into the `/opt/simba/impala/lib/32` or `/opt/simba/impala/lib/64` folder, depending on the version of the driver that you installed. You must have root privileges when changing the contents of this folder.

Next, configure the environment variables on your machine to make sure that the ODBC driver manager can work with the driver. For more information, see [Configuring the ODBC Driver Manager on Non-Windows Machines](#) on page 37.

Verifying the Driver Version Number on AIX

If you need to verify the version of the Simba Impala ODBC Driver that is installed on your AIX machine, you can query the version number through the command-line interface.

To verify the driver version number on AIX:

- At the command prompt, run the following command:

```
rpm -qa | grep SimbaImpalaODBC
```

The command returns information about the Simba Impala ODBC Driver that is installed on your machine, including the version number.

Solaris Driver

Solaris System Requirements

The Simba Impala ODBC Driver supports Cloudera Impala versions 1.0.1 through 2.10.

Install the driver on client machines where the application is installed. Each machine that you install the driver on must meet the following minimum system requirements:

- Solaris 10 or later (sparc and sparc64 editions are supported)
- 50 MB of available disk space
- One of the following ODBC driver managers installed:
 - iODBC 3.52.7 or later
 - unixODBC 2.3.0 or later

To install the driver, you must have root access on the machine.

Installing the Driver on Solaris

The Simba Impala ODBC Driver is available for Solaris as a tarball package named `Simba Impala ODBC Driver_Solaris-gcc_[Version].[Release]_Solaris.tar.gz`, where *[Version]* is the version number of the driver and *[Release]* is the release number for this version of the driver. The package contains both the 32-bit and 64-bit versions of the driver.

On sparc64 editions of Solaris, you can execute both sparc and sparc64 applications. However, sparc64 applications must use 64-bit drivers, and sparc applications must use 32-bit drivers. Make sure that you use the version of the driver that matches the bitness of the client application. You can install both versions of the driver on the same machine.

To install the Simba Impala ODBC Driver on Solaris:

1. Log in as the root user, and then navigate to the folder containing the tarball package.
2. Run the following command to extract the package and install the driver:

```
tar --directory=/opt -zxvf [TarballName]
```

Where *[TarballName]* is the name of the tarball package containing the driver.

The Simba Impala ODBC Driver files are installed in the `/opt/simba/impala/` directory.

3. If you received a license file via email, then copy the license file into the `/opt/simba/impala/lib/32` or `/opt/simba/impala/lib/64` folder, depending on the version of the driver that you installed. You must have root privileges when changing the contents of this folder.

Next, configure the environment variables on your machine to make sure that the ODBC driver manager can work with the driver. For more information, see [Configuring the ODBC Driver Manager on Non-Windows Machines](#) on page 37.

Verifying the Driver Version Number on Solaris

If you need to verify the version of the Simba Impala ODBC Driver that is installed on your Solaris machine, you can query the version number through the command-line interface.

To verify the driver version number on Solaris:

- At the command prompt, run the following command:

```
rpm -qa | grep SimbaImpalaODBC
```

The command returns information about the Simba Impala ODBC Driver that is installed on your machine, including the version number.

Configuring the ODBC Driver Manager on Non-Windows Machines

To make sure that the ODBC driver manager on your machine is configured to work with the Simba Impala ODBC Driver, do the following:

- Set the library path environment variable to make sure that your machine uses the correct ODBC driver manager. For more information, see [Specifying ODBC Driver Managers on Non-Windows Machines](#) on page 37.
- If the driver configuration files are not stored in the default locations expected by the ODBC driver manager, then set environment variables to make sure that the driver manager locates and uses those files. For more information, see [Specifying the Locations of the Driver Configuration Files](#) on page 38.

After configuring the ODBC driver manager, you can configure a connection and access your data store through the driver. For more information, see [Configuring ODBC Connections on a Non-Windows Machine](#) on page 40.

Specifying ODBC Driver Managers on Non-Windows Machines

You need to make sure that your machine uses the correct ODBC driver manager to load the driver. To do this, set the library path environment variable.

macOS

If you are using a macOS machine, then set the `DYLD_LIBRARY_PATH` environment variable to include the paths to the ODBC driver manager libraries. For example, if the libraries are installed in `/usr/local/lib`, then run the following command to set `DYLD_LIBRARY_PATH` for the current user session:

```
export DYLD_LIBRARY_PATH=$DYLD_LIBRARY_PATH:/usr/local/lib
```

For information about setting an environment variable permanently, refer to the macOS shell documentation.

Linux or AIX

If you are using a Linux or AIX machine, then set the `LD_LIBRARY_PATH` environment variable to include the paths to the ODBC driver manager libraries. For example, if the libraries are installed in `/usr/local/lib`, then run the following command to set `LD_LIBRARY_PATH` for the current user session:

```
export LD_LIBRARY_PATH=$LD_LIBRARY_PATH:/usr/local/lib
```

For information about setting an environment variable permanently, refer to the Linux or AIX shell documentation.

Solaris

If you are using a Solaris machine, then set the `LD_LIBRARY_PATH` environment variable to include the paths to the ODBC driver manager libraries and the third-party libraries that are installed with the driver. For example, if the driver manager libraries are installed in `/usr/local/lib` and the 32-bit driver is installed in `/opt/simba/impala`, then run the following command to set `LD_LIBRARY_PATH` for the current user session:

```
export LD_LIBRARY_PATH=$LD_LIBRARY_PATH:/usr/local/lib:/opt/simba/impala/lib/32
```

For information about setting an environment variable permanently, refer to the Solaris shell documentation.

Specifying the Locations of the Driver Configuration Files

By default, ODBC driver managers are configured to use hidden versions of the `odbc.ini` and `odbcinst.ini` configuration files (named `.odbc.ini` and `.odbcinst.ini`) located in the home directory, as well as the `simba.impalaodbc.ini` file in the `lib` subfolder of the driver installation directory. If you store these configuration files elsewhere, then you must set the environment variables described below so that the driver manager can locate the files.

If you are using iODBC, do the following:

- Set `ODBCINI` to the full path and file name of the `odbc.ini` file.
- Set `ODBCINSTINI` to the full path and file name of the `odbcinst.ini` file.
- Set `SIMBAIMPALAODBCINI` to the full path and file name of the `simba.impalaodbc.ini` file.

If you are using unixODBC, do the following:

- Set `ODBCINI` to the full path and file name of the `odbc.ini` file.
- Set `ODBCSYSINI` to the full path of the directory that contains the `odbcinst.ini` file.

- Set `SIMBAIMPALAODBCINI` to the full path and file name of the `simba.impalaodbc.ini` file.

For example, if your `odbc.ini` and `odbcinst.ini` files are located in `/usr/local/odbc` and your `simba.impalaodbc.ini` file is located in `/etc`, then set the environment variables as follows:

For iODBC:

```
export ODBCINI=/usr/local/odbc/odbc.ini
export ODBCINSTINI=/usr/local/odbc/odbcinst.ini
export SIMBAIMPALAODBCINI=/etc/simba.impalaodbc.ini
```

For unixODBC:

```
export ODBCINI=/usr/local/odbc/odbc.ini
export ODBCYSINI=/usr/local/odbc
export SIMBAIMPALAODBCINI=/etc/simba.impalaodbc.ini
```

To locate the `simba.impalaodbc.ini` file, the driver uses the following search order:

1. If the `SIMBAIMPALAODBCINI` environment variable is defined, then the driver searches for the file specified by the environment variable.
2. The driver searches the directory that contains the driver library files for a file named `simba.impalaodbc.ini`.
3. The driver searches the current working directory of the application for a file named `simba.impalaodbc.ini`.
4. The driver searches the home directory for a hidden file named `.simba.impalaodbc.ini` (prefixed with a period).
5. The driver searches the `/etc` directory for a file named `simba.impalaodbc.ini`.

Configuring ODBC Connections on a Non-Windows Machine

The following sections describe how to configure ODBC connections when using the Simba Impala ODBC Driver on non-Windows platforms:

- [Creating a Data Source Name on a Non-Windows Machine](#) on page 40
- [Configuring a DSN-less Connection on a Non-Windows Machine](#) on page 43
- [Configuring Authentication on a Non-Windows Machine](#) on page 45
- [Configuring SSL Verification on a Non-Windows Machine](#) on page 49
- [Configuring Server-Side Properties on a Non-Windows Machine](#) on page 50
- [Configuring Logging Options on a Non-Windows Machine](#) on page 51
- [Setting Driver-Wide Configuration Options on a Non-Windows Machine](#) on page 52
- [Testing the Connection on a Non-Windows Machine](#) on page 53

Creating a Data Source Name on a Non-Windows Machine

Typically, after installing the Simba Impala ODBC Driver, you need to create a Data Source Name (DSN). A DSN is a data structure that stores connection information so that it can be used by the driver to connect to Impala.

You can specify connection settings in a DSN (in the `odbc.ini` file), in a connection string, or as driver-wide settings (in the `simba.impalaodbc.ini` file). Settings in the connection string take precedence over settings in the DSN, and settings in the DSN take precedence over driver-wide settings.

The following instructions describe how to create a DSN by specifying connection settings in the `odbc.ini` file. If your machine is already configured to use an existing `odbc.ini` file, then update that file by adding the settings described below. Otherwise, copy the `odbc.ini` file from the `Setup` subfolder in the driver installation directory to the home directory, and then update the file as described below.

For information about specifying settings in a connection string, see [Configuring a DSN-less Connection on a Non-Windows Machine](#) on page 43 and [Using a Connection String](#) on page 57. For information about driver-wide settings, see [Setting Driver-Wide Configuration Options on a Non-Windows Machine](#) on page 52.

To create a Data Source Name on a non-Windows machine:

1. In a text editor, open the `odbc.ini` configuration file.

Note:

If you are using a hidden copy of the `odbc.ini` file, you can remove the period (.) from the start of the file name to make the file visible while you are editing it.

2. In the `[ODBC Data Sources]` section, add a new entry by typing a name for the DSN, an equal sign (=), and then the name of the driver.

For example, on a macOS machine:

```
[ODBC Data Sources]
Sample DSN=Simba Impala ODBC Driver
```

As another example, for a 32-bit driver on a Linux/AIX/Solaris machine:

```
[ODBC Data Sources]
Sample DSN=Simba Impala ODBC Driver 32-bit
```

3. Create a section that has the same name as your DSN, and then specify configuration options as key-value pairs in the section:
 - a. Set the `Driver` property to the full path of the driver library file that matches the bitness of the application.

For example, on a macOS machine:

```
Driver=/Library/simba/impala/lib/libimpalaodbcodbc_sbu.dylib
```

As another example, for a 32-bit driver on a Linux/AIX/Solaris machine:

```
Driver=/opt/simba/impala/lib/32/libimpalaodbc_sb32.so
```

- b. Set the `Host` property to the IP address or host name of the server.

For example:

```
Host=192.168.222.160
```

- c. Set the `Port` property to the number of the TCP port that the server uses to listen for client connections.

For example:

```
Port=21050
```

- d. If authentication is required to access the server, then specify the authentication mechanism and your credentials. For more information, see [Configuring Authentication on a Non-Windows Machine](#) on page 45.
 - e. If you want to connect to the server through SSL, then enable SSL and specify the certificate information. For more information, see [Configuring SSL Verification on a Non-Windows Machine](#) on page 49.
 - f. If you want to configure server-side properties, then set them as key-value pairs using a special syntax. For more information, see [Configuring Server-Side Properties on a Non-Windows Machine](#) on page 50.
 - g. Optionally, set additional key-value pairs as needed to specify other optional connection settings. For detailed information about all the configuration options supported by the Simba Impala ODBC Driver, see [Driver Configuration Options](#) on page 66.
4. Save the `odbc.ini` configuration file.

 **Note:**

If you are storing this file in its default location in the home directory, then prefix the file name with a period (.) so that the file becomes hidden. If you are storing this file in another location, then save it as a non-hidden file (without the prefix), and make sure that the ODBCINI environment variable specifies the location. For more information, see [Specifying the Locations of the Driver Configuration Files](#) on page 38.

For example, the following is an `odbc.ini` configuration file for macOS containing a DSN that connects to an Impala server that does not require authentication:

```
[ODBC Data Sources]
Sample DSN=Simba Impala ODBC Driver
[Sample DSN]
Driver=/Library/simba/impala/lib/libimpalaodbcodbc_sbu.dylib
Host=192.168.222.160
Port=21050
```

As another example, the following is an `odbc.ini` configuration file for a 32-bit driver on a Linux/AIX/Solaris machine, containing a DSN that connects to an Impala server that does not require authentication:

```
[ODBC Data Sources]
Sample DSN=Simba Impala ODBC Driver 32-bit
[Sample DSN]
Driver=/opt/simba/impala/lib/32/libimpalaodbc_sb32.so
```

```
Host=192.168.222.160
Port=21050
```

You can now use the DSN in an application to connect to the data store.

Configuring a DSN-less Connection on a Non-Windows Machine

To connect to your data store through a DSN-less connection, you need to define the driver in the `odbcinst.ini` file and then provide a DSN-less connection string in your application.

If your machine is already configured to use an existing `odbcinst.ini` file, then update that file by adding the settings described below. Otherwise, copy the `odbcinst.ini` file from the `Setup` subfolder in the driver installation directory to the home directory, and then update the file as described below.

To define a driver on a non-Windows machine:

1. In a text editor, open the `odbcinst.ini` configuration file.

Note:

If you are using a hidden copy of the `odbcinst.ini` file, you can remove the period (.) from the start of the file name to make the file visible while you are editing it.

2. In the `[ODBC Drivers]` section, add a new entry by typing a name for the driver, an equal sign (=), and then `Installed`.

For example:

```
[ODBC Drivers]
Simba Impala ODBC Driver=Installed
```

3. Create a section that has the same name as the driver (as specified in the previous step), and then specify the following configuration options as key-value pairs in the section:
 - a. Set the `Driver` property to the full path of the driver library file that matches the bitness of the application.

For example, on a macOS machine:

```
Driver=/Library/simba/impala/lib/libimpalaodbc_
sbu.dylib
```

As another example, for a 32-bit driver on a Linux/AIX/Solaris machine:

```
Driver=/opt/simba/impala/lib/32/libimpalaodbc_
sb32.so
```

- b. Optionally, set the `Description` property to a description of the driver.

For example:

```
Description=Simba Impala ODBC Driver
```

4. Save the `odbcinst.ini` configuration file.

 **Note:**

If you are storing this file in its default location in the home directory, then prefix the file name with a period (.) so that the file becomes hidden. If you are storing this file in another location, then save it as a non-hidden file (without the prefix), and make sure that the `ODBCINSTINI` or `ODBCSYSINI` environment variable specifies the location. For more information, see [Specifying the Locations of the Driver Configuration Files](#) on page 38.

For example, the following is an `odbcinst.ini` configuration file for macOS:

```
[ODBC Drivers]
Simba Impala ODBC Driver=Installed
[Simba Impala ODBC Driver]
Description=Simba Impala ODBC Driver
Driver=/Library/simba/impala/lib/libimpalaodbc_sbu.dylib
```

As another example, the following is an `odbcinst.ini` configuration file for both the 32- and 64-bit drivers on Linux/AIX/Solaris:

```
[ODBC Drivers]
Simba Impala ODBC Driver 32-bit=Installed
Simba Impala ODBC Driver 64-bit=Installed
[Simba Impala ODBC Driver 32-bit]
Description=Simba Impala ODBC Driver (32-bit)
Driver=/opt/simba/impala/lib/32/libimpalaodbc_sb32.so
[Simba Impala ODBC Driver 64-bit]
Description=Simba Impala ODBC Driver (64-bit)
Driver=/opt/simba/impala/lib/64/libimpalaodbc_sb64.so
```

You can now connect to your data store by providing your application with a connection string where the `Driver` property is set to the driver name specified in the `odbcinst.ini` file, and all the other necessary connection properties are also set.

For more information, see "DSN-less Connection String Examples" in [Using a Connection String](#) on page 57.

For instructions about configuring specific connection features, see the following:

- [Configuring Authentication on a Non-Windows Machine](#) on page 45
- [Configuring SSL Verification on a Non-Windows Machine](#) on page 49
- [Configuring Server-Side Properties on a Non-Windows Machine](#) on page 50

For detailed information about all the connection properties that the driver supports, see [Driver Configuration Options](#) on page 66.

Configuring Authentication on a Non-Windows Machine

The Impala server supports multiple authentication mechanisms. You must determine the authentication type your server is using and configure your DSN accordingly. The available authentication methods are as follows:

- [Using No Authentication](#) on page 45
- [Using Kerberos](#) on page 46
- [Using Advanced Kerberos](#) on page 46
- [Using SASL User Name](#) on page 48
- [Using User Name And Password](#) on page 48

You can set the connection properties for authentication in a connection string, in a DSN (in the `odbc.ini` file), or as a driver-wide setting (in the `simba.impalaodbc.ini` file). Settings in the connection string take precedence over settings in the DSN, and settings in the DSN take precedence over driver-wide settings.

Note:

In addition to authentication, you can configure the driver to connect over the Secure Sockets Layer (SSL). For more information, see [Configuring SSL Verification on a Non-Windows Machine](#) on page 49.

Using No Authentication

For this authentication mechanism, you do not need to configure any additional settings.

 **Note:**

The default configuration of Impala requires the Simba Impala ODBC Driver to be configured to use the No Authentication mechanism.

To configure a connection without authentication:

- Set the `AuthMech` connection attribute to 0.

Using Kerberos

Kerberos must be installed and configured before you can use this authentication mechanism. For more information, refer to the MIT Kerberos Documentation: <http://web.mit.edu/kerberos/krb5-latest/doc/>.

To configure Kerberos authentication:

1. Set the `AuthMech` connection attribute to 1.
2. Choose one:
 - To use the default realm defined in your Kerberos setup, do not set the `KrbRealm` attribute.
 - Or, if your Kerberos setup does not define a default realm or if the realm of your Impala server is not the default, then set the appropriate realm using the `KrbRealm` attribute.
3. Set the `KrbFQDN` attribute to the fully qualified domain name of the Impala server host.

 **Note:**

To use the Impala server host name as the fully qualified domain name for Kerberos authentication, set `KrbFQDN` to `_HOST`.

4. Set the `KrbServiceName` attribute to the service name of the Impala server.
5. Optionally, set the `TSaslTransportBufSize` attribute to the number of bytes to reserve in memory for buffering unencrypted data from the network.

 **Note:**

In most circumstances, the default value of 1000 bytes is optimal.

Using Advanced Kerberos

This authentication mechanism allows concurrent connections within the same process to use different Kerberos user principals.

When you use Advanced Kerberos authentication, you do not need to run the `kinit` command to obtain a Kerberos ticket. Instead, you use a JSON file to map your Impala user name to a Kerberos user principal name and a keytab that contains the corresponding keys. The driver obtains Kerberos tickets based on the specified mapping. As a fallback, you can specify a keytab that the driver uses by default if the mapping file is not available or if no matching keytab can be found in the mapping file.

 **Note:**

- For information about the schema of the mapping file and how the driver handles invalid mappings, see [UPN Keytab Mapping File](#) on page 81.
- For information about how the driver searches for a keytab file if the keytab mapping and default keytab file are invalid, see [Default Keytab File](#) on page 70.

To configure Advanced Kerberos authentication:

1. Set the `AuthMech` connection attribute to 1.
2. Choose one:
 - To use the default realm defined in your Kerberos setup, do not set the `KrbRealm` attribute.
 - Or, if your Kerberos setup does not define a default realm or if the realm of your Impala server is not the default, then set the appropriate realm using the `KrbRealm` attribute.
3. Optionally, if you are using MIT Kerberos and a Kerberos realm is specified using the `KrbRealm` connection attribute, then choose one:
 - To have the Kerberos layer canonicalize the server's service principal name, leave the `ServicePrincipalCanonicalization` attribute set to 1.
 - Or, to prevent the Kerberos layer from canonicalizing the server's service principal name, set the `ServicePrincipalCanonicalization` attribute to 0.
4. Set the `KrbFQDN` attribute to the fully qualified domain name of the Impala server host.

 **Note:**

To use the Impala server host name as the fully qualified domain name for Kerberos authentication, set `KrbFQDN` to `_HOST`.

5. Set the `KrbServiceName` attribute to the service name of the Impala server.
6. Set the `UseKeytab` attribute to 1.
7. Set the `UID` attribute to an appropriate user name for accessing the Impala server.

8. Set the `UPNKeytabMappingFile` attribute to the full path to a JSON file that maps your Impala user name to a Kerberos user principal name and a keytab file.
9. Set the `DefaultKeytabFile` attribute to the full path to a keytab file that the driver can use if the mapping file is not available or if no matching keytab can be found in the mapping file.
10. If the Impala server is configured to use SSL, then configure SSL for the connection. For more information, see [Configuring SSL Verification on a Non-Windows Machine](#) on page 49.
11. Optionally, set the `TSaslTransportBufSize` attribute to the number of bytes to reserve in memory for buffering unencrypted data from the network.

 **Note:**

In most circumstances, the default value of 1000 bytes is optimal.

Using SASL User Name

This authentication mechanism requires a user name but does not require a password. The user name labels the session, facilitating database tracking.

To configure SASL User Name authentication:

1. Set the `AuthMech` connection attribute to 2.
2. Set the `UID` attribute to an appropriate user name for accessing the Impala server.
3. Optionally, set the `TSaslTransportBufSize` attribute to the number of bytes to reserve in memory for buffering unencrypted data from the network.

 **Note:**

In most circumstances, the default value of 1000 bytes is optimal.

Using User Name And Password

This authentication mechanism requires a user name and a password.

 **Note:**

This authentication mechanism should not be used with an Impala configuration that does not have LDAP enabled.

To configure User Name And Password authentication:

1. Set the `AuthMech` connection attribute to 3.
2. Set the `UID` attribute to an appropriate user name for accessing the Impala server.
3. Set the `PWD` attribute to the password corresponding to the user name you provided above.
4. Optionally, set the `TSaslTransportBufSize` attribute to the number of bytes to reserve in memory for buffering unencrypted data from the network.

 **Note:**

In most circumstances, the default value of 1000 bytes is optimal.

5. Optionally, to use SASL to handle authentication, set the `UseSASL` attribute to 1.

Configuring SSL Verification on a Non-Windows Machine

If you are connecting to an Impala server that has Secure Sockets Layer (SSL) enabled, you can configure the driver to connect to an SSL-enabled socket. When using SSL to connect to a server, the driver can be configured to verify the identity of the server.

You can set the connection properties described below in a connection string, in a DSN (in the `odbc.ini` file), or as a driver-wide setting (in the `simba.impalaodbc.ini` file). Settings in the connection string take precedence over settings in the DSN, and settings in the DSN take precedence over driver-wide settings.

To configure SSL verification on a non-Windows machine:

1. To enable SSL connections, set the `SSL` attribute to 1.
2. To allow self-signed certificates from the server, set the `AllowSelfSignedServerCert` attribute to 1.
3. To allow the common name of a CA-issued SSL certificate to not match the host name of the Impala server, set the `AllowHostNameCNMismatch` attribute to 1.
4. Choose one:
 - To configure the driver to load SSL certificates from a specific `.pem` file when verifying the server, set the `TrustedCerts` attribute to the full path of the `.pem` file.
 - Or, to use the trusted CA certificates `.pem` file that is installed with the driver, do not specify a value for the `TrustedCerts` attribute.

Configuring Server-Side Properties on a Non-Windows Machine

When connecting to a server that is running Impala 2.0 or later, you can use the driver to apply configuration properties to the Impala server.

You can set the connection properties described below in a connection string, in a DSN (in the `odbc.ini` file), or as a driver-wide setting (in the `simba.impalaodbc.ini` file). Settings in the connection string take precedence over settings in the DSN, and settings in the DSN take precedence over driver-wide settings.

! Important:

This feature is not supported for earlier versions of Impala, where the SET statement can only be executed from within the Impala shell.

To configure server-side properties on a non-Windows machine:

1. To set a server-side property, use the syntax `SSP_[SSPKey]=[SSPValue]`, where `[SSPKey]` is the name of the server-side property and `[SSPValue]` is the value to specify for that property. For example, to set the `MEM_LIMIT` query option to 1 GB and the `REQUEST_POOL` query option to `myPool`, type the following in the `odbc.ini` file:

```
SSP_MEM_LIMIT=1000000000
SSP_REQUEST_POOL=myPool
```

Or, to set those properties in a connection string, type the following:

```
SSP_MEM_LIMIT={1000000000};SSP_REQUEST_POOL={myPool}
```

Note:

When setting a server-side property in a connection string, it is recommended that you enclose the value in braces (`{ }`) to make sure that special characters can be properly escaped.

2. To disable the driver's default behavior of converting server-side property key names to all lower-case characters, set the `LCaseSspKeyName` property to 0.

Configuring Logging Options on a Non-Windows Machine

To help troubleshoot issues, you can enable logging in the driver.

! Important:

Only enable logging long enough to capture an issue. Logging decreases performance and can consume a large quantity of disk space.

Logging is configured through driver-wide settings in the `simba.impalaodbc.ini` file, which apply to all connections that use the driver.

To enable logging on a non-Windows machine:

1. Open the `simba.impalaodbc.ini` configuration file in a text editor.
2. To specify the level of information to include in log files, set the `LogLevel` property to one of the following numbers:

LogLevel Value	Description
0	Disables all logging.
1	Logs severe error events that lead the driver to abort.
2	Logs error events that might allow the driver to continue running.
3	Logs events that might result in an error if action is not taken.
4	Logs general information that describes the progress of the driver.
5	Logs detailed information that is useful for debugging the driver.
6	Logs all driver activity.

3. Set the `LogPath` key to the full path to the folder where you want to save log files.
4. Set the `LogFileCount` key to the maximum number of log files to keep.

 **Note:**

After the maximum number of log files is reached, each time an additional file is created, the driver deletes the oldest log file.

5. Set the `LogFileSize` key to the maximum size of each log file in megabytes (MB).

 **Note:**

After the maximum file size is reached, the driver creates a new file and continues logging.

6. Optionally, to prefix the log file name with the user name and process ID associated with the connection, set the `UseLogPrefix` property to 1.
7. Save the `simba.impalaodbc.ini` configuration file.
8. Restart your ODBC application to make sure that the new settings take effect.

The Simba Impala ODBC Driver produces two log files at the location you specify using the `LogPath` key, where `[DriverName]` is the name of the driver:

- A `Simba[DriverName]_driver.log` file that logs driver activity that is not specific to a connection.
- A `Simba[DriverName]_connection_[Number].log` for each connection made to the database, where `[Number]` is a number that identifies each log file. This file logs driver activity that is specific to the connection.

If you set the `UseLogPrefix` property to 1, then each file name is prefixed with `[UserName]_[ProcessID]_`, where `[UserName]` is the user name associated with the connection and `[ProcessID]` is the process ID of the application through which the connection is made. For more information, see [UseLogPrefix](#) on page 88.

To disable logging on a non-Windows machine:

1. Open the `simba.impalaodbc.ini` configuration file in a text editor.
2. Set the `LogLevel` key to 0.
3. Save the `simba.impalaodbc.ini` configuration file.
4. Restart your ODBC application to make sure that the new settings take effect.

Setting Driver-Wide Configuration Options on a Non-Windows Machine

When you specify connection settings in a DSN or connection string, those settings apply only when you connect to Impala using that particular DSN or string. As an

alternative, you can specify settings that apply to every connection that uses the Simba Impala ODBC Driver by configuring them in the `simba.impalaodbc.ini` file.

 **Note:**

Settings in the connection string take precedence over settings in the DSN, and settings in the DSN take precedence over driver-wide settings.

To set driver-wide configuration options on a non-Windows machine:

1. In a text editor, open the `simba.impalaodbc.ini` configuration file.
2. In the `[Driver]` section, specify configuration options as key-value pairs. Start a new line for each key-value pair.

For example, to enable SASL User Name authentication using "simba" as the user name, type the following:

```
AuthMech=2
UID=simba
```

For detailed information about all the configuration options supported by the driver, see [Driver Configuration Options](#) on page 66.

3. Save the `simba.impalaodbc.ini` configuration file.

Testing the Connection on a Non-Windows Machine

To test the connection, you can use an ODBC-enabled client application. For a basic connection test, you can also use the test utilities that are packaged with your driver manager installation. For example, the iODBC driver manager includes simple utilities called `iodbctest` and `iodbctestw`. Similarly, the unixODBC driver manager includes simple utilities called `isql` and `iusql`.

Using the iODBC Driver Manager

You can use the `iodbctest` and `iodbctestw` utilities to establish a test connection with your driver. Use `iodbctest` to test how your driver works with an ANSI application, or use `iodbctestw` to test how your driver works with a Unicode application.

 **Note:**

There are 32-bit and 64-bit installations of the iODBC driver manager available. If you have only one or the other installed, then the appropriate version of `iodbctest` (or `iodbctestw`) is available. However, if you have both 32- and 64-bit versions installed, then you need to make sure that you are running the version from the correct installation directory.

For more information about using the iODBC driver manager, see <http://www.iodbc.org>.

To test your connection using the iODBC driver manager:

1. Run **`iodbctest`** or **`iodbctestw`**.
2. Optionally, if you do not remember the DSN, then type a question mark (?) to see a list of available DSNs.
3. Type the connection string for connecting to your data store, and then press ENTER. For more information, see .

If the connection is successful, then the `SQL>` prompt appears.

Using the unixODBC Driver Manager

You can use the `isql` and `iusql` utilities to establish a test connection with your driver and your DSN. `isql` and `iusql` can only be used to test connections that use a DSN. Use `isql` to test how your driver works with an ANSI application, or use `iusql` to test how your driver works with a Unicode application.

 **Note:**

There are 32-bit and 64-bit installations of the unixODBC driver manager available. If you have only one or the other installed, then the appropriate version of `isql` (or `iusql`) is available. However, if you have both 32- and 64-bit versions installed, then you need to make sure that you are running the version from the correct installation directory.

For more information about using the unixODBC driver manager, see <http://www.unixodbc.org>.

To test your connection using the unixODBC driver manager:

- Run `isql` or `iusql` by using the corresponding syntax:

- `isql [DataSourceName]`
- `iusql [DataSourceName]`

`[DataSourceName]` is the DSN that you are using for the connection.

If the connection is successful, then the `SQL>` prompt appears.

 **Note:**

For information about the available options, run `isql` or `iusql` without providing a DSN.

Authentication Options

Impala supports multiple authentication mechanisms. You must determine the authentication type that your server is using. The authentication methods available in the Simba Impala ODBC Driver are as follows:

- No Authentication
- Kerberos
- SASL User Name
- User Name And Password

 **Note:**

- The default configuration of Impala requires the Simba Impala ODBC Driver to be configured to use the No Authentication mechanism.
- In addition to regular Kerberos authentication, the driver also supports an advanced configuration of Kerberos authentication that allows concurrent connections within the same process to use different Kerberos user principals.

In addition to authentication, you can configure the driver to connect over SSL or use SASL to handle authentication.

The Impala server uses SASL (Simple Authentication and Security Layer) to support some of the authentication methods. Kerberos is supported with the SASL GSSAPI mechanism. SASL User Name and User Name And Password (with SASL enabled) are supported with the SASL PLAIN mechanism.

SASL mechanisms	Non-SASL mechanisms
<ul style="list-style-type: none"> • Kerberos • SASL User Name • User Name And Password (with SASL enabled) 	<ul style="list-style-type: none"> • No Authentication • User Name And Password (without SASL enabled)

 **Note:**

Thrift (the layer for handling remote process communication between the Simba Impala ODBC Driver and the Impala server) has a limitation where it cannot detect a mix of non-SASL and SASL mechanisms being used between the driver and the server. If this happens, the driver will appear to hang during connection establishment.

Using a Connection String

For some applications, you might need to use a connection string to connect to your data source. For detailed information about how to use a connection string in an ODBC application, refer to the documentation for the application that you are using.

The connection strings in the following sections are examples showing the minimum set of connection attributes that you must specify to successfully connect to the data source. Depending on the configuration of the data source and the type of connection you are working with, you might need to specify additional connection attributes. For detailed information about all the attributes that you can use in the connection string, see [Driver Configuration Options](#) on page 66.

DSN Connection String Example

The following is an example of a connection string for a connection that uses a DSN:

```
DSN= [DataSourceName]
```

[DataSourceName] is the DSN that you are using for the connection.

You can set additional configuration options by appending key-value pairs to the connection string. Configuration options that are passed in using a connection string take precedence over configuration options that are set in the DSN.

DSN-less Connection String Examples

Some applications provide support for connecting to a data source using a driver without a DSN. To connect to a data source without using a DSN, use a connection string instead.

The placeholders in the examples are defined as follows, in alphabetical order:

- *[DomainName]* is the fully qualified domain name of the Impala server host.
- *[MappingFile]* is the full path to a JSON file that maps your Impala user name to a Kerberos user principal name and a keytab file.
- *[PortNumber]* is the number of the TCP port that the Impala server uses to listen for client connections.
- *[Realm]* is the Kerberos realm of the Impala server host.
- *[Server]* is the IP address or host name of the Impala server to which you are connecting.
- *[ServiceName]* is the Kerberos service principal name of the Impala server.

- *[YourPassword]* is the password corresponding to your user name.
- *[YourUserName]* is the user name that you use to access the Impala server.

Connecting to an Impala Server Without Authentication

The following is the format of a DSN-less connection string that connects to an Impala server that does not require authentication:

```
Driver=Simba Impala ODBC Driver;Host=[Server];  
Port=[PortNumber];
```

For example:

```
Driver=Simba Impala ODBC Driver;Host=192.168.222.160;  
Port=21050;
```

If you are connecting to the server through SSL, then set the `SSL` property to 1. For example:

```
Driver=Simba Impala ODBC Driver;Host=192.168.222.160;  
Port=21050;SSL=1;
```

Connecting to an Impala Server that Requires Kerberos Authentication

The following is the format of a DSN-less connection string that connects to an Impala server requiring Kerberos authentication:

```
Driver=Simba Impala ODBC Driver;Host=[Server];  
Port=[PortNumber];AuthMech=1;KrbRealm=[Realm];  
KrbFQDN=[DomainName];KrbServiceName=[ServiceName];
```

For example:

```
Driver=Simba Impala ODBC Driver;Host=192.168.222.160;  
Port=21050;AuthMech=1;KrbRealm=SIMBA;  
KrbFQDN=localhost.localdomain;KrbServiceName=impala;
```

If you are connecting to the server through SSL, then set the `SSL` property to 1. For example:

```
Driver=Simba Impala ODBC Driver;Host=192.168.222.160;  
Port=21050;AuthMech=1;KrbRealm=SIMBA;  
KrbFQDN=localhost.localdomain;KrbServiceName=impala;SSL=1;
```

Connecting to an Impala Server using Advanced Kerberos Authentication

The following is the format of a DSN-less connection string that connects to an Impala server using Advanced Kerberos authentication:

```
Driver=Simba Impala ODBC Driver;Host=[Server];  
Port=[PortNumber];AuthMech=1;KrbRealm=[Realm];  
KrbFQDN=[DomainName];KrbServiceName=[ServiceName];  
UseKeytab=1;UID=[YourUserName];  
UPNKeytabMappingFile=[MappingFile];
```

For example:

```
Driver=Simba Impala ODBC Driver;Host=192.168.222.160;  
Port=21050;AuthMech=1;KrbRealm=SIMBA;  
KrbFQDN=localhost.localdomain;KrbServiceName=impala;  
UseKeytab=1;UID=simba;  
UPNKeytabMappingFile=C:\Temp\simba.keytab;
```

If you are connecting to the server through SSL, then set the SSL property to 1. For example:

```
Driver=Simba Impala ODBC Driver;Host=192.168.222.160;  
Port=21050;AuthMech=1;KrbRealm=SIMBA;  
KrbFQDN=localhost.localdomain;KrbServiceName=impala;  
UseKeytab=1;UID=simba;  
UPNKeytabMappingFile=C:\Temp\simba.keytab;SSL=1;
```

Connecting to an Impala Server that Requires User Name Authentication

The following is the format of a DSN-less connection string that connects to an Impala server requiring User Name authentication. By default, the driver uses **anonymous** as the user name.

```
Driver=Simba Impala ODBC Driver;Host=[Server];  
Port=[PortNumber];AuthMech=2;
```

For example:

```
Driver=Simba Impala ODBC Driver;Host=192.168.222.160;  
Port=21050;AuthMech=2;
```

If you are connecting to the server through SSL, then set the `SSL` property to 1. For example:

```
Driver=Simba Impala ODBC Driver;Host=192.168.222.160;  
Port=21050;AuthMech=2;SSL=1;
```

Connecting to an Impala Server with LDAP Authentication or other User Name and Password Authentication Enabled

The following is the format of a DSN-less connection string that connects to an Impala server with LDAP authentication, or another form of username/password authentication, enabled:

```
Driver=Simba Impala ODBC Driver;Host=[Server];  
Port=[PortNumber];AuthMech=3;UID=[UserName];  
PWD=[Password];
```

For example:

```
Driver=Simba Impala ODBC Driver;Host=192.168.222.160;  
Port=21050;AuthMech=3;UID=simba;PWD=simba;
```

If you are connecting to the LDAP-enabled server through SSL, then set the `SSL` property to 1. For example:

```
Driver=Simba Impala ODBC Driver;Host=192.168.222.160;  
Port=21050;AuthMech=3;UID=simba;PWD=simba;SSL=1;
```

Features

For more information on the features of the Simba Impala ODBC Driver, see the following:

- [Data Types](#) on page 61
- [Catalog and Schema Support](#) on page 63
- [SQL Translation](#) on page 63
- [Server-Side Properties](#) on page 63
- [Active Directory](#) on page 63
- [Write-back](#) on page 64
- [Security and Authentication](#) on page 64

Data Types

The Simba Impala ODBC Driver supports many common data formats, converting between Impala data types and SQL data types.

The table below lists the supported data type mappings.

Impala Type	SQL Type
ARRAY	SQL_VARCHAR
BIGINT	SQL_BIGINT
BINARY	SQL_VARBINARY
BOOLEAN	SQL_BOOLEAN
CHAR	SQL_CHAR
<p> Note: Only available in CDH 5.2 or later.</p>	<p> Note: SQL_WCHAR is returned instead if the Use SQL Unicode Types configuration option (the UseUnicodeSqlCharacterTypes key) is enabled.</p>

Impala Type	SQL Type
DATE	SQL_DATE
DECIMAL <div data-bbox="228 415 787 533" style="border: 1px solid gray; padding: 5px; margin-top: 10px;"> <p> Note: Only available in CDH 5.2 or later.</p> </div>	SQL_DECIMAL
DOUBLE <div data-bbox="228 638 787 756" style="border: 1px solid gray; padding: 5px; margin-top: 10px;"> <p> Note: REAL is an alias for DOUBLE.</p> </div>	SQL_DOUBLE
FLOAT	SQL_REAL
INT	SQL_INTEGER
MAP	SQL_VARCHAR
SMALLINT	SQL_SMALLINT
STRUCT	SQL_VARCHAR
TIMESTAMP	SQL_TIMESTAMP
TINYINT	SQL_TINYINT
VARCHAR <div data-bbox="228 1392 787 1509" style="border: 1px solid gray; padding: 5px; margin-top: 10px;"> <p> Note: Only available in CDH 5.2 or later.</p> </div>	SQL_VARCHAR <div data-bbox="833 1392 1396 1665" style="border: 1px solid gray; padding: 5px; margin-top: 10px;"> <p> Note: SQL_WVARCHAR is returned instead if the Use SQL Unicode Types configuration option (the UseUnicodeSqlCharacterTypes key) is enabled.</p> </div>

Catalog and Schema Support

The Simba Impala ODBC Driver supports both catalogs and schemas to make it easy for the driver to work with various ODBC applications. Since Impala only organizes tables into schemas/databases, the driver provides a synthetic catalog named IMPALA under which all of the schemas/databases are organized. The driver also maps the ODBC schema to the Impala schema/database.

SQL Translation

The Simba Impala ODBC Driver can parse queries locally before sending them to the Impala server. This feature allows the driver to calculate query metadata without executing the query, support query parameters, and support extra SQL features such as ODBC escape sequences and additional scalar functions that are not available in the Impala-shell tool.

 **Note:**

The driver does not support translation for queries that reference a field contained in a nested column (an ARRAY, MAP, or STRUCT column). To retrieve data from a nested column, make sure that the query is written in valid Impala SQL syntax.

Server-Side Properties

The Simba Impala ODBC Driver allows you to set server-side properties via a DSN. Server-side properties specified in a DSN affect only the connection that is established using the DSN.

For more information about setting server-side properties when using the Windows driver, see [Configuring Server-Side Properties on Windows](#) on page 19. For information about setting server-side properties when using the driver on a non-Windows platform, see [Configuring Server-Side Properties on a Non-Windows Machine](#) on page 50.

Active Directory

The Simba Impala ODBC Driver supports Active Directory Kerberos on Windows. There are two prerequisites for using Active Directory Kerberos on Windows:

- MIT Kerberos is not installed on the client Windows machine.

- The MIT Kerberos Hadoop realm has been configured to trust the Active Directory realm, according to Cloudera's documentation, so that users in the Active Directory realm can access services in the MIT Kerberos Hadoop realm.

Write-back

The Simba Impala ODBC Driver supports translation for the following syntax:

- INSERT
- CREATE
- DROP

The driver also supports translation for UPDATE and DELETE syntax, but only when querying Kudu tables while connected to an Impala server that is running Impala 2.7 or later.

If the statement contains non-standard SQL-92 syntax, then the driver is unable to translate the statement to SQL and instead falls back to using Impala SQL.

Security and Authentication

To protect data from unauthorized access, some Impala data stores require connections to be authenticated with user credentials or the SSL protocol. The Simba Impala ODBC Driver provides full support for these authentication protocols.

Note:

In this documentation, "SSL" refers to both TLS (Transport Layer Security) and SSL (Secure Sockets Layer). The driver supports TLS 1.0, 1.1, and 1.2. The SSL version used for the connection is the highest version that is supported by both the driver and the server.

The driver provides mechanisms that enable you to authenticate your connection using the Kerberos protocol, your Impala user name only, or your Impala user name and password. You must use the authentication mechanism that matches the security requirements of the Impala server. For information about determining the appropriate authentication mechanism to use based on the Impala server configuration, see [Authentication Options](#) on page 56. For detailed driver configuration instructions, see [Configuring Authentication on Windows](#) on page 11 or [Configuring Authentication on a Non-Windows Machine](#) on page 45.

Additionally, the driver supports SSL connections with or without one-way authentication. If the server has an SSL-enabled socket, then you can configure the driver to connect to it.

It is recommended that you enable SSL whenever you connect to a server that is configured to support it. SSL encryption protects data and credentials when they are transferred over the network, and provides stronger security than authentication alone. For detailed configuration instructions, see [Configuring SSL Verification on Windows](#) on page 16 or [Configuring SSL Verification on a Non-Windows Machine](#) on page 49.

Driver Configuration Options

Driver Configuration Options lists the configuration options available in the Simba Impala ODBC Driver alphabetically by field or button label. Options having only key names, that is, not appearing in the user interface of the driver, are listed alphabetically by key name.

When creating or configuring a connection from a Windows machine, the fields and buttons are available in the following dialog boxes:

- Simba Impala ODBC Driver DSN Setup
- Advanced Options
- Keytab Options
- Server Side Properties
- SSL Options

When using a connection string, configuring driver-wide settings, or configuring a connection from a Linux/macOS/AIX/Solaris machine, use the key names provided.

**Note:**

Settings in the connection string take precedence over settings in the DSN, and settings in the DSN take precedence over driver-wide settings.

Configuration Options Appearing in the User Interface

The following configuration options are accessible via the Windows user interface for the Simba Impala ODBC Driver, or via the key name when using a connection string, configuring driver-wide settings, or configuring a connection from a Linux/macOS/AIX/Solaris machine:

- [Allow Common Name Host Name Mismatch](#) on page 67
- [Allow Self-Signed Server Certificate](#) on page 68
- [Async Exec Poll Interval](#) on page 68
- [Canonicalize Principal FQDN](#) on page 69
- [Password](#) on page 76
- [Port](#) on page 77
- [Realm](#) on page 77
- [Restrict Metadata with Current Schema](#) on page 77
- [Rows Fetched Per Block](#) on page 78
- [Save Password \(Encrypted\)](#) on

- [Check Certificate Revocation](#) on page 69
- [Convert Key Name to Lower Case](#) on page 70
- [Database](#) on page 70
- [Default Keytab File](#) on page 70
- [Delegation UID](#) on page 71
- [Enable Auto Reconnect](#) on page 71
- [Enable Simulated Transactions](#) on page 72
- [Enable SSL](#) on page 72
- [Host](#) on page 73
- [Host FQDN](#) on page 73
- [Log Level](#) on page 73
- [Log Path](#) on page 74
- [Mechanism](#) on page 76
- [page 78](#)
- [Service Name](#) on page 79
- [Socket Timeout](#) on page 79
- [String Column Length](#) on page 79
- [Transport Buffer Size](#) on page 79
- [Trusted Certificates](#) on page 80
- [UPN Keytab Mapping File](#) on page 81
- [Use Keytab](#) on page 82
- [Use Native Query](#) on page 82
- [Use Only SSPI](#) on page 83
- [Use Simple Authentication and Security Layer \(SASL\)](#) on page 84
- [Use SQL Unicode Types](#) on page 84
- [Use System Trust Store](#) on page 85
- [User Name](#) on page 85

Allow Common Name Host Name Mismatch

Key Name	Default Value	Required
AllowHostNameCNMismatch	Clear (0)	No

Description

This option specifies whether a CA-issued SSL certificate name must match the host name of the Impala server.

Note:

The key for this option used to be `CAIssuedCertNamesMismatch`, and will still be recognized by the driver under that key. If both keys are defined, `AllowHostNameCNMismatch` will take precedence.

- **Enabled (1):** The driver allows a CA-issued SSL certificate name to not match the host name of the Impala server.
- **Disabled (0):** The CA-issued SSL certificate name must match the host name of the Impala server.

 **Note:**

This setting is applicable only when SSL is enabled.

Allow Self-Signed Server Certificate

Key Name	Default Value	Required
AllowSelfSignedServerCert	Clear (0)	No

Description

This option specifies whether the driver allows self-signed certificates from the server.

- Enabled (1): The driver authenticates the Impala server even if the server is using a self-signed certificate.
- Disabled (0): The driver does not allow self-signed certificates from the server.

 **Note:**

This setting is applicable only when SSL is enabled.

Async Exec Poll Interval

Key Name	Default Value	Required
AsyncExecPollInterval	10	No

Description

The time in milliseconds between each poll for the query execution status.

"Asynchronous execution" refers to the fact that the RPC call used to execute a query against Impala is asynchronous. It does not mean that ODBC asynchronous operations are supported.

Canonicalize Principal FQDN

Key Name	Default Value	Required
ServicePrincipal Canonicalization	Selected (1)	No

Description

This option specifies whether the Kerberos layer canonicalizes the host FQDN in the server's service principal name.

- Enabled (1): The Kerberos layer canonicalizes the host FQDN in the server's service principal name.
- Disabled (0): The Kerberos layer does not canonicalize the host FQDN in the server's service principal name.

Note:

- This option only affects MIT Kerberos, and is ignored when using Active Directory Kerberos.
- This option can only be disabled if the Kerberos Realm or `KrbRealm` key is specified.

Check Certificate Revocation

Key Name	Default Value	Required
CheckCertRevocation	Clear (0)	No

Description

This option specifies whether the driver checks to see if a certificate has been revoked while retrieving a certificate chain from the Windows Trust Store.

This option is only applicable if you are using a CA certificate from the Windows Trust Store (see [Use System Trust Store](#) on page 85).

- Enabled (1): The driver checks for certificate revocation while retrieving a certificate chain from the Windows Trust Store.
- Disabled (0): The driver does not check for certificate revocation while retrieving a certificate chain from the Windows Trust Store.

 **Note:**

This option is only available on Windows.

Convert Key Name to Lower Case

Key Name	Default Value	Required
LCaseSspKeyName	Selected (1)	No

Description

This option specifies whether the driver converts server-side property key names to all lower-case characters.

- Enabled (1): The driver converts server-side property key names to all lower-case characters.
- Disabled (0): The driver does not modify the server-side property key names.

Database

Key Name	Default Value	Required
Schema	default	No

Description

The name of the database schema to use when a schema is not explicitly specified in a query. You can still issue queries on other schemas by explicitly specifying the schema in the query.

 **Note:**

To inspect your databases and determine the appropriate schema to use, at the Impala command prompt, type `show databases`.

Default Keytab File

Key Name	Default Value	Required
DefaultKeytabFile	None	No

Description

The full path to the keytab file that the driver uses to obtain the ticket for Kerberos authentication.

Note:

- This option is applicable only when the authentication mechanism is set to Kerberos (`AuthMech=1`) and the Use Keytab option is enabled (`UseKeytab=1`).
- If the UPN Keytab Mapping File option (the `UPNKeytabMappingFile` key) is set to a JSON file with a valid mapping to a keytab, then that keytab takes precedence.

If you do not set this option but the Use Keytab option is enabled (`UseKeytab=1`), then the MIT Kerberos library will search for a keytab using the following search order:

- The file specified by the `KRB5_KTNAME` environment variable.
- The `default_keytab_name` setting in the `[libdefaults]` section of the Kerberos configuration file (`krb5.conf/krb5.ini`).
- The default keytab file specified in the MIT Kerberos library. Typically, the default file is `C:\Windows\krb5kt` for Windows platforms and `/etc/krb5.keytab` for non-Windows platforms.

Delegation UID

Key Name	Default Value	Required
DelegationUID	None	No

Description

If a value is specified for this setting, the driver delegates all operations against Impala to the specified user, rather than to the authenticated user for the connection.

Enable Auto Reconnect

Key Name	Default Value	Required
AutoReconnect	Selected (1)	Yes

Description

This option specifies whether the driver attempts to automatically reconnect to the server when a communication link error occurs.

- Enabled (1): The driver attempts to reconnect.
- Disabled (0): The driver does not attempt to reconnect.

Enable Simulated Transactions

Key Name	Default Value	Required
EnableSimulatedTransactions	Clear (0)	No

Description

This option specifies whether the driver should simulate transactions, or return an error.

- Enabled (1): The driver simulates transactions, enabling queries that contain transaction statements to be run successfully. The transactions are not executed.
- Disabled (0): The driver returns an error if it attempts to run a query that contains transaction statements.

 **Note:**

ODBC does not support transaction statements, so they cannot be executed.

Enable SSL

Key Name	Default Value	Required
SSL	Clear (0)	No

Description

This option specifies whether the client uses an SSL encrypted connection to communicate with the Impala.

- Enabled (1): The client communicates with the Impala using SSL.
- Disabled (0): SSL is disabled.

SSL is configured independently of authentication. When authentication and SSL are both enabled, the driver performs the specified authentication method over an SSL connection.

Host

Key Name	Default Value	Required
Host	None	Yes

Description

The IP address or host name of the Impala server.

Host FQDN

Key Name	Default Value	Required
KrbFQDN	_HOST	No

Description

The fully qualified domain name of the Impala host.

When the value of Host FQDN is `_HOST`, the driver uses the Impala server host name as the fully qualified domain name for Kerberos authentication.

Log Level

Key Name	Default Value	Required
LogLevel	OFF (0)	No

Description

Use this property to enable or disable logging in the driver and to specify the amount of detail included in log files.

! Important:

- Only enable logging long enough to capture an issue. Logging decreases performance and can consume a large quantity of disk space.
- The settings for logging apply to every connection that uses the Simba Impala ODBC Driver, so make sure to disable the feature after you are done using it.
- This option is not supported in connection strings. To configure logging for the Windows driver, you must use the Logging Options dialog box. To configure logging for a non-Windows driver, you must use the `simba.impalaodbc.ini` file.

Set the property to one of the following values:

- OFF (0): Disable all logging.
- FATAL (1): Logs severe error events that lead the driver to abort.
- ERROR (2): Logs error events that might allow the driver to continue running.
- WARNING (3): Logs events that might result in an error if action is not taken.
- INFO (4): Logs general information that describes the progress of the driver.
- DEBUG (5): Logs detailed information that is useful for debugging the driver.
- TRACE (6): Logs all driver activity.

When logging is enabled, the driver produces two log files at the location you specify in the Log Path (`LogPath`) property, where `[DriverName]` is the name of the driver:

- A `ImpalaODBC_driver.log` file that logs driver activity that is not specific to a connection.
- A `[DriverName]_connection_[Number].log` for each connection made to the database, where `[Number]` is a number that identifies each log file. This file logs driver activity that is specific to the connection.

If you enable the `UseLogPrefix` connection property, the driver prefixes the log file name with the user name associated with the connection and the process ID of the application through which the connection is made. For more information, see [UseLogPrefix](#) on page 88.

Log Path

Key Name	Default Value	Required
<code>LogPath</code>	None	Yes, if logging is enabled.

Description

The full path to the folder where the driver saves log files when logging is enabled.

! Important:

This option is not supported in connection strings. To configure logging for the Windows driver, you must use the Logging Options dialog box. To configure logging for a non-Windows driver, you must use the `simba.impalaodbc.ini` file.

Max File Size

Key Name	Default Value	Required
LogFileSize	20	No

Description

The maximum size of each log file in megabytes (MB). After the maximum file size is reached, the driver creates a new file and continues logging.

! Important:

This option is not supported in connection strings. To configure logging for the Windows driver, you must use the Logging Options dialog box. To configure logging for a non-Windows driver, you must use the `simba.impalaodbc.ini` file.

Max Number Files

Key Name	Default Value	Required
LogFileCount	50	No

Description

The maximum number of log files to keep. After the maximum number of log files is reached, each time an additional file is created, the driver deletes the oldest log file.

! Important:

This option is not supported in connection strings. To configure logging for the Windows driver, you must use the Logging Options dialog box. To configure logging for a non-Windows driver, you must use the `simba.impalaodbc.ini` file.

Mechanism

Key Name	Default Value	Required
AuthMech	No Authentication (0)	No

Description

The authentication mechanism to use.

Select one of the following settings, or set the key to the corresponding number:

- No Authentication (0)
- Kerberos (1)
- SASL User Name (2)
- User Name And Password (3)

Password

Key Name	Default Value	Required
PWD	None	Yes, if the authentication mechanism is User Name And Password (3).

Description

The password corresponding to the user name that you provided in the User Name field (the `UID` key).

Port

Key Name	Default Value	Required
Port	21050	Yes

Description

The TCP port that the Impala server uses to listen for client connections.

Realm

Key Name	Default Value	Required
KrbRealm	NULL	No

Description

The realm of the Impala host.

If your Kerberos configuration already defines the realm of the Impala host as the default realm, then you do not need to configure this option.

Restrict Metadata with Current Schema

Key Name	Default Value	Required
CurrentSchema RestrictedMetadata	Clear (0)	No

Description

This option specifies whether the driver should restrict catalog function results to tables and views in the current schema if a catalog function call is made without specifying a schema, or if the schema is specified as the wildcard character %.

Note:

Restricting results to the tables and views in the current schema may improve the performance of catalog calls that do not specify a schema.

- Enabled (1): The driver restricts catalog function results to the current schema if a schema is not specified.
- Disabled (0): The driver does not restrict catalog function results to the current schema if a schema is not specified.

Rows Fetched Per Block

Key Name	Default Value	Required
RowsFetchedPerBlock	10000	No

Description

The maximum number of rows that a query returns at a time.

Valid values for this setting include any positive 32-bit integer. However, testing has shown that performance gains are marginal beyond the default value of 10000 rows.

Save Password (Encrypted)

Key Name	Default Value	Required
N/A	Selected	No

Description

This option specifies whether the password is saved in the registry.

- Enabled: The password is saved in the registry.
- Disabled: The password is not saved in the registry.

This option is available only in the Windows driver. It appears in the Simba Impala ODBC Driver DSN Setup dialog box.

! Important:

The password is obscured (not saved in plain text). However, it is still possible for the encrypted password to be copied and used.

Service Name

Key Name	Default Value	Required
KrbServiceName	impala	No

Description

The Kerberos service principal name of the Impala server.

Socket Timeout

Key Name	Default Value	Required
SocketTimeout	0	No

Description

The number of seconds after which Impala closes the connection with the client application if the connection is idle.

When this option is set to 0, the connection does not time out.

String Column Length

Key Name	Default Value	Required
StringColumnLength	32767	No

Description

The maximum number of characters that can be contained in STRING columns.

Transport Buffer Size

Key Name	Default Value	Required
TSaslTransportBufSize	1000	No

Description

The number of bytes to reserve in memory for buffering unencrypted data from the network.

Note:

In most circumstances, the default value of 1000 bytes is optimal.

Trusted Certificates

Key Name	Default Value	Required
TrustedCerts	The <code>cacerts.pem</code> file in the <code>\lib</code> subfolder within the driver's installation directory. The exact file path varies depending on the version of the driver that is installed. For example, the path for the Windows driver is different from the path for the macOS driver.	No

Description

The full path of the `.pem` file containing trusted CA certificates, for verifying the server when using SSL.

If this option is not set, then the driver defaults to using the trusted CA certificates `.pem` file installed by the driver.

Important:

If you are connecting from a Windows machine and the Use System Trust Store option is enabled, then the driver uses the certificates from the Windows system trust store instead of your specified `.pem` file. For more information, see [Use System Trust Store](#) on page 85.

UPN Keytab Mapping File

Key Name	Default Value	Required
UPNKeytabMappingFile	None	No

Description

The full path to a JSON file that maps your Impala user name to a Kerberos user principal name and a keytab file.

Note:

This option is applicable only when the authentication mechanism is set to Kerberos (`AuthMech=1`) and the Use Keytab option is enabled (`UseKeytab=1`).

The mapping in the JSON file must be written using the following schema, where `[UserName]` is the Impala user name, `[KerberosUPN]` is the Kerberos user principal name, and `[KeytabFile]` is the full path to the keytab file:

```
{
  "[UserName]": {
    "principal" : "[KerberosUPN]",
    "keytabfile": "[KeytabFile]"
  },
  ... }
```

For example, the following file maps the Impala user name **simba** to the **simba@SIMBA** Kerberos user principal name and the `C:\Temp\simba.keytab` file:

```
{
  "simba": {
    "principal" : "simba@SIMBA",
    "keytabfile": "C:\Temp\simba.keytab"
  },
  ... }
```

If parts of the mapping are invalid or not defined, then the following occurs:

- If the mapping file fails to specify a Kerberos user principal name, then the driver uses the Impala user name as the Kerberos user principal name.

- If the mapping file fails to specify a keytab file, then the driver uses the keytab file that is specified in the Default Keytab File setting.
- If the entire mapping file is invalid or not defined, then the driver does both of the actions described above.

Use Keytab

Key Name	Default Value	Required
UseKeytab	Clear (0)	No

Description

This option specifies whether the driver obtains the ticket for Kerberos authentication by using a keytab.

- Enabled (1): The driver uses a keytab to obtain a ticket before authenticating the connection using Kerberos.
- Disabled (0): The driver does not attempt to obtain the Kerberos ticket, and assumes that a valid ticket is already available in the credentials cache.

Note:

This option is applicable only when the authentication mechanism is set to Kerberos (`AuthMech=1`).

If you enable this option but do not set the Default Keytab File option (the `DefaultKeytabFile` key), then the MIT Kerberos library will search for a keytab file using the following search order:

1. The file specified by the `KRB5_KTNAME` environment variable.
2. The `default_keytab_name` setting in the `[libdefaults]` section of the Kerberos configuration file (`krb5.conf/krb5.ini`).
3. The default keytab file specified in the MIT Kerberos library. Typically, the default file is `C:\Windows\krb5kt` for Windows platforms.

Use Native Query

Key Name	Default Value	Required
UseNativeQuery	Clear (0)	No

Description

This option specifies whether the driver uses native queries, or converts them into an equivalent form in .

- Enabled (1): The driver does not transform the queries emitted by an application, and executes queries directly.
- Disabled (0): The driver transforms the queries emitted by an application and converts them into an equivalent form in .

Note:

If the application is Impala-aware and already emits , then enable this option to avoid the extra overhead of query transformation.

Use Only SSPI

Key Name	Default Value	Required
UseOnlySSPI	Clear (0)	No

Description

This option specifies how the driver handles Kerberos authentication: either with the SSPI plugin or with MIT Kerberos.

- Enable For This DSN (1 in the DSN entry in the registry): The driver handles Kerberos authentication in the DSN connection by using the SSPI plugin instead of MIT Kerberos by default.
- Enable For DSN-less Connections (1 in the driver configuration section of the registry): The driver handles Kerberos authentication in DSN-less connections by using the SSPI plugin instead of MIT Kerberos by default.

If you want all connections that use the Simba Impala ODBC Driver to use the SSPI plugin by default, then enable Use Only SSPI for both DSN and DSN-less connections.

- Disabled (0): The driver uses MIT Kerberos to handle Kerberos authentication, and only uses the SSPI plugin if the GSSAPI library is not available.

Important:

This option is available only in the Windows driver.

Use Simple Authentication and Security Layer (SASL)

Key Name	Default Value	Required
UseSASL	0 if using No Authentication. 1 if using User Name And Password or Kerberos or SASL User Name authentication.	No

Description

This option specifies whether the driver uses SASL to handle authentication.

- Enabled (1): The driver uses SASL to handle authentication.
- Disabled (0): The driver does not use SASL.

This option is configurable only when you are using the User Name And Password authentication mechanism. If the driver is configured to use the other authentication mechanisms, then it uses the default setting for the Use Simple Authentication and Security Layer (SASL) option.

Use SQL Unicode Types

Key Name	Default Value	Required
UseSQLUnicodeTypes	Clear (0)	No

Description

This option specifies the SQL types to be returned for string data types.

- Enabled (1): The driver returns SQL_WVARCHAR for STRING and VARCHAR columns, and returns SQL_WCHAR for CHAR columns.
- Disabled (0): The driver returns SQL_VARCHAR for STRING and VARCHAR columns, and returns SQL_CHAR for CHAR columns.

Use System Trust Store

Key Name	Default Value	Required
UseSystemTrustStore	Clear (0)	No

Description

This option specifies whether to use a CA certificate from the system trust store, or from a specified PEM file.

- Enabled (1): The driver verifies the connection using a certificate in the system trust store.
- Disabled (0): The driver verifies the connection using a specified PEM file. For information about specifying a PEM file, see [Trusted Certificates](#) on page 80.

Note:

This option is only available on Windows.

User Name

Key Name	Default Value	Required
UID	For User Name (2) authentication only, the default value is <code>anonymous</code>	Yes, if the authentication mechanism is User Name And Password (3). No, if the authentication mechanism is SASL User Name (2).

Description

The user name that you use to access the Impala server.

Configuration Options Having Only Key Names

The following configuration options do not appear in the Windows user interface for the Simba Impala ODBC Driver. They are accessible only when you use a connection string, configure driver-wide settings, or configure a connection from a Linux/macOS/AIX/Solaris machine:

- [DelegationUserIDCase](#) on page 86
- [Driver](#) on page 87
- [SSP_](#) on page 87

The `UseLogPrefix` property must be configured as a Windows Registry key value, or as a driver-wide property in the `simba.impalaodbc.ini` file for macOS or Linux.

- [UseLogPrefix](#) on page 88

DelegationUserIDCase

Key Name	Default Value	Required
DelegationUserIDCase	Unchanged	No

Description

This option specifies whether the driver changes the Delegation UID (or `DelegationUID`) value to all upper-case or all lower-case. The following values are supported:

- `Upper`: Change the delegated user name to all upper-case.
- `Lower`: Change the delegated user name to all lower-case.
- `Unchanged`: Do not modify the delegated user name.

For more information about delegating a user name, see [Delegation UID](#) on page 71.

Driver

Key Name	Default Value	Required
Driver	Simba Impala ODBC Driver when installed on Windows, or the absolute path of the driver shared object file when installed on a non-Windows machine.	Yes

Description

On Windows, the name of the installed driver (Simba Impala ODBC Driver).

On other platforms, the name of the installed driver as specified in `odbcinst.ini`, or the absolute path of the driver shared object file.

SSP_

Key Name	Default Value	Required
SSP_	None	No

Description

Set a server-side property by using the following syntax, where `[SSPKey]` is the name of the server-side property and `[SSPValue]` is the value for that property:

```
SSP_[SSPKey]=[SSPValue]
```

For example:

```
SSP_MEM_LIMIT=1000000000
SSP_REQUEST_POOL=myPool
```

Or, to set those properties in a connection string, type the following:

```
SSP_MEM_LIMIT={1000000000};SSP_REQUEST_POOL={myPool}
```

After the driver applies the server-side property, the `SSP_` prefix is removed from the DSN entry, leaving an entry of `[SSPKey]=[SSPValue]`.

! Important:

This property is supported only for connections to Impala 2.0 or later. In earlier versions of Impala, the SET statement can only be executed from within the Impala shell.

Note:

- The `SSP_` prefix must be upper case.
- When setting a server-side property in a connection string, it is recommended that you enclose the value in braces (`{ }`) to make sure that special characters can be properly escaped.

UseLogPrefix

Key Name	Default Value	Required
UseLogPrefix	0	No

Description

This option specifies whether the driver includes a prefix in the names of log files so that the files can be distinguished by user and application.

! Important:

To configure this option for the Windows driver, you create a value for it in one of the following registry keys:

- For a 32-bit driver installed on a 64-bit machine: `HKEY_LOCAL_MACHINE\SOFTWAREWow6432Node\Simba\Simba Impala ODBC Driver\Driver`
- Otherwise: `HKEY_LOCAL_MACHINE\SOFTWARE\Simba\Simba Impala ODBC Driver\Driver`

Use `UseLogPrefix` as the value name, and either `0` or `1` as the value data.

To configure this option for a non-Windows driver, you must use the `simba.impalaodbc.ini` file.

Set the property to one of the following values:

- `1`: The driver prefixes log file names with the user name and process ID associated with the connection that is being logged.

For example, if you are connecting as a user named "jdoe" and using the driver in an application with process ID 7836, the generated log files would be named

`jdoue_7836_SimbaImpalaODBCDriver.log` and `jdoue_7836_SimbaImpalaODBCDriver_connection_[Number].log`, where *[Number]* is a number that identifies each connection-specific log file.

- 0: The driver does not include the prefix in log file names.

Third-Party Trademarks

IBM and AIX are trademarks or registered trademarks of IBM Corporation or its subsidiaries in Canada, United States, and/or other countries.

Kerberos is a trademark of the Massachusetts Institute of Technology (MIT).

Linux is the registered trademark of Linus Torvalds in Canada, United States and/or other countries.

- Redistributions of source code must retain the above copyright notice, this list of conditions and the following disclaimer.
- Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.

THIS SOFTWARE IS PROVIDED BY THE COPYRIGHT HOLDERS AND CONTRIBUTORS "AS IS" AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE COPYRIGHT HOLDER OR CONTRIBUTORS BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

Downloading of this software may constitute an export of cryptographic software from the United States of America that is subject to the United States Export Administration Regulations (EAR), 15 CFR 730-774. Additional laws or regulations may apply. It is the responsibility of the person or entity contemplating export to comply with all applicable export laws and regulations, including obtaining any required license from the U.S. government.

The U.S. government prohibits export of encryption source code to certain countries and individuals, including, but not limited to, the countries of Cuba, Iran, North Korea, Sudan, Syria, and residents and nationals of those countries.

Documentation components of this software distribution are licensed under a Creative Commons Attribution-ShareAlike 3.0 Unported License.

(<http://creativecommons.org/licenses/by-sa/3.0/>)

Individual source code files are copyright MIT, Cygnus Support, Novell, OpenVision Technologies, Oracle, Red Hat, Sun Microsystems, FundsXpress, and others.

Project Athena, Athena, Athena MUSE, Discuss, Hesiod, Kerberos, Moira, and Zephyr are trademarks of the Massachusetts Institute of Technology (MIT). No commercial use of these trademarks may be made without prior written permission of MIT.

"Commercial use" means use of a name in a product or other for-profit manner. It does NOT prevent a commercial firm from referring to the MIT trademarks in order to convey information (although in doing so, recognition of their trademark status should be given).

The following copyright and permission notice applies to the OpenVision Kerberos Administration system located in `kadmin/create`, `kadmin/dbutil`, `kadmin/passwd`, `kadmin/server`, `lib/kadm5`, and portions of `lib/rpc`:

Copyright, OpenVision Technologies, Inc., 1993-1996, All Rights Reserved

WARNING: Retrieving the OpenVision Kerberos Administration system source code, as described below, indicates your acceptance of the following terms. If you do not agree to the following terms, do not retrieve the OpenVision Kerberos administration system.

You may freely use and distribute the Source Code and Object Code compiled from it, with or without modification, but this Source Code is provided to you "AS IS" EXCLUSIVE OF ANY WARRANTY, INCLUDING, WITHOUT LIMITATION, ANY WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, OR ANY OTHER WARRANTY, WHETHER EXPRESS OR IMPLIED. IN NO EVENT WILL OPENVISION HAVE ANY LIABILITY FOR ANY LOST PROFITS, LOSS OF DATA OR COSTS OF PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES, OR FOR ANY SPECIAL, INDIRECT, OR CONSEQUENTIAL DAMAGES ARISING OUT OF THIS AGREEMENT, INCLUDING, WITHOUT LIMITATION, THOSE RESULTING FROM THE USE OF THE SOURCE CODE, OR THE FAILURE OF THE SOURCE CODE TO PERFORM, OR FOR ANY OTHER REASON.

OpenVision retains all copyrights in the donated Source Code. OpenVision also retains copyright to derivative works of the Source Code, whether created by OpenVision or by a third party. The OpenVision copyright notice must be preserved if derivative works are made based on the donated Source Code.

OpenVision Technologies, Inc. has donated this Kerberos Administration system to MIT for inclusion in the standard Kerberos 5 distribution. This donation underscores our commitment to continuing Kerberos technology development and our gratitude for the valuable work which has been performed by MIT and the Kerberos community.

Portions contributed by Matt Crawford crawdad@fnal.gov were work performed at Fermi National Accelerator Laboratory, which is operated by Universities

Research Association, Inc., under contract DE-AC02-76CHO3000 with the U.S. Department of Energy.

Portions of `src/lib/crypto` have the following copyright:

Copyright © 1998 by the FundsXpress, INC.

All rights reserved.

Export of this software from the United States of America may require a specific license from the United States Government. It is the responsibility of any person or organization contemplating export to obtain such a license before exporting.

WITHIN THAT CONSTRAINT, permission to use, copy, modify, and distribute this software and its documentation for any purpose and without fee is hereby granted, provided that the above copyright notice appear in all copies and that both that copyright notice and this permission notice appear in supporting documentation, and that the name of FundsXpress. not be used in advertising or publicity pertaining to distribution of the software without specific, written prior permission. FundsXpress makes no representations about the suitability of this software for any purpose. It is provided "as is" without express or implied warranty.

THIS SOFTWARE IS PROVIDED "AS IS" AND WITHOUT ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, WITHOUT LIMITATION, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

The implementation of the AES encryption algorithm in `src/lib/crypto/builtin/aes` has the following copyright:

This product includes cryptographic software written by Eric Young (eay@cryptsoft.com). This product includes software written by Tim Hudson (tjh@cryptsoft.com).

Original SSLeay License

Copyright (C) 1995-1998 Eric Young (eay@cryptsoft.com)

All rights reserved.

This package is an SSL implementation written by Eric Young (eay@cryptsoft.com). The implementation was written so as to conform with Netscapes SSL.

This library is free for commercial and non-commercial use as long as the following conditions are aheared to. The following conditions apply to all code found in this distribution, be it the RC4, RSA, lhash, DES, etc., code; not just the SSL code. The SSL documentation included with this distribution is covered by the same copyright terms except that the holder is Tim Hudson (tjh@cryptsoft.com).

Copyright remains Eric Young's, and as such any Copyright notices in the code are not to be removed. If this package is used in a product, Eric Young should be given attribution as the author of the parts of the library used. This can be in the form of a textual message at program startup or in documentation (online or textual) provided with the package.

Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

1. Redistributions of source code must retain the copyright notice, this list of conditions and the following disclaimer.
2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.
3. All advertising materials mentioning features or use of this software must display the following acknowledgement:

"This product includes cryptographic software written by Eric Young (eay@cryptsoft.com)"

The word 'cryptographic' can be left out if the rouines from the library being used are not cryptographic related :-).

4. If you include any Windows specific code (or a derivative thereof) from the apps

directory (application code) you must include an acknowledgement:

"This product includes software written by Tim Hudson (tjh@cryptsoft.com)"

THIS SOFTWARE IS PROVIDED BY ERIC YOUNG "AS IS" AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE AUTHOR OR CONTRIBUTORS BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

The licence and distribution terms for any publically available version or derivative of this code cannot be changed. i.e. this code cannot simply be copied and put under another distribution licence [including the GNU Public Licence.]

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.
3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s)

was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:
 - (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and
 - (b) You must cause any modified files to carry prominent notices stating that You changed the files; and
 - (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and
 - (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall

- supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.
6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.
 7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.
 8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.
 9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives.
