| Request URL | http[s]://<host>:<port>/rest/ label/modify?<parameters> |

Parameters

label

Possible Values: Any label

Description: The label to use for the storage pool. See [Using Storage Labels](#) on page 1068 for more information on labels.

The label should contain only the following characters:

```
A-Z a-z 0-9 _ - .
```

maxactiveioperdisk

Possible Values: Any integer value between 100 and 50000.

Description: The number of concurrent IO operations per second that can be issued on the disk. Not specifying this value uses the default value specified in the `mfs.conf` file.

isssd

Possible Values: true or false

Description: Set to true to indicate that the disk is an SSD.

istrimenabled

Possible Values: true or false

Description: Set to true to indicate that the SSD disk is TRIM enabled.

TRIM enables the File System to inform a SSD disk which data blocks it can erase because they are no longer in use. The use of TRIM can improve the performance of writing data to SSDs and contribute to longer SSD life. Set this parameter to true only if the SSD vendor recommends it.

Examples

Modify a label:

CLI

```
maprcli label modify -label
WDcheetah -maxactiveioperdisk
5000 -isssd true -istrimenabled true
```

REST

```
https://abc.sj.us:8443/rest/labels/
modify?
label=WDcheetah&maxactiveioperdisk=5000
&-isssd=true&istrimenabled=true
```

Related concepts

nfsmgmt

Refreshes NFS exports and server cache.

nfsmgmt refreshexports

Refreshes the list of clusters and mount points available to mount with NFS. Permissions required: `fc` or `a`.

Syntax**CLI**

```

[ -nfs host <ip or hostname> ]
[ -nfsport <port> ]
[ -isusermode <true | false> ]

```

REST

N/A

Parameters

| Parameter | Description |
|------------|---|
| nfshost | The hostname of the node that is running the MapR NFS server. Default: 127.0.0.1 |
| nfsport | The port to use. Default: 9998 |
| isusermode | Specifies whether the mode for creating the ticket for NFS is in user mode or not. Options: True or False. The ticket can not be created for nfs in user mode. Default: false |

Example

CLI

```
maprcli nfsmgmt refreshexports -nfshost
10.10.82.29 -nfsport 9998
```

nfsmgmt refreshgidcache

Deletes the GID list (uidGidCache_ entries) in NFS server cache. Permissions required: fc or a.

Useful for immediately reflecting the groups update.

Syntax

CLI

```
[ -nfshost <ip or hostname> ]
[ -nfsport <port> ]
[ -isusermode <true | false> ]
```

REST

N/A

Parameters

| Parameter | Description |
|------------|---|
| nfshost | The hostname of the node that is running the MapR NFS server. Default: 127.0.0.1 |
| nfsport | The port to use. Default: 9998 |
| isusermode | Specifies whether the mode for nfs is in user mode or not. Options: True or False. The ticket can not be created for nfs in user mode. Default: false |

Example

CLI

```
maprcli nfsmgmt refreshgidcache -nfshost
10.10.82.29 -nfsport 9998
```

nfs4mgmt

Manages NFSv4 server.

nfs4mgmt add-export

Adds an export.

Syntax**CLI**

```

/opt/mapr/bin/maprcli nfs4mgmt
add-export
    [ -nfshost ip/hostname.
default: 127.0.0.1 ]
    [ -nfsport port. default:
9995 ]
    -exportid export id. default:
0
    -conffile conf file path

```

REST

N/A

Parameters

| Parameter | Description |
|-----------|--|
| conffile | The path to the NFSv4 configuration file. |
| exportid | The export ID as specified in the configuration file. The default value is 0. |
| nfshost | The NFS server host. Value can be the IP address or the hostname of the NFS server host. The default value is 127.0.0.1. |
| nfsport | The NFS server port. The default value is 9995. |

Examples**nfs4mgmt list-exports**

Returns the list of exports.

Syntax**CLI**

```

/opt/mapr/bin/maprcli nfs4mgmt
list-exports
    [ -nfshost ip/hostname.
default: 127.0.0.1 ]
    [ -nfsport port. default:
9995 ]

```

REST

N/A

Parameters

| Parameter | Description |
|-----------|--|
| nfshost | The NFS server host. Value can be the IP address or the hostname of the NFS server host. The default value is 127.0.0.1. |
| nfsport | The NFS server port. The default value is 9995. |

Output**Example**

Troubleshooting

Issue

Sometimes, you might see the following error when you run the `list-exports` command:

```
Error
org.freedesktop.DBus.Error.ServiceUnknown: The name org.ganesha.nfsd was
not provided by any .service files
```

Resolution

Modify the `/etc/dbus-1/system.conf` file as follows:

1. Remove the following:

```
<deny
send_destination="org.freedesktop.DBus"

send_interface="org.freedesktop.DBus"

send_member="UpdateActivationEnvironment" />
```

2. Add the following:

```
<allow send_interface="*" />
<allow receive_interface="*" />
<allow own="*" />
```

nfs4mgmt remove-export

Removes an export.

Syntax

CLI

```
/opt/mapr/bin/maprcli nfs4mgmt
remove-export
    [ -nfshost ip/hostname.
default: 127.0.0.1 ]
    [ -nfsport port. default:
9995 ]
    -exportid export id. default:
0
```

REST

N/A

Parameters

| Parameter | Description |
|-----------|--|
| exportid | The export ID to remove as specified in the configuration file. The default value is 0. |
| nfshost | The NFS server host. Value can be the IP address or the hostname of the NFS server host. The default value is 127.0.0.1. |
| nfsport | The NFS server port. The default value is 9995. |

Examples

nfs4mgmt update-export

Updates an export based on configuration changes.

Syntax

CLI

```

/opt/mapr/bin/maprcli nfs4mgmt
update-export
    [ -nfshost ip/hostname.
default: 127.0.0.1 ]
    [ -nfsport port. default:
9995 ]
    -exportid export id. default:
0
    -conffile conf file path

```

REST

N/A

Parameters

| Parameter | Description |
|-----------|--|
| conffile | The path to the NFSv4 configuration file. |
| exportid | The export ID to update as specified in the configuration file. The default value is 0. |
| nfshost | The NFS server host. Value can be the IP address or the hostname of the NFS server host. The default value is 127.0.0.1. |
| nfsport | The NFS server port. The default value is 9995. |

Examples

node

Manages nodes in the cluster

Fields

The following table lists the data fields that provide information about each node. Each field has two names:

- Field name - displayed in the output of the `node list` command
- Short name - used to specify the columns displayed using the `columns` parameter

The short name is also used when specifying rows with a filter, for example when specifying nodes on which to perform an action with the `node services` command.

| Field Name | Short Name | Description |
|---------------|------------|---|
| blockMovesIn | bmi | Block moves in. |
| blockMovesOut | bmo | Block moves out. |
| bytesReceived | br | Bytes received by the node since the last CLDB heartbeat. |

| Field Name | Short Name | Description |
|--------------------|------------|---|
| bytesSent | bs | Bytes sent by the node since the last CLDB heartbeat. |
| clienthealth | clhealth | The status of the client. Value can be one of the following: <ul style="list-style-type: none"> Active Inactive |
| clienttype | cltype | The type of client. For example, posixclientgold, posixclientbasic, posixclientplatinum, LOOPBACK_NFS, NFS_V3, NFS_V4. |
| configuredservice | csvc | Services that are configured as roles on the node. |
| CorePresentAlarm | ncp | Timestamp when the Core Present alarm was raised. |
| cpus | cpc | The total number of CPUs on the node. |
| davail | dsa | Disk space available on the node, in GB. |
| DiskFailureAlarm | fda | Timestamp when Disk Failure on page 2511 alarm was raised. |
| disks | dsc | Total number of disks on the node. |
| dreadK | drk | Disk Kbytes read since the last heartbeat. |
| dreads | dro | Disk read operations since the last heartbeat. |
| DRILLDOWNALARM | nadrill | Timestamp when "Drill Service Down" alarm was raised. |
| dtotal | dst | Total disk space on the node, in GB. |
| dused | dsu | Disk space used on the node, in GB. |
| dwriteK | dwk | Disk Kbytes written since the last heartbeat. |
| dwrites | dwo | Disk write ops since the last heartbeat. |
| ESServerDown | naes | Timestamp when "Elasticsearch Server Down" alarm was raised. |
| faileddisks | nfd | Number of failed filesystem disks on the node. <ul style="list-style-type: none"> 0 = Clear 1 = Raised |
| fs-heartbeat | fhb | Time since the last heartbeat to the CLDB, in seconds. |
| GatewayServiceDown | nagwsd | Timestamp when "Gateway Service Down" alarm was raised. |

| Field Name | Short Name | Description |
|---------------------------------|-------------|--|
| HbaseThriftServiceDown | hbasethrift | Timestamp when "HBase Thrift Service Down" alarm was raised. |
| HbProcessingSlow | hbpsa | Timestamp when Heartbeat Processing Slow on page 2512 alarm was raised. |
| health | h | Overall node health, calculated from various alarm states: <ul style="list-style-type: none"> • 0 = Healthy • 1 = Needs attention • 2 = Degraded • 3 = Maintenance • 4 = Critical |
| healthDesc | hd | The health description. |
| HighMfsMemoryAlarm | nhmm | Timestamp when MapR File System High Memory alarm was raised. |
| HomeMapRFullAlarm | hmf | Timestamp when Installation Directory Full alarm was raised. |
| hostname | hn | The host name. In the output for the <code>clientsonly</code> option, this is the hostname where the client is running. |
| id | id | The node ID. |
| IncorrectTopologyAlarm | ita | Timestamp when Incorrect Topology alarm was raised. |
| InstanceMismatch | nanim | Timestamp when Instance Mismatch alarm was raised. |
| Insufficient memory for buckets | tbwarning | Timestamp when Tiny Bucket Flush alarm was raised. |
| ip | ip | A list of IP addresses associated with the node. In the output for the <code>clientsonly</code> option, this is the IP address of the host where the client is running. |
| JobHistoryServerDown | nasjhsd | Timestamp when "Job History Server Down" alarm was raised. |
| jt-heartbeat | jhb | Time since the last heartbeat to the JobTracker, in seconds. |
| labels | lbl | Labels associated with a node. See Using Storage Labels on page 1068 for more information on labels. |
| lasthb | lhb | Time since the last heartbeat from the client host. |
| LogLevelAlarm | lla | Timestamp when Excess Logs alarm was raised. |
| MapRfs disks | nmd | Number of disks for use by filesystem |

| Field Name | Short Name | Description |
|-----------------------------|------------|--|
| MemoryAllocationAlarm | maa | Timestamp when Memory Allocation alarm was raised. |
| MemorySwapping | nams | Timestamp when Memory Usage alarm was raised. |
| mtotal | mt | Total memory, in MB. |
| mused | mu | Memory used, in MB. |
| NodeDuplicateHostIdAlarm | ndh | Timestamp when Duplicate Host ID on page 2511 alarm was raised. |
| NodeManagerDown | nanmd | Timestamp when "Node Manager Down" alarm was raised. |
| NodeMaprUserMismatchAlarm | nma | Timestamp when MapR User Mismatch on page 2516 alarm was raised. |
| NodeNoHeartbeatAlarm | nha | Timestamp when No Heartbeat alarm was raised. |
| NodeTooManyContainersAlarm | nmc | Timestamp when Node Too Many Containers on page 2520 alarm was raised. |
| NoDiskAttached | nanda | Timestamp when No Disk Attached alarm was raised. |
| numInstances | ni | Number of configured filesystem instances. |
| numReportedInstances | nri | The number of running instances reported by filesystem to CLDB. |
| numResyncSlots | nrs | The number of resync slots. |
| numGetsInLastTenSeconds | ngl10s | Number of table get operations in last 10 seconds. |
| numGetsInLastMinute | ngl1m | Number of table get operations in last 1 minute. |
| numGetsInLastFiveMinutes | ngl5m | Number of table get operations in last 5 minutes. |
| numGetsInLastFifteenMinutes | ngl15m | Number of table get operations in last 15 minutes. |
| numPutsInLastTenSeconds | npl10s | Number of table put operations in last 10 seconds. |
| numPutsInLastMinute | npl1m | Number of table put operations in last 1 minute. |
| numPutsInLastFiveMinutes | npl5m | Number of table put operations in last 5 minutes |
| numPutsInLastFifteenMinutes | npl15m | Number of table put operations in last 15 minutes. |
| numScansInLastTenSeconds | nsl10s | Number of table scan operations in last 10 seconds. |
| numScansInLastMinute | nsl1m | Number of table scan operations in last 1 minute. |

| Field Name | Short Name | Description |
|--------------------------------------|------------|--|
| numScansInLastFiveMinutes | nsI5m | Number of table scan operations in last 5 minutes. |
| numScansInLastFifteenMinutes | nsI15m | Number of table scan operations in last 15 minutes. |
| PamMisconfiguredAlarm | pma | PAM misconfigured alarm (NODE_ALARM_PAM_MISCONFIGURED): <ul style="list-style-type: none"> 0 = Clear 1 = Raised |
| ResourceManagerDown | narmd | Timestamp when "Resource Manager Down" alarm is raised. |
| RootPartitionFullAlarm | rpf | Timestamp when Root Partition Full alarm was raised. |
| rpcin | rpi | RPC bytes received since the last heartbeat. |
| rpcout | rpo | RPC bytes sent since the last heartbeat. |
| rpcs | rpc | Number of RPCs since the last heartbeat. |
| service | svc | A comma-separated list of services running on the node: <ul style="list-style-type: none"> cldb - CLDB fileserv - filesystem nfs - NFS Gateway Example: "cldb,fileserv,nfs" |
| ServiceBeeswaxDownNotRunningAlarm | sbwa | Timestamp when "Beeswax Service Down" alarm was raised. |
| ServiceCLDBDownNotRunningAlarm | sca | Timestamp when CLDB alarm was raised. |
| ServiceFileserverDownNotRunningAlarm | sfsa | Timestamp when Fileserver alarm was raised. |
| ServiceHiveDownNotRunningAlarm | shsma | Timestamp when HiveMeta Service Down alarm was raised. |
| ServiceHoststatsDownNotRunningAlarm | sha | Timestamp when Hoststats alarm was raised. |
| ServiceHs2DownNotRunningAlarm | shsa | Timestamp when HS2 Service Down alarm was raised. |
| ServiceHttpfsDownNotRunningAlarm | shfsa | Timestamp when "Httpfs Service Down" alarm is raised. |
| ServiceHueDownNotRunningAlarm | shuea | Timestamp when "Hue Service Down" alarm was raised. |
| ServiceNFSDDownNotRunningAlarm | sna | Timestamp when NFS alarm was raised. |

| Field Name | Short Name | Description |
|---------------------------------------|------------|---|
| ServiceOozieDownNotRunningAlarm | sooza | Timestamp when Oozie Service Down alarm was raised. |
| ServicesWebserverDownNotRunning Alarm | swa | Timestamp when Webserver alarm was raised. |
| spsPerInstance | nsp | Number of storage pools per file server instance. |
| TimeSkewAlarm | tsa | Timestamp when Time Skew alarm was raised. |
| racktopo | rp | The rack path. |
| uptime | cpt | Date when the node came up. |
| utilization | cpu | CPU use percentage since the last heartbeat. |
| VersionMismatchAlarm | vma | Timestamp when Version alarm was raised. |
| vip | vip | The virtuap IP address |

node allow-into-cluster

Allows host IDs to join the cluster after duplicates have been resolved.

When the CLDB detects duplicate nodes with the same host ID, all nodes with that host ID are removed from the cluster and prevented from joining it again. After making sure that all nodes have unique host IDs, you can use the `node allow-into-cluster` command to un-ban the host ID that was previously duplicated among several nodes.

Syntax

CLI

```
maprcli node allow-into-cluster
[ -hostids <host IDs> ]
```

REST

| | |
|--------------|---|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/node/allow-into-cluster[?<parameters>] |

Parameters

| Parameter | Description |
|-----------|-------------------------------------|
| hostids | A comma-separated list of host IDs. |

Examples

Allow former duplicate host IDs node1 and node2 to join the cluster:

CLI

```
maprcli node
allow-into-cluster -hostids
node1,node2
```

REST

```
https://abc.sj.us:8443/rest/node/
allow-into-cluster?hostids=node1,node2
```

node cldbmaster

Returns the address of the master CLDB node.

The `node cldbmaster` API returns the server ID and hostname of the node serving as the CLDB master node.

Syntax

CLI

```
maprcli node cldbmaster
[ -cluster <cluster name> ]
```

REST

| | |
|--------------|---|
| Request Type | GET |
| Request URL | http[s]://<host>:<port>/rest/node/cldbmaster[?<parameters>] |

Parameters

| Parameter | Description |
|-----------|---|
| cluster | The name of the cluster for which to return the CLDB master node information. |

Examples

Return the CLDB master node information for the cluster my.cluster.com:

CLI

```
maprcli node cldbmaster -cluster my.cluster.com
```

```
{
  "timestamp":1622099062802,
  "timeofday":"2021-05-27 07:04:22.802 GMT+0000 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "cldbmaster":"ServerID: 3523090783455785824 HostName: m2-mapreng-vmm167214.xxxx"
    }
  ]
}
```

REST

```
curl -k -X POST 'https://10.163.167.214:8443/rest/node/cldbmaster?cluster=my.cluster.com' --user mapr:mapr
```

```
{"timestamp":1622099484367,"timeofday":"2021-05-27 07:11:24.367 GMT+0000 AM","status":"OK","total":1,"data":[{"cldbmaster":"ServerID: 3523090783455785824 HostName: m2-mapreng-vmm167214.mip.xxx"}]}
```

node failover

Fails over master containers and VIPs to another node.

When this command runs, all master and intermediate containers are moved off the node and VIPs are re-assigned.

Syntax

CLI

```
maprcli node failover [ -nodes <node hostname> ]
```

REST

| | |
|--------------|------|
| Request Type | POST |
|--------------|------|

| | |
|-------------|---|
| Request URL | http[s]://<host>:<port>/rest/node/failover[?<parameters>] |
|-------------|---|

Parameters

| Parameter | Description |
|-----------|--------------------------------------|
| nodes | The hostname of the node going down. |

Examples

Notify CLDB of the node, exampleHost, going down:

CLI

```
maprcli node failover -nodes exampleHost
```

REST

```
https://abc.sj.us:8443/rest/node/failover?nodes=exampleHost
```

node heatmap

Displays a heatmap for the specified nodes.

Syntax

CLI

```
maprcli node heatmap [ -cluster <cluster> ] [ -filter <filter> ] [ -view <view> ] -json | -long
```

REST

| | |
|--------------|--|
| Request Type | GET |
| Request URL | http[s]://<host>:<port>/rest/node/heatmap[?<parameters>] |

Parameters

| Parameter | Description |
|-----------|--|
| cluster | The cluster on which to run the command. |
| filter | A filter specifying snapshots to preserve. See Filters for more information. |

| Parameter | Description |
|---|---|
| view | <p>Name of the heatmap view to show:</p> <ul style="list-style-type: none"> • <code>status</code> = Node status (the default view): <ul style="list-style-type: none"> • 0 = Healthy • 1 = Needs attention • 2 = Degraded • 3 = Maintenance • 4 = Critical • <code>cpu</code> = CPU utilization, as a percent from 0-100. • <code>memory</code> = Memory utilization, as a percent from 0-100. • <code>diskspace</code> = MapR filesystem disk space utilization, as a percent from 0-100. • <code>NODE_*</code> = Status of various alarms: 0 if clear, 1 if raised. For example: <code>NODE_ALARM_DISK_FAILURE</code> or <code>NODE_ALARM_SERVICE_CLDB_DOWN</code>. You can return a complete list of supported alarm parameters by running: <pre>maprcli node heatmap -view</pre> <p>See the lists of parameters below this table.</p> |
| <code>-json</code> <code>-long</code> | This command returns multiple levels of data. You must specify either JSON format or "long" format to see the full output. |

Alarm Parameters

You can view the status of a number of different alarms, including the status of alarms for services down and alarms for other conditions on the cluster.

Service Down Alarms

```
NODE_ALARM_SERVICE_CLDB_DOWN NODE_ALARM_SERVICE_FILESERVER_DOWN
NODE_ALARM_SERVICE_JT_DOWN NODE_ALARM_SERVICE_TT_DOWN
NODE_ALARM_SERVICE_HBMASTER_DOWN NODE_ALARM_SERVICE_HBREGION_DOWN
NODE_ALARM_SERVICE_WEBSERVER_DOWN NODE_ALARM_SERVICE_NFS_DOWN
NODE_ALARM_SERVICE_HOSTSTATS_DOWN NODE_ALARM_SERVICE_OOZIE_DOWN
NODE_ALARM_SERVICE_HUE_DOWN NODE_ALARM_SERVICE_HTTPFS_DOWN
NODE_ALARM_SERVICE_BEESWAX_DOWN NODE_ALARM_SERVICE_HIVEMETA_DOWN
NODE_ALARM_SERVICE_HS2_DOWN
```

Other Alarms

```
NODE_ALARM_DEBUG_LOGGING NODE_ALARM_DISK_FAILURE NODE_ALARM_VERSION_MISMATCH
NODE_ALARM_TIME_SKEW NODE_ALARM_ROOT_PARTITION_FULL
NODE_ALARM_OPT_MAPR_FULL NODE_ALARM_CORE_PRESENT NODE_ALARM_HIGH_MFS_MEMORY
NODE_ALARM_PAM_MISCONFIGURED NODE_ALARM_TT_LOCALDIR_FULL
NODE_ALARM_NO_HEARTBEAT NODE_ALARM_MAPRUSER_MISMATCH
NODE_ALARM_DUPLICATE_HOSTID NODE_ALARM_METRICS_WRITE_PROBLEM
NODE_ALARM_TOO_MANY_CONTAINERS
```

Output

In general, the heatmap output looks like this (in JSON format).

```
{
  status: "OK",
  data: [{
    "{{rackTopology}}" : {
      "{{nodeName}}" : {{heatmapValue}},
      "{{nodeName}}" : {{heatmapValue}},
      "{{nodeName}}" : {{heatmapValue}},
      ...
    },
    "{{rackTopology}}" : {
      "{{nodeName}}" : {{heatmapValue}},
      "{{nodeName}}" : {{heatmapValue}},
      "{{nodeName}}" : {{heatmapValue}},
      ...
    },
    ...
  ]
}
```

Table

| Field | Description |
|--------------|---|
| rackTopology | The topology for a particular rack. |
| nodeName | The name of the node in question. |
| heatmapValue | The value of the metric specified in the view parameter for this node, as an integer. |

Examples

Display a heat map with the node status (default view) for the default rack:

```
maprcli node heatmap -json
{
  "timestamp":1422567293873,
  "timeofday":"2015-01-29 01:34:53.873 GMT-0800",
  "status":"OK",
  "total":1,
  "data":[
    {"/data/default-rack":{
      "centos24":2}
    }
  ]
}
```

The equivalent REST API command would be:

```
https://rln1.sj.us:8443/rest/node/heatmap
```

Display memory usage for the default rack:

```
maprcli node heatmap -view memory -json
{
  "timestamp":1422585976631,
  "timeofday":"2015-01-29 06:46:16.631 GMT-0800",
  "status":"OK",
```

```

    "total":1,
    "data":[
      {"/data/default-rack":{
        "centos24":71}
      }
    ]
  }

```

The equivalent REST API command would be:

```
https://rln1.sj.us:8443/rest/node/heatmap?view=memory
```

Display the value of `NODE_ALARM_DISK_FAILURE` for the default rack:

```

maprcli node heatmap -view NODE_ALARM_DISK_FAILURE -long
/data/default-rack
{"centos24":0}

```

node list

Lists nodes in the cluster.

You can retrieve information for a set of nodes in several ways:

- To list only nodes with raised alarms, set `alarmednodes` to 1.
- To list only NFS nodes, set `nfsnodes` to 1.
- To view only a few nodes from the list, use the `start` and `limit` options to select only a portion of the results.
- To list nodes that match certain criteria, pass a filter to the `filter` parameter. See the [node](#) on page 1900 table for the filter options. See the [Filters](#) on page 1703 page for information on filters.

Using the `node list` command without the `-clientsonly true` or the `-nfsnodes true` option, does not list edge nodes. To include edge nodes, use the `-nfsnodes true` or the `-clientsonly true` option.

Syntax

CLI

```

/opt/mapr/bin/maprcli node list
[ -alarmednodes 0|1 ]
[ -cluster <cluster> ]
[ -clientsonly true|false ]
[ -columns <columns>|all ]
[ -filter <filter> ]
[ -limit <limit> ]
[ -nfsnodes true|false ]
[ -output terse|verbose ]
[ -sortby <attribute> ]
[ -sortorder asc|desc ]
[ -start <offset> ]
[ -zkconnect <ZooKeeper Connect String> ]

```

REST

| | |
|--------------|-----|
| Request Type | GET |
|--------------|-----|

Request URL

```
http[s]://<host>:<port>/
rest/node/list[?
<parameters>]
```

Parameters

| Parameter | Description |
|--------------|---|
| alarmednodes | When set to 1, displays only nodes with raised alarms. You cannot use this parameter if <code>nfsnodes</code> is set. |
| cluster | The cluster on which to run the command. |
| clientsonly | Set this parameter to <code>true</code> to return the list of nodes running unique platinum FUSE-based POSIX clients, and NFSv3, and NFSv4 services. The command returns the following fields: <code>clienttype</code> , <code>clienthealth</code> , <code>hostname</code> , <code>ip</code> , <code>lasthb</code> , <code>id</code> . For more information, see the fields table . If you set this parameter to <code>false</code> , which is the default value, this parameter returns node-level information for all the services running on each node. |
| columns | A comma-separated list of fields to return in the query, specified by the short names. When specifying this option, the <code>ip</code> and <code>hostname</code> columns are always returned in the query. |
| filter | A filter specifying nodes on which to start or stop services. See the Fields table on the node page for the fields available to filter. See the maprcli and REST API Syntax page for information on filters. |
| limit | The number of rows to return, beginning at start. Default: 0 |
| nfsnodes | Set this to <code>true</code> to display POSIX (edge) nodes. When set to <code>false</code> , edge nodes are not displayed. Cannot be used if <code>alarmednodes</code> is set. When you set the <code>cldb.ignore.posix.only.hb.alarm</code> parameter to 1, dead edge nodes are displayed for 4 minutes from the time they went down, as CLDB removes all the dead edge nodes after 4 minutes. However, when you set <code>cldb.ignore.posix.only.hb.alarm</code> parameter to 0, dead edge nodes are displayed for 24 hours. |
| output | Specifies whether the output should be terse or verbose. |

| Parameter | Description |
|-----------|---|
| sortby | Specifies one of the following attributes by which to sort the list of nodes: nodeid, nodeip, nodehostname, noderackpath, nodeswitchpath, nodestatus, nodeservices, nodefshb, nodejthb, nodedisktotal, nodediskused, nodediskavail, noderpc, noderpcin, noderpcout, nodediskcount, nodediskreadops, nodediskreadkbytes, nodediskwriteops, nodediskwritekbytes, nodecpucount, nodecpuutil, nodememtotal, nodememused, nodefaileddisks, nodevirtualip, nodevirtualipend, nodenetmaskvnodeaddress, nodegateway, nodebytesreceived, nodebytessent, nodecpuuptime, nodemaprdiskcount, nodestatusdesc, nodeblockmovesout, nodeblockmovesin, nodemaxcontainerthreshold, nodenuminstances, nodenumspersinstance, nodenfsstate, nodeisposixclient, nodeisloopbacknfs, nodeisloopbacknfsrunning |
| start | The offset from the starting row according to sort. Default: 0 |
| zkconnect | ZooKeeper Connect String |

Output

Information about the nodes. See the [fields](#) for more information.

Sample Output

```
# /opt/mapr/bin/maprcli node list -json
{
  "timestamp":1555342212112,
  "timeofday":"2019-04-15 08:30:12.112 GMT-0700 AM",

Fields

For definitions of the output fields, and short names for use with filters, see the [fields table](#).

Examples

List all nodes:

For neatly formatted results, use the `-json` option when listing all nodes or a large subset of node information.

CLI

```

/opt/mapr/bin/maprcli node list -json
{
  "timestamp":1555342212112,
  "timeofday":"2019-04-15
08:30:12.112 GMT-0700 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "id":"7146221175287263104",
      "ip":[
        "10.10.82.29",
        "172.17.0.1"
      ],
      "hostname":"doc29.lab",
      "racktopo":"/data/
default-rack/doc29.lab",
      "health":2,
      "healthDesc":"One or more
services is down",
      "service":"resourcemanager,fileserver,
cldb,nfs4,mastgateway,nodemanager,gate
way,hoststats,apiserver,posixclientbas
ic",
      "configuredservice":"resourcemanager,f
ilemigrate,fileserver,cldb,nfs4,mastga
teway,nodemanager,gateway,hoststats,ap
iserver,posixclientbasic",

```

```

REST

```
curl -u mapr:mapr -X GET -k "https://
host:8443/rest/node/list"
```

List the health and configured service of all nodes:

The following examples show the use of short forms for the `column` parameter.

CLI

```
/opt/mapr/bin/maprcli node
list -columns
service,health,configuredservice -json
/opt/mapr/bin/maprcli node
list -columns svc,h,csvc -json
{
  "timestamp":1555343115082,
  "timeofday":"2019-04-15
08:45:15.082 GMT-0700 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "ip":[
        "10.10.82.29",
        "172.17.0.1"
      ],
      "hostname":"doc29.lab",
      "health":2,

      "service":"resourcemanager,fileserver,
cldb,nfs4,mastgateway,nodemanager,gate
way,hoststats,apiserver,posixclientbas
ic",

      "configuredservice":"resourcemanager,f
ilemigrate,fileserver,cldb,nfs4,mastga
teway,nodemanager,gateway,hoststats,ap
iserver,posixclientbasic"
    }
  ]
}
```

REST

```
curl -u mapr:mapr -X GET -k "https://
host:8443/rest/node/list?
columns=service%2Chealth%2Cconfigureds
ervice"
curl -u mapr:mapr -X GET -k "https://
host:8443/rest/node/list?
columns=svc%2Ch%2Ccsvs"
{"timestamp":1555482645387,"timeofday"
:"2019-04-16 11:30:45.387 GMT-0700
PM","status":"OK","total":1,"data":
[{"ip":
```

```
[ "10.10.82.29", "172.17.0.1" ], "hostname": "doc29.lab", "health": 2, "service": "", "configuredservice": "" ]}]}
```

List the number of slots on all nodes:

CLI

```
/opt/mapr/bin/maprcli node
list -columns
ip,ttmapSlots,ttmapUsed,ttReduceSlots,
ttReduceUsed -json
{
  "timestamp":1555483525095,
  "timeofday":"2019-04-16
11:45:25.095 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[

Related concepts

[node](#) on page 1900

Manages nodes in the cluster

[Using Storage Labels](#) on page 1068

Describes the Storage Labels feature.

Related reference

[disk add](#) on page 1786

Adds one or more disks to the specified node. Permissions required: `fc` or `a`.

[disk setlabel](#) on page 1788

Adds a label to disks or a storage pool. Permissions required: `fc` or `a`.

[label add](#) on page 1891

Registers a label. Permissions required: `fc` or `a`.

[volume create](#) on page 2190

Creates a volume.

[volume move](#) on page 2294

Moves the specified volume or mirror to a different topology. Permissions required: `m` or `fc` on the volume.

[label list](#) on page 1895

Lists registered labels. Permissions required: `fc` or `a`.

[dump volumeinfo](#) on page 1830

Returns information about volumes and the associated containers. For JSON formatted output, use the `-json` option from the command line.

[configure.sh](#) on page 2331

Describes the syntax and parameters of the `configure.sh` script that you run for a number of tasks including setting up HPE Ezmeral Data Fabric client nodes, and configuring services for a node.

node listcllbs

Returns the hostnames of the nodes in the cluster that are running the CLDB service.

Syntax

CLI

```
maprcli node listcllbs
    [ -cluster <cluster name> ]
    [ -cldb <cldb hostname|ip:port> ]
```

REST

| | |
|--------------|-----|
| Request Type | GET |
|--------------|-----|

Request URL

```
http[s]://<host>:<port>/
rest/node/listcldbs[?
<parameters>]
```

Parameters

| Parameter | Description |
|-----------|--|
| cluster | The name of the cluster for which to return the list of CLDB node hostnames. |
| cldb | The hostname or IP address and port number of a CLDB node. |

Examples

Return the list of CLDB nodes for the cluster **my.cluster.com**:

CLI

```
# maprcli node listcldbs -cluster
my.cluster.com -json
{
  "timestamp":1529445021408,
  "timeofday":"2018-06-19
02:50:21.408 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "CLDBs":"in111-22.qa.lab,in111-24.qa.l
ab,in111-21.qa.lab"
    }
  ]
}
```

REST

```
# curl -k -X GET 'https://
abc.sj.us:8443/rest/node/listcldbs?
cluster=my.cluster.com' --user
mapr:mapr
{"timestamp":1529445190525,"timeofday"
:"2018-06-19 02:53:10.525 GMT-0700
PM","status":"OK","total":1,"data":
[{"CLDBs":"in111-22.qa.lab,in111-24.qa
.lab,in111-21.qa.lab"}]}
```

node listcldbzs

Returns the hostnames of the nodes in the cluster that are running the CLDB service and the IP addresses and port numbers for the nodes in the cluster that are running the ZooKeeper service.

Syntax**CLI**

```
maprcli node listcldbzks
  [ -cluster <cluster name> ]
  [ -cldb <cldb hostname|ip:port> ]
```

REST

| | |
|--------------|--|
| Request Type | GET |
| Request URL | http[s]://<host>:<port>/rest/node/listcldbzks[?<parameters>] |

Parameters

| Parameter | Description |
|-----------|---|
| cluster | The name of the cluster for which to return the CLDB and ZooKeeper information. |
| cldb | The hostname or IP address and port number of a CLDB node. |

Examples

Return CLDB and ZooKeeper node information for the cluster my.cluster.com:

CLI

```
maprcli node listcldbzks -cluster
my.cluster.com
{
  "timestamp":1529445399193,
  "timeofday":"2018-06-19
02:56:39.193 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "CLDBs":"in111-22.qa.lab,in111-24.qa.l
ab,in111-21.qa.lab",
      "Zookeepers":"in111-21.qa.lab:5181,in
11-22.qa.lab:5181,in111-24.qa.lab:5181
"
    }
  ]
}
```

REST

```
# curl -k -X GET 'https://
abc.sj.us:8443/rest/node/listcldbzks?
cluster=my.cluster.com' --user
mapr:mapr
{"timestamp":1529445324540,"timeofday"
:"2018-06-19 02:55:24.540 GMT-0700
PM","status":"OK","total":1,"data":
[{"CLDBs":"in111-22.qa.lab,in111-24.qa
```

```
.lab,in111-21.qa.lab", "Zookeepers": "in111-21.qa.lab:5181,in111-22.qa.lab:5181,in111-24.qa.lab:5181"]}]}
```

node listzookeepers

Returns the hostnames of the nodes in the cluster that are running the ZooKeeper service.

Syntax

CLI

```
maprcli node listzookeepers
[ -cluster <cluster name> ]
[ -cldb <cldb hostname|ip:port> ]
```

REST

| | |
|--------------|---|
| Request Type | GET |
| Request URL | http[s]://<host>:<port>/rest/node/listzookeepers[?<parameters>] |

Parameters

| Parameter | Description |
|-----------|---|
| cluster | The name of the cluster for which to return the list of zookeeper node hostnames. |
| cldb | The hostname or IP address and port number of a valid CLDB node. The other CLDB nodes and zookeeper nodes can be discovered from this node. |

Examples

Return the list of zookeeper nodes for the cluster my.cluster.com

If you know that the CLDB service is running on a node with hostname `host1`, you can enter:

CLI

```
maprcli node listzookeepers -cluster my.cluster.com -cldb host1 -json
{
  "timestamp":1529451245796,
  "timeofday":"2018-06-19 04:34:05.796 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "Zookeepers":"in111-21.qa.lab:5181,in111-22.qa.lab:5181,in111-24.qa.lab:5181"
    }
  ]
}
```

REST

```
https://abc.sj.us:8443/rest/node/
listzookeepers?
cluster=my.cluster.com&cldb=host1
{"timestamp":1529451245796,"timeofday"
:"2018-06-19 04:34:05.796 GMT-0700
PM","status":"OK","total":1,"data":
[{"Zookeepers":"in111-21.qa.lab:5181,i
n111-22.qa.lab:5181,in111-24.qa.lab:51
81"}]}
```

node maintenance

Places a node into a maintenance mode for a specified duration.

 **Important:** Stop CLDB if it is running on the node, before putting that node in maintenance mode. Else, the maintenance mode operation is not permitted. Run: `maprcli node services -name cldb -action stop -nodes mapr-<node>`

 **Note:** You cannot put a master CLDB node in Maintenance mode.

For the duration of the maintenance mode, the cluster's CLDB does not consider the data of this node as lost and does not trigger a resync of the data on this node. See [Administering Nodes](#) on page 874 for more information.

Syntax

CLI

```
/opt/mapr/bin/maprcli node maintenance
[ -cluster <cluster> ]
[ -serverids <serverids> ]
-nodes <node names>
-timeoutminutes <timeout in
minutes>
```

REST

| | |
|--------------|--|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/node/maintenance?<parameters> |

Parameters

| Parameter | Description |
|----------------|---|
| cluster | The cluster on which to run the command. |
| serverids | List of server IDs |
| nodes | List of nodes, space separated. |
| timeoutminutes | Duration of the maintenance mode in minutes |

Examples

CLI

```
/opt/mapr/bin/maprcli
node maintenance -nodes
centos22.lab -timeoutminutes 20
```

REST

```
curl -u mapr:mapr -X POST -k 'https://
abc.sj.us:8443/rest/node/maintenance?
nodes=centos22.lab&timeoutminutes=20'
```

node metrics

Retrieves metrics information for nodes in a cluster.

 **Warning:** This command is deprecated. See [Using HPE Ezmeral Data Fabric Monitoring \(Spyglass Initiative\)](#) on page 1442 for information about viewing metrics and logs for nodes, services, and applications.

This command retrieves and displays various metrics related to the operation of nodes. The data displayed comes from the files that each node updates periodically that are stored in the node local volume on each node in the cluster.

Syntax

CLI

```
maprcli node metrics
    -nodes <hostname>
    -start <start time>
    -end <end time>
    [ -interval <interval
timestamp> ]
    [ -events true|false ]
    [ -columns <column names> ]
    [ -cluster <cluster name> ]
```

Parameters

| Parameter | Description |
|-----------------|---|
| nodes | A space-separated list of host names. The host name must be either the specific hostname (use the <code>maprcli node list -columns hostname</code> command to obtain the hostname value) or the name "hostname" if using the command line on the actual node. The IP address and "localhost" can not be used. |
| start | The start of the time range. Can be a UTC timestamp (in this case, a Java millisecond timestamp) or a UTC date in MM/DD/YY or MM/DD/YYYY format. |
| end | The end of the time range. Can be a UTC timestamp (in this case, a Java millisecond timestamp) or a UTC date in MM/DD/YY or MM/DD/YYYY format. |
| interval | Data measurement interval in seconds. The minimum value is 10 seconds. |

| Parameter | Description |
|-----------|---|
| events | Specify <code>TRUE</code> to return node events only. The default value of this parameter is <code>FALSE</code> . |
| columns | Comma-separated list of column names to return. |
| cluster | Cluster name. |

Column Name Parameters

The `node metrics` API always returns the `NODE` (node name) and `TIMESTAMP` (integer timestamp) columns. Use the `-columns` flag to specify a comma-separated list of column names to return.

 **Warning:** The `CPUNICE`, `CPUUSER`, and `CPUSYSTEM` parameters return information in *jiffies*. This unit measures one tick of the system timer interrupt and is usually equivalent to 10 milliseconds, but may vary depending on your particular node configuration. The reporting interval is the maximum possible value. In addition, the `CPU*` parameters accumulate and do not reset from report to report. Call `sysconf(_SC_CLK_TCK)` to determine the exact value for your node.

| | | |
|-----------------|--|--|
| CPUNICE | Amount of CPU time used by processes with a positive nice value. | |
| CPUUSER | Amount of CPU time used by user processes. | |
| CPUSYSTEM | Amount of CPU time used by system processes. | |
| LOAD5PERCENT | Percentage of time this node spent at load 5 or below | |
| LOAD1PERCENT | Percentage of time this node spent at load 1 or below | |
| MEMORYCACHED | Memory cache size in bytes | |
| MEMORYSHARED | Shared memory size in bytes | |
| MEMORYBUFFERS | Memory buffer size in bytes | |
| MEMORYUSED | Memory used in megabytes | |
| PROCRUN | Number of processes running | |
| RPCCOUNT | Number of data-fabric RPC calls | |
| RPCINBYTES | Number of bytes passed in by data-fabric RPC calls | |
| RPCOUTBYTES | Number of bytes passed out by data-fabric RPC calls | |
| SERVAVAILSIZEMB | Server storage available in megabytes | |
| SERVUSEDSEIZEMB | Server storage used in megabytes | |

| | | |
|--------------|---|--|
| SWAPFREE | Free swap space in bytes | |
| TTMAPUSED | Number of TaskTracker slots used for map tasks | |
| TTREDUCEUSED | Number of TaskTracker slots used for reduce tasks | |

Three column name parameters return data that is too granular to display in a standard table. Use the `-json` option to return this information as a JSON object.

| Parameter | Description | Metrics Returned |
|-----------|---|--|
| CPUS | Activity on this node's CPUs. Each CPU on the node is numbered from zero, <code>cpu0</code> to <code>cpuN</code> . Metrics returned are for each CPU. | CPUIDLE: Amount of CPU time spent idle. Reported as <i>jiffies</i> . CPUWAIT: Amount of CPU time spent waiting for I/O operations. Reported as <i>jiffies</i> . CPUTOTAL: Total amount of CPU time. Reported as <i>jiffies</i> . |
| DISKS | Activity on this node's disks. Metrics returned are for each partition. | READOPS: Number of read operations. READKB: Number of kilobytes read. WRITEOPS: Number of write operations. WRITEKB: Number of kilobytes written. |
| NETWORK | Activity on this node's network interfaces. Metrics returned are for each interface. | BYTESIN: Number of bytes received. BYTESOUT: Number of bytes sent. PKTSIN: Number of packets received. PKTSOUT: Number of packets sent. |

Examples

Retrieving the percentage of time that a node spent at the 1 and 5 load levels between dates

```
$ maprcli node metrics
  -nodes centos24.lab
  -start 08/02/15
  -end 08/03/15
  -interval 7200
  -columns LOAD5PERCENT,LOAD1PERCENT
```

Sample Output

```

}

```

node move

Moves one or more nodes to a different topology. Permissions required: `fc` or `a`.

Syntax

CLI

```

maprcli node move
[ -cluster <cluster> ]
-serverids <server IDs>
-topology <topology>

```

REST

| | |
|--------------|---|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/node/move?<parameters> |

Parameters

| Parameter | Description |
|------------------------|---|
| <code>cluster</code> | The cluster on which to run the command. |
| <code>serverids</code> | The comma-separated list of server IDs of the nodes to move. If you insert spaces between server IDs, the command only operates on the first server ID in the list. |
| <code>topology</code> | The new topology. |

To obtain existing topology, run

```
maprcli node topo
```

To obtain the server ID, run

```
maprcli node list -columns id
```

Sample output from `maprcli node list -columns id` is shown below. The resulting server ID(s) can be copied and pasted into the `maprcli node move` command.

```

id                hostname      ip
547819249997313015  node-34.lab  10.10.40.34,10.10.88.34

```

```
2130988050310536949 node-36.lab 10.10.40.36,10.10.88.36
8683110801227243688 node-37.lab 10.10.40.37,10.10.88.37
5056865595028557458 node-38.lab 10.10.40.38,10.10.88.38
31111411192171195352 node-39.lab 10.10.40.39,10.10.88.39
```

Examples

CLI

```
maprcli node move
-topology /newData
-serverids 547819249997313015
```

REST

```
https://abc.sj.us:8443/rest/node/move?
topology=%2FnewData&serverids=54781924
9997313015
```

node remove

Removes one or more server nodes from the system. Permissions required: `fc` or `a`.

After issuing the `node remove` command, wait several minutes to ensure that the node has been properly and completely removed.

Syntax

CLI

```
maprcli node remove
[ -filter "<filter>" ]
[ -hostids <host IDs> ]
[ -nodes <node names> ]
[ -service <fileserver or
nfserver> ]
[ -zkconnect <ZooKeeper Connect
String> ]
```

REST

| | |
|--------------|---|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/node/remove[?<parameters>] |

Parameters

| Parameter | Description |
|-----------|---|
| filter | A filter specifying nodes on which to start or stop services. See Filters for more information. |
| hostids | A list of host IDs, separated by spaces. |
| nodes | A list of node names, separated by spaces. |
| service | Service to be removed. Either fileserver or nfserver. |

| Parameter | Description |
|-----------|--|
| zkconnect | ZooKeeper Connect String . Example: 'host:port,host:port,host:port,...'. To obtain zookeeper connection strings, use the <code>maprcli node listzookeepers</code> command. Default: localhost:5181 |

Examples

CLI

```
maprcli node remove -nodes 10.20.30.40
```

REST

```
https://abc.sj.us:8443/rest/node/remove?nodes=10.20.30.40
```

node services

Starts, stops, or restarts services on one or more server nodes. Permissions required: `ss`, `fc` or `a`.

To start or stop services, you must specify the service name, the action (start, stop, or restart), and the nodes on which to perform the action. You can specify the nodes in one of two ways:

- Use the `nodes` parameter to specify a space-delimited list of node names.
- Use the `filter` parameter to specify all nodes that match a certain pattern. See [Filters](#) for more information.

Syntax

CLI

```
/opt/mapr/bin/maprcli node services
  [ -action start|stop|restart|
  enable|disable ]
  [ -apiserver start|stop|restart|
  enable|disable ]
  [ -cldb start|stop|restart|enable|
  disable ]
  [ -cluster <cluster> ]
  [ -filesserver start|stop|restart|
  enable|disable ]
  [ -filter <filter> ]

  [ -name <service> ]
  [ -nfs start|stop|restart|enable|
  disable ]
  [ -nfs4 start|stop|restart|enable|
  disable ]
  [ -nodes <node names> ]

  [ -zkconnect <ZooKeeper Connect
  String> ]
```

REST

| | |
|--------------|---|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/node/services[?<parameters>] |

Parameters

To perform an action on a service, on a particular set of nodes, you must specify the following three parameters:

- `action`- the action to perform:
 - Start, stop, restart a service.
 - Disable a service to prevent it from starting when Warden restarts and enable a service to allow the service to start when Warden restarts.

Note: Suspend and resume are not supported.

- `node` or `filter` - the nodes on which to perform the action; either a list of nodes, or a filter that matches a set of nodes
- `name` - the service on which to perform the action

The following table lists the parameters available with the `node services` command.

| Parameter | Description |
|-------------------------|---|
| <code>action</code> | An action to perform on a service specified in the <code>name</code> parameter: Values: start, stop, suspend, resume, restart, enable, or disable |
| <code>apiserver</code> | Starts, stops, or restarts the <code>apiserver</code> . Values: start, stop, restart, enable, or disable |
| <code>cldb</code> | Starts, stops, or restarts the <code>cldb</code> service. Values: start, stop, suspend, resume, restart, enable, or disable |
| <code>cluster</code> | The cluster on which to run the command. |
| <code>fileserver</code> | Starts, stops, or restarts the <code>fileserver</code> service. Values: start, stop, suspend, resume, restart, enable, or disable |
| <code>filter</code> | A filter specifying nodes on which to start or stop services. For fields to use with the filter, see the node on page 1900 table. See Filters on page 1703 for more information about filters. Note: You must specify either the <code>filter</code> parameter or the <code>nodes</code> parameter. |
| <code>name</code> | A service on which to perform an action specified by the <code>action</code> parameter. Any service can be specified with this option, but the following services can be specified only with the <code>name</code> option: <code>collectd</code> , <code>elasticsearch</code> , <code>fluentd</code> , <code>grafana</code> , <code>historyserver</code> , <code>hivemeta</code> , <code>hoststats</code> , <code>hs2</code> , <code>httpfs</code> , <code>hue</code> , <code>kibana</code> , <code>nodemanager</code> , <code>opentsdb</code> , <code>oozie</code> , and <code>resource manager</code> . |
| <code>nfs</code> | Starts, stops, or restarts the <code>nfs</code> service. Values: start, stop, suspend, resume, restart, enable, or disable |
| <code>nfs4</code> | Starts, stops, or restarts the NFSv4 service. Values: start, stop, restart, enable, or disable |
| <code>nodes</code> | A list of node names, separated by spaces. Note: Either this or <code>filter</code> is required. |

| Parameter | Description |
|-----------|--|
| zkconnect | The ZooKeeper Connect String . |

Examples

Start the NodeManager Service

```
/opt/mapr/bin/maprcli node services -name nodemanager -nodes
abc.sj.us -action start
```

Stop the ResourceManager Service

```
/opt/mapr/bin/maprcli node services -name resourcemanager -nodes
abc.sj.us -action stop
```

Stop the ResourceManager Service

```
/opt/mapr/bin/maprcli node services -name resourcemanager -nodes
abc.sj.us -action restart
```

Restart NFS server

```
/opt/mapr/bin/maprcli node services -nodes abc.sj.us -nfs restart
```

Restart NFS server using a filter

Using a filter is common, especially in HBase environments, where full restarts of region and master servers are needed.

```
/opt/mapr/bin/maprcli node services -filter ["csvc==nfs"] -nfs restart
```

Start the Hue Service

```
/opt/mapr/bin/maprcli node services -name hue -action start -nodes <node n>
```

Restart the hoststats service

Restart the hoststats service after making changes to the HPE Ezmeral Data Fabric Metrics database. You do not need to restart warden.

```
/opt/mapr/bin/maprcli node services -name hoststats -action restart -nodes
<nodes>
```

OR

```
/opt/mapr/bin/maprcli node services -name hoststats -action restart -filter
'[csvc==hoststats]'
```

node topo

Lists cluster topology information.

Lists internal nodes only (switches/racks/etc) and not leaf nodes (server nodes).

Syntax**CLI**

```
maprccli node topo
  [ -cluster <cluster> ]
  [ -path <path> ]
```

REST

| | |
|--------------|---|
| Request Type | GET |
| Request URL | http[s]://<host>:<port>/rest/node/topo?<parameters> |

Parameters

| Parameter | Description |
|-----------|--|
| cluster | The cluster on which to run the command. |
| path | The path on which to list node topology. |

Output

Node topology information.

Sample output

```
{
  "timestamp":1433545849048,
  "timeofday":"2015-06-05 11:10:49.048 GMT+0000",
  "status":"OK",
  "total":4,
  "data":[
    {
      "path":"/"
    },
    {
      "path":"/data"
    },
    {
      "path":"/data/default-rack"
    },
    {
      "path":"/default-rack"
    }
  ]
}
```

Output Fields

| Field | Description |
|-------|---|
| path | The physical topology path to the node. |

Examples

CLI

```
# maprcli node topo
path
/
/data
/data/default-rack
/default-rack
```

REST

```
# curl -k -X GET 'https://
abc.sj.us:8443/rest/node/topo' --user
mapr:mapr
{"timestamp":1529382835319,"timeofday"
:"2018-06-18 09:33:55.319 GMT-0700
PM","status":"OK","total":4,"data":
[{"path":"/"}, {"path":"/data"},
{"path":"/data/default-rack"},
{"path":"/default-rack"}]}
```

node toposize

Lists disk space utilization for each topology.

Syntax

CLI

```
maprcli node toposize
[ -cluster <cluster> ]
```

REST

| | |
|--------------|---|
| Request Type | GET |
| Request URL | http[s]://<host>:<port>/rest/node/toposize[?<parameters>] |

Parameters

| Parameter | Description |
|-----------|--|
| cluster | The cluster on which to run the command. |

Output

| Field | Description |
|----------------|--|
| AvailableSpace | The amount of available disk space (in GB). |
| path | The cluster rack path to the node (or topology of the node). |
| TotalSpace | The amount of total disk space (in GB). |
| UsedSpace | The amount of utilized disk space (in GB). |

Example

Retrieve topology-based disk utilization information:

CLI

```
# maprcli node toposize
path
TotalSpace(GB)  UsedSpace(GB)
AvailableSpace(GB)
/
1584             18             1563
/abcd
432              6              425
/abcd/test
288              0              288
/abcd/test/test1
144              0              144
/cldb
576              6              569
/cldb/test
432              0              432
/cldb/test/test1
288              0              288
/cldb/test/test1/test2
144              0              144
/ecvol
288              0              288
/ecvol/test
288              0              288
/ecvol/test/test1
144              0              144
/ecvol/test/test1/test2
144              0              144
/ecvol/test/test1/test2/test3
144              0              144
/ecvol/test/test1/test2/test3/test4
144              0              144
```

REST

```
# curl -k -X GET 'https://
abc.sj.us:8443/rest/node/
toposize' --user mapr:mapr
{"timestamp":1533655046390,"timeofday":
"2018-08-07 08:17:26.390 GMT-0700
AM","status":"OK","total":3,"data":
[{"path":"/","TotalSpace(GB)":273,"Use
dSpace(GB)":0,"AvailableSpace(GB)":272
}, {"path":"/
data","TotalSpace(GB)":273,"UsedSpace(
GB)":0,"AvailableSpace(GB)":272},
{"path":"/data/
default-rack","TotalSpace(GB)":273,"Us
edSpace(GB)":0,"AvailableSpace(GB)":27
2}]}
```

rlimit

Manages resource usage limits for the cluster.

rlimit get

Returns the resource usage limit for the cluster's disk resource.

Syntax

CLI

```
maprcli rlimit get
  -resource disk
  [ -cluster <cluster name> ]
```

REST

| | |
|--------------|--|
| Request Type | GET |
| Request URL | http[s]://<host>:<port>/rest/rlimit/get?<parameters> |

Parameters

| Parameter | Description |
|-----------|---|
| resource | The type of resource to get the usage limit for. Currently only the value <code>disk</code> is supported. |
| cluster | The name of the cluster whose usage limit is being queried. |

Examples

Return the disk usage limit for the cluster `my.cluster.com`:

CLI

```
# maprcli rlimit get -resource
disk -cluster ksTest -json
{
  "timestamp":1529382231966,
  "timeofday":"2018-06-18
09:23:51.966 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "limit":"251947MB",
      "clusterSize":"279942MB",
      "currentUsage":"3MB"
    }
  ]
}
```

REST

```
# curl -k -X GET 'https://
abc.sj.us:8443/rest/rlimit/get?
cluster=ksTest' --user mapr:mapr
{"timestamp":1529382231966,"timeofday"
:"2018-06-18 09:23:51.966 GMT-0700
PM","status":"OK","total":1,"data":
[{"limit":"251947MB","clusterSize":"27
9942MB","currentUsage":"3MB"}]}
```

rlimit set

Sets the resource usage limit for the cluster's disk resource.

Syntax**CLI**

```
maprcli rlimit set
  -resource disk
  [ -cluster <cluster name> ]
  -value <limit>
```

REST

| | |
|--------------|--|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/rlimit/set?<parameters> |

Parameters

| Parameter | Description |
|-----------|---|
| resource | The type of resource for which to set the usage limit. Currently <code>disk</code> is the only value that is supported. |
| cluster | The name of the cluster whose usage limit is being set. |
| value | The value of the limit being set. You can express the value as KB, MB, GB, or TB. |

Examples

Set the disk usage limit for the cluster `my.cluster.com` to 80TB:

CLI

```
maprcli rlimit set -resource
disk -cluster my.cluster.com -value
80TB
```

REST

```
https://abc.sj.us:8443/rest/rlimit/
get?
resource=disk&cluster=my.cluster.com&v
alue=80TB
```

Related tasks

[Setting Quota Defaults for Users and Groups](#) on page 857

Explains how to set disk space quotas for users and groups.

Related reference

[entity modify](#) on page 1843

Modifies a user or group quota or email address. Permissions required: `fc` or `a`.

schedule

Manages schedules.

Schedule Fields

The schedule object contains the following fields:

| Field | Value |
|-------|---|
| id | The ID of the schedule. |
| name | The name of the schedule. |
| inuse | Indicates whether the schedule is associated with an action. |
| rules | An array of JSON objects specifying how often the scheduled action occurs. See Rule Fields below. |

Rule Fields

The following table shows the fields to use when creating a rules object.

| Field | Values |
|-----------|--|
| frequency | <p>How often to perform the action:</p> <ul style="list-style-type: none"> • <code>once</code> - Once • <code>yearly</code> - Yearly • <code>monthly</code> - Monthly • <code>weekly</code> - Weekly • <code>daily</code> - Daily • <code>hourly</code> - Hourly • <code>semihourly</code> - Every 30 minutes • <code>quarterhourly</code> - Every 15 minutes • <code>fiveminutes</code> - Every 5 minutes • <code>minute</code> - Every minute |
| retain | <p>How long to retain the data resulting from the action. For example, if the schedule creates a snapshot, the <code>retain</code> field sets the snapshot's expiration. The <code>retain</code> field consists of an integer and one of the following units of time:</p> <ul style="list-style-type: none"> • <code>mi</code> - minutes • <code>h</code> - hours • <code>d</code> - days • <code>w</code> - weeks • <code>m</code> - months • <code>y</code> - years <p> Note: For offload schedule, set the value for this to 0.</p> |

| Field | Values |
|-------|--|
| time | The time of day to perform the action, in 24-hour format: HH |
| date | The date on which to perform the action: <ul style="list-style-type: none"> For single occurrences, specify month, day and year: MM/DD/YYYY For yearly occurrences, specify the month and day: MM/DD For monthly occurrences occurrences, specify the day: DD Daily and hourly occurrences do not require the date field. |

Example

The following example JSON shows a schedule called "snapshot," with three rules.

```
{
  "id": 8,
  "name": "snapshot",
  "inuse": 0,
  "rules": [
    {
      "frequency": "monthly",
      "date": "8",
      "time": 14,
      "retain": "1m"
    },
    {
      "frequency": "weekly",
      "date": "sat",
      "time": 14,
      "retain": "2w"
    },
    {
      "frequency": "hourly",
      "retain": "1d"
    }
  ]
}
```

schedule create

Creates a schedule. Permissions required: `fc` or `a`.

A schedule can be associated with a volume to automate mirror syncing, snapshot creation, and data offload. See [volume create](#) and [volume modify](#).

Syntax

CLI

```
maprcli schedule create
[ -cluster <cluster> ]
-schedule <JSON>
```

REST

| | |
|--------------|------|
| Request Type | POST |
|--------------|------|

| | |
|-------------|---|
| Request URL | http[s]://<host>:<port>/rest/schedule/create?<parameters> |
|-------------|---|

Parameters

| Parameter | Description |
|-----------|---|
| cluster | The cluster on which to run the command. |
| schedule | A JSON object describing the schedule. See Schedule Objects for more information. |

Examples

Scheduling a Single Occurrence

CLI

```
maprcli schedule create -schedule
'{"name":"Schedule-1","rules":
[{"frequency":"once","retain":"1w","time":13,"date":"12/5/2010"}]}'
```

REST

```
https://abc.sj.us:8443/rest/schedule/
create?
schedule={"name":"Schedule-1","rules":
[{"frequency":"once","retain":"1w","time":13,"date":"12/5/2010"}]}
```

A Schedule with Several Rules

CLI

```
maprcli schedule create -schedule
'{"name":"Schedule-2","rules":
[{"frequency":"weekly","date":"sun","time":7,"retain":"2w"},
{"frequency":"daily","time":14,"retain":"1w"},
{"frequency":"hourly","retain":"1w"},
{"frequency":"yearly","date":"11/5","time":14,"retain":"1w"}]}'
```

REST

```
https://abc.sj.us:8443/rest/schedule/
create?
schedule={"name":"Schedule-1","rules":
[{"frequency":"weekly","date":"sun","time":7,"retain":"2w"},
{"frequency":"daily","time":14,"retain":"1w"},
{"frequency":"hourly","retain":"1w"},
{"frequency":"yearly","date":"11/5","time":14,"retain":"1w"}]}
```

schedule list

Lists the schedules on the cluster.

Syntax

CLI

```
maprcli schedule list
  [ -cluster <cluster> ]
  [ -output terse|verbose ]
  [ -sortby ]
```

REST

| | |
|--------------|---|
| Request Type | GET |
| Request URL | http[s]://<host>:<port>/rest/schedule/list[?<parameters>] |

Parameters

| Parameter | Description |
|-----------|--|
| cluster | The cluster on which to run the command. |
| output | Specifies whether the output should be terse or verbose. |
| sortby | Specifies one of the following attributes to sort the list of schedules by: scheduleid, schedulename, schedulerulefrequency, scheduleruledate, scheduleruletime, scheduleruleminutes, scheduleruleretaintime, scheduleinuse. By default, the list of schedules sorted by schedulename. |

Output

A list of all schedules on the cluster. See [Schedule Objects](#) for more information.

Sample Output

```
# maprcli schedule list
id  name          inuse  rules
1   Critical data  0      ...
2   Important data 0      ...
3   Normal data   0      ...
```

Examples

List schedules:

CLI

```
# maprcli schedule list -json
{
  "timestamp":1531004445284,
  "timeofday":"2018-07-07
04:00:45.284 GMT-0700 PM",
  "status":"OK",
  "total":4,
  "data":[
    {
      "id":4,
      "name":"Automatic Tiering
Scheduler",
```

```

        "inuse":0,
        "description":"Automatic
Scheduler for EC and Cold Tier: It
uses internal policies to schedule
the task",

}

```

schedule modify

Modifies an existing schedule, specified by ID. Permissions required: `fc` or `a`.

To find a schedule's ID:

1. Use the `schedule list` command to list the schedules.
2. Select the schedule to modify.
3. Pass the selected schedule's ID in the `-id` parameter to the `schedule modify` command.

Syntax

CLI

```

maprcli schedule modify
  [ -cluster <cluster> ]
  -id <schedule ID>
  [ -name <schedule name> ]
  [ -rules <JSON>]

```

REST

| | |
|--------------|--|
| Request Type | POST |
| Request URL | <code>http[s]://<host>:<port>/rest/schedule/modify?<parameters></code> |

Parameters

| Parameter | Description |
|-----------|---|
| cluster | The cluster on which to run the command. |
| id | The ID of the schedule to modify. |
| name | The new name of the schedule. |
| rules | A JSON object describing the rules for the schedule. If specified, replaces the entire existing rules object in the schedule. For information about the fields to use in the JSON object, see Rule Fields . |

Examples**Modify a schedule****CLI**

```
maprcli schedule modify -id 0 -name
Newname -rules
' [{"frequency": "weekly", "date": "sun", "
time": 7, "retain": "2w"},
{"frequency": "daily", "time": 14, "retain
": "1w"} ]'
```

REST

```
https://abc.sj.us:8443/rest/schedule/
modify?
id=0&name=Newname&rules=[{"frequency":
"weekly", "date": "sun", "time": 7, "retain
": "2w"},
{"frequency": "daily", "time": 14, "retain
": "1w"} ]
```

schedule remove

Removes a schedule.

A schedule can only be removed if it is not associated with any volumes. See [volume modify](#).

Syntax**CLI**

```
maprcli schedule remove
[ -cluster <cluster> ]
-id <schedule ID>
```

REST

| | |
|--------------|---|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/schedule/remove?<parameters> |

Parameters

| Parameter | Description |
|-----------|--|
| cluster | The cluster on which to run the command. |

| Parameter | Description |
|-----------|-----------------------------------|
| id | The ID of the schedule to remove. |

Examples

Remove schedule with ID 0:

CLI

```
maprcli schedule remove -id 0
```

REST

```
https://abc.sj.us:8443/rest/schedule/
remove?id=0
```

security

Configures security options.

genkey

Generates keys and certificates.

This command is for internal use only. You must use `configure.sh` with the `genkeys` option instead.

genticket

Generates tickets.

This command is for internal use only. You must use the [maprlogin](#) utility instead.

policy create

Describes how to create a security policy using the CLI.

Syntax

CLI

```
/opt/mapr/bin/maprcli security policy
create
        -name
<security-policy-name>
        [ -description
<description> ]
        [ -cluster cluster-name]
        [ -allowtagging true|
false ]
        [ -accesscontrol Armed|
Disarmed|Denied ]
        [ -auditenabled true|
false ]
        [ -dataauditops <+|-
operations>|all ]
        [ -wiresecurityenabled
true|false ]
        [ -readfileace <file
read ACE> ]
        [ -writefileace <file
write ACE> ]
        [ -executefileace <file
execute ACE> ]
        [ -readdirace
<directory read ACE> ]
        [ -addchildace
<directory add child ACE> ]
```

```

        [ -deletechildace
<directory delete child ACE> ]
        [ -lookupdirace
<directory lookup ACE> ]
        [ -readdbace <db cf
read ACE]> ]
        [ -writedbace <db cf
write ACE]> ]
        [ -traversedbace <db cf
traverse ACE> ]
        [ -readaces <file,
directory, db, streams ACE> ]
        [ -writeaces <file,
directory, db, streams ACE> ]

        [ -user
<user:permission,permission,...
user:permission,permission,...> ]
        [ -group
<group:permission,permission,...
group:permission,permission,...> ]

```

REST

| | |
|--------------|--|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/security/policy/create?<parameters> |

Parameters

| Parameter | Description |
|--------------|--|
| name | The name of this security policy. Security policy names must be unique within the cluster and must contain only alphanumeric characters, hyphen (-) and underscore (_). Other characters like space and commas are not allowed. Maximum length of the security policy name is 128 characters. This parameter is mandatory. |
| description | The description of the policy. The maximum length of the description is 128 characters. |
| cluster | The cluster name on which to run the command. This parameter is optional. The local cluster is the default cluster. |
| allowtagging | Allows or disallows tagging for the security policy. If set to <code>true</code> , this security policy can be used to tag HPE Ezmeral Data Fabric filesystem resources. When the security policy is first created, the <code>allowtagging</code> flag is set to <code>false</code> to give the administrator time to configure the security policy, before allowing users to tag HPE Ezmeral Data Fabric resources with this security policy. Default is <code>false</code> . |

| Parameter | Description |
|---------------|---|
| accesscontrol | <p>Determines whether the relevant ACEs in this security policy are enforced for HPE Ezmeral Data Fabric resources that are tagged with this security policy. The following settings are supported:</p> <ul style="list-style-type: none"> • Armed: When a HPE Ezmeral Data Fabric resource is tagged with this security policy, the relevant ACEs in this security policy are enforced when the resource is accessed. This is the normal operation mode. • Disarmed (default setting): Even if a HPE Ezmeral Data Fabric resource is tagged with this security policy, the ACEs in this security policy are NOT enforced. This setting can be used as an emergency switch when an incorrectly configured security policy denies authorized users from accessing resources. • Denied: Access is always denied to any HPE Ezmeral Data Fabric resources tagged with this security policy. Use this setting for security policies that are no longer in use, but are still tagged to some HPE Ezmeral Data Fabric resources. Administrators can look at the audit logs to determine the root cause. |
| auditenabled | <p>Specifies whether or not to enable auditing for this policy. Set to <code>true</code> to enable auditing, and <code>false</code> to disable auditing.</p> <p>Default: <code>false</code>.</p> |

| Parameter | Description |
|---------------------|---|
| dataauditops | <p>The comma separated list of filesystem operations to include (specified with a preceding plus sign (+)), or exclude (specified with a preceding minus sign (-)) from auditing.</p> <p>To exclude the first operation in the list of operations from auditing, precede the operation by two minus (--) signs. Precede subsequent operations to exclude by only a single minus (-) sign, irrespective of whether the first operation was included (using a plus (+) sign) or excluded (using two minus (--) signs). If neither sign is specified, the given operation is included for auditing.</p> <p>The operations that can be included (+) or excluded (-) from auditing are listed in Auditing Data-Access Operations. Alternatively, you can group all the operations using the keyword all, which:</p> <ul style="list-style-type: none"> • If included (+), cannot be specified with a list of other included operations. • If excluded (-), cannot be specified with a list of other excluded operations. <p>All specified operations must either be included or excluded from auditing. You cannot specify a mixed list of included and excluded operations. Other than the specified operations, by default, all other operations are:</p> <ul style="list-style-type: none"> • Included for auditing, if the specified list is a list of excluded operations. • Excluded from auditing, if the specified list is a list of included operations. |
| wiresecurityenabled | <p>Determines whether or not to perform wire-level encryption on the returned data. Set to <code>true</code> to enable wire-level encryption, and <code>false</code> to disable wire-level encryption.</p> <p>Default: <code>true</code> for secure clusters, <code>false</code> for insecure clusters.</p> |
| readfileace | <p>An ACE that controls who can read from this file. If you do not set an ACE, basic file permissions are used. Files created with basic file permissions have mode <code>0755</code>. Anyone can read the file contents. To read a file that is tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Read permission to the volume • Read permission to the file |
| writefileace | <p>An ACE that controls who can write to this file. If you do not set an ACE, basic file permissions are used. Files created with basic file permissions have mode <code>0755</code>. Only the owner can write to the file. To write to a file that is tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Write permission to the volume • Write permission to the file |

| Parameter | Description |
|----------------|---|
| executefileace | <p>An ACE that controls who can execute this file. If you do not set an ACE expression, basic file permissions are used. Files created with basic file permissions have mode 0755. Anyone can execute this file (assuming that the contents are executable). To execute a file that is tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Read permission to the volume • Read and execute permissions to the file |
| readdirace | <p>Controls who can read the contents of files in this directory. If you do not set an ACE, basic file permissions are used. Directories created with basic file permissions have mode 0755. Anyone can read the contents of files in this directory. To read the contents of a file in a directory tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Read permission to the volume • Read permission to the parent directory • Read permission to the file |
| addchildace | <p>Controls who can create objects (files and directories) in this directory. If you do not set an ACE, basic file permissions are used. Directories created with basic file permissions have mode 0755. By default, only the owner can create files and directories in this directory. To create files and directories in a directory tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Add child permission for the parent directory • Read and execute permissions to all directories in the path • Write permission to the parent directory, and • Write permission to the volume. |
| deletechildace | <p>Controls who can delete objects (files and directories) in this directory. If you do not set an ACE, basic file permissions are used. Directories created with basic file permissions have mode 0755. By default, only the owner can delete files and directories in this directory. To delete files and directories in a directory tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Delete child permission for the parent directory • Read and execute access to all directories in the path • Write permission to the parent directory • Write permission to the volume |

| Parameter | Description |
|---------------|---|
| lookupdirace | <p>Controls who can list the contents (files and directories) of this directory. If you do not set an ACE, basic file permissions are used. Directories created with basic file permissions have mode 0755. Anyone can list the files in this directory. To list the contents of a directory tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Read permission to the directory • Read permission to the volume |
| readdbace | <p>The ACE for <i>column reads</i>. Fields within the <i>column family</i> inherit this permission.</p> <p>Default: <code>u:creator</code>.</p> <p>To read fields in <i>JSON DB column families</i> tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Read permission to the DB column family • Read and execute permissions to all directories in the path • Read permission to the volume |
| writedbace | <p>The ACE for <i>column writes</i> (puts and deletes). Fields within the <i>column family</i> inherit this permission.</p> <p>Default: <code>u:creator</code>.</p> <p>To perform column writes, you must have the following permissions:</p> <ul style="list-style-type: none"> • Write permission to the DB column family • Read and execute permission to all directories in the path • Write permission to the parent directory • Write permission to the volume |
| traversedbace | <p>DB CF traverse permission settings, which determine the permission to pass over fields in JSON documents. Fields within the <i>column family</i> inherit this permission.</p> <p>Default: <code>u:creator</code>.</p> <p>To traverse fields in <i>JSON DB column families</i> tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Traverse permission to the DB column family • Read and execute permissions to all directories in the path • Read permission to the volume |

| Parameter | Description |
|-----------|--|
| readaces | A convenience option to set read permissions for all objects. This is equivalent to setting the same ACE for the readfileace, readdirace, lookupdirace, readdbase, and traversedbase options. |
| writeaces | A convenience option to set write permissions for all objects. This is equivalent to setting the same ACE for writefileace, addchildace, deletchildace, and writedbase options. |
| user | <p>Space separated list of <code>user:permission,permission</code> pairs. Use commas to separate each permission, and spaces to separate each user. For example, to give user <code>tom</code>, <code>admin (a)</code> and full control (<code>fc</code>) permissions, and user <code>jane</code>, <code>admin (a)</code> permission, use <code>-user tom:a,fc jane:a</code></p> <p>If you do not specify this option, a security policy level administrative ACL is added for the administrator who created this security policy to have full privileges by default, that is <code>[r,a,fc]</code>. However, another user with <code>admin (a)</code> privilege for this security policy can subsequently remove this privilege. Specifying this option overwrites the default setting to give security policy level privileges only to the users specified in the <code>-user</code> list.</p> <p> CAUTION: You must specify <code>admin (a)</code> privilege for at least one administrator (for example, <code>-user admin1:r,a,fc</code>) in addition to privileges for any other users to modify this security policy after creation. If the <code>-user</code> or <code>-group</code> options are specified but without <code>admin (a)</code> or full control (<code>fc</code>) permission, (for example, <code>-user operator:r</code>), only the <code>mapr</code> user can modify the security policy.</p> |
| group | Space separated list of <code>group:permission,permission</code> pairs. Use commas to separate each permission, and spaces to separate each group. For example, to give group operators <code>read (r)</code> permission, and group <code>secadmin</code> full control (<code>fc</code>) permission, use <code>-group operators:r secadmin:a,fc</code> |

policy export
Exports security policies.

Syntax

CLI

Use the `maprcli security policy export` command to export all security policies from the master node. You can then use the [policy import](#) on page 1966 command to import policies.

```
/opt/mapr/bin/maprcli security policy
export
```

REST

None

CLI

The `maprcli security policy export` command dumps the security policies to the standard output. Use redirection to redirect the output to a file. For example, the following command redirects output to the `/tmp/polfile` file.

```
/opt/mapr/bin/maprcli security policy
export > /tmp/polfile
```

REST

```
curl -u mapr:mapr -X GET -k "https://
host:8443/rest/security/policy/export
> /tmp/polfile
```

policy info

Display security policy information using the CLI.

Syntax

CLI

Use the `maprcli security policy info` command to display the details of the specified security policy.

```
/opt/mapr/bin/maprcli security policy
info
  -name policy name
  [ -cluster cluster name ]
  [ -output terse|verbose. Default:
verbose ]
  [ -columns <comma-separated list of
column names>. Default: all ]
  [ -expandaces true|false. Default:
false ]
```

REST

| | |
|--------------|--|
| Request Type | GET |
| Request URL | http[s]://<host>:<port>/rest/security/policy/info?<parameters> |

Parameters

| Parameter | Description |
|-----------|---|
| name | The name of the security policy. This parameter is mandatory. |
| cluster | The cluster name on which to run the command. This parameter is optional. The local cluster is the default cluster. |
| output | Specifies whether the output should be <code>terse</code> or <code>verbose</code> . Default: <code>verbose</code> |
| columns | A comma-separated list of fields to return in the query. See policy create on page 1955 for the list of column names. When issuing <code>maprcli security policy info -columns</code> and <code>maprcli security policy list -columns</code> commands, the column for the policy name is <code>name</code> . |

| Parameter | Description |
|------------|--|
| expandaces | Expand ACE into their respective fields for display. Default: false |

Examples

Display security policy information with the [ACE](#) information expanded.

CLI

```
/opt/mapr/bin/maprcli security policy
info -name TOPSECRET -expandaces
TRUE -json
{
  "timestamp":1555063260868,

```

policy import

Imports security policies.

Syntax

CLI

Use the `maprcli security policy import` command to import the exported security policies.

```

/opt/mapr/bin/maprcli security policy
import
  -filename fileName

```

REST

| | |
|--------------|--|
| Request Type | GET |
| Request URL | http[s]://<host>:<port>/rest/security/policy/import?<parameters> |

Parameters

| Parameter | Description |
|-----------|--|
| filename | The file that contains the policies to import. Policies are exported to this file when running the policy export on page 1963 command. |

CLI

```
/opt/mapr/bin/maprcli security
policy import -filename /tmp/
polfile
```

REST

```
curl -u mapr:mapr -X GET -k "https://
host:8443/rest/security/policy/import?
filename=/tmp/polfile"
```

policy list

List security policies using the CLI.

Syntax**CLI**

Use the following command to display the list of security policies. This command returns just the list of security policies that the user is allowed to view. Therefore, if there are a total of 10 security policies, but the administrative privileges only allow the user to view 6 of them, then this command returns the details of the 6 security policies.

For the 4 remaining security policies, this command returns just the name and ID fields:

```
/opt/mapr/bin/maprcli security policy
list
  [ -cluster cluster-name]
  [ -output terse|verbose. Default:
verbose]
  [ -start <start record number,
starting from 0>. Default: 0 ]
  [ -limit <limit>. Default:
2147483647 ]
  [ -filter <filters>. Default: none ]
  [ -columns <comma-separated list of
column names>. Default: all ]
  [ -sortby <sort field> ]
  [ -sortorder asc|desc ]
  [ -expandaces true|false. Default:
false ]
```

REST

| | |
|--------------|---|
| Request Type | GET |
| Request URL | <code>http[s]://<host>:<port>/rest/security/policy/list?<parameters></code> |

Parameters

| Parameter | Description | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------|---|-----------------------|-------------|-------------|---|------------|------|----|----------|-----------|----|-------|---------------|----|-------|-------------------|----|---------|---------------|----|--------------|-----------------------|----|--------------|---------------|----|---------------|----------------|
| cluster | The cluster name on which to run the command. This parameter is optional. The local cluster is the default cluster. | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| output | Specifies whether the output should be <code>terse</code> or <code>verbose</code> . Default: <code>verbose</code> | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| start | Starting record to return. Default: 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| limit | Number of rows to return, beginning at <code>start</code> . Default: 2147483647 ($2^{31} - 1$) | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| filter | A filter specifying the policies to display. The supported filters are as follows: <table border="1" data-bbox="820 1081 1461 1591"> <thead> <tr> <th>Abbreviated Name</th> <th>Filter Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>n</td> <td>policyname</td> <td>Name</td> </tr> <tr> <td>id</td> <td>policyid</td> <td>Policy ID</td> </tr> <tr> <td>ct</td> <td>ctime</td> <td>Creation time</td> </tr> <tr> <td>mt</td> <td>mtime</td> <td>Modification time</td> </tr> <tr> <td>ea</td> <td>audited</td> <td>Audit enabled</td> </tr> <tr> <td>ws</td> <td>wiresecurity</td> <td>Wire security enabled</td> </tr> <tr> <td>at</td> <td>allowtagging</td> <td>Allow tagging</td> </tr> <tr> <td>ac</td> <td>accesscontrol</td> <td>Access control</td> </tr> </tbody> </table> | Abbreviated Name | Filter Name | Description | n | policyname | Name | id | policyid | Policy ID | ct | ctime | Creation time | mt | mtime | Modification time | ea | audited | Audit enabled | ws | wiresecurity | Wire security enabled | at | allowtagging | Allow tagging | ac | accesscontrol | Access control |
| Abbreviated Name | Filter Name | Description | | | | | | | | | | | | | | | | | | | | | | | | | | |
| n | policyname | Name | | | | | | | | | | | | | | | | | | | | | | | | | | |
| id | policyid | Policy ID | | | | | | | | | | | | | | | | | | | | | | | | | | |
| ct | ctime | Creation time | | | | | | | | | | | | | | | | | | | | | | | | | | |
| mt | mtime | Modification time | | | | | | | | | | | | | | | | | | | | | | | | | | |
| ea | audited | Audit enabled | | | | | | | | | | | | | | | | | | | | | | | | | | |
| ws | wiresecurity | Wire security enabled | | | | | | | | | | | | | | | | | | | | | | | | | | |
| at | allowtagging | Allow tagging | | | | | | | | | | | | | | | | | | | | | | | | | | |
| ac | accesscontrol | Access control | | | | | | | | | | | | | | | | | | | | | | | | | | |
| columns | A comma-separated list of fields to return in the query. See the parameters for the list of column names. When issuing <code>maprcli security policy info -columns</code> and <code>maprcli security policy list -columns</code> commands, the column for the policy name is <code>name</code> . | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| Parameter | Description | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--|---|-------------------------|------------|-------------|-----------------------------------|---|------|-------------------------------|----|-----------|------------------------------|----|---------------|-------------------------------|----|-------------------|---|----|---------------|--|----|-------------------------|---|----|---------------|---|----|---------------------|
| sortby | <p>The field on which the results should be sorted. You can use either of the two long names or the shortname. Valid values are:</p> <table border="1"> <thead> <tr> <th>Long Name</th> <th>Short Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>polycyname/ securitypolycyname</td> <td>n</td> <td>Name</td> </tr> <tr> <td>policyid/ securitypolicyid</td> <td>id</td> <td>Policy ID</td> </tr> <tr> <td>ctime/ securitypolycytime</td> <td>ct</td> <td>Creation time</td> </tr> <tr> <td>mtime/ securitypolycymtime</td> <td>mt</td> <td>Modification time</td> </tr> <tr> <td>audited/ securitypolicyauditdataaccess</td> <td>ea</td> <td>Audit enabled</td> </tr> <tr> <td>wiresecurity/ securitypolicywiresecurityenabled</td> <td>ws</td> <td>Wire encryption enabled</td> </tr> <tr> <td>allowtagging/ securitypolicyallowtagging</td> <td>at</td> <td>Allow tagging</td> </tr> <tr> <td>accesscontrol/ securitypolicyaccesscontrol</td> <td>ac</td> <td>Access control flag</td> </tr> </tbody> </table> | Long Name | Short Name | Description | polycyname/ securitypolycyname | n | Name | policyid/ securitypolicyid | id | Policy ID | ctime/ securitypolycytime | ct | Creation time | mtime/ securitypolycymtime | mt | Modification time | audited/ securitypolicyauditdataaccess | ea | Audit enabled | wiresecurity/ securitypolicywiresecurityenabled | ws | Wire encryption enabled | allowtagging/ securitypolicyallowtagging | at | Allow tagging | accesscontrol/ securitypolicyaccesscontrol | ac | Access control flag |
| Long Name | Short Name | Description | | | | | | | | | | | | | | | | | | | | | | | | | | |
| polycyname/ securitypolycyname | n | Name | | | | | | | | | | | | | | | | | | | | | | | | | | |
| policyid/ securitypolicyid | id | Policy ID | | | | | | | | | | | | | | | | | | | | | | | | | | |
| ctime/ securitypolycytime | ct | Creation time | | | | | | | | | | | | | | | | | | | | | | | | | | |
| mtime/ securitypolycymtime | mt | Modification time | | | | | | | | | | | | | | | | | | | | | | | | | | |
| audited/ securitypolicyauditdataaccess | ea | Audit enabled | | | | | | | | | | | | | | | | | | | | | | | | | | |
| wiresecurity/ securitypolicywiresecurityenabled | ws | Wire encryption enabled | | | | | | | | | | | | | | | | | | | | | | | | | | |
| allowtagging/ securitypolicyallowtagging | at | Allow tagging | | | | | | | | | | | | | | | | | | | | | | | | | | |
| accesscontrol/ securitypolicyaccesscontrol | ac | Access control flag | | | | | | | | | | | | | | | | | | | | | | | | | | |
| sortorder | The sort order. Valid values are <code>asc</code> (ascending) or <code>desc</code> (descending). | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| expandaces | Expand ACEs into their respective fields for display. Default: <code>false</code> | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Examples

Example 1

A user without administrative privileges can only view the security policy name and ID. In the following example, there are 2 security policies `pci` and `hipaa`. `test1` is a user with a regular user ticket, but without administrative privileges. This user can only view the `name` and `id` fields of the security policies:

CLI

```
/opt/mapr/bin/maprcli security policy
list -json
{
  "timestamp":1548363754194,
  "timeofday":"2019-01-24
01:02:34.194 GMT-0800 PM",
```

```

"status":"OK",
"total":2,
"data":[
  {
    "policyname":"pci",
    "policyid":1
  },
  {
    "policyname":"hipaa",
    "policyid":2
  }
]
}

```

REST

```

curl -u mapr:mapr -X GET -k "https://
host:8443/rest/security/policy/list"
{"timestamp":1548363754194,"timeofday"
:"2019-01-24 01:02:34.194 GMT-0800
PM","status":"OK","total":2,"data":
[{"policyname":"pci","policyid":1},
{"policyname":"hipaa","policyid":2}]}

```

Example 2

List the policies sorted by their name. You can use either of the two `sortby` long names parameters, or the `shortname` parameter to sort the policies. In this example, the two policies are `MILITARY` and `TOPSECRET`. The policies are displayed in the ascending order of their name.

CLI

```

/opt/mapr/bin/maprcli security policy
list -sortby securitypolicyname -json
{
  "timestamp":1554957377267,
  "timeofday":"2019-04-10
09:36:17.267 GMT-0700 PM",
  "status":"OK",
  "total":2,
  "data":[
    {
      "policyname":"MILITARY",
      "policyid":2,
      "mtime":"Tue Apr 09
06:07:54 PDT 2019",
      "ctime":"Tue Apr 09
04:19:00 PDT 2019",
      "wiresecurity":"1",
      "audited":"0",
      "allowtagging":"1",

      "accesscontrol":"Disarmed",

      "enableddataauditoperations":"getattr,
setattr,chown,chperm,chgrp,getxattr,li
stxattr,setxattr,removexattr,read,writ
e,create,delete,mkdir,readdir,rmdir,cr

te,tablecfcreate,tablecfdelete,tablecf
modify,tablecfScan,tableget,tableput,t
ablescan,tablecreate,tableinfo,tablemo
dify,getperm,getpathforfid,hardlink,fi

```

```

lescan,fileoffload,filerecall,filetier
jobstatus,filetierjobabort,filetieroff
loadevent,filetierrecallevent",

"disableddataauditoperations":"","
    "acl":{
        "Principal":"User
root",
        "Allowed
actions":"[r, a, fc]"
    },
    "aces":{
        "writeaces":"u:user7
| u:user10"
    }
},
{
    "policyname":"TOPSECRET",
    "policyid":1,
    "mtime":"Mon Apr 08
22:33:52 PDT 2019",
    "ctime":"Mon Apr 08
22:33:52 PDT 2019",
    "wiresecurity":"1",
    "audited":"0",
    "allowtagging":"1",
    "accesscontrol":"Armed",

"enableddataauditoperations":"getattr,
setattr,chown,chperm,chgrp,getxattr,li
stxattr,setxattr,removexattr,read,writ
e,create,delete,mkdir,readdir,rmdir,cr

        },
        {
            "Principal":"User
user10",
            "Allowed
actions":"[a]"
        }
    ]
}
}

```

Now use the other long name parameter to see if you get the same result:

```
/opt/mapr/bin/maprcli security policy
list -sortby policyname -json
{
  "timestamp":1554957411992,
  "timeofday":"2019-04-10
09:36:51.992 GMT-0700 PM",
  "status":"OK",
  "total":2,
  "data":[
    {
      "policyname":"MILITARY",
      "policyid":2,
      "mtime":"Tue Apr 09
06:07:54 PDT 2019",
      "ctime":"Tue Apr 09
04:19:00 PDT 2019",
      "wiresecurity":"1",
      "audited":"0",
      "allowtagging":"1",

      "accesscontrol":"Disarmed",

      "enableddataauditoperations":"getattr,
setattr,chown,chperm,chgrp,getattr,li
stxattr,setxattr,removexattr,read,writ
e,create,delete,mkdir,readdir,rmdir,cr

```

Example 3

Display just the name of the policy and the access control state.

CLI

```
/opt/mapr/bin/maprcli security
policy list -columns
"policyname,accesscontrol"
accesscontrol  policyname
Armed          TOPSECRET
Disarmed       MILITARY
```

REST

```
curl -u mapr:mapr -X GET -k "https://
host:8443/rest/security/policy/list?
&sortby=securitypolicyname&columns=policyname,accesscontrol"
{"timestamp":1554959313985,"timeofday":
"2019-04-10 10:08:33.985 GMT-0700
PM", "status":"OK", "total":2, "data":
[{"policyname":"MILITARY", "accesscontrol":
"Disarmed"},
{"policyname":"TOPSECRET", "accesscontrol":
"Armed"}]}
```

Example 4

Use a filter to search for matching policy(ies):

CLI

```
/opt/mapr/bin/maprcli security policy
list -filter \[n!="TOP*" -json
{
  "timestamp":1554963795805,
  "timeofday":"2019-04-10
11:23:15.805 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "policyname":"TOPSECRET",
      "policyid":1,

REST

| | |
|--------------|--|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/security/policy/modify?<parameters> |

Parameters

You must specify either name or path, but not both.

| Parameter | Description |
|---------------|---|
| name | The name of this security policy. Security policy names must be unique within the cluster and must contain only alphanumeric characters, hyphen (-) and underscore (_). Other characters like space and commas are not allowed. Maximum length of the security policy name is 32 characters. This parameter is mandatory. |
| description | An ASCII string that gives a user-readable description of the policy. |
| cluster | The cluster name on which to run the command. If the cluster name is not supplied, the command is run on the current cluster. |
| allowtagging | Allows or disallows tagging for the security policy. If set to <code>true</code> , this security policy can be used to tag HPE Ezmeral Data Fabric filesystem resources. When the security policy is first created, the <code>allowtagging</code> flag is set to <code>false</code> to give the administrator time to configure the security policy, before allowing users to tag HPE Ezmeral Data Fabric resources with this security policy. Default is <code>false</code> . |
| accesscontrol | <p>Determines whether the relevant ACEs in this security policy are enforced for HPE Ezmeral Data Fabric resources that are tagged with this security policy. The following settings are supported:</p> <ul style="list-style-type: none"> • Armed: When a HPE Ezmeral Data Fabric resource is tagged with this security policy, the relevant ACEs in this security policy are enforced when the resource is accessed. This is the normal operation mode. • Disarmed (default setting): Even if a HPE Ezmeral Data Fabric resource is tagged with this security policy, the ACEs in this security policy are NOT enforced. Use this setting as an emergency switch when an incorrectly configured security policy denies authorized users from accessing resources. • Denied: Access is always denied to any HPE Ezmeral Data Fabric resources tagged with this security policy. Use this setting for security policies that are no longer in use, but are still tagged to some HPE Ezmeral Data Fabric resources. Administrators can look at the audit logs to determine the root cause. |
| auditenabled | <p>Specifies whether or not to audit operation on the resource on which the policy is tagged. Set to <code>true</code> to enable auditing, and <code>false</code> to disable auditing.</p> <p>Default: <code>false</code>.</p> |

| Parameter | Description |
|----------------------|---|
| dataauditops | <p>The comma separated list of filesystem operations to include (specified with a preceding plus sign (+)), or exclude (specified with a preceding minus sign (-)) from auditing.</p> <p>To exclude the first operation in the list of operations from auditing, you must precede the operation by two minus (--) signs. You must precede subsequent operations to exclude, by only a single minus (-) sign, irrespective of whether the first operation was included (using a plus (+) sign) or excluded (using two minus (--) signs). If neither sign is specified, the given operation is included for auditing.</p> <p>The operations that can be included (+) or excluded (-) from auditing are listed in Auditing Data Access Operations on page 665. You can, alternatively, group all the operations using the keyword all, which:</p> <ul style="list-style-type: none"> • If included (+), cannot be specified with a list of other included operations. • If excluded (-), cannot be specified with a list of other excluded operations. <p>All specified operations must either be included or excluded from auditing. You cannot specify a mixed list of included and excluded operations. Other than the specified operations, by default, all other operations are:</p> <ul style="list-style-type: none"> • Included for auditing, if the specified list is a list of excluded operations. • Excluded from auditing, if the specified list is a list of included operations. |
| disableddataauditops | <p>The comma-separated list of disabled filesystem audit operations to set. This is an alternate way of setting audit operations from the <code>dataauditops</code> option.</p> <p>No plus (+) or minus signs (-) are allowed for this option.</p> <p>Any audit operations specified with this option replace any existing disabled audit operations configured for this security policy, while any audit operations that are not specified, are enabled.</p> <p>Merging of the specified audit operations with existing audit operations is not done, as compared to the <code>dataauditops</code> option.</p> |
| wiresecurityenabled | <p>Determines whether or not to perform wire-level encryption for data of resource on which security is tagged. Set to <code>true</code> to enable wire-level encryption, and <code>false</code> to disable wire-level encryption.</p> <p>Default: <code>true</code> for secure clusters, <code>false</code> for insecure clusters.</p> |

| Parameter | Description |
|----------------|--|
| readfileace | <p>An ACE that controls who can read from this file. If you do not set an ACE, basic file permissions are used. Files created with basic file permissions have mode 0755. Anyone can read the file contents. To read a file that is tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Read permission to the volume • Read permission to the file |
| writefileace | <p>An ACE that controls who can write to this file. If you do not set an ACE, basic file permissions are used. Files created with basic file permissions have mode 0755. Only the owner can write to the file. To write to a file that is tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Write permission to the volume • Write permission to the file |
| executefileace | <p>An ACE that controls who can execute this file. If you do not set an ACE, basic file permissions are used. Files created with basic file permissions have mode 0755. Anyone can execute this file (assuming that the contents are executable). To execute a file that is tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Read permission to the volume • Read and execute permissions to the file |
| readdirace | <p>Controls who can read the contents of files in this directory. If you do not set an ACE, basic file permissions are used. Directories created with basic file permissions have mode 0755. Anyone can read the contents of files in this directory. To read the contents of a file in a directory tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Read permission to the volume • Read permission to the parent directory • Read permission to the file |

| Parameter | Description |
|----------------|--|
| addchildace | <p>Controls who can create objects (files and directories) in this directory. If you do not set an ACE, basic file permissions are used. Directories created with basic file permissions have mode 0755. By default, only the owner can create files and directories in this directory. To create files and directories in a directory tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Add child permission for the parent directory • Read and execute permissions to all directories in the path • Write permission to the parent directory, and • Write permission to the volume. |
| deletechildace | <p>Controls who can delete objects (files and directories) in this directory. If you do not set an ACE, basic file permissions are used. Directories created with basic file permissions have mode 0755. By default, only the owner can delete files and directories in this directory. To delete files and directories in a directory tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Delete child permission for the parent directory • Read and execute access to all directories in the path • Write permission to the parent directory • Write permission to the volume |
| lookupdirace | <p>Controls who can list the contents (files and directories) of this directory. If you do not set an ACE, basic file permissions are used. Directories created with basic file permissions have mode 0755. Anyone can list the files in this directory. To list the contents of a directory tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Read permission to the directory • Read permission to the volume |
| readdbace | <p>The ACE for <i>column reads</i>. Fields within the <i>column family</i> inherit this permission.</p> <p>Default: <code>u:creator</code>.</p> <p>To read fields in <i>JSON DB column families</i> tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Read permission to the DB column family • Read and execute permissions to all directories in the path • Read permission to the volume |

| Parameter | Description |
|---------------|---|
| writedbace | <p>The ACE for <i>column writes</i> (puts and deletes). Fields within the <i>column family</i> inherit this permission..</p> <p>Default: <code>u:creator</code>.</p> <p>To perform column writes, you must have the following permissions:</p> <ul style="list-style-type: none"> • Write permission to the DB column family • Read and execute permission to all directories in the path • Write permission to the parent directory • Write permission to the volume |
| traversedbace | <p>DB CF traverse permission settings, which determine the permission to pass over fields in JSON documents. Fields within the <i>column family</i> inherit this permission.</p> <p>Default: <code>u:creator</code>.</p> <p>To traverse fields in <i>JSON DB column families</i> tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Traverse permission to the DB column family • Read and execute permissions to all directories in the path • Read permission to the volume |
| readaces | <p>A convenience option to set read permissions for all objects. This is equivalent to setting the same ACE for the <code>readfileace</code>, <code>readdirace</code>, <code>lookupdirace</code>, <code>readdbace</code>, and <code>traversedbace</code> options.</p> |
| writeaces | <p>A convenience option to set write permissions for all objects. This is equivalent to setting the same ACE for <code>writefileace</code>, <code>addchildace</code>, <code>deletetechildace</code>, and <code>writedbace</code>, options.</p> |

| Parameter | Description |
|-----------|--|
| user | <p>Space separated list of <code>user:permission,permission</code> pairs. Use commas to separate each permission, and spaces to separate each user. For example, to give user <code>tom</code>, <code>admin (a)</code> and full control (<code>fc</code>) permissions, and user <code>jane</code>, <code>admin (a)</code> permission, use <code>-user tom:a,fc jane:a</code></p> <p>If you do not specify this option, a security policy level administrative ACL is added for the administrator who created this security policy to have full privileges by default, that is <code>[r,a,fc]</code>. However, any other user with <code>admin (a)</code> privilege for this security policy can remove this privilege . Specifying this option overwrites the default setting to give security policy level privileges only to the users specified in the <code>-user</code> list.</p> <p>Use this option with care. You MUST specify <code>admin (a)</code> privilege for at least one administrator (for example, <code>-user admin1:r,a,fc</code>) in addition to privileges for any other users, to modify this security policy after creation. Otherwise, if the <code>-user</code> or <code>-group</code> options are specified but without <code>admin (a)</code> or full control (<code>fc</code>) permission, (for example, <code>-user operator:r</code>), no one other than the <code>mapr</code> administrator can modify the security policy.</p> |
| group | <p>Space separated list of <code>group:permission,permission</code> pairs. Use commas to separate each permission, and spaces to separate each group. For example, to give group operators <code>read (r)</code> permission, and group <code>secadmin</code> full control (<code>fc</code>) permission, use <code>-group operators:r secadmin:a,fc</code></p> |

ACE Handling Behaviour

Specified [ACE](#) are merged with the existing [ACE](#) for the security policy. For example, assume there is a security policy `hipaa` that currently only has `readfileace` and `writefileace` specified, with all other [ACEs](#) not specified:

| ACE Type | ACE Value |
|---------------------------|----------------------|
| <code>readfileace</code> | <code>g:staff</code> |
| <code>writefileace</code> | <code>g:staff</code> |

Use the `maprcli security policy modify` command to set the `writefileace` and `addchildace` [ACE](#):

```
maprcli security policy modify -name hipaa -writefileace g:mapr -addchildace g:admin
```

Here, the value of `readfileace` remains as `g:staff`, `writefileace` is replaced by the new value `g:mapr`, and `addchildace` is added to the list of [ACE](#) for this security policy:

| ACE Type | ACE Value |
|---------------------------|--|
| <code>readfileace</code> | <code>g:staff</code> |
| <code>writefileace</code> | <code>g:mapr (overwrites older value)</code> |
| <code>addchildace</code> | <code>g:admin (new ACE)</code> |

Using the readaces convenience

The following example illustrates how to use the `readaces` convenience feature.

You create a security policy named `hipaa`, and set the `readfileace` and `writefileace` to `u:mapr`:

```
/opt/mapr/bin/maprcli security policy create -name hipaa -readfileace
u:mapr -writefileace u:mapr

/opt/mapr/bin/maprcli security policy info -name hipaa -json
{
  "timestamp":1548660146619,
  "timeofday":"2019-01-27 11:22:26.619 GMT-0800 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "name":"hipaa",
      "id":3,
      "mtime":"Sun Jan 27 23:22:08 PST 2019",
      "ctime":"Sun Jan 27 23:22:08 PST 2019",
      "wireEncrypt":true,
      "auditEnabled":false,
      "allowTagging":false,
      "accessControl":"Disarmed",

      "enabled_dataAuditOps":"getattr,setattr,chown,chperm,chgrp,getxattr,listxatt
r,setxattr,removexattr,read,write,create,delete,mkdir,readdir,rmdir,createsy
m,lookup,rename,createdev,truncate,tablecfcreate,tablecfdelete,tablecfmodify
,tablecfScan,tableget,tableput,tablescan,tablecreate,tableinfo,tablemodify,g
etperm,getpathforfid,hardlink,filesan,fileoffload,filerecall,filetierjobsta
tus,filetierjobabort,filetieroffloadevent,filetierrecallevnt",
      "disabled_dataAuditOps":"","",
      "acl":{
        "Principal":"User test1",
        "Allowed actions":"[r, a, fc]"
      },
      "securityPolicyAces":{
        "readfileace":"u:mapr",
        "writefileace":"u:mapr"
      }
    }
  ]
}
```

You use the `maprcli security policy modify` command to change all the read [ACE](#), using the `readaces` option. `readaces` replaces all read [ACE](#) (`executefileace`, `readfileace`, `lookupdirace`, `readdirace`, `readdbace`, `traversedbace`) with the specified [ACE](#), leaving the write [ACE](#) intact:

```
/opt/mpr/bin/maprcli security policy modify -name hipaa -readaces g:mapr

/opt/mapr/bin/maprcli security policy info -name hipaa -json
{
  "timestamp":1548660250167,
  "timeofday":"2019-01-27 11:24:10.167 GMT-0800 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "name":"hipaa",
      "id":3,
      "mtime":"Sun Jan 27 23:24:04 PST 2019",
      "ctime":"Sun Jan 27 23:22:08 PST 2019",
```

```

    "wireEncrypt":true,
    "auditEnabled":false,
    "allowTagging":false,
    "accessControl":"Disarmed",
    "enabled_dataAuditOps":"getattr,setattr,chmod,chperm,chgrp,getxattr,listxattr,
    setattr,removexattr,read,write,create,delete,mkdir,readdir,rmdir,createsy
    m,lookup,rename,createdev,truncate,tablecfcreate,tablecfdelete,tablecfmodify
    ,tablecfScan,tableget,tableput,tablescan,tablecreate,tableinfo,tablemodify,g
    etperm,getpathforfid,hardlink,filesan,fileoffload,filerecall,filetierjobsta
    tus,filetierjobabort,filetieroffloadevent,filetierrecallevent",
    "disabled_dataAuditOps":"","
    "acl":{
    "Principal":"User test1",
    "Allowed actions":"[r, a, fc]"
    },
    "securityPolicyAces":{
    "executeFileace":"g:mapr",
    "readFileace":"g:mapr",
    "lookupDirace":"g:mapr",
    "readdirace":"g:mapr",
    "writeFileace":"u:mapr",
    "readdbace":"g:mapr",
    "traversedbace":"g:mapr",
    }
    }
    ]
    }

```

Examples

CLI

For example, add the writeaces [ACE](#) setting to the existing security policy MILITARY:

```

/opt/mapr/bin/maprcli security policy
modify -name MILITARY -writeaces
"u:user7|u:user10" -json
{
  "timestamp":1554814308487,
  "timeofday":"2019-04-09
05:51:48.487 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[

  ],
  "messages":[
    "Successfully updated
security policy 'MILITARY'"
  ]
}

```

REST

```

curl -u mapr:mapr -X POST -k "https://
host:8443/rest/security/policy/modify?
name=MILITARY&writeaces=u%3auser7|
u%3auser10"
{"timestamp":1554815274740,"timeofday"
:"2019-04-09 06:07:54.740 GMT-0700
AM","status":"OK","total":0,"data":

```

```
[ ], "messages": ["Successfully updated security policy 'MILITARY'"]}]}
```

service list

Lists all services on the specified node, the memory allocated for each service, the state of each service, and log path for each service.

Syntax**CLI**

```
/opt/mapr/bin/maprcli service list
-node <node name>
[ -cluster <cluster name> ]
[ -zkconnect <ZooKeeper connect string> ]
[ -output terse|verbose ]
```

REST

| | |
|--------------|--|
| Request Type | GET |
| Request URL | http[s]://<host>:<port>/rest/service/list?<parameters> |

Parameters

| Parameter | Description |
|-----------|---|
| cluster | The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command. |
| node | The node for which to list services. Default: localhost. If this is not specified, the <code>/etc/hosts</code> file must include the IP address or hostname for the localhost. |
| output | Whether the output should be terse or verbose. Default: verbose. |
| zkconnect | A ZooKeeper connect string, which specifies a list of the hosts running ZooKeeper, and the port to use on each, in the format: ' <code><host>[:<port>][,<host>[:<port>]...]</code> '. To obtain zookeeper connection strings, use the <code>maprcli node listzookeepers</code> command. |

Output Fields

| Field | Description |
|-------------|--|
| name | Service name. |
| state | Current state of the service. See Service States on page 1988. |
| logpath | Path to the log files for the service. |
| displayname | Display name of the service in the Control System. |

Service States

The following table lists the service states with their descriptions:

| State | Description |
|-------|--|
| 0 | Not configured. The package for the service is not installed and/or the service is not configured (<code>configure.sh</code> has not run). This state is also returned for all the services if you run the command without specifying a node. |
| 1 | Configured. The package for the service is installed and configured. |
| 2 | Running. The service is installed, started by the warden, and is currently running. |
| 3 | Stopped. The service is installed and <code>configure.sh</code> has run, but the service is not running. |
| 4 | Failed. The service is installed and configured, but not running. |
| 5 | Stand by. The service is installed and is in standby mode, waiting to take over in case of failure of another instance. |

Examples

CLI Example

The following output is an example of the service information returned when you run the `service list` command without specifying the node:

```
# /opt/mapr/bin/maprcli service list -json
{
  "timestamp":1555048050131,
  "timeofday":"2019-04-11 10:47:30.131 GMT-0700 PM",
  "status":"OK",
  "total":10,
  "data":[
    {
      "name":"fileserver",
      "state":0,
      "logpath":"/opt/mapr/logs/mfs.log",
      "displayname":"FileServer"
    },
    {
      "name":"resourcemanager",
      "state":0,
      "logpath":"/opt/mapr/hadoop/hadoop-2.7.4/logs",
      "displayname":"ResourceManager"
    },
    {
      "name":"filemigrate",
      "state":0,
      "logpath":"/opt/mapr/filemigrate/filemigrate-1.0.0/logs",
      "displayname":"FileMigrate"
    },
    {
      "name":"cldb",
      "state":0,
      "logpath":"/opt/mapr/logs/cldb.log",
      "displayname":"CLDB"
    }
  ],
}
```

```

    {
      "name": "nfs4",
      "state": 0,
      "logpath": "/opt/mapr/logs/nfs4/nfs4server.log",
      "displayname": "NFS4 Gateway"
    },
    {
      "name": "mastgateway",
      "state": 0,
      "logpath": "/opt/mapr/logs/mastgateway.log",
      "displayname": "MASTGatewayService"
    },
    {
      "name": "nodemanager",
      "state": 0,
      "logpath": "/opt/mapr/hadoop/hadoop-2.7.4/logs",
      "displayname": "NodeManager"
    },
    {
      "name": "gateway",
      "state": 0,
      "logpath": "/opt/mapr/logs/gateway.log",
      "displayname": "GatewayService"
    },
    {
      "name": "hoststats",
      "state": 0,
      "logpath": "/opt/mapr/logs/hoststats.log",
      "displayname": "HostStats"
    },
    {
      "name": "apiserver",
      "state": 0,
      "logpath": "/opt/mapr/apiserver/logs/apiserver.log",
      "displayname": "APIServer"
    }
  ]

```

REST Example

The following output is an example of the service information returned when you issue the `service list` REST API call, without specifying a node:

```

# curl -k -X GET 'https://abc.sj.us:8443/rest/service/list' --user mapr:mapr
{"timestamp":1529380971417,"timeofday":"2018-06-18
09:02:51.417 GMT-0700 PM","status":"OK","total":9,"data":
[{"name":"fileserver","state":0,"logpath":"/opt/
mapr/logs/mfs.log","displayname":"FileServer"},
{"name":"resourcemanager","state":0,"logpath":"/opt/mapr/
hadoop/hadoop-2.7.0/logs","displayname":"ResourceManager"},
{"name":"cldb","state":0,"logpath":"/opt/mapr/logs/
cldb.log","displayname":"CLDB"},{"name":"nfs4","state":0,"logpath":"/opt/
mapr/logs/nfs4/nfs4server.log","displayname":"NFS4
Gateway"},{"name":"mastgateway","state":0,"logpath":"/opt/
mapr/logs/mastgateway.log","displayname":"MASTGatewayService"},
{"name":"nodemanager","state":0,"logpath":"/opt/mapr/
hadoop/hadoop-2.7.0/logs","displayname":"NodeManager"},
{"name":"gateway","state":0,"logpath":"/opt/mapr/
logs/gateway.log","displayname":"GatewayService"},
{"name":"hoststats","state":0,"logpath":"/opt/mapr/

        "logpath": "/opt/mapr/apiserver/logs/apiserver.log",
        "displayname": "APIServer"
    }
]
}

```

REST Example

The following output is an example of the service information returned when you issue the `service list` REST API call, after specifying a node:

```

curl -k -X GET 'https://abc.sj.us:8443/rest/service/list' --user mapr:mapr
{"timestamp":1529380971417,"timeofday":"2018-06-18
09:02:51.417 GMT-0700 PM","status":"OK","total":9,"data":
[{"name":"fileserver","state":0,"logpath":"/opt/
mapr/logs/mfs.log","displayname":"FileServer"},
{"name":"resourcemanager","state":0,"logpath":"/opt/mapr/
hadoop/hadoop-2.7.0/logs","displayname":"ResourceManager"},
{"name":"cldb","state":0,"logpath":"/opt/mapr/logs/
cldb.log","displayname":"CLDB"},{"name":"nfs4","state":0,"logpath":"/opt/
mapr/logs/nfs4/nfs4server.log","displayname":"NFS4
Gateway"},{"name":"mastgateway","state":0,"logpath":"/opt/
mapr/logs/mastgateway.log","displayname":"MASTGatewayService"},
{"name":"nodemanager","state":0,"logpath":"/opt/mapr/
hadoop/hadoop-2.7.0/logs","displayname":"NodeManager"},
{"name":"gateway","state":0,"logpath":"/opt/mapr/
logs/gateway.log","displayname":"GatewayService"},
{"name":"hoststats","state":0,"logpath":"/opt/mapr/
logs/hoststats.log","displayname":"HostStats"},
{"name":"apiserver","state":0,"logpath":"/opt/mapr/apiserver/logs/
apiserver.log","displayname":"APIServer"}]}

```

Note: When you configure high availability for the ResourceManager, the status of the standby ResourceManager service differs based on the selected failover implementation. When the cluster uses manual or automatic failover for the ResourceManager, standby ResourceManagers have a state equal to 2 (running). When the cluster uses zero configuration failover for the ResourceManager, standby ResourceManagers have a state equal to 5 (stand by).

setloglevel

Sets log level on individual services.

setloglevel cldb

Sets the log level on the CLDB service. Permissions required: `fc` or `a`.

Syntax**CLI**

```
maprcli setloglevel cldb
  -classname <class>
  -loglevel DEBUG|ERROR|FATAL|INFO|
TRACE|WARN
  -node <node>
  -port <port>
```

REST

| | |
|--------------|--|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/setloglevel/cldb?<parameters> |

Parameters

| Parameter | Description |
|------------------|--|
| classname | The name of the class for which to set the log level. The class can be at the package level or a specific class. Contact MapR Support for this parameter. |
| loglevel | The log level to set. Default: INFO <ul style="list-style-type: none"> • DEBUG • ERROR • FATAL • INFO • TRACE • WARN |
| node | The node on which to set the log level. |
| port | The CLDB port. Default: 7222 |

Examples**CLI**

```
maprcli setloglevel cldb
  -classname
com.mapr.fs.cldb.CLDBServer
  -loglevel debug
  -node abc.sj.us
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/setloglevel/cldb?
classname=com.mapr.fs.cldb.CLDBServer&
loglevel=debug&node=abc.sj.us' --user
mapr:mapr
{"timestamp":1529380341288,"timeofday"
```

```
:"2018-06-18 08:52:21.288 GMT-0700
PM", "status": "OK", "total": 0, "data": []}
```

setloglevel fileserver

Sets the log level on the FileServer service. Permissions required: fc or a.

Syntax

CLI

```
maprcli setloglevel fileserver
  -classname <class>
  -loglevel DEBUG|ERROR|FATAL|INFO|
TRACE|WARN
  -node <node>
  -port <port>
```

REST

| | |
|--------------|--|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/setloglevel/fileserver?<parameters> |

Parameters

| Parameter | Description |
|-----------|--|
| classname | The name of the class for which to set the log level. The classname is listed under the maprcli trace info command. Contact MapR Support for this parameter. |
| loglevel | The log level to set. Default: INFO <ul style="list-style-type: none"> • DEBUG • ERROR • FATAL • INFO • TRACE • WARN |
| node | The node on which to set the log level. |
| port | The filesystem port. Default: 5660 |

Examples

CLI

```
maprcli setloglevel fileserver
  -classname FileServer
  -loglevel debug
  -node centos26.lab
```

REST

```
https://abc.sj.us:8443/rest/
setloglevel/fileserver?
classname=FileServer&loglevel=debug&no
de=centos26.lab
```

setloglevel hbmaster

Sets the log level on the HBase Master service. Permissions required: fc or a.

Syntax**CLI**

```
maprcli setloglevel hbmaster
  -classname <class>
  -loglevel DEBUG|ERROR|FATAL|INFO|
TRACE|WARN
  -node <node>
  -port <port>
```

REST

```
http[s]://<host>:<port>/rest/
setloglevel/hbmaster?<parameters>
```

Parameters

| Parameter | Description |
|------------------|--|
| classname | The name of the class for which to set the log level. The class can be specified at the package level or for a specific class. Contact MapR Support for this parameter. |
| loglevel | The log level to set. Default: INFO <ul style="list-style-type: none"> • DEBUG • ERROR • FATAL • INFO • TRACE • WARN |
| node | The node on which to set the log level. |
| port | The HBase Master webserver port. Default: 16000 (16010 for the WebUI) |

Examples**CLI**

```
maprcli setloglevel hbmaster
  -classname
  org.apache.hadoop.hbase.master
  -loglevel debug
```

```
-node centos26.lab
-port 16000
```

REST

```
https://centos26.lab:8443/rest/
setloglevel/hbmaster?
classname=org.apache.hadoop.hbase.mast
er&loglevel=debug&node=centos26.lab&po
rt=16000
```

setloglevel hbregionserver

Sets the log level on the HBase RegionServer service. Permissions required: fc or a.

Syntax

CLI

```
maprcli setloglevel hbregionserver
-classname <class>
-loglevel DEBUG|ERROR|FATAL|INFO|
TRACE|WARN
-node <node>
-port <port>
```

REST

```
http[s]://<host>:<port>/rest/
setloglevel/hbregionserver?
<parameters>
```

Parameters

| Parameter | Description |
|------------------|--|
| classname | The name of the class for which to set the log level. The class can be specified at the package level or for a specific class. Contact MapR Support for this parameter. |
| loglevel | The log level to set. Default: INFO <ul style="list-style-type: none"> • DEBUG • ERROR • FATAL • INFO • TRACE • WARN |
| node | The node on which to set the log level. |
| port | The HBase Region Server webserver port. Default: 16020 (16030 for the WebUI) |

Examples

CLI

```
maprcli setloglevel hbregionserver
  -classname
  org.apache.hadoop.hbase.regionserver
  -loglevel debug
  -node centos26.lab
  -port 16020
```

REST

```
https://centos26.lab:8443/rest/
setloglevel/hbregionserver?
classname=org.apache.hadoop.hbase.regi
onserver&loglevel=debug&node=centos26.
lab&port=16020
```

setloglevel nfs

Sets the log level on the NFS service. Permissions required: *fc* or *a*.

Syntax

CLI

```
maprcli setloglevel nfs
  -classname <class>
  -loglevel DEBUG|ERROR|FATAL|INFO|
TRACE|WARN
  -node <node>
  -port <port>
  -isusermode <TRUE|FALSE>
```

REST

| | |
|--------------|---|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/setloglevel/nfs?<parameters> |

Parameters

| Parameter | Description |
|------------------|--|
| classname | The name of the class for which to set the log level. The classname is listed under the <code>maprcli trace info</code> command. Contact MapR Support for this parameter. |
| loglevel | The log level to set. Default: INFO <ul style="list-style-type: none"> • DEBUG • ERROR • FATAL • INFO • TRACE • WARN |

| Parameter | Description |
|------------|---|
| node | The node on which to set the log level. |
| port | The NFS port. Default: 9998 |
| isusermode | Whether or not is the request is for user mode. |

Examples

CLI

```
maprcli setloglevel nfs
  -classname NFSD
  -loglevel debug
  -node centos26.lab
```

REST

```
https://abc.sj.us:8443/rest/
setloglevel/nfs?
classname=NFSD&loglevel=debug&node=centos26.lab
```

stream

Manages stream functionality.

stream assign list

For the given stream, lists consumers and the topics and partitions that the consumers are reading messages from.

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) on the volume
- [lookupdir](#) on directories in the path
- `adminperm`, `consumeperm`, `produceperm`, or `topicperm` permission on the stream

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Event Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|------|---|
| CLI | <pre>maprcli stream assign list -path <Stream Path > [-consumergroup <Consumer Group ID>] [-topic <Topic Name>] [-partition <Partition ID>] [-detail <Detail Parameter takes no value>]</pre> |
| REST | <code>http[s]://<host>:<port>/rest/stream/assign/list?path=<path></code> |

Parameters

| Parameter | Description |
|-----------|----------------------------------|
| path | The path and name of the stream. |

| Parameter | Description |
|---------------|--|
| consumergroup | Specifies the ID of a particular consumer group that you want to list the consumers for. |
| topic | The name of a topic to list the consumers for. If you also specify the <code>-partition</code> parameter, only the consumers that are reading from the indicated partition are listed. |
| partition | The ID of a specific partition. If you specify this ID, you must also use the <code>-topic</code> parameter. |
| detail | Includes the values of additional parameters in the output. These parameters are used internally. |

Sample Output

With the `-detail` parameter:

```
# maprcli stream assign list -path /s1 -json -detail
{
  "timestamp":1441965109585,
  "timeofday":"2015-09-11 02:51:49.585 GMT-0700",
  "status":"OK",
  "total":1,
  "data":[
    {
      "consumergroup":"xyzt1",
      "topic":"topic1",
      "assignseqnum":1,
      "consumerguid":"F3693413-2600-0876-CC91-052FA4F25500",
      "consumer":"ravindra.perf",
      "consumerip":"10.10.30.200",
      "consumerpid":"30768",
      "assignment":"0,1,2,3"
    }
  ]
}
```

Without the `-detail` parameter:

```
# maprcli stream assign list -path /s1 -json
{
  "timestamp":1441965116100,
  "timeofday":"2015-09-11 02:51:56.100 GMT-0700",
  "status":"OK",
  "total":1,
  "data":[
    {
      "consumergroup":"xyzt1",
      "topic":"topic1",
      "consumer":"ravindra.perf",
      "consumerip":"10.10.30.200",
      "consumerpid":"30768",
      "assignment":"0,1,2,3"
    }
  ]
}
```

Field Descriptions

consumergroup

The name of the consumer group that is reading messages from this topic partition.

| | |
|---------------------------|--|
| <code>topic</code> | The name of the topic. |
| <code>assignseqnum</code> | The sequence number of the current assignment of this partition. This value is used internally. |
| <code>consumerguid</code> | The globally unique identifier for the consumer. This value is used internally. |
| <code>consumer</code> | The ID of the consumer. This value is set with the <code>client.id</code> configuration parameter. |
| <code>consumerip</code> | The IP address of the consumer. |
| <code>consumerpid</code> | The process ID of the consumer. |
| <code>assignment</code> | The index numbers of the partitions that are assigned to this consumer. |

stream create

Creates a new stream.

After you create a stream, you can edit the values of its parameters with the command `maprcli stream edit`.

To see the value of a stream's parameters, use the command `maprcli stream info`.

To run this command, your user ID must have write permission on the directory in which you want to create a stream.

Permissions Required

To run this command, your user ID must have the following permissions:

- readAce and writeAce on the volume
- lookupdir on directories in the path

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Event Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|------|---|
| CLI | <pre> maprcli stream create -path <Stream Path> [-ttl <Time to live in second> default:604800] [-autocreate <Auto create topics> default:true] [-defaultpartitions <Default partitions per topic> default:1] [-compression off lz4 lzf zlib. default: inherit from parent directory] [-produceperm <Producer access control expression> default u:creator] [-consumeperm <Consumer access control expression> default u:creator] [-topicperm <Topic CRUD access control expression> default u:creator] [-copyperm <Stream copy access control expression> default u:creator] [-adminperm <Stream administration access control expression> default u:creator] [-copymetafrom <Stream to copy attributes from> default:none] [-ischangelog <true false> default: false] [-defaulttimestamp type timestamp type: createtime logappendtime. default: createtime] [-pidexpirysecs <Producer ID expiry time in seconds. Default: 6048000>] [-mincompactionlag <Set time in melliseconds for which a message remains uncompactd. Default: 0>] [-deleteretention <Set the time in milliseconds for which delete records are retained. Default: 86400000>] </pre> |
| REST | http[s]://<host>:<port>/rest/stream/create?path=<path> |

Parameters

| Parameter | Description |
|------------|--|
| path | <p>The path and name of the stream to create.</p> <p>The path to the stream can include any character allowed by MapR. For example, /my/path/with:/to/mystream is valid, but /my/path/with:/to/mystream:withcolon is invalid.</p> <p>The name of the stream cannot include a colon (:) or a forward slash (/).</p> |
| ttl | <p>Specifies the number of seconds to elapse between the publication of a message in a topic in this stream and the expiration of that message.</p> <p>Consumers do not see messages that have expired.</p> <p>Messages that have expired are deleted during the next purge process. See Time-to-Live for Messages for details.</p> <p>A value of 0 causes messages to be retained indefinitely.</p> |
| autocreate | <p>Specifies whether to create a topic automatically when a producer tries to write the first message to it. Values are true and false. The default is true.</p> |

| Parameter | Description |
|-------------------|--|
| defaultpartitions | Specifies the default number of partitions to allocate to new topics in the stream. |
| compression | <p>Specifies the compression setting to use for the stream. Producer client libraries can bundle messages that are to be published on the same partition and compress them. The messages are sent to the server compressed, are stored compressed, are replicated to other containers compressed, and (if stream replication is configured) replicated to replica streams compressed. Consumer client libraries receive compressed data, decompresses it, and passes it to client applications.</p> <p>Valid options are <code>off</code>, <code>lz4</code>, <code>lz4</code>, and <code>zlib</code>. The default setting is the type of compression that is set for the directory in which the stream is located.</p> <p>For more information, see Compression.</p> |
| produceperm | Specifies the access-control expression that controls who can publish messages to topics in the stream. See ACE Syntax . |
| consumeperm | Specifies the access-control expression that controls who can who can listen to topics in the stream. See ACE Syntax . |
| topicperm | Specifies the access-control expression that controls who can create, edit, or remove topics in the stream. See ACE Syntax . |
| copyperm | Specifies the access-control expression that controls who can use <code>mapr copystream</code> or <code>mapr diffstreams</code> on the stream. See ACE Syntax . |
| adminperm | <p>Determines which users can modify ACEs for a stream, set up replication of a stream, and modify other attributes of a stream. By default, the stream owner and the Data Fabric user can modify this setting. See ACE Syntax.</p> <p>This permission includes the <code>topicperm</code> permission.</p> |
| copymetafrom | If you plan to replicate messages to this stream from another stream, specify the path to that other stream. The metadata from that stream will be copied to the new stream when the new stream is created. |

| Parameter | Description |
|----------------------|---|
| ischangelog | <p>Specifies whether the stream is for the Change Data Capture feature's changed data records. Value: true false. Default: false.</p> <ul style="list-style-type: none"> If you want to use a non-default partition value (Default: 1) for the topic, use the <code>maprcli stream create -path </mypath/stream:topic> -ischangelog true -defaultpartitions < value other than 1 ></code> command to create the stream and then create the topic with the <code>maprcli streams topic create</code> command. If you want to use the default partitions value (1) for the Change Data Capture feature, use the <code>maprcli stream create -path </mypath/stream> -ischangelog true</code> command to create the stream and then use the <code>maprcli table changelog add -path </mypath/stream:topic></code> command to set up the Change Data Capture feature and create the topic. |
| defaulttimestamptype | <p>Specifies the type of timestamp stored in the topic's message. Value: createtime logappendtime Default: createtime. The topic inherits the default value from the stream unless the topic sets the timestamp type to a different value.</p> <p>A <code>createtime</code> value is the time defined by the user or application (when creating the message). If user or application does not define this value (or passes null), the client uses the current system timestamp.</p> <p>A <code>logappendtime</code> value is the time when the message (log) was appended to the server.</p> |
| pidexpirysecs | <p>Specifies the expiration time for the Producer ID. This parameter fixes the lifetime for the Producer ID. Default: 604800</p> |
| mincompactionlag | <p>Sets the minimum delay (in milliseconds) before which messages are not compacted. It is the minimum time that the messages are available for consumption. Beyond this time period, the messages may be compacted. Default: 0</p> <p>The lag is calculated from the time that a message was produced to the stream topic-partition.</p> <p> Note: Compaction is set only when you edit the stream. See stream edit on page 2006.</p> |
| deleteretention | <p>Sets the minimum time (in milliseconds) before which deleted records are removed. It is the minimum time that the deleted records are still available. Beyond this time period, the deleted messages may be removed. Default: 86400000</p> <p>Used with log compaction.</p> |

stream cursor delete

Deletes committed cursors that are in the partitions in a stream.

 **Note:** Deleting the committed cursors for active consumers has no effect on the consumers. Consumers use read cursors to keep track of where they currently are in partitions.

For example, the consumer `consumer1` continues reading the messages in a partition from the position of the consumer's read cursor even after the consumer's committed cursor is deleted. However, if `consumer1` goes offline and the partition is reassigned to another consumer (`consumer2`) in the same consumer group before `consumer1` creates another committed cursor, `consumer2` starts reading the partition at the most recent message.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `adminperm` or `consumeperm` permission on the stream

 **Note:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Event Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|-------------|--|
| CLI | <pre>maprcli stream cursor delete -path <Stream Path> [-consumergroup <Consumer Group ID>] [-topic <Topic Name>] [-partition <Partition ID>]</pre> |
| REST | <code>http[s]://<host>:<port>/rest/stream/cursor/delete?path=<path></code> |

Parameters

| Parameter | Description |
|----------------------------|---|
| <code>path</code> | The path and name of the stream in which the committed cursors are located. |
| <code>consumergroup</code> | Specifies the ID of a particular consumer group that you want to delete the committed cursors for. |
| <code>topic</code> | The name of a topic to delete committed cursors from. If you also specify the <code>-partition</code> parameter, only the committed cursors in the indicated partition are deleted. |
| <code>partition</code> | The ID of the partition where the committed cursors that you want to delete is located. If you specify this ID, you must also use the <code>-topic</code> parameter. |

stream cursor list

Lists the cursors for the consumers of a stream.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` on the volume

- `lookupdir` on directories in the path
- `adminperm`, `consumeperm`, `produceperm`, or `topicperm` permission on the stream

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Event Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|-------------|--|
| CLI | <pre>maprcli stream cursor list -path <Stream Path> [-consumergroup <Consumer Group ID>] [-topic <Topic Name>] [-partition <Partition ID>]</pre> |
| REST | <code>http[s]://<host>:<port>/rest/stream/cursor/list?path=<path></code> |

Parameters

| Parameter | Description |
|----------------------------|--|
| <code>path</code> | The path and name of the stream in which the cursors are located. |
| <code>consumergroup</code> | Specifies the ID of a particular consumer group that you want to list the cursors for. |
| <code>topic</code> | The name of a topic to list committed cursors from. If you also specify the <code>-partition</code> parameter, only the committed cursors in the indicated partition are listed. |
| <code>partition</code> | The ID of the partition where the particular cursor that you want to list is located. If you specify this ID, you must also use the <code>-topic</code> parameter. |

Sample Output

```
# maprcli stream cursor list -path /s1 -topic topic0 -json
{
  "timestamp":1441883091373,
  "timeofday": "2015-09-10 04:04:51.373 GMT-0700",

        "consumerlagmillis": "6313"
    },
]
}

```

Field Descriptions

| | |
|--------------------------|--|
| consumergroup | The ID of the consumer group to which belongs the consumer that owns the committed cursor. |
| committedoffset | The last offset that was committed by the consumer that is reading from the listed partition and that belongs to the listed consumer group. |
| consumerlagmillis | The difference in milliseconds between the timestamp of the last published message and the timestamp of the last message consumed by the consumer. |
| consumertimestamp | The timestamp of the most recent message that the consumer has consumed. |
| partitionid | The index number of the partition within the topic. The first partition in a topic has an index of 0, the next partition an index of 1, and so on. |
| produceroffset | The maximum offset produced for this partition. |
| topic | The name of the topic that the cursor corresponds to. |
| stream delete | Deletes the specified stream. Deleted streams cannot be recovered unless they were previously replicated. Producers are no longer able to publish messages to topics in the stream, and consumers are no longer able to read messages from topics in the stream. |

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume
- [lookupdir](#) on directories in the path

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Event Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|------|---|
| CLI | <pre>maprcli stream delete -path <Stream Path></pre> |
| REST | <code>http[s]://<host>:<port>/rest/stream/delete?path=<path></code> |

Parameters

| Parameter | Description |
|-------------------|--|
| <code>path</code> | The path and name of the stream to delete. |

`stream edit`

Edits the values of parameters for the specified stream.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `adminperm` permission on the stream

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Event Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|------|---|
| CLI | <pre> maprcli stream edit -path Stream Path [-ttl <Time to live in seconds>] [-autocreate true false] [-defaultpartitions <Default partitions per topic>] [-compression off lz4 lzf zlib] [-produceperm <Producer access control expression> default u:creator] [-consumeperm <Consumer access control expression> default u:creator] [-topicperm <Topic CRUD access control expression> default u:creator] [-copyperm <Stream copy access control expression> default u:creator] [-adminperm <Stream administration access control expression> default u:creator] [-defaulttimestamptype timestamp type: createtime logappendtime. default: createtime] [-compact <Sets log compaction for a stream. Value: true false default: false>] [-pidexpirysecs <Producer ID expiry time in seconds. Default: 604800>] [-mincompactionlag <Sets time in milliseconds for which a message remains uncompactd. default: 0>] [-deleteretention <Sets the time in milliseconds for which delete records are retained. Default: 86400000>] [-force <When used with -compact, forces enabling log compaction on a stream. Parameter takes no value.>] </pre> |
| REST | http[s]://<host>:<port>/rest/stream/edit?path=<path> |

Parameters

| Parameter | Description |
|-------------------|--|
| path | The path and name of the stream to create. |
| ttl | <p>Specifies the number of seconds to elapse between the publication of a message in a topic in this stream and the expiration of that message.</p> <p>Consumers do not see messages that have expired.</p> <p>Messages that have expired are deleted during the next purge process. See Time-to-Live for Messages for details.</p> <p>A value of 0 causes messages to be retained indefinitely.</p> |
| autocreate | Specifies whether to create a topic automatically when a producer tries to write the first message to it. Values are <code>true</code> and <code>false</code> . The default is <code>true</code> . |
| defaultpartitions | Specifies the default number of partitions to allocate to new topics in the stream. |

| Parameter | Description |
|----------------------|--|
| compression | <p>Specifies the compression setting to use for the stream. Producer client libraries can bundle messages that are to be published on the same partition and compress them. The messages are sent to the server compressed, are stored compressed, are replicated to other containers compressed, and (if stream replication is configured) replicated to replica streams compressed. Consumer client libraries receive compressed data, decompresses it, and passes it to client applications.</p> <p>Valid options are <code>off</code>, <code>lzf</code>, <code>lz4</code>, and <code>zlib</code>. The default setting is the type of compression that is set for the directory in which the stream is located.</p> <p>For more information, see Compression.</p> |
| produceperm | Specifies the access-control expression that controls who can publish messages to topics in the stream. See ACE Syntax . |
| consumeperm | Specifies the access-control expression that controls who can who can listen to topics in the stream. See ACE Syntax . |
| topicperm | Specifies the access-control expression that controls who can create, edit, or remove topics in the stream. See ACE Syntax . |
| copyperm | Specifies the access-control expression that controls who can use <code>mapr copystream</code> or <code>mapr diffstreams</code> on the stream. See ACE Syntax . |
| adminperm | <p>Determines which users can modify ACEs for a stream, set up replication of a stream, and modify other attributes of a stream. By default, the stream owner and the Data Fabric user can modify this setting. See ACE Syntax.</p> <p>This permission includes the <code>topicperm</code> permission.</p> |
| defaulttimestamptype | <p>Specifies the type of timestamp stored in the topic's message. Value: <code>createtime</code> <code>logappendtime</code> Default: <code>createtime</code>. The topic inherits the default value from the stream unless the topic sets the timestamp type to a different value.</p> <p>A <code>createtime</code> value is the time defined by the user or application (when creating the message). If user or application does not define this value (or passes null), the client uses the current system timestamp.</p> <p>A <code>logappendtime</code> value is the time when the message (log) was appended to the server.</p> |
| pidexpirysecs | Specifies the expiration time for the Producer ID. This parameter fixes the lifetime for the Producer ID. Default: 604800 |
| compact | <p>Sets log compaction for stream. When set to true, enables log compaction. When set to false, disables log compaction.</p> <p>Value: <code>true false</code> Default: <code>false</code></p> <p> Note: A license is required to run the <code>-compact</code> option; otherwise, the command hangs. See Adding a License on page 854.</p> |
| mincompactionlag | <p>Sets the minimum delay (in milliseconds) before which messages are not compacted. It is the minimum time that the messages are available for consumption. Beyond this time period, the messages may be compacted. Default: 0</p> <p>The lag is calculated from the time that a message was produced to the stream topic-partition.</p> |
| deleteretention | <p>Sets the minimum time (in milliseconds) before which deleted records are removed. It is the minimum time that the deleted records are still available. Beyond this time period, the deleted messages may be removed. Default: 86400000</p> |

| Parameter | Description |
|-----------|---|
| force | Used with the <code>-compact</code> parameter to force log compaction on a stream parameter. No values are passed. Used for backward compatibility. |

stream info

Displays the values of the parameters of the specified stream.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` on the volume
- `lookupdir` on directories in the path
- `adminperm`

When a user with this permission runs the command, the output includes the access-control expressions for the `adminperm` and `topicperm` permissions.
- `produceperm, consumeperm, or topicperm`

When a user with one of these permissions runs the command, the output does not include any access-control expressions.

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Event Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|------|---|
| CLI | <code>maprcli stream info -path <Stream Path></code> |
| REST | <code>http[s]://<host>:<port>/rest/stream/info?path=<path></code> |

Parameters

| Parameter | Description |
|-----------|---|
| path | The path and name of the stream that you want to see information about. |

Sample Output

```
maprcli stream info -path /streamVol/stream1 -json
{
  "timestamp":1521233326943,
  "timeofday":"2018-03-16 01:48:46.943 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "path":"/streamVol/stream1",
      "physicalsize":57344,
      "logicalsize":32768,
      "numtopics":1,
      "defaultpartitions":1,
      "ttl":604800,
      "compression":"lz4",
      "autocreate":true,

```

```

        "produceperm": "u:root",
        "consumeperm": "u:root",
        "topicperm": "u:root",
        "copyperm": "u:root",
        "adminperm": "u:root",
        "ischangelog": false,
        "timestamptype": "createtime"
    }
]
}

```

stream purge

Runs the purge process, removing messages that are marked for deletion and reclaiming disk space.

For information about the purge process, see [Time-to-Live for Messages](#).

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Event Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `adminperm` permission on the stream

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Event Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|------|--|
| CLI | <pre>maprcli stream purge -path <Stream Path></pre> |
| REST | <code>http[s]://<host>:<port>/rest/stream/purge?path=<path></code> |

Parameters

| Parameter | Description |
|-------------------|---|
| <code>path</code> | The path and name of the stream to reclaim disk space from. |

stream replica add

Registers an existing stream as a replica of the specified stream.

Note: A license is required to run this command. Running this command without a license can cause the command to hang. See [Adding a License](#) on page 854.

Permissions Required at the Source Cluster

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume

- `lookupdir` on directories in the path
- `adminperm` and `copyperm` permissions on the source stream

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Event Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Permissions Required at the Target Cluster

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path

Syntax

| | |
|------|--|
| CLI | <pre>maprcli stream replica add -path <stream path> -replica <remote stream path> [-paused <start replication in paused state> default: false] [-throttle <throttle replication operations under load> default: false] [-networkencryption <enable on-wire encryption> default: false] [-synchronous <replicate to remote stream before acknowledging producers> default: false] [-networkcompression <on-wire compression type: off lz4 lzf zlib> default: compression setting on stream]</pre> |
| REST | <pre>http[s]://<host>:<port>/rest/stream/replica/add? path=<path>&replica=<name></pre> |

Parameters

| Parameter | Description |
|----------------------|--|
| <code>path</code> | The path and name of the stream that you want to create a replica for. |
| <code>replica</code> | The path and name of the stream that you want to create as a replica of the stream that you specified with the <code>-path</code> parameter. |

| Parameter | Description |
|--------------------|--|
| paused | <p>A boolean value that specifies whether to pause the replication so that it does not start immediately. The replication can be resumed using the replica resume command at a later time. The values are <code>true</code> or <code>false</code>. The default is <code>false</code>.</p> <p>Set <code>-paused</code> to <code>true</code> if you want to run <code>mapr copystream</code> to load the replica stream before starting replication. If it is not paused, replication starts immediately after you run the commands <code>maprcli stream replica add</code> and <code>maprcli stream upstream add</code>, in which case the replica stream starts empty and accumulates messages over time. If you are interested only in the messages that are published to the source stream after replication starts, then you do not need to pause replication initially. However, if you want the full set of messages from the source stream that have not yet been purged or marked for deletion, then pause replication initially.</p> |
| throttle | <p>A boolean value that specifies whether to throttle replication operations. Throttle the replication stream to minimize the impact of the replication process on incoming operations during periods of heavy load. The values are <code>true</code> or <code>false</code>. The default is <code>false</code>.</p> <p>Throttling has two effects, both of which allow HPE Ezmeral Data Fabric Event Streams to use more system resources to process new messages:</p> <ul style="list-style-type: none"> • Throttling slows down the rate at which changes to a stream are replicated. • Throttling slows down the rate at which messages to be replicated are read from disk. |
| networkencryption | <p>A boolean value that specifies whether or not to enable on-wire encryption. The values are <code>true</code> or <code>false</code>. The default is <code>false</code>. If you set the value to <code>true</code>, the local cluster and any other cluster that is part of the replication process must be enabled for security.</p> |
| synchronous | <p>A boolean value that specifies whether replication is synchronous or asynchronous. The values are <code>true</code> or <code>false</code>. The default is <code>false</code> and specifies asynchronous replication.</p> |
| networkcompression | <p>Specifies the type of compression to use when replicating messages. For more information, see Managing Compression.</p> |

stream replica autoseup

Sets up and starts replication between a source stream and replica stream.

The `maprcli stream replica autoseup` command performs the following steps to set up replication:

1. Creates a stream in the destination cluster.
2. Declares the new stream to be a replica of the source stream and ensures that replication does not begin immediately after the next step.
3. Declares the source stream as the original of the replica stream.

4. Runs the `mapr costream` utility to load a copy of the source data into the replica.
5. For multi-master replication, it declares the source stream to be a replica of the new stream and then declares the new stream to be an upstream source for the source stream.
6. Clears the paused replication state to start replication.

For more information about the automatic setup process, see [Replica Autosetup for Streams](#) on page 622.

Note: Before you set up replication for a stream, verify that the cluster is setup for replication. For more information, see [Preparing Clusters for Stream Replication](#) on page 1246.

Permissions Required at the Source Cluster

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `adminperm` and `copyperm` permissions on the source stream

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Event Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Permissions Required at the Target Cluster

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path

Syntax

| | |
|------|--|
| CLI | <pre>maprcli stream replica autosetup -path <stream path> -replica <remote stream path> [-synchronous <replicate to remote stream before acknowledging producers> default: false] [-multimaster <set up bi-directional replication> default: false] [-throttle <throttle replication operations under load> default: false] [-networkencryption <enable on-wire encryption> default: false] [-networkcompression <on-wire compression type: off lz4 lzf zlib> default: compression setting on stream] [-directcopy enable directcopy. default: true] [-useexistingreplica use existing replica table if present. default: false]</pre> |
| REST | <pre>http[s]://<host>:<port>/rest/stream/replica/autosetup? path=<path>&replica=<name></pre> |

Parameters

| Parameter | Description |
|---------------------------------|---|
| <code>path</code> | The path and name of the stream that you want to create a replica for. |
| <code>replica</code> | The path and name of the stream that you want to create as a replica of the stream that you specified with the <code>-path</code> parameter. |
| <code>synchronous</code> | A boolean value that specifies whether replication is synchronous or asynchronous. The values are <code>true</code> or <code>false</code> . The default is <code>false</code> and specifies asynchronous replication. |
| <code>multimaster</code> | A boolean value that specifies whether or not to set up a multi-master topology. The values are <code>true</code> or <code>false</code> . The default is <code>false</code> and specifies to use the basic primary-secondary topology, rather than the multi-master topology. |
| <code>throttle</code> | <p>A boolean value that specifies whether to throttle replication operations. Throttle the replication stream to minimize the impact of the replication process on incoming operations during periods of heavy load. The values are <code>true</code> or <code>false</code>. The default is <code>false</code>.</p> <p>Throttling has two effects, both of which allow HPE Ezmeral Data Fabric Event Streams to use more system resources to process new messages:</p> <ul style="list-style-type: none"> • Throttling slows down the rate at which changes to a stream are replicated. • Throttling slows down the rate at which messages to be replicated are read from disk. |
| <code>networkencryption</code> | A boolean value that specifies whether or not to enable on-wire encryption. The values are <code>true</code> or <code>false</code> . The default is <code>false</code> . If you set the value to <code>true</code> , the local cluster and any other cluster that is part of the replication process must be enabled for security. |
| <code>networkcompression</code> | Specifies the type of compression to use when replicating messages. For more information, see Managing Compression . |
| <code>directcopy</code> | A Boolean value that specifies whether or not autoseup will use the <code>directcopy</code> option. The values are <code>true</code> or <code>false</code> . Autoseup with <code>direct copy</code> (<code>true</code>) is the default. If you set this parameter to <code>false</code> , the cluster will run autoseup without the <code>directcopy</code> option. For more information, see Replica Autoseup for Streams on page 622. |
| <code>useexistingreplica</code> | When the <code>directcopy</code> parameter is set to <code>true</code> (default), this Boolean value specifies whether or not an existing stream can be used as the replica stream. The values for this parameter are <code>true</code> or <code>false</code> . No reuse of existing tables (<code>false</code>) is the default. If a stream exists with the specified name, and this parameter is set to <code>false</code> , the create stream operation will fail. |

stream replica edit

Modifies the way in which messages are replicated from one stream to another.

Permissions Required at the Source Cluster

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `adminperm` permission on the source stream

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Event Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Permissions Required at the Target Cluster

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path

Syntax

| | |
|------|---|
| CLI | <pre>maprcli stream replica edit -path <stream path> -replica <remote stream path> [-newreplica <renamed stream path>] [-throttle <throttle replication operations under load>] [-networkencryption <enable on-wire encryption>] [-synchronous <replicate to remote stream before acknowledging producers>] [-networkcompression <on-wire compression type: off lz4 lzf zlib>]</pre> |
| REST | <pre>http[s]://<host>:<port>/rest/stream/replica/edit? path=<path>&replica=<name></pre> |

Parameters

| Parameter | Description |
|-------------------------|--|
| <code>path</code> | The path and name of the stream that you want to create a replica for. |
| <code>replica</code> | The path and name of the stream that you want to create as a replica of the stream that you specified with the <code>-path</code> parameter. |
| <code>newreplica</code> | Specifies a new name to give to the replica stream. |

| Parameter | Description |
|--------------------|---|
| throttle | <p>A boolean value that specifies whether to throttle replication operations. Throttle the replication stream to minimize the impact of the replication process on incoming operations during periods of heavy load. The values are <code>true</code> or <code>false</code>. The default is <code>false</code>.</p> <p>Throttling has two effects, both of which allow HPE Ezmeral Data Fabric Event Streams to use more system resources to process new messages:</p> <ul style="list-style-type: none"> • Throttling slows down the rate at which changes to a stream are replicated. • Throttling slows down the rate at which messages to be replicated are read from disk. |
| networkencryption | <p>A boolean value that specifies whether or not to enable on-wire encryption. The values are <code>true</code> or <code>false</code>. The default is <code>false</code>. If you set the value to <code>true</code>, the local cluster and any other cluster that is part of the replication process must be enabled for security.</p> |
| synchronous | <p>A boolean value that specifies whether replication is synchronous or asynchronous. The values are <code>true</code> or <code>false</code>. The default is <code>false</code> and specifies asynchronous replication.</p> |
| networkcompression | <p>Specifies the type of compression to use when replicating messages. For more information, see Managing Compression.</p> |

stream replica list

Lists the replicas of a given stream.

Permissions Required on the Source Cluster

To run this command, your user ID must have the following permissions:

- `readAce` on the volume
- `lookupdir` on directories in the path
- `adminperm` permission on the source stream

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Event Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|------|--|
| CLI | <pre>maprcli stream replica list -path <stream path> [-refreshnow <immediately refresh replication statistics> default: false]</pre> |
| REST | <pre>http[s]://<host>:<port>/rest/stream/replica/list?path=<path></pre> |

Parameters

| Parameter | Description |
|------------|--|
| path | The path and name of the stream that you want to list the replicas of. |
| refreshnow | A boolean value that specifies whether to trigger an immediate update of the replica statistics. The values are true or false. By default, the value is false and the command lists the current version of the replica statistics, which could be a maximum of five minutes old. |

Sample with Output

```
# maprcli stream replica list -path /srcVol/srcStream -json
{
  "timestamp":1507758209755,
  "timeofday":"2017-10-11 02:43:29.755 GMT-0700",
  "status":"OK",
  "total":1,
  "data":[
    {
      "cluster":"my.cluster.com",
      "stream":"/destVol",
      "type":"MapRStream",
      "replicaPath":"/destVol",
      "replicaState":"REPLICA_STATE_CREATE_SCHEDULE",
      "paused":false,
      "throttle":false,
      "idx":1,
      "networkencryption":false,
      "synchronous":false,
      "networkcompression":"lz4",
      "propagateExistingData":false,
      "isUptodate":true,
      "minPendingTS":0,
      "maxPendingTS":0,
      "bytesPending":0,
      "bucketsPending":0,
      "copyTableCompletionPercentage":0,
    }
  ]
}
```

Data Fields

| Data Fields | Description |
|--------------|---|
| cluster | The cluster on which the replica stream resides. |
| stream | The path of the replica stream. |
| type | Identifies the type of table: HPE Ezmeral Data Fabric Database table or HPE Ezmeral Data Fabric Event Streams stream. |
| replicaPath | The replica location of the source stream. |
| replicaState | The replication state indicates when stream replication is in progress and it also displays the status of operations related to replica autoseup with directcopy. |
| paused | A Boolean values that specifies if replication is paused. |
| throttle | A Boolean value that specifies if replication is throttled. |

| Data Fields | Description |
|-------------------------------|--|
| idx | The index number of the replica stream. |
| networkencryption | A Boolean value that specifies if replication is encrypted. |
| synchronous | A Boolean value that specifies whether replication is synchronous or asynchronous. |
| networkcompression | The type of on-wire compression. |
| propagateExistingData | Used to identify whether existing data in a CDC table is propagated to stream topic. |
| isUptodate | A Boolean value that specifies if the replica is up-to-date. |
| minPendingTS | The epoch time in milliseconds of the oldest message that has yet to be replicated. |
| maxPendingTS | The epoch time in milliseconds of the newest message that has yet to be replicated. |
| bytesPending | The number of bytes that have yet to be replicated. |
| bucketsPending | The number of buckets that have yet to be replicated. |
| copyTableCompletionPercentage | <p>The percentage of data replication completed from the source stream to the destination stream.</p> <p> Note: When replicating HPE Ezmeral Data Fabric Database data, the copyTablePercentageCompletion data may re-adjust to a lower rate. This depends on table region (also referred to as tablets) splits and merges as well as the rate of incoming data to replicating data.</p> |

stream replica pause

Pauses replication from a *source* stream to a *replica* stream during autoseup and replication phases.

Permissions Required on the Source Cluster

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `adminperm` permission on the source stream

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Event Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|------|--|
| CLI | <pre>maprcli stream replica pause -path <stream path> -replica <remote stream path></pre> |
| REST | <pre>http[s]://<host>:<port>/rest/stream/replica/pause? path=<path>&replica=<name></pre> |

Parameters

| Parameter | Description |
|-----------|---|
| path | The path and name of the stream that is the source for the replica that you want to pause replication to. |
| replica | The path and name of the stream replica that you want to pause replication to. |

stream replica remove

Unregisters a stream as the replica of another stream.

Permissions Required on the Source Cluster

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume
- [lookupdir](#) on directories in the path
- `adminperm` permission on the source stream

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Event Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|------|---|
| CLI | <pre>maprcli stream replica remove -path <stream path> -replica <remote stream path></pre> |
| REST | <pre>http[s]://<host>:<port>/rest/stream/replica/remove? path=<path>&replica=<name></pre> |

Parameters

| Parameter | Description |
|-----------|---|
| path | The path and name of the stream that is the source for the replica that you want to remove. |
| replica | The path and name of the stream replica that you want to remove. |

stream replica resume

Resumes replication from one stream to another stream. Replication can be paused during autosetup and replication phases. When replication resumes, it continues from where it left off.

Permissions Required on the Source Cluster

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume
- [lookupdir](#) on directories in the path
- `adminperm` permission on the source stream

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Event Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|------|---|
| CLI | <pre>maprcli stream replica resume -path <stream path> -replica <remote stream path></pre> |
| REST | <pre>http[s]://<host>:<port>/rest/stream/replica/resume? path=<path>&replica=<name></pre> |

Parameters

| Parameter | Description |
|-----------|--|
| path | The path and name of the stream that is the source for the replica that you want to resume replicating to. |
| replica | The path and name of the stream replica that you want to resume replicating to. |

stream upstream add

Registers a stream as an upstream source for a given stream. For example, if you wanted to replicate messages from `Stream_A` to `Stream_B`, `Stream_A` would be the upstream source for `Stream_B`.

Permissions Required on the Target Cluster

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `adminperm` permission on the source stream

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Event Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|------|--|
| CLI | <pre>maprcli stream upstream add -path <stream path> -upstream <upstream stream path></pre> |
| REST | <pre>http[s]://<host>:<port>/rest/stream/upstream/add? path=<path>&upstream=<name></pre> |

Parameters

| Parameter | Description |
|-----------|---|
| path | The path and name of the stream that you want to specify a source stream for. |

| Parameter | Description |
|-----------|---|
| upstream | The path and name of the stream that you want to use as a source for the stream that you specified with the <code>-path</code> parameter. |

stream upstream list

Lists all of the streams that are replicating to a given stream.

Permissions Required on the Target Cluster

To run this command, your user ID must have the following permissions:

- `readAce` on the volume
- `lookupdir` on directories in the path
- `adminperm` permission on the source stream

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Event Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|------|--|
| CLI | <pre>maprcli stream upstream list -path <Stream Path></pre> |
| REST | <pre>http[s]://<host>:<port>/rest/stream/upstream/list?path=<path></pre> |

Parameters

| Parameter | Description |
|-----------|---|
| path | The path and name of the stream that you want to list the source streams for. |

Sample Output

```
# maprcli stream upstream list -path /dst -json
{
  "timestamp":1437992841303,
  "timeofday":"2015-07-27 03:27:21.303 GMT-0700",
  "status":"OK",
  "total":1,
  "data":[
    {
      "cluster":"my.cluster.com",
      "stream":"/src",
      "idx":1,
      "uuid":"3e98ee93-d88a-f3d6-bc80-001b02b65500"
    }
  ]
}
```

Field Descriptions

| | |
|--|---|
| <code>cluster</code> | The name of the MapR cluster in which the upstream stream is located. |
| <code>stream</code> | The name of the upstream stream. |
| <code>idx</code> | The index number of the upstream stream. |
| <code>uuid</code> | The upstream stream's universally unique identifier. |
| stream upstream remove | |
| Unregisters a stream as an upstream source for a given stream. | |

Permissions Required on the Target Cluster

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `adminperm` permission on the source stream

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Event Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|------|---|
| CLI | <pre>maprcli stream upstream remove -path <stream path> -upstream <upstream stream path></pre> |
| REST | <pre>http[s]://<host>:<port>/rest/stream/upstream/remove? path=<path>&upstream=<name></pre> |

Parameters

| Parameter | Description |
|-----------------------|--|
| <code>path</code> | The path and name of the stream that you want to remove a source stream from. |
| <code>upstream</code> | The path and name of the stream that you want to remove as a source for the stream that you specified with the <code>-path</code> parameter. |

stream topic create

Creates a topic in the specified stream.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `topicperm` permission on the stream

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Event Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|------|--|
| CLI | <pre>maprcli stream topic create -path <Stream Path> -topic <Topic Name> [-partitions <Number of partitions> default: attribute defaultpartitions on the stream] [-timestamptype Timestamp type: createtime logappendtime default: createtime]</pre> |
| REST | <code>http[s]://<host>:<port>/rest/stream/topic/create?path=<path>&topic=<name></code> |

Parameters

| Parameter | Description |
|------------|--|
| path | The path and name of the stream in which to create the topic. |
| topic | The name of the topic to create. A name can include alphanumeric characters and the period, underscore, and dash characters. |
| partitions | <p>The number of partitions to use for the topic. After you create the topic, you can increase the number of partitions, but you cannot reduce the number. The default number of partitions for new topics is set by the <code>defaultpartitions</code> parameter in the commands <code>maprcli stream create</code> and <code>maprcli stream edit</code>.</p> <p> Important: A CDC changelog stream's default partitions can impact how many partitions a stream topic can have. This is because once you create a stream topic for a changelog stream, the number of topic partitions is <i>locked</i>. The number of topic partitions cannot change.</p> <ul style="list-style-type: none"> • If the <code>stream topic create</code> command is used to create a stream topic, then the number of topic partitions can be set at creation time and then is <i>locked</i>. • If the table changelog add on page 2068 command is used to add a stream topic (as well as establish a relationship between the source table and the changelog stream), then the number of topic partitions is inherited from the changelog stream and is <i>locked</i>. |

| Parameter | Description |
|---------------|--|
| timestamptype | <p>Specifies the type of timestamp stored in the topic's message. Value: createtime logappendtime Default: createtime. The topic inherits the default value from the stream unless the topic sets the timestamp type to a different value.</p> <p>A createtime value is the time defined by the user or application (when creating the message). If user or application does not define this value (or passes null), the client uses the current system timestamp.</p> <p>A logappendtime value is the time when the message (log) was appended to the server.</p> |

stream topic delete

Deletes the specified topic from the specified stream.

Consumers do not have to stop consuming from a topic before the topic is deleted.

The deletion of the topic and the messages is immediate. However, the command also starts a background process for the purging the topic and messages to reclaim disk space.

If the parameter `-autocreate` for the stream is set to `true`, a topic with the same name is created if a producer writes a message to a topic of the same name. For example, if you delete the topic `Topic_A` and then a producer writes a message to the topic `Topic_A`, HPE Ezmeral Data Fabric Event Streams creates a topic that is named `Topic_A`. Aside from the name, the new topic `Topic_A` shares nothing with the deleted topic `Topic_A`.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `topicperm` permission on the stream

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Event Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|------|--|
| CLI | <pre>maprcli stream topic delete -path <Stream Path> -topic <Topic Name></pre> |
| REST | <code>http[s]://<host>:<port>/rest/stream/topic/delete?path=<path>&topic=<name></code> |

Parameters

| Parameter | Description |
|-----------|---|
| path | The path and name of the stream from which to delete the topic. |
| topic | The name of the topic to delete. |

stream topic edit

Allows you to increase the number of partitions that are in the specified topic.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `topicperm` permission on the stream

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Event Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|------|---|
| CLI | <pre>maprcli stream topic edit -path <Stream Path> -topic <Topic Name> [-partitions <Number of partitions>] [-timestamptype Timestamp type: createtime logappendtime default: createtime]</pre> |
| REST | <pre>http[s]://<host>:<port>/rest/stream/topic/edit? path=<path>&topic=<name>&partitions=<number></pre> |

Parameters

| Parameter | Description |
|--------------------|--|
| <code>path</code> | The path and name of the stream in which the topic is located. |
| <code>topic</code> | The name of the topic to edit. |

| Parameter | Description |
|---------------|--|
| partitions | <p>The number of partitions to use for the topic. You cannot reduce the number of partitions.</p> <p>To find out how many partitions a topic is currently using, run the command <code>maprcli stream topic info</code>.</p> <p> Important: A CDC changelog stream's default partitions can impact how many partitions a stream topic can have. This is because once you create a stream topic for a changelog stream, the number of topic partitions is <i>locked</i>. The number of topic partitions cannot change and the <code>stream topic edit</code> command can not modify the topic's partition number.</p> <ul style="list-style-type: none"> • If the <code>stream topic create</code> command is used to create a stream topic, then the number of topic partitions can be set at creation time and then is <i>locked</i>. • If the table changelog add on page 2068 command is used to add a stream topic (as well as establish a relationship between the source table and the changelog stream), then the number of topic partitions is inherited from the changelog stream and is <i>locked</i>. |
| timestamptype | <p>Specifies the type of timestamp stored in the topic's message. Value: <code>createtime</code> <code>logappendtime</code> Default: <code>createtime</code>. The topic inherits the default value from the stream unless the topic sets the timestamp type to a different value.</p> <p>A <code>createtime</code> value is the time defined by the user or application (when creating the message). If user or application does not define this value (or passes null), the client uses the current system timestamp.</p> <p>A <code>logappendtime</code> value is the time when the message (log) was appended to the server.</p> |

stream topic info

Lists information about a stream's topic, grouped by partition ID.

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) on the volume
- [lookupdir](#) on directories in the path
- `adminperm`, `consumeperm`, `produceperm`, or `topicperm` permission on the stream

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Event Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|------|--|
| CLI | <pre>maprcli stream topic info -path <Stream Path> -topic <Topic Name></pre> |
| REST | <pre>http[s]://<host>:<port>/rest/stream/topic/info?path=<path>&topic=<name></pre> |

Parameters

| Parameter | Description |
|-----------|---|
| path | The path and name of the stream for which you want to display information about topics. |
| topic | The name of the topic for which you want to display information. |

Sample Output

```
maprcli stream topic info -path /streamVol/stream1 -topic topic1 -json
{
  "timestamp":1521232252550,
  "timeofday":"2018-03-16 01:30:52.550 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "partitionid":0,
      "physicalsize":0,
      "logicalsize":0,
      "maxoffset":-1,
      "minoffsetacrossconsumers":0,
      "mintimestamp":"1969-12-31T04:00:00.000-0800 PM",
      "maxtimestamp":"1969-12-31T04:00:00.000-0800 PM",
      "mintimestampacrossconsumers":"1969-12-31T04:00:00.000-0800 PM",
      "fid":"2113.32.131400",
      "master":"doc24.lab:5660",
      "servers":"doc24.lab:5660",
      "timestamptype":"createtime",

      "logcompactionlaststarted":"1969-12-31T04:00:00.000-0800 PM",

      "logcompactionlastcompleted":"1969-12-31T04:00:00.000-0800 PM",
      "logcompactionstatus":"not started"
    }
  ]
}
```

Field Descriptions

| | |
|---------------------|--|
| partitionid | The index number of the partition within the topic. The first partition in a topic has an index of 0, the next partition an index of 1, and so on. |
| physicalsize | The physical size (in bytes) of the stream topic with data compression. |
| logicalsize | The logical size (in bytes) of the stream topic without data compression. |

| | |
|--|--|
| <code>maxoffset</code> | The maximum offset for this partition. |
| <code>minoffsetacrossconsumers</code> | All known consumers for this partition have consumed messages at least up to this offset. |
| <code>mintimestamp</code> | The timestamp of oldest message in the partition. |
| <code>maxtimestamp</code> | The timestamp of newest message in the partition. |
| <code>mintimestampacrossconsumers</code> | All known consumers for this partition have consumed messages older than this timestamp. |
| <code>fid</code> | The inode hosting the head of the partition. |
| <code>master</code> | <i>For use by MapR support:</i> The master server that is hosting the head of the partition. |
| <code>servers</code> | <i>For use by MapR support:</i> Lists all of the servers that are hosting the head of the partition. |
| <code>timestamptype</code> | The type of timestamp stored in the topic's message. Possible values: createtime (default) and logappendtime. |
| <code>logcompactionlaststarted</code> | Displays the last time log compaction was started if log compaction was enabled. The value is displayed in epoch time. This field displays when there is a change in the value for this field. |
| <code>logcompactionlastcompleted</code> | Displays the last time log compaction completed if log compaction was enabled. The value is displayed in epoch time. This field displays when there is a change in the value for this field. |
| <code>logcompactionstatus</code> | Displays whether log compaction was started or completed. |
| <code>stream topic list</code> | Lists the topics that are in a stream, as well as the number of partitions in each topic. |

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` on the volume
- `lookupdir` on directories in the path
- `adminperm`, `consumeperm`, `produceperm`, or `topicperm` permission on the stream

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Event Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|------|---|
| CLI | <pre>maprcli stream topic list -path <Stream Path></pre> |
| REST | <pre>http[s]://<host>:<port>/rest/stream/topic/list?path=<path></pre> |

Parameters

| Parameter | Description |
|-----------|--|
| path | The path and name of the stream for which you want to list the topics. |

Sample Output

```
# maprcli stream topic list -path /s1 -json
{
  "timestamp":1441882201851,
  "timeofday":"2015-09-10 03:50:01.851 GMT-0700",
  "status":"OK",
  "total":2,
  "data":[
    {
      "topic":"topic0",
      "partitions":4,
      "consumers":8,
      "physicalsize":148373504,
      "logicalsize":1009713152,
      "maxlag":6314
    },
    {
      "topic":"topic1",
      "partitions":4,
      "consumers":8,
      "physicalsize":148373504,
      "logicalsize":1009713152,
      "maxlag":6385
    }
  ]
}
```

table

Performs functions related to HPE Ezmeral Data Fabric Database tables.

table create

Creates a HPE Ezmeral Data Fabric Database binary or JSON table.

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume
- [lookupdir](#) on directories in the path

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|------|---|
| CLI | <pre> /opt/mapr/bin/maprcli table create -path <path> [-copymetafrom <path to source table>] [-copymetatype all cfs aces splits attrs] [-regionsizeMB <region size in MB>] [-autosplit true false] [-bulkload true false] [-audit true false] [-tabletype <Table Type - json or binary> default: binary] [-packperm <Pack Permission settings>] [-bulkloadperm <Bulk load Permission settings>] [-splitmergeperm <Split and Merge Permission settings>] [-createrenamefamilyperm <Add/Rename Family Permission settings>] [-deletefamilyperm <Delete Family Permission settings>] [-adminaccessperm <ACE Admin Permission settings>] [-replperm <Replication Admin Permission settings>] [-indexperm <ACE Admin Permission settings>] [-defaultversionperm <CF Versions Default Permission setting>] [-defaultcompressionperm <CF Compression Default Permission setting>] [-defaultmemoryperm <CF Memory Default Permission setting>] [-defaultreadperm <CF Read Default Permission setting>] [-defaultwriteperm <CF Write Default Permission setting>] [-defaulttraverseperm <CF Traverse Default Permission] [-defaultappendperm <CF Append Default Permission setting>] [-metricsinterval <metric interval setting>] [-securitypolicy <comma-delimited list of policies>] </pre> |
| REST | <pre> curl -k -X POST 'http[s]://<host>:<port>/rest/table/ create?path=<path>&<parameters>' -u <username>:<password> </pre> |

Parameters

| Parameter | Description |
|-----------|--|
| path | <p>The path to the new HPE Ezmeral Data Fabric Database table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code> For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code> <p> Note: You cannot use the following characters in the table name:</p> <pre data-bbox="924 716 1455 774">< > ? % \</pre> <p>To use the following characters in the table name, enclose them either in single or double quotes:</p> <pre data-bbox="857 879 1463 938">; () /</pre> <p>For example:</p> <pre data-bbox="857 1010 1463 1150">maprcli table create -path "/^=#; {}&()/" (or) maprcli table create -path '/^=#; {}&()/'</pre> <p>To use either the <code>'</code> or the <code>"</code> character in the table name, enclose:</p> <ul style="list-style-type: none"> the <code>'</code> character within double quotes (<code>"</code>) the <code>"</code> character within single quote (<code>'</code>) <p>For example:</p> <pre data-bbox="857 1398 1463 1539">maprcli table create -path "'^=#; {}&()/" (or) maprcli table create -path '"^=#; {}&()/'</pre> |

| Parameter | Description |
|--------------|--|
| copymetafrom | <p>The path to a table that contains the metadata that should be used to create the table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, if you want to copy metadata from a table named test under volume1 which has a mount point at /volume1, specify the following path: /volume1/test For a path on a remote cluster, you must also specify the cluster name in the path. For example, if you want to copy metadata from a table named test under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer |
| copymetatype | <p>The type of metadata to copy from the table identified in the copymetafrom parameter. You can specify one or more of the following options in a comma separated list:</p> <ul style="list-style-type: none"> all. Copy all metadata. This is the default. cfs. Copy column family metadata. aces. Copy ACE permissions. splits. Copy split keys. attrs. Copy table attributes. |
| regionsizeMB | <p>The average size of the regions into which HPE Ezmeral Data Fabric Database tries to split the table as the table grows. The default is 4096 MB. This value is ignored if autosplit is set to false.</p> <p>If autosplit is set to true, HPE Ezmeral Data Fabric Database splits a region when the size of the region exceeds 150% of the average value. For example, if the average value is 4096 MB, HPE Ezmeral Data Fabric Database splits a region that is larger than 6144 MB.</p> <p>Although splits are automatic, merges are not. For example, if the value of regionsizeMB is changed from 8 GB to 4 GB, all regions that are eligible are split automatically, if autosplit is set to true. However, if the value of regionsizeMB is changed from 2 GB to 4 GB, regions smaller than 4 GB are not automatically merged.</p> <p> Note: When a table has less than 4 regions, HPE Ezmeral Data Fabric Database ignores the regionsizeMB parameter and splits regions at a lower threshold.</p> |
| autosplit | <p>A Boolean value that specifies whether to split the table into regions automatically as the table grows. The average size of each region is determined by the regionsizeMB parameter.</p> <p>The default value is true. If you set the value to false, you can manually split tables into regions by using the table region split command.</p> |

| Parameter | Description |
|------------------------|--|
| bulkload | A Boolean value that specifies whether to allow a full bulk load of the table. The default is <code>false</code> . For more information, see Loading Data into Binary Tables on page 1144 and Loading Documents into JSON Tables on page 1140. |
| audit | Specifies whether to turn auditing on for the table. If auditing is also enabled at the cluster level with the <code>maprcli audit data</code> command and enabled for the current volume, setting this value to <code>true</code> causes auditing to start for the table. |
| tabletype | Specifies whether the table will be a binary table or a JSON table. The values are <code>binary</code> and <code>json</code> . The default is <code>binary</code> . |
| packperm | The ACE that controls who can pack table regions. By default, permission is given to the user ID that is used to create the table. |
| bulkloadperm | The ACE that controls who can load this table with bulk loads if the table was created with bulk load support. By default, permission is given to the user ID that is used to create the table. |
| splitmergeperm | The ACE that controls who can take the following actions: <ul style="list-style-type: none"> Run the <code>table region split</code> and <code>table region merge</code> commands to split the table into regions or to merge regions of the table together. Change the value of <code>regionsizemb</code>. By default, permission is given to the user ID that is used to create the table. |
| createrenamefamilyperm | The ACE that controls who can create column families for this table or rename existing column families. By default, permission is given to the user ID that is used to create the table. |
| deletefamilyperm | The ACE that defines access to delete column families for this table. Delimit the expression with single-quotation marks. By default, permission is given to the user ID that is used to create the table. |
| adminaccessperm | The ACE that controls who can view and edit the permissions for this table. By default, permission is given to the user ID that is used to create the table. |
| replperm | The ACE that controls who can set up replication either to or from a table. By default, permission is given to the user ID that is used to create the table. |
| indexperm | The secondary index Admin permissions setting that controls who can create an index associated with this table. By default, permission is given to the user ID that is used to create the table. |

| Parameter | Description |
|------------------------|---|
| defaultversionperm | <p>The default ACE for the version permission on new column families that are created in this table. If no value is specified, the default is u:<username of the table creator>. This value of the parameter <code>versionperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value.</p> <p> Note: This permission is not applicable to JSON tables. Versioning is not supported for JSON documents.</p> |
| defaultcompressionperm | <p>Applies to binary tables only: The default ACE for the compression permission on new column families that are created in this table. If no value is specified, the default is u:<username of the table creator>. This value of the parameter <code>compressionperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value.</p> |
| defaultmemoryperm | <p>The default ACE for the memory permission on new column families that are created in this table. If no value is specified, the default is u:<username of the table creator>. This value of the parameter <code>memoryperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value.</p> |
| defaultreadperm | <p>The default ACE for the read permission on new column families that are created in this table. If no value is specified, the default is u:<username of the table creator>. This value of the parameter <code>readperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value. See table cf create on page 2048 and table cf edit on page 2055</p> |
| defaultwriteperm | <p>The default ACE for the write permission on new column families that are created in this table. If no value is specified, the default is u:<username of the table creator>. This value of the parameter <code>writeperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value. See table cf create on page 2048 and table cf edit on page 2055</p> |
| defaulttraverseperm | <p>Applies to JSON tables only: The default Access Control Expression for the traverse permission on new column families. For more information about this permission, see Permission Types for Fields and Column Families in JSON Tables on page 1157.</p> |
| defaultappendperm | <p>Applies to binary tables only: The default ACE for the append permission on new column families that are created in this table. If no value is specified, the default is u:<username of the table creator>. This value of the parameter <code>appendperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value.</p> |

| Parameter | Description |
|-----------------|---|
| metricsinterval | <p>The metrics collection interval, in seconds, for the table. Possible values: 10, 60, 600 Default: 60 seconds</p> <p>When configured to 10 seconds, under normal workloads, the metrics are available in OpenTSDB in about 30 seconds. At an interval of 60 seconds, the metrics are available in about 90 seconds.</p> <p> Note: You cannot disable metrics collection for a table by setting the interval to 0.</p> |
| securitypolicy | <p>The security policy or policies that apply to the table. If the parameter is not specified during table creation, the default value is uninitialized ("[-]"), and there is no security policy for the table.</p> |

Example

Creates a HPE Ezmeral Data Fabric Database table named `newtable` in `volume1`:

| | |
|------|---|
| CLI | <pre>/opt/mapr/bin/maprcli table create -path /volume1/newtable</pre> |
| REST | <pre>curl -k -X POST \ 'https://rln1.sj.us:8443/rest/table/ create?path=%2Fvolume1%2Fnewtable' \ -u mapr:mapr</pre> |

`table cf`

Manages column families for HPE Ezmeral Data Fabric Database tables.

`table cf colperm get`

Lists the Access Control Expressions (ACEs) for a specified column.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` on the volume
- `lookupdir` on directories in the path
- `adminaccessperm` on the table

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
maprcli table cf colperm get
-path <path>
-cfname <column-family name>
```

```
[ -name <column name> ]
[ -json | -long ]
```

REST

```
curl -k -X GET
  'http[s]://<host>:<port>/rest/
table/cf/colperm/get?
path=<path>&cfname=<name>&name=<name>'

-u <username>:<password>
```

Parameters

| Parameter | Description |
|-----------|---|
| path | <p>The path to the table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under volume1 which has a mount point at /volume1, specify the following path: /volume1/test For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named test under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer |
| cfname | The name of the column family in which the column is located. |
| name | The name of the column that you want to list the ACEs for. If you do not specify the column name, the ACEs for all of the columns in the family are listed. |
| json | This command returns multiple levels of data. You must specify to display the output either in JSON or the "long" format to see the full set of information. |
| long | This command returns multiple levels of data. You must specify to display the output either in JSON or the "long" format to see the full set of information. |

Example

Lists ACEs for column coll in table mytable and column family cf1:

CLI

```
maprcli table cf colperm get -path /
mytable -cfname cf1 -name coll -long
```

REST

```
curl -k -X GET \
  'https://r1n1.sj.us:8443/
rest/table/cf/colperm/get?
path=%2Fmytable&cfname=cf1&name=coll'
\
-u mapr:mapr
```

table cf colperm set

Sets access control expressions (ACEs) for a specified column.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `adminaccessperm` on the table

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
/opt/mapr/bin/maprcli table cf
colperm set
  -path <path>
  -cfname <column-family name>
  -name <column name>
  [ -appendperm <Access Control
Expression for column appends> ]
  [ -readperm <Access Control
Expression for column reads> ]
  [ -writeperm <Access Control
Expression for column writes> ]
  [ -traverseperm <Access Control
Expression for column traversals in
JSON tables> ]
```

REST

```
curl -k -X POST
'http[s]://<host>:<port>/rest/
table/cf/colperm/set?
path=<path>&cfname=<name>&name=<name>&
<parameters>'
-u <username>:<password>
```

Parameters

| Parameter | Description |
|-------------------|---|
| path | <p>The path to the table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code> For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>test</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code> |
| cfname | The name of the column family in which the column is located. |
| name | <p>For binary tables: The name of the column for which you want to set the ACE.</p> <p>For JSON tables: The fieldpath of the field on which you want to set permissions. For example, if you wanted to grant <code>readperm</code> to a user on field <code>b</code> in the following document, the fieldpath would be <code>a.b</code>.</p> <pre>{ "a" : { "b" : "value_b" } }</pre> |
| appendperm | <p>Applies to binary tables only: The ACE for column appends. Use single quotation marks around the ACE.</p> <p>Column appends require permission both at the column-family level and at the column level.</p> |
| readperm | <p>The ACE for column reads. Use single quotation marks around the ACE.</p> <p>Reads require permission both at the column-family level and at the column level (for binary tables) or field level (for JSON tables). In JSON tables, this permission is inherited by fields within the column family.</p> |
| writeperm | <p>The ACE for column writes (puts and deletes). Use single quotation marks around the ACE.</p> <p>Writes require permission both at the column-family level and at the column level (for binary tables) or field level (for JSON tables). In JSON tables, this permission is inherited by fields within the column family.</p> |

| Parameter | Description |
|--------------|--|
| traverseperm | <p>Applies to JSON tables only: The Access Control Expressions that specifies who has permission to pass over fields in JSON documents. For example, suppose that a JSON table contains documents of this general structure:</p> <pre data-bbox="834 380 1451 632"> { "_id" : "ID", "a" : { "b" : "value", "c" : "value" } }</pre> <p>Suppose further that the user <code>sjohnson</code> has read permission on <code>a.b</code>, but not on <code>a</code>. For <code>sjohnson</code> to read <code>a.b</code>, the user needs the traverse permission on <code>a</code>. The user can then pass over field <code>a</code> to <code>a.b</code>.</p> <p>This permission is inherited by fields within the column family. By default, this permission is given to the value of <code>defaulttraverseperm</code> for the JSON table.</p> |

Example

Sets `readperm` ACE for column `col1` in table `mytable` and column family `cf1` :

CLI

```
/opt/mapr/bin/maprcli table cf
colperm set -path /mytable -cfname
cf1 -name col1 -readperm 'g:group1'
```

REST

```
curl -k -X POST \
'https://rln1.sj.us:8443/rest/
table/cf/colperm/set?
path=%2Fmytable&cfname=cf1&name=col1&r
eadperm="g:group1" ' \
-u mapr:mapr
```

table cf colperm delete

Deletes the Access Control Expressions (ACEs) for a specified column. Deletion cannot be undone.

Note: When a user, group, or role requests to read data from, write data to, or append data to a column, HPE Ezmeral Data Fabric Database checks whether that user, group, or role has read or write permission for the column family AND read or write permission for the column. For example, suppose user `i_montoya` tries to write data to columns `col1` and `col2` in column family `cf1`. HPE Ezmeral Data Fabric Database checks whether `i_montoya` has write permission on `cf1` AND `col1` AND `col2`. If `i_montoya` does not have all three permissions, HPE Ezmeral Data Fabric Database returns an error that says access for the write is denied.

If this user were to try to read from the same two columns, HPE Ezmeral Data Fabric Database would simply not return the data. If the user tried to read from those two columns and additional columns on which he had read permissions, the results would contain the data for those additional columns but exclude the data for `col1` and `col2`.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `adminaccessperm` on the table

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
maprcli table cf colperm delete
-path <path>
-cfname <column-family name>
-name <column name>
```

REST

```
curl -k -X POST
'http[s]://<host>:<port>/
rest/table/cf/colperm/delete?
path=<path>&cfname=<name>&name=<name>'
-u <username>:<password>
```

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameters

| Parameter | Description |
|---------------------|---|
| <code>path</code> | <p>The path to the table.</p> <ul style="list-style-type: none"> • For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code> • For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>test</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code> |
| <code>cfname</code> | The name of the column family in which the column is located. |
| <code>name</code> | The name of the column that you want to delete the ACEs for. |

Example

Deletes ACEs for column `col1` in table `mytable` and column family `cf1`:

CLI

```
maprcli table cf
colperm delete -path /mytable -cfname
cf1 -name coll
```

REST

```
curl -k -X POST \
'https://r1n1.sj.us:8443/
rest/table/cf/colperm/delete?
path=%2Fmytable&cfname=cf1&name=coll'
\
-u mapr:mapr
```

table cf column securitypolicy add

Adds one or more security policies to the existing list of policies associated with a field in a HPE Ezmeral Data Fabric Database JSON table.

Permissions Required

To run this command, your user ID must have the following permissions:

- adminaccessperm on the table

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|------|--|
| CLI | <pre>maprcli table cf column securitypolicy add -path <path> -cfname <column family name> -column <JSON table field> -securitypolicy <comma-delimited list of policies></pre> |
| REST | <pre>http[s]://<host>:<port>/rest/table/cf/ column/securitypolicy/add? path=<path>&cfname=<column-family-name>& column=<JSON-table-field>&securitypolicy =<policies></pre> |

Parameters

| Parameter | Description |
|----------------|--|
| path | The path to the HPE Ezmeral Data Fabric Database table. <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code> For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code> |
| cfname | The name of the column family of the JSON table field to which the security policies will be added. |
| column | The JSON table field. |
| securitypolicy | The list of security policy tags to be added to the JSON table field. |

Example

Adds the security policy named `newpolicy` to the `sales` field in the default column family of a MapR table named `table1`:

| | |
|------|---|
| CLI | <pre>maprcli table securitypolicy add -path "/table1" -cfname "default" -column "sales" -securitypolicy "newpolicy"</pre> |
| REST | <pre>http[s]://<host>:<port>/rest/table/cf/ column/securitypolicy/add?path=/ table1&cfname=default&column=sales&secur itypolicy=newpolicy</pre> |

table cf column list

Lists column-level attributes including any dynamic data masking properties set for JSON table columns.

Syntax**CLI**

```
maprcli table cf column list -path
<table-path>
-cfname <column family name>
[ -name <column-name>
```

REST

```
http[s]://<host>:<port>/rest/table/cf/
column/list?<parameters>
```

Parameters

| Parameter | Description |
|-----------|---|
| path | <p>The path to the HPE Ezmeral Data Fabric Database table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code> For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code> |
| cfname | The name of the column family of the JSON table field. |
| name | The JSON column family field to list attributes. If omitted, all columns for the specified column family that have associated column-level attributes are returned. |

Example

In the following example, only user `mapr` can read column `Creditcard` from the default CF of table `/table1` unmasked. User `user1` can read the `Creditcard` column, but it will be masked:

CLI

```
maprcli table cf colperm set -path /
table1--cfname default \
-name Creditcard -readperm "u:user1|
u:mapr" -unmaskedreadperm "u:mapr" \
-writeperm "u:mapr"

maprcli table cf
column securitypolicy set -path /
table1 -cfname default \
-name Creditcard -securitypolicy pci

maprcli table cf column datamask set
-path /table1 -cfname default \
-name Creditcard -datamask
mrddm_last4

maprcli table cf column list -path /
table1 -cfname default -json

{
  "timestamp":1612303576139,
  "timeofday":"2021-02-02
02:06:16.139 GMT-0800 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
```

```

    "name": "Creditcard",
    "aces": {
        "readperm": "u:user1|u:mapr",
        "unmaskedreadperm": "u:mapr",
        "writeperm": "u:mapr"
    },
    "securitypolicy": "pci",
    "datamask": "mrddm_last4"
}
]

```

table cf column securitypolicy list

Displays the list of security policies associated with a field in a HPE Ezmeral Data Fabric Database JSON table.

Permissions Required

To run this command, your user ID must have the following permissions:

- `adminaccessperm` on the table

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
maprcli table cf column
securitypolicy list
  -path <path>
  -cfname <column family name>
  -column <JSON table field>
```

REST

```
http[s]://<host>:<port>/rest/table/cf/
column/securitypolicy/list?
path=<path>&cfname=<name>&column=<JSON-
table-field>
```

Parameters

| Parameter | Description |
|-----------|--|
| path | The path to the table. <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under volume1 which has a mount point at /volume1, specify the following path: /volume1/test For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named test under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer |
| cfname | The name of the column family. |
| column | The JSON table field. |

Example

This example lists the security policies associated with the sales field in the default column family of the JSON table jtable.

CLI

```
maprcli table cf
column securitypolicy list -path /
my.cluster.com/volume1/jtable -cfname
default -column sales
```

REST

```
https://r1n1.sj.us:8443/rest/table/cf/
securitypolicy/list?
path=%2Fmy.cluster.com%2Fvolume1%2Fjta
ble' &cfname=default &column=sales
```

Example Output

```
{
  "timestamp":1539674179277,
  "timeofday":"2018-10-16 12:16:19.277 GMT-0700 AM",
  "status":"OK",
```

```

    "total":1,
    "data":[
      {
        "securitypolicy":["Sales"]
      }
    ]
  }

```

table cf column securitypolicy remove

Removes one or more security policies from the list of security policies associated with a field in a HPE Ezmeral Data Fabric Database JSON table.

Permissions Required

To run this command, your user ID must have the following permissions:

- `adminaccessperm` on the table

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|------|---|
| CLI | <pre> maprcli table cf column securitypolicy remove -path <path> -cfname <column family name> -column <JSON table field> -securitypolicy <comma-delimited list of policies> </pre> |
| REST | <pre> http[s]://<host>:<port>/rest/table/cf/ column/securitypolicy/remove? path=<path>&cfname=<column-family-name>& column=<JSON-table-field>&securitypolicy =<policies> </pre> |

Parameters

| Parameter | Description |
|-----------|---|
| path | <p>The path to the HPE Ezmeral Data Fabric Database table.</p> <ul style="list-style-type: none"> • For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code> • For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code> |
| cfname | The name or names of the column families containing the security policies you want to remove. |

| Parameter | Description |
|----------------|---|
| column | The JSON table field. |
| securitypolicy | The security policy tags to be removed from the list of security policies for the specified JSON table field. |

Example

Removes the security policy named `newpolicy` from the `sales` field in the default column family of a JSON table named `table1`:

| | |
|------|---|
| CLI | <pre>maprcli table cf column securitypolicy remove -path "/table1" -cfname "default" -column "sales" -securitypolicy "newpolicy"</pre> |
| REST | <pre>http[s]://<host>:<port>/rest/table/cf/ securitypolicy/remove?path=/ table1&cfname=default&column=sales&secu ritypolicy=newpolicy</pre> |

table cf column securitypolicy set

Replaces the existing list of security policies associated with a field in a HPE Ezmeral Data Fabric Database JSON table with one or more new security policies.

Permissions Required

To run this command, your user ID must have the following permissions:

- `adminaccessperm` on the table

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|------|--|
| CLI | <pre>maprcli table cf column securitypolicy set -path <path> -cfname <column family name> -column <JSON table field> -securitypolicy <comma-delimited list of policies></pre> |
| REST | <pre>http[s]://<host>:<port>/rest/table/cf/ column/securitypolicy/set? path=<path>&cfname=<column-family-name>& column=<JSON-table-field>&securitypolicy =<policies></pre> |

Parameters

| Parameter | Description |
|----------------|---|
| path | <p>The path to the HPE Ezmeral Data Fabric Database table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code> For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code> |
| cfname | The name of the column family of the JSON table field for which the security policies will be replaced. |
| column | The JSON table field |
| securitypolicy | The list of security policy tags to be replaced in the JSON table field. |

Example

Replaces the security policy for the `sales` field in the `default` column family of a MapR table named `table1` with a new security policy named `newpolicy`:

| | |
|------|--|
| CLI | <pre>maprcli table securitypolicy set -path "/table1" -cfname "default" -column "sales" -securitypolicy "newpolicy"</pre> |
| REST | <pre>http[s]://<host>:<port>/rest/table/ securitypolicy/set?path=/ table1&cfname=default&column=sales&securitypolicy=newpolicy</pre> |

table cf create

Creates a column family for a HPE Ezmeral Data Fabric binary or JSON table.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `createrenamefamilyperm` on the table

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```

/opt/mapr/bin/maprcli table cf create
-path <Table path >
-cfname <Column family name >
[ -minversions <Min versions to
keep> Default: 0 ]
[ -maxversions <Max versions to
keep> Default: 1 ]
[ -ttl <Time to live> Enter 0 for
forever, otherwise, enter time in
seconds. Default: 0 ]
[ -inmemory <In-memory> Default:
false ]
[ -compression <off|lzf|lz4|zlib>
Default: table's compression setting
is applied. ]
[ -versionperm <Version
Permissions> ]
[ -compressionperm <Compression
Permissions> ]
[ -memoryperm <Memory Permissions> ]
[ -readperm <Read Permissions> ]
[ -writeperm <Write Permissions> ]
[ -appendperm <Append
Permissions> ]

[ -jsonpath Json <Family Path -
needed for JSON column family, like
a.b.c> ]
[ -securitypolicy <comma-delimited
list of policies> ]
[ -force <Force create non-default
column family for json tabletype>
Default: false ]
[ -traverseperm <Traverse
Permissions> ]

```

REST

```

curl -k -X POST
'http[s]://<host>:<port>/rest/
table/cf/create?
path=<path>&cfname=<name>&<parameters>
'
-u <username>:<password>

```

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameters

| Parameter | Description |
|-------------|--|
| path | <p>The path to the table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under volume1 which has a mount point at /volume1, specify the following path: /volume1/test For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named test under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer |
| cfname | The name of the column family to create. |
| minversions | Applies to binary tables only: Minimum number of versions of column values to keep. The default is zero. |
| maxversions | Applies to binary tables only: Maximum number of versions of column values to keep. The default is one. |
| ttl | <p>Time to live in seconds. When the age of the data in this column family exceeds the value of the <code>ttl</code> parameter, the data is purged. Setting the value of <code>ttl</code> to 0 is equivalent to allowing data to remain indefinitely. Default: 0</p> <p> Note: If the value of <code>-ttl</code> for an existing column family in a JSON table is not 0, you cannot add another column family. You also cannot set the TTL for a JSON table if it has secondary indexes. See Setting TTL for Data.</p> |

| Parameter | Description |
|-----------------|---|
| inmemory | <p>Boolean. Determines whether preference is given to values of this column family for storage with row keys. Because row keys are cached in memory in preference to row data, column-family data that is stored inline with the row keys is also cached in memory.</p> <p>For all column families in a table together, up to 200 bytes of row data will be stored inline with each row key. Storing data inline with a row key might speed retrieval of the data from a column family because disk access can often be avoided. For each column family, up to 32 bytes can be stored inline with each row key even if its <code>inmemory</code> parameter is set to <code>false</code>, but preference will be given to column families where this parameter is set to <code>true</code>. A column family can have more than 32 bytes stored inline if its <code>inmemory</code> parameter is set to <code>true</code>.</p> <p>If the total number of bytes for all column families together exceeds 200 for a row, then preference for inclusion within the inline storage for that row is given to column families that have the <code>inmemory</code> parameter set to <code>true</code>.</p> <p> Note: All of the data for a column family are either stored in-line with the row key, or not stored at all. If the contents in a column family for a particular row are larger than the maximum number of bytes that are allowed to be stored for that column family, then data is not stored in-line for that column family.</p> <p>The default value for the <code>inmemory</code> parameter is <code>false</code>.</p> |
| compression | <p>The compression setting to use for the column family. Valid options are <code>off</code>, <code>lzf</code>, <code>lz4</code>, and <code>zlib</code>. The default setting is equal to the compression setting for the directory in which the table is located. To find out whether a directory is compressed and the type of compression, see Turning Compression On or Off on Directories Using the CLI on page 1082.</p> |
| versionperm | <p>Applies to binary tables only: ACE for changing the value of the <code>maxversions</code> and <code>minversions</code> parameters. By default, permission is given to the value of <code>defaultversionperm</code> for the table.</p> |
| compressionperm | <p>Applies to binary tables only: ACE for changing the value of the <code>compression</code> parameter. By default, permission is given to the value of <code>defaultcompressionperm</code> for the table.</p> |
| memoryperm | <p>The ACE for changing the value of the <code>inmemory</code> parameter. Use single quotation marks around the ACE. By default, permission is given to the value of <code>defaultmemoryperm</code> for the table.</p> |

| Parameter | Description |
|------------|--|
| readperm | <p>The ACE for column reads. Use single quotation marks around the ACE.</p> <p>Reads require permission both at the column-family level and at the column level (for binary tables) or field level (for JSON tables). In JSON tables, this permission is inherited by fields within the column family.</p> <p>By default, permission is given to the value of <code>defaultreadperm</code> for the table.</p> |
| writeperm | <p>The ACE for column writes (puts and deletes). Use single quotation marks around the ACE.</p> <p>Writes require permission both at the column-family level and at the column level (for binary tables) or field level (for JSON tables). In JSON tables, this permission is inherited by fields within the column family.</p> <p>By default, permission is given to the value of <code>defaultwriteperm</code> for the table.</p> |
| appendperm | <p>Applies to binary tables only: The ACE for column appends. Use single quotation marks around the ACE.</p> <p>Column appends require permission both at the column-family level and at the column level. By default, permission is given to the value of <code>defaultappendperm</code> for the table.</p> |
| jsonpath | <p>Applies to JSON tables only: Specifies the path to the column family. The path is in dotted notation. For example, suppose the table contained JSON documents that were of this general structure:</p> <pre data-bbox="820 1123 1458 1459"> { "_id" : "ID", "a" : { "b" : { "c" : "value", }, "e" : "value" } } </pre> <p>You want to create a column family at the field <code>d</code> in the new path <code>a.b.d</code> because you plan to store image files in fields in that column family.</p> <p> Important: Ensure that the field at which you want to create the column family does not yet exist. Also ensure that there are no secondary indexes defined on the field. If the field does exist or is a field in an index, the data in the field could become inaccessible after you create the column family.</p> <p> Restriction: As of MapR 6.0, a column family cannot be deleted from a JSON table.</p> |

| Parameter | Description |
|----------------|--|
| securitypolicy | The security policy or policies that apply to the column family. One or more tags can be assigned to a column family at the same time. If a security policy is not specified during column-family creation, the column family inherits the table <code>securitypolicy</code> value as its own security policy at runtime. If a security policy is specified during column-family creation, the table security policy is enforced followed by the column-family security policy. |
| force | Applies to JSON tables only: By default, every time you try to create a non-default column family in a JSON table, this command fails and returns a warning message that you should ensure there is no existing data at the specified path. Set this parameter to true if you want to override this warning mechanism and create a column family. |
| traverseperm | <p>Applies to JSON tables only: The Access Control Expressions that specifies who has permission to pass over fields in JSON documents. For example, suppose that a JSON table contains documents of this general structure:</p> <pre data-bbox="818 848 1463 1104"> { "_id" : "ID", "a" : { "b" : "value", "c" : "value" } } </pre> <p>Suppose further that the user <code>sjohnson</code> has read permission on <code>a.b</code>, but not on <code>a</code>. For <code>sjohnson</code> to read <code>a.b</code>, the user needs the traverse permission on <code>a</code>. The user can then pass over field <code>a</code> to <code>a.b</code>.</p> <p>This permission is inherited by fields within the column family. By default, this permission is given to the value of <code>defaulttraverseperm</code> for the JSON table.</p> |

Note: If a field is specified as a column family JSON path name, that field cannot be defined as either an indexed or included field when creating an index. For example, suppose you have the following JSON table:

```
{
  "_id" : "ID",
  "a" :
  {
    "b" :
    {
      "c" : "value",
      "d" : "value"
    },
    "e" : "value"
  }
}
```

If you created a column family at field `c` in the JSON path `a.b.c`, when creating an index, field `a.b.c` cannot be defined as an indexed or included field. However, you can define, as either an indexed or included field, fields `a`, `a.b`, `a.b.d`.

Example

Creates a new column family `mynewcf` for table `mytable`, keeping four versions in memory:

CLI

```
/opt/mapr/bin/maprcli table cf
create -path /volume1/mytable -cfname
mynewcf \
  -maxversions 4 -inmemory true
```

REST

```
curl -k -X POST \
  'https://r1n1.sj.us:8443/rest/
table/cf/create?
path=%2Fvolume1%2Fmytable&cfname=mynew
cf&maxversions=4&inmemory=true' \
  -u mapr:mapr
```

table cf delete

Deletes a column family from a HPE Ezmeral Data Fabric Database binary table or JSON table. Deletion cannot be undone.

Important: As of MapR 6.0, a column family cannot be deleted from a JSON table.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `deletefamilyperm` on the table

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
maprcli table cf delete
  -path <path>
  -cfname <name>
```

REST

```
curl -k -X POST
  'http[s]://
  <host>:<port>/rest/table/cf/delete?
  path=<path>&cfname=<name>'
  -u <username>:<password>
```

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameters

| Parameter | Description |
|-----------|---|
| path | <p>The path to the table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code> For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>test</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code> |
| cfname | <p>The name of the column family to delete.</p> <p> Note: In JSON tables, it is not possible to delete column families in addition to the default column family.</p> |

Example

Deletes a column family `mycf` from table `thetable`:

CLI

```
maprcli table cf delete -path /
  volume1/thetable -cfname mycf
```

REST

```
curl -k -X POST \
  'https://rln1.sj.us:8443/rest/
  table/cf/delete?
  path=%2Fvolume1%2Fthetable&cfname=mycf' \
  -u mapr:mapr
```

table cf edit

Edits a column family in a binary table or JSON table.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `createrenamefamilyperm` on the table

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
/opt/mapr/bin/maprcli table cf edit
-path <Table path >
-cfname <Column family name>
 [ -newcfname <New column family
name> ]
 [ -minversions <Min versions to
keep> ]
 [ -maxversions <Max versions to
keep> ]
 [ -ttl <Time to live> Enter 0 for
forever, otherwise, enter time in
seconds. Default: 0 ]
 [ -inmemory <In-memory> ]
 [ -compression <off|lzf|lz4|zlib> ]
 [ -versionperm <Version
Permissions> ]
 [ -compressionperm <Compression
Permissions> ]
 [ -memoryperm <Memory Permissions> ]
 [ -readperm <Read Permissions> ]
 [ -writeperm <Write Permissions> ]
 [ -appendperm <Append Permissions> ]
 [ -traverseperm <Traverse
Permissions> ]
```

REST

```
curl -k -X POST
'http[s]://<host>:<port>/rest/
table/cf/edit?
path=<path>&cfname=<name>&<parameters>
'
-u mapr:mapr
```

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameters

| Parameter | Description |
|-------------|---|
| path | <p>The path to the table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under volume1 which has a mount point at /volume1, specify the following path: /volume1/test For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named test under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer |
| cfname | The name of the column family to edit. |
| newcfname | The new name to give to the column family. |
| minversions | Applies to binary tables only: Minimum number of versions of column values to keep. The default is zero. |
| maxversions | Applies to binary tables only: Maximum number of versions of column values to keep. The default is one. |
| ttl | <p>Time to live in seconds. When the age of the data in this column family exceeds the value of the ttl parameter, the data is purged. Setting the value of ttl to 0 is equivalent to allowing data to remain indefinitely. Default: 0</p> <p> Note: If the value of -ttl for an existing column family in a JSON table is not 0, you cannot add another column family. You also cannot set the TTL for a JSON table if it has secondary indexes. See Setting TTL for Data.</p> |

| Parameter | Description |
|-----------------|---|
| inmemory | <p>Boolean. Determines whether preference is given to values of this column family for storage with row keys. Because row keys are cached in memory in preference to row data, column-family data that is stored inline with the row keys is also cached in memory.</p> <p>For all column families in a table together, up to 200 bytes of row data will be stored inline with each row key. Storing data inline with a row key might speed retrieval of the data from a column family because disk access can often be avoided. For each column family, up to 32 bytes can be stored inline with each row key even if its <code>inmemory</code> parameter is set to <code>false</code>, but preference will be given to column families where this parameter is set to <code>true</code>. A column family can have more than 32 bytes stored inline if its <code>inmemory</code> parameter is set to <code>true</code>.</p> <p>If the total number of bytes for all column families together exceeds 200 for a row, then preference for inclusion within the inline storage for that row is given to column families that have the <code>inmemory</code> parameter set to <code>true</code>.</p> <p> Note: All of the data for a column family will be stored in-line with the row key, or none will be. If the contents in a column family for a particular row are larger than the maximum number of bytes that are allowed to be stored for that column family, no data at all will be stored in-line for that column family.</p> <p>The default value for the <code>inmemory</code> parameter is <code>false</code>.</p> |
| compression | <p>The compression setting to use for the column family. Valid options are <code>off</code>, <code>lzf</code>, <code>lz4</code>, and <code>zlib</code>. The default setting is equal to the compression setting for the directory in which the table is located. To find out whether a directory is compressed and the type of compression, see Turning Compression On or Off on Directories Using the CLI on page 1082.</p> |
| versionperm | <p>Applies to binary tables only: ACE for changing the value of the <code>maxversions</code> and <code>minversions</code> parameters. By default, permission is given to the value of <code>defaultversionperm</code> for the table.</p> |
| compressionperm | <p>Applies to binary tables only: ACE for changing the value of the <code>compression</code> parameter. By default, permission is given to the value of <code>defaultcompressionperm</code> for the table.</p> |
| memoryperm | <p>ACE for changing the value of the <code>inmemory</code> parameter. Use single quotation marks around the ACE. By default, permission is given to the value of <code>defaultmemoryperm</code> for the table.</p> |

| Parameter | Description |
|--------------|--|
| readperm | <p>The ACE for column reads. Use single quotation marks around the ACE.</p> <p>Reads require permission both at the column-family level and at the column level (for binary tables) or field level (for JSON tables). In JSON tables, this permission is inherited by fields within the column family.</p> <p>By default, permission is given to the value of <code>defaultreadperm</code> for the table.</p> |
| writeperm | <p>The ACE for column writes (puts and deletes). Use single quotation marks around the ACE.</p> <p>Writes require permission both at the column-family level and at the column level (for binary tables) or field level (for JSON tables). In JSON tables, this permission is inherited by fields within the column family.</p> <p>By default, permission is given to the value of <code>defaultwriteperm</code> for the table.</p> |
| appendperm | <p>Applies to binary tables only: ACE for column appends. Use single quotation marks around the ACE.</p> <p>Column appends require permission both at the column-family level and at the column level. By default, permission is given to the value of <code>defaultappendperm</code> for the table.</p> |
| traverseperm | <p>Applies to JSON tables only: The Access Control Expressions that specifies who has permission to pass over fields in JSON documents. For example, suppose that a JSON table contains documents of this general structure:</p> <pre> { "_id" : "ID", "a" : { "b" : "value", "c" : "value" } } </pre> <p>Suppose further that the user <code>s_johnson</code> has read permission on <code>a.b</code>, but not on <code>a</code>. For <code>s_johnson</code> to read <code>a.b</code>, the user needs the traverse permission on <code>a</code>. The user can then pass over field <code>a</code> to <code>a.b</code>.</p> <p>This permission is inherited by fields within the column family. By default, this permission is given to the value of <code>defaulttraverseperm</code> for the JSON table.</p> |

Note: If a field is specified as a column family JSON path name, that field cannot be defined as either an indexed or included field when creating an index. For example, suppose you have the following JSON table:

```
{
  "_id" : "ID",
  "a" :
    {
      "b" :
        {
          "c" : "value",
          "d" : "value"
        },
      "e" : "value"
    }
}
```

If you created a column family at field `c` in the JSON path `a.b.c`, when creating an index, field `a.b.c` cannot be defined as an indexed or included field. However, you can define, as either an indexed or included field, fields `a`, `a.b`, `a.b.d`.

Example

Changes the name of a column family in table `mytable` from `mycf` to `mynewcfname`. Also changes the time to live setting.

CLI

```
/opt/mapr/bin/maprcli table
cf edit -path /my.cluster.com/volume1/
mytable -cfname mycf \
  -newcfname mynewcfname -ttl 86400
```

REST

```
curl -k -X POST \
  'https://r1n1.sj.us:8443/rest/
table/cf/edit?
path=%2Fmy.cluster.com%2Fvolume1%2Fmyt
able&cfname=mycf&newcfname=mynewcfname
&ttl=86400' \
  -u mapr:mapr
```

table cf list

Lists the column families for a HPE Ezmeral Data Fabric table.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` on the volume
- `lookupdir` on directories in the path
- `adminaccessperm` on the table

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax**CLI**

```
maprcli table cf list
  -path <path>
  [ -cfname <name>]
```

REST

```
curl -k -X GET \
  'http[s]://<host>:<port>/rest/
  table/cf/list? \
  path=<path>&cfname=<name>' \
  -u <username>:<password>
```

Parameters

| Parameter | Description |
|-----------|---|
| path | <p>The path to the table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under volume1 which has a mount point at /volume1, specify the following path: /volume1/test For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named test under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer |
| cfname | The name of the column family. |
| showcol | Set to <i>false</i> by default. If set to <i>true</i> , then all column-level attributes for this column family are displayed. |

Output Fields

| Verbose Field Name | Terse Field Name | Field Value |
|--------------------|------------------|--|
| inmemory | inmem | Whether or not this column value resides in memory |
| cfname | n | The column family name |
| maxversions | vmax | Maximum number of versions for this column family |
| minversions | vmin | Minimum number of versions for this column family |
| compression | comp | Compression scheme used for this column family |
| ttl | ttl | Time to live for this column family |

| Verbose Field Name | Terse Field Name | Field Value |
|--------------------|------------------|---|
| compressionperm | pcomp | Applies to binary tables only: ACE for changing the value of the <code>compression</code> parameter. By default, permission is given to the value of <code>defaultcompressionperm</code> for the table. |
| memoryperm | pmem | ACE for changing the value of the <code>inmemory</code> parameter. Use single quotation marks around the ACE . By default, permission is given to the value of <code>defaultmemoryperm</code> for the table. |
| readperm | pread | The ACE for column reads. Use single quotation marks around the ACE . Reads require permission both at the column-family level and at the column level (for binary tables) or field level (for JSON tables). In JSON tables, this permission is inherited by fields within the column family. By default, permission is given to the value of <code>defaultreadperm</code> for the table. |
| traverseperm | ptraverse | Applies to JSON tables only: The Access Control Expressions that specifies who has permission to pass over fields in JSON documents. For example, suppose that a JSON table contains documents of this general structure: <pre> { "_id" : "ID", "a" : { "b" : "value", "c" : "value" } } </pre> Suppose further that the user <code>s_johnson</code> has read permission on <code>a.b</code> , but not on <code>a</code> . For <code>s_johnson</code> to read <code>a.b</code> , the user needs the traverse permission on <code>a</code> . The user can then pass over field <code>a</code> to <code>a.b</code> . This permission is inherited by fields within the column family. By default, this permission is given to the value of <code>defaulttraverseperm</code> for the JSON table. |

| Verbose Field Name | Terse Field Name | Field Value |
|--------------------|------------------|--|
| writeperm | pwrite | <p>The ACE for column writes (puts and deletes). Use single quotation marks around the ACE.</p> <p>Writes require permission both at the column-family level and at the column level (for binary tables) or field level (for JSON tables). In JSON tables, this permission is inherited by fields within the column family.</p> <p>By default, permission is given to the value of defaultwriteperm for the table.</p> |

Example

This example lists all column families for the table `newtable`.

CLI

```
maprcli table cf list -path /
my.cluster.com/volume1/newtable
```

REST

```
curl -k -X GET \
'https://rln1.sj.us:8443/rest/
table/cf/list?
path=%2Fmy.cluster.com%2Fvolume1%2Fnew
table' \
-u mapr:mapr
```

Example Output

```
[user@node]# maprcli table cf list -path /mapr/default/user/user/newtable
comp  inmem  vmax  n      ttl      vmin
lz4   false  3     dine   2147483647  0
lz4   false  3     nahashchid 2147483647  0
lz4   false  3     wollachee 2147483647  0
```

This example shows the security policies for the `default` column family of the JSON table, `jtable`.

CLI

```
maprcli table cf list -path /
my.cluster.com/volume1/jtable -cfname
default -json
```

REST

```
curl -k -X GET \
'https://rln1.sj.us:8443/rest/
table/cf/list?
path=%2Fmy.cluster.com%2Fvolume1%2Fjta
ble' &cfname=default \
-u mapr:mapr
```

Example Output

```
{
  "timestamp":1539674179277,
  "timeofday":"2018-10-16 12:16:19.277 GMT-0700 AM",
```

```

    "status": "OK",

```

table cf securitypolicy add

Specifies new security policies to be associated with an existing column family for a HPE Ezmeral Data Fabric Database JSON table.

Permissions Required

To run this command, your user ID must have the following permissions:

- `adminaccessperm` on the table

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|------|---|
| CLI | <pre> maprcli table cf securitypolicy add -path <path> -cfname <column family name> -securitypolicy <comma-delimited list of policies> </pre> |
| REST | <pre> http[s]://<host>:<port>/rest/table/cf/ securitypolicy/add? path=<path>&cfname=<col-family-name>&sec uritypolicy=<policies> </pre> |

Parameters

| Parameter | Description |
|----------------|---|
| path | <p>The path to the HPE Ezmeral Data Fabric Database table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code> For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code> |
| cfname | The name of the column family to which security policies will be added. |
| securitypolicy | The security policy tags to be added to the list of security policies for the specified column family. |

Example

Adds the security policy named `newpolicy` to the column family `mycf` for a MapR table named `table1`:

| | |
|------|--|
| CLI | <pre>maprcli table cf securitypolicy add -path "/table1" -cfname "mycf" -securitypolicy "newpolicy"</pre> |
| REST | <pre>http[s]://<host>:<port>/rest/table/cf/ securitypolicy/add?path=/ table1&cfname=mycf&securitypolicy=newpol icy</pre> |

table cf securitypolicy remove

Removes specified security policies associated with a column family within a HPE Ezmeral Data Fabric Database JSON table.

Permissions Required

To run this command, your user ID must have the following permissions:

- `adminaccessperm` on the table

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|------|--|
| CLI | <pre>maprcli table cf securitypolicy remove -path <path> -cfname <column family name> -securitypolicy <comma-delimited list of policies></pre> |
| REST | <pre>http[s]://<host>:<port>/rest/ table/cf/securitypolicy/remove? path=<path>&securitypolicy=<policies></pre> |

Parameters

| Parameter | Description |
|----------------|---|
| path | <p>The path to the HPE Ezmeral Data Fabric Database table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code> For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code> |
| cfname | The name or names of the column families containing the security policies you want to remove. |
| securitypolicy | The security policy tags to be removed from the list of security policies for the specified column family. |

Example

Removes the security policy named `newpolicy` from the `default` column family of a MapR table named `table1`:

| | |
|------|--|
| CLI | <pre>maprcli table cf securitypolicy remove -path "/table1" -cfname "default" -securitypolicy "newpolicy"</pre> |
| REST | <pre>http[s]://<host>:<port>/rest/table/cf/ securitypolicy/remove?path=/ table1&cfname=default&securitypolicy=new policy</pre> |

table cf securitypolicy set

Replaces a security policy associated with a column family for a HPE Ezmeral Data Fabric Database JSON table with a new security policy.

Permissions Required

To run this command, your user ID must have the following permissions:

- `adminaccessperm` on the table.

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|------|--|
| CLI | <pre>maprcli table cf securitypolicy set -path <path> -cfname <column family name> -securitypolicy <comma-delimited list of policies></pre> |
| REST | <pre>http[s]://<host>:<port>/rest/table/cf/ securitypolicy/set? path=<path>&cfname=<column-family-name>& securitypolicy=<policies></pre> |

Parameters

| Parameter | Description |
|----------------|---|
| path | <p>The path to the HPE Ezmeral Data Fabric Database table.</p> <ul style="list-style-type: none"> • For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code> • For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code> |
| cfname | The name of the column family for which security policies will be replaced. |
| securitypolicy | The security policy tags to be replaced in the list of security policies for the specified column family. |

Example

Replaces the security policy for the column family `mycf` for a MapR table named `table1` with a new security policy named `newpolicy`:

| | |
|-----|---|
| CLI | <pre>maprcli table cf securitypolicy set -path "/table1" -cfname "mycf" -securitypolicy "newpolicy"</pre> |
|-----|---|

| | |
|------|---|
| REST | <code>http[s]://<host>:<port>/rest/table/cf/securitypolicy/set?path=/table1&cfname=mycf&securitypolicy=newpolicy</code> |
|------|---|

table changelog

These `maprcli` commands are used to create and manage Change Data Capture (CDC) changelogs. A changelog is used to establish a relationship between a HPE Ezmeral Data Fabric Database source table (JSON or binary) and a HPE Ezmeral Data Fabric Event Streams stream topic and to manage the propagation process.

`table changelog add`

Description

Creates a changelog and creates a stream topic if one does not already exist. A changelog establishes a relationship between a HPE Ezmeral Data Fabric Database source table (JSON or binary) and a HPE Ezmeral Data Fabric Event Streams stream topic.

Syntax**Table**

| | |
|------|---|
| CLI | <code>maprcli table changelog add -path <source table path> -changelog <destination stream path>:<topic name></code> |
| REST | <code>http://<ipaddress>:8443/rest/table/changelog/add?path=<source-table-path>&changelog=<destination stream path>:<topic name></code> |

Parameters**Table**

| Parameter | Description |
|------------------|--|
| path | (Required) Path of the source table. |
| changelog | <p>(Required) Target of the change log, specified as <code><stream_path>:<topic_name></code>, to which all change data records will be published. The stream must exist, otherwise, the command fails. If the topic does not already exist, <code>maprcli table changelog add</code> creates it. To propagate to an existing topic, specify <code>-useexistingtopic</code>.</p> <p> Note: The <code>maprcli stream create</code> command is used to create the changelog stream.</p> <p> Important: A CDC changelog stream's default partitions can impact how many partitions a stream topic can have. This is because once you create a stream topic for a changelog stream, the number of topic partitions is <i>locked</i>. The number of topic partitions cannot change.</p> <p>When using the <code>table changelog add</code> command to add a stream topic (as well as establish a relationship between the source table and the changelog stream), then the number of topic partitions is inherited from the changelog stream and is <i>locked</i>.</p> |
| useexistingtopic | If true, allows propagation to an existing topic. Default: false. |

Table (Continued)

| Parameter | Description |
|-----------------------|---|
| propagateexistingdata | If true, initiates propagation of the existing data to the stream topic, otherwise, only new changes are propagated. Default: true |
| columns | For HPE Ezmeral Data Fabric Database JSON, a comma separated list of field paths to be propagated. For HPE Ezmeral Data Fabric Database Binary, a comma separated list of column family names, for example, <family>[:<column>] to be propagated. Default: All fields are propagated. |
| throttle | If true, data transfers to the specified sink are throttled. Default: false |
| pause | If true, pauses propagation after the changelog is created. Default: false |
| synchronous | If true, acknowledges the client writes to the table before the internal CDC gateway receives the data. Default: false |
| networkencryption | Specifies whether the data transfer between MapR filesystem and the internal gateway is encrypted. If true, data propagation is encrypted on-wire. Default: false |
| networkcompression | Specifies the compression scheme (off lzf lz4 zlib) of the data transfer on-wire. Default: lz4 |

Example

```
maprcli table changelog add -path /tableVolume/cdcTable -changelog /
streamVolume/changelogStream:cdcTopic1
```

```
https://ip.address:8443/rest/table/changelog/add?path=/tableVolume/
cdcTable&changelog=/streamVolume/changelogStream:cdcTopic1
```

table changelog edit

Description

Changes changelog specifications.

Syntax**Table**

| | |
|------|---|
| CLI | <pre>maprcli table changelog edit -path <source table path> -changelog <destination stream path>:<topic name></pre> |
| REST | <pre>http://<ipaddress>:8443/rest/table/changelog/edit? path=<source-table-path>&changelog=<destination-stream-path>:<topic-name></pre> |

Parameters**Table**

| Parameters | Description |
|------------|--|
| path | (Required) Path of the HPE Ezmeral Data Fabric Database source table |
| changelog | (Required) Target of this changelog. |

Table (Continued)

| Parameters | Description |
|--------------------|--|
| throttle | If true, data propagation is throttled. Default: false |
| synchronous | If true, acknowledges the client writes to the table before the internal CDC gateway receives the data. Default: false |
| networkencryption | If true, data propagation is encrypted on-wire. Default: false |
| networkcompression | Specifies the compression scheme (off lzf lz4 zlib) of the data propagation on-wire. Default: lz4 |

Example

```
maprcli table changelog edit -path /tableVolume/cdcTable -changelog /
streamVolume/changelogStream:cdcTopic1
```

```
https://10.10.100.17:8443/rest/table/changelog/edit?path=/tableVolume/
cdcTable&changelog=/streamVolume/changelogStream:cdcTopic1
```

table changelog info

Description

Displays changelog source table information.

Syntax**Table**

| | |
|------|--|
| CLI | <pre>maprcli table changelog info -path <destination stream path>:<topic name></pre> |
| REST | <pre>http://<ipaddress>:8443/rest/table/changelog/info?path=<destination stream path>:<topic name></pre> |

Parameters**Table**

| Parameters | Description |
|------------|---|
| path | (Required) Path to the stream with topic. Specified in the format: <code>pathToStream:streamTopic</code> |

Example

```
maprcli table changelog info -changelog /streamVolume/
changelogStream:cdcTopic1 -json
https://10.10.100.17:8443/rest/table/changelog/info?changelog=/streamVolume/
changelogStream:cdcTopic1
```

Output

```
{
  "timestamp":1498526974087,
  "timeofday":"2017-06-26 06:29:34.087 GMT-0700",
  "status":"OK",
  "total":1,
  "data":[
    {
      "cluster":"clst185",
      "changelog":"/streamVolume/changelogStream/cdcTopic1",
      "idx":0,
      "uuid":"59bf0064-97a1-c417-b6d7-0a6681515900"
    }
  ]
}
```

table changelog list

Description

Lists changelog information.

Syntax

Table

| | |
|------|---|
| CLI | <code>maprcli table changelog list -path <source table path></code> |
| REST | <code>http://<ipaddress>:8443/rest/table/changelog/list?path=<source-table-path></code> |

Parameters

Table

| Parameters | Description |
|------------|--|
| path | (Required) Path of the source table in the HPE Ezmeral Data Fabric Database cluster. |
| refreshnow | Specifies if the user wants to trigger an immediate update of the sink statistics. |

Example

```
// CLI example
maprcli table changelog list -path /tableVolume/cdcTable -json

// REST example
https://10.10.100.17:8443/rest/table/changelog/list?path=/tableVolume/cdcTable
```

Output

```

{
  "timestamp":1505779365019,
  "timeofday":"2017-09-18 05:02:45.019 GMT-0700",
  "status":"OK",
  "total":1,
  "data":[
    {
      "cluster":"my.cluster.com",
      "changelog":"/streamVolume/changelogStream:cdcTopic1",
      "changelogStream":"/streamVolume/changelogStream",
      "replicaState":"REPLICA_STATE_REPLICATING",
      "paused":false,
      "throttle":false,
      "idx":1,
      "networkencryption":false,
      "synchronous":false,
      "networkcompression":"lz4",
      "propagateExistingData":true,
      "isUptodate":true,
      "minPendingTS":0,
      "maxPendingTS":0,
      "bytesPending":0,
      "putsPending":0,
      "bucketsPending":0,
      "uuid":"76a3efd3-6357-8cd6-092f-0fca5dc05900",
      "copyTableCompletionPercentage":100
    }
  ]
}

```

Output Data Fields

The following fields display for each replica.

| Field | Description |
|-----------------------|--|
| cluster | The cluster on which the replica resides. |
| changelog | Identifies the destination stream topic for the changelog. |
| changelogstream | Identifies the destination stream for the changelog. |
| replicaState | The replication state. For information about the replication states, see Table Replication States on page 588. |
| paused | A Boolean values that specifies if replication is paused. |
| throttle | A Boolean value that specifies if replication is throttled. |
| idx | The internal index value. |
| networkencryption | A Boolean value that specifies if replication is encrypted. |
| synchronous | A Boolean value that specifies whether replication is synchronous or asynchronous. |
| networkcompression | The type of on-wire compression. |
| propagateExistingData | Identifies whether existing data in the source table is propagated to the destination stream topic. |
| isUptodate | A Boolean value that specifies if the replica is up-to-date. |

| Field | Description |
|-------------------------------|---|
| minPendingTS | The epoch time in milliseconds of the oldest operation that has yet to be replicated to the replica. |
| maxPendingTS | The epoch time in milliseconds of the newest operation that has yet to be replicated to the replica. |
| bytesPending | The number of bytes that have yet to be replicated to the replica. |
| putsPending | The number of puts that have yet to be replicated to the replica. |
| bucketsPending | The number of buckets that have yet to be replicated to the replica. |
| uuid | The table UUID. |
| copyTableCompletionPercentage | When propagation of existing data is in progress, this value is the percentage of data from the source table that has been propagated to the destination stream topic.  Note: When replicating HPE Ezmeral Data Fabric Database data, the copyTablePercentageCompletion data may re-adjust to a lower rate. This depends on table region (also referred to as tablets) splits and merges as well as the rate of incoming data to replicating data. |
| errors | If applicable, an error is displayed. |

table changelog pause

Description

Pauses the propagation of changed data records.

Syntax

Table

| | |
|------|--|
| CLI | <pre>maprcli table changelog pause -path <source table path> -changelog <destination stream path>:<topic name></pre> |
| REST | <pre>http://<ipaddress>:8443/rest/table/changelog/pause? path=<source-table-path>&changelog=<destination stream path>:<topic_name></pre> |

Parameters

Table

| Parameters | Description |
|------------|--|
| path | (Required) Path of the HPE Ezmeral Data Fabric Database source table |
| changelog | (Required) Target of this change log. |

Example

```
maprcli table changelog pause -path /tableVolume/cdcTable -changelog /
streamVolume/changelogStream:cdcTopic1
```

```
https://10.10.100.17:8443/rest/table/changelog/pause?path=/tableVolume/
cdcTable&changelog=/streamVolume/changelogStream:cdcTopic1
```

table changelog remove

Description

Removes the changelog connection.

Syntax**Table**

| | |
|------|--|
| CLI | maprcli table changelog remove -path <source table path> -changelog <destination stream path>:<topic name> |
| REST | http://<ipaddress>:8443/rest/table/changelog/remove? path=<source-table-path>&changelog=<destination stream path>:<topic_name> |

Parameters**Table**

| Parameters | Description |
|------------|--|
| path | (Required) Path of the source table in the HPE Ezmeral Data Fabric Database cluster. |
| changelog | (Required) Target of the change log. |

Example

```
maprcli table changelog remove -path /tableVolume/cdcTable -changelog /
streamVolume/changelogStream:cdcTopic1
```

```
https://10.10.100.17:8443/rest/table/changelog/remove?path=/tableVolume/
cdcTable&changelog=/streamVolume/changelogStream:cdcTopic1
```

table changelog resume

Description

Resumes the propagation of changed data records after a pause.

Syntax

Table

| | |
|------|--|
| CLI | <code>maprcli table changelog resume -path <source table path> -changelog <destination stream path>:<topic name></code> |
| REST | <code>http://<ipaddress>:8443/rest/table/changelog/resume?path=<source-table-path>&changelog=<destination stream path>:<topic_name></code> |

Parameters

Table

| Parameters | Description |
|------------|--|
| path | (Required) Path of the HPE Ezmeral Data Fabric Database source table |
| changelog | (Required) Target of this change log. |

Example

```
maprcli table changelog resume -path /tableVolume/cdcTable -changelog /
streamVolume/changelogStream:cdcTopic1
```

```
https://10.10.100.17:8443/rest/table/changelog/resume?path=/tableVolume/
cdcTable&changelog=/streamVolume/changelogStream:cdcTopic1
```

table delete

Deletes a HPE Ezmeral Data Fabric Database binary or JSON table.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `adminaccessperm` on the table

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
maprcli table delete -path <path>
```

REST

```
curl -k -X POST
'http[s]://<host>:<port>/rest/table/
```

```
delete?path=<path>'
-u <username>:<password>
```

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameters

| Parameter | Description |
|-------------------|--|
| <code>path</code> | <p>Path to the MapR table to delete.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, if you want to delete a table named <code>test</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code> For a path on a remote cluster, you must also specify the cluster name in the path. For example, if you want to delete a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code> |

Example

Deletes the table `table`:

CLI

```
maprcli table delete -path /mapr/
mycluster/volume1/table
```

REST

```
curl -k -X POST \
  'https://r1n1.sj.us:8443/rest/table/
delete?
path=%2Fmapr%2Fmycluster%2Fvolume1%2Ft
able' \
  -u mapr:mapr
```

`table edit`

Edits the attributes of a HPE Ezmeral Data Fabric Database binary or JSON table.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `adminaccessperm` on the table

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```

maprcli table edit
  -path <path >
  [ -audit true|false ]
  [ -autosplit <Auto Split table> ]
  [ -regionsizemb <Region Size in
  MB> ]
  [ -bulkload <Bulk load> ]
  [ -deletettl <delete TTL in secs> ]
  [ -packperm <Pack Permission
  settings> ]
  [ -bulkloadperm <Bulk load
  Permission settings> ]
  [ -splitmergeperm <Split and Merge
  Permission settings>]
  [ -createrenamefamilyperm <Add/
  Rename Family Permission settings> ]
  [ -deletefamilyperm <Delete Family
  Permission settings> ]
  [ -adminaccessperm <Secondary Index
  Admin Permission settings> ]
  [ -replperm <Replication Admin
  Permission settings> ]
  [ -indexperm <Ace Admin Permission
  settings> ]
  [ -defaultversionperm <CF Versions
  Default Permission> ]
  [ -defaultcompressionperm <CF
  Compression Default Permission> ]
  [ -defaultmemoryperm <CF Memory
  Default Permission> ]
  [ -defaultreadperm <CF Read Default
  Permission> ]
  [ -defaultwriteperm <CF Write
  Default Permission> ]
  [ -defaulttraverseperm <CF Traverse
  Default Permission> ]
  [ -defaultappendperm <CF Append
  Default Permission> ]

  [ -metricsinterval <Metrics
  collection interval, in seconds> ]

```

REST

```

curl -k -X POST \
  'http[s]://<host>:<port>/rest/table/
  edit?path=<path>&<parameters>'
  -u <username>:<password>

```

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

| Parameter | Description |
|--------------|--|
| path | <p>The path to the table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code> For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>test</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code> |
| audit | <p>Specifies whether to turn auditing on for the table. If auditing is also enabled at the cluster level with the <code>maprcli audit data</code> command and enabled for the current volume, setting this value to <code>true</code> causes auditing to start for the table.</p> <p>The possible values are <code>true</code> and <code>false</code>. By default, the value is <code>false</code>.</p> |
| autosplit | <p>A Boolean value that specifies whether to split the table into regions automatically as the table grows. The average size of each region is determined by the <code>regionsizemb</code> parameter.</p> <p>The default value is <code>true</code>. If you set the value to <code>false</code>, you can manually split tables into regions by using the <code>table region split</code> command.</p> |
| regionsizemb | <p>The average size of the regions into which HPE Ezmeral Data Fabric Database tries to split the table as the table grows. The default is 4096 MB. This value is ignored if <code>autosplit</code> is set to <code>false</code>.</p> <p>If <code>autosplit</code> is set to <code>true</code>, HPE Ezmeral Data Fabric Database splits a region when the size of the region exceeds 150% of the average value. For example, if the average value is 4096 MB, HPE Ezmeral Data Fabric Database splits a region that is larger than 6144 MB.</p> <p>Although splits are automatic, merges are not. For example, if the value of <code>regionsizemb</code> is changed from 8 GB to 4 GB, all regions that are eligible are split automatically, if <code>autosplit</code> is set to <code>true</code>. However, if the value of <code>regionsizemb</code> is changed from 2 GB to 4 GB, regions smaller than 4 GB are not automatically merged.</p> <p> Note: When a table has less than 4 regions, HPE Ezmeral Data Fabric Database ignores the <code>regionsizemb</code> parameter and splits regions at a lower threshold.</p> |
| bulkload | <p>A Boolean value that specifies whether to allow a full bulk load of the table. The default is <code>false</code>. For more information, see Loading Data into Binary Tables on page 1144 and Loading Documents into JSON Tables on page 1140.</p> |

| Parameter | Description |
|------------------------|--|
| deletettl | The number of seconds to wait before purging the delete operations. The time-to-live for deletes should be greater than the amount of time that it takes replicated operations to reach replicas. By default, the value is 24 hours for tables configured for replication. If the table is not configured for replication, the default is 0 hours. |
| packperm | The Access Control Expression that controls who can pack table regions. By default, permission is given to the user ID that was used to create the table. |
| bulkloadperm | The Access Control Expression that controls who can load this table with bulk loads if the table was created with bulk load support. By default, permission is given to the user ID that was used to create the table. |
| splitmergeperm | <p>The Access Control Expression that controls who can take the following actions:</p> <ul style="list-style-type: none"> • Run the <code>table region split</code> and <code>table region merge</code> commands to split the table into regions or to merge regions of the table together. • Change the value of <code>regionsizemb</code>. <p>By default, permission is given to the user ID that was used to create the table.</p> |
| createrenamefamilyperm | The Access Control Expression that controls who can create column families for this table or rename existing column families. By default, permission is given to the user ID that was used to create the table. |
| deletefamilyperm | The Access Control Expression that defines access to delete column families for this table. Delimit the expression with single-quotation marks. By default, permission is given to the user ID that was used to create the table. |
| adminaccessperm | The Access Control Expression that controls who can view and edit the permissions for this table. By default, permission is given to the user ID that was used to create the table. |
| replperm | The Access Control Expression that controls who can set up replication either to or from a table. By default, permission is given to the user ID that is used to create the table. |
| indexperm | The secondary index admin permission setting that controls who can create an index associated with this table. By default, permission is given to the user ID that is used to create the table. |
| defaultversionperm | <p>The default Access Control Expression for the version permission on new column families that are created in this table. If no value is specified, the default is <code>u:<username of the table creator></code>. This value of the parameter <code>versionperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value.</p> <p> Note: This permission is not applicable to JSON tables. Versioning is not supported for JSON documents.</p> |

| Parameter | Description |
|------------------------|--|
| defaultcompressionperm | Applies to binary tables only: The default Access Control Expression for the compression permission on new column families that are created in this table. If no value is specified, the default is <code>u:<username of the table creator></code> . This value of the parameter <code>compressionperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value. |
| defaultmemoryperm | The default Access Control Expression for the memory permission on new column families that are created in this table. If no value is specified, the default is <code>u:<username of the table creator></code> . This value of the parameter <code>memoryperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value. |
| defaultreadperm | The default Access Control Expression for the read permission on new column families that are created in this table. If no value is specified, the default is <code>u:<username of the table creator></code> . This value of the parameter <code>readperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value. See table cf create on page 2048 and table cf edit on page 2055 |
| defaultwriteperm | The default Access Control Expression for the write permission on new column families that are created in this table. If no value is specified, the default is <code>u:<username of the table creator></code> . This value of the parameter <code>writeperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value. See table cf create on page 2048 and table cf edit on page 2055 |
| defaulttraverseperm | Applies to JSON tables only: The default Access Control Expression for the traverse permission on new column families. For more information about this permission, see Permission Types for Fields and Column Families in JSON Tables on page 1157. |
| defaultappendperm | Applies to binary tables only: The default Access Control Expression for the append permission on new column families that are created in this table. If no value is specified, the default is <code>u:<username of the table creator></code> . This value of the parameter <code>appendperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value. |
| metricsinterval | The metrics collection interval, in seconds, for the table. Possible values: 10, 60, 600 Default: 60 seconds When configured to 10 seconds, under normal workloads, the metrics are available in OpenTSDB in about 30 seconds. At an interval of 60 seconds, the metrics are available in about 90 seconds.  Note: You cannot disable metrics collection for a table by setting the interval to 0. |

Example

Changes the value of `regionsizemb` for the table `mytable`:

CLI

```
maprcli table edit -path /volume1/
mytable -regionsizemb 8192
```

REST

```
curl -k -X POST \
'https://rln1.sj.us:8443/rest/table/
edit?
path=%2Fvolume1%2Fmytable&regionsizemb
=8192' \
-u mapr:mapr
```

table index

Manages indexes for HPE Ezmeral Data Fabric Database JSON tables.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` on the volume
- `lookupdir` on directories in the table path

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

table index add

This topic describes how to add secondary indexes on HPE Ezmeral Data Fabric Database JSON tables.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` on the volume
- `lookupdir` on directories in the table path
- `indexperm` permission on the table

If you created the table in version 6.0 or later, you automatically have `indexperm` permission. For tables created before 6.0, even if you are the owner of the table, you must explicitly add `indexperm` permission.

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
maprcli table index add
-path <path>
-index <index name>
-indexedfields < indexed field
names >
[ -includedfields < included field
```

```
names > ]
  [ -hashed [ enable hashed index:
true | false> ]
  [ -numhashpartitions < number of
hash index partitions when hashed
index is enabled > ]
```

REST

```
curl -k -X POST \
'http[s]://<host>:<port>/rest/table/
index/add?path=<path>&index=<index
name>&indexedfields=<indexed field
names>&<parameters>' \
-u <username>:<password>
```

Parameters

| Parameter | Description |
|--------------|---|
| path | (Required) Path to where the parent JSON table resides. |
| index | (Required) Name of the index. |

| Parameter | Description |
|----------------|--|
| indexedfields | <p>(Required) Names of the indexed fields. This is a comma separated list of the fields from the JSON table that are indexed and used for ordering the index. The sort ordering of each field can be specified separately. The syntax is as follows:</p> <pre data-bbox="834 373 1446 464">-indexedfields <fieldname>:<sort_order>,<fieldname>:<sort_order>,...</pre> <p> Important: Do not place a space between the commas and the field names.</p> <p>A sort_order of <code>asc</code>, <code>ASC</code>, or <code>1</code> denotes an ascending sort order. This is the default.</p> <p>A sort_order of <code>desc</code>, <code>DESC</code>, or <code>-1</code> denotes a descending sort order.</p> <p>The following example specifies two indexed fields. <code>fieldName1</code> has an ascending sort, while <code>fieldName2</code> is descending.</p> <pre data-bbox="834 831 1289 888">-indexedfields fieldName1:asc,fieldName2:desc</pre> <p>If an indexed field contains a colon (:) in the name, you need to escape the last colon in the name. In the example below, the indexed field names are the following:</p> <ol data-bbox="820 1016 1081 1150" style="list-style-type: none"> 1. <code>field1</code> 2. <code>field2</code> 3. <code>colonField:X:Y</code> <p>The following shows how to escape the last colon in the third indexed field.</p> <pre data-bbox="834 1266 1289 1323">-indexedfields field1,field2,colonField:X\\:Y</pre> <p> Note: The <code>CAST</code> function can be applied on indexed fields. You must enclose each <code>CAST</code> function call in single quotes. See the next section for details.</p> |
| includedfields | <p>(Optional) Names of the included fields. This is a comma separated list of the fields from the JSON table that are part of the index, but not used for ordering. The syntax is as follows:</p> <pre data-bbox="834 1644 1240 1701">-includedfields <fieldname>,<fieldname>,...</pre> <p> Important: Do not place a space between the commas and the included field names.</p> |
| hashed | (Optional) True False. Default: false |

| Parameter | Description |
|-------------------|--|
| numhashpartitions | (Optional) Number of hash index partitions when the hashed index option is enabled. This parameter determines the number of logical partitions HPE Ezmeral Data Fabric Database distributes keys across. Incoming keys are hashed to 2 byte partition IDs. Default: 10 |

Applying CAST on Indexed Fields

Indexes can be defined with the CAST function applied to an indexed field.

The following statement queries a table named `lineitem` and casts the `L_LINENUMBER` and `L_ORDERKEY` fields to the `int` data type.

```
SELECT L_LINESTATUS, L_QUANTITY FROM lineitem WHERE CAST(L_LINENUMBER as int) = 1 AND CAST(L_ORDERKEY as int) = 550;
```

To optimize the previous statement, you can create an index on the `L_LINENUMBER` and `L_ORDERKEY` fields, and use the CAST function to map each field to a specific data type, as shown below:

```
maprcli table index add \
  -path /drill/testdata/qa/sfl/maprdb/json/lineitem \
  -index l_cast_comp_1 -indexedfields
  '$CAST(L_LINENUMBER@INT)', '$CAST(L_ORDERKEY@INT)' \
  -includedfields L_LINESTATUS,L_QUANTITY
```

The index stores the values of the `L_LINENUMBER` and `L_ORDERKEY` fields as the `int` data type. HPE Ezmeral Data Fabric Database can use the index for any subsequent queries that cast these fields to `int` instead of accessing data in the primary table and converting the values to `int`.

See [Using Casts in Secondary Indexes](#) on page 519 for more information.

Restrictions

The following restrictions apply to creating indexes.

Name Restrictions

You cannot use the following characters in the index name and in the indexed fields:

```
< > ? % \
```

To use the following characters in the index name and in the indexed fields, enclose them either in single or double quotes:

```
 ; | ( ) /
```

For example:

```
maprcli table index
add -path /volumel/MYTABLE -index
"MYTABLE1_ANALYSIS_1 ^=#{ }&()/" \
  -indexedfields "_timestamp":desc, "
", "LOTNo" -includedfields \
  " ", " ^=#{ }&()/" (or)
```

```
maprcli table index
add -path /volumel/MYTABLE -index
'MYTABLE1_ANALYSIS_1 ^=#{ }&()/' \
  -indexedfields "_timestamp":desc, "
```

```
" , "LOTNo" -includedfields \
  ' , '^=#;{ }&()/'
```

To use either the ' or the " character in the index name and in the indexed fields, enclose:

- the ' character within double quotes (")
- the " character within single quote (')

For example:

```
maprcli table index
add -path /volume1/MYTABLE -index
" 'MYTABLE1_ANALYSIS_1 '^=#;{ }&()/' \
  -indexedfields "_timestamp":desc, " '
" , "LOTNo" -includedfields \
  " ' , '^=#;{ }&()/' (or)

maprcli table index
add -path /volume1/MYTABLE -index
' "MYTABLE1_ANALYSIS_1 '^=#;{ }&()/' \
  -indexedfields "'_timestamp":desc, "
" , "LOTNo" -includedfields \
  ' ' , '^=#;{ }&()/'
```

Type Restrictions

- If a composite index includes the same subfield in multiple indexed fields, the implied types of the subfields must be consistent.

For example, you cannot create an index with the following indexed fields:

```
a.b[ ].c , a.b.d
```

Although subfield b appears in both indexed fields, in the first, it is an array and in the second, it is a nested document.

See [Composite Indexes and Container Field Paths](#) on page 516 for more details.

Size Restrictions

- The maximum size of all indexed fields in an index is 32 KB.

If the collective size exceeds 32 KB, then an insert of the corresponding document results in an encoding error (INDEX_ROW_KEY_ENCODER_ERROR_ENCODING_IS_TOO_LONG).

- The maximum number of indexes that you can create on a JSON table is 32.

Field Definition Restrictions

- You cannot specify individual array elements as indexed fields.
- You cannot specify a table's `_id` field as an indexed field.

- If a field contains an array of nested documents and you want to index on subfields in the nested documents, then you must define the indexed field using a container field path.
- You can include a specific field only once as either an indexed or included field, with the following two exceptions:

- The indexed field is a container field path:

```
maprcli table index add -path /
people \
  -index phoneNumberIdx \
  -indexedfields
Phones[ ].Number \
  -includedfields
Phones[ ].Number
```

- The field specifies a cast to another type.

You can create an index in which the `score` field is an indexed field cast as a double type, and `score` is also an included field. The included field retains the original data type of the `score` field:

```
maprcli table index add -path /
castTable \
  -index castIdx1 \
  -indexedfields
'$CAST(score@DOUBLE)' \
  -includedFields score
```

You can create an index in which the `score` field is an indexed field, cast as a double type, and the `score` field is also another indexed field, cast as a long type:

```
maprcli table index add -path /
castTable \
  -index castIdx2 \
  -indexedfields
'$CAST(score@DOUBLE)', '$CAST(score@LONG)'
```

- You cannot use casts with included fields.

- You cannot specify a field as either an indexed or included field if the field is also specified as a column family JSON path name.

For example, suppose you have the following JSON table:

```
{
  "_id" : "ID",
  "a" : {
    "b" : {
      "c" :
"value",
      "d" :
"value"
    },
    "e" : "value"
  }
}
```

If you create a column family at field `c` in the JSON path `a.b.c`, you cannot define field `a.b.c` as either an indexed or included field. You can define the fields `a`, `a.b`, and `a.b.d` as either indexed or included fields.

- You cannot specify an included field in which the data in the field spans more than one column family.

In the following example, the included field `s11.s12` spans column families, `cf2` and `cf3`:

```
maprcli table cf list -path /cftab
compressionperm readperm
traverseperm jsonfamilypath
writeperm minversions
maxversions compression
ttl          inmemory cfname
memoryperm
u:root          u:root
u:root
u:root          0
1                lz4
2147483647      false      default
u:root
u:root          u:root
u:root          s11
u:root          0
1                lz4
2147483647      false      cf1
u:root
u:root          u:root
u:root          s11.s12.s13
u:root          0
1                lz4
2147483647      false      cf2
u:root
u:root          u:root
u:root          s11.s12.s13.s14
u:root          0
1                lz4
2147483647      false      cf3
u:root

maprcli table index add -path /
cftab -index i1 -indexedfields
s11.s12.s13.s14.l4a,
s11.l1a -includedfields
s11.s12,s11.s12.s13.s14.s15.l5b -js
on
{
    "timestamp":1507419777919,
    "timeofday":"2017-10-07
04:42:57.919 GMT-0700 PM",
    "status":"ERROR",
    "errors":[
        {
            "id":22,

"desc":"Data for included field
s11.s12 may not span more than one
column family."
        }
    ]
}
```

- You cannot specify a composite index with more than one container field path as your indexed fields, unless the prefixes of the container field paths are the same.

See [Composite Indexes and Container Field Paths](#) on page 516 for more details.

- You cannot specify a composite index with an indexed field that is a subfield of another indexed field.

For example, you cannot create an index with the following indexed fields:

```
a, a.b
```

The indexed field `a.b` is a subfield of the indexed field `a`.

Option Restrictions

- As indexes are automatically split, you cannot disable splits when you create your index.

Index Use Restrictions

- Indexes do not optimize non-existence filter conditions.

Example

CLI

```
maprcli table index
add -path /demo/business -index
newIndex -indexedfields fieldName
```

REST

```
curl -k -X POST \
'https://rln1.sj.us:8443/rest/table/
index/add?
path=%2Fdemo%2Fbusiness&index=newIndex
&indexedfields=fieldName' \
-u mapr:mapr
```

table index list

This topic describes how to list information about the secondary indexes created on HPE Ezmeral Data Fabric Database JSON tables.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` on the volume
- `lookupdir` on directories in the table path

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax**CLI**

```
maprcli table index list
  -path <path>
  [ -indexname <index name> ]
  [ -refreshnow < true | false > ]
```

REST

```
curl -k -X GET
  'http[s]://<host>:<port>/rest/table/
  index/list?path=<path>&<parameters>'
  -u <username>:<password>
```

Parameters

| Parameter | Description |
|------------|--|
| path | (Required) Path to where the parent JSON table resides |
| indexname | (Optional) Name of the index for which to display information. If omitted, the output includes all indexes created on the table. |
| refreshnow | (Optional) Whether to fetch the current status of the index Default: False |

Example**CLI**

```
maprcli table index list -path /
my.cluster.com/volume1/table1
```

```
maprcli table index list -path /demo/
business -json
```

REST

```
curl -k -X GET \
  'https://r1n1.sj.us:8443/rest/table/
  index/list?
  path=%my.cluster.com%2Fvolume1%2Ftable
  1' \
  -u mapr:mapr
```

```
curl -k -X GET \
  'https://r1n1.sj.us:8443/rest/table/
  index/list?path=%2Fdemo%2Fbusiness' \
  -u mapr:mapr
```

Output Fields

| Output Field | Description |
|--------------|--|
| cluster | The cluster on which the index resides |
| type | For indexes, this is always maprdb.si |

| Output Field | Description |
|-------------------------------|--|
| indexFid | A unique id used to identify the index in filesystem |
| indexName | Name of the index |
| hashed | A boolean value that specifies whether the index is hashed |
| indexState | The replication state of the index. For information about the replication states, see Table Replication States on page 588. |
| idx | The index id. Unique per table. |
| indexedFields | The list of indexed fields with the sort order of each key |
| includedFields | The list of included fields in the index. Missing from output if there are no included fields. |
| isUptodate | A boolean value that specifies if the index is up-to-date |
| minPendingTS | The epoch time in milliseconds of the oldest operation that has yet to be replicated to the index |
| maxPendingTS | The epoch time in milliseconds of the newest operation that has yet to be replicated to the index |
| bytesPending | The number of bytes that have yet to be replicated to the index |
| putsPending | The number of puts that have yet to be replicated to the index |
| bucketsPending | The number of buckets that have yet to be replicated to the index |
| copyTableCompletionPercentage | <p>The percentage of data from the source that has been copied to the index during the setup phase of replication. After replication setup completes, the value remains at 100.</p> <p> Note: When replicating data to the index, the <code>copyTableCompletionPercentage</code> value may decrease. This happens when splits or merges occur in the JSON table's regions, or the table receives new data.</p> |
| numTablets | The number of tablets the index occupies |
| numRows | The number of rows in the index |
| totalSize | The total size of the index |

Example Output

```
maprcli table index list -path /demo/business -json -indexname il
{
  "timestamp":1506617667735,
  "timeofday":"2017-09-28 04:54:27.735 GMT+0000 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "cluster":"my.cluster.com",
      "type":"maprdb.si",
      "indexFid":"2049.93.10257820",
      "indexName":"il",
```

```

        "hashed":false,
        "indexState":"REPLICA_STATE_REPLICATING",
        "idx":1,
        "indexedFields":"a.b:ASC",
        "isUptodate":true,
        "minPendingTS":0,
        "maxPendingTS":0,
        "bytesPending":0,
        "putsPending":0,
        "bucketsPending":0,
        "copyTableCompletionPercentage":100,
        "numTablets":1,
        "numRows":4,
        "totalSize":24576
    }
]
}

```

Troubleshooting Use Cases

Situations where you can use this command include the following:

- Examine the properties of an index.
- Determine if there is a lag in updates in an index.

See [Troubleshooting Secondary Indexes](#) on page 1207 for more information on these use cases.

table index remove

This topic describe how to remove secondary indexes that are no longer needed.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` on the volume
- `lookupdir` on directories in the table path
- `indexperm` permission on the table, if you did not create the table

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```

maprcli table index remove
-path <path>
-index <index name>

```

REST

```

curl -k -X POST \
'http[s]://<host>:<port>/rest/table/
index/remove?path=<path>&index=<index
name>'
-u <username>:<password>

```

Parameters

| Parameter | Description |
|--------------|--|
| path | (Required) Path to where the parent JSON table resides |
| index | (Required) Name of the index |

Example

CLI

```
maprcli table
index remove -path /my.cluster.com/
volumel/newtable -index testIndex
```

REST

```
curl -k -X POST \
'https://r1n1.sj.us:8443/rest/table/
index/remove?
path=%2Fmy.cluster.com%2Fvolumel%2Fnew
table&index=testIndex' \
-u mapr:mapr
```

table info

Displays information about a HPE Ezmeral Data Fabric Database binary or JSON table, or an index on a JSON table.

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) on the volume
- [lookupdir](#) on directories in the path

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
maprcli table info
-path <path>
[ -index <index name> ]
```

REST

```
curl -k -X GET \
'http[s]://<host>:<port>/rest/table/
info?path=<path>&index=<index name>'
-u <username>:<password>
```

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameters

| Parameter | Description |
|-----------|---|
| path | <p>The path to the table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code> For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code> |
| index | The name of the index for which to display information. |

Example

Lists the information for a table named `mytable` in the JSON format, as described in [Common Options](#) on page 1702:

CLI

```
maprcli table info -path /mapr/
my.cluster.com/volume1/mytable -json
```

REST

```
curl -k -X GET \
'https://rln1.sj.us:8443/rest/table/
info?
path=%2Fmapr%2Fmy.cluster.com%2Fvolume
1%2Fmytable' \
-u mapr:mapr
```

Sample Output

Output Fields

```
maprcli table info -path /mapr/my.cluster.com/volume1/mytable -json
{
  "timestamp":1540362830403,
  "timeofday":"2018-10-23 11:33:50.403 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "path":"/mapr/my.cluster.com/volume1/mytable",
      "numregions":1,
      "totallogicalsize":0,
      "totalphysicalsize":0,
      "totalcopypendingsize":0,
      "totalrows":0,
      "totalnumberofspills":0,
      "totalnumberofsegments":0,
      "autosplit":true,
      "bulkload":false,
      "wireencryptionfrompolicies":false,
      "tabletype":"json",
```

```

"securitypolicy": "[Credit_Card_Data, Confidential] ",
"regionsize": 4096,
"audit": false,
"metricsinterval": 10,

```

| Output Field | Description |
|----------------------|--|
| path | <p>The path to the HPE Ezmeral Data Fabric Database table</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code> For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code> |
| numregions | Number of regions in the table |
| totallogicalsize | Estimated size (in bytes) of uncompressed data stored in table (excluding replication) |
| totalphysicalsize | <p>Estimated size (in bytes) of actual data stored in table (excluding replication).</p> <p>Includes internal metadata and reflects compressed data size when compression is enabled.</p> |
| totalcopypendingsize | Total size (in bytes) of pending data for replication |
| totalrows | Estimated number of rows in a table |
| autosplit | <p>A Boolean value that specifies whether to split the table into regions automatically as the table grows. The average size of each region is determined by the <code>regionsize</code> parameter.</p> <p>The default value is <code>true</code>. If value is set to <code>false</code>, you can manually split tables into regions by using the <code>table region split</code> command.</p> |

| Output Field | Description |
|------------------------|---|
| bulkload | A Boolean value that specifies whether to allow a full bulk load of the table. The default is <code>false</code> . For more information, see Loading Data into Binary Tables on page 1144 and Loading Documents into JSON Tables on page 1140. |
| tabletype | Specifies whether the table will be a binary table or a JSON table. The values are <code>binary</code> and <code>json</code> . The default is <code>binary</code> . |
| regionsize mb | <p>The average size of the regions into which HPE Ezmeral Data Fabric Database tries to split the table as the table grows. The default is 4096 MB. This value is ignored if <code>autosplit</code> is set to <code>false</code>.</p> <p>If <code>autosplit</code> is set to <code>true</code>, HPE Ezmeral Data Fabric Database splits a region when the size of the region exceeds 150% of the average value. For example, if the average value is 4096 MB, HPE Ezmeral Data Fabric Database splits a region that is larger than 6144 MB.</p> <p>Although splits are automatic, merges are not. For example, if the value of <code>regionsizemb</code> is changed from 8 GB to 4 GB, all regions that are eligible are split automatically, if <code>autosplit</code> is set to <code>true</code>. However, if the value of <code>regionsizemb</code> is changed from 2 GB to 4 GB, regions smaller than 4 GB are not automatically merged.</p> <p> Note: When a table has less than 4 regions, HPE Ezmeral Data Fabric Database ignores the <code>regionsizemb</code> parameter and splits regions at a lower threshold.</p> |
| audit | Specifies whether to turn auditing on for the table. If auditing is also enabled at the cluster level with the <code>maprcli audit data</code> command and enabled for the current volume, setting this value to <code>true</code> causes auditing to start for the table. |
| metricsinterval | The table metrics collection interval, in seconds |
| maxvalueszinmemindex | The maximum value size to save in an in-memory index |
| adminaccessperm | The Access Control Expression that controls who can view and edit the permissions for this table. By default, permission is given to the user ID that is used to create the table. |
| createrenamefamilyperm | The Access Control Expression that controls who can create column families for this table or rename existing column families. By default, permission is given to the user ID that is used to create the table. |
| bulkloadperm | The Access Control Expression that controls who can load this table with bulk loads if the table was created with bulk load support. By default, permission is given to the user ID that is used to create the table. |
| indexperm | The secondary index Admin permissions setting that controls who can create an index associated with this table. By default, permission is given to the user ID that is used to create the table. |

| Output Field | Description |
|------------------------|--|
| packperm | The Access Control Expression that controls who can pack table regions. By default, permission is given to the user ID that is used to create the table. |
| deletefamilyperm | The Access Control Expression that defines access to delete column families for this table. Delimit the expression with single-quotation marks. By default, permission is given to the user ID that is used to create the table. |
| replperm | The Access Control Expression that controls who can set up replication either to or from a table. By default, permission is given to the user ID that is used to create the table |
| splitmergeperm | <p>The Access Control Expression that controls who can take the following actions:</p> <ul style="list-style-type: none"> • Run the <code>table region split</code> and <code>table region merge</code> commands to split the table into regions or to merge regions of the table together. • Change the value of <code>regionsizemb</code>. <p>By default, permission is given to the user ID that is used to create the table.</p> |
| defaultappendperm | Applies to binary tables only: The default Access Control Expression for the append permission on new column families that are created in this table. If no value is specified, the default is <code>u:<username of the table creator></code> . This value of the parameter <code>appendperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value. |
| defaultcompressionperm | Applies to binary tables only: The default Access Control Expression for the compression permission on new column families that are created in this table. If no value is specified, the default is <code>u:<username of the table creator></code> . This value of the parameter <code>compressionperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value. |
| defaultmemoryperm | The default Access Control Expression for the memory permission on new column families that are created in this table. If no value is specified, the default is <code>u:<username of the table creator></code> . This value of the parameter <code>memoryperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value. |
| defaultreadperm | The default Access Control Expression for the read permission on new column families that are created in this table. If no value is specified, the default is <code>u:<username of the table creator></code> . This value of the parameter <code>readperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value. See table cf create on page 2048 and table cf edit on page 2055 |

| Output Field | Description |
|----------------------------|---|
| defaulttraverseperm | Applies to JSON tables only: The default Access Control Expression for the traverse permission on new column families. For more information about this permission, see Permission Types for Fields and Column Families in JSON Tables on page 1157. |
| defaultwriteperm | The default Access Control Expression for the write permission on new column families that are created in this table. If no value is specified, the default is <code>u:<username of the table creator></code> . This value of the parameter <code>writeperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value. See table cf create on page 2048 and table cf edit on page 2055. |
| securitypolicy | The security policy or policies tagged to the table. If the parameter is not specified during table creation, the default value is uninitialized (" <code>[-]</code> "), and there is no security policy for the table. |
| uuid | The table UUID. |
| wireencryptionfrompolicies | The system automatically sets this field to true if at least one security policy has wire-level encryption enabled, false otherwise. |

table region

Manages table regions for HPE Ezmeral Data Fabric Database binary and JSON tables.

table region list

Lists the regions that make up a specified table or index.

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) on the volume
- [lookupdir](#) on directories in the path

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax**CLI**

```
maprcli table region list
  -path <path>
  [ -start <offset from starting
region> ]
  [ -limit <number of regions to
return> ]
  [ -index <index name> ]
  [ -output terse | verbose ]
```

REST

```
curl -k -X GET \
'http[s]://<host>:<port>/rest/table/
```

```
region/list?path=<path>&<parameters>'
-u <username>:<password>
```

Parameters

| Parameter | Description |
|-----------|---|
| path | <p>Path to the table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, if you want to list regions for a table named <code>test</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code> For a path on a remote cluster, you must also specify the cluster name in the path. For example, if you want to list regions for a table named <code>test</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code> |
| start | The offset from the starting region. The default value is 0. |
| limit | The number of regions to return, counting from the starting region. The default value is 2147483647. |
| index | The name of the index for which to list region information. |
| output | <p>Specifies whether the output should be <code>terse</code> or <code>verbose</code>.</p> <p>Default: <code>verbose</code></p> |

Output Fields

| Verbose Field Name | Terse Field Name | Field Value |
|--------------------|------------------|--|
| primarymfs | pn | Host name and port of the primary node for this region |
| secondarymfs | sn | Host names and ports of the secondary nodes where this region is replicated |
| startkey | sk | <p>Value of the start key for this region</p> <p>For the first region in a table, this value is exclusive. For all other regions, it is inclusive. See the example output.</p> |
| endkey | ek | <p>Value of the end key for this region</p> <p>This value is always exclusive. See the example output.</p> |
| lastheartbeat | lhb | Time since last heartbeat from the region's primary node |
| fid | fid | The region's FID. |

| Verbose Field Name | Terse Field Name | Field Value |
|------------------------|------------------|---|
| logicalsize | ls | The logical size (in bytes) of the region without data compression (excluding replication). |
| physicalsize | ps | The physical size (in bytes) of the region with data compression (excluding replication). |
| copypendingsize | cps | Amount of data remaining to be replicated |
| numberofrows | nr | Number of rows in the region |
| numberofrowswithdelete | nrd | Number of rows in the region, counting deleted rows |
| numberofspills | nsp | Number of spills for the region |
| numberofsegments | nsg | Number of segments in the region |

Examples

Lists the Region Information for a Table

This example lists the region information for the table `newtable`.

CLI

```
maprcli table region list -path /
my.cluster.com/volume1/newtable
```

REST

```
curl -k -X GET \
  'https://r1n1.sj.us:8443/rest/table/
  region/list?
  path=%2Fmy.cluster.com%2Fvolume1%2Fnew
  table' \
  -u mapr:mapr
```

Example Output Using the -json Option

This example shows two table regions. The value of `endkey` for the first region is the value of `startkey` for the second region. The value of `endkey` is always exclusive. So, for the first region, `endkey` shows that the first region was split with the addition of the record with the key `5190414F2E44DB732547630A9A81452539749000`; for the second region, `startkey` shows that the region begins with that record.

        "numberofrowswithdelete":0,
        "numberofspills":0,
        "numberofsegments":0
    }
]
}

```

table region merge

Merges regions of a table together to reduce the number of regions that a table occupies.

This command merges the region that you specify with the region that contains the row keys that immediately follow the row keys of the specified region.

Note: Consider the table configuration when you decide to merge regions because it is possible that HPE Ezmeral Data Fabric Database might immediately split the regions after they are merged. If `autosplit` is set to true, HPE Ezmeral Data Fabric Database splits a region when the size of the region exceeds 150% of the average value (`regionsizeemb`). For example, if the average value is 4096 MB, HPE Ezmeral Data Fabric Database splits a region that is larger than 6144 MB.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `splitmergeperm` permission on the table

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
maprcli table region merge
  -fid <regionFID>
  -path <table path>
```

REST

```
curl -k -X POST
'http[s]://<host>:<port>/rest/
```

```
table/region/merge?fid=<region
FID>&path=<path>'
-u <username>:<password>
```

Parameters

| Parameter | Description |
|-------------|---|
| fid | The FID for the table region that you want to merge. The output of <code>maprcli table region list</code> lists the FIDs for the table. |
| path | The path to the table whose regions are being merged. <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, if you want to merge regions for table named <code>test</code> under volume1 which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code> For a path on a remote, you must also specify the cluster name in the path. For example, if you want to merge regions for table named <code>test</code> under volume1 in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code> |

Example

Merges the specified region:

CLI

```
maprcli table region merge -path /
user/test5 -fid 2086.32.131296
```

REST

```
curl -k -X POST \
'https://myhost:8443/rest/table/
region/merge?
path=%2Fuser%2Ftest5&fid=2086.32.13129
6' \
-u mapr:mapr
```

table region pack

Manually triggers the packing of regions.

HPE Ezmeral Data Fabric Database automatically compacts or packs regions and reclaims space when 25% of the data contained in the partitions (max of 3 per tablet) has expired; however, for a time series table, you **must** run this command to reclaim space used by expired rows and to avoid read amplification, if the old rows are never accessed.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `packperm` permission on the table

 **Note:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
maprcli table region pack
  -path <table path>
  -fid <fid>|all
  [ -nthreads <number of threads> ]
```

REST

```
curl -k -X POST
  'http[s]://
  <host>:<port>/rest/table/region/pack?
  path=<path>&fid=<fid>&<parameters>'
  -u <username>:<password>
```

 **Note:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameters

| Parameter | Description |
|-----------|--|
| path | <p>Specifies the path to the table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, if you want to pack a table named <code>test</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code> For a path on another cluster, you must also specify the cluster name in the path. For example, if you want to pack a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code> |
| fid | <p>Specifies that you want to pack all table regions or a single table region that you identify with a FID. The output of <code>maprcli table region list</code> lists the FIDs for the table.</p> |
| nthreads | <p>Specifies the number of threads allocated to process the packing of table regions. Default:16</p> |

Example

Packs the specified region:

CLI

```
maprcli table region pack -path /user/
test5 -fid 2086.32.131296
```

REST

```
curl -k -X POST \
  'https://myhost:8443/rest/table/
  region/pack?
```

```
path=%2Fuser%2Ftest5&fid=2086.32.13129
6' \
-u mapr:mapr
```

table region split
Splits a region in a table.

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume
- [lookupdir](#) on directories in the path
- [splitmergeperm](#) permission on the table

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
maprcli table region split
-path <path>
-fid <fid>
```

REST

```
curl -k -X POST
'http[s]://<host>:<port>/rest/table/
region/split?path=<path>&fid=<fid>'
-u <username>:<password>
```

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameters

| Parameter | Description |
|-------------|--|
| path | <p>Path to the table.</p> <ul style="list-style-type: none"> • For a path on the local cluster, start the path at the volume mount point. For example, if you want to split regions in a table named <code>test</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code> • For a path on another cluster, you must also specify the cluster name in the path. For example, if you want to split regions in a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code> |

| Parameter | Description |
|------------|--|
| fid | The FID of the region to split. The output of <code>maprcli table region list</code> lists the FIDs for the table's regions. |

Example

This example splits a region in the table `newtable`.

CLI

```
maprcli table region split -path /
my.cluster.com/volume1/newtable -fid
2086.32.131296
```

REST

```
curl -k -X POST \
'https://rln1.sj.us:8443/rest/table/
region/split?
path=%2Fmy.cluster.com%2Fvolume1%2Fnew
table&fid=2086.32.131296' \
-u mapr:mapr
```

`table replica`

Performs functions related to replication of HPE Ezmeral Data Fabric Database binary and JSON tables. Replication occurs for binary-to-binary tables and JSON-to-JSON tables.

`table replica add`

Registers a table as a replica of another HPE Ezmeral Data Fabric Database binary or JSON table.

Note: You do not need to use this command if you use the `table replica autoseup` command.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on both the source volume and the target volume
- `lookupdir` on directories in the paths of both tables
- `readperm` and `replperm` permissions on the source table

Note: The **mapr user** is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the **mapr user** to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
/opt/mapr/bin/maprcli table replica
add
-path <table path>
-replica <replica table path>
[ -columns <comma separated list of
<family>[:<column>]> ]
[ -paused <is replication paused>
default: false ]
[ -throttle <throttle replication
ops> default: false ]
[ -networkencryption <enable
```

```
on-wire encryption> default: false> ]
[ -synchronous <is synchronous
replication> default: false ]
[ -networkcompression <on-wire
compression type: off|on|lzf|lz4|
zlib> default: on ]
```

REST

```
curl -k -X POST
'http[s]://<host>:<port>/rest/table/
replica/add?
path=<path>&replica=<name>&<parameters
>
-u <username>:<password>
```

Note: The **mapr user** is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the **mapr user** to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameters

| Parameter | Description |
|-----------|---|
| path | <p>The path to the source table that you want to replicate.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>testsrc</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testsrc</code> For a path on another cluster, you must also specify the cluster name in the path. For example, for a table named <code>customersrc</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>mapr/sanfrancisco/volume1/customersrc</code> |
| replica | <p>The path to the replica.</p> <ul style="list-style-type: none"> For a table on the local cluster, start the path at the volume mount point. For example, for a table named <code>testdst</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testdst</code> For a table on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customerdst</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>mapr/sanfrancisco/volume1/customerdst</code> <p> Note: For replication to a table, the command will fail if the table in the replica path does not exist.</p> |

| Parameter | Description |
|----------------|--|
| <p>columns</p> | <p>By default, all columns in the source table are replicated.</p> <p>If you do not want to replicate all columns in the table, you can specify specific columns to replicate:</p> <p>For binary tables</p> <p>Provide a comma-separated list of column families or columns from a certain column family (column family:qualifier). For example, use the following syntax to replicate the column family purchases and the column stars in the reviews column family: <code>-columns purchases, reviews:stars</code></p> <p> Note: While the column families that you specify must already exist in the source table, the columns that you specify do not have to exist in the destination table for replication to succeed. If the column is added at a later date, replication for that column will start at that time.</p> <p>For JSON tables</p> <p>Provide a comma-delimited list of fields to replicate. Include the full field path for each field.</p> <p>Example</p> <p>Suppose your table contains documents that contain this general structure:</p> <pre data-bbox="1149 1478 1455 1982"> { "_id" : "ID", "a" : { "b" : { "c" : "value", }, "e" : "value" } } </pre> <p>To replicate fields a, c, and e, you would specify these field paths:</p> |

| Parameter | Description |
|--------------------|--|
| paused | A Boolean value that specifies whether to pause the replication so that it does not start immediately. The replication can be resumed using the replica resume command at a later time. The values are <code>true</code> or <code>false</code> . Default: Not paused (<code>false</code>) |
| throttle | A Boolean value that specifies whether to throttle replication operations. Throttle the replication stream to minimize the impact of the replication process on incoming operations during periods of heavy load. The values are <code>true</code> or <code>false</code> . Default: No throttle (<code>false</code>) |
| networkencryption | A Boolean value that specifies whether or not to enable on-wire encryption. The values are <code>true</code> or <code>false</code> . If you set this to <code>true</code> , the local cluster and any other cluster that is part of the replication process must be enabled for security. Default: No encryption (<code>false</code>) |
| synchronous | A Boolean value that specifies whether replication is synchronous or asynchronous. The values are <code>true</code> or <code>false</code> . Default: Asynchronous (<code>false</code>) |
| networkcompression | The type of on-wire compression. Default: on The types are: <ul style="list-style-type: none"> • <code>off</code> • <code>on</code> (default) • <code>lzf</code> • <code>lz4</code> • <code>zlib</code> The default compression is <code>lz4</code> , which can be set by specifying <code>on</code> or <code>lz4</code> as value. |

Example

Registers a table on the local cluster as a replica of another table on the local cluster:

CLI

```
/opt/mapr/bin/maprcli table
replica add -path /volume1/
custA -replica /volume2/custA
```

REST

```
curl -k -X POST \
  'https://rln1.sj.us:8443/rest/table/
  replica/add?
  path=%2Fvolume1%2FcustA&replica=%2Fvol
  ume2%2FcustA' \
  -u mapr:mapr
```

```
table replica autoseup
```

Sets up and starts replication between a *source* HPE Ezmeral Data Fabric Database binary or JSON table to a *replica* HPE Ezmeral Data Fabric Database binary or JSON table.

The `maprcli table replica autoseup` command performs the following steps to set up replication:

1. Creates a new table with metadata from the source table in the destination cluster.
2. Declares the new table to be a replica of the source table and ensures that replication does not begin immediately after the next step.
3. Declares the source table as an upstream source for the replica.
4. For multi-master replication, replica autoseup declares the source table to be a replica of the new table and then declares the new table to be an upstream source for the source table.
5. Loads a copy of the source data into the replica(s).
6. Clears the paused replication state to start the replication stream.

For more information about the automatic setup process, see [Replica Autoseup for HPE Ezmeral Data Fabric Database Tables](#) on page 587.

Before you set up replication for a table, verify that the cluster is setup for replication. For more information, see [Preparing Clusters for Table Replication](#) on page 1181.

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on both the source volume and the target volume
- [lookupdir](#) on directories in the paths of both tables
- [readperm](#) and [replperm](#) permissions on the source table

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with [ACE](#).

Syntax

CLI

```
/opt/mapr/bin/maprcli table replica
autoseup
  -path <table path>
  -replica <replica table path>
  [ -columns <comma separated list of
  <family>[:<column>]> ]
  [ -synchronous <is synchronous
  replication> default: false ]
  [ -multimaster <is multi master
  replication> default: false ]
  [ -throttle <throttle replication
  ops> default: false ]
  [ -networkencryption <enable
  on-wire encryption> default: false ]
  [ -networkcompression <on-wire
  compression type: off|on|lzf|lz4|
  zlib> default: on ]
  [ -directcopy <enable directcopy>
  default: true ]
  [ -useexistingreplica <use existing
  replica table if present> default:
  false ]
```

REST

```
curl -k -X POST
  'http[s]://<host>:<port>/rest/table/
  replica/autosetup?
  path=<path>&replica=<path>&<parameters
  >'
  -u <username>:<password>
```

Parameters

| | |
|----------------|--|
| <p>path</p> | <p>The path to the source table that you want to replicate.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>testsrc</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testsrc</code> For a path on another cluster, you must also specify the cluster name in the path. For example, for a table named <code>customersrc</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customersrc</code> |
| <p>replica</p> | <p>The path to the replica.</p> <ul style="list-style-type: none"> For a table on the local cluster, start the path at the volume mount point. For example, for a table named <code>testdst</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testdst</code> For a table on another cluster, you must also specify the cluster name in the path. For example, for a table named <code>customerdst</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customerdst</code> <p> Note: For replication to a table, the command will fail if the replica path you specify points to table that already exists.</p> |

columns

By default, all columns in the source table are replicated. If you do not want to replicate all columns in the table, you can specify specific columns to replicate:

For binary tables

Provide a comma-separated list of column families or columns from a certain column family (column family:qualifier). For example, use the following syntax to replicate the column family purchases and the column stars in the reviews column family: `-columns purchases, reviews:stars`

Note: While the column families that you specify must already exist in the source table, the columns that you specify do not have to exist in the destination table for replication to succeed. If the column is added at a later date, replication for that column will start at that time.

For JSON tables

Provide a comma-delimited list of fields to replicate. Include the full field path for each field.

Example

Suppose your table contains documents that contain this general structure:

```
{
  "_id" : "ID",
  "a" :
    {
      "b" :
        {
          "c" :
            "value",
          },
      "e" : "value"
        }
}
```

To replicate fields a, c, and e, you would specify these field paths:

```
a,a.b.c,a.e
```

| | |
|--------------------|---|
| synchronous | A Boolean value that specifies whether replication is synchronous or asynchronous. The value is either <code>true</code> or <code>false</code> . Asynchronous (<code>false</code>) is the default. |
| multimaster | A Boolean value that specifies whether or not to set up a multi-master topology. The value is either <code>true</code> or <code>false</code> . Basic primary-secondary topology (<code>false</code>) is the default. |
| throttle | A Boolean value that specifies whether or not to throttle replication operations. Throttle the replication stream to minimize the impact of the replication process on incoming operations during periods of heavy load. The value is either <code>true</code> or <code>false</code> . No throttle (<code>false</code>) is the default. |
| networkencryption | A Boolean value that specifies whether or not to enable on-wire encryption. The value is either <code>true</code> or <code>false</code> . No encryption (<code>false</code>) is the default. If you set this to <code>true</code> , the local cluster and any other cluster that is part of the replication process must be enabled for security. |
| networkcompression | <p>The type of on-wire compression.</p> <p>The types are:</p> <ul style="list-style-type: none"> • off • on (default) • lzf • lz4 • zlib <p>lz4 is the default compression which it set by parameter values <code>on</code> or <code>lz4</code>.</p> |
| directcopy | <p>A Boolean value that specifies whether or not autoseup will use the directcopy option . The value is either <code>true</code> or <code>false</code>. Autoseup with direct copy (<code>true</code>) is the default. If you set this parameter to <code>false</code>, the cluster will run autoseup without the directcopy option. For more information, see Replica Autoseup for HPE Ezmeral Data Fabric Database Tables on page 587.</p> <p> Note: If a table was originally created in MapR 5.x and the <code>maprcli table replica autoseup</code> command is specified with <code>directcopy=false</code>, then an error, “Copy Table failed for tables”, occurs. This is due to the introduction of new table meta information in 6.0. It is recommended that replication be setup using <code>directcopy=true</code> (which is the default). If the default method is not desired, then replication should be setup manually.</p> |
| useexistingreplica | When the <code>directcopy</code> parameter is set to <code>true</code> (default), this Boolean value specifies whether or not an existing table can be used as the replica table. The value is either <code>true</code> or <code>false</code> . No reuse of existing tables (<code>false</code>) is the default. If a table exists with the specified name, and this parameter is set to <code>false</code> , the create table operation will fail. |

Example

CLI

```
/opt/mapr/bin/maprcli table
replica autoseup -path /volume1/
custBsrc -replica /volume2/custBdst
```

REST

```
curl -k -X POST \
  'https://r1n1.sj.us:8443/rest/table/
  replica/autoseup?
  path=%2Fvolume2%2FcustBsrc&replica=%2F
  volume2%2FcustBdst' \
  -u mapr:mapr
```

table replica edit

Edits the properties of a replica of a HPE Ezmeral Data Fabric Database binary or JSON table.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on both the source volume and the target volume
- `lookupdir` on directories in the paths of both tables
- `readperm` and `replperm` permissions on the source table

Note: The **mapr user** is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the **mapr user** to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
maprcli table replica edit
-path <table path>
-replica <replica table path>
[ -newreplica <renamed table path> ]
[ -columns <comma separated list of
<family>[:<column>]> ]
[ -throttle <throttle replication
ops> ]
[ -networkencryption <enable
on-wire encryption> ]
[ -synchronous <is synchronous
replication> ]
[ -networkcompression <on-wire
compression type: off|on|lzf|lz4|
zlib> ]
```

REST

```
curl -k -X POST
  'http[s]://<host>:<port>/rest/table/
  replica/edit?
  path=<path>&replica=<path>&<parameters
  >'
  -u <username>:<password>
```

Note: The **mapr user** is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the **mapr user** to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameters

| Parameter | Description |
|------------|--|
| path | <p>The path to the source table that you want to replicate.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>testsrc</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testsrc</code> For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customersrc</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customersrc</code> |
| replica | <p>The path to the replica.</p> <ul style="list-style-type: none"> For a table on the local cluster, start the path at the volume mount point. For example, for a table named <code>testdst</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testdst</code> For a table on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customerdst</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customerdst</code> |
| newreplica | <p>The updated replica path due to a renamed replica table, renamed cluster, or changed table path. The table specified in the <code>replica</code> parameter and the table specified in the <code>newreplica</code> parameter must have the same UUID.</p> |

| Parameter | Description |
|-----------|--|
| columns | <p>By default, all columns in the source table are replicated.</p> <p>If you do not want to replicate all columns in the table, you can specify specific columns to replicate:</p> <p>For binary tables</p> <p>Provide a comma-separated list of column families or columns from a certain column family (column family:qualifier). For example, use the following syntax to replicate the column family purchases and the column stars in the reviews column family: <code>-columns purchases, reviews:stars</code></p> <p> Note: While the column families that you specify must already exist in the source table, the columns that you specify do not have to exist in the destination table for replication to succeed. If the column is added at a later date, replication for that column will start at that time.</p> <p>For JSON tables</p> <p>Provide a comma-delimited list of fields to replicate. Include the full field path for each field.</p> <p>Example</p> <p>Suppose your table contains documents that contain this general structure:</p> <pre data-bbox="1149 1478 1455 1982"> { "_id" : "ID", "a" : { "b" : { "c" : "value", }, "e" : "value" } } </pre> <p>To replicate fields a, c, and e, you would specify these field paths:</p> |

| Parameter | Description |
|--------------------|--|
| throttle | A Boolean value that specifies whether or not to throttle replication operations. Throttle the replication stream to minimize the impact of the replication process on incoming operations during periods of heavy load. The values are <code>true</code> or <code>false</code> . No throttle (<code>false</code>) is the default. |
| networkencryption | A Boolean value that specifies whether or not to enable on-wire encryption. The values are <code>true</code> or <code>false</code> . No encryption (<code>false</code>) is the default. If you set this to <code>true</code> , the local cluster and any other cluster that is part of the replication process must be enabled for security. |
| synchronous | A Boolean value that specifies whether replication is synchronous or asynchronous. The values are <code>true</code> or <code>false</code> . Asynchronous (<code>false</code>) is the default. |
| networkcompression | The type of on-wire compression. The types are: <ul style="list-style-type: none"> • <code>off</code> • <code>on</code> (default) • <code>lz4</code> • <code>lz4</code>. This is the default • <code>zlib</code> lz4 is the default compression which it set by parameter values <code>on</code> or <code>lz4</code> . |

Examples

Changes the replica path to reflect that replica `t2dst` is renamed to `t2dst_new`:

CLI

```
maprcli table replica edit -path /
volume1/t1src -replica /volume1/t2dst \
-newreplica /volume1/t2dst_new
```

REST

```
curl -k -X POST \
'https://rln1.sj.us:8443/rest/table/
replica/edit?
path=%2Fvolume1%2Ft1&replica=%2Fvolume
1%2Ft2&newreplica=%2Fvolume1%2Ft2_new' \
-u mapr:mapr
```

Changes the column families to replicate:

CLI

```
maprcli table
replica edit -path /volume1/
custAsrc -replica /volume2/custAdst \
-columns purchases, reviews, returns
```

REST

```
curl -k -X POST \
  'https://r1n1.sj.us:8443/rest/table/
  replica/edit?
  path=%2Fvolume1%2FcustAsrc&replica=%2F
  volume2%2FcustAdst&columns=purchases,r
  eviews,returns' \
  -u mapr:mapr
```

table replica list

Lists replicas and the associated replica statistics for a specified HPE Ezmeral Data Fabric Database binary or JSON table. By default, replica statistics are updated every five minutes.

Permissions Required

To run this command, your user ID must have the following permissions:

- readAce on the volume
- lookupdir on directories in the path

Note: The **mapr user** is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the **mapr user** to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax**CLI**

```
/opt/mapr/bin/maprcli table replica
list
-path <table path>
[ -refreshnow true|false ]
```

REST

```
curl -k -X GET
'http[s]://
<host>:<port>/rest/table/replica/list?
path=<path>&refreshnow=false'
-u <username>:<password>
```

Parameters

| Parameter | Description |
|-----------|---|
| path | <p>The path to the table that you want to list replicas for.</p> <ul style="list-style-type: none"> • For a table on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code> • For a table on another cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfranciscocluster</code>, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code> |

| Parameter | Description |
|------------|--|
| refreshnow | A Boolean value that specifies if you want to trigger an immediate update of the replica statistics. The values are <code>true</code> or <code>false</code> . By default, the value is <code>false</code> ; the command lists the current version of the replica statistics, which could be a maximum of five minutes old. |

Output

Lists information about each replica for the specified table.

Output Data Fields

The following fields display for each replica.

| Field | Description |
|--------------------|--|
| cluster | The cluster on which the replica resides. |
| table | The table name for the replica. |
| type | The table type. |
| paused | A Boolean values that specifies if replication is paused. |
| replicaPath | The table replica path. |
| replicaState | The replication state. For information about the replication states, see Table Replication States on page 588. |
| throttle | A Boolean value that specifies if replication is throttled. |
| idx | The internal index value. |
| networkencryption | A Boolean value that specifies if replication is encrypted. |
| synchronous | A Boolean value that specifies whether replication is synchronous or asynchronous. |
| networkcompression | The type of on-wire compression. |
| isUptodate | A Boolean value that specifies if the replica is up-to-date. |
| minPendingTS | The epoch time in milliseconds of the oldest operation that has yet to be replicated to the replica. |
| maxPendingTS | The epoch time in milliseconds of the newest operation that has yet to be replicated to the replica. |
| bytesPending | The number of bytes that have yet to be replicated to the replica. |
| putsPending | The number of puts that have yet to be replicated to the replica. |
| bucketsPending | The number of buckets that have yet to be replicated to the replica. |
| uuid | The table UUID. |

| Field | Description |
|-------------------------------|---|
| copyTableCompletionPercentage | <p>When replica autoseup with directcopy is in progress, this value is the percentage of data from the source that has been copied to the replica. After replication is setup, the value remains at 100.</p> <p> Note: When replicating HPE Ezmeral Data Fabric Database data, the copyTablePercentageCompletion data may re-adjust to a lower rate. This depends on table region (also referred to as tablets) splits and merges as well as the rate of incoming data to replicating data.</p> |
| errors | If applicable, an error is displayed. |

Sample Output

```
{
  "timestamp":1485555420019,
  "timeofday":"2017-01-27 10:17:00.019 GMT+0000",
  "status":"OK",
  "total":1,
  "data":[
    {
      "cluster":"cluster",
      "table":"/dst",
      "type":"MapRDB",
      "replicaPath":"/dst",
      "replicaState":"REPLICA_STATE_REPLICATING",
      "paused":false,
      "throttle":false,
      "idx":1,
      "networkencryption":false,
      "synchronous":false,
      "networkcompression":"lz4",
      "isUptodate":true,
      "minPendingTS":0,
      "maxPendingTS":0,
      "bytesPending":0,
      "putsPending":0,
      "bucketsPending":0,
      "uuid":"4164f38a-b4ed-0302-f929-0d8bc68b5800",
      "copyTableCompletionPercentage":100
    }
  ]
}
```

Example

Lists replicas for the `custA` table:

CLI

```
/opt/mapr/bin/maprcli table replica
list -path /volume1/custA
```

REST

```
curl -k -X GET \
  'https://r1n1.sj.us:8443/rest/table/
  replica/list?path=%2Fvolume1%2FcustA'
```

```
\
-u mapr:mapr
```

table replica pause

Pauses the replication of data from a *source* HPE Ezmeral Data Fabric Database binary or JSON table to a *replica* HPE Ezmeral Data Fabric Database binary or JSON table during autoseup and replication phases.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on both the source volume and the target volume
- `lookupdir` on directories in the paths of both tables
- `replperm` permissions on the source table

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
maprcli table replica pause
-path <table path>
-replica <replica table path>
```

REST

```
curl -k -X POST
'http[s]://
<host>:<port>/rest/table/replica/
pause?path=<path>&replica=<path>'
-u <username>:<password>
```

Parameters

| Parameter | Description |
|-----------|--|
| path | <p>The path to the source table.</p> <ul style="list-style-type: none"> • For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>testsrc</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testsrc</code> • For a path on another cluster, you must also specify the cluster name in the path. For example, for a table named <code>customersrc</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customersrc</code> |

| Parameter | Description |
|-----------|---|
| replica | <p>The path to the replica that will receive updates from the source.</p> <ul style="list-style-type: none"> For a table on the local cluster, start the path at the volume mount point. For example, for a table named <code>testdst</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testdst</code> For a table on another cluster, you must also specify the cluster name in the path. For example, for a table named <code>customerdst</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customerdst</code> |

Example

Sets the replication state to paused:

CLI

```
maprcli table
replica pause -path /volume1/
custAsrc -replica /volume2/custAdst
```

REST

```
curl -k -X POST \
  'https://rln1.sj.us:8443/rest/table/
replica/pause?
path=%2Fvolume1%2FcustAsrc&replica=%2F
volume2%2FcustAdst' \
  -u mapr:mapr
```

`table replica remove`

De-registers the specified HPE Ezmeral Data Fabric Database binary or JSON table as a replica.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on both the source volume and the target volume
- `lookupdir` on directories in the paths of both tables
- `replperm` permissions on the source table

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

After running this command, the specified table or index is no longer a replica of the source table and will no longer receive updates from the source table.

In addition, run the `table upstream remove` command to remove the association between the source table and the replica table.

Syntax

CLI

```
/opt/mapr/bin/maprcli table replica
remove
  -path <table path>
  -replica <replica table path>
```

REST

```
curl -k -X POST
'http[s]://
<host>:<port>/rest/table/replica/
remove?path=<path>&replica=<path>'
-u <username>:<password>
```

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameters

| Parameter | Description |
|-----------|--|
| path | <p>The path to the source table that is being replicated.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>testsrc</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testsrc</code> For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customersrc</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customersrc</code> |
| replica | <p>The path to the replica.</p> <ul style="list-style-type: none"> For a table on the local cluster, start the path at the volume mount point. For example, for a table named <code>testdst</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testdst</code> For a table on another cluster, you must also specify the cluster name in the path. For example, for a table named <code>customerdst</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customerdst</code> |

Example

De-registers table `custAdst` as a replica of table `custAsrc`:

CLI

```
/opt/mapr/bin/maprcli table
replica remove -path /volume1/
custAsrc -replica /volume2/custAdst
```

REST

```
curl -k -X POST \
  'https://r1n1.sj.us:8443/rest/table/
  replica/remove?
  path=%2Fvolume1%2FcustAsrc&replica=%2F
  volume2%2FcustAdst' \
  -u mapr:mapr
```

table replica resume

Resumes replication between a *source* HPE Ezmeral Data Fabric Database binary or JSON table and a *replica* of that table. Replication can be paused during autoseup and replication phases. When replication resumes, it continues from where it left off.

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on both the source volume and the target volume
- [lookupdir](#) on directories in the paths of both tables
- `replperm` permissions on the source table

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
maprcli table replica resume
-path <table path>
-replica <replica table path>
```

REST

```
curl -k -X POST
  'http[s]://
  <host>:<port>/rest/table/replica/
  resume?path=<path>&replica=<path>'
  -u <username>:<password>
```

Parameters

| Parameter | Description |
|-----------|--|
| path | <p>The path to the table that will be replicated.</p> <ul style="list-style-type: none"> • For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>testsrc</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testsrc</code> • For a path on another cluster, you must also specify the cluster name in the path. For example, for a table named <code>customersrc</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>mapr/sanfrancisco/volume1/customersrc</code> |

| Parameter | Description |
|-----------|---|
| replica | <p>The path to the replica.</p> <ul style="list-style-type: none"> For a table on the local cluster, start the path at the volume mount point. For example, for a table named <code>testdst</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testdst</code> For a table on another cluster, you must also specify the cluster name in the path. For example, for a table named <code>customerdst</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customerdst</code> |

Example

CLI

```
maprcli table
replica resume -path /volume1/
custAsrc -replica /volume2/custAdst
```

REST

```
curl -k -X POST \
'https://r1n1.sj.us:8443/rest/table/
replica/resume?
path=%2Fvolume1%2FcustAsrc&replica=%2F
volume2%2FcustAdst' \
-u mapr:mapr
```

`table securitypolicy`

Manages security policies for HPE Ezmeral Data Fabric Database JSON tables.

`table securitypolicy add`

Adds a new security policy to a HPE Ezmeral Data Fabric Database JSON table without replacing existing security policies.

Permissions Required

To run this command, your user ID must have the following permissions:

- `adminaccessperm` on the table.

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|-----|---|
| CLI | <pre>maprcli table securitypolicy add -path <path> -securitypolicy <comma-delimited list of policies></pre> |
|-----|---|

| | |
|------|--|
| REST | <code>http[s]://<host>:<port>/rest/ table/securitypolicy/add? path=<path>&securitypolicy=<policies></code> |
|------|--|

Parameters

| Parameter | Description |
|----------------|---|
| path | <p>The path to the HPE Ezmeral Data Fabric Database table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code> For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code> |
| securitypolicy | The list of security policy tags to be added to this table. |

Example

Adds the security policy named `newpolicy` to a MapR table named `table1`:

| | |
|------|---|
| CLI | <code>maprcli table securitypolicy add -path "/table1" -securitypolicy "newpolicy"</code> |
| REST | <code>http[s]://<host>:<port>/rest/ table/securitypolicy/add?path= table1&securitypolicy=newpolicy</code> |

table securitypolicy remove

Removes a security policy from a HPE Ezmeral Data Fabric Database JSON table.

Permissions Required

To run this command, your user ID must have the following permissions:

- `adminaccessperm` on the table.

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|------|---|
| CLI | <pre>maprcli table securitypolicy remove -path <path> -securitypolicy <comma-delimited list of policies></pre> |
| REST | <pre>http[s]://<host>:<port>/rest/ table/securitypolicy/remove? path=<path>&securitypolicy=<policies></pre> |

Parameters

| Parameter | Description |
|----------------|---|
| path | <p>The path to the HPE Ezmeral Data Fabric Database table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code> For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code> |
| securitypolicy | The list of security policy tags to be removed from this table. |

Example

Removes the security policy named `newpolicy` from a MapR table named `table1`:

| | |
|------|---|
| CLI | <pre>maprcli table securitypolicy remove -path "/table1" -securitypolicy "newpolicy"</pre> |
| REST | <pre>http[s]://<host>:<port>/rest/ table/securitypolicy/remove?path=/ table1&securitypolicy=newpolicy</pre> |

table securitypolicy set

Replaces a security policy on a HPE Ezmeral Data Fabric Database JSON table with a new security policy.

Permissions Required

To run this command, your user ID must have the following permissions:

- `adminaccessperm` on the table.

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

| | |
|------|--|
| CLI | <pre>maprcli table securitypolicy set -path <path> -securitypolicy <comma-delimited list of policies></pre> |
| REST | <pre>http[s]://<host>:<port>/rest/ table/securitypolicy/set? path=<path>&securitypolicy=<policies></pre> |

Parameters

| Parameter | Description |
|----------------|---|
| path | <p>The path to the HPE Ezmeral Data Fabric Database table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code> For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code> |
| securitypolicy | The list of security policy tags to be associated with this table. |

Example

Replaces the security policy on a MapR table named `table1` with a new security policy named `newpolicy`:

| | |
|------|--|
| CLI | <pre>maprcli table securitypolicy set -path "/table1" -securitypolicy "newpolicy"</pre> |
| REST | <pre>http[s]://<host>:<port>/rest/ table/securitypolicy/set?path=/ table1&securitypolicy=newpolicy</pre> |

table upstream

Performs functions related to upstream sources for table replication.

table upstream add

Adds a binary table as upstream source for a replica.

 **Note:** You do not need to use this command if you use the `table replica autosetup` command.

Syntax

CLI

```
maprcli table upstream add
  -path <table path>
  -upstream <upstream table
  path>
```

REST

```
curl -k -X POST
  'http[s]://
  <host>:<port>/rest/table/upstream/add?
  path=<path>&upstream=<name>'
  -u <username>:<password>
```

 **Note:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameters

| Parameter | Description |
|-----------|---|
| path | <p>The path to the replica.</p> <ul style="list-style-type: none"> For a path to a table on the local cluster, start the path at the volume mount point. For example, for a table named <code>testdst</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testdst</code> For a path to a table on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customerdst</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customerdst</code> |
| upstream | <p>The path to the source table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>testsrc</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testsrc</code> For a path on another cluster, you must also specify the cluster name in the path. For example, for a table named <code>customersrc</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customersrc</code> |

Example

Adds `company1src` as the upstream source for replica `company1dst`:

CLI

```
maprcli table
upstream add -path /volume2/
companyldst -upstream /volume1/
companylsrc
```

REST

```
curl -k -X POST \
  'https://r1n1.sj.us:8443/rest/table/
upstream/add?
path=%2Fvolume2%2Fcompanyldst&upstream
=%2Fvolume1%2Fcompanylsrc' \
  -u mapr:mapr
```

table upstream list

Lists the binary tables that replicate data to the specified replica binary table.

Syntax**CLI**

```
maprcli table upstream list
-path <table path>
```

REST

```
curl -k -X GET
'http[s]://<host>:<port>/rest/table/
upstream/list?path=<path>'
-u <username>:<password>
```

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameters

| Parameter | Description |
|-----------|---|
| path | <p>The path to the replica.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>testdst</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testdst</code> For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customerdst</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customerdst</code> |

Sample Output

```
maprcli table upstream list -path /volume2/company1 -json
{
  "timestamp":1423162601288,
  "timeofday":"2015-02-05 10:56:41.288 GMT-0800",
  "status":"OK",
  "total":1,
```

```

    "data": [
      {
        "cluster": "mycluster",
        "table": "/volume1/company1",
        "idx": 1,
        "uuid": "P?\x18\xCC\x17\xB1&\xA7i,\x04\xBB\xB8\xD3T\x00"
      }
    ]
  }
}

```

Example

Lists sources that replicate data to the replica `/volume2/company1`:

CLI

```
maprcli table upstream list -path /
volume2/company1 -json
```

REST

```
curl -k -X GET \
'https://
rln1.sj.us:8443/rest/table/upstream/
list?path=%2Fvolume2%2Fcompany1' \
-u mapr:mapr
```

table upstream remove

Un-registers a binary table as an upstream source for a replica.

Note: This step is separate from the `table replica remove` command, which stops replication updates to a replica.

Syntax

CLI

```
maprcli table upstream remove
-path <table path>
-upstream <upstream table path>
```

REST

```
curl -k -X POST
'http[s]://
<host>:<port>/rest/table/upstream/
remove?path=<path>&upstream=<path>'
-u <username>:<password>
```

Note: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameters

| Parameter | Description |
|-----------|---|
| path | <p>The path to the replica.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>testdst</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testdst</code> For a path on another cluster, you must also specify the cluster name in the path. For example, for a table named <code>customerdst</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customerdst</code> |
| upstream | <p>The path to the source table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>testsrc</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testsrc</code> For a path on another cluster, you must also specify the cluster name in the path. For example, for a table named <code>customersrc</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customersrc</code> |

Example

Removes `company1src` as the upstream source for replica `company1dst`:

CLI

```
maprcli table upstream remove -path /
volume2/company1dst -upstream /
volume1/company1src
```

REST

```
curl -k -X POST \
'https://rln1.sj.us:8443/rest/table/
upstream/remove?
path=%2Fvolume2%2Fcompany1dst&upstream
=%2Fvolume1%2Fcompany1src' \
-u mapr:mapr
```

tier

Lets you create, modify, remove, and retrieve list of tiers and tiering rules.

tier create

Creates a new tier.

Syntax

CLI

```
maprcli tier create
-name <tier_name>
-type cold|ectier
```

```

[ -url <tier_url> ]
[ -credential
<credentials_file_path> ]
[ -tag <object_store_type> ]
[ -credential_str
<tier_credentials> ]
[ -dbtopology
<metadata_volume_path> ]
[ -cluster <cluster_name> ]

```

REST

| | |
|--------------|---|
| Request Type | POST |
| Request URL | http[s]://<host:port>/rest/tier/create?<parameters> |

Usage

To create a warm tier:

```

maprcli tier create
[ -cluster <cluster_name> ]
-name <tier_name>
-type ectier
[ -dbtopology <path> ]

```

To create a cold tier:

```

maprcli tier create
[ -cluster <cluster_name> ]
-name <tier_name>
-type cold -url <tier_URL>
-credential|credential_str <credential>
[ -dbtopology <path> ]
[ -tag S3-AWS|S3-GCS|S3-HDS|S3-IBM|Azure-Blobs|S3-Others ]

```

Note: The `-tag` parameter is required for Azure.

Parameters

| Parameter | Description |
|----------------|---|
| cluster | The name of the cluster on which to run the command. |
| credential | (For tier of type <code>cold</code> only) The path to the credentials file to use for accessing the tier. The credentials file must already exist on the node from where the tier is being created. For more information, see Setting up a Credentials File for Connecting to a Cold Tier Using the CLI or REST API on page 1047. Note: Either this or <code>-credential_str</code> is required for creating a cold tier. |
| credential_str | (For tier of type <code>cold</code> only) The credentials, access key and secret key, bucket name, and region in JSON format. Either this or <code>-credential</code> is required for creating a cold tier. |

| Parameter | Description |
|------------|--|
| dbtopology | The rack path to the volume where metadata is stored in DB tables. The default value is <code>/data</code> . |
| name | The name of the tier. |
| tag | <p>(For tier of type <code>cold</code> only) The object store to connect to. Value can be one of the following:</p> <ul style="list-style-type: none"> • S3-GCS (for Google Cloud Platform) • S3-HDS (for Hitachi HCP) • S3-IBM (for IBM Cloud Object Storage) • S3-AWS (for Amazon AWS) • Azure-Blobs (for Microsoft Azure) • S3-Others (for other all vendors) <p>The MAST Gateway uses this to determine the connector library (such as <code>libcurl</code>, etc.) to use. See Specifying the Vendor/Object Store for a Cold Tier on page 1049 for more information on the object store.</p> <p> Note: This parameter is required for Azure.</p> |
| type | <p>The type of tier to create. Value can be:</p> <ul style="list-style-type: none"> • <code>cold</code> — to offload to low-cost storage alternative on the cloud • <code>ectier</code> — to offload to low-cost storage alternative on the MapR cluster |
| url | <p>(For tier of type <code>cold</code> only) The URL (or endpoint) of the tier in the following format: <code><protocol>://<IP hostname>.<domain></code>. For more information, see Specifying the Vendor/Object Store for a Cold Tier on page 1049. When specifying the URL (for S3), use double quotes.</p> <p>If the protocol is <code>https</code>, the MAST Gateway uses HTTPS to upload data to the cold-tier. If the cold-tier storage does not support HTTPS, all tier related operations will fail. If the cold tier does not support HTTPS, set the protocol to <code>http</code>, which is the default.</p> |

Examples

Create a cold tier for offloading to S3:

CLI

```
# /opt/mapr/bin/maprcli
tier create -name
ksTestCold -type cold -url
"s3.amazonaws.com" -credential
credentials.txt -json
{
  "timestamp":1519669953410,
  "timeofday":"2018-02-26
10:32:33.410 GMT-0800 AM",
  "status":"OK",
```

```

    "total":0,
    "data":[

    ],
    "messages":[
        "Successfully created tier:
'ksTestCold'"
    ]
}

```

REST

```

# curl -k -X POST 'https://
abc.sj.us:8443/rest/tier/create?
name=ksTestCold&type=cold&url=s3.amazo
naws.com&credential=/root/
credentials.txt' --user mapr:mapr
{"timestamp":1519679457859,"timeofday"
:"2018-02-26 01:10:57.859 GMT-0800
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
tier: 'ksTestCold'"]}

```

Create a EC tier for offloading to a erasure coded volume on the MapR cluster:**CLI**

```

# /opt/mapr/bin/maprcli tier
create -name ksTestEC -type
ectier -json
{
    "timestamp":1519664750448,
    "timeofday":"2018-02-26
09:05:50.448 GMT-0800 AM",
    "status":"OK",
    "total":0,
    "data":[

    ],
    "messages":[
        "Successfully created tier:
'ksTestEC'"
    ]
}

```

REST

```

# curl -k -X POST 'https://
abc.sj.us:8443/rest/tier/create?
name=ksTestEC&type=ectier' --user
mapr:mapr
{"timestamp":1519679884411,"timeofday"
:"2018-02-26 01:18:04.411 GMT-0800
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
tier: 'ksTestEC'"]}

```

Create a cold tier by sending the credentials as a string:**CLI**

```

# maprcli tier create -name
testCold -type cold -url
"s3.amazon.com" -credential_str
'{"bucketName":"testbucket","credentia

```

```
ls":
{"accessKey":"ABCDEFGHIJKLM","secretKey":"OPQRSTUVWXYZ"}}' -json
{
  "timestamp":1526406945863,
  "timeofday":"2018-05-15
10:55:45.863 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "Successfully created tier:
'testCold'"
  ]
}
```

REST

```
# curl -k -X POST 'https://
abc.sj.us:8443/rest/tier/create?
name=testCold&type=cold&url=s3.amazon.
com&credential_str=%7B%22bucketName%2
%3A%22testbucket%22%2C%22credentials%2
%3A%7B%22accessKey%22%3A%ABCDEFGHIJKL
%22%2C%22secretKey%22%3A%22OPQRSTUWXYZ%22%7D%7D' --user mapr:mapr
{"timestamp":1526483636503,"timeofday"
:"2018-05-16 08:13:56.503 GMT-0700
AM","status":"OK","total":0,"data":
[],"messages":["Successfully created
tier: 'testCold'"]}
```

tier info

Retrieves information about a tier.

Syntax

CLI

```
$ maprcli tier info
-name <tier_name>
[ -cluster <cluster_name> ]
```

REST

| | |
|--------------|---|
| Request Type | GET |
| Request URL | http[s]://<host:port>/rest/tier/info?<parameters> |

Parameters

| Parameter | Description |
|-----------|--|
| cluster | The name of the cluster on which to run the command. |
| name | The name of the tier. |

Output

The command returns the following:

| | |
|-----------------|---|
| volume | The name of the volume associated with the tier. |
| tiertype | The type of tier. Value can be one of the following: <ul style="list-style-type: none"> • cold • ectier |
| tierid | The ID of the tier. |
| dbtopology | The topology of the volume associated with the tier. |
| dbvolumeid | The ID of the volume associated with the tier. |
| tiername | The name of the tier. |
| bucketname | The name of the bucket. The value is displayed for cold tiers only. |
| region | The region. The value is displayed for cold tiers only. |
| objectstoretype | The type of object store (for cold tiers only). Value can be one of the following: <ul style="list-style-type: none"> • S3-GCS • S3-HDS • S3-IBM • S3-Others • Azure-Blobs |
| url | The tier URL. The value is displayed for cold tiers only. |

Examples

Retrieve information about a warm tier:

CLI

```
# maprcli tier info -name testWarm
volume
tiertype dbtopology dbvolumeid
tierid tiername
mapr.internal.tier.testWarm
ectier /data 201186661
74117928 testWarm
```

REST

```
# curl -k -X GET 'https://
abc.sj.us:8443/rest/tier/info?
name=testWarm' --user mapr:mapr
{"timestamp":1530987914127,"timeofday"
:"2018-07-07 11:25:14.127 GMT-0700
AM","status":"OK","total":1,"data":
[{"tierid":"74117928","tiername":"test
Warm","tiertype":"ectier","volume":"ma
pr.internal.tier.testWarm","dbtopology
":"/data","dbvolumeid":201186661}]}
```

Retrieve information about a cold tier:

CLI

```
# maprcli tier info -name testCold
volume
tiertype dbtopology dbvolumeid
tierid tiername bucketname
region objectstoretype
url
mapr.internal.tier.testCold
cold /data 13372843
49971858 testCold testbucket
us-east-1 S3-AWS http://
s3.amazon.com
```

REST

```
# curl -k -X GET 'https://
abc.sj.us:8443/rest/tier/info?
name=testCold' --user mapr:mapr
{"timestamp":1530987683808,"timeofday"
:"2018-07-07 11:21:23.808 GMT-0700
AM","status":"OK","total":1,"data":
[{"tierid":"49971858","tiername":"test
Cold","tiertype":"cold","url":"http://
s3.amazon.com","bucketname":"testbucke
t","region":"us-east-1","volume":"mapr
.internal.tier.testCold","dbtopology":
"/
data","dbvolumeid":13372843,"objectsto
retype":"S3-AWS"}]}
```

tier list

Lists the tiers on the cluster.

Syntax

CLI

```
maprcli tier list
[ -cluster <cluster_name> ]
[ -sortby <attribute> ]
[ -sortorder asc|desc ]
```

REST

| | |
|--------------|---|
| Request Type | GET |
| Request URL | http[s]://<host:port>/rest/tier/list?<parameters> |

Parameters

| Parameter | Description |
|-----------|--|
| cluster | The name of the cluster on which to run the command. |
| sortby | Specifies one of the following attributes to sort the list of tiers by: tierid, tiername, tiertype, url, throttling, bucketname, region, objectstoretype, volume, topology |

| Parameter | Description |
|-----------|--|
| sortorder | The order to sort the results by. Value can be: <ul style="list-style-type: none"> • asc - for ascending order • desc - for descending order |

Output

The command returns the following:

| | |
|-----------------|---|
| volume | The name of the tiered volume. |
| tiertype | The type of tier. Value can be one of the following: <ul style="list-style-type: none"> • cold • ectier |
| dbtopology | The topology of the metadata volume associated with the tier. |
| dbvolumeid | The ID of the metadata volume associated with the tier. |
| tierid | The ID of the tier. |
| tiername | The name of the tier. |
| bucketname | The name of the bucket. The value is displayed for cold tiers only. |
| region | The region. The value is displayed for cold tiers only. |
| objectstoretype | The type of object store (for cold tiers only). Value can be one of the following: <ul style="list-style-type: none"> • S3-AWS • S3-GCS • S3-HDS • S3-IBM • S3-Others • Azure-Blobs |
| url | The tier URL. The value is displayed for cold tiers only. |

Example

Get the list of tiers:

CLI

```
# maprcli tier list
volume
tiertype dbtopology dbvolumeid
tierid tiername bucketname
region objectstoretype
url
mapr.internal.tier.ksTestCold
cold /data 135415553
30712925 ksTestCold ksekhar-test
us-east-1 S3-AWS http://
s3.amazonaws.com
```

```
mapr.internal.tier.testCold
cold /data 192997092
189158428 testCold testbucket
us-east-1 S3-AWS http://
s3.amazon.com
mapr.internal.tier.ksTestEC
ectier /data 87658196
198680137 ksTestEC
```

REST

```
# curl -k -X GET 'https://
abc.sj.us:8443/rest/tier/list' --user
mapr:mapr
{"timestamp":1533055528861,"timeofday"
:"2018-07-31 09:45:28.861 GMT-0700
AM","status":"OK","total":0,"data":

pr.internal.tier.ksTestEC","dbtopology
":"/data","dbvolumeid":87658196}
```

tier modify

Modifies the credentials used to access tier.

Syntax

CLI

```
maprcli tier modify
-name <tier_name>
[ -credential
<path_to_credentials_file> ]
[ -credential_str
<tier_credentials> ]
[ -cluster <cluster_name> ]
[ -force true|false ]
[ -tag <object_store_type> ]
[ -url <tier_url> ]
```

REST

| | |
|--------------|------|
| Request Type | POST |
|--------------|------|

| | |
|-------------|---|
| Request URL | http[s]://<host:port>/rest/tier/modify?<parameters> |
|-------------|---|

Parameters

| Parameter | Description |
|----------------|---|
| cluster | The name of the cluster on which to run the command. |
| credential | <p>(For cold tier only) The path to the credentials file to use to access the tier.</p> <p> Note: You cannot modify the bucket name in the credentials file after the tier is created; only the accesskey and the secretkey can be modified.</p> <p>For more information, see Setting up a Credentials File for Connecting to a Cold Tier Using the CLI or REST API on page 1047.</p> |
| credential_str | (For cold tier only) The region, bucket, and credentials, access key and secret key, specified in JSON format. Either this or <code>-credential</code> is required to connect to a cold tier. |
| force | <p>Required to force a change of any of the following:</p> <ul style="list-style-type: none"> • Bucket on the tier where data is offloaded. • Region where the bucket resides. • URL (or endpoint) of the tier. <p>Value can be one of the following:</p> <ul style="list-style-type: none"> • <code>true</code> — to force a change • <code>false</code> — to not change <p>The default value is <code>false</code>.</p> |
| name | The name of the tier. |
| tag | <p>(For cold tier only) The tier to connect to. Value can be one of the following:</p> <ul style="list-style-type: none"> • S3-GCS • S3-HDS • S3-IBM • S3-AWS • S3-Others • Azure-Blobs <p>The MAST Gateway uses this to determine the connector library (such as libcurl, etc.) to use.</p> <p> Note: You must specify this parameter to connect to Azure.</p> |

| Parameter | Description |
|-----------|--|
| url | <p>(For cold tier only) The URL (or endpoint) of the tier. This can be modified only with the <code>-force</code> option. See Specifying the Vendor/Object Store for a Cold Tier on page 1049 for information on the tier endpoints and supported authentication protocols.</p> <p> Note: If the credentials for the new URL are different, specify the new credentials through the credentials file or using the <code>credential_str</code> parameter.</p> |

Examples

Modify the credentials (credential file) used to access the tier:

CLI

```
# /opt/mapr/bin/maprcli tier
modify -name testCold -credential
credentials.txt -json
{
  "timestamp":1519670281090,
  "timeofday":"2018-02-26
10:38:01.090 GMT-0800 AM",
  "status":"OK",
  "total":0,
  "data":[

  ],
  "messages":[
    "Successfully updated tier:
'ksTestCold'"
  ]
}
```

REST

```
# curl -k -X POST 'https://
10.10.82.24:8443/rest/tier/modify?
name=testCold&credential=credentials.t
xt' --user mapr:mapr
{"timestamp":1526485277061,"timeofday"
:"2018-05-16 08:41:17.061 GMT-0700
AM", "status":"OK", "total":0, "data":
[], "messages":["Successfully updated
tier: 'testCold'"]}
```

Modify the tier by passing the credentials as a string:

CLI

```
# maprcli tier modify -name
testCold -credential_str
'{"bucketName":"testbucket","credentia
ls":
{"accessKey":"ABCDEFGHIJKL","secretKey
":"MNOPQRSTUVWXYZ}}' -json
{
  "timestamp":1526484682668,
  "timeofday":"2018-05-16
08:31:22.668 GMT-0700 AM",
  "status":"OK",
  "total":0,
```

```
"data":[
],
"messages":[
  "Successfully updated tier:
'testCold'"
]
}
```

REST

```
# curl -k -X POST 'https://
abc.sj.us:8443/rest/tier/modify?
name=testCold&credential_str=%7B%22buc
k3A%22testbucket%22%2C%22credentials%2
2%3A%7B%22accessKey%22%3A%22ABCDEF
GHIJKLMN%22%2C%22secretKey%22%3A%22
OPQRSTU
VWXYZ%22%7D%7D' --user mapr:mapr
{"timestamp":1526485116177,"timeofday"
:"2018-05-16 08:38:36.177 GMT-0700
AM","status":"OK","total":0,"data":
[],"messages":["Successfully updated
tier: 'testCold'"]}
```

tier remove
Removes a tier.

 **Note:** You cannot remove a tier currently associated with a volume.

Syntax

CLI

```
$ maprcli tier remove
  -name <tier_name>
  [ -cluster <cluster_name> ]
```

REST

| | |
|--------------|---|
| Request Type | POST |
| Request URL | http[s]://<host:port>/rest/tier/remove?<parameters> |

Parameters

| Parameter | Description |
|-----------|--|
| cluster | The name of the cluster on which to run the command. |
| name | The name of the tier to remove. |

Examples

Remove a tier (specified by name):

CLI

```
# /opt/mapr/bin/maprcli tier
remove -name testCold -json
{
```

```

    "timestamp":1521064355911,
    "timeofday":"2018-03-14
02:52:35.911 GMT-0700 PM",
    "status":"OK",
    "total":0,
    "data":[

    ],
    "messages":[
        "Successfully deleted tier:
'testCold'"
    ]
}

```

REST

```

# curl -k -X POST 'https://
abc.sj.us:8443/rest/tier/remove?
name=testCold' --user mapr:mapr
{"timestamp":1526485963448,"timeofday"
:"2018-05-16 08:52:43.448 GMT-0700
AM","status":"OK","total":0,"data":
[],"messages":["Successfully deleted
tier: 'testCold'"]}

```

tier rule create

Creates a rule for offloading data to a tier.

Syntax

CLI

```

$ maprcli tier rule create
  -name <rule_name>
  -expr <regular_expression>
  [ -cluster <cluster_name> ]

```

REST

| | |
|--------------|--|
| Request Type | POST |
| Request URL | http[s]://<host:port>/rest/tier/rule/create?<parameters> |

Parameters

| Parameter | Description |
|-----------|--|
| cluster | The name of the cluster on which to run the command. |

| Parameter | Description | |
|-----------|-------------|---|
| expr | u | Username or user ID, as configured in the OS registry (such as <code>/etc/passwd</code> file, LDAP, etc.), of a specific user. Usage: <code>u:<username or user ID></code> |
| | g | Group name or group ID, as configured in the OS registry (such as <code>/etc/group</code> file, LDAP, etc.), of a specific group. Usage: <code>g:<groupname or group ID></code> |
| | a | <p>(<code>atime</code>) Time (in seconds or days) since the files were last accessed. The number of seconds can be specified by appending <code>s</code> to value and the number of days can be specified by appending <code>d</code> to the value.</p> <p>Usage:</p> <ul style="list-style-type: none"> "a:<value>s" — specifies <code>atime</code> in seconds "a:<value>d" — specifies <code>atime</code> in days <p> Note: If the system time on CLDB and file server nodes are different, the <code>atime</code> rule for offloading data may not work as intended.</p> <p>This tier rule is matched and files are offloaded, when all of the following conditions are met:</p> <ol style="list-style-type: none"> <code>atime</code> tracking is enabled at volume level Time since <code>atime</code> that is configured on the volume is more than the time specified in the rule Duration since the file was last accessed is more than the time specified in the rule <p>Assume that the <code>atime</code> feature is enabled on the volume and that the time in the rule is set to a:300s.</p> |

| Parameter | Description |
|-----------|-----------------------|
| name | The name of the rule. |

Examples

Create a rule to offload files older than a year:

CLI

```
/opt/mapr/bin/maprcli tier
rule create -name rule1 -expr
"m:365d" -json
{
  "timestamp":1519681290079,
  "timeofday":"2018-02-26
01:41:30.079 GMT-0800 PM",
  "status":"OK",
  "total":0,
  "data":[

  ],
  "messages":[
    "Successfully created rule:
'rule1'"
  ]
}
```

REST

```
# curl -k -X POST 'https://
abc.sj.us:8443/rest/tier/rule/create?
name=rule1&expr=m:365d' --user
mapr:mapr
{"timestamp":1519681475025,"timeofday":
"2018-02-26 01:44:35.025 GMT-0800
PM", "status":"OK", "total":0, "data":
[], "messages":["Successfully created
rule: 'rule1'"]}
```

Create a rule to offload files larger than 5 GB:

CLI

```
# /opt/mapr/bin/maprcli tier rule
create -name rule2 -expr "s:5g" -json
{
  "timestamp":1519681586774,
  "timeofday":"2018-02-26
01:46:26.774 GMT-0800 PM",
  "status":"OK",
  "total":0,
  "data":[

  ],
  "messages":[
    "Successfully created rule:
'rule2'"
  ]
}
```

REST

```
# curl -k -X POST 'https://
abc.sj.us:8443/rest/tier/rule/create?
```

```
name=rule2&expr=s:5g' --user mapr:mapr
{"timestamp":1519681667766,"timeofday"
:"2018-02-26 01:47:47.766 GMT-0800
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
rule: 'rule2'"]}
```

Create rule to offload files whose owner is m7user1:

CLI

```
# /opt/mapr/bin/maprcli tier
rule create -name rule3 -expr
"u:m7user1" -json
{
  "timestamp":1519682014521,
  "timeofday":"2018-02-26
01:53:34.521 GMT-0800 PM",
  "status":"OK",
  "total":0,
  "data":[
    ],
  "messages":["
    Successfully created rule:
    'rule3'"]
}
```

REST

```
# curl -k -X POST 'https://
abc.sj.us:8443/rest/tier/rule/create?
name=rule3&expr=u:m7user1' --user
mapr:mapr
{"timestamp":1519682095080,"timeofday"
:"2018-02-26 01:54:55.080 GMT-0800
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
rule: 'rule3'"]}
```

Create rule to offload all files:

CLI

```
# /opt/mapr/bin/maprcli tier rule
create -name rule4 -expr "p" -json
{
  "timestamp":1519682694183,
  "timeofday":"2018-02-26
02:04:54.183 GMT-0800 PM",
  "status":"OK",
  "total":0,
  "data":[
    ],
  "messages":["
    Successfully created rule:
    'rule4'"]
}
```

REST

```
# curl -k -X POST 'https://
abc.sj.us:8443/rest/tier/rule/create?
name=rule4&expr=p' --user mapr:mapr
{"timestamp":1519682828031,"timeofday"
:"2018-02-26 02:07:08.031 GMT-0800
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
rule: 'rule4'"]}
```

Create rule to not offload any files:

```
# /opt/mapr/bin/maprcli tier rule create -name rule5 -expr "" -json
{
  "timestamp":1519682947271,
  "timeofday":"2018-02-26 02:09:07.271 GMT-0800 PM",
  "status":"OK",
  "total":0,
  "data":[

  ],
  "messages":[
    "Successfully created rule: 'rule5'"
  ]
}
```

Create a rule, called testRule, for offloading all files owned by user m7user1 or for offloading files owned by user mapr and whose size is greater than 5 GB or whose file modification timestamp is greater than 365 (days):

CLI

```
# /opt/mapr/bin/maprcli tier
rule create -name testRule -expr
"u:m7user1 | (u:mapr & (s:5g |
m:365d))" -json
{
  "timestamp":1519683138305,
  "timeofday":"2018-02-26
02:12:18.305 GMT-0800 PM",
  "status":"OK",
  "total":0,
  "data":[

  ],
  "messages":[
    "Successfully created rule:
'testRule'"
  ]
}
```

REST

```
# curl -k -X POST 'https://
10.10.82.24:8443/rest/tier/rule/
create?
name=testRule&expr=u%3Am7user1%7C%28u%
3Amapr%26%28s%3A5g%20%7C%20m%3A365d%29
%29' --user mapr:mapr
{"timestamp":1526488621687,"timeofday"
:"2018-05-16 09:37:01.687 GMT-0700
AM","status":"OK","total":0,"data":
```

```
[ ], "messages": ["Successfully created rule: 'testRule'"]}
```

tier rule info

Retrieves information on a rule (specified by name).

Syntax**CLI**

```
maprcli tier rule info
  -name <rule_name>
  [ -output verbose ]
  [ -cluster <cluster_name> ]
```

REST

| | |
|--------------|--|
| Request Type | GET |
| Request URL | http[s]://<host:port>/rest/tier/rule/info?<parameters> |

Parameters

| Parameter | Description |
|-----------|--|
| cluster | The name of the cluster on which to run the command. |
| name | The name of the rule. |
| output | The type of output. The default value is verbose. |

Output

The command returns the following:

| | |
|------------|---|
| expression | The rules defined using a combination of expressions. |
| inuse | Whether (true) or not (false) the rule is associated with a volume. |
| rulename | The name of the rule. |
| ruleid | The ID of the rule. |

Example

Retrieve information on the rule named testRule:

CLI

```
# maprcli tier rule info -name
testRule
expression
  inuse  rulename  ruleid
u:m7user1 | (u:mapr & (s:5g |
m:365d)) true  testRule  2
```

REST

```
# curl -k -X GET 'https://
abc.sj.us:8443/rest/tier/rule/info?
```

```
name=testRule' --user mapr:mapr
{"timestamp":1528147823598,"timeofday"
:"2018-06-04 02:30:23.598 GMT-0700
PM","status":"OK","total":1,"data":
[{"ruleid":"2","rulename":"testRule",
"expression":"u:m7user1 | (u:mapr &
(s:5g | m:365d))","inuse":"true"}]}
```

tier rule list

Retrieves the list of rules for offloading data.

Syntax**CLI**

```
$ maprcli tier rule list
[ -output terse|verbose ]
[ -cluster cluster_name ]
[ -sortby <attribute> ]
[ -sortorder <asc|desc> ]
```

REST

| | |
|--------------|--|
| Request Type | GET |
| Request URL | http[s]://<host:port>/rest/tier/rule/list?<parameters> |

Parameters

| Parameter | Description |
|-----------|--|
| cluster | The name of the cluster on which to run the command. |
| output | Specifies whether the output should be <code>terse</code> or <code>verbose</code> . Default: <code>verbose</code> . |
| sortby | The attributes by which to sort the list of tiers. Value can be one of the following: <code>ruleid</code> , <code>rulename</code> , <code>expression</code> |
| sortorder | The order to sort the results by. Value can be: <ul style="list-style-type: none"> <code>asc</code> - for ascending order <code>desc</code> - for descending order |

Output

The command returns the following:

| | |
|------------|---|
| expression | The rules defined using a combination of expressions. |
| rulename | The name of the rule. |
| ruleid | The ID of the rule. |

Example

Retrieve the list of tier rules:

CLI

```
# /opt/mapr/bin/maprcli tier rule list
expression
  rulename  ruleid
m:365d
  rule1     1
s:5g
  rule2     2
u:m7user1
  rule3     3
p
  rule4     4

  rule5     5
u:m7user1 | (u:mapr & (s:5g |
m:365d)) testRule 6
```

REST

```
# curl -k -X GET 'https://
abc.sj.us:8443/rest/tier/rule/
list' --user mapr:mapr
{"timestamp":1519840839491,"timeofday"
:"2018-02-28 10:00:39.491 GMT-0800
AM","status":"OK","total":6,"data":
[{"ruleid":"1","rulename":"rule1","exp
ression":"m:365d"},
{"ruleid":"2","rulename":"rule2","expr
ession":"s:5g"},
{"ruleid":"3","rulename":"rule3","expr
ession":"u:m7user1"},
{"ruleid":"4","rulename":"rule4","expr
ession":"p"},
{"ruleid":"5","rulename":"rule5","expr
ession":""},
{"ruleid":"6","rulename":"testRule","e
xpression":"u:m7user1 | (u:mapr &
(s:5g | m:365d))"}]}
```

tier rule modify

Modifies the criteria in a tiering rule (specified by name).

Syntax**CLI**

```
$ maprcli tier rule modify
  -name <rule_name>
  -expr <expression>
  [ -cluster <cluster_name> ]
```

REST

| | |
|--------------|--|
| Request Type | POST |
| Request URL | http[s]://<host:port>/rest/tier/rule/modify?<parameters> |

Parameters

| Parameter | Description |
|-----------|--|
| cluster | The name of the cluster on which to run the command. |
| expr | <p>The criteria for offloading data. The criteria can be defined using a combination of the following:</p> <ul style="list-style-type: none"> • <code>u</code> — the user who owns the file(s) to offload • <code>g</code> — the group that owns the file(s) to offload • <code>m</code> — the time since the file was modified • <code>s</code> — the size of the file to offload. Use <code>b</code> for bytes, <code>k</code> for kilobytes, <code>m</code> for megabytes, or <code>g</code> for gigabytes. <p>Or, use:</p> <ul style="list-style-type: none"> • <code>p</code> — to offload all the files • <code>"</code> — empty string to not offload any files <p>Use the following to string multiple criteria for offload:</p> <ul style="list-style-type: none"> • <code>&</code> — to indicate all specified criteria must be met for offload • <code> </code> — to indicate any of the specified criteria is adequate for offload • <code>()</code> — to specify sub-expressions |
| name | The name of the rule. |

Examples

Modify the criteria in the tiering rule, `ksTestRule`, to offload all files in the volume:

CLI

```
# /opt/mapr/bin/maprcli tier rule
modify -name ksTestRule -expr
"p" -json
{
  "timestamp":1516225073780,
  "timeofday":"2018-01-17
09:37:53.780 GMT+0000",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "Successfully updated rule:
'ksTestRule'"
  ]
}
```

REST

```
# curl -k -X POST 'https://
abc.sj.us:8443/rest/tier/rule/modify?
name=ksTestRule&expr=p' --user
mapr:mapr
```

```
{ "timestamp":1526489124827,"timeofday"
:"2018-05-16 09:45:24.827 GMT-0700
AM", "status":"OK", "total":0, "data":
[], "messages":["Successfully updated
rule: 'ksTestRule'"] }
```

tier rule remove

Removes the rule for offloading data.

**Note:** You cannot remove a rule that is currently associated with a volume.**Syntax****CLI**

```
$ maprcli tier rule remove
  -name <rule_name>
  [ -cluster <cluster_name> ]
```

REST

| | |
|--------------|--|
| Request Type | POST |
| Request URL | http[s]://<host:port>/rest/tier/rule/remove?<parameters> |

Parameters

| Parameter | Description |
|-----------|--|
| cluster | The name of the cluster on which to run the command. |
| name | The name of the rule to remove. |

Examples

Remove the rule named testRule:

CLI

```
# /opt/mapr/bin/maprcli tier rule
remove -name testRule -json
{
  "timestamp":1516225222172,
  "timeofday":"2018-01-17
09:40:22.172 GMT+0000",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":["
    Successfully deleted rule:
    'testRule'"]
}
```

REST

```
# curl -k -X POST 'https://
abc.sj.us:8443/rest/tier/rule/remove?
```

```
name=testRule' --user mapr:mapr
{"timestamp":1526488467571,"timeofday"
:"2018-05-16 09:34:27.571 GMT-0700
AM","status":"OK","total":0,"data":
[],"messages":["Successfully deleted
rule: 'testRule'"]}
```

trace

Lets you view and modify the trace buffer, and the trace levels for the system modules.

The valid trace levels are:

- DEBUG
- INFO
- ERROR
- WARN
- FATAL

trace dump

Dumps the contents of the trace buffer into the MapR filesystem log.

Syntax

CLI

```
maprcli trace dump
[ -host <host> ]
[ -port <port> ]
```

REST

None.

Parameters

| Parameter | Description |
|-----------|--|
| host | The IP address of the node from which to dump the trace buffer. Default: localhost |
| port | The port to use when dumping the trace buffer. Default: 5660 |

Examples

Dump the trace buffer to the MapR filesystem log:

CLI

```
maprcli trace dump
```

trace info

Displays the trace level of each module.

Syntax**CLI**

```
maprcli trace info
  [ -host <host> ]
  [ -port <port> ]
```

REST

None.

Parameters

| Parameter | Description |
|-----------|---|
| host | The IP address of the node on which to display the trace level of each module. Default: localhost |
| port | The port to use. Default: 5660 |

Output

A list of all modules and their trace levels.

Sample Output

```
RPC Client Initialize
**Trace is in DEFAULT mode.
**Allowed Trace Levels are:
FATAL
ERROR
WARN
INFO
DEBUG
**Trace buffer size: 2097152
**Modules and levels:
Global : INFO
RPC : ERROR
MessageQueue : ERROR
CacheMgr : INFO
IOMgr : INFO
Transaction : ERROR
Log : INFO
Cleaner : ERROR
Allocator : ERROR

```

```

Cidcache : ERROR
Client : ERROR
Fidcache : ERROR
Fidmap : ERROR
Inode : ERROR
JniCommon : ERROR
Shmem : ERROR
Table : ERROR
Fctest : ERROR
DONE

```

Examples

Display trace info:

CLI

```
maprcli trace info
```

trace print

Manually dumps the trace buffer to stdout.

Syntax

CLI

```

maprcli trace print
[ -host <host> ]
[ -port <port> ]
-size <size>

```

REST

None.

Parameters

| Parameter | Description |
|-----------|--|
| host | The IP address of the node from which to dump the trace buffer to stdout. Default: localhost |
| port | The port to use. Default: 5660 |
| size | The number of kilobytes of the trace buffer to print. Maximum: 64 |

Output

The most recent <size> bytes of the trace buffer.

```

-----
2010-10-04 13:59:31,0000 Program: mfs on Host: fakehost IP: 0.0.0.0, Port:
0, PID: 0
-----
DONE

```

Examples

Display the trace buffer:

CLI

```
maprcli trace print
```

trace reset

Resets the in-memory trace buffer.

Syntax**CLI**

```
maprcli trace reset
[ -host <host> ]
[ -port <port> ]
```

REST

None.

Parameters

| Parameter | Description |
|-----------|---|
| host | The IP address of the node on which to reset the trace parameters. Default: localhost |
| port | The port to use. Default: 5660 |

Examples**Reset trace parameters:****CLI**

```
maprcli trace reset
```

trace resize

Resizes the trace buffer.

Syntax**CLI**

```
maprcli trace resize
[ -host <host> ]
[ -port <port> ]
-size <size>
```

REST

None.

Parameters

| Parameter | Description |
|-----------|--|
| host | The IP address of the node on which to resize the trace buffer. Default: localhost |
| port | The port to use. Default: 5660 |
| size | The size of the trace buffer, in kilobytes. Default: 2097152 Minimum: 1 |

Examples**Resize the trace buffer to 1000**

CLI

```
maprcli trace resize -size 1000
```

trace setlevel

Sets the trace level on one or more modules.

Syntax

CLI

```
/opt/mapr/bin/maprcli trace setlevel
[ -host <host> ]
  -level <trace level>
  -module <module name>
[ -port <port> ]
```

REST

None.

Parameters

| Parameter | Description |
|---------------|---|
| host | The node on which to set the trace level. Default: localhost |
| module | The module on which to set the trace level. If set to all, sets each module to the specified trace level. |

| Parameter | Description |
|---------------------|---|
| <p>level</p> | <p>The new trace level. Set the level to <code>default</code>, to set the trace level of the specified module(s) to its default.</p> <p>If you do not set the level, then INFO is set as the level.</p> <p>You can find the existing trace level of each module, using the command: <code>/opt/mapr/bin/maprcli trace info</code></p> <p>The current modules along with their default trace level are:</p> <ul style="list-style-type: none"> • Global : INFO • RPC : ERROR • MessageQueue : ERROR • CacheMgr : INFO • IOMgr : INFO • Transaction : ERROR • Log : ERROR • Cleaner : INFO • Allocator : ERROR • BTreeMgr : ERROR • BTree : ERROR • BTreeDelete : ERROR • BTreeOwnership : INFO • MapServerFile : ERROR • MapServerDir : INFO • MFSReadAhead : INFO • Container : INFO • Snapshot : INFO • Util : ERROR • Replication : INFO • PunchHole : INFO • KvStore : INFO • Truncate : ERROR • Orphanage : INFO • FileServer : INFO • Heartbeat : ERROR • Defer : ERROR • ServerCommand : INFO • Write : ERROR • DB : INFO |

| Parameter | Description |
|-----------|--------------------------------|
| port | The port to use. Default: 5660 |

Examples

Set the trace level of the Log module to INFO:

CLI

```
/opt/mapr/bin/maprcli trace
setlevel -module Log -level info
```

Set the trace level of the BTreeMgr module to FATAL:

CLI

```
/opt/mapr/bin/maprcli trace
setlevel -module BTreeMgr -level FATAL
```

Set the trace levels of all modules to their defaults:

CLI

```
/opt/mapr/bin/maprcli trace
setlevel -module all -level default
```

Set the trace levels of all modules to INFO:

CLI

```
/opt/mapr/bin/maprcli trace
setlevel -module all -level INFO
```

or equivalently:

```
/opt/mapr/bin/maprcli trace
setlevel -module all
```

trace setmode

Sets the trace mode.

There are two modes:

- Default
- Continuous

In default mode, all trace messages are saved in a memory buffer. If there is an error, the buffer is dumped to stdout. In continuous mode, every allowed trace message is dumped to stdout in real time.

Syntax

CLI

```
maprcli trace setmode
[ -host <host> ]
-mode default|continuous
[ -port <port> ]
```

REST

None.

Parameters

| Parameter | Description |
|-----------|---|
| host | The IP address of the host on which to set the trace mode |
| mode | The trace mode. |
| port | The port to use. |

Examples**Set the trace mode to continuous:****CLI**

```
maprcli trace setmode -mode continuous
```

urls

Displays the status page URL for the specified service.

Syntax**CLI**

```
/opt/mapr/bin/maprcli urls
                        [ -cluster
<cluster name> ]
                        [ -zkconnect
<ZooKeeper Connect String:
'host:port,host:port,host:port,...'> ]
                        -name <name of
the service link is required for>
                        [ -validate
<Validate if URL is reachable or not.
default: true> ]
```

REST

| | |
|--------------|---|
| Request Type | GET |
| Request URL | <pre>http[s]://<host>:<port>/ rest/urls/statuspage? <parameters></pre> <p>If you submit the request without <code>statuspage</code> in the request URL, the return value contains a 404 error because the API requires a subcommand (empty or otherwise) to be present even though the subcommand is ignored.</p> |

Parameters

| Parameter | Description |
|-----------|---|
| cluster | The name of the cluster on which to save the configuration. |

| Parameter | Description |
|-----------|--|
| name | The name of the service for which to get the status page: <ul style="list-style-type: none"> cldb |
| validate | Enables (<code>true</code>) or disables (<code>false</code>) validating whether the URL is reachable. |
| zkconnect | ZooKeeper Connect String |

Examples

Display the URL of the status page for the CLDB service:

CLI

```
# /opt/mapr/bin/maprcli urls -name
cldb
url
https://abc.sj.us:7443/cldb.jsp
```

REST

```
curl -k -X GET 'https://
abc.sj.us:8443/rest/urls/statuspage?
name=cldb' --user mapr:mapr
{"timestamp":1544561148186,"timeofday"
:"2018-12-11 12:45:48.186 GMT-0800
PM","status":"OK","total":1,"data":
[{"url":"https://abc.sj.us:7443/
cldb.jsp"}]}
```

virtualip

Manages virtual IP addresses for NFS nodes.

Table

| Field | Description |
|--------------|------------------------------------|
| macaddress | The MAC address of the virtual IP. |
| netmask | The netmask of the virtual IP. |
| virtualipend | The virtual IP range end. |

virtualip add

Adds a virtual IP address.

Permissions Required

`fc` or `a` on the cluster.

Syntax

CLI

```
maprcli virtualip add
[ -cluster <cluster> ]
[ -gateway <gateway> ]
[ -macs <MAC address> ]
-netmask <netmask>
-virtualip <virtualip>
```

```
[ -virtualipend <virtual IP range
end> ]
[ -preferredmac <MAC address> ]
[ -service nfs3|nfs4 ]
```

REST

| | |
|--------------|---|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/virtualip/add?<parameters> |

Parameters

| Parameter | Description |
|--------------|--|
| cluster | The cluster on which to run the command. |
| gateway | The NFS gateway IP or address |
| macs | A list of the MAC addresses that represent the NICs on the nodes that the VIPs in the VIP range can be associated with. Use this list to limit VIP assignment to NICs on a particular subnet when your NFS server is part of multiple subnets. |
| netmask | The netmask of the virtual IP. |
| preferredmac | The preferred MAC for this virtual IP. When an NFS server restarts, the MapR system attempts to move all of the virtual IP addresses that list a MAC address on this node as a preferred MAC to this node. If the new value is null, this parameter resets the preferred MAC value. |
| service | The service to assign VIPs to. Value can be one of the following: <ul style="list-style-type: none"> nfs3 — for NFSv3 nfs4 — for NFSv4 The default value is nfs3, which is used if this option is not specified. You must specify the MAC addresses (macs) with this option. |
| virtualip | The virtual IP, or the start of the virtual IP range. |
| virtualipend | The end of the virtual IP range. |

Example

Add VIP for NFSv3 node:

CLI

```
maprcli virtualip add
  -cluster
mycluster.402.source
  -macs "09:0C:29:3C:47:AB
03:3C:34:76:CF:21 02:0E:22:71:AD:34"
  -netmask 255.255.255.0
  -virtualip 10.1.1.5
```

REST

```
-preferredmac
"02:0E:22:71:AD:34"
```

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/virtualid/add?
cluster=mycluster.402.source&macs=%220
9%3A0C%3A29%3A3C%3A47%3AAB%2003%3A3C%3
A34%3A76%3ACF%3A21%2002%3A0E%3A22%3A71
%3AAD%3A34%22&netmask=255.255.255.0&vi
rtualid=10.1.1.5&preferredmac=%2202%3A
0E%3A22%3A71%3AAD%3A34%22' --user
mapr:mapr
```

Add VIP range for NFSv3 nodes:

CLI

```
maprcli virtualip add
-cluster
mycluster.402.source
-service nfs3
-macs "09:0C:29:3C:47:AB
03:3C:34:76:CF:21 02:0E:22:71:AD:34"
-netmask 255.255.255.0
-virtualip 10.1.1.5
-virtualipend 10.1.1.7
-preferredmac
"02:0E:22:71:AD:34"
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/virtualid/add?
cluster=mycluster.402.source&service=n
fs3&macs=%2209%3A0C%3A29%3A3C%3A47%3AA
B%2003%3A3C%3A34%3A76%3ACF%3A21%2002%3
A0E%3A22%3A71%3AAD%3A34%22&netmask=255
.255.255.0&virtualid=10.1.1.5&virtuali
pend=10.1.1.7&preferredmac=%2202%3A0E%
3A22%3A71%3AAD%3A34%22' --user
mapr:mapr
```

Add VIP for NFSv4 node:

CLI

```
maprcli virtualip add
-cluster
mycluster.402.source
-service nfs4
-macs "09:0C:29:3C:47:AB
03:3C:34:76:CF:21 02:0E:22:71:AD:37"
-netmask 255.255.255.0
-virtualip 10.1.2.7
-preferredmac
"02:0E:22:71:AD:37"
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/virtualid/add?
cluster=mycluster.402.source&service=n
fs4&macs=%2209%3A0C%3A29%3A3C%3A47%3AA
```

```
B%2003%3A3C%3A37%3A76%3ACF%3A21%2002%3
A0E%3A22%3A71%3AAD%3A34%22&netmask=255
.255.255.0&virtualid=10.1.2.7&preferre
dmac=%2202%3A0E%3A22%3A71%3AAD%3A37%22
' --user mapr:mapr
```

virtualip edit

Edits a virtual IP (VIP) range. Permissions required: `fc` or `a`.

Syntax**CLI**

```
maprcli virtualip edit
  [ -cluster <cluster> ]
  [ -macs <MAC addresses> ]
  -netmask <netmask>
  -virtualip <virtualip>
  [ -virtualipend <virtual IP range
end> ]
  [ -preferredmac <MAC address> ]
  [ -service nfs3|nfs4 ]
```

REST

| | |
|--------------|---|
| Request Type | POST |
| Request URL | <code>http[s]://<host>:<port>/rest/virtualip/edit?<parameters></code> |

Parameters

| Parameter | Description |
|---------------------------|--|
| <code>cluster</code> | The cluster on which to run the command. |
| <code>macs</code> | A list of the MAC addresses that represent the NICs on the nodes to which the VIPs in the VIP range can be associated. Use this list to limit VIP assignment to NICs on a particular subnet when your NFS server is part of multiple subnets. |
| <code>netmask</code> | The netmask of the virtual IP. |
| <code>preferredmac</code> | The preferred MAC for this virtual IP. When a NFS server restarts, the MapR system attempts to move all of the virtual IP addresses that list a MAC address on this node as a preferred MAC to this node. If the new value is null, this parameter resets the preferred MAC value. |
| <code>service</code> | The service to which the VIPs need to be assigned. The Value can be one of the following: <ul style="list-style-type: none"> <code>nfs3</code> — for NFSv3 <code>nfs4</code> — for NFSv4 The default value is <code>nfs3</code> . You must specify the MAC addresses (<code>macs</code>) with this option. |
| <code>virtualip</code> | The virtual IP, or the start of the virtual IP range. |

| Parameter | Description |
|--------------|----------------------------------|
| virtualipend | The end of the virtual IP range. |

Examples

Single virtual IP

CLI

```
maprcli virtualip edit
    -cluster
mycluster.402.source
    -macs
"09:0C:29:3C:47:AB
00:0c:29:9e:96:15"
    -netmask 255.255.255.0
    -virtualip 10.1.1.5
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/virtualip/remove?
cluster=mycluster.402.source&macs=%22
09%3A0C%3A29%3A3C%3A47%3AAB%2000%3A0c%3
A29%3A9e%3A96%3A15%22&netmask=255.255.
255.0&virtualip=10.1.1.5' --user
mapr:mapr
```

Virtual IP range

CLI

```
maprcli virtualip edit
    -cluster
mycluster.402.source
    -macs
"09:0C:29:3C:47:AB
00:0c:29:9e:96:15"
    -netmask
255.255.255.0
    -virtualip
10.1.1.5
    -virtualipend
10.1.1.8
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/virtualip/remove?
cluster=mycluster.402.source&macs=%22
09%3A0C%3A29%3A3C%3A47%3AAB%2000%3A0c%3
A29%3A9e%3A96%3A15%22&netmask=255.255.
255.0&virtualip=10.1.1.5&virtualipend=
10.1.1.8' --user mapr:mapr
```

virtualip list

Lists the virtual IP addresses in the cluster.

Syntax

CLI

```
maprcli virtualip list
[ -cluster <cluster> ]
[ -columns <columns> ]
[ -filter <filter> ]
[ -limit <limit> ]
[ -nfsmacs <NFS macs> ]
```

```
[ -output <output> ]
[ -range <range> ]
[ -sortby <attribute> ]
[ -start <start> ]
```

REST

| | |
|--------------|--|
| Request Type | GET |
| Request URL | http[s]://<host>:<port>/rest/virtualip/list[?<parameters>] |

Parameters

| Parameter | Description |
|-----------|--|
| cluster | The cluster on which to run the command. |
| columns | The columns to display.  Note: <ul style="list-style-type: none"> The <code>hostname</code> and <code>ip</code> fields are always returned in the query. The value(s) for <code>assignables</code> are not returned as a column. |
| filter | A filter specifying VIPs to list. See Filters for more information. |
| limit | The number of records to return. |
| nfsmacs | Specifies whether (1) or not (0) to return the MAC addresses of servers running NFS. If value is 1, the command returns the MAC addresses of the NFS servers. |
| output | Whether the output should be <code>terse</code> or <code>verbose</code> . |
| range | Specifies whether (1) or not (0) to return the VIP ranges. The default value is 0, which returns all VIPs individually. If: <ul style="list-style-type: none"> The value is 0, the command returns the assignment of VIPs to hosts (specified by <code>hn</code>, <code>mac</code>, and <code>ip</code> in the output). The value is 1, the command returns the VIP ranges and the assignables, which is the group of nodes amongst which the VIP range (specified by <code>vip</code> and <code>vipe</code> in the output) must be distributed. If <code>assignables</code> is empty in the output, the range of VIPs (specified by <code>vip</code> and <code>vipe</code> in the output) can be assigned to any NFSv3 server.  Note: The <code>assignables</code> contains the list of MAC addresses only if the VIP assignment is restricted to a group of nodes. You must specify <code>-json</code> with the command to view the <code>assignables</code> . |

| Parameter | Description |
|-----------|---|
| sortby | Specifies one of the following attributes to sort the list of virtual IP addresses by: vipip, vipendip, vipnetmask, vipgateway, vipnumdevices, viphealth, vipassigneddevname, vipassigneddevip, vipassigneddevmac, vippreferredhostname, vippreferredip, vippreferredmac. |
| start | The index of the first record to return. |

Output

| Field | Description |
|-------------|---|
| assignables | The group of nodes to assign the VIP range to. If empty, the range of VIPs can be assigned to any NFSv3 server.  Note: You must specify <code>-json</code> with the command to view the assignables. |
| hn | The hostname. |
| ip | The IP address. |
| mac | The MAC address. |
| nm | The netmask. |
| vip | The virtual IP. If output contains VIP range, this is the start of the VIP range. |
| vipe | The end of the VIP range. |

Examples

Return the list of VIPs:

CLI

```
# maprcli virtualip list
hn          ip
vip         mac
nm
atsqa4-164.nfs4ad.com 10.10.88.164
10.10.88.10 0c:c4:7a:1f:91:a5

10.10.88.11 0c:c4:7a:1f:91:0a
255.255.255.0
```

REST

```
curl -k -X
GET 'https://abc.sj.us:8443/rest/
virtualip/list?limit=2' --user
mapr:mapr
```

Return a list of VIP ranges:**CLI**

```
# maprcli virtualip list -range 1
assignables vip
vipe        nm
...         10.10.88.10
10.10.88.13 255.255.255.0
...         10.10.88.14
10.10.88.15 255.255.255.0
...         10.10.88.17
10.10.88.18 255.255.255.0
```

REST

```
curl -k -X
GET 'https://abc.sj.us:8443/rest/
virtualip/list?range=1' --user
mapr:mapr
```

virtualip move

Reassigns a virtual IP or a range of virtual IP addresses to a specified Media Access Control (MAC) address.

Syntax**CLI**

```
maprcli virtualip move
[ -cluster <cluster name> ]
```

```
-virtualip <virtualip>
[ -virtualipend <virtualip end
range>
-tomac <mac>
[ -service nfs3|nfs4 ]
```

REST

| | |
|--------------|--|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/virtualip/move?<parameters> |

Parameters

| Parameter | Description |
|--------------|--|
| cluster | The name of the cluster where the virtual IP addresses are being moved. |
| service | The service to assign the VIPs to. Value can be one of the following: <ul style="list-style-type: none"> nfs3 — for NFSv3 nfs4 — for NFSv4 The default value is <code>nfs3</code> , which is used if this option is not specified. |
| tomac | The MAC address that the virtual IP addresses are being assigned. |
| virtualip | A virtual IP address. If you provide a value for <code>-virtualipend</code> , this virtual IP address defines the beginning of the range. |
| virtualipend | A virtual IP address that defines the end of a virtual IP address range. |

Examples

Move a range of three virtual IP addresses to a MAC address for the cluster `my.cluster.com`:

CLI

```
maprcli virtualip move -cluster
my.cluster.com -virtualip
192.168.0.8 -virtualipend
192.168.0.10 -tomac 00:FE:ED:CA:FE:99
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/virtualip/move?
cluster=my.cluster.com&virtualip=192.1
68.0.8&virtualipend=192.168.0.10&tomac
=00%3AFE%3AED%3ACA%3AFE%3A99' --user
mapr:mapr
```

virtualip remove

Removes a virtual IP (VIP) or a VIP range. Permissions required: `fc` or `a`.

Syntax

CLI

```
maprcli virtualip remove
  [ -cluster <cluster> ]
  -virtualip <virtual IP>
  [ -virtualipend <Virtual IP Range
  End> ]
```

REST

| | |
|--------------|--|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/virtualip/remove?<parameters> |

Parameters

| Parameter | Description |
|--------------|---|
| cluster | The cluster on which to run the command. |
| virtualip | The virtual IP or the start of the VIP range to remove. |
| virtualipend | The end of the VIP range to remove. |

Examples

CLI

```
maprcli virtualip remove -virtualip
10.1.1.5
```

REST

```
https://abc.sj.us:8443/rest/virtualip/
remove?virtualip=10.1.1.5
```

volume

Manages volumes, snapshots and mirrors.

Fields

The following table lists the data fields that provide information about each volume. Each field has two names:

- Field name - displayed in the output of the `volume list` command and used to specify the columns displayed using the `columns` parameter
- Short name - used to specify the columns displayed using the `columns` parameter

The short name is also used when specifying rows with a filter, for example when specifying a set of volumes about which to get information.

| Field Name | Short Name | Description |
|------------|------------|--|
| accesstime | va | A value that can be used to determine when this volume was accessed. |

| | | |
|----------------------------|------|--|
| actualreplication | arf | The actual current replication factor by percentage of the volume, as a zero-based array of integers from 0 to 100. For each position in the array, the value is the percentage of the volume that is replicated index number of times. Example: arf=5,10,85 means that 5% is not replicated, 10% is replicated once, 85% is replicated twice. |
| advisoryquota | aqt | The advisory quota for the volume, in MB. A value of 0 indicates there are no soft or advisory quotas for this volume. |
| AdvisoryQuotaExceededAlarm | aqa | Alarm raised if the volume size is more than the value configured for the advisory quota. |
| aename | aen | The accounting entity (AE) name. |
| aetype | aet | The type of accounting entity (AE) . Value can be: <ul style="list-style-type: none"> • 0 - user • 1 - group |
| allowGrant | ag | Specifies whether a parent volume grants permission for a child volume to inherit its properties. Value can be true or false. |
| allowReadforExecute | re | When set to <code>true(1)</code> , allows execution of SUID binaries with only their executable bit set, on a FUSE filesystem. This parameter works in conjunction with the <code>fuse.mount.setuid</code> FUSE option. For more information, see Configuring the HPE Ezmeral Data Fabric FUSE-Based POSIX Client on page 1358 |
| AlmostFullTopologyAlarm | afta | Timestamp when Topology Almost Full on page 2529 alarm was raised. |

| | | |
|---------------------------|---------------|---|
| atimeTrackingStartTime | atimeinterval | <p>Indicates the time at which <code>atimeUpdateInterval</code> is enabled.</p> <p><code>aTimeTrackingStartTime</code> is updated to the current time in the following cases:</p> <ul style="list-style-type: none"> • Just started tracking <code>atime</code>, which means that the <code>atimeUpdate</code> frequency was previously zero • If the value of <code>atimeUpdate</code> frequency is decreased • If the value of <code>atimeUpdate</code> frequency is increased and <code>atime</code> has not been tracked for the duration of the new frequency value <p>For more information, see Tuning Last Access Time on page 448.</p> |
| atimeUpdateInterval | atst | <p>Defines the frequency at which the last file access time is updated. For more information, see Tuning Last Access Time on page 448.</p> |
| audited | ea | <p>Indicates whether 1 or not (0) auditing is enabled for the volume. See Enabling Auditing for the steps to enable auditing on a volume and on directories, files, and tables in that volume.</p> |
| auditVolume | av | <p>Indicates whether (1) or not volume accommodates audit logs.</p> |
| BecomeMasterStuckAlarm | bms | <p>Timestamp when the Volume Become Master Stuck on page 2531 alarm has been raised for the volume.</p> |
| CannotMirrorAlarm | cma | <p>Timestamp when the "Cannot Mirror" alarm was raised.</p> |
| coalesceInterval | ci | <p>The interval of time in minutes during which only the first instance of an operation on a node is recorded in audit logs, if auditing is enabled. Subsequent identical operations performed on the same node are ignored during the interval. Setting this field to a larger number helps prevent audit logs from growing quickly.</p> <p> Note: The default value is 60 minutes.</p> |
| CompactionFailureAlarm | cfa | <p>Timestamp when the Compaction Failed on page 2525 alarm has been raised for the volume.</p> |
| containerAllocationFactor | caf | <p>Indicates the number of containers created for the volume.</p> |

| | | |
|----------------------------------|--------|---|
| ContainersNonLocalAlarm | cnla | Timestamp when the Local Volume containers non-local alarm was raised. |
| creationTime | ct | The volume creation time (epoch time in seconds). This is only available on volumes created using MapR v6.0.0 or later. For volumes created using older MapR versions, the volume info on page 2227 and volume list on page 2247 commands will return empty value for this field. |
| creator | on | Name of the user that created the volume. |
| creatorcontainerid | ccid | ID for the container. |
| creatorvolumeuuid | cvid | ID that supports the container chain identification for mirroring. The creatorcontainerid and creatorvolumeuuid fields combined form a unique identifier for the container chain. |
| CriticallyDegradedEcStripesAlarm | cea | Timestamp when the Data Under-Encoded on page 2527 alarm has been raised for the volume. |
| criticalReReplTimeOutSec | crto | The timeout (in seconds) before re-replicating critically under-replicated containers only. |
| cvtotalused | | The total space used by the associated cache volume. |
| dareEnabled | de | Indicates whether (1) or not (0) data-at-rest encryption is enabled for the volume. |
| data-size-mirrored-mb | dsm | Indicates the amount of data (in MB) that has been mirrored to the volume. |
| data-size-to-mirror-mb | dstm | Indicates the amount of data (in MB) that is yet to be mirrored to the volume. |
| DataUnavailableAlarm | dua | Timestamp when the Data Unavailable on page 2526 alarm was raised. |
| DataUnderReplicatedAlarm | rfa | Timestamp when the Data Under-Replicated on page 2526 alarm was raised. |
| dbindexlagsecalarmthresh | dilsat | Defines the lag time in seconds for updating secondary indexes after which the Secondary Index Encoding Error on page 2525 alarm is raised. |
| dbrepllagsecalarmthresh | dlsat | Defines the lag time in seconds for replication after which the Table Replication Lag High on page 2523 alarm is raised. |
| DegradedEcStripesAlarm | dea | Timestamp when the Warm-Tier Data Node Down on page 2527 alarm has been raised for the volume. |

| | | |
|-----------------------------|-----------------|--|
| disableddataauditoperations | ddao | The list of operations excluded from auditing. For more information, see Auditing Data Access Operations on page 665 and Selective Auditing of filesystem , HPE Ezmeral Data Fabric Database Table , and HPE Ezmeral Data Fabric Event Streams Operations Using the CLI on page 837. |
| ecscheme | ecs | The erasure coding scheme for the volume if the volume is enabled for warm tiering. |
| ecstorevolume | ecstore | The name of the backend volume or erasure coded volume associated with the tiering enabled front-end volume. |
| ecstripedepthmb | ecstripedepthmb | The stripe depth of the erasure coded volume. The default value is 4 MB. |
| ectopology | ectopo | The rack path to the erasure coded volume. |
| ectotalused | ecused | The total space, after compression, used by the erasure-coded volume. This includes the disk space used by the parity fragments. |
| enableddataauditoperations | edao | The list of operations selected for auditing. For more information, see Auditing Data Access Operations on page 665 and Selective Auditing of filesystem , HPE Ezmeral Data Fabric Database Table , and HPE Ezmeral Data Fabric Event Streams Operations Using the CLI on page 837. |

| | | |
|----------------------------|-----------|--|
| enforcementmode | em | <p>The enforcement mode when evaluating authorization for data access. Permitted values are as follows:</p> <ul style="list-style-type: none"> <code>PolicyAceOnly</code>: Determines data access authorization based only on the security policy tags, for the file or directory. Ignores both mode bits and file or directory ACEs in determining access rights, when the resource is tagged with a security policy. Volume level ACEs still apply. <code>PolicyAceAndDataAce</code>: Evaluates access rights based on the AND of the (file/directory ACEs OR mode bits), and security policy ACEs. <code>DataAceOnly</code>: Evaluates access rights based on the AND of file/directory ACEs OR mode bits. Use this mode to switch off the policy-based security feature, on a per-volume basis, in an emergency situation. <p>Default: <code>PolicyAceAndDataAce</code></p> |
| enforceMinReplicationForIO | esmr | Indicates whether (<code>true</code>) or not (<code>false</code>) to enforce minimum number of replicas for the volume. |
| fixCreatorId | fcid | An internal flag for MapR volumes to fix the creator container ID. |
| forceAudit | fa | Indicates whether (1) or not (0) to force audit of operations on all files, tables, and streams in the volume. |
| FullTopologyAlarm | fta | Timestamp when the Topology Full Alarm on page 2530 was raised. |
| gateway | gwips | The hostname or IP address and port of the MAST Gateway associated with the volume. |
| InodesExceededAlarm | ia | Timestamp when the Inodes Exceeded alarm was raised. |
| label | l | Label associated with the volume. See Using Storage Labels on page 1068 for more information on labels. |
| LargeRowWarning | lrwarning | Timestamp when the Large Row on page 2528 alarm was raised. |
| lastSuccessfulMirrorTime | lmt | Last time when the mirror completed successfully. |

| | | |
|---------------------------|----------|--|
| limitspread | ls | An internal flag for MapR volumes to control the growth of volumes in terms of the number of containers. When this flag is set, CLDB tried to limit the number of new containers created depending on the present size of the volume. If the volume size (the data in the volume) is small, the CLDB tries to reuse space in existing containers thus avoiding the creation of new containers. |
| localpath | lp | Topology of the volume. |
| logicalUsed | dlu | Logical size of disk used by this volume in MB. |
| maxinodesalarmthreshold | miath | The threshold of inodes in use that set off the Inodes Limit Exceeded on page 2528 alarm. |
| maxnssizembalarmthreshold | mnsszath | The namespace container size, which when exceeded raises the INODES_EXCEEDED alarm. |
| metricsEnabled | me | Indicates whether (1) or not (0) metrics collection is enabled for the volume. |
| minreplicas | mrf | Minimum number of replicas before re-replication starts. |
| mirror-percent-complete | mpc | Percentage complete for the most recent or current mirror operation. |
| mirrorDataSrcCluster | mdc | Name of the cluster of the originator volume. |
| mirrorDataSrcVolume | mds | Name of the originator volume. This is used to identify the mirror family in cascaded mirroring. |
| mirrorDataSrcVolumeld | mdi | ID of the originator volume. |
| MirrorFailureAlarm | mfa | Timestamp when the Mirror Failure on page 2528 alarm was raised. |
| mirrorId | mid | Current mirror ID of the volume. |
| mirrorscheduleid | msid | ID of the schedule that determines when the volume needs to be mirrored. |
| mirrorSrcCluster | msc | Name of the source cluster from which the current mirroring will happen. |
| mirrorSrcVolume | src | Name of the source volume from which the current mirroring will happen. |
| mirrorSrcVolumeld | msi | ID of the source volume from which the current mirroring will happen. |
| mirrorstatus | mst | Status of the last mirror attempt. |

| | | |
|------------------------------|------------------|--|
| mirrorthrottle | dt | Flag to determine if the throttling need to be done on mirroring. Value can be: <ul style="list-style-type: none"> 0 - disabled 1 - enabled |
| mirrortype | mrt | Determines the type of volume: <ul style="list-style-type: none"> 0 - Read-write Volume 1 - Mirror Volume 2 - Mirror than can be converted to read-write 3 - Read-write volume that can be converted to mirror |
| mountdir | p | The path the volume is mounted on. |
| mounted | mt | A value of 1 indicates the volume is mounted |
| nameContainerDataThresholdMB | ncdt | Maximum amount of data allowed in the name container. |
| nameContainerSizeMB | ncsmb | Size of the name container for this volume in MB. |
| nsMinReplicas | nsmr | Minimum replication level for the namespace container. |
| nsNumReplicas | nsnr | Replication level for the namespace container. |
| needsGfsck | nfscck | Indicates whether (<code>true</code>) or not (<code>false</code>) this volume requires a filesystem check. |
| nextMirrorId | nmid | Mirror ID that is assigned if the mirroring successfully completes the next time. |
| NoNodesInTopologyAlarm | nna | Timestamp when the No Nodes in Topology on page 2529 alarm was raised. |
| nslabel | nsl | The name container label. See Using Storage Labels on page 1068 for more information on labels. |
| nsMinReplicas | nsmr | Indicates the minimum number of name space replicas configured for the volume. |
| nsNumRelicas | nsnr | Indicates the desired number of name space replicas configured for the volume. |
| numactivecgcontainers | numactivecgcntrs | The number of active CG containers for the volume. |
| numcontainers | nc | Number of containers that the volume has. |

| | | |
|------------------------------------|---------------|---|
| numreplicas | drf | Desired number of replicas. Containers with this amount of replicas are not re-replicated. |
| OffloadRecallFailureAlarm | ora | Timestamp when the Offload/Recall Failed on page 2527 alarm has been raised for the volume. |
| partlyOutOfTopology | poot | A value of 1 indicates this volume is partly out of its topology |
| quota | qta | Quota for limiting disk size in MB. A value of 0 indicates there are no hard quotas for this volume |
| QuotaExceededAlarm | qa | Timestamp when the Volume Quota Alarm on page 2531 was raised. |
| rackpath | rp | The rack path for this volume. |
| readonly | ro | A value of 1 indicates the volume is read-only. |
| replicatedlogicalused | replused | Replicated logical used data of this volume |
| replicatedtotalused | replusedtotal | Replicated total used data of this volume |
| replicationtype | dcr | Replication type. Value can be <code>low_latency</code> (star replication) or <code>high_throughput</code> (chain replication). |
| ReplTypeConversionInProgress | rtip | Indicates whether (1) replication type conversion is currently happening. |
| reReplTimeOutSec | rto | Timeout (in seconds) before attempting re-replication of replica containers. This volume property defines the timeout period until CLDB starts re-replicating the containers on the node of the volume when CLDB stops receiving a heartbeat from the node. |
| scheduleid | sid | The ID of the schedule, if any, used by this volume. |
| schedulename | sn | The name of the schedule, if any, used by this volume. |
| securityPolicyTags | spt | The list of security policy tags to be associated with this volume. If the volume is not tagged, an empty list is returned with this property. |
| skipWireSecurityForTierInternalOps | swsfti | Indicates whether the skip wire security tier internal ops got enabled for this volume. |
| SnaprestoreMaxretriesExceededAlarm | sra | Timestamp when the Snapshot Restore Failure on page 2529 alarm was raised. |
| snapshotcount | sc | The number of snapshots for this volume. |

| | | |
|---------------------------------|----------|--|
| SnapshotFailureAlarm | sfa | Timestamp when the Snapshot Failure on page 2529 alarm was raised. |
| snapshotused | ssu | Total space used (in MB) by the data owned only by the snapshot and not present in the RW volume. Data shared between the snapshot and RW volume is not counted in this field. |
| TableIndexEncodingErrorAlarm | vatinee | Timestamp when the the VOLUME_ALARM_TABLE_INDEX_ENCODING_ERROR alarm has been raised for the volume. |
| TableIndexErrorAlarm | vatinde | Timestamp when the VOLUME_ALARM_TABLE_INDEX_ERROR alarm has been raised for the volume. |
| TableIndexLagHighAlarm | vatindlh | Timestamp when the VOLUME_ALARM_TABLE_INDEX_LAG_HIGH alarm has been raised for the volume. |
| TableReplicationAsyncAlarm | vatrepa | Timestamp when the Table Replication Asynchronous on page 2524 alarm was raised. |
| TableReplicationErrorAlarm | vatrepe | Timestamp when the Table Replication Errors on page 2522 alarm was raised. |
| TableReplicationLagHighAlarm | vatreplh | Timestamp when the Table Replication Lag High on page 2523 alarm was raised. |
| tiercompactionoverheadthreshold | tcovr | The percentage of offloaded data that must have been deleted on the MapR cluster to qualify the data for compaction (or deletion from the tier). |
| tiercompactionscheduleid | tcsid | The ID of the schedule to use for running the compactor. |
| tierenable | tenb | Indicates whether (1) or not (0) storage efficiency through tiering is enabled for the volume. |
| tierencryption | tenc | Indicates whether (<code>true</code>) or not (<code>false</code>) encryption of data on the tier is enabled. |
| tierid | tid | The ID of the tier. |
| tierjobendtime | tjetime | The date and time when the last tiering operation was completed. |
| tierjoboffloadavgthroughputmbps | tjospeed | The average throughput (MB per second) for offloaded data. |
| tierjobrecallavgthroughputmbps | tjrspeed | The average throughput (MB per second) for recalled data. |
| tierjobprogress | tjprog | The completion percentage of the currently running or last tiering operation. |

| | | |
|-------------------------|----------|--|
| tierjobstarttime | tjstime | The date and time when the currently running or last tiering operation was started. |
| tierjobstate | tjstatus | The status of the currently running or last tiering operation. Value can be one of the following: <ul style="list-style-type: none"> • Scheduled • Running • FailureFatal • FailureRetriable • Success • Aborted • AbortInProgress • AbortedInternal For more information on these, see Statuses on page 2313. |
| tierjobtotaloffloadsize | tjsize | The total amount of data offloaded to the tier during the last offload operation. |
| tierjobtype | tjtype | The type of tiering operation currently running or last performed on the volume. |
| tierLocal | tloc | The amount of (in MB) physical user data (including recalled data) on the volume in the cluster. |
| tiename | tname | The name of the tier. |
| tieroffloadscheduleid | tsid | The ID of the schedule for offloading data to the tier. |
| tierPurged | tpur | The amount (in MB) of physical user data that is offloaded to the tier. |
| tierRecall | trec | The amount of (in MB) physical user data that is recalled to the cluster. |
| tierrecallexpirytime | ret | The amount of time to keep recalled data on the MapR cluster before offloading (if there are changes) or purging (if there are no changes) the data. |
| tierruleid | rid | The ID of the rule or storage policy. |
| tiertype | ttype | The type of tier. Value can be either: <ul style="list-style-type: none"> • cold • ectier |
| totalused | tsu | Total space used for volume and snapshots, in MB. |
| used | dsu | Disk space used (in MB), not including snapshots. |

| | | |
|--------------|------|--|
| volumeAces | vace | Displays the ACE values set for this volume. |
| volumeid | id | The volume ID. |
| volumename | n | The name of the volume. |
| volumetype | t | The volume type (for backward-compatibility): <ul style="list-style-type: none"> • 0 - Read-write Volume • 1 - Mirror Volume |
| wireSecurity | ws | Indicates whether (1) or not (0) wire-level security is enabled. |

Related concepts

[node](#) on page 1900

Manages nodes in the cluster

Related reference

[disk add](#) on page 1786

Adds one or more disks to the specified node. Permissions required: `fc` or `a`.

[disk setlabel](#) on page 1788

Adds a label to disks or a storage pool. Permissions required: `fc` or `a`.

[label add](#) on page 1891

Registers a label. Permissions required: `fc` or `a`.

[volume create](#) on page 2190

Creates a volume.

[volume move](#) on page 2294

Moves the specified volume or mirror to a different topology. Permissions required: `m` or `fc` on the volume.

[label list](#) on page 1895

Lists registered labels. Permissions required: `fc` or `a`.

[node list](#) on page 1911

Lists nodes in the cluster.

[dump volumeinfo](#) on page 1830

Returns information about volumes and the associated containers. For JSON formatted output, use the `-json` option from the command line.

[configure.sh](#) on page 2331

Describes the syntax and parameters of the `configure.sh` script that you run for a number of tasks including setting up HPE Ezmeral Data Fabric client nodes, and configuring services for a node.

volume audit

Enables or disables auditing on the specified volume.

You must have the `fc` permission on the cluster to use this command. See [acl](#) for details about this permission.

To learn how to determine whether auditing is enabled for a volume, see [Checking Whether Auditing is Enabled for a Directory, File, or HPE Ezmeral Data Fabric Database Table](#).

Syntax**CLI**

```
maprcli volume audit
  [ -cluster <cluster name> ]
  -name <volume name>
  [-dataauditops <+|-operations>]
  [ -enabled <true|false> ]
  [ -forceenable true|false ]
  [ -coalesce <interval in
minutes> ]
```

REST

| | |
|--------------|--|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/volume/audit?<parameters> |

Parameters

| Parameter | Description |
|-----------------|---|
| cluster | The cluster on which the volume is located. This parameter is required if the volume is on a remote cluster. The remote cluster must be listed in the <code>mapr-clusters.conf</code> file for the cluster where you run the command. |
| <i>coalesce</i> | <p>The interval of time during which READ, WRITE, or GETATTR operations on one file from one IP address or UID are logged only once for a particular operation, if auditing is enabled.</p> <p>For example, suppose that a client application reads a single file three times in 6 minutes, so that there is one read at 0 minutes, another at 3 minutes, and a final read at 6 minutes. If the coalesce interval is at least 6 minutes, then only the first read operation is logged. However, if the interval is between 4 minutes, then only the first and third read operations are logged. If the interval is 2 minutes, all three read operations are logged.</p> <p>Now however, if the client was also writing to the file, irrespective of the coalesce interval for the read operation in the example stated previously, the write operation is logged, as it is a different operation from reading.</p> <p>The default value is 60 minutes. Setting this field to a larger number helps prevent audit logs from growing quickly.</p> |

| Parameter | Description |
|--------------|--|
| dataauditops | <p>The comma separated list of filesystem operations to include (specified with a preceding plus sign (+)) and/or exclude (specified with a preceding minus sign (-)) from auditing.</p> <p> Note: If the first operation in the list is to be excluded from auditing, it must be preceded by two minus (--) signs. Subsequent operations to exclude must be preceded by only a single minus (-) sign, whether or not the first operation was included (using a plus (+) sign) or excluded (using two minus (--) signs). If neither sign is specified, the given operation is included for auditing.</p> <p>The operations that can be included (+) and/or excluded (-) from auditing are listed here. You can, alternatively, group all the filesystem and table operations using the keyword <code>all</code>, which:</p> <ul style="list-style-type: none"> • If included (+), cannot be specified with a list of other included operations. • If excluded (-), cannot be specified with a list of other excluded operations. <p> Note: You can specify a mixed list of included and excluded operations. There are no changes to operations that are not specified with the command.</p> |
| enabled | <p>Enables or disables the auditing of operations within the volume. You must use either this parameter, the <code>-coalesce</code> parameter, or both.</p> <p>See Enabling Auditing for the steps to enable auditing on directories, files, and tables in a volume.</p> <p>When you set the value to false, auditing of operations within the volume ceases. None of the auditing settings are changed on the directories, files, and HPE Ezmeral Data Fabric Database tables within the volume. If you later run the <code>maprcli volume audit</code> command with <code>-enabled</code> set to <code>true</code>, auditing begins again on the objects that were already enabled for auditing.</p> |
| forceenable | <p>Enables or disables auditing of all directories, files, tables, and streams in the volume whether or not auditing is enabled at the individual file, table, and/or stream level.</p> |
| name | <p>The name of the volume.</p> |

Examples

Enable Auditing for a volume

The following example shows how to enable auditing for the volume “auditVolume”:

CLI

```
maprcli volume audit -name
auditVolume -enabled true
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/audit?
name=auditVolume&enabled=true' --user
mapr:mapr
```

Modify the list of operations to audit

The following example shows how to specify the operations to audit. Here, `create` operation is included for auditing and `lookup` operation is excluded from auditing. There are no changes to operations that are not specified.

CLI

```
maprcli volume audit -name
sampleAuditVolume -dataauditops
+create,-lookup
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/audit?
name=sampleAuditVolume&dataauditops=%2
Bcreate%2C%2Dlookup' --user mapr:mapr
```

volume balancecontainers

Balances the containers, or stops the balancing of containers associated with the volume.

Syntax**CLI**

```
maprcli volume balancecontainers
[ -cluster cluster_name ]
-name <volume name>
[ -cancel <true|false>. default:
false ]
```

REST API

N/A

Parameters

| Parameter | Description |
|-----------|--|
| cancel | Stop the balancing of containers associated with the volume. Set this parameter to <code>true</code> to cancel balancing a volume. |
| cluster | The name of the cluster on which to run the command. |
| name | The name of the volume. |

Examples**Start balancing the containers associated with a volume:**

```
maprcli volume balancecontainers -name sampleVol
```

Stop balancing the containers associated with a volume:

```
maprcli volume balancecontainers -name sampleVol -cancel true
```

volume balancinginfo

Fetch currently running or scheduled balancer information for one or more volumes.

Note: For best results, use the `-json` option when running the command.

Syntax**CLI**

```
maprcli volume balancinginfo
[ -cluster cluster_name ]
[ -name <volume name> ]
```

REST API

N/A

Parameters

| Parameter | Description |
|-----------|--|
| cluster | The name of the cluster on which to run the command. |
| name | The name of the volume. |

Output

The command returns the following fields:

| Field | Description |
|---------------|---|
| spId | The ID of the storage pool. |
| capacity | The capacity/size of the storage pool in MB. |
| usedSize | The size of the storage pool that is consumed. |
| desiredSize | The total size of the containers of a volume that should be allocated on this storage pool. |
| isUnderweight | Value is <code>true</code> if the storage pool contains less than 50% of the <code>desiredSize</code> for this volume. |
| isOverweight | Value is <code>true</code> if the storage pool contains more than 1.5 times the <code>desiredSize</code> for this volume. |

Examples

Fetch the list of volumes whose balancing is currently in progress or scheduled:

```
maprcli volume balancinginfo -json
```

Fetch the balancing information for a volume:

```
maprcli volume balancinginfo -name snapshotVolume1 -json
```

Output:

```
{
  "timestamp":1502529117881,
  "timeofday":"2017-08-12 09:11:57.881 GMT+0000",
  "status":"OK",
  "total":5,
  "data":[
    {
```

```

        "isOverweight": false
      }
    ]
  }
]
}

```

volume compact

Runs the compactor to remove recalled data on the MapR cluster or stale data on the tier.

Permissions Required

The user running the command must have one of the following:

- Full control (fc) on the cluster or volume
- Volume edit permissions

Syntax

CLI

```
maprcli volume compact
  [ -cluster <cluster_name> ]
  -name <vol_name>
  [ -forcerecallexpiry true|false ]
```

REST

| | |
|--------------|--|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/volume/compact?<parameters> |

Parameters

| Parameter | Description |
|-------------------|---|
| cluster | The name of the cluster on which to run the command. |
| forcerecallexpiry | Specifies whether (true) or not (false) to purge recalled data on the MapR cluster. If the command is run with the value for this set to true, the compactor purges recalled data on the MapR cluster whether or not the expiry time for recalled data has been reached. If this is not specified or if the value for this is false, the compactor purges stale data on the tier and recalled data on the MapR cluster if the expiry time for recalled data has been reached or has passed. The default value is false. |
| name | The name of the volume. |

Examples

Remove stale data on the tier for the volume named sampleVol:

CLI

```
# maprcli volume compact -name
sampleVol -json
{
  "timestamp":1528299575917,
  "timeofday":"2018-06-06
08:39:35.917 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "Successfully started
compaction."
  ]
}
```

REST

```
# curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/compact?
name=sampleVol' --user mapr:mapr
```

```
{ "timestamp":1528299575917,"timeofday"
:"2018-06-06 08:39:35.917 GMT-0700
AM", "status":"OK", "total":0, "data":
[], "messages":["Successfully started
compaction."]}
```

Remove recalled data immediately on the volume named `sampleVol`:

CLI

```
# maprcli volume compact -name
sampleVol -forcerecallexpiry
true -json
{
  "timestamp":1528299765110,
  "timeofday":"2018-06-06
08:42:45.110 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
    ],
  "messages":["
    Successfully started
    compaction."
  ]
}
```

REST

```
# curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/compact?
name=sampleVol&forcerecallexpiry=true'
--user mapr:mapr
{"timestamp":1528299765110,"timeofday"
:"2018-06-06 08:42:45.110 GMT-0700
AM", "status":"OK", "total":0, "data":
[], "messages":["Successfully started
compaction."]}
```

volume container move

Moves a container. Permissions required: `fc` or `m` on the volume.

The volume container move command moves a specified container (`cid`) from a source file server (`fromfileserver`) to a destination file server (`tofileserver`). If the `tofileserver` parameter is not specified, a destination file server is chosen by the CLDB. If the `tofileserver` is specified but does not exist, the command fails with an error. If the `fromfileserver` does not exist or is down, the container move occurs once the source file server comes back up.

Syntax

CLI

```
volume container move
  -cid <cid>
  -fromfileserverid
<fromfileserverid>
  [ -tofileserverid
<tofileserverid> ]
```

REST

| | |
|--------------|------|
| Request Type | POST |
|--------------|------|

| | |
|-------------|---|
| Request URL | http[s]://<host>:<port>/rest/volume/container/move?<parameters> |
|-------------|---|

Parameters

| Parameter | Description |
|------------------|---|
| cid | The container ID. |
| fromfileserverid | The ID of the file server on which the container to be moved currently resides. The ID is available from the <code>maprcli node list</code> command. |
| tofileserverid | The ID of the file server to which to move the container. If not specified, a file server is chosen by the CLDB. The ID is available from the <code>maprcli node list</code> command. |

Examples

CLI

```
maprcli volume container
move -cid 2316 -fromfileserverid
5227152973904547710 -tofileserverid
875290643748357753
```

REST

```
curl -k -X POST 'https://abc.sj.us:8443/
rest/volume/container/move?
cid=2316&fromfileserverid=52271529739045
47710&tofileservicerid=87529064374835775
3' --user mapr:mapr
```

volume container switchmaster

Switches the master replica for a specified container to another replica in the replica chain.

This command fails if there is only one up-to-date replica for the container.

Note: Only the `root` and the `MAPR_USER` (user name under which HPE Ezmeral Data Fabric services run) user have permissions to run this command.

Syntax

CLI

```
maprcli volume container switchmaster
[ -cluster <cluster_name> ]
-cid <cid>
```

REST

| | |
|--------------|---|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/volume/container/switchmaster?<parameters> |

Parameters

| Parameter | Description |
|-----------|---|
| cluster | The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command. |
| cid | The unique ID number for the container that you want to run the command on. |

Example

Switches the master container for a specified container:

CLI

```
maprcli volume container
switchmaster -cid 2049
```

REST

```
https://abc.sj.us:8443/rest/volume/
container/switchmaster?cid=2049
```

volume create

Creates a volume.

Permissions Required

cv or fc on the cluster.

Note: See [acl](#) on page 1705 for more information.

Syntax

CLI

```
/opt/mapr/bin/maprcli volume create
-name <volume name>

REST

| | |
|--------------|---|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/volume/create?<parameters> |

Parameters

Parameter: advisoryquota

Default Value: No default value
Possible Values: 0 or any other integer value.
Description: The advisory quota for the volume as integer plus unit. Example: quota=500G;
Units: B, K, M, G, T, P

Parameter: ae

Default Value: No default value
Possible Values: Name of the entity that owns the volume.
Description: The accounting entity that owns the volume.

Parameter: aetype

Default Value: No default value
Possible Values:

- 0=user
- 1=group

Description: Type of accounting entity.

Parameter: allowgrant

Default Value: false

| | |
|---------------------------------------|---|
| | <p>Possible Values:</p> <ul style="list-style-type: none"> • true • false |
| Parameter: allowinherit | <p>Description: Specifies whether the volume as a parent, grants permission for a child volume to inherit its properties.</p> <p><i>Default Value:</i> true</p> <p>Possible Values:</p> <ul style="list-style-type: none"> • true • false |
| | <p>Description: Specifies whether a new volume inherits properties from the parent mount point volume.</p> <p><i>Default Value:</i> false</p> <p>Possible Values:</p> <ul style="list-style-type: none"> • true • false |
| Parameter: allowreadforexecute | <p>Description: Allows execution of SUID binaries with only their executable bit set, on a FUSE filesystem. This parameter works in conjunction with the <code>fuse.mount.setuid</code> FUSE option. For more information, see Configuring the HPE Ezmeral Data Fabric FUSE-Based POSIX Client on page 1358.</p> <p><i>Default Value:</i> 0 (the <code>atime</code> is not updated)</p> <p>Possible Values: Any positive integer</p> |
| Parameter: atimeUpdateInterval | <p>Description:</p> <p>The <code>atimeUpdateInterval</code> denotes how frequently the last access time of a file is updated. The value is in days.</p> <p>For more information, see Tuning Last Access Time on page 448.</p> |
| Parameter: auditenabled | <p><i>Default Value:</i> true</p> <p>Possible Values:</p> <ul style="list-style-type: none"> • true • false <p>Description: Specifies whether to turn on auditing for the volume. If you enable auditing at the cluster level with the <code>audit data</code> on page 1733 command, setting this value to <code>true</code> causes auditing to start for any directories, files, tables, or streams that are already enabled for auditing. If none are yet enabled, enabling auditing on any of them causes auditing of them to start.</p> <p>Set <code>auditenabled</code> to <code>true</code> to enable auditing on directories, files, tables, and streams in the volume.</p> <p>You must have the <code>fc</code> permission on the cluster to use this parameter. See acl for details about this permission.</p> |

| | |
|--|--|
| Parameter: <code>autooffloadthresholdgb</code> | <p><i>Default Value:</i> 1024 GB</p> <p>Possible Values: Any positive integer.</p> <p>Description: The size of the volume in GB (threshold). When this threshold is reached or exceeded, volume data is automatically offloaded by the Automatic Tiering Scheduler. To use the global size threshold (of 1024 GB), set the value to 0.</p> |
| Parameter: <code>cluster</code> | <p><i>Default Value:</i> No default value</p> <p>Possible Values: Any valid cluster.</p> <p>Description: The cluster on which to create the volume.</p> |
| Parameter: <code>coalesce</code> | <p><i>Default Value:</i> 60 minutes</p> <p>Possible Values: Set this parameter to a large number of minutes to prevent audit logs from growing quickly.</p> <p>Description: The interval of time (in minutes) during which READ, WRITE, or GETATTR operations on one file from one IP address or UID are logged only once for a particular operation, if auditing is enabled.</p> <p>For example, suppose that a client application reads a single file three times in 6 minutes, so that there is one read at 0 minutes, another at 3 minutes, and a final read at 6 minutes. If the coalesce interval is at least 6 minutes, then only the first read operation is logged. However, if the interval is 4 minutes, then only the first and third read operations are logged. If the interval is 2 minutes, all three read operations are logged.</p> <p>Now however, if the client was also writing to the file, irrespective of the coalesce interval for the read operation in the example stated previously, the write operation is logged, as it is a different operation from reading.</p> |
| Parameter: <code>compactionoverheadthreshold</code> | <p><i>Default Value:</i> 30%</p> <p>Possible Values: 0-100%</p> <p>Description: Specifies the percentage of offloaded data that must have been deleted on the cluster to qualify the data for compaction (or deletion from the tier).</p> |
| Parameter: <code>compactionschedule</code> | <p><i>Default Value:</i> Automatic Internal Schedule</p> <p>Possible Values: Any valid schedule ID.</p> <p>Set this parameter to 0 to disable the compactor.</p> <p>Description: Specifies the schedule to use for running the compactor.</p> |
| Parameter: <code>containerallocationfactor</code> | <p><i>Default Value:</i> 5</p> <p>Recommended Value: 2* SP count in the volume topology.</p> <p>Description: Specifies the number of containers to create when the first write from a remote client is sent to the volume. The pre-created containers are distributed equally across topologies, servers, filesystem instances, and storage pools. CLDB also takes into consideration the load (IO/Space) when selecting target storage pools for containers. The value must be a positive integer.</p> |
| Parameter: <code>createparent</code> | <p><i>Default Value:</i> 1</p> |

Possible Values:

- 0 - Do not create a parent directory
- 1 - Create a parent directory

Description: Specifies whether or not to create a parent directory to hold the volume link.

Parameter: criticalrereplicationtimeoutsec

Default Value: 0 (No timeout)

Possible Values: Any integer between 300 and 3600 (seconds)

Description: Timeout (in seconds) before re-replicating only the critically under-replicated containers . If you set both `rereplicationtimeoutsec` and `criticalrereplicationtimeoutsec`, and if the value of:

- `rereplicationtimeoutsec` is less than `criticalrereplicationtimeoutsec`, `rereplicationtimeoutsec` overrides the `criticalrereplicationtimeoutsec` setting for both under-replicated and critically under-replicated containers.
- `rereplicationtimeoutsec` is greater than `criticalrereplicationtimeoutsec`, `criticalrereplicationtimeoutsec` overrides the `rereplicationtimeoutsec` setting only for critically under-replicated containers; `rereplicationtimeoutsec` setting is still applicable for under-replicated containers.

Parameter: dare

Default Value: false

Possible Values:

- true
- false

Description: Specifies whether or not to enable data-at-rest encryption for volume. This setting takes effect only if the data-at-rest encryption feature is also enabled at the cluster level. Once enabled, this feature cannot be disabled.

Parameter: dataauditops

Default Value: Default enabled audit ops:

`setattr, chown, chperm, chgrp, getxattr, listxattr, setxattr, removexattr, read, write, create, delete, mkdir, readdir, rmdir, createsym, lookup, rename, createdev, truncate, tablecfcreate, tablecfdelete, tablecfmodify, tablecfScan, tableget, tableput, tablescan, tablecreate, tableinfo, tablemodify, getperm, getpathforfid, hardlink, filesan, fileoffload, filerecall, filetierjobstatus, filetierjobabort`

Possible Values: Any audit operations that you want to enable.

Description: The comma separated list of filesystem operations to include (specified with a preceding plus sign (+)) or exclude (specified with a preceding minus sign (-)) from auditing.

To exclude the first operation in the list (of operations) from auditing, precede it by two minus (--) signs. To exclude subsequent operations, precede them by only a single minus (-) sign, irrespective of whether the first operation was included (using a plus (+) sign) or excluded (using two minus (--) signs). If neither sign is specified, the given operation is included for auditing.

The operations that can be included (+) or excluded (-) from auditing are listed [here](#). You can, alternatively, group all the operations using the keyword `all`, which:

- If included (+), cannot be specified with a list of other included operations.
- If excluded (-), cannot be specified with a list of other excluded operations.

You can specify a mixed list of included and excluded operations. There is no change to operations that are not specified with the command.

Note: If you specify only `setattr` as the audit operation to enable, `chown`, `chperm`, and `chgrp` are automatically added and enabled.

For more information, see [Selective Auditing of Filesystem and Table Operations](#).

Parameter: `dbindexlagsecalarmthresh`

Default Value: 300 seconds

Possible Values: Any integer value.

Description: Specifies the threshold (in seconds) to raise an alarm for index update lag.

Parameter: `dbrepllagsecalarmthresh`

Default Value: 900 seconds

Possible Values: Any integer value.

Description: Specifies the threshold (in seconds) to raise an alarm for DB replication lag.

Parameter: `ecenable`

Default Value: `false`

Possible Values:

- `true`
- `false`

Description: Enable (`true`) or disable (`false`) warm tiering for the volume. Either this parameter or `tieringenable` is required to enable warm tiering. If you specify this parameter, you cannot specify `tiername`; when the command runs, a new tier is created for the volume. If you do not specify any rule, the default rule, which is all files (`p`), is associated with the volume.

Parameter: `eclabel`

Default Value: HDD

Possible Values: Any label.

Description: The label to use for the erasure-coded volume. See [Using Storage Labels](#) on page 1068 for more information on labels.

The label should contain only the following characters:

```
A-Z a-z 0-9 _ - .
```

Parameter: ecscheme

Default Value: 4+2

Possible Values: Any valid EC scheme.

Description:

Note: This parameter is applicable only for EC volumes, and only when you set the `ecenable` parameter to `true`.

The number of data chunks and the number of parity chunks separated by a plus (+) sign.

For schemes with local parity, the scheme is of the form $x+y+z$, where x is the number of data chunks, y is the number of local parity chunks, and z is the number of global parity chunks.

For information on the supported schemes, see [Erasure Coding Scheme for Data Protection and Recovery](#) on page 1004.

Parameter: ectopology

Default Value: /data/default-rack

Possible Values: Any topology that exists in your environment.

Description: Sets the topology to store the erasure coded volume. Once set, you cannot change the topology of an erasure coded volume using this command. To change the topology of an erasure coded volume, use `volume move` on page 2294.

Note:

1. This parameter is applicable only for EC volumes.
2. The specified EC topology needs to have sufficient nodes for the selected EC Scheme. For example, 6 nodes for 4+2, 5 nodes for 3+2 etc.

Parameter: enforcementmode

Default Value: No default value

Possible Values:

- PolicyAceOnly
- PolicyAceAndDataAce
- DataAceOnly
- PolicyAceAuditAndDataAce

Description: The enforcement mode when evaluating authorization for data access. Permitted values are as follows:

- **PolicyAceOnly:** Determines data access authorization based only on the ACEs set in security policies. Ignores POSIX mode bits and ACEs directly defined on data objects when determining access rights, if a data object is tagged with at least one security policy. If a data object is not associated with at least one security policy, the system will enforce POSIX mode bits and ACEs directly defined on the data object. Volume-level ACEs are always enforced.
- **PolicyAceAndDataAce:** Determines data access authorization based on the ACEs set in security policies AND ACEs or POSIX mode bits directly set on data objects.
- **DataAceOnly:** Determines data access authorization based on the ACEs or POSIX mode bits directly set on data objects. You can use this mode to switch off the policy-based security feature, on a per-volume basis, in an emergency situation.
- **PolicyAceAuditAndDataAce:** Use this mode when testing security policies. In this mode:
 - ACEs defined directly on data objects are enforced.
 - Data objects associated with security policies are checked for access, and any access denied events are audited, but access itself is allowed.

See the section on [Volume-Level Security Policy Enforcement Mode](#) on page 678 for a discussion on how to determine permission to access a resource, when this flag is set.

Parameter: `enforceminreplicationforio`

Default Value: false

Possible Values:

- true
- false

Description: Specifies whether (`true`) or not (`false`) to enforce minimum number of replicas for the (read-write) volume during IO. This flag ensures that further updates (writes) to volume are successful only when the minimum number of copies of the container are available. Setting this parameter to `true` ensures that if writes succeed, then it has been applied to at least the minimum number of copies; if writes fail, it may have been applied to zero or more copies.

Enabling this parameter, may stall `volume dump` and `volume snapshot create` operations, if the minimum number of copies of the container are not available.

If you do not set this parameter on a volume, or if you modified this parameter from `false` to `true`, then you need to restart all the nodes where the containers associated with the volume exist, for the changes to take effect.

This flag is ignored on mirror volumes. If there are more than five cluster nodes, this flag is set to `true`, by default, on the tier volume. If the number of cluster nodes is less than five, this flag is set to `false`, by default, on the tier volume.

Parameter: filefilter

Possible Values: Any file filter.

Description: Specifies the file filter to use to prevent specific types of files from being stored on the volume. For more information, see [Prevent Storage of Specified Types of Files](#) on page 658. You can associate only one filter for each volume.

Parameter: forceauditenable

Default Value: `false`

Possible Values:

- `true` - force audit of all content
- `false` - do not force audit

Description: Specifies whether (`true`) or not (`false`) to force audit of operations on all files, tables, and streams in the volume if auditing is enabled at the cluster and volume levels, irrespective of the audit setting on the individual directory, file, table, and stream.

Parameter: group

Default Value: No default value

Possible Values: Any user with `Create Volume` privileges.

Description: Space-separated list of `group:permission` pairs. Use commas to separate permissions. For example:
`group:permission,permission,...`

Parameter: inherit

Default Value: No default value

Possible Values: Any existing volume name

Description: Specifies the name of the volume from which the new volume inherits properties. When you specify `inherit`, you do not need to specify `allowgrant`. See the following section on Inheritance for more information.

Parameter: label

Default Value: `default`

Possible Values: Any label.

Description: The label to use for the storage pool. See [Using Storage Labels](#) on page 1068 for more information on labels.

The label should contain only the following characters:

```
A-Z a-z 0-9 _ - .
```

Tip: Use the special label named `anywhere` to let a volume reside on any storage pool. Not setting a label, causes a volume to reside only on a storage pool without a label.

Parameter: localvolumehost

Default Value: No default value

Possible Values: Any existing volume name

Description: Specifies the name of the local volume host.

| | |
|---|---|
| Parameter: localvolumeport | <p><i>Default Value:</i> 5660</p> <p>Possible Values: Any valid port number</p> <p>Description: Specifies the port number of the local volume host.</p> |
| Parameter: maxinodesalarmthreshold | <p><i>Default Value:</i> 50000000</p> <p>Possible Values: Any positive integer.</p> <p>Description: The number of inodes, which when exceeded raises the INODES_EXCEEDED alarm.</p> |
| Parameter: maxnssizembalarmthreshold | <p><i>Default Value:</i> 500 GB</p> <p>Possible Values: Any positive integer.</p> <p>Description: The namespace container size, which when exceeded raises the INODES_EXCEEDED alarm.</p> |
| Parameter: metricsenabled | <p><i>Default Value:</i> false</p> <p>Possible Values:</p> <ul style="list-style-type: none"> • true • false <p>Description: Specifies whether (<i>true</i>) or not (<i>false</i>) to enable metrics collection for a volume.</p> |
| Parameter: minreplication | <p><i>Default Value:</i> 2</p> <p>Possible Values: Can be any value that you desire based on the replication you need.</p> <p>Description: The minimum replication level. When the replication factor falls below this minimum, re-replication occurs as aggressively as possible to restore the replication level. If any containers in the CLDB volume fall below the minimum replication factor, writes are disabled until aggressive re-replication restores the minimum level of replication.</p> <p style="text-align: right;">Tip: For more information, see Understanding Replication on page 410.</p> |
| Parameter: mirrorschedule | <p><i>Default Value:</i> 0</p> <p>Possible Values: Any valid schedule ID.</p> <p>Description: The schedule ID corresponding to the schedule to be used for mirroring. If you specify a mirror schedule ID, then the mirror volume automatically syncs with its source volume on the specified schedule. Pre-assigned IDs include 1 for critical data, 2 for important data, and 3 for normal data. Custom schedules are assigned ID numbers in sequence. To determine the ID number, use the <code>schedule list</code> command.</p> |
| Parameter: mirrorthrottle | <p><i>Default Value:</i> true</p> <p>Possible Values:</p> <ul style="list-style-type: none"> • true • false <p>Description: Specifies whether mirror throttling is enabled (<i>true</i>) or disabled (<i>false</i>). Throttling is set on the source volume and applies to all its mirrors.</p> |

Parameter: mount*Default Value:* true

Possible Values:

- true
- false

Description: Specifies whether to mount the volume (*true*) or not (*false*) after creating the volume.

Parameter: name*Default Value:* No default value

Possible Values: Any valid name

Description: Specifies the name for the volume.

The name should contain only the following characters:

```
A-Z a-z 0-9 _ - .
```

For tiering-enabled volumes, the volume name cannot exceed 98 characters. For regular volumes, the volume name should be a maximum of 128 characters.

Parameter: namecontainerdatathreshold*Default Value:* 524288 MB

Possible Values: Any integer value. The value is interpreted as being in MB.

If you set this parameter to 0, there is no limit on the size of user data that can be stored in the name container.

If chunk size is 0, by default, all data is stored in the name container. However, if this property is set, all data is stored in a second container and only the meta data is stored in the name container once the threshold is reached. The size of the second container is not limited by this setting; you must ensure that the size does not grow too large, by limiting the amount of data in the volume.

Description: Limits the size of user data that can be placed in the name container. The value is interpreted as being in MB. If the user data size limit:

- Has not yet been reached, the first 64 KB of data is stored in name container, and the rest of the data is stored in data containers.
- Has already been reached, only meta data is stored in the name container, and the data is stored in data containers. For example, if you set the current name container size to 200GB and the limit to 100GB, then all new user data is stored in data containers.

Parameter: nslabel*Default Value:* default

Possible Values: Any value.

Description: The label to use for the namespace container. See [Using Storage Labels](#) on page 1068 for more information on labels.

The label should contain only the following characters:

```
A-Z a-z 0-9 _ - .
```

Parameter: nsminreplication*Default Value:* 2

Possible Values: Any integer value.

Description: A replication factor of the namespace container. When the replication factor falls below this value, re-replication occurs as aggressively as possible to restore the replication level. If any containers in the CLDB volume fall below the minimum replication factor, writes are disabled until aggressive re-replication restores the minimum level of replication.

When enabled, the CLDB manages the namespace container replication separate from the data container replication. You use this capability when you have low volume replication but want to have higher namespace replication.

Set the value to be the same or larger than the value of the equivalent data replication parameter, `minreplication`.

See also: [Understanding Replication](#) on page 410.

Parameter: nsreplication*Default Value:* 3

Possible Values: Any integer value.

Description: A replication factor of the namespace container. When the number of copies fall below the desired replication factor, but remains equal to or above the minimum replication factor, re-replication occurs after the timeout specified in the `cldb.fs.mark.rereplicate.sec` parameter. This timeout is the time given for a node that is offline to come back online. After this timeout period, the CLDB takes action to restore the replication factor. When enabled, the CLDB manages the namespace container replication separate from the data container replication. This capability is used when you have low volume replication but want to have higher namespace replication. By default, the value of this parameter is the same or larger than the value of the equivalent data replication parameter. However, to set the value of this parameter lower than the replication value, first set `engg.manual.override` to `true` in `cldb.conf`. See also: [Understanding Replication](#) on page 410.

Parameter: numactivecgcontainers*Default Value:* 0

Possible Values: Any integer between 1 and 100.

Description: Number of containers to be assigned for a CG assign request.

Parameter: offloadschedule*Default Value:* No default value

Possible Values: Any valid schedule ID. To disable schedule-based offload, set this value to 0.

Description: The ID of the schedule to associate with the volume for offloading volume data to the tier.

Note: This parameter is required only for Cold/EC tiered volumes.

Parameter: path*Default Value:* No default value

Possible Values: Any valid path.

Description: The path at which to mount the volume. The path must be relative to / and cannot be in

Parameter: quota

the form of a global namespace path (for example, /mapr/<cluster-name>/).

Default Value: 0

Possible Values: Any integer value along with a unit.

Description: The quota for the volume as integer plus unit. Example: quota=500G; Units: B, K, M, G, T, P

Do not use two-letter abbreviations for quota units, such as GB and MB.

When you set a quota for a tiering-enabled volume, the quota is the total space allocated for the volume irrespective of the location (cluster or tier) where the volume data is stored. For example, if you allocate 1GB of hard quota for a tiering-enabled volume, writes fail after you write 1GB of data whether or not the volume data is local (on the cluster) or offloaded (to the tier).

Note that quotas for source and mirror volumes must match.

Parameter: readAce

Default Value: p (grant access to all users)

Possible Values: Any valid permissions.

Description: Specifies [Access Control Expressions](#)(ACEs) that grant permissions at the volume level to read files and tables in the volume. The default value is p, which grants access to all users.

See [ACEs](#).

Parameter: readonly

Default Value: No default value

Possible Values:

- 0
- 1

Description: Specifies whether the volume is read-only.

- 0 - read/write
- 1 - read-only

Parameter: recallexpirytime

Default Value: 1 day

Possible Values: Any integer between 1 and 7500.

Description: The amount of time (in days) to keep the recalled data before purging or offloading it.

Parameter: replication

Default Value: 3

Possible Values: Any integer starting at 0.

Description: The desired replication level. When the number of copies falls below the desired replication factor, but remains equal to or above the minimum replication factor, re-replication occurs after the timeout specified in the `cldb.fs.mark.rereplicate.sec` parameter. Note that this timeout is the time given for a node that is offline to come back online. After this timeout period, the CLDB takes action to restore the replication factor.

Tip: For more information, see [Understanding Replication](#) on page 410.

Parameter: replicationtype

Default Value: high_throughput

Possible Values:

- low_latency (star replication)
- high_throughput (chain replication)

Description: The desired replication type. The default setting is high_throughput.

Parameter: rereplicationtimeoutsec

Default Value: 3600 seconds (1 hour)

Possible Values: Any positive integer.

Description: Timeout (in seconds) before attempting re-replication of replica containers. This volume property defines the timeout period until CLDB starts re-replicating the containers on the node of the volume after CLDB stops receiving a heartbeat from the node.

When a node is down, CLDB gives the node an hour to come back online before it takes any action for the containers on this node. You can set this parameter on volumes to reduce the default value to a shorter time period. This option is provided mainly for local volumes, so that when the filesystem is down, CLDB can give up quickly and decide that the container has no master. This forces the TT to give up on local containers, and take the appropriate recovery action of deleting the mapped volume and creating another one.

Parameter: rootdirgroup

Default Value: User who is running the command

Possible Values: Any valid group

Description: Group that owns the root directory

Parameter: rootdirperms

Default Value: rwxr-xr-x

Possible Values: Any valid permission

Description: Permissions on the volume root directory.

Parameter: rootdiruser

Default Value: User who is running the command

Possible Values: Any valid user

Description: User that owns the root directory.

rootdirsecuritypolicy

Default Value: None

Possible Values: An empty string, or a list of security policy tags.

Description: A comma-delimited list of security policy tags to be associated with the volume root directory. This parameter is not mandatory.

If you do not specify a security policy, the volume is created without initial security policy tags.

Parameter: schedule

Default Value: 0

Possible Values: 0 or a valid schedule ID.

Description: The ID of a schedule. Use the [schedule list](#) command to find the ID of the named schedule that you want to apply to the volume.

Parameter: securitypolicy

To disable the schedule, set this parameter to 0.

Default Value: None

Possible Values: An empty string, or a list of security policy tags.

Description: A comma-delimited list of security policy tags to be associated with the volume. This parameter is not mandatory.

If you do not specify a security policy, the volume is created without initial security policy tags.

Parameter: skipinherit

Default Value: No default value

Possible Values:

- schedule
- tiername

Description: Specifies not to inherit given properties associated with the:

- Parent volume (for other volumes)
- Source volume (for mirror volumes)

Value must be either or both:

- schedule to not inherit snapshot schedule settings
- tiername to not:
 - Inherit tiering properties like tierid, tieroffloadscheduleid, ecshceme, ectopology
 - Set default values for compactionscheduleid and compactionoverheadthreshold

Use comma to separate multiple values.

Parameter: source

Default Value: No default value

Possible Values: Any volume.

Description: The source volume from which a mirror volume receives updates, specified in the format <volume>@<cluster>.

Parameter: tenant

Default Value: No default value

Possible Values: Any valid tenant user.

Description: The tenant is the entity for which resources such as volumes are created. The tenant can be an organization, a department within an organization, or an individual.

This parameter indicates the tenant for whom the volume is being created. All resources within the created volume are owned by the specified tenant.

Parameter: tierencryption

Default Value: false

Possible Values:

- true
- false

Description: Specifies whether to enable (`true`) or disable (`false`) encryption of data on the object store. This parameter is applicable only for cold-tier volumes. If you enable this parameter, user data is encrypted before being written to the object, and the HTTPS protocol is used for communication with the object store to ensure that data is encrypted both on the wire and on the tier.

You can set this parameter only if you specify a tier name (see the `tiername` parameter) as well. You cannot modify this parameter after you set it.

If you set the value to `true`, you can also specify a custom key using the `tierkey` parameter. Once set to `true`, the MAST Gateway uses HTTPS to upload data to the cold-tier. If the cold tier does not support HTTPS, all tier related operations fail. If the cold-tier does not support HTTPS, you must explicitly set the value for this to `false` at the time of associating a tier with the volume because the default value for this parameter is `true`.

Tip: For warm tier, use `-dare` option on the front-end volume to enable or disable encryption of data-at-rest.

Parameter: tieringenable

Default Value: No default value

Possible Values:

- true
- false

Description: Enable (`true`) or disable (`false`) tiering for the volume. When you specify this parameter, you must also specify the `tiername`. For creating a tiering-enabled mirror volume, specify this parameter if the source volume is enabled for cold-tier; specify either this parameter or `ecenable`, if the source volume is enabled for warm-tier.

Parameter: tieringrule

Default Value: p (all files)

Possible Values: Name of any valid rule

Description: The name of the rule (referred to as storage policy in the Control System) to use for offloading data to the tier. If you do not specify a rule, the default rule, which is all files (p), is associated with the volume. See [Creating a Rule in Creating a Storage Tier Policy](#) on page 1057 for more information.

Parameter: tierkey

Default Value: Auto generated

Possible Values: Any 32-character HEX string, or let CLDB auto-generate this string

Description: The 32-character HEX string to use for encryption only for cold tier volumes. If you do not specify a string, CLDB generates a 32 character HEX string to use for encrypting the data to offload to the tier.

Parameter: tiername

Default Value: No default value

Parameter: topology

Possible Values: Any

Description: The name of the tier to use for offloading data. You can set this name only once and cannot modify it.

For warm tiering, you cannot specify this parameter if `ecenable` is set to `true`.

Default Value: /data

Possible Values: Any

Description: The rack path to the volume.

To create a volume in a specific topology, you must have the [Converged Enterprise Edition](#) installed on your system. Without the Converged Enterprise Edition, when you run the `maprcli volume create` command with the `-topology` option, the following error message is returned:

```
ERROR (10010) - Volume Creation
Failed: Setting topology on
           a volume
requires data placement feature.
License not found for data placement.
```

Parameter: type*Default Value:* 0

Possible Values:

- mirror
- rw
- 0
- 1

Description: The type of volume to create.

The following values are accepted:

- `mirror` - standard mirror (read-only) volume (promotable to standard read-write volume)
- `rw` - standard (read-write) volume (convertible to standard mirror volume)
- `0` - standard (read-write) volume (for backward compatibility)
- `1` - non-convertible mirror (read-only) volume (for backward compatibility)

Parameter: user

Default Value: All permissions (`dump`, `restore`, `m`, `a`, `d`, `fc`) for the administrator who created the volume

Possible Values: Any valid permissions

Description: Space-separated list of `user:permission` pairs.

Use comma to separate permissions. For example:
`user:permission,permission,...`

Parameter: wiresecurityenabled*Default Value:* true

Possible Values:

- true
- false

Description: Enables (`true`) or disables (`false`) on-wire encryption for all files, tables, and streams in the volume for secure clusters. This parameter is not supported on insecure clusters.

If `true`, this setting overrides all file, table, and stream level encryption settings (set using the `hadoop mfs` command) and enables on-wire encryption for all files, tables, and streams. If you disable (`false`) this parameter at the volume level, but enable it at the file, table, or stream level, the file, table, or stream level encryption setting overrides this setting on those files, tables, and streams where it is enabled; for all other files, tables, and streams where encryption is not enabled at the file, table, or stream level, the on-wire encryption is disabled.

Parameter: `writeAce`

Default Value: `p` (grants access to all users)

Possible Values: Any valid permissions

Description: Specifies [Access Control Expressions \(ACEs\)](#) that grant permission at the volume level to write to files and tables in the volume. The default value is `p`, which grants access to all users.

See [ACEs](#).

Inheritance

The following table shows the list of inheritable parameters that are (Yes) and are not (No) inherited by a:

- Mirror volume from the source volume on the same cluster
- Mirror volume from the source volume on a different cluster

Note: All (non-mirror) volumes inherit all the inheritable properties from the parent volume. For more information on the properties, refer to `volume create parameters`.

| Inheritable Properties (which are inherited by non-mirror volumes by default) | Inherited by Mirror Volume on the same cluster as the source volume? | Inherited by Mirror Volume on a different cluster from the source volume? |
|---|--|---|
| <code>advisoryquota</code> | Yes | Yes |
| <code>ae</code> | Yes | No |
| <code>aetype</code> | Yes | No |
| <code>allowgrant</code> | Yes | Yes |
| <code>allowinherit</code> | Yes | Yes |
| <code>auditenabled</code> | Yes | Yes |
| <code>coalesce</code> | Yes | Yes |
| <code>dare</code> | Yes | Yes ¹ , No ² |
| <code>dataauditops</code> | Yes | Yes |
| <code>dbindexlagsecalarmthresh</code> | Yes | Yes |

| Inheritable Properties (which are inherited by non-mirror volumes by default) | Inherited by Mirror Volume on the same cluster as the source volume? | Inherited by Mirror Volume on a different cluster from the source volume? |
|---|--|---|
| dbrepllagseccalarmthresh | Yes | Yes |
| enforcementMode | Yes | Yes |
| ecscheme | Yes | No |
| ectopology | Yes | No |
| group | Yes | Yes |
| inherit | Yes | Yes |
| localvolumehost | No | No |
| localvolumeport | No | No |
| maxinodesalarmthreshold | Yes | Yes |
| minreplication | Yes | Yes |
| mirrorschedule | Yes | No |
| mirrorthrottle | Yes | Yes |
| nsminreplication | Yes | Yes |
| nsreplication | Yes | Yes |
| ofloadschedule | Yes | No |
| quota | Yes | Yes |
| readonly | Yes | Yes |
| recallexpirytime | Yes | No |
| replication | Yes | Yes |
| replicationtype | Yes | Yes |
| rereplicationtimeoutsec | Yes | Yes |
| rootdirperms | Yes | Yes |
| schedule | Yes ³ | No |
| securitypolicy | Yes | Yes |
| source | Yes | Yes |
| tierencryption | Yes | No |
| tieringenable | Yes | No |
| tieringrule | Yes | No |
| tierkey | Yes | No |
| tiername ⁴ | Yes | No |
| topology | Yes | No |
| type | Yes | Yes |
| user | Yes | Yes |
| wiresecurityenabled | Yes | Yes |

- ¹ If destination cluster is also enabled for data-at-rest encryption, `dare` setting is inherited by the mirror volume on the destination cluster.
- ² If destination cluster is not enabled for data-at-rest encryption, `dare` setting is not inherited by the mirror volume on the destination cluster.
- ³ If `schedule` keyword is specified with the `skipinherit` parameter, `schedule(s)` are not inherited while inheriting volume properties from the source volume.
- ⁴ If `tiername` keyword is specified with the `skipinherit` parameter:
 - The tiering properties are not inherited by the mirror volume while inheriting volume properties from the tiering-enabled source volume.
 - For volumes enabled for warm-tier, the backend erasure-coded volume is not created.

Examples

Create the volume "test-volume" mounted at "/test/test-volume" with an atime of 2 days

CLI

```
/opt/mapr/bin/maprcli volume
create -name test-volume -path /
test/test-volume -type rw
-atimeUpdateInterval 2 -json
{
  "timestamp":1526522204072,
  "timeofday":"2020-05-16
06:56:44.072 GMT-0700 PM",
  "status":"OK",
  "total":0,
  "data":[

  ],
  "messages":["
    Successfully created volume:
'test-volume' "
  ]
}
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/create?
name=test-volume&path=/test/
test-volume&type=rw&atimeUpdateInterva
l=2' --user mapr:mapr
{"timestamp":1526522305703,"timeofday":
"2020-05-16 06:58:25.703 GMT-0700
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
volume: 'test-volume'"]}
```

Create the volume "test-volume" mounted at "/test/test-volume" with EC scheme "6+2+2"

CLI

```
/opt/mapr/bin/maprcli volume
create -name test-volume -path /test/
test-volume -type rw -ecscheme
"6+2+2" -json
{
```

```

"timestamp":1526522204072,

"timeofday":"2018-05-16 06:56:44.072
GMT-0700 PM",

        "status":"OK",
        "total":0,
        "data":[

        ],
        "messages":[
        "Successfully
created volume: 'test-volume'"
        ]
    }

```

REST

```

curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/create?
name=test-volume&path=/test/
test-volume&type=rw&ecscheme=6+2+2'
--user mapr:mapr

{"timestamp":1526522305703,"timeofday"
:"2018-05-16 06:58:25.703 GMT-0700
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
volume: 'test-volume'"]}

```

Create Volume with a Quota and an Advisory Quota

This example creates a volume with the following parameters:

- advisoryquota: 100M
- name: volumename
- path: /volumepath
- quota: 500M
- replication: 3
- schedule: 2
- topology: /East Coast
- type: rw

CLI

```

/opt/mapr/bin/maprcli volume
create -name volumename -path /
volumepath -advisoryquota 100M -quota
500M -replication 3 -schedule
2 -topology "/East Coast" -type
rw -json
{
    "timestamp":1526522474660,
    "timeofday":"2018-05-16
07:01:14.660 GMT-0700 PM",
    "status":"OK",
    "total":0,

```

```

    "data":[
      ],
      "messages":[
        "Successfully created volume:
        'volumename'"
      ]
    ]
  }

```

REST

```

curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/create?
name=volumename&path=/
volumepath&advisoryquota=100M&quota=50
0M&replication=3&schedule=2&type=rw'
--user mapr:mapr
{"timestamp":1526522622494,"timeofday":
"2018-05-16 07:03:42.494 GMT-0700
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
volume: 'volumename'"]}

```

Create the mirror volume "test-volume.mirror" from source volume "test-volume" and mount at "/test/test-volume-mirror"**CLI**

```

/opt/mapr/bin/maprcli
volume create -name
test-volume.mirror -source
test-volume@ksTest -path /test/
test-volume-mirror -type mirror -json
{
  "timestamp":1526524458615,
  "timeofday":"2018-05-16
07:34:18.615 GMT-0700 PM",
  "status":"OK",
  "total":0,
  "data":[
    ],
    "messages":[
      "Successfully created
volume: 'test-volume.mirror'"
    ]
  ]
}

```

REST

```

curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/create?
name=test-volume.mirror&path=/test/
test-volume-mirror&type=mirror&source=
test-volume@ksTest' --user mapr:mapr
{"timestamp":1526524637534,"timeofday":
"2018-05-16 07:37:17.534 GMT-0700
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
volume: 'test-volume.mirror'"]}

```

Create volumes that inherit from a parent volume

When creating and mounting a volume, the location of the mount path is specified by the `path` parameter. Volumes can be mounted via the web console, the `maprcli` commands, or the REST commands. The `maprcli` commands include `volume create -path` command and the `maprcli volume mount -path` command if the volume was previously created. Sub-volumes (children) can inherit properties from their parent volume.

In the following example, a parent volume and two (2) child volumes are create where the child volume inherit properties from the parent. When the `inherit` flag is explicitly used, the `allowgrant` parameter for the parent volume is not required.

- For child volumes, `c1` and `c2`, inheritance is explicit because the `inherit` option is specified. Thus, `p1.c1` and `p1.c2` volumes will inherit all properties from volume `p1` (note that `p1` is not a parent of `p1.c1`) regardless of whether the `allowgrant` option is set on `p1` or not. In this case, there is an explicit inheritance ant the `allowgrant` flag is ignored and volume properties are inherited.
- For the child volume, `c3`, inheritance is implicit. Meaning, the child volume, `p1.c3`, inherits all properties from the parent volume, `p1`, only if the `allowgrant` option is set on `p1`.

CLI

```
/opt/mapr/bin/maprcli volume
create -name p1 -path /p1
/opt/mapr/bin/maprcli volume
create -name p1.c1 -inherit p1
/opt/mapr/bin/maprcli
volume create -name
p1.c2 -path /p1/c2 -inherit p1
/opt/mapr/bin/maprcli volume
create -name p1.c3 -path /p1/c3
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/create?
name=p1&path=%2Fp1' --user mapr:mapr
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/create?
name=p1.c1&inherit=p1' --user
mapr:mapr
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/create?
name=p1.c2&path=%2Fp1%2Fc2&inherit=p1'
--user mapr:mapr
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/create?
name=p1.c3&path=%2Fp1%2Fc3' --user
mapr:mapr
```

In the following example, the `p1.child` volume normally inherits from the `p1` parent volume properties because `p1.child` is mounted under `p1` and `allowgrant` option is set to `true` on the parent volume. However, if the child volume doesn't want to inherit properties, then set the `allowinherit` option to `false` (default: `true`).

CLI

```
/opt/mapr/bin/maprcli volume
create -name p1 -path /p1 -allowgrant
true
/opt/mapr/bin/maprcli volume
create -name p1.child -path /p1/
p1.child -allowinherit false
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/create?
name=p1&path=%2Fp1&allowgrant=true'
--user mapr:mapr
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/create?
name=p1.child&path=%2Fp1%2Fp1.child&al
lowinherit=false' --user mapr:mapr
```

Create a volume with namespace container replicas**CLI**

```
/opt/mapr/bin/maprcli
volume create -name
testVol -nsminreplication
2 -nsreplication 3 -json
{
  "timestamp":1526525132522,
  "timeofday":"2018-05-16
07:45:32.522 GMT-0700 PM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "Successfully created volume:
'testVol'"
  ]
}
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/create?
name=testVol&path=/
testVol&nsminreplication=2&nsreplicati
on=3' --user mapr:mapr
{"timestamp":1526525257461,"timeofday"
:"2018-05-16 07:47:37.461 GMT-0700
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
volume: 'testVol'"]}
```

Create a volume and set ACEs**CLI**

```
/opt/mapr/bin/maprcli volume
create -name testVol -readAce
p -writeAce 'g:group1&!u:user1' -json
{
  "timestamp":1526525429326,
  "timeofday":"2018-05-16
07:50:29.326 GMT-0700 PM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "Successfully created volume:
```

```
'testVol'"
  ]
}
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/create?
name=testVol&readAce=p&writeAce=g%3Agr
oup1%26%21u%3Auser1' --user mapr:mapr
{"timestamp":1526525572035,"timeofday"
:"2018-05-16 07:52:52.035 GMT-0700
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
volume: 'testVol'"]}
```

Create a volume with auditing disabled for specific operations**CLI**

```
/opt/mapr/bin/maprcli volume
create -name
test-volume -auditenabled
true -dataauditops --lookup,-read,-wri
te -json
{
  "timestamp":1526525720308,
  "timeofday":"2018-05-16
07:55:20.308 GMT-0700 PM",
  "status":"OK",
  "total":0,
  "data":[
    ],
  "messages":["
    Successfully created volume:
    'test-volume'"
  ]
}
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/create?
name=test-volume&path=/test/
test-volume&auditenabled=true&dataaudi
tops=%2D%2Dlookup%2C%2Dread%2C%2Dwrite
' --user mapr:mapr
{"timestamp":1526525795017,"timeofday"
:"2018-05-16 07:56:35.017 GMT-0700
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
volume: 'test-volume'"]}
```

Create a volume and grant user permissions on the volume:**CLI Example 1**

```
/opt/mapr/bin/maprcli volume
create -name testVoll -path /
testVoll -user user1:dump
user2:fc -json
{
  "timestamp":1521162402826,
  "timeofday":"2018-03-15
```

```
06:06:42.826 GMT-0700 PM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "Successfully created volume:
'testVol1'"
  ]
}
```

REST

```
curl -k -X POST 'https://
10.10.82.24:8443/rest/volume/create?
name=testVol&path=/
testVol&user=user1%3Adump%20user2%3Afc
' --user mapr:mapr
{"timestamp":1526526072608,"timeofday":
"2018-05-16 08:01:12.608 GMT-0700
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
volume: 'testVol'"]}
```

CLI Example 2

```
/opt/mapr/bin/maprcli volume
create -name testVol -path /
testVol2 -user user1:dump,restore
user2:a,fc -json
{
  "timestamp":1521162467485,
  "timeofday":"2018-03-15
06:07:47.485 GMT-0700 PM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "Successfully created volume:
'testVol2'"
  ]
}
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/create?
name=testVol2&path=/
testVol2&user=user1%3Adump%2Crestore%2
0user2%3Aa%2Cfc' --user mapr:mapr
{"timestamp":1526526256845,"timeofday":
"2018-05-16 08:04:16.845 GMT-0700
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
volume: 'testVol2'"]}
```

Create a volume for a tenant

This example creates a volume for a tenant with the following parameters:

- name: volumename
- path: /volumepath

- advisoryquota: 500MB
- quota: 1GB
- replication: 3

CLI

```
/opt/mapr/bin/maprcli volume
create -name tenantVol -cluster
ksTest -path /egTenant -tenantuser
egTenant -advisoryquota 500M -quota

```

Create a volume and enable tiering, but do not specify the tier type and do not associate an offload rule or schedule:

CLI

```

/opt/mapr/bin/maprcli volume
create -name sampleVol -path /
sampleVol -tieringenable true -json
{
  "timestamp":1519922099117,
  "timeofday":"2018-03-01
08:34:59.117 GMT-0800 AM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":["
    Successfully created volume:
'sampleVol'"
  ]
}

```

REST

```

curl -k -X POST 'https://
10.10.82.24:8443/rest/volume/create?
name=sampleVol&path=/
sampleVol&tieringenable=true' --user
mapr:mapr
{"timestamp":1519922181381,"timeofday"
:"2018-03-01 08:36:21.381 GMT-0800
AM","status":"OK","total":0,"data":
[],"messages":["Successfully created
volume: 'sampleVol'"]}

```

Create a volume, enable cold tiering, associate a rule and schedule for offloading data, and set the number of days to keep recalled data:

CLI

```

/opt/mapr/bin/maprcli volume
create -name sampleVol -path /
sampleVol -tieringenable
true -tiername

```

```
ksTestCold -tieringrule
rule1 -offloadschedule
2 -recallexpirytime 2 -json
{
  "timestamp":1519922642632,
  "timeofday":"2018-03-01
08:44:02.632 GMT-0800 AM",

hedule=2&recallexpirytime=2' --user
mapr:mapr
{"timestamp":1519922784818,"timeofday"
:"2018-03-01 08:46:24.818 GMT-0800
AM","status":"OK","total":0,"data":
[],"messages":["Successfully created
volume: 'sampleVol'"]}
```

Create a volume, enable warm tiering, associate a rule and schedule for offloading data, and set the number of days to keep recalled data:

CLI

```
/opt/mapr/bin/maprcli volume
create -name sampleVol -path /
sampleVol -tieringenable
true -tiername ksTestEC -tieringrule
testRule -ecscheme 6+3 -ectopology /
ecdata -offloadschedule
2 -recallexpirytime 2 -json
{
  "timestamp":1516336193635,
  "timeofday":"2018-01-19
04:29:53.635 GMT+0000",
  "status":"OK",
  "total":0,
  "data":[

  ],
  "messages":[
    "Successfully created volume:
'sampleVol'"
  ]
}
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/create?
```

```
name=sampleVol&path=/
sampleVol&tieringenable=true&tiername=
testWarm&tieringrule=testRule&ecscheme
=6%2B3&ectopology=/
ecdatab&offloadschedule=2&recallexpiryt
ime=2' --user mapr:mapr
{"timestamp":1526521538688,"timeofday"
:"2018-05-16 06:45:38.688 GMT-0700
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
volume: 'sampleVol'"]}
```

Create a volume and enable it for warm tiering, but do not specify tier name:

CLI

```
/opt/mapr/bin/maprcli volume
create -name sampleVol3 -path /
sampleVol3 -ecenable true -json
{
  "timestamp":1527690187540,
  "timeofday":"2018-05-30
07:23:07.540 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
    ],
  "messages":["
    Successfully created volume:
'sampleVol3'"]
}
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/create?
name=sampleVol3&path=/
sampleVol3&ecenable=true' --user
mapr:mapr
{"timestamp":1527690187540,"timeofday"
:"2018-05-30 07:23:07.540 GMT-0700
AM","status":"OK","total":0,"data":
[],"messages":["Successfully created
volume: 'sampleVol3'"]}
```

Create a volume with a security policy:

CLI

```
/opt/mapr/bin/maprcli volume
create -name volTest1 -securitypolicy
LabTest -enforcementmode PolicyAceOnly

/opt/mapr/bin/maprcli volume
info -name volTest1 -columns
enforcementMode,securityPolicyTags -js
on
{
  "timestamp":1536160885967,
  "timeofday":"2018-09-05 08:21:25.967
GMT-0700 AM",
  "status":"OK",
```

```
"total":1,
"data":[
{
"securityPolicyTags":["LabTest"],
"enforcementMode":"PolicyAceOnly"
}
]
}
```

Lists nodes in the cluster.

[configure.sh](#) on page 2331

Describes the syntax and parameters of the `configure.sh` script that you run for a number of tasks including setting up HPE Ezmeral Data Fabric client nodes, and configuring services for a node.

volume dump create

Creates a volume *dump file* containing data from a volume for distribution or restoration.

Permissions Required

`dump` or `fc` on the volume.

Note: In a secure cluster, you must use the HPE Ezmeral Data Fabric user ID. Using `root` or any other user ID results in the system hanging.

Syntax

CLI

```
/opt/mapr/bin/maprcli volume dump
create
  [ -cluster cluster_name
  [-s startvolumepointname]
  [-e endvolumepointname]
  [-o (for dumpfile on stdout)]
  [-dumpfile dumpfilename (ignored
if -o is used)]
  -name volumename
```

REST

| | |
|--------------|--|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/volume/dump/create?<parameters> |

Parameters

| Parameter | Description |
|-----------|---|
| cluster | The cluster on which to run the command. |
| dumpfile | The name of the dump file (ignored if -o is used). |
| e | The name of the state file to create for the end point of the dump. |
| name | A volume name. |
| o | This option dumps the volume to stdout instead of to a file. |
| s | The start point for an incremental dump. |

Note: The data is not encrypted in the dump file created for a volume enabled for data at rest encryption.

Examples

Create a full dump:

CLI

```
/opt/mapr/bin/maprcli volume dump
create -e statefile1 -dumpfile
fulldump1 -name volume -n
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/dump/
create?
e=statefile1&dumpfile=fulldump1&name=v
olume&n' --user mapr:mapr
```

Create an incremental dump:

CLI

```
/opt/mapr/bin/maprcli volume
dump create -s statefile1 -e
statefile2 -name volume -dumpfile
incrdump1
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/dump/
create?
s=statefile1&e=statefile2&name=volume&
dumpfile=incrdump1' --user mapr:mapr
```

Create and Maintain Volume Dump File

Describes how to create full dump files and add incremental volume dump files.

You can use `volume dump create` to create two types of files:

- *full* dump files containing all data in a volume
- *incremental* dump files that contain changes to a volume between two points in time

A full dump file is useful for restoring a volume from scratch. An incremental dump file contains the changes necessary to take an existing (or restored) volume from one point in time to another. Along with the dump file, a full or incremental dump operation can produce a *state* file (specified by the `?-e` parameter) that contains a table of the version number of every container in the volume at the time the dump file was created. This represents the *end point* of the dump file, which is used as the *start point* of the next incremental dump. The main difference between creating a full dump and creating an incremental dump is whether the `-s` parameter is specified; if `-s` is not specified, the volume create command includes all volume data and creates a full dump file. If you create a full dump followed by a series of incremental dumps, the result is a sequence of dump files and their accompanying state files:

```
dumpfile1 statefile1
```

```
dumpfile2 statefile2
```

```
dumpfile3 statefile3
```

Note: You can restore the volume from scratch, using the [volume dump restore](#) command with the full dump file, followed by each dump file in sequence.

When you create a dump file for a volume enabled for data at rest encryption, data in the dump file is not encrypted.

Note: In a secure cluster, you must use the MapR user ID. Using root or any other user ID results in the system hanging.

To create and maintain an up-to-date dump of a volume:

1. Create a full dump file.

Example:

```
maprcli volume dump create -name cli-created -dumpfile fulldump1 -e
statefile1
```

2. Periodically, add an incremental dump file.

Examples:

```
maprcli volume dump create -s statefile1 -e statefile2 -name
cli-created -dumpfile incrdump1
maprcli volume dump create -s statefile2 -e statefile3 -name
cli-created -dumpfile incrdump2
maprcli volume dump create -s statefile3 -e statefile4 -name
cli-created -dumpfile incrdump3
```

...and so on.

volume dump restore

Restores or updates a volume from a dump file. Permissions required: `fc` or `restore` on the volume.

Syntax

CLI

```
maprcli volume dump restore
  [ -cluster cluster_name ]
  [-i (read dump from stdin)]
  [-n (create new volume if it
doesn't exist)]
  [-dumpfile dumpfilename (ignored
if -i is used)]
  [-full <true|false> (perform
full volume restore, default:false ]
  -name volumename
```

REST

| | |
|--------------|---|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/volume/dump/restore?<parameters> |

Parameters

| Parameter | Description |
|-----------|--|
| cluster | The cluster on which to run the command. |
| dumpfile | The name of the dumpfile (ignored if <code>-i</code> is used). |
| i | This option reads the dump file from <code>stdin</code> . |
| n | This option creates a new volume if it doesn't exist. |
| full | Perform either a full volume restore or an incremental volume restore. The default restore is incremental. |
| name | A volume name, in the form <code>volumename</code> |

Note: In a secure cluster, you must use the HPE Ezmeral Data Fabric user ID. Using `root` or any other user ID results in the system hanging.

Examples

Restore a volume from a full dump file:

CLI

```
maprcli volume dump restore -name
volume -dumpfile fulldump1 -full true
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/dump/
restore?
name=volume&dumpfile=fulldump1&full=tr
ue' --user mapr:mapr
```

Apply an incremental dump file to a volume:

CLI

```
maprcli volume dump restore -name
volume -dumpfile incrdump1
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/dump/
restore?
name=volume&dumpfile=incrdump1' --user
mapr:mapr
```

Restore Volume From a Dump

Describes how to restore from full and incremental dump files.

There are two ways to use volume dump restore:

- With a full dump file, `volume dump restore` recreates a volume from scratch from volume data stored in the dump file.
- With an incremental dump file, `volume dump restore` updates a volume using incremental changes stored in the dump file.

The volume that results from a `volume dump restore` operation is a mirror volume whose source is the volume from which the dump was created. After the operation, this volume can perform mirroring from the source volume.

When you are updating a volume from an incremental dump file, you must specify an existing volume and an incremental dump file. To restore from a sequence of previous dump files would involve first restoring from the volume's full dump file, then applying each subsequent incremental dump file.

Note: In a secure cluster, you must use the MapR user ID. Using root or any other user ID results in the system hanging.

A restored volume may contain mount points that represent volumes that were mounted under the original source volume from which the dump was created. In the restored volume, these mount points have no meaning and do not provide access to any volumes that were mounted under the source volume. If the source volume still exists, then the mount points in the restored volume will work if the restored volume is associated with the source volume as a mirror.

To restore from a full dump plus a sequence of incremental dumps:

1. Restore from the full dump file, using the `-n` option to create a new mirror volume and the `-name` option to specify the name.

Example:

```
maprcli volume dump restore -dumpfile fulldump1 -name restore1 -n
```

2. Restore from each incremental dump file in order, specifying the same volume name.

Examples:

```
maprcli volume dump restore -dumpfile incrdump1 -name restore1 maprcli
volume dump restore -dumpfile incrdump2 -name
restore1 maprcli volume dump restore
-dumpfile incrdump3 -name restore1
```

...and so on.

volume fixmountpath

Corrects the mount path of a volume. Permissions required: `fc` or `m` on the volume.

The CLDB maintains information about the mount path of every volume. If a directory in a volume's path is renamed (by a `hadoop fs` command, for example) the information in the CLDB will be out of date. The `volume fixmountpath` command does a reverse path walk from the volume and corrects the mount path information in the CLDB.

Syntax

CLI

```
maprcli volume fixmountpath
-name <name>
[ -cluster <clustername> ]
```

REST

| | |
|--------------|---|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/volume/fixmountpath?<parameters> |

Parameters

| Parameter | Description |
|-----------|------------------|
| name | The volume name. |
| cluster | The cluster name |

Examples

Fix the mount path of volume v1:

CLI

```
maprcli volume fixmountpath -name v1
```

REST

```
https://abc.sj.us:8443/rest/volume/fixmountpath?name=v1
```

volume info

Displays information about the specified volume. For JSON formatted output, use the `-json` option when running the command.

Syntax

CLI

```
maprcli volume info
[ -cluster <cluster name> ]
[ -output verbose. default:
verbose ]
[ -path <mount directory> ]
[ -name <volume name> ]
[ -columns comma separated list
of column names. default: all ]
```

REST

| | |
|--------------|-----|
| Request Type | GET |
|--------------|-----|

| | |
|-------------|---|
| Request URL | http[s]://<host>:<port>/rest/volume/info?<parameters> |
|-------------|---|

Parameters

You must specify either name or path, but not both.

| Parameter | Description |
|-----------|--|
| cluster | The cluster on which to run the command. |
| columns | A comma-separated list of fields to return in the query. See the Fields table on the volume command page. Default: all |
| name | The volume name for which to retrieve information. When issuing the <code>maprcli volume info -columns</code> and <code>marcli volume list -columns</code> commands, the column for the volume name is <code>volumename</code> . |
| output | Indicates whether the output should be terse or verbose. Default: verbose |
| path | The mount path of the volume for which to retrieve information. |

Output

For definitions of the output fields, and short names for use with filters, see the [Fields](#) table on the volume command [page](#).

Examples

Return information on standard volume named `test_vol1`:

CLI

```
/opt/mapr/bin/maprcli volume
info -name test_vol -json
{
  "timestamp":1520275171388,

```

Return security policy related information for a volume:

In the following example, the volume named `my_volume` is tagged with two security policies, `Lab_Security_Policy` and `Sensitive_Data`. The enforcement mode was not specified during volume creation, and is set to the default value of `PolicyAceAndDataAce`.

CLI

```

/opt/mapr/bin/maprcli volume
info -name my_volume -json
{
  "timestamp":143018287317,
  "timeofday":"2019-02-05
15:45:22.130 GMT-0700",
  "status":"OK",
  "total":1,
  "data":[
    "volumename":"my_volume",
    "volumeAces":{
      "writeAce":"p",
      "readAce":"p",

"securitypolicy":"Lab_Security_Policy,
Sensitive_Data",

"enforcementmode":"PolicyAceAndDataAce
"
    },
    ... other properties ...
  ]
}

```

REST

```

curl -k -X GET 'https://
abc.sj.us:8443/rest/volume/info?
name=my_volume' --user mapr:mapr

{"timestamp":143018287317,"timeofday":

"enforcementmode":"PolicyAceAndDataAc
e"}]}]}

```

Return snapshot information for a volume when a snapshot restore operation is in progress:

In the following example, the volume named `my_volume` has a snapshot restore operation in progress, and the snapshot is named `s1`.

CLI

```

/opt/mapr/bin/maprcli volume
info -name my_volume -json
{
  "timestamp":143018287317,
  "timeofday":"2019-02-05
15:45:22.130 GMT-0700",
  "status":"OK",
  "total":1,
  "data":[
    "volumename":"my_volume",
    "snapshotRestore":{

"snapshotname":"s1",

```

```

"snapshotid":256000049,
"inprogress":true,
"seqnum":602446,

Moves the specified volume or mirror to a different topology. Permissions required: `m` or `fc` on the volume.

[label list](#) on page 1895

Lists registered labels. Permissions required: `fc` or `a`.

[node list](#) on page 1911

Lists nodes in the cluster.

[dump volumeinfo](#) on page 1830

Returns information about volumes and the associated containers. For JSON formatted output, use the `-json` option from the command line.

[configure.sh](#) on page 2331

Describes the syntax and parameters of the `configure.sh` script that you run for a number of tasks including setting up HPE Ezmeral Data Fabric client nodes, and configuring services for a node.

volume link create

Creates a link to a volume. Permissions required: `fc` or `m` on the volume.

Syntax

CLI

```
maprcli volume link create
[ -cluster <clustername> ]
-path <link path>
-type <type>
-volume <volume>
```

REST

| | |
|--------------|--|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/volume/link/create?<parameters> |

Parameters

| Parameter | Description |
|----------------------|---|
| <code>path</code> | The <code>-path</code> parameter specifies the link path: <code>/link</code> Example: <code>/home/abc/.rw</code> |
| <code>type</code> | The volume type: <code>writable</code> or <code>mirror</code> . |
| <code>volume</code> | The volume name. |
| <code>cluster</code> | The cluster name. |

Examples

Create a link to v1 at the path v1. mirror:

CLI

```
maprcli volume link create -volume
v1 -type mirror -path /v1.mirror
```

REST

```
https://abc.sj.us:8443/rest/
volume/link/create?path=/
vl.mirror&type=mirror&volume=v1
```

volume link remove

Removes the specified symbolic link. Permissions required: `fc` or `m` on the volume.

Syntax

CLI

```
maprcli volume link remove
-path <path>
[ -cluster <clustername> ]
```

REST

| | |
|--------------|--|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/volume/link/remove?<parameters> |

Parameters

| Parameter | Description |
|-----------|--|
| path | <p>The symbolic link to remove. The path parameter specifies the link path and other information about the symbolic link, using the following syntax: <code>/link/[maprfs::][volume::]<volume type>::<volume name></code></p> <ul style="list-style-type: none"> link - the symbolic link path maprfs - a keyword to indicate a special MapR filesystem link volume - a keyword to indicate a link to a volume volume type - writeable or mirror volume name - the name of the volume <p>Example: <code>/abc/maprfs::mirror::abc</code></p> |
| cluster | The cluster name. |

Examples

Remove the link /abc:

CLI

```
maprcli volume link remove -path /abc/
maprfs::mirror::abc
```

REST

```
https://abc.sj.us:8443/rest/
volume/link/remove?path=/abc/
maprfs::mirror::abc
```

volume list

Lists information about volumes specified by name, path, or filter.

See the Fields table on the [volume](#) on page 2170 page for the fields available to filter. See the [Filters](#) on page 1703 for more information.

Syntax

CLI

```

/opt/mapr/bin/maprcli volume list
[ -alarmedvolumes 0|1 ]
[ -atimeUpdateInterval <days> ]
[ -cluster <cluster> ]
[ -columns <columns> ]
[ -enforcementmode <mode> ]
[ -filter <filter> ]
[ -limit <limit> ]
[ -nodes <nodes> ]
[ -output terse | verbose ]
[ -securitypolicy <tags> ]
[ -sortby <attribute> ]
[ -start <offset> ]
    
```

 **Note:** For JSON formatted output, use the `-json` option when running `volume list` from the command line.

REST

| | |
|--------------|--|
| Request Type | GET |
| Request URL | <code>http[s]://<host>:<port>/rest/volume/list[?<parameters>]</code> |

Parameters

| Parameter | Description |
|---------------------|---|
| alarmedvolumes | Specifies whether (1) or not (0) to list alarmed volumes only. Default: 0 |
| atimeUpdateInterval | The <code>atimeUpdateInterval</code> denotes how frequently the last access time of a file is updated. The value is in days. For more information, see Tuning Last Access Time on page 448. |
| cluster | The cluster name on which to run the command. |
| columns | A comma-separated list of fields to return in the query. See the volume on page 2170 table on the volume page. When issuing the <code>maprcli volume info -columns</code> and <code>marcli volume list -columns</code> commands, the column for the volume name is <code>volumename</code> . |
| enforcementmode | The data access enforcement mode. |
| filter | A filter specifying volumes to list. See Filters on page 1703 for more information. Default: none |
| limit | The number of rows to return, beginning at start. Default: 2147483647 |
| nodes | A list of nodes. If specified, <code>volume list</code> only lists volumes on the specified nodes. |

| Parameter | Description |
|----------------|--|
| output | Specifies whether the output should be terse or verbose. Default: verbose |
| securitypolicy | The list of security policy tags to be associated with this volume. |
| sortBy | Specifies one of the following attributes to sort the list of volumes by: volumeowner, volumenumreplicas, volumeminreplicas, volumerackpath, volumemountdir, volumename, volumequota, volumeused, volumequotaadvisory, volumeaename, volumeaetype, volumeschedule, volumetype, volumemirrorpercentcomplete, volumesnapshotcount, volumeid, volumenamecontainersize, volumelocalpath, volumesnapshotused, volumetotalused, volumelogicalused, volumecontainercount, volumemirrorschedule, volumeaccesstime, volumenamespacecontainernumreplicas, volumenamespacecontainerminreplicas, volumerereplicationtimeoutsec, volumecriticalrereplicationtimeoutsec, volumecreatetime, volumedareenabled |
| start | The offset from the starting row according to sort. Default: 0 |

Output

Information about the specified volumes.

For standard and mirror volumes (not enabled for tiering), the output looks similar to the following:

```
{
  "timestamp":1435363624712,
  "timeofday": "2015-06-26 05:07:04.712 GMT-0700",

```

Fields

For definitions of the output fields, and short names for use with filters, see the [Fields](#) table on the `volume` command [page](#).

Examples

List all volumes

CLI

```

/opt/mapr/bin/maprcli volume
list -json

```

REST

```

https://10.10.82.23:8443/rest/volume/
list

```

List the first ten volumes

The `start` and `limit` parameters are useful for windowing the results. You can list the first ten volumes, then the next ten, and so on.

CLI

```
/opt/mapr/bin/maprcli volume
list -start 0 -limit 10 -json
```

REST

```
curl -k -X
GET 'https://abc.sj.us:8443/rest/
node/list?start=0&limit=10' --user
mapr:mapr
```

Filter by aename**CLI**

```
maprcli volume list -filter
'[aename==mapr]' -columns volumeid
volumeid
243256560
139026416
192452723

```

volume mirror push

Pushes the changes in a volume to all of its mirror volumes in the same cluster, and waits for each mirroring operation to complete.

Use this command when you need to push recent changes.

Syntax

CLI

```

maprcli volume mirror push
[ -cluster <cluster> ]
-name <volume name>
[ -verbose true|false ]

```

REST

None.

Parameters

| Parameter | Description |
|-----------|---|
| cluster | The cluster on which to run the command. |
| name | The volume to push. |
| verbose | Specifies whether the command output should be verbose. Default: true |

Output

Sample Output

```

Starting mirroring of volume mirror1
Mirroring complete for volume mirror1
Successfully completed mirror push to all local mirrors of volume volume1

```

Examples

Push changes from the volume "volume1" to its local mirror volumes:

CLI

```
maprcli volume mirror push -name
volume1 -cluster mycluster
```

volume mirror start

Starts mirroring on the specified volume from its source volume.

- License required: Enterprise Edition
- Permissions required: `fc` or `restore` on the volume

When a mirror is started, the mirror volume is synchronized from a hidden internal snapshot so that the mirroring process is not affected by any concurrent changes to the source volume. The `volume mirror start` command does not wait for mirror completion, but returns immediately. The changes to the mirror volume occur atomically at the end of the mirroring process; deltas transmitted from the source volume do not appear until mirroring is complete.

To provide rollback capability for the mirror volume, the mirroring process creates a snapshot of the mirror volume before starting the mirror, with the following naming format: `<volume>.mirrorsnap.<date>.<time>`.

Normally, the mirroring operation transfers only deltas from the last successful mirror. Under certain conditions (mirroring a volume repaired by `fsck`, for example), the source and mirror volumes can become out of sync. In such cases, it is impossible to transfer deltas, because the state is not the same for both volumes. Use the `-full` option to force the mirroring operation to transfer all data to bring the volumes back in sync.

Syntax

CLI

```
maprcli volume mirror start
[ -cluster <cluster> ]
[ -full true|false ]
-name <volume name>
```

REST

| | |
|--------------|--|
| Request Type | POST |
| Request URL | <code>http[s]://<host>:<port>/rest/volume/mirror/start?<parameters></code> |

Parameters

| Parameter | Description |
|----------------------|---|
| <code>cluster</code> | The cluster on which to run the command. |
| <code>full</code> | Specifies whether to perform a full copy of all data. If <code>false</code> , only the deltas are copied. |
| <code>name</code> | The volume for which to start the mirror. |

Output

Sample Output

```
messages
Started mirror operation for volumes 'testMirror'
```

Examples

Start mirroring the mirror volume "testMirror":

CLI

```
maprcli volume mirror start -name
testMirror
```

REST

```
https://abc.sj.us:8443/rest/volume/
mirror/start?name=testMirror
```

volume mirror status

Displays the status of the mirroring operation in progress. Use this command to examine the progress of mirroring.

- License required: Enterprise Edition
- Permissions required: `fc` or `restore` on the volume

The `status` command displays the statistics of the mirroring operation including the total number of container IDs to resync, the current status of the mirroring, the number of indoes in use for the mirror, the container ID information for the source and destination volumes, and the error code if any, to name a few.

Syntax

CLI

```
maprcli volume mirror status
[ -cluster cluster_name ]
-name name
[ -start start. default: 1 ]
[ -limit limit. default:
2147483647 ]
[ -verbose <true/false> if true,
will displayed detailed container
information. default: true ]
```

REST

| | |
|--------------|---|
| Request Type | POST |
| Request URL | <code>http[s]://<host>:<port>/rest/volume/mirror/status?<parameters></code> |

Parameters

| Parameter | Description |
|----------------------|--|
| <code>cluster</code> | The cluster on which to run the command. |
| <code>name</code> | The volume for which to determine the mirror status. |

| Parameter | Description |
|-----------|---|
| start | The container to start with. |
| limit | The number of containers for which to display status. |
| verbose | Whether to display a terse output or display full statistics. |

Examples

Check the status of the mirroring on mirror volume "testvol":

CLI

```
maprcli volume mirror status -name
testvol -json

**** Displays mirroring statistics.
****

mirror/status?name=testvol
```

volume mirror stop

Stops mirroring on the specified volume.

- License required: Enterprise Edition
- Permissions required: `fc` or `restore` on the volume

The `volume mirror stop` command lets you stop mirroring (for example, during a network outage). You can use the `volume mirror start` command to resume mirroring.

Syntax

CLI

```
maprcli volume mirror stop
[ -cluster <cluster> ]
-name <volume name>
```

REST

| | |
|--------------|--|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/volume/mirror/stop?<parameters> |

Parameters

| Parameter | Description |
|----------------------|--|
| <code>cluster</code> | The cluster on which to run the command. |
| <code>name</code> | The volume for which to stop the mirror. |

Output

Sample Output

```
messages
Stopped mirror operation for volumes 'testMirror'
```

Examples

Stop mirroring the mirror volume "testMirror":

CLI

```
maprcli volume mirror stop -name
testMirror
```

REST

```
https://abc.sj.us:8443/rest/volume/
mirror/stop?name=testMirror
```

volume modify

Modifies an existing volume. Permissions required: `m` or `fc` on the volume.

An error occurs if the name or path refers to a non-existent volume, or cannot be resolved.

Syntax

CLI

```
/opt/mapr/bin/maprcli volume modify
[ -cluster <cluster name> ]
-name <volume name>
[ -advisoryquota <advisory
quota> ]
[ -ae <accounting entity> ]
[ -aetype <aetype> ]

REST

| | |
|--------------|---|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/volume/modify?<parameters> |

Parameters

Parameter: advisoryquota

Possible Values: 0 or any other integer value.

Description: The advisory quota for the volume as integer plus unit. Example: quota=500G;
Units: B, K, M, G, T, P

Parameter: ae

Possible Values: Name of the entity that owns the volume.

Description: The accounting entity that owns the volume.

Parameter: aetype

Possible Values:

- 0=user
- 1=group

Description: Type of accounting entity.

Parameter: allowgrant

Possible Values:

- true
- false

Description: Specifies whether the volume as a parent, grants permission for a child volume to inherit its properties.

Parameter: allowreadforexecute

Possible Values:

- true
- false

Description: Allows execution of SUID binaries with only their executable bit set, on a FUSE filesystem. This parameter works in conjunction with the `fuse.mount.setuid` FUSE option. For more information, see [Configuring the HPE Ezmeral Data Fabric FUSE-Based POSIX Client](#) on page 1358.

Parameter: atimeUpdateInterval

Possible Values: Any positive integer

Description:

The `atimeUpdateInterval` denotes how frequently the last access time of a file is updated. The value is in days.

For more information, see [Tuning Last Access Time](#) on page 448.

Parameter: auditenabled

Possible Values:

- true
- false

Description: Specifies whether to turn on auditing for the volume. If you enable auditing at the cluster level with the `audit data` on page 1733 command, setting this value to `true` causes auditing to start for any directories, files, tables, or streams that are already enabled for auditing. If none are yet enabled, enabling auditing on any of them causes auditing of them to start.

| | |
|--|--|
| | <p>Set <code>auditenabled</code> to <code>true</code> to enable auditing on directories, files, tables, and streams in the volume.</p> <p>You must have the <code>fc</code> permission on the cluster to use this parameter. See acl for details about this permission.</p> |
| Parameter: <code>autooffloadthresholdgb</code> | <p>Possible Values: Any positive integer.</p> <p>Description: The size of the volume in GB (threshold). When this threshold is reached or exceeded, volume data is automatically offloaded by the Automatic Tiering Scheduler. To use the global size threshold (of 1024 GB), set the value to 0.</p> |
| Parameter: <code>cluster</code> | <p>Possible Values: Any valid cluster.</p> <p>Description: The cluster on which to run the command.</p> |
| Parameter: <code>coalesce</code> | <p>Possible Values: Set this parameter to a large number of minutes to prevent audit logs from growing quickly.</p> <p>Description: The interval of time (in minutes) during which READ, WRITE, or GETATTR operations on one file from one IP address or UID are logged only once for a particular operation, if auditing is enabled.</p> <p>For example, suppose that a client application reads a single file three times in 6 minutes, so that there is one read at 0 minutes, another at 3 minutes, and a final read at 6 minutes. If the coalesce interval is at least 6 minutes, then only the first read operation is logged. However, if the interval is 4 minutes, then only the first and third read operations are logged. If the interval is 2 minutes, all three read operations are logged.</p> <p>Now however, if the client was also writing to the file, irrespective of the coalesce interval for the read operation in the example stated previously, the write operation is logged, as it is a different operation from reading.</p> |
| Parameter: <code>compactionoverheadthreshold</code> | <p>Possible Values: 0-100%</p> <p>Description: Specifies the percentage of offloaded data that must have been deleted on the cluster to qualify the data for compaction (or deletion from the tier).</p> |
| Parameter: <code>compactionschedule</code> | <p>Possible Values: Any valid schedule ID.</p> <p>Set this parameter to 0 to disable the compactor.</p> <p>Description: Specifies the schedule to use for running the compactor. By default, the compactor runs on an automatic internal schedule.</p> |
| Parameter: <code>containerallocationfactor</code> | <p>Recommended value: 2* SP count in the volume topology.</p> <p>Description: Specifies the number of containers to create when the first write from a remote client is sent to the volume. The pre-created containers are distributed equally across topologies, servers, filesystem instances, and storage pools. CLDB also takes into consideration the load (IO/Space) when selecting target storage pools for containers. The value must be a positive integer.</p> |
| Parameter: <code>criticalrereplicationtimeoutsec</code> | <p>Possible Values: Any integer between 300 and 3600 (seconds)</p> |

Description: Timeout (in seconds) before re-replicating only the critically under-replicated containers . If you set both `rereplicationtimeoutsec` and `criticalrereplicationtimeoutsec`, and if the value of:

- `rereplicationtimeoutsec` is less than `criticalrereplicationtimeoutsec`, `rereplicationtimeoutsec` overrides the `criticalrereplicationtimeoutsec` setting for both under-replicated and critically under-replicated containers.
- `rereplicationtimeoutsec` is greater than `criticalrereplicationtimeoutsec`, `criticalrereplicationtimeoutsec` overrides the `rereplicationtimeoutsec` setting only for critically under-replicated containers; `rereplicationtimeoutsec` setting is still applicable for under-replicated containers.

Parameter: dataauditops

Possible Values: Any audit operations that you want to enable.

Description: The comma separated list of filesystem operations to include (specified with a preceding plus sign (+)) or exclude (specified with a preceding minus sign (-)) from auditing.

To exclude the first operation in the list (of operations) from auditing, precede it by two minus (--) signs. To exclude subsequent operations, precede them by only a single minus (-) sign, irrespective of whether the first operation was included (using a plus (+) sign) or excluded (using two minus (--) signs). If neither sign is specified, the given operation is included for auditing.

The operations that can be included (+) or excluded (-) from auditing are listed [here](#). You can, alternatively, group all the operations using the keyword `all`, which:

- If included (+), cannot be specified with a list of other included operations.
- If excluded (-), cannot be specified with a list of other excluded operations.

You can specify a mixed list of included and excluded operations. There is no change to operations that are not specified with the command.

Tip: For more information, see [Selective Auditing of Filesystem and Table Operations](#).

Parameter: disableddataauditops

Possible Values: Any audit operations that you want to disable.

Description: The comma-separated list of disabled filesystem audit operations to set. This parameter is an alternate way of setting audit operations as compared to the `dataauditops` option. Plus (+) or minus signs (-) are not allowed for this option. Any audit operation that is specified with this option replaces any existing disabled audit operations configured for this security policy, while any audit operations that are not specified, are enabled.

| | |
|---|--|
| | Merging of the specified audit operations with existing audit operations is not performed, as with the <code>dataauditops</code> option. |
| Parameter: <code>dbindexlagsecalarmthresh</code> | <p>Possible Values: Any integer value.</p> <p>Description: Specifies the threshold (in seconds) to raise an alarm for index update lag.</p> |
| Parameter: <code>dbrepplagsecalarmthresh</code> | <p>Possible Values: Any integer value.</p> <p>Description: Specifies the threshold (in seconds) to raise an alarm for DB replication lag.</p> |
| Parameter: <code>ecenable</code> | <p>Possible Values:</p> <ul style="list-style-type: none"> • <code>true</code> • <code>false</code> <p>Description: Enable (<code>true</code>) warm tiering for the volume only if it is already not enabled. When specified, you cannot specify <code>tiername</code> to use an existing warm-tier; when the command runs, a new tier and rule are automatically created for the volume.</p> <p><code>ecenable</code> works only if you have set <code>tieringenable</code> to <code>true</code> at the time of volume creation.</p> <p>When modifying volumes, <code>ecenable</code> does not automatically set <code>tieringenable</code> to <code>true</code> as in the case of volume creation.</p> <p>Setting this parameter to <code>false</code> is the same as not specifying this parameter, and does nothing.</p> |
| Parameter: <code>ecscheme</code> | <p>Possible Values: Any valid EC scheme.</p> <p>Description: The number of data chunks and the number of parity chunks separated by a plus (+) sign. The default scheme is 4+2. For information on the supported schemes, see Erasure Coding Scheme for Data Protection and Recovery on page 1004.</p> <p> Note: This parameter is applicable only for EC volumes, and only when you set the <code>ecenable</code> parameter to <code>true</code>.</p> |
| Parameter: <code>ectopology</code> | <p>Possible Values: Any topology that exists in your environment.</p> <p>Description: Sets the topology of the erasure coded volume if it is not set.</p> <p> Note: This parameter is applicable only for EC volumes.</p> <p>Once set, you cannot change the topology of an erasure coded volume using this command. To change the topology of an erasure coded volume, use volume move on page 2294</p> |
| Parameter: <code>enforcementmode</code> | <p>Possible Values:</p> <ul style="list-style-type: none"> • <code>PolicyAceOnly</code> • <code>PolicyAceAndDataAce</code> |

- `DataAceOnly`
- `PolicyAceAuditAndDataAce`

Description: The enforcement mode when evaluating authorization for data access. Permitted values are as follows:

- `PolicyAceOnly`: Determines data access authorization based only on the ACEs set in security policies. Ignores POSIX mode bits and ACEs directly defined on data objects when determining access rights, if a data object is tagged with at least one security policy. If a data object is not associated with at least one security policy, the system will enforce POSIX mode bits and ACEs directly defined on the data object. Volume-level ACEs are always enforced.
- `PolicyAceAndDataAce`: Determines data access authorization based on the ACEs set in security policies AND ACEs or POSIX mode bits directly set on data objects.
- `DataAceOnly`: Determines data access authorization based on the ACEs or POSIX mode bits directly set on data objects. You can use this mode to switch off the policy-based security feature, on a per-volume basis, in an emergency situation.
- `PolicyAceAuditAndDataAce`: Use this mode when testing security policies. In this mode:
 - ACEs defined directly on data objects are enforced.
 - Data objects associated with security policies are checked for access, and any access denied events are audited, but access itself is allowed.

See the section on [Volume-Level Security Policy Enforcement Mode](#) on page 678 for a discussion on how to determine permission to access a resource, when this flag is set.

Parameter: `enforceminreplicationforio`

Possible Values:

- `true`
- `false`

Description: Specifies whether (`true`) or not (`false`) to enforce minimum number of replicas for the (read-write) volume during IO. This flag ensures that further updates (writes) to volume are successful only when the minimum number of copies of the container are available. Setting this parameter to `true` ensures that if writes succeed, then it has been applied to at least the minimum number of copies; if writes fail, it may have been applied to zero or more copies.

Enabling this parameter, may stall `volume dump` and `volume snapshot create` operations, if the minimum number of copies of the container are not available.

If you do not set this parameter on a volume, or if you modified this parameter from `false` to `true`, then you need to restart all the nodes where the containers associated with the volume exist, for the changes to take effect.

This flag is ignored on mirror volumes.

Parameter: filefilter

Possible Values: Any file filter.

Description: Specifies the file filter to use to prevent specific types of files from being stored on the volume. For more information, see [Prevent Storage of Specified Types of Files](#) on page 658. You can associate only one filter for each volume.

Note: To remove the filter from a volume, use the special filter `" "`.

Parameter: forceauditenable

Possible Values:

- `true`
- `false`

Description: Specifies whether (`true`) or not (`false`) to force audit of operations on all files, tables, and streams in the volume if auditing is enabled at the cluster and volume levels, irrespective of the audit setting on the individual directory, file, table, and stream.

Parameter: group

Possible Values: Any user with `Create Volume` privileges.

Description: Space-separated list of `group:permission` pairs.

Parameter: maxinodesalarmthreshold

Possible Values: Any positive integer.

Description: The number of inodes, which when exceeded raises the `INODES_EXCEEDED` alarm.

Parameter: maxnssizembalarmthreshold

Possible Values: Any positive integer.

Description: The namespace container size, which when exceeded raises the `INODES_EXCEEDED` alarm.

Parameter: metricsenabled

Possible Values:

- `true`
- `false`

Description: Specifies whether (`true`) or not (`false`) to enable metrics collection for a volume.

Parameter: minreplication

Possible Values: Can be any value that you desire based on the replication you need.

Description: The minimum replication level. When the replication factor falls below this minimum, re-replication occurs as aggressively as possible to restore the replication level. If any containers in the CLDB volume fall below the minimum replication factor, writes are disabled until aggressive re-replication restores the minimum level of replication.

Tip: For more information, see [Understanding Replication](#) on page 410.

Parameter: mirrorschedule

Possible Values: 0 or a valid schedule ID.

Description: The schedule ID corresponding to the schedule to be used for mirroring. If you specify a mirror schedule ID, the mirror volume automatically syncs with its source volume on the specified schedule. Pre-assigned IDs include 1 for critical data, 2 for important data, and 3 for normal data. Custom schedules are assigned ID numbers in sequence. To determine the ID number, use the `schedule list` command. To disable the schedule, set this parameter to 0.

Parameter: mirrorthrottle

Possible Values:

- true
- false

Description: Specifies whether mirror throttling is enabled (`true`) or disabled (`false`). Throttling is set on the source volume and applies to all its mirrors.

Parameter: namecontainerdatathreshold

Possible Values: Any integer value.

If you set this parameter to 0, there is no limit on the size of user data that can be stored in the name container.

Description: Limits the size of user data that can be placed in the name container. The value is interpreted as being in MB. If the user data size limit:

- Has not yet been reached, the first 64 KB of data is stored in name container, and the rest of the data is stored in data containers.
- Has already been reached, only meta data is stored in the name container, and the data is stored in data containers. For example, if you set the current name container size to 200GB and the limit to 100GB, then all new user data is stored in data containers.

Parameter: nsminreplication

Possible Values: Any integer value.

Description: When the replication factor falls below this value, re-replication occurs as aggressively as possible to restore the replication level. If any containers in the CLDB volume fall below the minimum replication factor, writes are disabled until aggressive re-replication restores the minimum level of replication.

When enabled, the CLDB manages the namespace container replication separate from the data container replication. You use this capability when you have low volume replication but want to have higher namespace replication.

Set the value to be the same or larger than the value of the equivalent data replication parameter, `minreplication`.

See also: [Understanding Replication](#) on page 410.

Parameter: nsreplication

Possible Values: Any integer value.

Description: The desired namespace container replication level.

When the number of copies falls below the desired replication factor, but remains equal to or above the minimum replication factor, re-replication occurs after the timeout specified in the `cldb.fs.mark.rereplicate.sec` parameter. This timeout is the time given for a node that is down to come back online. After this timeout period, the CLDB takes the action required to restore the replication factor.

When enabled, the CLDB manages the namespace container replication separate from the data container replication. Use this capability when you have low volume replication but want to have higher namespace replication.

By default, the value of this parameter is the same or larger than the value of the equivalent data replication parameter, `replication`. However, to set the value of this parameter lower than the `replication` value, first set `engg.manual.override` to `true` in `cldb.conf`.

See also: [Understanding Replication](#) on page 410.

Parameter: name

Possible Values: Not Applicable.

Description: The name of the volume to modify.

Parameter: numactivecgcontainers

Possible Values: Any integer between 1 and 100.

Description: Number of containers to be assigned for a CG assign request.

Parameter: offloadschedule

Possible Values: Any valid schedule ID. To disable schedule-based offload, set this value to 0.

Description: The ID of the schedule to associate with the volume for offloading volume data to the tier.

Note: This parameter is required only for Cold/EC tiered volumes.

Parameter: quota

Possible Values: Any integer value along with a unit.

Description: The quota for the volume as `integer plus unit`. Example: `quota=500G; Units: B, K, M, G, T, P`

Do not use two-letter abbreviations for quota units, such as `GB` and `MB`.

When you set a quota for a tiering-enabled volume, the quota is the total space allocated for the volume irrespective of the location (cluster or tier) where the volume data is stored. For example, if you allocate 1GB of hard quota for a tiering-enabled volume, writes fail after you write 1GB of data whether or not the volume data is local (on the cluster) or offloaded (to the tier).

Note that quotas for source and mirror volumes must match.

Parameter: readAce

Possible Values: Any valid permissions.

Description: Specifies [Access Control Expressions](#)(ACEs) that grant permissions at the

volume level to read files and tables in the volume. The default value is `p`, which grants access to all users.

See [ACEs](#).

Parameter: readonly

Possible Values:

- 0
- 1

Description: Specifies whether the volume is read-only.

- 0 - read/write
- 1 - read-only

Parameter: recallexpirytime

Possible Values: Any integer between 1 and 7500.

Description: The amount of time (in days) to keep the recalled data before purging or offloading it.

Parameter: replication

Possible Values: Any integer starting at 0.

Description: The desired replication level. When the number of copies falls below the desired replication factor, but remains equal to or above the minimum replication factor, re-replication occurs after the timeout specified in the `cldb.fs.mark.rereplicate.sec` parameter. Note that this timeout is the time given for a node that is offline to come back online. After this timeout period, the CLDB takes action to restore the replication factor.

Tip: For more information, see [Understanding Replication](#) on page 410.

Parameter: rereplicationtimeoutsec

Possible Values: Any positive integer.

Description: Timeout (in seconds) before attempting re-replication of replica containers. This volume property defines the timeout period until CLDB starts re-replicating the containers on the node of the volume after CLDB stops receiving a heartbeat from the node.

When a node is down, CLDB gives the node an hour to come back online before it takes any action for the containers on this node. You can set this parameter on volumes to reduce the default 1 hour to a shorter time period. This option is provided mainly for local volumes, so that when the filesystem is down, CLDB can give up quickly and decide that the container has no master. This forces the TT to give up on local containers, and take the appropriate recovery action of deleting the mapped volume and creating another one.

Parameter: schedule

Possible Values: 0 or a valid schedule ID.

Description: The ID of a schedule. Use the [schedule list](#) command to find the ID of the named schedule that you want to apply to the volume.

To disable the schedule, set this parameter to 0.

Parameter: securitypolicy

Possible Values: An empty string, or a list of security policy tags.

| | |
|--|--|
| <p>Parameter: <code>skipwiresecurityfortierinternalops</code></p> | <p>Description: A comma-delimited list of security policy tags to be associated with the volume. This parameter is not mandatory.</p> <p>If you do not specify a security policy, the volume is created without initial security policy tags.</p> <p>Specifying an empty string for this parameter, deletes all security policy tags associated with the volume.</p> <p>Possible Values:</p> <ul style="list-style-type: none"> • <code>true</code> • <code>false</code> <p>Description: Skips wire security for internal operations.</p> |
| <p>Parameter: <code>source</code></p> | <p>Possible Values: Any volume.</p> <p>Description: The source volume from which a mirror volume receives updates, specified in the format <code><volume>@<cluster></code>.</p> |
| <p>Parameter: <code>tierencryption</code></p> | <p>Possible Values:</p> <ul style="list-style-type: none"> • <code>true</code> • <code>false</code> <p>Description: Specifies whether to enable (<code>true</code>) or disable (<code>false</code>) encryption of data on the object store. This parameter is applicable only for cold-tier volumes. If you enable this parameter, user data is encrypted before being written to the object, and the HTTPS protocol is used for communication with the object store to ensure that data is encrypted both on the wire and on the tier.</p> <p>You can set this parameter only if you specify a tier name (see the <code>tiername</code> parameter) as well. You cannot modify this parameter after you set it.</p> <p>If you set the value to <code>true</code>, you can also specify a custom key using the <code>tierkey</code> parameter. Once set to <code>true</code>, the MAST Gateway uses HTTPS to upload data to the cold-tier. If the cold tier does not support HTTPS, all tier related operations fail. If the cold-tier does not support HTTPS, you must explicitly set the value for this to <code>false</code> at the time of associating a tier with the volume because the default value for this parameter is <code>true</code>.</p> <p style="text-align: center;">Tip: For warm tier, use <code>-dare</code> option on the front-end volume to enable or disable encryption of data-at-rest.</p> |
| <p>Parameter: <code>tieringrule</code></p> | <p>Possible Values: Name of any valid rule</p> <p>Description: The name of the rule (referred to as storage policy in the Control System) to use for offloading data to the tier. If you do not specify a rule, the default rule, which is all files (<code>p</code>), is associated with the volume. See Creating a Storage Tier Policy on page 1057 for more information.</p> |
| <p>Parameter: <code>tierkey</code></p> | <p>Possible Values: Any 32-character HEX string, or let CLDB auto-generate this string</p> |

Description: The 32-character HEX string to use for encryption only for cold tier volumes. If you do not specify a string, CLDB generates a 32 character HEX string to use for encrypting the data to offload to the tier.

 **Restriction:** You cannot modify the tierkey that is already associated with the volume.

Parameter: `tiername`

Possible Values: Not Applicable

Description: The name of the tier to use for offloading data. You can set this name only once and cannot modify it.

For warm tiering, you cannot specify this parameter if `ecenable` is set to `true`.

Parameter: `type`

Possible Values:

- `mirror`
- `rw`
- `0`
- `1`

Description: The type of volume to create.

The following values are accepted:

- `mirror` - standard mirror (read-only) volume (promotable to standard read-write volume)
- `rw` - standard (read-write) volume (convertible to standard mirror volume)
- `0` - standard (read-write) volume (for backward compatibility)
- `1` - non-convertible mirror (read-only) volume (for backward compatibility)

Parameter: `user`

Possible Values: Any valid permissions

Description: Space-separated list of `user:permission` pairs.

Use comma to separate permissions. For example: `user:permission,permission,...`

Parameter: `wiresecurityenabled`

Default Value: `true`

Possible Values:

- `true`
- `false`

Description: Enables (`true`) or disables (`false`) on-wire encryption for all files, tables, and streams in the volume for secure clusters. This parameter is not supported on insecure clusters.

If `true`, this setting overrides all file, table, and stream level encryption settings (set using the `hadoop mfs` command) and enables on-wire encryption for all

files, tables, and streams. If you disable (`false`) this parameter at the volume level, but enable it at the file, table, or stream level, the file, table, or stream level encryption setting overrides this setting on those files, tables, and streams where it is enabled; for all other files, tables, and streams where encryption is not enabled at the file, table, or stream level, the on-wire encryption is disabled.

Parameter: `writeAce`

Possible Values: Any valid permissions

Description: Specifies [Access Control Expressions \(ACEs\)](#) that grant permission at the volume level to write to files and tables in the volume. The default value is `p`, which grants access to all users.

See [ACEs](#).

Examples

Change the source volume of the mirror "test-mirror" and update the atime value to 2 days:

CLI

```
/opt/mapr/bin/maprcli volume
modify -name test-mirror -source
volume-2@my-cluster
-atimeUpdateInterval 2
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/modify?
name=test-mirror&source=volume-2@my-cl
uster&atimeUpdateInterval=2' --user
mapr:mapr
```

Create a volume with namespace container replicas

CLI

```
/opt/mapr/bin/maprcli
volume modify -name
testVol -nsminreplication
2 -nsreplication 4 -json
{
  "timestamp":1526528489360,
  "timeofday":"2018-05-16
08:41:29.360 GMT-0700 PM",
  "status":"OK",
  "total":0,
  "data":[
  ]
}
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/modify?
name=testVol&nsminreplication=2&nsrepl
ication=4' --user mapr:mapr
{"timestamp":1526528556748,"timeofday"
:"2018-05-16 08:42:36.748 GMT-0700
PM","status":"OK","total":0,"data":[]}
```

Modify a volume to allow inheritance by a child volume

Sub-volumes (children) can inherit properties from their parent volume. The `maprcli volume create` and `volume modify` commands provide parameters for setting the inheritance feature. For a child volume to inherit from a parent volume, the parent volume must grant permission, and the child volume must be created specifying the volume name of the parent. In the following example, the parent volume, `parentVol`, grants inheritance to child volumes.

CLI

```
/opt/mapr/bin/maprcli volume
modify -name parentVol -allowgrant
true
```

REST

```
curl -k -X
POST 'https://abc.sj.us:8443/
rest/volume/modify?name=parentVol?
allowgrant=true' --user mapr:mapr
```

Set and modify ACEs on a volume

In the following example, the command sets and modifies access (defined using ACEs) to the volume data. When the command runs, new values:

- Overwrite existing values for access types that were previously set.
- Are set for access types that were not set.

Note: There is no change to the `readAce` access type, which is not specified with the command, irrespective of whether it is set or not.

CLI

```
/opt/mapr/bin/maprcli volume
modify -name testVol -writeAce
'g:group1&(!u:user1|!r:role1)'
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/modify?
name=testVol&writeAce=g%3Agroup1%26%28
%21u%3Auser1%7C%21r%3Arole1%29' --user
mapr:mapr
```

Modify the list of operations that are audited

In the following example, the `create` operation is included for auditing and the `lookup` operation is excluded from auditing. There are no changes to operations that are not specified.

CLI

```
/opt/mapr/bin/maprcli volume
modify -name parentVol -dataauditops
+create,-lookup
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/modify?
name=pl&dataauditops=%2Bcreate%2C-look
up' --user mapr:mapr
```

Modify an existing volume to enable on-wire encryption:

CLI

```
/opt/mapr/bin/maprcli
volume modify -name
local2 -wiresecurityenabled true -json
{
    "timestamp":1505205889697,
    "timeofday":"2017-09-12
01:44:49.697 GMT-0700",
    "status":"OK",
    "total":0,
    "data":[
        ]
    }
}
```

REST

```
# curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/modify?
name=pl&wiresecurityenabled=true' --us
er mapr:mapr
{"timestamp":1526569299139,"timeofday"
:"2018-05-17 08:01:39.139 GMT-0700
AM","status":"OK","total":0,"data":[]}
```

Associate an offload rule with a tiering-enabled volume:**CLI**

```
/opt/mapr/bin/maprcli volume
modify -name sampleVol -tieringrule
ksTestRule -json
{
    "timestamp":1526569498559,
    "timeofday":"2018-05-17
08:04:58.559 GMT-0700 AM",
    "status":"OK",
    "total":0,
    "data":[
        ]
    }
}
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/modify?
name=sampleVol&tieringrule=ksTestRule'
--user mapr:mapr
{"timestamp":1526569554743,"timeofday"
:"2018-05-17 08:05:54.743 GMT-0700
AM","status":"OK","total":0,"data":[]}
```

Modify a volume to set a schedule for data offload and set number of days to three days to keep recalled data:**CLI**

```
/opt/mapr/bin/maprcli
volume modify -name
sampleVol -offloadschedule
3 -recallexpirytime 3 -json
{
    "timestamp":1526569615285,
    "timeofday":"2018-05-17
```

```
08:06:55.285 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
    ]
}
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/modify?
name=sampleVol&offloadschedule=3&recal
lexpirytime=3' --user mapr:mapr
{"timestamp":1526569653267,"timeofday"
:"2018-05-17 08:07:33.267 GMT-0700
AM","status":"OK","total":0,"data":[]}
```

Tag a volume with a security policy**CLI**

```
/opt/mapr/bin/maprcli volume
modify -securitypolicy
Lab_Security_Policy -name
my_volume -json
{
  "timestamp":1526569615285,
  "timeofday":"2019-02-15
08:06:55.285 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
    ]
}
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/modify?
name=my_volume& \
securitypolicy=Lab_Security_Policy'
--user mapr:mapr
{"timestamp":1526569653267,"timeofday"
:"2019-02-15 08:07:33.267 GMT-0700
AM","status":"OK","total":0,"data":[]}
```

The `-securitypolicy` option in the `maprcli volume modify` command sets the volume to be tagged with the specified policies, replacing any security policies that existed before the command was run. This command works as follows, depending on the security policies that are associated with this volume prior to invoking this command.

- If the volume initially has no security policy tags before invoking this command, then it is tagged with the specified security policy (`Lab_Security_Policy` in our example).
- If the volume initially has two security policy tags before invoking this command, say `Lab_Security_Policy` and `Sensitive_Data`, then the `Sensitive_Data` Policy security policy is disassociated from this volume, and the volume now has only the `Lab_Security_Policy` tag.

- If the volume initially has one security policy tag, say `Sensitive_Data`, then the `Sensitive_Data` security policy is removed and replaced with the security policy `Lab_Security_Policy`.
- If the volume has one security policy tag, say `Lab_Security_Policy`, which is the same as the security policy specified in the command, then modifications are not made.

Remove all security policies that are tagged to a volume

To remove all security policy tags from a volume, pass in an empty string as the value of the `securitypolicy` parameter.

For example:

CLI

```
/opt/mapr/bin/maprcli volume
modify -securitypolicy "" -name
my_volume
```

This code removes all security policy tags from the volume named `my_volume`.

REST

```
curl -u mapr:mapr -k 'https://
abc.sj.us:8443/rest/volume/modify?
name=my_volume<securitypolicy=' |
python -m json.tool
% Total % Received % Xferd
Average Speed Time Time Current
Dload Upload Total Spent Left Speed
100 111 100 111 0 0
184 0 --:--:-- --:--:-- ---:--:-- 190
{
  "data": [],
  "status": "OK",
  "timeofday": "2018-09-03
11:20:13.282 GMT-0700 PM",
  "timestamp": 1536042013282,
  "total": 0
}
```

Disable scheduled snapshot creation

To disable a schedule, set the `schedule` parameter to 0.

For example:

CLI

```
/opt/mapr/bin/maprcli volume
modify -name mapr.apps -schedule 0
/opt/mapr/bin/maprcli volume
info -name mapr.apps -json | grep
schedule

"scheduleid": "0",

"schedulename": "",

"mirrorscheduleid": "0"
```

Remove file filter from a volume

To remove a file filter use the special filefilter `""`.

For example:

CLI

```
/opt/mapr/bin/maprcli volume
modify -name noexec -filefilter ""
```

Related reference

[disk add](#) on page 1786

Adds one or more disks to the specified node. Permissions required: `fc` or `a`.

Modifies the attributes of one or more disks on the specified node. Permissions required: `fc` or `a`.

[volume create](#) on page 2190

Creates a volume.

volume mount

Mounts one or more specified volumes. Permissions required: `fc` or `m` on the volume.

Syntax

CLI

```
maprcli volume mount
[ -cluster <cluster> ]
-name <volume list>
-path <path list>
[ -createparent 0|1 ]
```

REST

| | |
|--------------|---|
| Request Type | POST |
| Request URL | <code>http[s]://<host>:<port>/rest/volume/mount?<parameters></code> |

Parameters

| Parameter | Description |
|---------------------------|---|
| <code>cluster</code> | The cluster on which to run the command. |
| <code>name</code> | The name of the volume to mount. |
| <code>path</code> | The path at which to mount the volume. The path must be relative to <code>/</code> and cannot be in the form of a global namespace path (for example, <code>/mapr/<cluster-name>/</code>). |
| <code>createparent</code> | Specifies whether or not to create a parent volume: <ul style="list-style-type: none"> 0 = Do not create a parent volume. 1 = Create a parent volume. |

Examples

Mount the volume "test-volume" at the path "/test":

CLI

```
maprcli volume mount -name
test-volume -path /test
{
  "timestamp":1537804971391,
  "timeofday":"2018-09-24
09:02:51.391 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
    ]
}
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/mount?
name=test-volume&path=/test' --user
mapr:mapr
{"timestamp":1537804971391,"timeofday"
:"2018-09-24 09:02:51.391 GMT-0700
AM","status":"OK","total":0,"data":[]}
```

volume move

Moves the specified volume or mirror to a different topology. Permissions required: `m` or `fc` on the volume.

Syntax

CLI

```
/opt/mapr/bin/maprcli volume move
-name volumeName
[ -cluster cluster_name ]
[ -eclabel new label for ec-store
volume ]
[ -ectopology <topology> ]
[ -label new label for volume data ]
[ -nslabel new label for volume name
container ]
[ -topology topology ]
```

REST

| | |
|--------------|---|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/volume/move?<parameters> |

Parameters

Parameter: cluster

Possible Values: Any valid cluster.
Description: The cluster on which to create the volume.

Parameter: eclabel

Possible Values: Any label.
Description: The label to use for the erasure-coded volume. See [Using Storage Labels](#) on page 1068 for more information on labels.

Parameter: ectopology

The label should contain only the following characters:

```
A-Z a-z 0-9 _ - .
```

Possible Values: Any topology that exists in your environment.

Description: The new rack path for the erasure-coded volume if you are moving an erasure-coded volume.

Note: This parameter is applicable only for EC volumes.

Parameter: label

Possible Values: Any label.

Description: The label to use for the storage pool. See [Using Storage Labels](#) on page 1068 for more information on labels.

The label should contain only the following characters:

```
A-Z a-z 0-9 _ - .
```

Tip: Use the special label named `anywhere` to let a volume reside on any storage pool. Not setting a label, causes a volume to reside only on a storage pool without a label.

Parameter: name

Possible Values: Any valid name

Description: The name of the volume to move. For moving:

- An erasure coded volume, specify the name of the front-end volume.
- The metadata volume associated with a tier, specify the name of the metadata volume.

The name should contain only the following characters:

```
A-Z a-z 0-9 _ - .
```

For tiering-enabled volumes, the volume name cannot exceed ninety-eight characters.

Parameter: nslabel

Possible Values: Any value.

Description: The label to use for the namespace container. See [Using Storage Labels](#) on page 1068 for more information on labels.

The label should contain only the following characters:

```
A-Z a-z 0-9 _ - .
```

Parameter: topology

Possible Values: Any

Description: The new rack path for the:

- Regular or tiered standard volume, if you are moving a regular or tiered standard volume.
- Regular or tiered mirror volume, if you are moving a regular or tiered mirror volume.

- Metadata volume, if you are moving a metadata volume associated with a tier.

This parameter is not required, if you are moving an erasure-coded volume.

Advisory Note on Storage Labels

When the volume of a label is changed, replicas cannot be migrated within the file server, from one SP with the old label to another SP with the desired label. If there no other SPs, all old copies will not be fully migrated to the new desired label.

Examples

CLI

```
maprcli volume move -name
testVolume -topology /newPath
```

REST

```
curl -k -X 'https://abc.sj.us:8443/
rest/volume/move?
name=testVolume&topology=%2FnewPath'
--user mapr:mapr
```

volume offload

Offloads data in the volume to the tier.

Permissions Required

The user running the command must have one of the following:

- Full control (`fc`) on the cluster or volume

- Volume edit permissions

Syntax

CLI

```
maprcli volume offload
  [ -cluster cluster_name ]
  [ -ignorerule <true|false> ]
  -name <volume_name>
```

REST

| | |
|--------------|--|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/volume/offload?<parameters> |

Parameters

| Parameter | Description |
|------------|--|
| cluster | The name of the cluster on which to run the command. |
| ignorerule | Specify whether (<i>true</i>) or not (<i>false</i>) to ignore existing rules associated with the volume for offloading data. If value is: <ul style="list-style-type: none"> • <i>true</i>, all data in the volume is offloaded and rules associated with the volume for offload are ignored. • <i>false</i>, data is offloaded based on the rules set up for offloading data. Default value is <i>false</i> . |
| name | The name of the volume. |

Example

Offload a volume:

CLI

```
# /opt/mapr/bin/maprcli volume
offload -name sampleVol -json
{
  "timestamp":1501104289006,
  "timeofday":"2017-07-26
02:24:49.006 GMT-0700",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "Successfully started
offload."
  ]
}
```

REST

```
# curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/offload?
name=sampleVol' --user mapr:mapr
{"timestamp":1519947659597,"timeofday"
:"2018-03-01 03:40:59.597 GMT-0800
PM","status":"OK","total":0,"data":
[],"messages":["Successfully started
offload."]}
```

volume recall

Recalls the offloaded data for the specified volume.

Permissions Required

The user running the command must have one of the following:

- Full control (fc) on the cluster or volume
- Volume edit permissions

Syntax

CLI

```
maprcli volume recall
[-cluster cluster_name ]
-name <volume_name>
```

REST

| | |
|--------------|---|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/volume/recall?<parameters> |

Parameters

| Parameter | Description |
|-----------|--|
| cluster | The name of the cluster on which to run the command. |
| name | The name of the volume. |

Example

Recall a volume:

CLI

```
# /opt/mapr/bin/maprcli volume
recall -name sampleVol -json
{
  "timestamp":1520007453541,
  "timeofday":"2018-03-02
08:17:33.541 GMT-0800 AM",
  "status":"OK",
  "total":0,
  "data":[
```

```

    ],
    "messages": [
        "Successfully started recall."
    ]
}

```

REST

```

# curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/recall?
name=sampleVol' --user mapr:mapr
{"timestamp":1520007538784,"timeofday"
:"2018-03-02 08:18:58.784 GMT-0800
AM","status":"OK","total":0,"data":
[],"messages":["Successfully started
recall."]}

```

volume remove

Removes the specified volume or mirror. Permissions required: d or fc on the volume.

Syntax**CLI**

```

maprcli volume remove
[ -cluster <cluster> ]
[ -force true|false ]
[ -filter <filter> ]
-name <volume name>

```

REST

| | |
|--------------|---|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/volume/remove?<parameters> |

Parameters

| Parameter | Description |
|-----------|---|
| cluster | The cluster on which to run the command. |
| force | Forces the removal of the volume, even if there are dependencies. |
| name | The volume name. |
| filter | All volumes with names that match the filter are removed. |

Examples**CLI**

```
maprcli volume remove -name testVolume
```

REST

```
https://abc.sj.us:8443/rest/volume/
remove?name=testVolume
```

volume rename

Renames the specified volume or mirror. Permissions required: `fc` or `d` on the volume.

Note: If you rename a volume, you must **unmount** and **re-mount** the volume to allow applications and/or users to continue accessing the volume.

Syntax**CLI**

```
maprcli volume rename
[ -cluster <cluster> ]
-name <volume name>
-newname <new volume name>
```

REST

| | |
|--------------|---|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/volume/rename?<parameters> |

Parameters

| Parameter | Description |
|----------------------|--|
| <code>cluster</code> | The cluster on which to run the command. |
| <code>name</code> | The volume name. |
| <code>newname</code> | The new volume name. For tiering-enabled volumes, volume name cannot exceed ninety-eight characters. |

Examples**Rename a standard volume:****CLI**

```
# maprcli volume
rename -name testVolume -newname
newVolumeName -json
{
  "timestamp":1537994815889,
  "timeofday":"2018-09-26
01:46:55.889 GMT-0700 PM",
  "status":"OK",
  "total":0,
  "data":[
  ]
}
```

REST

```
# curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/rename?
name=testVolume&newname=newVolumeName'
--user mapr:mapr
{"timestamp":1537994918599,"timeofday"
:"2018-09-26 01:48:38.599 GMT-0700
PM","status":"OK","total":0,"data":[]}
```

volume showmounts

Returns a list of mount points for the specified volume.

Note: The three dots in the output indicate hierarchical mounts within a volume. Use `-json` to format the output.

Syntax**CLI**

```
maprcli volume showmounts
[ -cluster <cluster name> ]
-name <volume name>
-json
```

REST

| | |
|--------------|---|
| Request Type | GET |
| Request URL | http[s]://<host>:<port>/rest/volume/showmounts?<parameters> |

Parameters

| Parameter | Description |
|-----------|--|
| cluster | The name of the cluster hosting the volume. |
| json | (Required) Returns the output in JSON format. |
| name | The name of the volume to return a list of mount points for. |

Examples

Return the mount points for volume `mapr.user.volume` for the cluster `my.cluster.com`:

CLI

```
maprcli volume showmounts -cluster
my.cluster.com -name
mapr.user.volume -json
```

REST

```
curl -k -X GET 'https://
abc.sj.us:8443/rest/volume/showmounts?
cluster=my.cluster.com&name=mapr.user.
volume' --user mapr:mapr
```

volume snapshot create

Creates a snapshot of the specified volume, using the specified snapshot name.

- License required: Enterprise Edition
- Permissions required: `fC` or `m` on the volume

Syntax

CLI

```
maprcli volume snapshot create
  [ -cluster <cluster> ]
  [ -retain <positive_integer>mi|h|
d|w|m|y ]
  -snapshotname <snapshot>
  -volume <volume>
```

REST

| | |
|--------------|--|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/volume/snapshot/create?<parameters> |

Parameters

| Parameter | Description |
|--------------|---|
| cluster | The cluster on which to run the command. |
| retain | <p>Specifies how long to retain the snapshot data. Value can be specified in:</p> <ul style="list-style-type: none"> Minutes by appending <code>mi</code> to the integer. For example, <code>30mi</code> can be specified as the value for this parameter to retain snapshot data for 30 minutes. Hours by appending <code>h</code> to the integer. For example, <code>1h</code> can be specified as the value for this parameter to retain snapshot data for 1 hour. Days by appending <code>d</code> to the integer. For example, <code>2d</code> can be specified as the value for this parameter to retain snapshot data for 2 days. Weeks by appending <code>w</code> to the integer. For example, <code>4w</code> can be specified as the value for this parameter to retain snapshot data for 4 weeks. Months by appending <code>m</code> to the integer. For example, <code>10m</code> can be specified as the value for this parameter to retain snapshot data for 10 months. Years by appending <code>y</code> to the integer. For example, <code>7y</code> can be specified as the value for this parameter to retain snapshot data for 7 years. <p>If this is not specified, snapshot data will never expire.</p> |
| snapshotname | The name of the snapshot to create. |
| volume | The volume for which to create a snapshot. |

Examples

Create a snapshot called "test-snapshot" for volume "test-volume":

CLI

```
maprcli volume
snapshot create -snapshotname
test-snapshot -volume test-volume
{
  "timestamp":1537805380237,
  "timeofday":"2018-09-24
09:09:40.237 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
    ]
}
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/snapshot/
create?
volume=test-volume&snapshotname=test-s
napshot' --user mapr:mapr
{"timestamp":1537805548885,"timeofday"
:"2018-09-24 09:12:28.885 GMT-0700
AM","status":"OK","total":0,"data":[]}
```

volume snapshot list

Displays info about a set of snapshots.

You can specify the snapshots by volumes or paths, or by specifying a filter to select volumes with certain characteristics.

Syntax**CLI**

```
/opt/mapr/bin/maprcli volume snapshot
list
[ -cluster <cluster name> ]
[ -columns <fields> ]
( -filter <filter> ]
[ -path <volume path list> ]
[ -volume <volume list> ]
[ -limit <rows> ]
[ -output (terse|verbose) ]
[ -start <offset> ]
```

REST

| | |
|--------------|--|
| Request Type | GET |
| Request URL | http[s]://<host>:<port>/rest/volume/snapshot/list[?<parameters>] |

Parameters

Either `volume` or `path` can be used if you wish to specify the snapshots. In addition, `filter` can be used with `volume` and `path`, or independently.

| Parameter | Description |
|-----------|---|
| cluster | The cluster on which to run the command. |
| columns | A comma-separated list of fields to return in the query. See the Fields on page 2304 table below. Default: none |
| filter | A filter specifying snapshots to list. See Filters on page 1703 for more information. |
| limit | The number of rows to return, beginning at start. Default: 2147483647 |
| output | Specifies whether the output should be <code>terse</code> or <code>verbose</code> . Default: <code>verbose</code> |
| path | A comma-separated list of paths for which to list snapshots. |
| start | The offset from the starting row. Default: 0 |
| volume | A comma-separated list of volumes for which to list snapshots. |

Fields

The following table lists the fields used in the `columns` parameter, and returned as output.

| Field Name | Short Name | Description |
|-------------------------|-----------------------|--|
| snapshotid | id | Unique snapshot ID. |
| sharedSize | shSz | Size of data (in MB) that the snapshot shares with previous snapshots. |
| volumename | vn | Name of the read-write volume associated with the snapshot. |
| ownername | on | Owner (user or group) associated with the volume. |
| cumulativeReclaimSizeMB | cs | Disk space (in MB) used/owned by the snapshot |
| numSizeUpdates | numSizeUpdates | Number of times the size of the snapshot has been updated. The size of a snapshot is updated a few times at different intervals, as a snapshot's size takes time to settle to the correct value. |
| snapshotname | n | Snapshot name. |
| ownedsize | owSz | Size of data (in MB) owned by a snapshot, as opposed to <code>sharedSize</code> (owned by previous snapshots). |
| sizeUpdateRequestedAt | sizeUpdateRequestedAt | Internal field to determine the time at which a snapshot's size update is first queued. |
| ownertype | ot | Owner type for the owner of the volume: <ul style="list-style-type: none"> 0=user 1=group |

| Field Name | Short Name | Description |
|-----------------------|-----------------------|---|
| numSizeUpdatesDesired | numSizeUpdatesDesired | Number of times a snapshot's size should be updated to fetch and record the correct size of the snapshot (refer to @numSizeUpdates field description). |
| volumeid | vid | ID of the volume associated with the snapshot. |
| creationtime | ct | Snapshot creation time. Date time string (verbose output) or milliseconds since 1970 (terse output). |
| volumePath | vp | Path to the volume associated with the snapshot. |
| expirytime | et | The time until which the snapshot should be maintained. Expired snapshots are purged (deleted) periodically. Date time string (verbose output), or milliseconds since 1970 (terse output); 0 = never expires. |
| volumeSnapshotAces | N/A | ACE permissions for read and write on the volume snapshot. Use <code>-json</code> to view the ACE permissions. |
| sizeUpdatedAt | sizeUpdatedAt | The time at which the size of the snapshot was last updated. |

Output

This sample output is based on using the following code to create a snapshot called `uservolume` for the volume named `users`.

```
/opt/mapr/bin/maprcli volume snapshot create -snapshotname
uservolsnap -volume users
```

Sample Output

```
# /opt/mapr/bin/maprcli volume snapshot list
      snapshotid  sharedSize  volumename  ownername
cumulativeReclaimSizeMB  numSizeUpdates  snapshotname  ownedsize
sizeUpdateRequestedAt  ownertype  numSizeUpdatesDesired
volumeid  creationtime  volumepath  volumeSnapshotAces
sizeUpdatedAt
      256000049  0  sampleVoll  root
0  1  sampleVoll1snapshot1  0
Mon Dec 03 14:44:07 PST 2018  1  1  181800573
Mon Dec 03 14:44:07 PST 2018  ...  Mon Dec 03
14:53:13 PST 2018
```

Examples

List all snapshots:

CLI

```
# /opt/mapr/bin/maprcli volume
snapshot list
      snapshotid
```

```

sharedSize volumename
ownername cumulativeReclaimSizeMB
numSizeUpdates
snapshotname ownedsize

    ]
  }
}

```

volume snapshot preserve

Preserves one or more snapshots from expiration.

Specify the snapshots by volumes, paths, filter, or IDs.

- License required: Enterprise Edition
- Permissions required: `fc` or `m` on the volume

Syntax**CLI**

```

maprcli volume snapshot preserve
  [ -cluster <cluster> ]
  ( -filter <filter> | -path
  <volume path list> | -snapshots
  <snapshot list> | -volume <volume
  list> )

```

REST

| | |
|--------------|---|
| Request Type | POST |
| Request URL | <code>http[s]://<host>:<port>/rest/volume/snapshot/preserve[?<parameters>]</code> |

Parameters

Specify exactly one of the following parameters: volume, path, filter, or snapshots.

| Parameter | Description |
|-----------|---|
| cluster | The cluster on which to run the command. |
| filter | A filter specifying snapshots to preserve. See Filters on page 1703 for more information. |
| path | A comma-separated list of paths for which to preserve snapshots. |
| snapshots | A comma-separated list of snapshot IDs to preserve. |
| volume | A comma-separated list of volumes for which to preserve snapshots. |

Examples**Preserve two snapshots by ID:**

First, use `volume snapshot list` to get the IDs of the snapshots you wish to preserve. Example:

```

# maprcli volume snapshot list
snapshotid  ownedsize  sharedSize  volumename  ownertype  cumulativeReclaimSizeMB  volumeid  snapshotname
creationtime  volumepath  volumeSnapshotAces
256000049    0            0            egVol      mapr      1
0            29379677    egVol-snapshot  Wed Sep 26 10:42:52 PDT
2018 /egVol      ...

```

```
256000051 0 0 users mapr 1
0 212450174 uservolsnap Wed Sep 26 10:45:27 PDT
2018 /user ...
256000050 0 0 egVol mapr 1
0 29379677 egVolSnapshot Wed Sep 26 10:43:12 PDT
2018 /egVol ...
```

Use the IDs in the `volume snapshot preserve` command. For example, to preserve the first two snapshots in the above list, run the commands as follows:

CLI

```
maprcli volume
snapshot preserve -snapshots
256000049,256000051 -json
{
  "timestamp":1537986060505,
  "timeofday":"2018-09-26
11:21:00.505 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
  ]
}
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/snapshot/
preserve?
snapshots=256000049,256000051' --user
mapr:mapr
{"timestamp":1537986132998,"timeofday"
:"2018-09-26 11:22:12.998 GMT-0700
AM","status":"OK","total":0,"data":[]}
```

volume snapshot remove

Removes one or more snapshots.

- License required: Enterprise Edition
- Permissions required: `fc` or `m` on the volume

Syntax

CLI

```
maprcli volume snapshot remove
[ -cluster <cluster> ]
( -snapshotname <snapshot name> )
[ -snapshots <snapshots> ]
[ -volume <volume name> ]
```

REST

| | |
|--------------|--|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/volume/snapshot/remove[?<parameters>] |

Parameters

Specify both snapshot name and volume, or just snapshot ID.

| Parameter | Description |
|--------------|--|
| cluster | The cluster on which to run the command. |
| snapshotname | The name of the snapshot to remove. You must also specify the volume name using the <code>volume</code> parameter. |
| snapshots | A comma-separated list of IDs of snapshots to remove. |
| volume | The name of the volume from which to remove the snapshot. This is required if you are removing snapshot by specifying the snapshot name (using <code>snapshotname</code> parameter). |

Examples

Remove the snapshot named "test-snapshot" associated with volume named "test-volume":

CLI

```
maprcli volume
snapshot remove -snapshotname
test-snapshot -volume test-volume
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/api/volume/snapshot/
remove?
snapshotname=test-snapshot&volume=tes
t-volume' --user mapr:mapr
```

Remove two snapshots by ID:

First, use `volume snapshot list` to get the IDs of the snapshots you wish to remove. Example:

```
# maprcli volume snapshot list
snapshotid ownedsize sharedSize volumename ownername
ownertype cumulativeReclaimSizeMB volumeid snapshotname
creationtime volumepath volumeSnapshotAces
256000049 0 0 egVol mapr 1
0 29379677 egVol-snapshot Wed Sep 26 10:42:52 PDT
2018 /egVol ...
256000051 0 0 users mapr 1
0 212450174 uservolsnap Wed Sep 26 10:45:27 PDT
2018 /user ...
256000050 0 0 egVol mapr 1
0 29379677 egVolSnapshot Wed Sep 26 10:43:12 PDT
2018 /egVol ...
```

Use the IDs in the `volume snapshot remove` command. For example, to remove the first two snapshots in the above list, run the commands as follows:

CLI

```
maprcli volume snapshot
remove -snapshots 256000049,256000051
{
  "timestamp":1537986405764,
  "timeofday":"2018-09-26
11:26:45.764 GMT-0700 AM",
  "status":"OK",
```

```
"total":0,
"data":[
]
}
```

REST

```
# curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/snapshot/
remove?
snapshots=256000049,256000051' --user
mapr:mapr
{"timestamp":1537987406574,"timeofday"
:"2018-09-26 11:43:26.574 GMT-0700
AM","status":"OK","total":0,"data":[]}
```

volume tierjobabort

Terminates an ongoing offload or recall operation for a volume (specified by name).

Permissions Required

The user running the command must have one of the following:

- Full control (fc) on the cluster or volume
- Volume edit permissions

Syntax

CLI

```
maprcli volume tierjobabort
[ -cluster cluster_name ]
-name name
```

REST

| | |
|--------------|---|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/volume/tierjobabort?<parameters> |

Parameters

| Parameter | Description |
|-----------|--|
| cluster | The name of the cluster on which to run the command. |
| name | The name of the volume. |

Example

Stop offloading data to the tier:

CLI

```
/opt/mapr/bin/maprcli volume
tierjobabort -name sampleVol -json
{
```

```

        "timestamp":1503504450211,
        "timeofday":"2017-08-23
04:07:30.211 GMT+0000",
        "status":"OK",
        "total":0,
        "data":[

        ],
        "messages":[
            "Successfully started
to abort."
        ]
    }

```

REST

```

curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/
tierjobabort?name=sampleVol' --user
mapr:mapr
{"timestamp":1503504450211,"timeofday"
:"2017-08-23 04:07:30.211
GMT+0000","status":"OK","total":0,"dat
a":[],"messages":["Successfully
started to abort."]}

```

volume tierjobstatus

Retrieves the status of the currently running operation (such as offload, recall, or terminate) for a volume.

Permissions Required

The user running the command must have one of the following:

- Full control (fc) on the cluster or volume
- Volume edit permissions

Syntax

CLI

```

maprcli volume tierjobstatus
[ -cluster <cluster_name> ]
-name <volume_name>
[ -verbose true|false ]

```

REST

| | |
|--------------|--|
| Request Type | GET |
| Request URL | http[s]://<host>:<port>/rest/volume/tierjobstatus?<parameters> |

Parameters

| Parameter | Description |
|-----------|--|
| cluster | The name of the cluster on which to run the command. |

| Parameter | Description |
|-----------|--|
| name | The name of the volume. |
| verbose | Specifies whether the command output should be verbose. The value for this must be <code>true</code> to retrieve the status of a compaction operation. The default value is <code>false</code> . |

Output

The command returns the following:

| | |
|-------------------|--|
| state | The status of the offload, recall, or terminate operation. See Statuses on page 2313 below for more information. |
| offloadedDataSize | The amount of data offloaded. This is returned only when returning the status of an offload operation. |
| progress | The percentage of containers that have been processed so far. |
| recalledDataSize | The amount of data recalled. This is returned only when returning the status of a recall operation. |
| reclaimedDataSize | The amount of data purged. This is returned only when returning the status of a compaction job. |
| startTime | The date and timestamp for when the offload operation started. |
| endTime | The date and timestamp for when the offload operation completed. |
| gateway | The IP address of the MAST Gateway used for the tiering operation. |

Statuses

The value for the `state` field (statuses) can be one of the following:

| State | Description |
|-----------|---|
| Scheduled | <p data-bbox="818 212 1456 296">Indicates the job request has reached CLDB, but has not yet been forwarded to any MAST Gateway service. For example:</p> <p data-bbox="818 317 873 344">CLI</p> <pre data-bbox="1166 338 1456 1178"> { "timestamp":1532093619983, "timeofday":"2018-07-20 06:33:39.983 GMT-0700 AM", "status":"OK", "total":1, "data":[{ "compaction":{ "state":"Scheduled", "scheduleTime":"2018-07-20 06:33:38.953 GMT-0700", "gateway":"10.10.108.116:8660" } }] } </pre> <p data-bbox="818 1224 894 1251">REST</p> <pre data-bbox="1166 1241 1456 1661"> {"timestamp":1532093619983,"timeofday":"2018-07-20 06:33:39.983 GMT-0700 AM","status":"OK", "total":1,"data":[{"compaction":{"state":"Scheduled","scheduleTime":"2018-07-20 06:33:38.953 GMT-0700","gateway":"10.10.108.116:8660"}}]} </pre> |

| State | Description |
|---------|---|
| Running | <p>Indicates the offload or recall job has been forwarded to MAST Gateway service. The MAST Gateway service can either still be waiting for resources to run the job or is actually performing the requested job. For example:</p> <p>CLI</p> <pre data-bbox="1149 348 1458 1835"> { "timestamp":1532095481297, "timeofday":"2018-07-20 07:04:41.297 GMT-0700 AM", "status":"OK", "total":1, "data":[{ "offload":{ "state":"Running", "progress":"61%", "startTime":"2018-07-20 07:00:02.277 GMT-0700", "gateway":"10.10.108.115:8660", "compaction":{ "state":"Success", "progress":"100%", "startTime":"2018-07-20 06:34:06.628 GMT-0700", "endTime":"2018-07-20 06:40:25.334 GMT-0700", "reclaimedDataSize":"0 MB", "gateway":"10.10.108.115:8660" } } }] } </pre> <p>REST</p> <pre data-bbox="1149 1873 1458 2003"> {"timestamp":1532095481297,"timeofday":"2018-07-20 07:04:41.297 GMT-0700 AM","status":"OK", "total":1,"data": [{"offload": </pre> |

| State | Description |
|---------------------|---|
| <p>FailureFatal</p> | <p>Indicates the job has failed with non-retriable error. You must resolve the issue and retry the operation. For example:</p> <p>CLI</p> <pre data-bbox="1149 321 1455 1419"> { "timestamp":1531778057385, "timeofday":"2018-07-16 09:54:17.385 GMT+0000 PM", "status":"OK", "total":1, "data":[{ "offload":{ "state":"FailureFatal", "progress":"50%", "startTime":"2018-07-16 21:54:01.779 GMT+0000", "endTime":"2018-07-16 21:54:05.339 GMT+0000", "offloadedDataSize":"0 MB", "gateway":"10.10.88.198:8660" } }] } </pre> <p>REST</p> <pre data-bbox="1149 1455 1455 2064"> {"timestamp":1531778057385,"timeofday":"2018-07-16 09:54:17.385 GMT+0000 PM","status":"OK","total":1,"data":[{"offload":{"state":"FailureFatal","progress":"50%","startTime":"2018-07-16 21:54:01.779 GMT+0000","endTime":"2018-07-16 21:54:05.339 GMT+0000","offloadedDataSize":"0 MB","gateway":"10.10.88.198:8660"}}]} </pre> |

| State | Description |
|-------------------------|---|
| <p>FailureRetriable</p> | <p>Indicates the job has failed with an error for which CLDB will retry the job based on the configuration parameters, <code>cldb.gateway.retry.count</code> and <code>cldb.gateway.retry.waittime</code>. But if the job is restarted manually or terminated, CLDB will not retry. For example:</p> <p>CLI</p> <pre data-bbox="1149 407 1455 1528"> { "timestamp":1532624516372, "timeofday":"2018-07-26 10:01:56.372 GMT-0700 AM", "status":"OK", "total":1, "data":[{ "offload":{ "state":"FailureRetry, RetryCount:5", "progress":"50%", "startTime":"2018-07-25 17:43:27.924 GMT-0700", "endTime":"2018-07-25 17:43:59.108 GMT-0700", "offloadedDataSize":"0 MB", "gateway":"10.10.25.29:8660" } }] } </pre> <p>REST</p> <pre data-bbox="1149 1570 1455 2091"> {"timestamp":1532624656640,"timeofday":"2018-07-26 10:04:16.640 GMT-0700 AM","status":"OK", "total":1,"data":[{"offload":{"state":"FailureRetry, RetryCount:5","progress":"50%","startTime":"2018-07-25 17:43:27.924 GMT-0700","endTime":"2018-07-25 17:43:59.108 GMT-0700","offload </pre> |

| State | Description |
|----------------|--|
| <p>Success</p> | <p>Indicates the job has been successfully completed. For example:</p> <p>CLI</p> <pre data-bbox="1149 296 1455 1980"> { "timestamp":1531311128469, "timeofday":"2018-07-11 12:12:08.469 GMT+0000 PM", "status":"OK", "total":1, "data":[{ "offload":{ "state":"Success", "progress":"100%", "startTime":"2018-07-11 12:10:26.290 GMT+0000", "endTime":"2018-07-11 12:10:35.521 GMT+0000", "offloadedDataSize":"353.16 MB", "gateway":"10.10.20.12:8660", "compaction":{ "state":"Success", "progress":"100%", "startTime":"2018-07-11 12:12:01.335 GMT+0000", "endTime":"2018-07-11 12:12:02.264 GMT+0000", "reclaimedDataSize":"353.097 MB", "gateway":"10.10.20.12:8660" } } }] } </pre> |

| State | Description |
|---------|---|
| Aborted | <p>Indicates the job has been terminated. For example:</p> <p>CLI</p> <pre data-bbox="1149 268 1455 1142"> { "timestamp":1503504464179, "timeofday":"2017-08-23 04:07:44.179 GMT+0000", "status":"OK", "total":1, "data":[{"offload":{ "state":"Aborted", "startTime":"2017-08-23 04:06:06.867 GMT+0000", "endTime":"2017-08-23 04:06:38.910 GMT+0000", "gateway":"10.10.88.199:8660" }}] } </pre> <p>REST</p> <pre data-bbox="1149 1176 1455 1688"> {"timestamp":1503504464179,"timeofday":"2017-08-23 04:07:44.179 GMT+0000","status":"OK","total":1,"data":[{"offload":{"state":"Aborted","startTime":"2017-08-23 04:06:06.867 GMT+0000","endTime":"2017-08-23 04:06:38.910 GMT+0000","gateway":"10.10.88.199:8660"}}]} </pre> |

| State | Description |
|-----------------|---|
| AbortInProgress | <p data-bbox="818 212 1446 268">Indicates that the terminate operation is in progress. For example:</p> <p data-bbox="818 291 873 319">CLI</p> <pre data-bbox="1166 310 1446 1213"> { "timestamp":1533005375001, "timeofday":"2018-07-30 07:49:35.001 GMT-0700 PM", "status":"OK", "total":1, "data":[{ "offload":{ "state":"AbortInProgress", "progress":"98%", "startTime":"2018-07-30 19:02:37.108 GMT-0700", "gateway":"10.10.101.121:8660" } }] } </pre> <p data-bbox="818 1255 889 1283">REST</p> <pre data-bbox="1166 1268 1446 1724"> {"timestamp":1533005375001,"timeofday":"2018-07-30 07:49:35.001 GMT-0700 PM","status":"OK", "total":1,"data":[{"offload":{"state":"AbortInProgress","progress":"98%","startTime":"2018-07-30 19:02:37.108 GMT-0700","gateway":"10.10.101.121:8660"}}]} </pre> |

| State | Description |
|-----------------|---|
| AbortedInternal | <p>Indicates the offload operation was terminated by another internal process, such as when promoting a mirror volume to a read-write volume when offload is in progress. For example:</p> <p>CLI</p> <pre data-bbox="1149 348 1455 1304"> { "timestamp":1515488569411, "timeofday":"2018-01-09 01:02:49.411 GMT-0800", "status":"OK", "total":1, "data":[{"recall":{ "state":"AbortedInternal", "progress":"36%", "startTime":"2018-01-09 01:01:57.824 GMT-0800", "endTime":"2018-01-09 01:02:43.329 GMT-0800", "gateway":"10.10.108.150:8660"}]}] } </pre> <p>REST</p> <pre data-bbox="1149 1350 1455 1871"> {"timestamp":1515488569411,"timeofday":"2018-01-09 01:02:49.411 GMT-0800","status":"OK","total":1,"data":[{"recall":{"state":"AbortedInternal","progress":"36%","startTime":"2018-01-09 01:01:57.824 GMT-0800","endTime":"2018-01-09 01:02:43.329 GMT-0800","gateway":"10.10.108.150:8660"}}]}] </pre> |

Example**CLI**

```
# maprcli volume tierjobstatus -name
testVol -json -verbose true
{
  "timestamp":1533005419522,
  "timeofday":"2018-07-30
07:50:19.522 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "offload":{
        "state":"Success",
        "progress":"100%",
        "startTime":"2018-07-30
19:00:06.185 GMT-0700",
        "endTime":"2018-07-30
19:19:58.303 GMT-0700",

"offloadedDataSize":"2487.911 MB",

"gateway":"10.10.108.117:8660"
      },
      "compaction":{
"state":"AbortInProgress",
        "progress":"45%",

```

volume tierstats

Retrieves statistics on the offload and recall operation.

Permissions Required

The user running the command must have one of the following:

- Full control (fc) on the cluster or volume
- Volume edit permissions

Syntax**CLI**

```
maprcli volume tierstats
    [ -cluster cluster_name ]
    -name <volume_name>
```

REST

| | |
|--------------|--|
| Request Type | GET |
| Request URL | http[s]://<host>:<port>/rest/volume/tierstats?<parameters> |

Parameters

| Parameter | Description |
|-----------|--|
| cluster | The name of the cluster on which to run the command. |
| name | The name of the volume. |

Output

The command returns the following:

| | |
|--------------------------|--|
| offloadThroughput | The amount of data (in MB) offloaded per second. |
| totalTierDataSize | The total size of tiered data (in MB). |
| totalTierReclaimableSize | The size of deleted data (in MB) that is under the compaction operation threshold. |
| recallThroughput | The amount of data (in MB) recalled per second. |

Example

Retrieve statistics for a volume specified by name:

CLI

```
# /opt/mapr/bin/maprcli volume
tierstats -name sampleVol -json
{
  "timestamp":1520275614872,
  "timeofday":"2018-03-05
06:46:54.872 GMT+0000",
  "status":"OK",
  "total":1,
```

```

    "data":[
      {
        "totalTierDataSize":"404.323 MB",
        "offloadThroughput":"17.063 MB/s",
        "recallThroughput":"14.071 MB/s"
      }
    ]
  }
}

```

REST

```

curl -k -X GET 'https://
abc.sj.us:8443/rest/volume/tierstats?
name=sampleVol' --user mapr:mapr
{"timestamp":1520275614872,"timeofday"
:"2018-03-05 06:46:54.872
GMT+0000","status":"OK","total":1,"dat
a":[{"totalTierDataSize":"404.323
MB","offloadThroughput":"17.063 MB/
s","recallThroughput":"14.071 MB/s"}]}

```

Retrieve statistics for a volume after a compaction operation:**CLI**

```

# maprcli volume tierstats -name
test1 -json
{
  "timestamp":1527048672887,
  "timeofday":"2018-05-23
04:11:12.887 GMT+0000 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "totalTierDataSize":"3001.926 MB",
      "totalTierReclaimableSize":"100 MB",
      "offloadThroughput":"31.064 MB/s"
    }
  ]
}

```

REST

```

curl -k -X GET 'https://
abc.sj.us:8443/rest/volume/tierstatus?
name=test1' --user mapr:mapr
{"timestamp":1527048672887,"timeofday"
:"2018-05-23 04:11:12.887 GMT+0000
AM","status":"OK","total":1,"data":
[{"totalTierDataSize":"3001.926
MB","totalTierReclaimableSize":"100
MB","offloadThroughput":"31.064 MB/
s"}]}

```

volume unmount

Unmounts one or more mounted volumes. Permissions required: `fc` or `m` on the volume.

Syntax

CLI

```
maprcli volume unmount
  [ -cluster <cluster> ]
  [ -force 0|1 ]
  -name <volume name>
```

REST

| | |
|--------------|--|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/volume/unmount?<parameters> |

Parameters

| Parameter | Description |
|-----------|--|
| cluster | The cluster on which to run the command. |
| force | Specifies whether (1) or not (0) to force the volume to unmount. |
| name | The name of the volume to unmount. |

Examples

Unmount the volume "test-volume":

CLI

```
maprcli volume unmount -name
test-volume
{
  "timestamp":1537804903335,
  "timeofday":"2018-09-24
09:01:43.335 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
  ]
}
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/unmount?
name=test-volume' --user mapr:mapr
{"timestamp":1537805053854,"timeofday"
:"2018-09-24 09:01:43.335 GMT-0700
AM","status":"OK","total":0,"data":[]}
```

volume upgradeformat

Upgrades and old-type volume to a new-type volume, which can in turn be used as a promotable mirror volume. Permissions required: `m` or `fc` on the volume.

Syntax**CLI**

```
maprcli volume upgradeformat
[ -cluster <cluster> ]
-name <volume name>
```

REST

| | |
|--------------|--|
| Request Type | POST |
| Request URL | http[s]://<host>:<port>/rest/volume/upgradeformat?<parameters> |

Parameters

| Parameter | Description |
|-----------|--|
| cluster | The cluster on which to run the command. |
| name | The volume name. |

Examples**CLI**

```
maprcli volume upgradeformat -name
vol999 -json
```

REST

```
https://abc.sj.us:8443/rest/volume/
upgradeformat?name=vol999
```

volume snapshot restore

Restores a volume from a snapshot using the CLI.

For an overview on the Snapshot Restore functionality, refer to [Restoring a Volume From a Snapshot](#) on page 442.

To restore a snapshot using the Control System, refer to [Restoring Volume Snapshots Using the Control System](#) on page 1034.

To check the progress of a snapshot restore operation, use the [volume snapshot restorestatus](#) on page 2328 command.

Syntax**CLI**

```
/opt/mapr/bin/maprcli volume snapshot
restore
[ -cluster <cluster> ]
( -snapshotname <snapshot name> ]
[ -volume <volume name> ]
```

REST

| | |
|--------------|------|
| Request Type | POST |
|--------------|------|

Request URL

```
http[s]://<host>:<port>/
rest/volume/snapshot/
restore[?<parameters>]
```

Parameters

| Parameter | Description |
|--------------|--|
| cluster | The cluster on which to run the command. This parameter is not mandatory. If not specified, the current cluster is used by default. |
| snapshotname | The name of the snapshot to use for restoring a volume. You must also specify the volume name using the <code>volume</code> parameter. |
| volume | The name of the volume to restore from a snapshot. |

Example

CLI

The following example command restores a snapshot named `s3` to a volume named `vol2`:

```
/opt/mapr/bin/maprcli volume snapshot
restore -volume vol2 -snapshotname
s3 -json
{
  "timestamp":1549970648390,
  "timeofday":"2019-02-12
11:24:08.390 GMT+0000 AM",
  "status":"OK",
  "total":0,
  "data":[
    ],
  "messages":["
    "Snapshot Restore
    queued for volume vol2, snapshot name
    s3"
  ]
}
```

REST

```
curl -k -X
POST 'https://abc.sj.us:8443/
rest/volume/snapshot/restore?
snapshotname=s3&volume=vol2' --user
mapr:mapr
```

To restore a snapshot using the Control System, refer to [Restoring Volume Snapshots Using the Control System](#) on page 1034.

To restore a snapshot, use the [volume snapshot restore](#) on page 2326 command.

Syntax**CLI**

```
/opt/mapr/bin/maprcli volume snapshot
restorestatus
  [ -cluster <cluster> ]
  [ -volume <volume name> ]
  [ -verbose <true/false> ]
```

REST

| | |
|--------------|---|
| Request Type | GET |
| Request URL | http[s]://<host>:<port>/rest/volume/snapshot/restorestatus[?<parameters>] |

Parameters

| Parameter | Description |
|-----------|---|
| cluster | The cluster on which to run the command. This parameter is not mandatory. If not specified, the current cluster is used by default. |
| volume | The name of the volume that is being restored from a snapshot. |
| verbose | Displays container statistics in addition to percentage. |

Examples**CLI**

The following example command displays the status of the snapshot restore operation on a volume named vol2. See the example in [volume snapshot restore](#) on page 2326 for the command that triggered the snapshot restore operation.

```
/opt/mapr/bin/maprcli volume snapshot
restorestatus -volume vol2 -json
{
  "timestamp":1549970683260,
  "timeofday":"2019-02-12
```

```
11:24:43.260 GMT+0000 AM",
  "status":"OK",
  "total":1,

Utilities

Contains information about various scripts and utilities, that help setup, maintain, and monitor clusters.

The following scripts and utilities help you configure clusters, setup cross cluster security, setup storage pools, monitor CLDB activity, perform consistency checks and repair errors on volumes and snapshots, and maintain clusters with ease.

| Script or Utility | Description |
|--|--|
| Cluster Configuration | |
| configure.sh on page 2331 | Describes the syntax and parameters of the <code>configure.sh</code> script that you run for a number of tasks, including setting up MapR client nodes, and configuring services for a node. |
| configure-crosscluster.sh on page 2345 | Sets up cross-cluster security between two clusters. |
| disksetup on page 2372 | Formats specified disks for use by MapR storage, and adds those disks to the <code>disktab</code> file. |
| mrconfig on page 2420 | Lets you create, remove, and manage storage pools, disk groups, and disks; and provides information about containers. |
| pullcentralconfig on page 2465 | Pulls master configuration files from <code>/var/mapr/configuration</code> on the cluster to the local disk, on each node. |
| fcdebug on page 2379 | Dynamically sets the loglevel to debug a library. |
| Auditing and Monitoring | |
| cldbguts on page 2360 | Monitors CLDB activity. This utility prints information about the CLDB service that is running on the node from which you run the utility. |
| ectool on page 2375 | Dumps or checks the validity of the stripelets in the backend volume that is associated with the volume configured for warm tiering. |
| expandaudit on page 2376 | Expands IDs captured in the audit logs to their corresponding names. |
| fsck on page 2380 | Detects and fixes inconsistencies in the filesystem. |
| gfsck on page 2383 | Performs consistency checks and appropriate repairs on a volume, or a volume snapshot. |
| mapr-support-collect.sh on page 2403 | Collects information about a cluster's recent activity, to help MapR Support diagnose problems. |
| mapr-support-dump.sh on page 2409 | Collects node and cluster-level information for the node on which you invoke the script. |
| mrdirectorystats on page 2461 | Prints the space usage for each directory, for a container. |
| mrfscmd on page 2464 | Returns the path to the file specified by ID (fid). |
| stubfuse on page 2465 | Determines the read and write performance of a FUSE mount point. |
| Authentication | |

| Script or Utility | Description |
|--|---|
| maprlogin on page 2412 | Authenticates logins to secure MapR clusters. |

configure.sh

Describes the syntax and parameters of the `configure.sh` script that you run for a number of tasks including setting up HPE Ezmeral Data Fabric client nodes, and configuring services for a node.

Note: The `configure.sh` script must always be run as `root`.

You run `configure.sh` to [set up a HPE Ezmeral Data Fabric cluster node](#), or to [set up a HPE Ezmeral Data Fabric client node for communication with one or more clusters](#). You can also run `configure.sh` to update the configuration of a node. For example, you can use `configure.sh` to [change the services running on a node](#), or specify the [user that runs HPE Ezmeral Data Fabric services](#).

Attention: On a Windows client, the `configure.sh` script is named `configure.bat`. The script requires the `-c` parameter and does not accept the `-z` parameter, but otherwise works similarly as on a Linux client.

Steps Performed by configure.sh

`configure.sh` performs the following steps, each time you run it:

- **Updates `/opt/mapr/conf/mapr-clusters.conf` with the cluster name.** It creates or modifies a line in `/opt/mapr/conf/mapr-clusters.conf` containing a cluster name followed by a list of CLDB nodes. New entries are added to `mapr-clusters.conf` when the cluster name passed to the `-N` parameter is different from the existing cluster name in that file.
- **Checks that the node has at least 4GB of RAM, and that the `/tmp` and `/opt` partitions each have at least 1 GB of free space.** If these conditions are not met, the script asks for confirmation before continuing.
- **Disables standard NFS daemons.** If the node has the `mapr-nfs` role, the script disables the standard Linux NFS daemon, since both NFS processes cannot run on the same node.
- **Updates additional `*.conf` and `*.xml` files related to the cluster and the services running on the node.** For example, `yarn-site.xml`, `warden.conf`, and `cldb.conf` may be updated based on input to `configure.sh`.
- **On cluster nodes, it creates a group named `shadow`, adds the HPE Ezmeral Data Fabric user to this group, and then enables members of the `shadow` group to view the `/etc/shadow` file.** Read access to the `/etc/shadow` file enables HPE Ezmeral Data Fabric users to authenticate with the HPE Ezmeral Data Fabric cluster.
- **Starts newly installed services.** Automatically starts new services, if Warden is running at the time you run `configure.sh`.
- **All changes to configuration options or system files are logged to `/opt/mapr/logs/configure.log`.** You can use the `-L` parameter to specify a different log file name.

When you include disk-setup options (`-D` or `-F`) on nodes with the `mapr-fileserver` role, the script performs the following additional steps:

- **Runs disksetup to create the `disktab` file.** `configure.sh` takes the values that you specify in the `-disk-opts` option, and passes the value to `disksetup`. For example, if you include `-disk-opts FW5` when you run `configure.sh`, `configure.sh` runs `disksteup -F -W5`. If `disksetup` fails, `configure.sh` exits with an error.

- **Starts Zookeeper and Warden.** When the `configure.sh` script starts services, the message `starting <servicename>` is echoed to the standard output to enable the user to see which services are starting. When Warden starts, the Warden and ZooKeeper services are added to the `inittab` file as the first available `inittab` IDs, enabling these services to restart automatically on failure.

You can specify the `-no-autostart` option to prevent the script from starting Zookeeper or Warden when you run `configure.sh` with the `-F` or `-D` options.

Syntax

```
/opt/mapr/server/configure.sh
-C <cldb_list>
-Z <zookeeper_list>
-EZ <ext_zookeeper_list>
[<parameters>]
```

```
/opt/mapr/server/configure.sh
-C <cldb_list>
[ -M <cldb_mh_list ...> ]
-Z <zookeeper_list>
[<parameters>]
```

```
/opt/mapr/server/configure.sh
-c
[ -R ]
[<parameters>]
```

```
/opt/mapr/server/configure.sh
-R
[ -c ]
[<parameters>]
```

Options

-C

Use the `-C` option for CLDB servers that only have a single IP address. This option takes a comma-separated list of the CLDB nodes that this machine uses to connect to the HPE Ezmeral Data Fabric cluster. The list is in the following format:

```
hostname[:port_no]
[,hostname[:port_no]...]
```

-c

Specifies client setup. The `-C` option is required, while the `-z` option is optional. See [set up a HPE Ezmeral Data Fabric client node for communication with one or more clusters](#).

-EZ

The `-EZ` option is optional when configuring the cluster, and is not applicable when configuring a client. This option takes a comma-separated list of the external IP addresses of the ZooKeeper nodes in the cluster. The list is in the following format:

```
hostname[:port_no]
[,hostname[:port_no] ...]
```

-M

Use the `-M` option only for multihomed CLDB servers that have more than one IP address. This option takes a comma-separated list of the multihomed CLDB nodes that this machine uses to connect to the HPE Ezmeral Data Fabric cluster. The list is in the following format:

```
hostname[:port_no][,
[hostname[:port_no]...]]
```

-R

After initial node configuration, specifies that `configure.sh` should use the previously configured ZooKeeper and CLDB nodes. The `-C` and `-Z` parameters are not required when you specify `-R`. When `-R` is specified, the CLDB credentials are read from `mapr-clusters.conf`, while the ZooKeeper credentials are read from `warden.conf`. Use the `-R` option when you make changes to the services configured on a node without changing the CLDB and ZooKeeper nodes. Specify the `--noRecalcMem` parameter to skip recalculating memory settings when refreshing roles.

Note: This parameter impacts the JMX parameters in `/opt/mapr/conf/env_override.sh` in the following ways:

- When you set `MAPR_JMXLOCALBINDING` to true, running `/opt/mapr/server/configure.sh -R` sets `MAPR_JMXAUTH` to false, since JMX is only accessible from the local machine and does not require authentication.
- When you set `MAPR_JMXLOCALBINDING` to false but set `MAPR_JMXLOCALHOST` to true, running `/opt/mapr/server/configure.sh -R` sets `MAPR_JMXAUTH` to true and `MAPR_JMXSSL` to false, since JMX is only accessible from the local network and does not require secure authentication.
- When you set `MAPR_JMXLOCALBINDING` to false but set `MAPR_JMXREMOTEHOST` to true, running `/opt/mapr/server/configure.sh -R` sets `MAPR_JMXAUTH` to true and `MAPR_JMXSSL` to true, since JMX is now accessible remotely and requires secure authentication.

-Z

The `-Z` option is required unless you specify the `-c` (lowercase), or the `-R` option. The `-Z` option takes a comma-separated list of the ZooKeeper nodes in the cluster. The list is in the following format:

```
hostname[:port_no]
[,hostname[:port_no]...]
```

Parameters

| | |
|---------------------------------|--|
| <code>-certdomain</code> | Specifies a DNS domain for generated SSL wildcard certificates. This domain overrides the default DNS domain. |
| <code>--create-user -a</code> | Creates a local user to run HPE Ezmeral Data Fabric services, using the user specified either with the <code>-u</code> parameter, or from the environment variable <code>\$MAPR_USER</code> . |
| <code>-D</code> | Specifies a comma-delimited list of disks to use with the HPE Ezmeral Data Fabric filesystem. With the <code>-D</code> option, you cannot specify partitions. By default, the <code>configure.sh</code> script automatically starts cluster services, after the configuration finishes successfully. If you do not want cluster services to be restarted, include the <code>-no-autostart</code> option along with the <code>-D</code> option. |
| <code>-d</code> | The host and port of the MySQL database to use for storing HPE Ezmeral Data Fabric Metrics data. |
| <code>-dare</code> | Enables on-disk encryption at the cluster-level. When run on the first CLDB node with the <code>-genkeys</code> option, the utility generates the data-at-rest encryption master key file at <code>/opt/mapr/conf/dare.master.key</code> . |
| <code>-defaultdb</code> | Sets the default database (HBase or HPE Ezmeral Data Fabric Database) to which the HBase clients connect. If you do not explicitly configure this option, it defaults to <code>hbase</code> (HBase) when you have <code>mapr-hbase-regionserver</code> or <code>mapr-hbase-master</code> installed on the node. Otherwise, it defaults to <code>maprdb</code> (HPE Ezmeral Data Fabric Database). You can also change the database setting using <code>hbase-site.xml</code> or the HBase client connection. For more information, see Configure the Default Database for HBase Clients on page 3601. |
| <code>-disk-opts</code> | Denotes disksetup formatting options. Do not include spaces or commas between the disksetup options. For example, you can specify <code>-disk-opts FW5</code> to format the disks (F), and configure five disks per storage pool (W5). |
| <code>-disablessl</code> | <p>Disables SSL for ZooKeeper nodes on secure clusters.</p> <p>The new ZooKeeper (ZK version 3.5.6) supports SSL encryption for server-to-server communication. When you install a new clean 6.2 secure cluster, SSL between ZooKeeper servers is enabled automatically.</p> <p>However when you perform a rolling upgrade, few nodes are upgraded to data-fabric 6.2 (with the new ZooKeeper server), while other nodes still run the old data-fabric 6.1, where the ZooKeeper is at version 3.4.11 and is incapable of using SSL.</p> <p>You must disable SSL using this option, to get this hybrid cluster to work. You must enable SSL for ZooKeeper only AFTER you upgrade all nodes to data-fabric 6.2.</p> <p>You can use this option even when refreshing roles. For example: <code>configure.sh -R -disableSsl</code>.</p> |

Running `configure.sh` without this option enables SSL. To turn on SSL:

1. Shutdown the cluster.
2. On every ZooKeeper node, run `configure.sh -R` (without this `disableSsl` parameter).
3. Start the cluster.

The `sslQuorum` parameter in `zoo.cfg` on page 2505 controls whether or not the ZooKeeper nodes can use SSL for communication.

To verify that ZooKeeper nodes are communicating over SSL, check the ZooKeeper log for messages such as *SSL handshake complete with ...* and/or *Accepted TLS connection from...*

| | |
|------------|--|
| -dp | Specifies the password for logging into the MySQL database used for storing HPE Ezmeral Data Fabric Metrics data. |
| -ds | Specifies the name of the database schema to use for the MySQL database used for storing HPE Ezmeral Data Fabric Metrics data. The default schema name is <i>metrics</i> . |
| -du | Specifies the username for logging into the MySQL database used for storing HPE Ezmeral Data Fabric Metrics data. |
| -EC | Specifies a host or hosts that contain the Hive Metastore. Use this parameter and the <code>-hiveMetastoreHost</code> argument to configure an ecosystem component, such as Drill, to communicate with the Hive Metastore. Use the following format to specify a list of hosts: <pre>hostname[:port_no] [,hostname[:port_no]...] </pre> <p>See the <code>-EC</code> parameter example later on this page. If you do not specify a host port number, Drill uses the default Hive Metastore port number (9083) for every host.</p> |
| -EP | Specifies an option that is passed directly to an ecosystem <code>configure.sh</code> script. These commands follow the form <code>-EP<ecosystem component name> <option></code> . In general, <code>-EP</code> options are not documented, and should be used only if the documentation specifically instructs you to use them. <p>In HPE Ezmeral Data Fabric 6.0 and later, some ecosystem components have their own <code>configure.sh</code> scripts. The server <code>configure.sh</code> script or a user, can pass options directly to the ecosystem component by using the <code>-EP</code> syntax. For example, in the following command:</p> <pre>/opt/mapr/server/ configure.sh -R -EPkibana '-kibanaPort 5610'</pre> |

`-EPkibana '-kibanaPort 5610'` changes the default port for Kibana to 5610.

As ecosystem components are updated more frequently than HPE Ezmeral Data Fabric Core (which contains the server `configure.sh` script), implementing some `configure.sh` functions through an ecosystem `configure.sh` script can accelerate the introduction of new features.

-ES

Specifies a comma-separated list of host names or IP addresses that identify the Elasticsearch nodes. The Elasticsearch nodes can either be part of the current HPE Ezmeral Data Fabric cluster, or part of a different HPE Ezmeral Data Fabric cluster. Do not use this option when you configure a node for the first time. Use this option along with the `-R` parameter.

The list is in the following format:

```
hostname/IPaddress[:port_no]
[,hostname/IPaddress[:port_no]...]
```

Note: The default Elasticsearch port is 9200. If you want to use a different port, specify the port number when you list the Elasticsearch nodes.

-ESDB

Specifies a non-default location for writing index data on Elasticsearch nodes. To configure an index location, you only need to include this parameter on Elasticsearch nodes.

Elasticsearch requires a lot of disk space. Therefore, a separate filesystem for the index is recommended. It is not recommended to store index data under the `/` or the `/var` file system.

For more information, see [Log Aggregation and Storage](#) on page 1503.

-F

Specifies a path to a text file that [lists the disks and partitions to use with the HPE Ezmeral Data Fabric filesystem](#). By default, the `configure.sh` script automatically starts cluster services after the configuration finishes successfully. If you do not want cluster services to be restarted, include the `-no-autostart` option along with the `-F` option.

-f

Specifies that the node should be configured without performing the system prerequisite check.

-forceSecurityDefaults

Instructs `configure.sh` to undo any custom security settings for a cluster, and reconfigure security to the default HPE Ezmeral Data Fabric values for `-unsecure` or `-secure`. You must specify either the `-secure` or the `-unsecure` option. Using the `-forceSecurityDefaults` option removes the `/opt/mapr/conf/.customSecure` file. Use the following syntax:

```
/opt/mapr/server/
configure.sh -forceSecurityDefaults
[ -unsecure | -secure ] -C
<CLDB_node> -Z <ZK_node>
```

For more information, see [Customizing Security in HPE Ezmeral Data Fabric](#) on page 1648.

Important: It is possible that the `-forceSecurityDefaults` operation might not undo all custom security settings since `configure.sh` cannot know all of the custom settings that were implemented. Therefore, you might have to edit some configuration files and settings to restore the cluster to full functionality.

| | |
|--------------------------------------|--|
| <code>-G</code> | The group ID to use when creating <code>\$MAPR_USER</code> with the <code>-create-user</code> or <code>-a</code> option; corresponds to the <code>-g</code> or <code>-gid</code> option of the <code>useradd</code> command in Linux. |
| <code>-g</code> | The group name under which HPE Ezmeral Data Fabric services run. |
| <code>-genkeys</code> | Generates needed keys and certificates for the initial CLDB node in a secure cluster. If specified with the <code>-dare</code> option, the <code>-genkeys</code> option generates a master key at <code>/opt/mapr/conf/dare.master.key</code> on the first CLDB node. Without the master key, you cannot start the cluster, nor can you access the data. |
| <code>-H</code> | Specifies the HTTPS port number for connecting to the CLDB node. The default port is 7443. |
| <code>-HS</code> | Specifies the IP or hostname of the node in the cluster that performs the HistoryServer role. This parameter is required only when a node in the cluster performs the HistoryServer role. In HPE Ezmeral Data Fabric 5.1 and later, this parameter is expanded to support the Mesos DNS-style name with format for Job History. The format is <code><myriad-fwk-name>.mesos</code> . For example, if the <code>-MF</code> parameter is <code>myriadA</code> , the name is: <code>jobhistory.myriadA.mesos</code> . Myriad is not supported in HPE Ezmeral Data Fabric 6.2.0 and later. |
| <code>--isvm</code> | Specifies the virtual machine setup. Required when <code>configure.sh</code> is run on a cluster node, that is on a virtual machine. This option configures the script to use less memory. |
| <code>-J</code> | Specifies the JMX port for the CLDB. Default: 7220 |
| <code>-JMXEnable</code> | Globally enables JMX support for services on the node. JMX is enabled by default. |
| <code>-JMXDisable</code> | Globally disables JMX support for services on the node. |
| <code>-JMXLocalBindingEnable</code> | Enables local binding for JMX connections. |
| <code>-JMXLocalBindingDisable</code> | Disables local binding for JMX connections. |
| <code>-JMXLocalHostEnable</code> | Enables the local-host TCP port for JMX. This setting is mutually exclusive with <code>JMXRemoteHostEnable</code> . |
| <code>-JMXLocalHostDisable</code> | Disables the local-host TCP port for JMX. |
| <code>-JMXRemoteHostEnable</code> | Enables the remote TCP port for JMX. This setting is mutually exclusive with <code>JMXLocalHostEnable</code> . |
| <code>-JMXRemoteHostDisable</code> | Disables the remote TCP port for JMX. |

| | |
|-----------------------------|--|
| -K -kerberosEnable | Indicates that Kerberos security has been enabled . Kerberos security is disabled by default. |
| -L | Specifies a log file. If not specified, <code>configure.sh</code> logs errors to <code>/opt/mapr/logs/configure.log</code> . |
| -label | <p><i>Default Value:</i> default</p> <p><i>Possible Values:</i> Any registered label</p> <p><i>Description:</i> The label to use for the storage pool. See Using Storage Labels on page 1068 for more information on labels.</p> <p>The label should contain only the following characters:</p> <pre style="background-color: #f0f0f0; padding: 5px;">A-Z a-z 0-9 _ - .</pre> <p> Attention: This option is meant to be run ONLY on CLDB nodes. However, if you intend to use this option on data nodes, ensure that you first register the label on the data node before using this option.</p> |
| --logHTTPFS | Specifies the hostname to enable centralized logging using <code>fluentd</code> . |
| -MCL | Specifies the top-level directory where all the staging data as well as shuffle data is written for a specific Myriad framework. Used when multiple clusters are implementing Myriad. Myriad is not supported in HPE Ezmeral Data Fabric 6.2.0 and later. |
| -MP | Specifies the name of the Myriad framework that is displayed in the Mesos UI. Myriad is not supported in HPE Ezmeral Data Fabric 6.2.0 and later. |
| -MHA | Enables Myriad high availability. Myriad is not supported in HPE Ezmeral Data Fabric 6.2.0 and later. |
| -M7 | Deprecated as of HPE Ezmeral Data Fabric 4.0.1. |
| -maprpam | When specified, the <code>configure.sh</code> script installs the HPE Ezmeral Data Fabric version of Pluggable Authentication Modules (PAM). This option is ignored if <code>-S</code> is not set. |
| -N | <p>Specifies the cluster name. If you do not specify a name, <code>configure.sh</code> applies a default name (<code>my.cluster.com</code>) to the cluster. Whenever you run <code>configure.sh</code>, be aware of the existing cluster name or names in <code>mapr-clusters.conf</code> and specify the <code>-N</code> parameter accordingly. If you specify a name that does not exist, a new line is created in <code>mapr-clusters.conf</code> and is treated as a configuration for a separate cluster.</p> <p>Subsequent runs of <code>configure.sh</code> without the <code>-N</code> parameter operate on this default cluster. If you specify a name when you first run <code>configure.sh</code>, you can modify the CLDB and ZooKeeper settings corresponding to the named cluster by specifying the same name and running <code>configure.sh</code> again. Whenever you need to re-run <code>configure.sh</code> on a given cluster (to add or rename nodes, for example), be sure to specify the same cluster name that you used when you ran <code>configure.sh</code> for the first time.</p> |

| | |
|-----------------------------------|---|
| -no-autostart | Specifies that the script should not start Zookeeper or Warden when you run <code>configure.sh</code> . |
| -no-auto-permission-update | Pass this option to prevent HPE Ezmeral Data Fabric from silently altering permissions in <code>/etc/shadow</code> . |
| -nocerts | When specified, the <code>configure.sh</code> script does not generate SSL certificates even when the <code>-genkeys</code> option is specified. |
| -noDB | Specifies that HPE Ezmeral Data Fabric Database is not in use. |
| -noRecalcMem | Skips recalculating memory settings when refreshing roles. Can be used only with the <code>-R</code> option. |
| -OT | <p>Specifies a comma-separated list of host names or IP addresses that identify the OpenTSDB nodes. The OpenTSDB nodes can be part of the current HPE Ezmeral Data Fabric cluster or part of a different HPE Ezmeral Data Fabric cluster. Do not use this option when you configure a node for the first time. Use this option along with the <code>-R</code> parameter. The Warden service must be running when you use <code>configure.sh -R -OT</code>.</p> <p>Use the following format to list the hostnames:</p> <pre>hostname/IP address[:port_no] [,hostname/IP address[:port_no]...] </pre> <p> Note: The default OpenTSDB port is 4242. If you want to use a different port, specify the port number when you list the OpenTSDB nodes.</p> |
| -on-prompt-cont | <p>Specify:</p> <ul style="list-style-type: none"> • <code>y</code> to automatically respond Yes to all prompts. • <code>n</code> to automatically respond No to all prompts. |
| -P | Specifies the Kerberos instance that is used to form a CLDB Kerberos principal in the form of <code>mapr/<instance-name>@<realm-name></code> . Enclose this value in quotes ("). This value is ignored if Kerberos security is not enabled. |
| -QS | Use the <code>-QS</code> option to configure the OJAI Distributed Query Service. See Configure the OJAI Distributed Query Service on page 172. |
| -RM | <p>In HPE Ezmeral Data Fabric 5.1, this parameter is expanded to support the Mesos DNS-style hostname for Myriad configuration. The Mesos-style hostname is <code><application name>.marathon.mesos</code>. When starting ResourceManager from Marathon, the <code>.<application name> rm</code>, for example, is <code>rm.marathon.mesos</code>.</p> <p>In HPE Ezmeral Data Fabric 4.0.2, this parameter is not required unless you want to configure manual or automatic failover; zero configuration failover is enabled by default. In HPE Ezmeral Data Fabric 4.0.1, this parameter specifies the nodes in the cluster with the ResourceManager role.</p> |

List the nodes in the following format:
hostname[,hostname] . . .]

For more information, see [ResourceManager High Availability](#) on page 1685. Myriad is not supported in HPE Ezmeral Data Fabric 6.2.0 and later.

| | |
|---------------------|---|
| -s -secure | Specifies that this cluster is a secure cluster, and configures security on the platform and on all ecosystem components that support security. Default: <code>insecure</code> . |
| -syschk | Configures the system checks to be enabled or disabled. Value: Y/N. |
| -TL | Specifies the single node on which the timeline server is installed for the Hive-on-Tez user interface. When you install Tez manually, you must also install the timeline server and run <code>configure.sh -TL <timeline_server_node></code> on all nodes to indicate where the timeline server resides. |
| -U | The user ID to use when creating <code>\$MAPR_USER</code> with either the <code>--create-user</code> or <code>-a</code> option; corresponds to the <code>-u</code> or <code>--uid</code> option of the <code>useradd</code> command in Linux. |
| -u | The user name under which HPE Ezmeral Data Fabric services run. |
| -unsecure | Specifies that this cluster is not secure. Default: <code>unsecure</code> . |
| -v | In addition to logging information, also prints to <code>stdout</code> . |

HSM Parameters - For more information, see [Setting Up the External KMIP Keystore](#) on page 706

| | |
|---|--|
| -hsm | Performs HSM configuration. This will always run the mrhsm init on page 720 command to initialize the HSM if not already initialized. The <code>-hsmlabel</code> option is required if the <code>-hsm</code> option is specified for the first time. When used with the <code>-genkeys</code> option, <code>-hsm</code> invokes the mrhsm enable on page 713 command to generate the CLDB and also the DARE keys if the <code>-dare</code> option is specified. Otherwise, <code>-hsm</code> configures the settings specified by the <code>-hsmip</code> , <code>-hsmport</code> , <code>-hsmcacert</code> , <code>-hsmclientcert</code> , <code>-hsmclientkey</code> and <code>-hsmkmipversion</code> options, but does not enable the HSM feature or generate any keys. |
| -hsmip <ip-address> | The comma-separated list of host names or IP addresses of the external HSM. This parameter is required only when no IP addresses have been configured, or when you need to modify the IP addresses of the external HSM. |
| -hsmport <port> | The KMIP port of the external HSM. This parameter is optional. If omitted, this defaults to the standard KMIP port of 5696. |
| -hsmcacert </path/to/cert> | The full path name of the file containing the HSM CA certificate downloaded from the HSM. |

| | |
|---|---|
| | This parameter is required only when no CA certificate has been configured, or when we need to modify the CA certificate. |
| <code>-hsmclientcert </path/to/cert></code> | The full path name of the file containing the KMIP-enabled client certificate. This parameter is required only when no client certificate has been configured, or when you need to modify the client certificate. |
| <code>-hsmclientkey </path/to/key></code> | The full path name of the file containing the KMIP-enabled client key. This parameter is required only when no client key has been configured, or when you need to modify the client key. |
| <code>-hsmlabel <label></code> | The KMIP token label. This is an ASCII string which is used to describe the KMIP token and can range from 1 to 32 characters, e.g. Utimaco ESKM. This parameter is only needed when initializing the KMIP token for the first time. It is ignored for subsequent invocations. |
| <code>-hsmsopin <so-pin></code> | PIN for the Security Officer (SO). This should be between 4 to 255 characters inclusive. The SO PIN is set in the KMIP token during the initial invocation. In subsequent invocations, the SO PIN entered into this utility must match the configured SO PIN. If this argument is not specified, you will be prompted to enter it. |
| <code>-hsmkmipversion <version></code> | The KMIP version number to use for all communication with the external KMIP-enabled key store. Supported values are 1.0, 1.1, 1.2, 1.3 and 1.4. The default value is 1.1. |

At the end of the `configure.sh` script, the HSM should be up and running, when you use the HSM parameters. Use the [mrhsm info](#) on page 717 command to check the HSM status.

Protection of Java key stores is NOT supported in the HSM for HPE Ezmeral Data Fabric 6.2. In later releases, `configure.sh` will generate `PKCS#12` key stores instead of `JCEKS` key stores.

Examples

1. **Add a node (not CLDB or ZooKeeper) to a cluster that is running the CLDB and ZooKeeper on three nodes:**

On the new node, run the following command:

```
/opt/mapr/server/configure.sh -C nodeA,nodeB,nodeC -Z nodeA,nodeB,nodeC
```

2. Configure a client to work with cluster my.cluster.com, which has one CLDB at nodeA:

On a Linux client, run the following command:

```
/opt/mapr/server/configure.sh -N my.cluster.com -c -C nodeA
```

On a Windows 7 client, run the following command:

```
C:\opt\mapr\server\configure.bat -N my.cluster.com -c -C nodeA
```

3. Add a second cluster to the configuration:

On a node in the second cluster your.cluster.com, run the following command:

```
/opt/mapr/server/configure.sh -C nodeZ -N your.cluster.com -Z  
<zKNodeA, zKNodeB, zKNodeC>
```

4. Add CLDB servers with multiple IP addresses to a cluster:

In this example, the cluster my.cluster.com has CLDB servers at nodeA, nodeB, nodeC, and nodeD. The CLDB servers nodeB and nodeD have two NICs each at *eth0* and *eth1*.

On a node in the cluster my.cluster.com, run the following command:

```
/opt/mapr/server/configure.sh -N my.cluster.com -C  
nodeAeth0,nodeCeth0 -M \  
nodeBeth0,nodeBeth1 -M nodeDeth0,nodeDeth1 -Z zknodeA
```

5. Start a cluster in secure mode using configure.sh

In this example, the cluster my.cluster.com has two CLDB servers at nodeA and nodeB. The ZooKeeper node for this cluster is at nodeC. To start the cluster in secure mode, run the following command on nodeA:

```
/opt/mapr/server/configure.sh -N my.cluster.com -C nodeA,nodeB -Z  
nodeC -secure \  
-genkeys -F <disklist file>
```

This command creates the *ssl_truststore*, *ssl_keystore*, *maprserverticket*, and *cldb.key* files. Copy these files from nodeA's */opt/mapr/conf* directory to nodeB's */opt/mapr/conf* directory.

On nodeB, change the permissions on the *ssl_keystore*, *maprserverticket*, and *cldb.key* files to 600 (the *mapr* user) by using the following command:

```
chmod 600 ssl_keystore maprserverticket cldb.key
```

On the *ssl_truststore* file, change the permissions to 644 (world readable):

```
chmod 644 ssl_truststore
```

On nodeB, run the following command:

```
/opt/mapr/server/configure.sh -N mycluster.com -C nodeA,nodeB -Z  
nodeC -secure -F \  
<disklist file>
```

6. Configure the Drill storage plugin to communicate with a Hive Metastore:

This example uses the `-EC` parameter to configure the Drill storage plugin to communicate with a Hive Metastore located on `nodeA`:

```
/opt/mapr/server/configure.sh -EC '-hiveMetastoreHost nodeA'
```

7. Configure HSM:

A sample session transcript using the `/opt/mapr/server/configure.sh` script with DARE enabled is as follows. The portions in **bold** relate to the common HSM features, while the portions in *italics* relate to the DARE-specific features:

```
# /opt/mapr/server/configure.sh -secure -genkeys -N
test96.cluster.com -C perfnode96.lab:7222 -Z perfnode96.lab:5181 -F
disks.txt -dare -hsm -hsmip 10.10.30.129 -hsmlabel "SafeNet
KeySecure" -hsmopin 12345678 -hsmclientcert /root/safenet-keysecure/
client.pem -hsmcacert /root/safenet-keysecure/CA.pem -hsmclientkey /root/
safenet-keysecure/key.pem
create /opt/mapr/conf/conf.old

... Starting hadoop-util
To further manage the system, use "maprcli", or connect browser to
https://{webserver host name}:8443/
To stop and start this node, use "systemctl start/stop mapr-warden "
No need to set label returning from SetDiskLabel
```

Troubleshooting configure.sh

When you run `configure.sh` with the `-OT` option for the first time, you might encounter an error message such as **directory /opt/mapr/conf/proxy is not owned by root**. You must ignore this transient error

message. If you repeatedly see this error during client operations, then re-run `configure.sh` with the `-R` option.

configure-crosscluster.sh

Use the `configure-crosscluster.sh` utility to set up cross-cluster security between two clusters.

You can use the [configure-crosscluster.sh](#) on page 2345 utility to set up cross-cluster security between two clusters. When you run this utility with the `create` subcommand, it establishes security between the local cluster and a remote cluster. After the setup, communication between the two clusters is bi-directional. You can run this utility on any node in the source cluster to grant secure access to users and servers (for replication, or mirroring) on the destination cluster.

The utility prompts for the passwords for both the local and remote clusters. All hosts on a cluster must have the same password. Alternatively, you can use `ssh` public key authentication between the current node and the other nodes in the local and remote clusters.

Prerequisites

Before running this utility, you must:

- Enable wire-level security for both the local and remote clusters.
 - Set `secure=true` in your cluster entry for `/opt/mapr/conf/mapr-clusters.conf`, for both the local and remote clusters.
- Install the `pssh` (Parallel SSH) package from EPEL.
- Install the `expect` package.

If you plan to use a user other than the `mapr` administrative user for mirroring or gateway/streams replication, that user must already exist on both the local and remote clusters.

Syntax

```
/opt/mapr/server/configure-crosscluster.sh create <cross-cluster-type>
[ -localcrossclusteruser <user> ]
[ -localhosts <path_to_file> ]
[ -localport <port_number> ]
[ -localuser <user> ]
[ -recover <id> ]
[ -remotecrossclusteruser <user> ]
[ -remotehosts <port_number> ]
-remoteip <ip_address>
[ -remoteport <port_number> ]
[ -remoteuser <user> ]
```

Type Parameters

The `<cross-cluster-type>` parameter specifies the type of entity for which cross-cluster access must be established. The value can be one of the following:

| | |
|---------------|---|
| user | <p>Used for direct data access for the given user. When you run the utility with the <code>user</code> parameter, it performs the following tasks on both the clusters:</p> <ol style="list-style-type: none"> 1. Updates the <code>/opt/mapr/conf/mapr-clusters.conf</code> file to include the first entry from the <code>/opt/mapr/conf/mapr-clusters.conf</code> file on the other cluster. 2. Imports the certificate of the other cluster in the <code>/opt/mapr/conf/ssl_truststore</code> file, and copies the updated <code>/opt/mapr/conf/ssl_truststore</code> file to all the other nodes on the cluster. |
| server | <p>Used for data-fabric server access such as mirroring and replication. When you run the utility with the <code>server</code> parameter, it performs the following tasks on both the clusters:</p> <ol style="list-style-type: none"> 1. Generates a cross-cluster ticket on this cluster for the other cluster, and copies the ticket to the CLDB node on the other cluster. 2. Merges the ticket with the <code>/opt/mapr/conf/maprserverticket</code> file on the node on the other cluster, and copies the updated <code>/opt/mapr/conf/maprserverticket</code> file to all the other CLDB nodes on the other cluster. |
| all | <p>Used for both user and server access. When you run the utility with the <code>all</code> parameter, it performs the following actions on both the clusters:</p> <ol style="list-style-type: none"> 1. Updates the <code>/opt/mapr/conf/mapr-clusters.conf</code> file to include the first entry from the <code>/opt/mapr/conf/mapr-clusters.conf</code> file on the other cluster. |

2. Imports the certificate of the other cluster in the `/opt/mapr/conf/ssl_truststore` file, and copies the updated `/opt/mapr/conf/ssl_truststore` file to all the other nodes on the cluster.
3. Generates a cross-cluster ticket for the other cluster, copies the ticket to the CLDB node on the other cluster, merges the ticket with the `/opt/mapr/conf/maprserverticket` file on the node in the other cluster, and copies the updated `/opt/mapr/conf/maprserverticket` file to all other CLDB nodes on the other cluster.

Options

The `configure-crosscluster.sh` on page 2345 utility supports the following options:

localcrossclusteruser

Default value: local user

This option applies only to the server parameter. Specifies the name of the local cross-cluster user if different from the local user, for mirroring and replication of tables, and streams.

localhosts

Default value: No Default Value

Contains the full or relative path to the file containing the list of IP addresses or host names of the hosts to update in the local cluster. Specify one host per line in the file, excluding the current host. If you specify this option, the utility updates the configuration, both on the host on which you are running the utility, and on the other nodes specified in the file. If you do not specify this option, the utility copies both the:

- Updated server security configuration in the `/opt/mapr/conf/maprserverticket` file to only the CLDB nodes in the local cluster.
- Updated user security configuration in the `/opt/mapr/conf/mapr-clusters.conf` file, and the `/opt/mapr/conf/ssl_truststore` file, to all the nodes in the local cluster.

localport

Default value: 22

Indicates the port to use to connect (using `ssh` or `scp`) to local cluster hosts.

localuser

Default value: mapr

Specifies the name of the user for the local cluster.

recover

Default value: No Default Value

Defines the option to recover from the failure to copy files to nodes in the local or remote cluster, due to failed cluster nodes. Use the special ID keyword `latest` to run with the contents of the most recent run. See [Troubleshooting and Recovery](#) on page 2351 for more information.

remotecrossclusteruser

Default value: remote user

remotehosts

This option applies only to the server parameter. Specifies the name of the remote cross-cluster user, if different from the remote user.

Default value: No Default Value

Contains the full or relative path to the file containing the list of IP addresses or host names of the hosts to update in the remote cluster. Specify one host per line in the file. If you do not specify this option, the utility copies both the:

- Updated server security configuration in the `/opt/mapr/conf/maprserverticket` file to only the CLDB nodes in the remote cluster.
- Updated user security configuration in the `/opt/mapr/conf/mapr-clusters.conf` file, and the `/opt/mapr/conf/ssl_truststore` file, to all the nodes in the remote cluster.

For example, if you have a file `myhosts.txt` in the current directory with the following contents:

```
10.10.20.100
10.10.20.101
10.10.20.102
```

then, specify `-remotehosts myhosts.txt` for this parameter.

Attention: All hosts specified in this file must be directly reachable from the local hosts from which you run the [configure-crosscluster.sh](#) on page 2345 utility.

remoteip

Default value: No Default Value

This option is mandatory. Specifies the host name or IP address of a host in the remote cluster.

remoteport

Default value: 22

Indicates the port to use to connect (using `ssh` or `scp`) to remote cluster hosts.

remoteuser

Default value: local user

Designates the name of the user for the remote cluster.

Verification

To verify that cross-cluster security is correctly set up, perform one of the following actions:

- If you ran the utility using the cross-cluster type `user` or `all`, and the utility completed successfully, you should be able to run remote commands from the local node after obtaining a user ticket using the [maprlogin](#) on page 2412 utility. See [Configuring Secure Clusters for Running Commands Remotely](#) on page 1658 for more information.
- If you ran the utility using the cross-cluster type `server` or `all`, and the utility completed successfully, you should be able to perform various service operations from the local to the remote cluster and vice versa, including mounting volumes over NFS, mirroring volumes, and replicating tables and streams. See [Configuring Secure Clusters for Cross-Cluster Mirroring and Replication](#) on page 1661 for more information.

Sample Session

To configure cross-cluster security, run the utility on a CLDB host with wire-level security enabled, :

```
# /opt/mapr/server/configure-crosscluster.sh create all -remoteip

```

Cleanup

After running the utility, you must perform two cleanup actions:

1. Log out of the local and remote clusters if needed, using the `maprlogin logout` command.
2. Delete the `/tmp/mapr-xcs` directory, if it is present, after verifying that the cross-cluster setup is correct.

If you run this utility without the `-recover` option, the utility creates temporary files in the `/tmp/mapr-xcs` directory under the current process ID. These directories contain sensitive information such as server tickets that are protected by Unix permissions. The utility preserves these tickets, so that you can perform troubleshooting and recovery actions, as needed. You must delete this directory after verifying that the cross-cluster setup is correct:

```
$ /bin/rm -rf /tmp/mapr-xcs
```

Post-Configuration Tasks

After you run this utility, cross-cluster security should be successfully set up between the local and the remote cluster. If you specified either the `user` or `all` cross-cluster type when running the utility, to

perform any operations on the remote cluster from the local node, login to the remote cluster to obtain a user ticket using the [maprlogin](#) on page 2412 command.

```
$ maprlogin password -cluster <remote-cluster-name>
```

 **Note:** You must obtain a new ticket when your current ticket expires.

Examples of Using the Cross-Cluster Utility

For examples on how to run the [configure-crosscluster.sh](#) on page 2345 utility, see [Configure-crosscluster.sh Examples](#) on page 2350.

Related information

[Configure-crosscluster.sh Examples](#) on page 2350

Demonstrates how to use the `configure-crosscluster.sh` utility.

[Troubleshooting and Recovery](#) on page 2351

Configure-crosscluster.sh Examples

Demonstrates how to use the `configure-crosscluster.sh` utility.

Example 1

Suppose both the local and remote cluster administrator usernames are `mapr`, and both the local and remote cross-cluster users for mirroring and gateway/streams replication are also `mapr`, specify only the `-remoteip` argument for a fresh run:

```
$ /opt/mapr/server/configure-crosscluster.sh create server -remoteip
10.10.1.1
```

Example 2

Assume that the local MapR administrator username defaults to `mapr`, and the remote MapR administrator username defaults to the local MapR administrator username. Specify different user names for the local and remote MapR administrator using the `-localuser` and `-remoteuser` arguments. For example, if the local MapR administrator username is `admin` and the remote MapR administrator username is `mapr`:

```
$ /opt/mapr/server/configure-crosscluster.sh create server -remoteip
10.10.1.1 -localuser admin -remoteuser mapr
```

Example 3

Assume that the local cross-cluster user defaults to the local MapR administrative user, and the remote cross-cluster user defaults to the remote MapR administrative user. To use a different cross-cluster user for mirroring or gateway/streams replication, specify the `-localcrossclusteruser` and/or `-remotecrossclusteruser` parameters. For example, if the local cross-cluster username is `crosscluster`, run the utility as follows:

```
$ /opt/mapr/server/configure-crosscluster.sh create server -remoteip
10.10.1.1 -localcrossclusteruser crosscluster
```

Example 4

By default, the utility performs `ssh` and `scp` operations between the node where the utility is running and the other nodes in the local and remote clusters, using the default SSH port 22. To use a non-default SSH port, either for the local or remote clusters, specify the port number using the `-localport` or

the `-remoteport` option. For example, if the SSH port for the local cluster is 10022, run the utility as follows. The remote SSH port is the default value of 22 if the `-remoteport` argument is not specified:

```
$ /opt/mapr/server/configure-crosscluster.sh create server -remoteip
10.10.1.1 -localport 10022
```

Example 5

By default, the utility runs the `maprcli node list` command on both the local and remote nodes to determine the list of hosts in the local and remote clusters, and updates the configuration for all the nodes in the local and remote clusters. To update the configuration only for a subset of nodes in either the local or remote cluster, such as when you want to update only the CLDB nodes, specify the path to the file containing the list of hosts, one per line, using the `-localhosts` and `-remotehosts` options respectively. For example, to update the configuration for only the local nodes specified in the file `/tmp/local` and the remote nodes specified in the file `/tmp/remote`, run:

```
$ /opt/mapr/server/configure-crosscluster.sh create server -remoteip
10.10.1.1 -localhosts /tmp/local -remotehosts /tmp/remote
```

Example 6

To configure cross-cluster functionality for a user without setting up server cross-cluster functionality, specify `user` as the parameter. This parameter allows users to run commands such as `maprcli node list` using the `-cluster` parameter, and the remote cluster name:

```
$ /opt/mapr/server/configure-crosscluster.sh create user -remoteip 10.10.1.1
```

Example 7

To configure both user and server cross-cluster functionality, specify `all` as the parameter, instead of `user` or `server`:

```
$ /opt/mapr/server/configure-crosscluster.sh create all -remoteip 10.10.1.1
```

Example 8

To copy the configuration files from the most recently failed run, use the `-recover` option. To update the configuration for a specified list of local or remote hosts, use the `-recover` option together with the `-localhosts` and `-remotehosts` options.

```
$ /opt/mapr/server/configure-crosscluster.sh create server -remoteip
10.10.1.103 -localuser admin -remoteuser mapr -recover latest -localhosts
local -remotehosts remote
```

See [Sample Failure, Troubleshooting, and Recovery Session](#) on page 2355 for more information.

Troubleshooting and Recovery

Typically, the utility succeeds and if the utility fails partially or completely, try the troubleshooting and recovery steps described here.

Completely Failed Runs

A completely failed run indicates that the utility did not set up cross-cluster communication between any of the local or remote nodes. Typical reasons for complete failure include:

- The prerequisites for running this utility were not met.

Refer to [Prerequisites](#) on page 2345 for running this utility.

- The utility was not run as `mapr` or administrative user.

The user running the utility must be able to run commands like `maprlogin password`, `maprlogin generateticket`, and `maprcli node list`.

- The `-localuser` option was not specified when there was a non-default username (like `admin`) for the `mapr` user on the local node.

- The `-remoteuser` option was not specified when there was a non-default username (like `admin`) for the `mapr` user on the remote node.

- The username specified in the `-localcrosscluster` option does not exist in the local cluster.

This utility requires that the username specified in the `-localcrossclusteruser` option to exist before running the utility.

- The username specified in the `-remotecrosscluster` option does not exist in the remote cluster.

This utility requires that the username specified in the `-remotecrossclusteruser` option to exist before running the utility.

- The wrong password was specified for the local `mapr` user for the local cluster.

This utility uses commands like `ssh` and `scp` to access other nodes in the local cluster. So, if the public key authentication between the local node and the other nodes in the local cluster is not setup, you must have set a password for the `mapr` administrative user specified in the `-localuser` argument.

- The wrong password was specified for the remote `mapr` user for the remote cluster.

This utility uses commands like `ssh` and `scp` to access other nodes in the local cluster. So, if the public key authentication between the local node and the node specified in the `-remoteip` option is not setup, there must be a password for the `mapr` administrative user specified in the `-remoteuser` option.

For completely failed runs, examine the log file in `/opt/mapr/logs/crosscluster.log` and the output of the latest run in `/tmp/mapr-xcs` directory.

The `crosscluster.log` looks something like the following:

```
Script started at Fri Sep 29 15:56:33
PDT 2017
Entering recovery mode. Using

opt/mapr/conf/mapr-clusters.conf
Logging in to local cluster
...
```

Partially Failed Runs

The utility may also report partial success. The utility does not fail due to inability to copy the updated files to the nodes in the local or remote clusters, so the most likely cause of partial failure is improperly configured or failed cluster nodes.

For partially failed runs, examine the contents of the latest run in `/tmp/mapr-xcs` directory in addition to the contents of the `/opt/mapr/logs/crosscluster.log` file.

In the following example, the latest run of the utility is in `/tmp/mapr-xcs/13194`, since this directory has the most recent modification date:

```
[admin@node95 ~]# ls -lt /tmp/mapr-xcs
total 8
drwx----- 14 mapr mapr 4096 Sep 29
15:49 13194
drwx----- 30 mapr mapr 4096 Sep 29
14:44 23802
```

The following is the sample content in `/tmp/mapr-xcs/13194`:

```
[admin@node95 mapr-xcs]# ls -l 13194
total 52

15:56 STATUS
```

Troubleshooting

1. Look at `/tmp/mapr-xcs/<latest>/STATUS`. A non-zero value indicates an overall error.
2. If you encounter a non-zero overall status, look at the `STATUS` files in each of the subdirectories.

3. For the subdirectories reporting a non-zero status, look at the contents of the files in that subdirectory.
4. If there is an error in updating the local cluster hosts, and you did not use the `-localhosts` option when running the script, also look at `/tmp/mapr-xcs/<latest>/localclusterhosts.txt` file.

The `/tmp/mapr-xcs/<latest>/localclusterhosts.txt` file contains the list of IP addresses of the local cluster hosts, which is the first IP address of each node if there are multiple IP addresses, obtained from the following command:

```
maprcli node list -cluster <local-cluster-name> -columns hostname
```

Verify the contents of the file to ensure that the list of local cluster hosts is correct. The original output of the above command is in `/tmp/mapr-xcs/<latest>/localclusterhosts_full.txt`, and you should also check the output to ensure that the list is correct. Otherwise, fix the errors and re-run the script with the `-localhosts` option.

5. If there is an error in updating the remote cluster hosts, and you did not use the `-remotehosts` option when running the script, you should also look at `/tmp/mapr-xcs/<latest>/remoteclusterhosts.txt` file.

The `/tmp/mapr-xcs/<latest>/remoteclusterhosts.txt` file contains the list of IP addresses of remote cluster hosts, which is the first IP address of each node if there are multiple IP addresses, obtained from the following command:

```
ssh <remoteuser>@<remote-ip> maprcli node list -cluster  
<remote-cluster-name> -columns hostname
```

Verify the contents of the file to ensure that the list of remote cluster hosts is correct. The original output of the above command is in `/tmp/mapr-xcs/<latest>/remoteclusterhosts_full.txt`, and you should also check the output to ensure that the list is correct. Otherwise, fix the errors and re-run the script with the `-remotehosts` option.

6. If you have an error copying to some or all of the local or remote cluster hosts, try doing an `ssh` to the local or remote cluster host (respectively) to ensure that it is accessible using the supplied username and password. If this fails, the copy operation in the script will also fail, since it relies on either public key authentication or username/password authentication to access the nodes. Specify the correct username and/or password and then re-run the script.

Sample Failure, Troubleshooting, and Recovery Session

Suppose the utility is run where one of the nodes in the local cluster (10.10.30.96) has a password that is different from other local cluster nodes, causing the `ssh` and `scp` commands to this node to fail.

1. Run the utility on the local node (10.10.30.95).

The highlighted text below are the warning messages. The utility continues to run, despite the warnings, to update the cross-cluster configuration on as many nodes as possible:

```
[admin@node95 cross-cluster]$ /opt/mapr/server/configure-crosscluster.sh
create server -remoteip 10.10.1.103 -localuser admin -remoteuser mapr
Remote IP is 10.10.1.103
WARNING: Strict host key checking will be disabled for this script.
Enter password for mapr user (admin) for local cluster:
Enter password for mapr user (mapr) for remote cluster:
Local cross-cluster user unset, defaulting to local user admin
Remote cross-cluster user unset, defaulting to remote user mapr
Verifying connectivity to 10.10.1.103 and presence of mapr-clusters.conf
MapR credentials of user 'admin' for cluster 'node95.cluster.com' are
written to '/tmp/maprticket_0'
node95.cluster.com secure=true node95.perf.lab:7222
WARNING: Copying local /opt/mapr/conf/mapr-clusters.conf to all hosts in
local cluster complete, but the operation failed for at least one node
in the cluster.
For details, look at the output directory /tmp/mapr-xcs/
14043/lpscp_clusterhosts_odir or error directory /tmp/mapr-xcs/14043/
lpscp_clusterhosts_edir.
Configuring cross-cluster communication for server-side operations
Generating cross-cluster ticket for user mapr on remote node
WARNING: Changing permissions of local maprserverticket complete, but
the operation failed for at least one node in the cluster.
For details, look at the output directory /tmp/mapr-xcs/
14043/lpssh_server_odir or error directory /tmp/mapr-xcs/14043/
lpssh_server_edir
WARNING: Cannot change permissions for local MapR server ticket for at
least 1 node
WARNING: Copy local maprserverticket to all hosts in local cluster
complete, but the operation failed for at least one node in the cluster.
For details, look at the output directory /tmp/mapr-xcs/
14043/lpscp_server_odir or error directory /tmp/mapr-xcs/14043/
lpscp_server_edir.
WARNING: Cannot copy local MapR server ticket for at least 1 node
Generating cross-cluster ticket for mirroring for user admin
MapR credentials of user 'admin' for cluster 'node95.cluster.com' are
written to '/tmp/mapr-xcs/14043/local_crosscluster_ticket'
An error has been encountered in configuring cross-cluster communication.
For more information, refer to the log file at /opt/mapr/logs/
crosscluster.log.
If the error is caused by non-functioning local and remote cluster
nodes, more information on the precise errors can be found in /tmp/
mapr-xcs/14043. The list of local cluster hosts is in /tmp/mapr-xcs/
14043/localclusterhosts.txt, and the list of remote cluster hosts is
in /tmp/mapr-xcs/14043/remotecusterhosts.txt.
In such cases, you can normally fix the error by editing the list
of local and/or remote cluster hosts file and then re-run the script
using the -r option, specifying the local or remote hosts file in
the -localhosts or -remotehosts option respectively.
This script has logged in to both the local and remote clusters. Please
log out of the clusters if needed.
```

2. Look at the specified directory, /tmp/mapr-xcs/14043, because the utility resulted in an error.

The overall status is 1 (indicating an error) as shown in bold below:

```
$ cat /tmp/mapr-xcs/14043/STATUS
1
```

3. Look at the STATUS files in each of the subdirectories to determine the content reporting error.

Content has non-zero status as shown in bold below:

```
[admin@node95 14043]$ find /tmp/mapr-xcs/14043 -print | grep STATUS |
xargs more
::::::::::::
./rpscp_clusterhosts_edir/STATUS
::::::::::::
0
::::::::::::
./lpscp_clusterhosts_edir/STATUS
::::::::::::
1 FAIL
::::::::::::
./lpssh_server_edir/STATUS
::::::::::::
1 FAIL
::::::::::::
./lpscp_server_edir/STATUS
::::::::::::
1 FAIL
::::::::::::
./rpssh_server_edir/STATUS
::::::::::::
0
::::::::::::
./rpscp_server_edir/STATUS
::::::::::::
0
::::::::::::
./STATUS
::::::::::::
1 Overall status is FAIL
```

4. Look at each of the files in the subdirectories reporting a non-zero status, for example, lpscp_clusterhosts_edir.

The error “lost connection” for 10.10.30.96 indicates that the local node 10.10.30.95 could not run the scp command to that node:

```
[admin@node95 14043]$ more lpscp_clusterhosts_edir/*
::::::::::::
lpscp_clusterhosts_edir/10.10.30.95
::::::::::::
lpscp_clusterhosts_edir/10.10.30.96
::::::::::::
lost connection
::::::::::::
lpscp_clusterhosts_edir/STATUS
::::::::::::
1
```

5. Try to `ssh` to that node (10.10.30.96), using the same local password used for running the utility.

The `ssh` (and therefore also `scp`) command fails:

```
[admin@node95 14043]$ ssh admin@10.10.30.96 ls
Password:
Password:
Password:
admin@10.10.30.96's password:
Permission denied, please try again.
admin@10.10.30.96's password:
Received disconnect from 10.10.30.96: 2: Too many authentication
failures for admin
```

6. Run the utility again.

The utility detects that the previous run did not complete successfully and prompts you to run the utility with the recovery option. It also detects the directories that contain the detailed error information as shown below:

```
[admin@node95 cross-cluster]$ /opt/mapr/server/configure-crosscluster.sh
create server -remoteip 10.10.1.103 -localuser admin -remoteuser mapr
Remote IP is 10.10.1.103
WARNING: Strict host key checking will be disabled for this script.
The previous run of this script with ID 14043 did not complete
successfully. Examine the error directories in /tmp/mapr-xcs/14043
for details of the error:
/tmp/mapr-xcs/14043/lpscp_clusterhosts_edir
/tmp/mapr-xcs/14043/lpscp_server_edir
/tmp/mapr-xcs/14043/lpssh_server_edir
If the failure is down to partially failed nodes, you should exit now,
and re-run this script in recovery mode using the -recover option to
copy the configured tickets and files to the remaining nodes, instead of
continuing and generating new tickets.
Exit now? Enter y to exit, or n to continue: y

Exiting. Re-run this script with the -recover option.
```

- Fix the error (in this example, by setting/changing the password for 10.10.30.96), and run the utility again with the `-recover` option to update the configuration for the previously failed operation for the local cluster node.

To copy the configuration again to all the nodes in the local and remote clusters, run the utility without the `-localhosts` and `-remotehosts` option. To rerun the utility to update the configuration for the failed nodes only, specify the IP addresses of the failed nodes only.

Note: Specify at least one node in the `-localhosts` and `-remotehosts` option. You can use hostnames instead of IP addresses, as long as you ensure that DNS is working properly between the local node you are running the utility on, and the nodes you specify in the `-localhosts` and `-remotehosts` options.

The output of the recovery session is shown below. Note that the utility returned a SUCCESS result:

```
[admin@node95 cross-cluster]$ cat local
10.10.30.96
[admin@node95 cross-cluster]$ cat remote
10.10.1.101
[admin@node95 cross-cluster]$ /opt/mapr/server/configure-crosscluster.sh
create server -remoteip 10.10.1.103 -localuser admin -remoteuser
mapr -recover latest -localhosts local -remotehosts remote
Remote IP is 10.10.1.103
WARNING: Strict host key checking will be disabled for this script.

log out of the clusters if needed.
```

Multiple Runs of the Utility

When running the utility with the `all` or `user` argument, you may see the following error if you run the utility multiple times:

```
keytool error: java.lang.Exception: Certificate not imported, alias
<remote.cluster.com> already exists
ERROR: Unable to import remote cluster certificate from /tmp/mapr-xcs/17056/
remote_mapcert into local SSL trust store
Please delete the certificate with the same alias remote.cluster.com from
the truststore first
```

Certificates with the same alias should be imported to the trust store only once. If you are able to run commands like `maprcli volume mount` on the remote cluster from the local cluster, you can ignore this error. If you really want to re-import the remote cluster certificate into the trust store, contact MapR support.

Also, note that when you run the utility multiple times, there are at least 2 entries with the same alias in `/opt/mapr/conf/maprserverticket` file. The utility generates a new cross-cluster ticket (useful for volume mirroring and table and streams replication) every time it is run, and does not delete any tickets in `/opt/mapr/conf/maprserverticket` file. Service tickets have a long lifetime, so this can be ignored if you are able to successfully perform volume mirroring, and table and streams replication operations. However, if you want to clean up the tickets, you can do the following:

1. Delete all the tickets with the remote cluster alias in the `/opt/mapr/conf/maprserverticket` file on the local node.
2. Delete all the tickets with the local cluster alias in the `/opt/mapr/conf/maprserverticket` file on the remote node referenced in the `-remoteip` parameter.
3. Re-run the utility with the `server` argument to set up the service tickets again.

cldbputs

Monitors the activity of the Container Location Database (CLDB). This utility prints information about the CLDB service that is running on the node from which you run the utility.

Monitoring the progress of the [container location database \(CLDB\)](#) may be useful when troubleshooting cluster issues.

The `cldbputs` utility prints information about active container reports, full container reports, registration requests, MapRHPE Ezmeral Data Fabric filesystem heartbeats, NFS server heartbeats, and containers. You can run `cldbputs` from any [container location database \(CLDB\)](#) node; however, running this command from the [container location database \(CLDB\)](#) master node provides the most relevant information.

Note: After you run `cldbputs`, it continues to print the output until you kill the process. To prevent `cldbputs` from printing indefinitely, specify the `-n` parameter that denotes the number of times `cldbputs` should print the output.

Syntax:

```
/opt/mapr/bin/cldbputs [[acr | rpc | heartbeat | containers | alarms |
table | all] [-n iterations-count]
```

Output Fields:

Note: When you run `cldbputs` without any parameters, only the `acr`, `clrpc`, `regcn`, `mfs hb`, `nfs hb`, `assigns`, `roles`, `progress`, and the `con-chain` fields are displayed.

acr

Represents active container requests (ACR).

This column includes the following information:

- `nr`: Number of ACRs completed in the previous second. The first entry displays the total number of ACRs completed since the start of the CLDB service on the node.

- `pt`: Processing time (in milliseconds) for the ACRs completed in the previous second. The first entry displays the total time (in milliseconds) spent processing the ACRs since the start of the CLDB service on the node.
- `to`: Number of ACRs that took longer than expected in the previous second. The first entry displays the total number of ACRs that took longer than expected since the start of the CLDB service on the node.
- `d`: Number of duplicate ACRs received in the previous second. The first entry displays the total number of duplicate ACRs since the start of the CLDB service on the node.
- `dp`: Number of duplicate ACRs that required additional work in the previous second. The first entry displays the total number of duplicate ACRs that required additional work since the start of the CLDB service on the node.

fcv

Represents full container report (FCR).

This column includes the following information:

- `nr`: Number of FCRs completed in the previous second. The first entry displays the total number of FCRs completed since the start of the CLDB service on the node.
- `pt`: Processing time (in milliseconds) for the FCRs completed in the previous second. The first entry displays the total time (in milliseconds) spent processing the FCRs since the start of the CLDB service on the node.
- `to`: Number of FCRs that took longer than expected in the previous second. The first entry displays the total number of FCRs that took longer than expected since the start of the CLDB service on the node.

regn

Represents registration requests.

This column includes the following information:

- `nr`: Number of registration requests completed in the previous second. The first entry displays the total number of registration requests completed since the start of the CLDB service on the node.
- `pt`: Processing time (in milliseconds) for the registration requests completed in the previous second. The first entry displays the total time (in milliseconds) spent processing the registration requests since the start of the CLDB service on the node.

- `to`: Number of registration requests that took longer than expected in the previous second. The first entry displays the total number of registration requests that took longer than expected since the start of the CLDB service on the node.
- `d`: Number of duplicate registration requests received in the previous second. The first entry displays the total number of duplicate registration requests since the start of the CLDB service on the node.
- `dp`: Number of duplicate registration requests that required additional work in the previous second. The first entry displays the total number of duplicate registration requests that required additional work since the start of the CLDB service on the node.

mfs hb

Information about HPE Ezmeral Data Fabric filesystem heartbeats.

This column includes the following information:

- `nr`: Number of HPE Ezmeral Data Fabric filesystem heartbeats completed in the previous second. The first entry displays total number of HPE Ezmeral Data Fabric filesystem heartbeats completed since the start of the CLDB service on the node.
- `pt`: Processing time (in microseconds) for the HPE Ezmeral Data Fabric filesystem heartbeats completed in the previous second. The first entry displays total time (in microseconds) spent processing HPE Ezmeral Data Fabric filesystem heartbeats since the start of the CLDB service on the node.
- `to`: Number of HPE Ezmeral Data Fabric filesystem heartbeats that took longer than expected in the previous second. The first entry displays total number of HPE Ezmeral Data Fabric filesystem heartbeats that took longer than expected since the start of the CLDB service on the node.
- `bmc`: Number of times the Become Master Command (`bmc`) has been sent to this MFS.
- `otc`: Number of times the other commands (apart from `bmc`) has been sent to this MFS.

nfs hb

Information about NFS server heartbeats.

This column includes the following information:

- `nr`: Number of NFS server heartbeats completed in the previous second. The first entry displays total number of NFS server heartbeats completed since the start of the CLDB service on the node.

- **pt**: Processing time (in microseconds) for the NFS server heartbeats completed in the previous second. The first entry displays the total time (in microseconds) spent processing HPE Ezmeral Data Fabric filesystem heartbeats since the start of the CLDB service on the node.

assigns

This column includes the following information:

- **nr**: Number of container assign requests in the previous second. The first entry displays the total number of container assign requests since the start of the CLDB service on the node.
- **nc**: Number of containers created as part of the above container assign requests in the previous second. The first entry displays the total number of containers created since the start of the CLDB service on the node.
- **nrt**: Number of container assign requests for tablets in the previous second. The first entry displays the total number of container assign requests for tablets since the start of the CLDB service on the node.
- **nct**: Number of containers created as part of the above container assign requests for tablets in the previous second. The first entry displays the total number of container created in tablets since the start of the CLDB service on the node.
- **pt**: Time taken by container assignment RPC in milliseconds
- **tpt**: Time taken by container assignment tablet RPC in milliseconds
- **cas**: Number of storage pools scanned for container assignment requests

roles

Represents the roles of the various replica containers.

This column includes the following information:

- **bm**: Number of replica containers that are in the process of becoming master
- **ms**: Number of replica containers that the CLDB thinks have valid masters
- **wr**: Number of replica containers that are waiting for CLDB to assign a role to them
- **rs**: Number of replica containers that are re-syncing
- **vr**: Number of non-master replica containers that have finished resynchronization

- `uu`: Number of replica containers that are unused. For example, the number of replica containers that are on nodes or storage pools which have been offline or unavailable for more than an hour.

Attention: It may take some time for the CLDB to be aware of role changes.

progress

This column includes the following information:

- `m%`: Percentage of containers that have valid masters
- `uc`: Number of unique containers
- `v%`: Percentage of replica containers that are valid (that is, have completed resynchronization)
- `tr`: Total number of replica containers

con-chain

This column includes the following information:

- `ms`: Number of unique containers that have a master
- `1r`: Number of unique containers that have 2 valid copies of the data
- `2r`: Number of unique containers that have 3 valid copies of the data

location

This column includes the following information:

- `1u`: Number of container location lookups
- `up`: Number of container location updates
- `d1`: Number of container location deletes
- `sc`: Number of container location scans

size

This column includes the following information:

- `1u`: Number of container size lookups
- `up`: Number of container size updates
- `d1`: Number of container size deletes
- `sc`: Number of container size scans

sptable

This column includes the following information:

- `1u`: Number of lookups on the SP-Container-Vol table
- `up`: Number of updates on the SP-Container-Vol table

- dl: Number of deletes on the SP-Container-Vol table
- sc: Number of scans on the SP-Container-Vol table

nodes

This column includes the following information:

- nn: Number of nodes in the cluster
- of: Number of offline nodes
- nsp: Number of storage pools
- of: Number of offline storage pools

Example Output:

```

/opt/mapr/bin/cldbguts all -n 3
                        2019-09-15 22:08:39,981

[Retrieving Tiering Statistics Using guts](#) on page 1024

Explains how to use the `guts` utility to retrieve tiering statistics.

[guts](#) on page 2391

`guts` is a tool to measure/analyse performance. In the default mode, it prints one line every second, and counts the number of operations or bytes-processed in one second intervals. `guts` is an internal utility, and is subject to change without notice.

cldbguts acr

The `acr` option displays active container requests (ACR).

Syntax

```

/opt/mapr/bin/cldbguts acr
    
```

Output Fields

| Field | Description |
|-------|---|
| nr | Number of ACRs completed in the previous 1 second. The first entry displays the total number of ACRs completed since the start of the CLDB service on the node. |
| pt | Processing time (in milliseconds) for the ACRs completed in the previous 1 second. The first entry displays the total time (in milliseconds) spent processing the ACRs since the start of the CLDB service on the node. |
| to | Number of ACRs that took longer than expected in the previous 1 second. The first entry displays the total number of ACRs that took longer than expected since start of the CLDB service on the node. |
| d | Number of duplicate ACRs received in the previous 1 second. The first entry displays the total number of duplicate ACRs since start of the CLDB service on the node. |
| dp | Number of duplicate ACRs that required additional work in the previous 1 second. The first entry displays the total number of duplicate ACRs that required additional work since start of the CLDB service on the node. |

Example Output

```
# /opt/mapr/bin/cldbguts acr
2017-09-01 15:15:25,034
      acr
nr      pt      to      d      dp
269644 63338      0      0      0
      1      0      0      0      0
      0      0      0      0      0
```

cldbguts containers

The `containers` option displays information on the containers.

Syntax

```
/opt/mapr/bin/cldbguts containers
```

Output Fields

assigns

This column includes the following information:

| Field | Description |
|-------|---|
| nr | Number of ContainerAssign requests in the previous 1 second. The first entry displays the total number of ContainerAssign requests since the start of the CLDB service on the node. |

| Field | Description |
|-------|---|
| nc | Number of containers created as part of the above ContainerAssign requests in the previous 1 second. The first entry displays the total number of containers created since the start of the CLDB service on the node. |
| nrt | Number of ContainerAssign requests for tablets in the previous 1 second. The first entry displays total number of ContainerAssign requests for tablets since the start of the CLDB service on the node. |
| nct | Number of containers created as part of the above ContainerAssign requests for tablets in previous 1 second. The first entry displays the total number of container created in tablets since the start of the CLDB service on the node. |

roles

Represents the roles of the various replica containers. This column includes the following information:

| Field | Description |
|-------|---|
| bm | Number of replica containers that are in the process of becoming master |
| ms | Number of replica containers that the CLDB thinks have valid masters |
| wr | Number of replica containers that are waiting for CLDB to assign a role to them |
| rs | Number of replica containers that are re-syncing |
| vr | Number of non-master replica containers that have finished resynchronization |

| Field | Description |
|-------|--|
| uu | Number of replica containers that are unused. For example, the number of replica containers that are on nodes or storage pools which have been offline or unavailable for more than an hour. |

 **Attention:** It may take some time for the CLDB to be aware of any role changes.

progress

This column includes the following information:

| Field | Description |
|-------|---|
| m% | Percentage of containers that have valid masters |
| uc | Number of unique containers |
| v% | Percentage of master + replica containers that are valid container copies |
| tr | Total number of replica containers |

con-chain

This column includes the following information:

| Field | Description |
|-------|--|
| ms | Number of unique containers that have a master |
| 1r | Number of unique containers that have 2 valid copies of the data |
| 2r | Number of unique containers that have 3 valid copies of the data |

Example Output

```
# /opt/mapr/bin/cldbguts containers
2019-10-03 03:05:15,846
                assigns                roles
progress                con-chain

0  -DZ-  0    0  0  0    0  0  0  0  0  0  0  -DZ-
0    0  0    0  0  0  0    0  0  0  0  0  0  -DZ-
0  -DZ-  0    0  0  0    0  0  0  0  0  0  0  -DZ-
```

cldbputs heartbeat

The `heartbeat` option displays information on the heartbeat sent by the filesystem and NFS.

Syntax

```
/opt/mapr/bin/cldbputs heartbeat
```

Output Fields**mfs hb**

Information about MapR filesystem heartbeats. This column includes the following information:

| Field | Description |
|-------|---|
| nr | Number of MapR filesystem heartbeats completed in the previous 1 second. The first entry displays the total number of MapR filesystem heartbeats completed since the start of the CLDB service on the node. |
| pt | Processing time (in microseconds) for the MapR filesystem heartbeats completed in the previous 1 second. The first entry displays total time (in microseconds) spent processing MapR filesystem heartbeats since the start of the CLDB service on the node. |
| to | Number of MapR filesystem heartbeats that took longer than expected in the previous 1 second. The first entry displays total number of MapR filesystem heartbeats that took longer than expected since the start of the CLDB service on the node. |
| bmc | Number of Become Master commands (such as <code>resync</code> , <code>reconnect</code> , etc.) sent by CLDB since the start of CLDB. |

nfs hb

Information about NFS server heartbeats. This column includes the following information:

| Field | Description |
|-------|--|
| nr | Number of NFS server heartbeats completed in the previous 1 second. The first entry displays total number of NFS server heartbeats completed since the start of the CLDB service on the node. |
| pt | Processing time (in microseconds) for the NFS server heartbeats completed in the previous 1 second. The first entry displays the total time (in microseconds) spent processing MapR filesystem heartbeats since the start of the CLDB service on the node. |

Example Output

```
# /opt/mapr/bin/cldbguts heartbeat
2019-10-03 03:14:56,811
      mfs hb      nfs hb
nr  pt  to  bmc  otc  nr  pt
0   0   0   0   0   0   0
0   0   0   0   0   0   0
0   0   0   0   0   0   0
```

cldbguts rpc

The `rpc` option returns a count of the RPCs that CLDB is processing from clients.

Syntax

```
/opt/mapr/bin/cldbguts rpc
```

Output Fields

clrpc

Represents a count of the client RPCs per second. This count includes:

1. ClusterInfoProc
2. ContainerLookupProc
3. ContainerRootLookupProc

This column includes the following information:

| Field | Description |
|-------|---|
| nr | Number of Client RPC's completed in the previous 1 second. The first entry displays total number of client RPCs completed since the start of the CLDB service on the node. |
| pt | Processing time (in milliseconds) for the Client RPCs completed in the previous 1 second. The first entry displays total time (in milliseconds) spent processing the client RPCs since the start of the CLDB service on the node. |
| to | Number of Client RPCs that took longer than expected in the previous 1 second. The first entry displays the total number of client RPCs that took longer than expected since the start of the CLDB service on the node. |

fcr

Represents full container report (FCR). This column includes the following information:

| Field | Description |
|-------|---|
| nr | Number of FCRs completed in the previous 1 second. The first entry displays total number of FCRs completed since the start of the CLDB service on the node. |
| pt | Processing time (in milliseconds) for the FCRs completed in the previous 1 second. The first entry displays total time (in milliseconds) spent processing the FCRs since the start of the CLDB service on the node. |

| Field | Description |
|-------|---|
| to | Number of FCRs that took longer than expected in the previous 1 second. The first entry displays the total number of FCRs that took longer than expected since the start of the CLDB service on the node. |

regn

Represents registration requests. This column includes the following information:

| Field | Description |
|-------|---|
| nr | Number of registration requests completed in the previous 1 second. The first entry displays total number of registration requests completed since the start of the CLDB service on the node. |
| pt | Processing time (in milliseconds) for the registration requests completed in the previous 1 second. The first entry displays the total time (in milliseconds) spent processing the registration requests since the start of the CLDB service on the node. |
| to | Number of registration requests that took longer than expected in the previous 1 second. The first entry displays total number of registration requests that took longer than expected since the start of the CLDB service on the node. |

Example Output

```
# /opt/mapr/bin/cldbguts rpc
2019-10-03 03:17:48,863
      fcr          clrpc          regn
nr  pt  to      nr  pt  to  nr  pt  to
0   0   0    16116  74239  0   0   0   0
0   0   0       0    0    0   0   0   0
0   0   0       0    0    0   0   0   0
```

disksetup

Describes the `disksetup` command that formats disks for use by HPE Ezmeral Data Fabric storage.

Description

Note: The `disksetup` command must be run as `root`.

The `disksetup` command formats specified disks for use by HPE Ezmeral Data Fabric storage, and adds those disks to the `disktab` file.

You do not need to set up Redundant Array of Independent Disks (RAID) on disks used by the filesystem. HPE Ezmeral Data Fabric uses `disksetup` to set up storage pools. In most cases, you should let HPE Ezmeral Data Fabric calculate storage pools using the default *stripe width* of two or three disks. If you anticipate a high volume of random-access I/O, you can use the `-w` option to specify larger storage pools of up to 8 disks each.

See [Setting Up Disks for MapR](#) for more information about when and how to use `disksetup`.

Important: On RHEL 8.1, run the following command to symlink `/usr/bin/python` to `/usr/bin/python3`. The `disksetup` command fails if `/usr/bin/python` is not found.

```
sudo alternatives --set python /usr/bin/python3
```

Syntax

```
/opt/mapr/server/disksetup
[-F]
[-G]
[-X]
[-M]
[-W <stripe_width>]
<disk list file>
```

Options

| Option | Description |
|--------|--|
| -F | Forces formatting of all specified disks. Disks that are already formatted for HPE Ezmeral Data Fabric are not reformatted by <code>disksetup</code> unless you specify this option. The <code>-F</code> option fails when a filesystem has an entry in the <code>disktab</code> file, is mounted, or is in use. Call <code>maprcli disk remove</code> to remove a disk entry from the <code>disktab</code> file. |
| -G | Generates the <code>disktab</code> file contents from input disk list, but does not format disks. Use this option if the <code>disktab</code> file is completely lost, and you need to regenerate it based on an input list of disks assigned to MapR-FS. This option reads the GUID from the provided disks, and generates the <code>disktab</code> output to stdout. You can redirect the output to a file. |
| -X | Fixes <code>disktab</code> contents from <code>/proc/partitions</code> , but does not format disks. Use this option if there is a change in the names of the disk devices referenced by <code>disktab</code> , but the disks themselves are still usable. For example, if <code>/dev/sdb</code> has been renamed to <code>/dev/sdf</code> but the device itself has the same GUID, only the <code>disktab</code> contents need to be updated to point to <code>/dev/sdf</code> . |

| Option | Description |
|--------|--|
| -M | Uses the maximum available number of disks per storage pool. |
| -W | Specifies the number of disks per storage pool. |

Examples

Setting up disks specified in the file `/tmp/disks.txt`:

```
/opt/mapr/server/disksetup -F /tmp/disks.txt
```

Reformatting all disks

To reformat all disks, remove the `disktab` file and issue the `disksetup -F` command to format the disk:

```
/opt/mapr/server/disksetup -F
```

To reformat a particular disk from the `disktab`, use the `maprcli disk remove` on page 1797 and `maprcli disk add` on page 1786 commands. For more information, see [Setting Up Disks for HPE Ezmeral Data Fabric](#) on page 912.

Specifying disks

To specify the disks to be formatted for use by the HPE Ezmeral Data Fabric cluster, create a text file `/tmp/disks.txt` listing the disks and partitions for use by HPE Ezmeral Data Fabric on the node. Each line lists either a single disk, or all applicable partitions on a single disk. When listing multiple partitions on a line, separate each partition by spaces. For example:

```
/dev/sdb
/dev/sdc1 /dev/sdc2 /dev/sdc4
/dev/sdd
```

Later, when you run `disksetup` to format the disks, specify the `disks.txt` file. For example:

```
/opt/mapr/server/disksetup -F /tmp/disks.txt
```

Important:

The `disksetup` command removes all data from the specified disks. Ensure that you specify the disks correctly, and that you have backed up any data that you wish to keep.

If you are re-using a node that was used previously in another cluster, be sure to format the disks to remove any traces of data from the old cluster.

Warning: Run `disksetup` on page 2372 only after you run the `configure.sh` on page 2331 .

Test Purposes Only: Using a Flat File for Storage

When setting up a small cluster for evaluation purposes, if a particular node does not have physical disks or partitions available to dedicate to the cluster, you can use a flat file on an existing disk partition as the node's storage. Create at least a 16GB file, and include a path to the file in the disk list file for the `disksetup` on page 2372 script.

The following example creates a 20 GB flat file (bs=1G specifies 1 gigabyte blocks, multiplied by count=20) at /root/storagefile:

```
dd if=/dev/zero of=/root/storagefile bs=1G count=20
```

Next, add the following entry to the disk list file /tmp/disks.txt to be used by disksetup:

```
/root/storagefile
```

ectool

Dumps or checks the validity of the stripelets in the backend volume that is associated with the volume configured for warm tiering.

You can use the /opt/mapr/server/tools/ectool utility to dump or check the validity of the stripelets in the backend volume that is associated with the volume configured for warm tiering.

Pre-Requirements

Before you run the utility, you must ensure that the node on which you plan to run this utility meets the following requirements:

- Set the path to the library (libjvm.so) in the LD_LIBRARY_PATH environment variable. If the path is not already set, use the export command to set the environment variable. For example:

```
export LD_LIBRARY_PATH=/opt/jdk1.8.0_141/jre/lib/amd64/server/
```

Syntax

```
/opt/mapr/server/tools/ectool <cmd> <params>
```

Commands

| Command | Description |
|----------------|---|
| dumpStripelet | Dumps the content of a stripelet to the given file. |
| listStripes | Lists all the stripes in a given container. |
| validateStripe | Validates if the given parity stripelet is valid and matches with other stripelets of the stripe. |
| validateCG | Iterates over all the stripes of the Container Group and checks the validity using the rebuild operation. |
| getFid | Returns the fid for a Virtual Cluster Descriptor (VCD) ID. |

Parameters

| Parameter | Description |
|-----------|--------------------------|
| cid | The ID of the container. |
| fid | The ID of the file. |
| file | The path to the file. |

| Parameter | Description |
|-----------|--|
| volid | The ID of the (backend) volume, referred to as <code>ecstorevolume</code> in the CLI output, associated with the tier. The ID can be retrieved using the <code>volume info</code> on page 2227 command. For example: <pre> /opt/mapr/bin/maprcli volume info -name a4 -json grep ecstorevolume "ecstorevolume":"mapr.internal.ec.a4.873 79483", /opt/mapr/bin/maprcli volume info -name mapr.internal.ec.a4.87379483 -json grep volumeid "volumeid":105118862,</pre> |
| vcdid | The ID of the Virtual Cluster Descriptor (VCD). |

Usage

```

/opt/mapr/server/tools/ectool dumpStripelet volid fid file
/opt/mapr/server/tools/ectool listStripes volid cid
/opt/mapr/server/tools/ectool validateStripe volid fid
/opt/mapr/server/tools/ectool validateCG volid cid
/opt/mapr/server/tools/ectool getFid cid vcdid
```

Examples

Dump the stripelet content to the file `/tmp/t` for the file specified by ID 2271.160.131606 in the volume specified by ID 116581327:

```

# /opt/mapr/server/tools/ectool dump 116581327 2271.160.131606 /tmp/t
Stripelet Read done!
```

List all the stripes in the container specified by ID 2271 for the volume specified by ID 116581327:

```

# /opt/mapr/server/tools/ectool list 116581327 2271
Inum:160 Uniq:131606 Size:4194304
Inum:161 Uniq:131608 Size:4194304
Inum:162 Uniq:131610 Size:4194304
```

Validates if the given stripelet matches with other stripelets of the stripe for the file specified by ID 2271.160.131606 in the volume specified by ID 116581327

```

# /opt/mapr/server/tools/ectool validateStripe 116581327 2271.160.131606
Valid Stripe
```

For the container specified by ID 2271, validate if all stripelets match with other stripelets of the corresponding stripe:

```

# /opt/mapr/server/tools/ectool validateCG 116581327 2271
Inum:160 Valid Stripe
Inum:161 Valid Stripe
Inum:162 Valid Stripe
```

expandaudit

Describes how to use the `expandaudit` utility to expand IDs captured in the audit logs to their corresponding names.

As you perform operations on the directories, files, and tables that you are auditing, the audit logs capture records of those operations. Those records identify the affected directories, files, and tables by means of file IDs, the volumes on which the operations took place by means of volume identifiers, and the users who performed the operations by means of user IDs. These IDs are used instead of names in the audit records because fetching the actual names of these objects and users in real-time is costly in terms of performance.

You can use the `expandaudit` utility to create copies of your logs files in which the IDs are resolved into names and inserted into the audit records.

This utility acts on audit logs that exist in the current data-fabric cluster at the time that the utility is run.

Restrictions

This utility operates on audit logs for filesystem operations and HPE Ezmeral Data Fabric Database operations, which are logged in a local data-fabric volume on each node where the operations are performed. These operations are logged in `FSAudit` and `DBAudit` log files.

File identifiers are converted to names only when either of the following conditions is met:

- The file exists at the time that `expandaudit` is run.
- The file has been deleted but the deletion of the file was logged and the log files being processed by `expandaudit` include the record of the file deletion.

If a volume is deleted, `expandaudit` does not convert identifiers for files that were in the volume unless the creation of the volume and files were logged.

If the creation of a file is audited and the file is later renamed, the file ID is converted to the current name.

Permissions

Although the permissions on the tool are 755, the tool generates output only when run by `root` or the user `mapr`.

Syntax

```
/opt/mapr/bin/expandaudit
[-volumename volume name]
[-volumeid volume ids. Either volume name or id must be specified]
-o output directory
[-d Specify for deleted volumes only]
[-cluster cluster name]
[-t number of threads used for parallel expansion across cluster nodes.
default 10]
```

Parameters

| Parameter | Description |
|----------------------|---|
| <code>cluster</code> | The name of the cluster on which to run the command. |
| <code>d</code> | Required for deleted volumes as it indicates that the volume is deleted. If you specify this parameter, you must specify a volume ID to be used during expansion. The deleted volume is tracked by the specified volume ID. You can optionally specify a volume name. This specified volume name is used for the expanded output. |

| Parameter | Description |
|------------|---|
| o | <p>The directory in the data-fabric filesystem in which to create the copies of the audit logs. The directory must already exist.</p> <p>The directory structure is:</p> <pre><output directory>/<volume id>/<node>/ <day>/<expanded audit log files></pre> <p>The file names are the same as the names of the input files, though you might see the following extensions:</p> <ul style="list-style-type: none"> <code>.part</code>: If present, this extension is on the log file with the most recent date. The input log file that corresponds to this output file might still have been receiving new audit records at the time that the <code>expandaudit</code> utility was run. If the utility is run again with the same output directory, the utility will update the <code>.part</code> file by including the most recent records and converting the identifiers in those records. <code>.pending</code>: This extension indicates files that contain one or more identifiers that the utility could not convert. <p> Note: Sometimes, you might see a combination of these two types of files, <code>part.pending</code>, which indicates that there is a problem converting identifiers in the most recent audit file.</p> |
| t | The number of threads to use for parallel expansion across cluster nodes. The default value is 10. |
| volumename | The name of the volume being audited. You must specify either the <code>volumename</code> or the <code>volumeid</code> parameter. |
| volumeid | The ID of the volume being audited. You must specify either the <code>volumename</code> or the <code>volumeid</code> parameter. |

Sample Expansion of a Record for Filesystem Operations

Original record

```
{ "timestamp" :
  { "$date" : "2015-06-06T13:02:23.746Z" }, "operation" : "GETATTR", "uid" : "1", "ipAddress" :
  "10.10.104.53", "srcFid" : "2049.652.263696", "volumeId" : 68048396, "status" : 0 }
```

Record processed by the expandaudit utility

```
{ "timestamp" :
  { "$date" : "2015-06-06T13:02:23.746Z" }, "operation" : "GETATTR", "user" :
  "userA", "uid" : "1", "ipAddress" : "10.10.104.53", "srcPath" : "/customers/
  US_Western_Region.json",
  "srcFid" : "2049.3296.268968", "volumeName" : "data_analysis", "volumeId" : 68048396
  , "status" : 0 }
```

Attention: Here, `uid` expands to `user`, `srcFid` expands to `srcPath`, and `volumeID` expands to `volumeName`. The original fields are also preserved in the output.

Sample Expansion of a Record for HPE Ezmeral Data Fabric Database Table Operations

Original record

```
{ "timestamp" :
  { "$date" : "2015-06-06T13:08:54.474Z" }, "operation" : "DB_PUT", "uid" : "1", "ipAddress" :
  "10.10.104.51", "volumeId" : 68048396, "columnFamily" : "fam63", "columnQualifier" :
  "col_96", "tableFid" :
  "2049.56.262518", "status" : 0 }
```

Record processed by the expandaudit utility

```
{ "timestamp" : { "$date=2015-06-06T13:08:54.474Z" }, "operation" : "DB_PUT", "user" :
  "userA", "uid" :
  "1", "ipAddress" : "10.10.104.51", "volumeName" : "mapr.cluster.root", "volumeId" : "
  68048396",
  "columnFamily" : "fam63", "columnQualifier" : "col_96", "tablePath" : "/
  mytable", "tableFid" : "2049.56.262518",
  "status" : "0" }
```

 **Attention:** Here, uid expands to user, volumeID expands to volumeName, and tableFid expands to tablePath. The original fields are also preserved in the output.

fcdebug

Dynamically sets the log level to debug a library.

You can modify the `core-site.xml` file to set the log level of all modules using the `fs.mapr.trace` property. However, you must restart FUSE for the change to take effect. As an alternative, you can use the `fcdebug` utility to debug a specific library (at runtime) without restarting FUSE.

 **Note:** You may have to run this command once per library (to debug).

Syntax

```
/opt/mapr/server/tools/fcdebug [-i] [-p <process ID>] [-s <shm ID>] [-m
<module>] [-l <level>] [-o <slowOpsTraceThreshold>]
```

Parameters

| Parameter | Description |
|-----------|---|
| -i | Lists the current debug level of all modules. |
| -l | Specifies the log level. Value can be one of the following: FATAL, ERROR, WARN, INFO, DEBUG.  Note: If you do not specify the log level, the default level is applied for the module. |
| -m | Specifies the module for which the log level is to be set. You can retrieve the list of modules with the <code>fcdebug -i -p <process ID></code> or the <code>fcdebug -i -s <shm ID></code> command.  Note: If you do not specify the module, the log level is set on all modules. |

| Parameter | Description |
|-----------|--|
| -o | For RPCs, we use the <code>-o</code> parameter to rate limit error messages. Default value: 0 milliseconds (no error messages are printed) Value of <code>x</code> milliseconds indicates that error messages are printed every <code>x</code> milliseconds. There is no limit to the maximum value. |
| -p | Specifies the process ID of either the file client, or the FUSE-based POSIX client. |
| -s | Specifies the shared memory ID (shmid) of either the file client, or the FUSE-based POSIX client. |

Attention: Specify either the `process ID` (`-p`) or the `shmid` (`-s`) option. If you specify both the options, only the `shmid` (`-s`) option is used.

Examples

The following command retrieves the list of modules:

Note: Use either the `-p` or the `-s` option.

```
/opt/mapr/server/tools/fcdebug -i -p 196614 (OR)
/opt/mapr/server/tools/fcdebug -i -s 335020032
```

Note: You can run this command after dynamically setting the log level to verify the setting.

The following command dynamically sets the log level to DEBUG on the given module:

Note: Use either the `-p` or the `-s` option.

```
/opt/mapr/server/tools/fcdebug -p 196614 -m FuseOps -l DEBUG (OR)
/opt/mapr/server/tools/fcdebug -s 335020032 -m FuseOps -l DEBUG
```

Note: It may take up to 30 seconds for the changes to take effect.

The following command sets the log level to DEBUG on all the modules:

Note: Use either the `-p` or the `-s` option.

```
/opt/mapr/server/tools/fcdebug -p 196614 -l DEBUG (OR)
/opt/mapr/server/tools/fcdebug -s 335020032 -l DEBUG
```

The following command resets the log level to the default value on all the modules:

Note: Use either the `-p` or the `-s` option.

```
/opt/mapr/server/tools/fcdebug -p 196614 (OR)
/opt/mapr/server/tools/fcdebug -s 335020032
```

fsck

Detects and fixes inconsistencies in the filesystem.

Use the filesystem check (`fsck`) utility to detect and fix inconsistencies in the filesystem.

Every storage pool has its own log to journal updates to the storage pool. The system performs all operations to a storage pool transactionally by journaling all operations to the log, before applying them

to storage pool metadata. If filesystem is not shutdown cleanly, some metadata blocks may not persist. However, on the next load of the storage pool, log recovery takes care of these metadata blocks by replaying the records in the log. The `fsck` utility also replays the log before it checks the metadata consistency in a storage pool. The `fsck` utility walks the storage pool in question to verify all MapR filesystem metadata (and data correctness if specified on the command line), and reports all potentially lost or corrupt containers, directories, tables, files, filelets, and blocks in the storage pool. The `fsck` utility:

- Checks whether all files and directories are reachable and all directory entries are valid.
- Checks whether BTrees are consistent for various inode types (such as files and directories).
- Walks the container file and visits every inode in the container to check that no block is owned by two inodes. Also, verifies the consistency of bitmaps of inodes and blocks.
- Checks consistency of snapshots.
- Visits every allocated block in the storage pool and recovers any blocks that are part of corrupted inodes.
- Checks consistency of HPE Ezmeral Data Fabric Database metadata.
- Checks consistency of tabletmap, tablets, buckets, and spill files.

The `fsck` utility can be used on an offline storage pool after a node failure, after a disk failure, or after a MapR filesystem process crash, or simply to verify the consistency of data for suspected software bugs.

Typical process flow:

- Take the affected storage pools offline with the [mrconfig sp offline](#) on page 2458 command.
- Execute the `fsck` command on the storage pools (or disks) as specified in the following discussion.
- Bring the storage pools back online with the [mrconfig sp online](#) on page 2459 command.
- Execute the [gfsck](#) on page 2383 command on the cluster, volumes, or snapshots that were affected.

You can run the `fsck` command in two modes:

- Verification mode - `fsck` only reports errors; it does not attempt to fix or modify any data on disk. You can run `fsck` in verification mode on an offline storage pool at any time, and it will report errors if there is inconsistency. If it does not report any errors, you can bring up the storage pool online without any risk of data loss. To run the `fsck` utility in verification mode, use any parameter *except* the `-r` parameter.
- Repair mode - `fsck` attempts to repair a bad storage pool. When you run the `fsck` utility in repair mode on a storage pool, some volumes might need a global fsck ([gfsck](#) on page 2383) after bringing the storage pool online. There is potential for loss of data in this case. To run the `fsck` utility in repair mode, use the `-r` parameter.

Using the `/opt/mapr/server/fsck` utility with the `-r` option produces different results depending on the scenario. The `fsck` utility does not interpret the scenario nor does it have a safe mode.

- If a disk is offline because of an imbalanced b-tree, using `fsck -r` may result in data loss from bad containers, and data loss if additional replicas are unavailable.
- If a disk is offline because of an I/O error, using `fsck -r` produces indeterminate results. A disk that is returning I/O errors is questionable in terms of data content and reliability. For example, an operation that completed on the disk but was never returned, may have partial data remaining on the disk. Using `fsck -r` retains any partial data.

- If a disk is offline because of slow I/O, using `fsck -r` does not produce data loss.

The most conservative usage of `fsck` is to first run `fsck` without the `-r` option (verification mode) and check the output. If the output returns errors, then run `fsck` with the `-r` option.

Syntax

```
/opt/mapr/server/fsck [{<device-paths>}] or [-n <sp name>]
-l <log filename> ; default /opt/mapr/logs/fsck.log.<ts>.<pid>
-p <mfs port> ; default 5660
-N to disable status bar
-P to purge deleted containers in repair
-h for help
-j to skip log replay
-m <memory in MB> to set cache size for blocks
-d to check data blocks crc
-b to check db consistency
-C to specify the container-id when using -d
-I to specify inode-number when using -d and -C
-r to repair ; USE WITH CAUTION AS IT CAN LEAD TO LOSS OF DATA
```

Parameters

| Parameter | Description |
|----------------|---|
| -b | Checks database consistency. |
| -C | Optional with the <code>-d</code> option. Specifies the read-write container ID on which CRC (cyclic redundancy check) must be performed. If this option is not specified with the <code>-d</code> option, the CRC is performed on all the containers on the storage pool. |
| -d | Performs a CRC on data blocks. By default, <code>fsck</code> will not validate the CRC of user data pages. Enabling this check causes the check to take a while to complete. |
| <device-paths> | <p>Paths to the disks that make up the storage pool.</p> <p> Note: Before running <code>fsck</code>, use the mrconfig disk remove on page 2433 command to remove all the disks from filesystem. For example:</p> <pre>/opt/mapr/server/mrconfig disk remove /dev/sdb /opt/mapr/server/fsck /dev/sdb</pre> |
| -h | Help |
| -l | Optional with the <code>-C</code> option. Specifies the inode number on which CRC (cyclic redundancy check) must be performed on the container specified by the <code>-C</code> option. If this option is not specified with the <code>-C</code> option, the CRC is performed on all the inodes. |

| Parameter | Description |
|-----------|---|
| -j | Skips log replay. Should be set only when log recovery fails. Log recovery can fail if the damaged blocks of a disk belong to the log, or if log recovery finds some CRC errors in the metadata blocks. *Using this parameter will typically lead to larger data loss.* |
| -l | The log filename. Default: /opt/mapr/logs/fsck.log.<ts>.<pid> |
| -m | Sets the cache size for blocks (MB). |
| -n | Storage pool name. This option works only if all the disks are in <code>disktab</code> . Otherwise, you must individually specify all the disks that make up the storage pool, using the <code><device-paths></code> parameter. |
| -N | Disables the status bar. |
| -p | The filesystem port. Default: 5660 |
| -P | Purges deleted containers in repair. |
| -r | Runs in repair mode. USE WITH CAUTION AS THIS CAN LEAD TO LOSS OF DATA. |

gfsck

Describes how you can use the `gfsck` command, under the supervision of HPE Ezmeral Data Fabric Support or Engineering, to perform consistency checks and appropriate repairs on a volume, or a volume snapshot.

You can use the `gfsck` command when the local `fsck` either repairs or loses some containers at the highest epoch.

For an overview of using the GFSCK command, see [Using Global File System Checking](#) on page 1072.

Permissions Required

Although you need to be the `root` user to run this command, checking tiering-enabled volumes requires you to be the `mapr` user.

Syntax

```
/opt/mapr/bin/gfsck
[-h] [--help]
[-c] [--clear]
[-d] [--debug]
[-b] [--dbcheck]
[-r] [--repair]
[-y] [--assume-yes]
[-Gquick] [--check-tiermetadata-only]
[-Gfull] [--check-tiermetadata-full]
[-Dquick] [--check-tierdata-presence]
[-Dfull] [--check-tierdata-crc]
[-J] [--skip-tier-log-replay]
[-D] [--crc]

[cluster=cluster-name (default=default)]
[rwvolume=volume-name (default=null)]
[snapshot=snapshot-name (default=null)]
```

```
[snapshotid=snapshot-id (default=0)]
[fid=fid (default=null)]
[cid=cid (default=0)]
[startCid=cid (default=0)]
[rIdx=<repl index>] (replication index, only enabled with [-D] [--crc]
[fidThreads=<check crc thread count for fid>] (default:16, max:128)
[cidThread=<check crc thread count for cid>] (default:16, max:128)
[scanthreads=inode scanner threads count (default:10, max:1000)]
```

Parameters

| | |
|------------------------|---|
| -h --help | <p><i>Description:</i> Prints usage text</p> <p><i>User who must use this option:</i> Either <code>root</code> or <code>mapr</code>.</p> |
| -c --clear | <p><i>Description:</i> Clears previous warnings before performing the global filesystem check.</p> <p><i>User who must use this option:</i> Either <code>root</code> or <code>mapr</code>.</p> |
| -d --debug | <p><i>Description:</i> Provides information for debugging.</p> <p><i>User who must use this option:</i> Either <code>root</code> or <code>mapr</code>.</p> |
| -b --dbcheck | <p><i>Description:</i> Checks that every key in a tablet is within that tablet's startKey and endKey range. This option is I/O intensive, so use this option only if you suspect database inconsistency.</p> <p><i>User who must use this option:</i> <code>root</code></p> <p>When used with S3 volumes, this option validates that <i>versionIds</i> of objects in a given partition are less than <i>maxVersionId</i> stored in Partition Map Entry.</p> <p><i>User who must use this option:</i> <code>mapr</code>.</p> |
| -r --repair | <p><i>Description:</i> Indicates and repairs the inconsistencies detected by <code>-GQuick</code>, <code>-GFull</code>, <code>-DQuick</code>, and <code>-DFull</code>. Repair is not supported for snapshots and mirrors.</p> <p><i>User who must use this option:</i> <code>root</code></p> |
| -y --assume-yes | <p><i>Description:</i> If specified, assumes that containers without valid copies (as reported by CLDB) are deleted automatically. If not specified, <code>gfsck</code> pauses for user input: yes to delete, no to exit <code>gfsck</code>, or ctrl-C to quit.</p> <p><i>User who must use this option:</i> Either <code>root</code> or <code>mapr</code>.</p> |
| -D --crc | <p><i>Description:</i> Provides validation of the CRC of the data present in the volume. The data can either be local or offloaded.</p> <p>You can use this option at the volume, container, snapshot, and the filelet levels. <code>gfsck</code> reports corruption found at each level.</p> <p><i>User who must use this option:</i> <code>root</code></p> |
| cluster | <p><i>Description:</i> Specifies the name of the cluster (default: default cluster)</p> <p><i>User who must use this option:</i> Either <code>root</code> or <code>mapr</code>.</p> |
| rwvolume | <p><i>Description:</i> Specifies the name of the volume (default: default cluster)</p> <p><i>User who must use this option:</i> Either <code>root</code> or <code>mapr</code>.</p> |

| | |
|--|---|
| fid | <p><i>Description:</i> Checks data CRC for the master copy of the specified fid. To check any other copy, use the <code>rIdx</code> option. You must use fid only with the <code>--crc</code> option.</p> <p><i>User who must use this option:</i> <code>mapr</code></p> |
| cid | <p><i>Description:</i> Checks data CRC for the master copy of the specified container ID. To check any other copy, use the <code>rIdx</code> option. The default value of 0 denotes that all containers are checked. You must use cid only with the <code>--crc</code> option.</p> <p><i>User who must use this option:</i> <code>mapr</code></p> |
| startCid | <p><i>Description:</i> startCid is only applicable with the option <code>--crc rwvolume=<volumename></code>.</p> <p>Use this option to start verification from the specific container instead of starting from the first container of that volume. If not provided, the <code>--crc</code> option checks the data CRC of all the containers.</p> <p>For example, assume that one particular volume has containers such as 205...2055...2900... .. 3000 5000.. .. . 9999.</p> <p>You can use the startCid option to start verification from container 3000, and all containers prior to 3000 will be skipped.</p> <p><i>User who must use this option:</i> <code>mapr</code></p> |
| rIdx | <p><i>Description:</i> Specifies the index (either <code>fid</code> or <code>cid</code>) of the copy of the data to check for errors.</p> <p>Use only with <code>-D</code> or <code>--crc</code> and either <code>fid</code> or <code>cid</code>.</p> <p>For example, <code>-D fid:2510.32.131204 rIdx=0</code> only checks the data for copy 1 of the specified fid.</p> <p><i>User who must use this option:</i> <code>mapr</code></p> |
| fidThreads | <p><i>Description:</i> Specifies the number of threads for scanning fids (default:16, max:128). You must use fidThreads only with the <code>--crc</code> option.</p> <p><i>User who must use this option:</i> <code>mapr</code></p> |
| cidThreads | <p><i>Description:</i> Specifies the number of threads for scanning container IDs (default:16, max:128). You must use cidThreads only with the <code>--crc</code> option.</p> <p><i>User who must use this option:</i> <code>mapr</code></p> |
| scanthreads | <p><i>Description:</i> Specifies the number of threads for scanning inodes (default:10, max:1000)</p> <p><i>User who must use this option:</i> Either <code>root</code> or <code>mapr</code>.</p> |
| snapshot | <p><i>Description:</i> Specifies the name of the snapshot (default: null)</p> <p><i>User who must use this option:</i> Either <code>root</code> or <code>mapr</code>.</p> |
| snapshotid | <p><i>Description:</i> Specifies the snapshot ID (default: 0)</p> <p><i>User who must use this option:</i> Either <code>root</code> or <code>mapr</code>.</p> |
| Tier Options | |
| -Gquick --check-tiermetadata-only | <p><i>Description:</i> Checks if the entries in the meta data tables maintained internally for objects and tiers (the mapping between the Virtual Cluster Descriptor (VCD)</p> |

map and object map) , are consistent, and reports an error if not.

User who must use this option: `mapr`

`-Gfull | --check-tiermetadata-full`

Description: Checks if the entries in the meta data tables maintained internally for objects and containers (the mapping between the VCD map and object map, along with the mapping between the VCD map and the MFS meta data), are consistent and reports an error if not.

User who must use this option: `mapr`

`-Dquick | --check-tierdata-presence`

Description: Specified with either `-Gquick` or `-Gfull`. Checks and reports if the object in the meta data tables exists in the tier or not.

User who must use this option: `mapr`

`-Dfull | --check-tierdata-crc`

Description: Specified with either `-Gquick` or `-Gfull`. Validates the data CRC for the object in the meta data tables.

User who must use this option: `mapr`

`-J | --skip-tier-log-replay`

Description: Skips replaying transactions from internal dot files if a tier operation ends abruptly. Data Fabric recommends that you use this option when running the GFSC utility on tiered volumes.

User who must use this option: Either `root` or `mapr`.

Examples

1. Debug Mode

In debug mode, run the `gfsck` command on the read/write volume named `mapr.cluster.root`:

```
/opt/mapr/bin/gfsck rwvolume=mapr.cluster.root -d
```

Sample output is as follows:

```
Starting GlobalFsck:
  clear-mode           = false
  debug-mode           = true
  dbcheck-mode         = false
  repair-mode          = false
  assume-yes-mode      = false
  cluster              = my.cluster.com
  rw-volume-name       = mapr.cluster.root
  snapshot-name        = null
  snapshot-id          = 0
  user-id              = 0
  group-id             = 0

  get volume properties ...
    rwVolumeName = mapr.cluster.root (volumeId = 205374230,
rootContainerId = 2049, isMirror = false)

  put volume mapr.cluster.root in global-fsck mode ...

  get snapshot list for volume mapr.cluster.root ...

  starting phase one (get containers) for volume
mapr.cluster.root(205374230) ...
    container 2049 (latestEpoch=3, fixedByFsck=false)
    got volume containers map
  done phase one

  starting phase two (get inodes) for volume
mapr.cluster.root(205374230) ...
    get container inode list for cid 2049

remove volume mappr.cluster.root from global-fsck mode (ret = 0) ...

```

```
GlobalFsck completed successfully (7142 ms); Result: verify succeeded
```

To verify if the object is present on the tier, run the `gfscck` command on the tiering-enabled read/write volume named `for_test5`:

Note: This example is valid for `-Dfull` as well. Replace `-Dquick` with `-Dfull`.

```
/opt/mapr/bin/gfscck rwvolume=for_test5 -Gfull -Dquick
```

Sample output is as follows:

```
Starting GlobalFsck:
  clear-mode           = false
  debug-mode           = false

2. Verifying CRC of Filelet

```

# /opt/mapr/bin/gfsck -D fid=2085.32.131412 --debug
verifying data crc
  mode      =      fid
  fid       =      2085.32.131412
  debug-mode =      true
  repair-mode =      false
  cluster   =      default
  replication index =      -1
  user-id   =      0
  group-id  =      0

crc validate result for fid : 2085.32.131412
  total local cluster/vcfs verified : 51
  total local cluster/vcfs corrupted : 0
  total local cluster/vcfs skipped: 0
  total purged cluster/vcfs verified : 0
  total purged cluster/vcfs corrupted : 0
  total purged cluster/vcfs skipped: 0

```

3. Verifying CRC at a Container Level

For CRC checks at the container level, the output is not displayed on the terminal. Instead it is written to the `/opt/mapr/log/gfsck.log` file. Sample output is as follows:

```
/opt/mapr/bin/gfsck -D rwvolume=rocky
verifying data crc
mode = volume
rwVolumeName = rocky
fid thread count = 16
cid thread count = 16
debug-mode = false
repair-mode = false
cluster = default
replication index = -1
user-id = 0
group-id = 0
total containers : 6
total container skipped : 0
data crc verification completed with no errors
```

[Using Global File System Checking](#) on page 1072

Describes how to use the `gfsck` command to check and repair filesystem errors.

guts

`guts` is a tool to measure/analyse performance. In the default mode, it prints one line every second, and counts the number of operations or bytes-processed in one second intervals. `guts` is an internal utility, and is subject to change without notice.

`guts` provides information on entities such as:

| | |
|-------------|---|
| CPU | Indicates whether the CPU is idle or busy |
| RPCs | Number of RPCs, RPCs-in, RPCs-out, bytes-in, and bytes-out |
| MFS | Number of local-writes, local-reads, and other operations (such as lookup, create and remove) |
| Log | Number of log writes, log flushes, and log force-flushes |
| IO | Number of disk-operations/second (read/write), and the disk-io/second in MB (read/write) |

Syntax

```
/opt/mapr/bin/guts
guts
-help
instance:<id> time:unix time:all time:none (add timestamp to output)
key:5660 (is server port)
shmid:<shared memory id> (client's shared memory id, check ipcs)
threadcpu:core threadcpu:all
cpu:none cpu:all
net:sum net:msum net:ksum net:all net:none
disk:none disk:ops disk:mb disk:all
diskMajor:major# of disk
ssd:none ssd:all
cache:none cache:small cache:med cache:all
cleaner:small cleaner:all cleaner:none
```

```

```

Interpreting Output

The prefix *c* identifies client metrics. The suffix *P* refers to the number of pending RPCs. The suffix *C* denotes the number of completed RPCs.

The pending metrics are a snapshot of pending RPCs when the output is printed. The completed metrics are the increase that happened in the last print interval.

Parameters and Output

CPU

`cpu:all` — Percentage of idle time of each CPU on the system in the last second.

IO

The metrics are `ior` and `iow`, which are displayed by default.

- `ior` — The first number reports the number of I/O reads for a machine in the last second. The second number reports the amount of I/O reads in MB in the last second.
- `iow` — The first number reports the number of I/O writes for a machine in the last second. The second number reports the amount of I/O writes in MB in the last second.

Disk

- `disk:ops` — Number of I/O requests (read+write) for each disk in the last second.
- `disk:mb` — Amount of I/O in MB (read+write) for each disk in the last second.
- `disk:all` — The preceding two numbers for each disk in the last second. The first number is from `disk:ops`, the second number is from `disk:mb`.

Filesystem

`fs:rw` — Reports MFS file system activities. Reported metrics are:

- `read` — The first number reports the number of remote reads in the last second. The second number reports the amount of data read in MB in the last second.
- `write` — The first number reports the number of remote writes in the last second. The second number reports the amount of data written in MB in the last second.
- `lread / lwrite` — are similar to the `read` and `write` metrics, but are applicable for local reads/writes.

In addition, `guts` displays the following *filesystem* metrics:

- `crP` — Total pending *read* RPCs in the last second.
- `crC` — Total completed *read* RPCs in the last second.
- `cwP` — Total pending *write* RPCs in the last second.
- `cwC` — Total completed *write* RPCs in the last second.
- `ccP` — Total pending *create* RPCs in the last second.
- `ccC` — Total completed *create* RPCs in the last second.
- `cuP` — Total pending *unlink* RPCs in the last second.
- `cuC` — Total completed *unlink* RPCs in the last second.

RPC

Reports the following metrics:

- `rpc:none` — Does not display any RPC related metrics.
- `rpc:op` — *rpc* metric
- `rpc:all` — *rpc*, *im*, and *om* metrics.

- `rpc` — Number of RPC calls received in the last second.
- `im` — Amount of RPC calls received in MB in the last second.
- `om` — Amount of RPC calls sent in MB in the last second.

Cache

`cache:small` — Metrics on *inode* and *dentry* cache, which are displayed by default. The metrics reported are:

- `icache` (inode cache) — The first number reports the number of inode cache lookups in the last second. The second number reports the number of inode cache lookup misses in the last second.
- `dcache` (dentry cache) — The first and second numbers report dcache lookups and lookup misses in the last second, respectively.

Network

- `net:sum` — Total network traffic in bytes received and transmitted from all network interfaces for a machine.
- `net:msum` — Total network traffic in megabytes.
- `net:ksum` — Total network traffic in kilobytes.
- `net:all` — Not yet implemented.
- `net:none` — Does not display any network related metrics.

Metrics returned are:

- `nI` — Total amount of network traffic *received* in bytes in the last second. This is a summation of network traffic from all network interfaces for a machine.
- `nO` — Total amount of network traffic *sent* in bytes in the last second. This is a summation of network traffic from all network interfaces in a machine.

Database

`db:get` — Metrics related to `gets`. The output columns are as follows:

- `rOP` — Number of RPCs completed for type `OP` in the last second.
- `rOPR` — Number of rows processed from all RPCs of type `OP` in the last second.
- `tOPR` — Number of rows processed from all RPCs in the last second.
- `cOP` — Number of in-progress RPCs for the `OP` (not differential).

Cleaner Metrics

`gets` displays the following *cleaner* metrics:

- `di` — Number of inodes dirtied by update operations in the last second.
- `ic` — Number of inodes cleaned by the drainer in the last second.
- `dd` — Number of data blocks dirtied by update operations in the last second.
- `dc` — Number of data blocks cleaned by the drainer in the last second.

Operational Metrics

`guts` displays the following *operational* metrics:

- `rput` — Number of *put* RPCs completed in the last second.
- `rputR` — Sum of *put* rows completed in the last second, from all *put* rpcs.
- `tputR` — Sum of *put* rows completed in the last second, from **all** rpcs (*put*, *increment*, *checkAndPut*, *Append ..*)
- `cput` — Number of *put* RPCs in progress currently. This is not a differential, but displays the number of outstanding *put* RPCs at that particular instant.
- `rget` — Number of *get* RPCs completed in the last second.
- `rgetR` — Sum of *get* rows completed in the last second, from all *get* RPCs.
- `tgetR` — Sum of *get* rows completed in the last second, from **all** rpcs (*get*, *increment*, *checkAndPut*, *Append ..*)
- `cget` — Number of *get* RPCs in progress currently. This is not a differential, but displays the number of outstanding *get* RPCs at that particular instant.
- `rsc` — Number of scan RPCs completed in the last second.
- `rscR` — Sum of scan rows returned in the last second, from **all** scan RPCs.
- `csc` — Number of scan RPCs currently in progress. This is not a differential, but shows the number of outstanding scan RPCs at that particular instant.
- `rinc` — Number of increment RPCs completed in the last second.
- `cinc` — Number of increment RPCs currently in progress. This is not a differential, but shows the number of outstanding increment RPCs at that particular instant.
- `rchk` — Number of *checkAndPut*/*checkAndDelete* RPCs completed in the last second.

- `rapp` — Number of append RPCs completed in the last second.
- `rtlk` — Number of tablet lookup RPCs completed in the last second.
- `ctlk` — Number of tablet lookup RPCs currently in progress. This is not a differential, but shows the number of outstanding lookup RPCs at that particular instant.
- `rbulkb` — Number of bulk-import-bucket RPCs completed in the last second.
- `rbulks` — Number of bulk-import-segment RPCs completed in the last second.

Put Metrics

`guts` displays the following *put* metrics:

- `rput` — Number of *put* RPCs completed in the last second.
- `rputR` — Sum of *put* rows completed in the last second, from all *put* rpcs.
- `tputR` — Sum of *put* rows completed in the last second, from **all** rpcs (*put*, *increment*, *checkAndPut*, *Append ..*)
- `cput` — Number of *put* RPCs in progress currently. This value is not a differential, but displays the number of outstanding *put* RPCs at that particular instant.
- `rsf` — Reserved free memory in MemIndex in MB. If this value falls very low, *put* RPCs can get throttled. This value is not a differential.
- `bucketWR`:
 - Column1 : Number of bucket writes (calls to MFS) in the last second.
 - Column2 : Amount of bucket writes in MB in the last second.
- `f1` — Number of bucket flushes fired in the last second.
- `ff1` — Number of force-flushes of buckets in the last second. If the bucket was flushed before it reached its optimal size, then the flush is counted as a force-flush.
- `sf1` — Number of segments touched by the bucket-flushes in the last second.
- `mcom` — Number of segments mini-packed in the last second.
- `fcom` — Number of segments packed fully in the last second.

- `ccom` — Number of segment packs running currently. This value is not a differential.
- `scr` — Number of segment creates in the last second.
- `spxr` — Number of spill creates in the last second.

Get Metrics

`guts` displays the following *get* metrics:

- `rget` — Number of *get* RPCs completed in the last second.
- `rgetR` — Sum of *get* rows completed in the last second, from all *get* RPCs.
- `tgetR` — Sum of *get* rows completed in the last second, from **all** rpcs (*get*, *increment*, *checkAndPut*, *Append* ..)
- `cget` — Number of *get* RPCs currently in progress. This is not a differential, but displays the number of outstanding *get* RPCs at that particular instant.
- `vcM` — Size of the value-cache in MB. This value is not differential.
- `cL` — Number of value-cache lookups in the last second.
- `vcH` — Number of value-cache hits in the last second.
- `bget` — Number of bucket *gets* in the last second. Will be 0 if there are no active buckets.
- `sg` — Number of segment *gets* in the last second. Will normally be equal to `tgetR` minus the number of value-cache hits.
- `spg` — Number of spill *gets* in the last second. This value is calculated as `sigma(segments * spill-per-segment) - bloomFilterSkips`
- `bskp` — Number of spill *gets* that were avoided/saved by the bloom filter in the last second.

Scan Metrics

`guts` displays the following *scan* metrics:

- `rsc` — Number of scan RPCs completed in the last second.
- `rscR` — Sum of scan rows returned in the last second, from **all** scan RPCs.
- `csc` — Number of scan RPCs currently in progress. This is not a differential, but shows the number of outstanding scan RPCs at that particular instant.
- `bsc` — Number of buckets scanned in the last second.

- `ssc` — Number of segments scanned in the last second.
- `spsc` — Number of spills scanned in the last second.
- `spscR` — Number of rows scanned from spills in the last second.
- `ldbr` — Number of *ldb* blocks read in the last second.
- `blkr` — Number of data blocks read in the last second (over *spills, buckets* ..)
- `raSg` — Number of segments for which read-ahead was done in the last second.
- `raSp` — Number of spills for which read-ahead was done in the last second.
- `nAdv` — Number of *advise* calls made to MFS for scan read-ahead in the last second.
- `raBl` — Sum of blocks in the *advise* calls made to MFS for scan read-ahead in the last second.

Cumulative Metrics

`guts` displays the following *cumulative* metrics:

- `cmP` — Total pending RPCs from the client in the last second.
- `cmC` — Total completed RPCs from the client in the last second.

DB Metrics

`guts` displays the following *database* metrics:

- `cgP` — Total pending *get* RPCs.
- `cgC` — Total completed *get* RPCs.
- `cpP` — Total pending *put* RPCs.
- `cpC` — Total completed *put* RPCs.
- `csP` — Total pending *scan* RPCs.
- `csC` — Total completed *scan* RPCs.
- `ciP` — Total pending *increment* RPCs.
- `ciC` — Total completed *increment* RPCs.
- `caP` — Total pending *append* RPCs.
- `caC` — Total completed *append* RPCs.
- `cgR` — Total client *get* rows.
- `cpR` — Total client *put* rows.
- `csR` — Total client *scan* rows.

- `ciR` — Total client *increment* rows.
- `caR` — Total client *append* rows.

Example Usage

The following example demonstrates viewing client metrics. Perform the following steps:

1. Find the process ID of the client program.
2. Find all the shared memory segments (*shmem*) for this program:

```
ipcs -mp | grep <pid>
998080521 root      30030      21850
998113290 root      30030      30030
^^^^^^^^^
shmem ID
```

Here, there are two shared memory segments — one between the client and MFS, and the other between the client and `guts`.

3. Identify the correct *shmem* segment for `guts`:

```
ipcs | grep 998113290
0x00000000 998113290 root      666      2288      1      dest
ipcs | grep 998080521
0x00000000 998080521 root      660      20971520 1      dest
^^^^^^^^^
size
```

The *shmem* with size 20M is between client and MFS. Here, we select *shmem* with ID 998113290.

4. Run `guts`:

```
/opt/mapr/bin/guts client:all shmid:998113290
Printing only client statistics
cmP  cmC  cgP  cgC  cpP  cpC  csP  csC  ciP  ciC
caP  caC  crP  crC  cwP  cwC  ccP  ccC  cuP  cuC
0    0    0    0    0    0    0    0    0    0
0    0    0    0    0    0    0    0    0    0
0    0    0    0    0    0    0    0    0    0
```

Pass the *shmem* ID and one of the client options. Client options are one of:

- `none` — Used when printing MFS/dbserver statistics
- `db` — Prints client statistics for DB operations
- `fs` — Prints client statistics for filesystem operations
- `all` — Prints all client statistics

CLDB Guts

The `cldbguts` utility prints information about active container reports, full container reports, registration requests, MapR-FS heartbeats, NFS server heartbeats, and containers. For more information, see [cldbguts](#) on page 2360.

NFS Guts

`guts` displays the following *NFS* metrics:

- `req` — Number of requests received from all the NFS clients to this NFS server in the last second.
- `dpC` — Number of dropped calls from NFS client due to running out of ONC handles (probably cluster is responding slow OR [NFS client is bombarding the NFS server](#)).
- `inReadReq` — Number of incoming read requests from NFS clients.
- `outReadResp` — Number of outgoing read request responses to NFS Clients.
- `inReadDataReq` — Size/Length of incoming read requests (buffer size) from NFS Clients.
- `outReadDataResp` — Size/Length of outgoing read request response (buffer size) to NFS Clients.
- `inWriteReq` — Number of incoming write requests from NFS clients.
- `outWriteResp` — Number of outgoing read request responses to NFS clients.
- `inWriteDataReq` — Size/Length of incoming write request (buffer size) from NFS clients.
- `outWriteDataResp` — Size/Length of outgoing write request response (buffer size) to NFS Clients.

Running Guts

Start `guts` on the node for which you need to collect metrics.

```

/opt/mapr/bin/guts
00 01 02 03 04 05 06 07      rpc      lpc      write      lwrite      bwrite
read      lread      icache      dcache      di      ic      dd      dc      ior
iow      rput      rputR      cput      tputR      rget      rgetR      cget      tgetR      rsc      rscR      csc
86 90 84 84 87 93 81 84      5      6      0      0      1      0      0      0      0
0   3   0      8      0      163     1     337  22     13  16     1   0     73
4   0   0      0      0      1      0     0     0     0   0     0   0     0
62 77 70 82 93 61 50 84      12     20     0     0     3     0     0     0     0
0  10  0      27     0      41     0     6     0     3     0     0     0     0

Related reference

[cldbguts](#) on page 2360

Monitors the activity of the Container Location Database (CLDB). This utility prints information about the CLDB service that is running on the node from which you run the utility.

[Retrieving Tiering Statistics Using guts](#) on page 1024

Explains how to use the `guts` utility to retrieve tiering statistics.

manageSSLKeys.sh

Use the `manageSSLKeys.sh` utility to create and manage SSL certificates.

Syntax

```
# /opt/mapr/server/manageSSLKeys.sh
manageSSLKeys.sh is a tool to create and manage the SSL certificates. It is
run once on the first node from configure.sh
Usage: manageSSLKeys and one of
    create [-d DNSDOMAIN] [-N clustername] [-p password] -ug
<maprUserGroup>
    creates the SSL key and trust stores needed for HTTPS traffic
    -d specifies DNS domain used in wildcard certificate. Default
        is detected from Local OS
    -N clustername
    -p password or file containing password
    -ug MapR user/group, e.g., mapr:mapr
    merge <in trust store> <out trust store> [inPasswordFile (needed to
override default password)]
    merges the certificates from the in trust store into the
existing out trust store
    copytruststore <outputFile> [password (needed to override default
password)]
    copywithconfiguredpassword <srcStore> <destStore> <srcPassword>
    createrandompassword [oldPassword (needed to override default
password)]
    createusercerts [-p password] [-N <clustername> ] [-d
DNSDOMAIN ] -ug <maprUserGroup>
    -N <clustername>
    -d specifies DNS domain used in wildcard certificate. Default
        is detected from Local OS
    -p password or file containing password
    -ug MapR user/group, e.g., mapr:mapr
    convert [-N <clustername> ] [-k] [-n] [-p <passwd>] [-srcType JKS|
pkcs12] [-dstType JKS|pkcs12] <in key/trust store> <out key/trust store>
trust store
    converts an existing key/trust store into a new PEM type key/
trust store
    if srcType and dstType are not specified, it is assumed that
you are
    converting from JKS to PEM(via pkcs12)
    -N <clustername>
    -a denotes the certificate alias you want to convert
    -k denotes you are converting a keystore
    -p <passwd> store password - needed if you are converting
custom stores
    -srcType JKS|pkcs12 denotes the source format of the store
    -dstType JKS|pkcs12 denotes the destination format of the
store
```

Operations

`manageSSLKeys.sh` performs the following operations:

convert

Description: Converts an existing key/trust store into a new PEM type key/trust store. If you do not specify the type of the source and the destination key/trust store, it is assumed that you are converting from JKS to PEM (via `pkcs12`).

Format: `convert [-N <clustername>] [-k] [-n] [-p <passwd>] [-srcType JKS|pkcs12] [-dstType JKS|pkcs12] <in key/trust store> <out key/trust store>`

Parameters:

- N: Cluster name.
- a: Certificate alias to convert.
- k: Indicates that a keystore is being converted.
- p: Password of the existing key/trust store.
- srcType: Format of the source key/trust store - either JKS or pkcs12.
- dstType: Format of the destination key/trust store - either JKS or pkcs12.
- in key/trust store: The existing key/trust store to convert.
- out key/trust store: The name to use for the converted key/trust store.

copytruststore

Description: Makes a copy of the existing trust store on the node on which this command is run.

Format: `copytruststore <outputFile> [password]`

Parameters:

- outputFile: The file in which to store the copy of the trust store.
- password: The password of the trust store being copied.

copywithconfiguredpassword

Description: Copies the source trust store to the destination trust store and secures the destination with the existing destination trust store password.

Format: `copywithconfiguredpassword <srcStore> <destStore> <srcPassword>`

Parameters:

- srcStore: Source trust store to copy.
- destStore: Destination trust store.
- srcPassword: The password of the source trust store.

create

Description: Creates the SSL key and trust stores needed for HTTPS traffic.

Format: `create [-d DNSDOMAIN] [-N clustername] [-p password] -ug <maprUserGroup>`

Parameters:

- `d`: DNS domain used for the wildcard certificate. The default domain is detected from the Local OS.
- `N`: Name of the cluster.
- `p`: Password to use for the SSL key.
- `ug`: *User:Group* to use for the key. For example: `mapr:mapr`.

createusercerts

Description: Creates SSL user certificates.

Format: `createusercerts [-p password] [-N <clustername>] [-d DNSDOMAIN] -ug <maprUserGroup>`

Parameters:

- `p`: Password to use for the SSL user certificate.
- `N`: Name of the cluster.
- `d`: DNS domain used for the wildcard certificate. The default domain is detected from the Local OS.
- `ug`: *User:Group* to use for the certificate. For example: `mapr:mapr`.

merge

Description: Merges the SSL certificates from the *in trust* store into the existing *out trust* store.

Format: `merge <in trust store> <out trust store> [inPasswordFile]`

Parameters:

- `in trust store`: Source trust store from which to obtain the SSL certificates.
- `out trust store`: Destination trust store to merge the SSL certificates.
- `inPasswordFile`: File containing the password for the source trust store.

Examples

The following links demonstrate using the `manageSSLKeys.sh` utility.

- Copy trust store: [Enabling Security](#) on page 1517
- Regenerate trust store password: [Enabling Security](#) on page 1517
- Merge trust store: [Configuring Secure Clusters for Running Commands Remotely](#) on page 1658
- Generate trust store and key store files: [Step 1: Restart and Check Cluster Services](#) on page 273 and [Configuring Encryption for ODBC Connection](#) on page 3749
- Convert type of keystore file: [Upgrading the Data Access Gateway](#) on page 313

mapr-support-collect.sh

Collects information about a cluster's recent activity, to help Data Fabric Support diagnose problems.

The "mini-dump" option limits the size of the support output. When the `-m` or `--mini-dump` option is specified along with a size, `mapr-support-collect.sh` collects only a head and tail, each limited to the

specified size, from any log file that is larger than twice the specified size. The total size of the output is therefore limited to approximately $2 * \text{size} * \text{number of logs}$. The size can be specified in bytes, or using the following suffixes:

- b - bytes
- k - kilobytes (1024 bytes)
- m - megabytes (1024 kilobytes)

Syntax

```

/opt/mapr/support/tools/mapr-support-collect.sh
-h, --hosts HOST_FILE
    hosts file, each line has entries [user@]host[:port]
-H, --host HOST_ENTRY
    additional host entry of the form [user@]host[:port], multiple
can be specified
-Q, --no-cldb
    do not query CLDB for list of nodes
-n, --name NAME
    name of output file
-d, --output-dir DIR_PATH
    absolute path of output directory
-l, --no-logs
    do not include log files
--no-hadoop-logs
    do not include hadoop log files
--hbase-logs
    include hbase log files
--sqoop-logs
    include sqoop log files
--eco-logs
    include all ecosystem log files
--oozie-logs
    include oozie log files
--spark-logs
    include spark log files
--pig-logs
    include pig log files
--impala-logs
    include impala log files
--hue-logs
    include hue log files
--hive-logs
    include hive log files
--flume-logs
    include flume log files
--drill-logs
    include drill log files
--no-kibana-logs
    do not include kibana log files
--no-grafana-logs
    do not include grafana log files
--no-elasticsearch-logs
    do not include elasticsearch log files
--no-opentsdb-logs
    do not include opentsdb log files
--no-collectd-logs
    do not include collectd log files
--no-fluentd-logs
    do not include fluentd log files
--no-vol-info

```

```

do not collect volume information
-L, --libraries
    include libraries
-s, --no-statistics
    do not include statistics
-c, --no-conf
    do not include configurations
-i, --no-sysinfo
    do not include system information
-x, --exclude-cluster
    do not collect cluster diagnostics
-u, --user USER
    username for ssh connections
-K, --strict-hostkey
    check for strict host key in ssh connection
-p, --par PAR
    maximum number of nodes from which support dumps will be gathered
concurrently (default: 10)
-t, --dump-timeout DUMPTIMEOUT
    timeout for execution of mapr-support-dump command on a node
(default: 3600 seconds, 0 = no limit)
-T, --scp-timeout SCPTIMEOUT
    timeout for copy of support dump output from a remote node to
local filesystem (default: no limit)
-y, --yes
    do not require acknowledgement of the number of nodes that will
be affected
-O, --online
    Leverage MapR APIs to gather support dumps. When not specified,
SSH and SCP will be used.
-S, --scp-port SCPPORT
    the local port to which remote nodes will establish an SCP session
--collect-cores
    Collect cores of running mfs processes from all nodes (off by
default)
--move-cores
    Move mfs and nfs cores from coresDir from all nodes (off by
default)
--use-hostname
    Use hostname to ssh instead of IP addresses (off by default)
--cldb CLDBNODE
    Use this option when the CLDB Service is down to point to a CLDB
node
--port PORT
    port number used by FileServer (default: 5660)
--nfsport NFS_MGMT_PORT
    port number used by NFS Server (default: 9998)
-m, --mini-dump SIZE
    Collects only first and last number of bytes of each log file if
file is greater then 2*SIZE.
    SIZE may have a multiplier suffix: b 512, k 1024, m 1024*1024
-A, --logs-age DAYS
    Use this option to collect logs newer than specified DAYS
(default: 7, nolimit: 0)
-f, --filter FILTER_STRING
    Use this option to filter nodes for which support dump should be
collected
-?, --help
    display usage

```

Parameters

| Parameter | Description |
|-------------------------|--|
| -h or --hosts | A file containing a list of hosts. Each line contains one host entry, in the format [user@]host[:port]. |
| -H or --host | One or more hosts in the format [user@]host[:port]. |
| -Q or --no-cldb | If specified, the command does not query the CLDB for list of nodes. |
| -n or --name | Specifies the name of the output file. If not specified, the default is a date-named file in the format YYYY-MM-DD-hh-mm-ss.tar. |
| -d or --output-dir | The absolute path to the output directory. The default path is /opt/mapr/support/collect/. |
| -l or --no-logs | If specified, the command output does not include any log files. |
| --no-hadoop-logs | If specified, the command output does not include Hadoop log files. |
| --hbase-logs | If specified, the command output includes HBase log files. |
| --sqoop-logs | If specified, the command output includes Sqoop log files. |
| --eco-logs | If specified, the command output includes the log files for all MapR ecosystem components. |
| --oozie-logs | If specified, the command output includes Oozie log files. |
| --spark-logs | If specified, the command output includes Spark log files. |
| --pig-logs | If specified, the command output includes Apache Pig log files. |
| --impala-logs | If specified, the command output includes Apache Impala log files. |
| --hue-logs | If specified, the command output includes Apache Hue log files. |
| --hive-logs | If specified, the command output includes Apache Hive log files. |
| --flume-logs | If specified, the command output includes Apache Flume log files. |
| --drill-logs | If specified, the command output includes Apache Drill log files. |
| --no-kibana-logs | If specified, the command output does not include Kibana log files. |
| --no-grafana-logs | If specified, the command output does not include Grafana log files. |
| --no-elasticsearch-logs | If specified, the command output does not include Elasticsearch log files. |
| --no-opentsdb-logs | If specified, the command output does not include OpenTSDB log files. |

| Parameter | Description |
|-------------------------|---|
| --no-collectd-logs | If specified, the command output does not include Collectd log files. |
| --no-fluentd-logs | If specified, the command output does not include Fluentd log files. |
| --no-vol-info | If specified, the command output does not include any volume information. |
| -L or --no-libraries | If specified, the command output does not include libraries. |
| -c or --no-conf | If specified, the command output does not include configurations. |
| -i or --no-sysinfo | If specified, the command output does not include system information. |
| -x or --exclude-cluster | If specified, the command does not collect cluster diagnostics. Even if cluster diagnostics are excluded, the script still collects local logs and local system diagnostic information. |
| -u or --user | The username for ssh connections. |
| -K or --strict-hostkey | If specified, checks for strict host key in the SSH connection. When specified, ssh never automatically adds host keys to the <code>~/.ssh/known_hosts</code> file, and refuses to connect to a host whose host key has changed. This provides maximum protection against trojan horse attacks, but can be troublesome when the <code>/etc/ssh/ssh_known_hosts</code> file is poorly maintained or connections to new hosts are frequently made. This option forces the user to manually add all new hosts. |
| -p or --par | The maximum number of nodes from which support dumps are gathered concurrently (default: 10). |
| -t or --dump-timeout | The timeout in seconds for execution of the <code>mapr-support-dump</code> command on a node (default: 3600 seconds or 0 = no limit). |
| -T or --scp-timeout | The timeout in seconds for copy of support dump output from a remote node to the local filesystem (default: no limit). |
| -y or --yes | If specified, the command does not require acknowledgement of the number of nodes that are affected. |
| -O or --online | Specifies a space-separated list of nodes from which to gather support output, and uses the MapR APIs instead of ssh for transmitting the support data. |
| -S or --scp-port | The local port to which remote nodes establish a SCP session. The default port is 22. |

| Parameter | Description |
|--------------------------------|---|
| --collect-cores | If specified, the command collects cores of running MFS processes from all nodes (default: off). |
| --move-cores | If specified, the command moves MFS and NFS cores from /opt/cores to /opt/mapr/logs/cores/ on all nodes (default: off). |
| --use-hostname | If specified, uses hostnames instead of IP address for SSH (default: off). |
| --cldb <cldbnode> | Use this option when the CLDB Service is down to point to a CLDB node. |
| --port | The port number used by FileServer (default: 5660). |
| --nfsport | The port number used by NFS Server (default: 9998). |
| -m or --mini-dump <size> | For any log file greater than 2 * <size>, collects only a head and tail each of the specified size. The <size> may have a suffix specifying units: <ul style="list-style-type: none"> • b - blocks (512 bytes) • k - kilobytes (1024 bytes) • m - megabytes (1024 kilobytes) |
| -A or --logs-ag | Use this option to collect logs newer than specified days (default: 7, nolimit: 0) |
| -f or --filter <filter string> | Use this option to specify a filter string. Support information is only collected for nodes with names that match the filter string. |
| -? or --help | Displays usage help text |

Examples

Collect support information and dump it to the file /opt/mapr/support/collect/mysupport-output.tar:

```

/opt/mapr/support/tools/mapr-support-collect.sh -n mysupport-output
2019-09-16 21:37:28.884 INFO Creating nodes file
2019-09-16 21:37:28.907 INFO Querying CLDB for nodes in the cluster
2019-09-16 21:37:31.883 INFO Created nodes file
Diagnostics will be collected from 1 nodes. Press enter to continue:

Password:
2019-09-16 21:44:25.137 INFO Making a tarball of all the dumps

-----
----- Finished collecting diagnostics
information -----
-----

Successfully collected support information on cluster from CLDB.
```

```
Total no. of nodes from which dump collection was attempted: 1
Nodes from which support information gathering succeeded:    1
Number of nodes from which dump collection failed:         0
Number of nodes from which dump file could not be copied:  0
```

```
The tar ball of the dumps is available at: /opt/mapr/support/collect/
mysupport-output.tar
```

mapr-support-dump.sh

Collects node and cluster-level information for the node on which you invoke the script.

The information collected is used to help MapR Support diagnose problems. Use [mapr-support-collect.sh](#) on page 2403 to collect diagnostic information from all nodes in the cluster.

The "mini-dump" option limits the size of the support output. When you specify the `-m` or `--mini-dump` option along with a size, `mapr-support-dump.sh` collects only a head and tail, each limited to the specified size, from any log file that is larger than twice the specified size. The total size of the output is therefore limited to approximately $2 * \text{size} * \text{number of logs}$. You can specify the size using the following suffixes:

- b - bytes
- k - kilobytes (1024 bytes)
- m - megabytes (1024 kilobytes)

Syntax

```
/opt/mapr/support/tools/mapr-support-dump.sh
[ -n | --name <name> ]
[ -l | --no-logs ]
[ --no-hadoop-logs ]
[ --hbase-logs ]
[ --sqoop-logs ]
[ --eco-logs ]
[ --oozie-logs ]
[ --spark-logs ]
[ --pig-logs ]
[ --impala-logs ]
[ --hue-logs ]
[ --hive-logs ]
[ --flume-logs ]
[ --drill-logs ]
[ -L | --libraries ]
[ -d | --output-dir <path> ]
[ -s | --no-statistics ]
[ -c | --no-conf ]
[ -i | --no-sysinfo ]
[ -o | --exclude-cluster ]
[ -O | --online ]
[ -z | --only-cluster ]
[ --collect-cores ]
[ --move-cores ]
[ --port <port> ]
[ --nfspport <port> ]
[ -m | --mini-dump <size> ]
[ -A | --logs-age <days> ]
[ -? | --help ]
```

Parameters

| Parameter | Description |
|-------------------------|---|
| -n or --name | Specifies the name of the output file. If not specified, the default is a date-named file in the format YYYY-MM-DD-hh-mm-ss.tar |
| -l or --no-logs | Does not include log files. |
| --no-hadoop-logs | Does not include Hadoop log files |
| --hbase-logs | Includes Hbase log files. |
| --sqoop-logs | Includes Sqoop log files |
| --eco-logs | Includes all ecosystem log files. |
| --oozie-logs | Includes Oozie log files. |
| --spark-logs | Includes Spark log files. |
| --pig-logs | Includes Pig log files. |
| --impala-logs | Includes Impala log files. |
| --hue-logs | Includes Hue log files. |
| --hive-logs | Includes Hive log files. |
| --flume-logs | Includes Flume log files. |
| --drill-logs | Includes Drill log files. |
| -L or --libraries | Includes libraries. |
| -d or --output-dir | The absolute path to the output directory. If not specified, the default is /opt/mapr/support/collect/ |
| | |
| -s or --no-statistics | Does not include statistics. |
| -c or --no-conf | Does not include configurations. |
| -i or --no-sysinfo | Does not include system information. |
| -o or --exclude-cluster | Does not collect cluster diagnostics. |
| -O or --online | Saves the support dump output file to the /var/mapr/cluster/support directory in maprfs. When not specified, the output file is stored at /opt/mapr/support/dump on the local machine filesystem. Specifies a space-separated list of nodes from which to gather support output, and uses the warden instead of ssh for transmitting the support data. |
| -z or --only-cluster | Collects diagnostic information at the cluster level only. |
| --collect-cores | Collects cores of running mfs processes from all nodes (off by default) |
| --move-cores | Moves mfs and nfs cores from /opt/cores from all nodes (off by default) |
| --port | The port number used by the FileServer. Default: 5660 |

| Parameter | Description |
|-------------------------|---|
| --nfs-port | The port used by the NFS server. Default: 9998 |
| -m, --mini-dump <size> | For any log file greater than 2 * <size>, collects only a head and tail each of the specified size. The <size> may have a suffix specifying units: <ul style="list-style-type: none"> • b - blocks (512 bytes) • k - kilobytes (1024 bytes) • m - megabytes (1024 kilobytes) |
| -A or --logs-age <days> | Collects logs newer than the specified number of days. The default value for this parameter is 7. Specify a value of 0 to have the <code>mapr-support-dump.sh</code> script collect logs of any age. |
| -? or --help | Displays usage help text |

Output

The example produces a tar file at `/opt/mapr/support/dump/mysupport-output.tar`. To extract the tar file, use `tar -xf mysupport-output.tar`. The directory structure is as follows:

```
$ ls
mysupport-output      mysupport-output.tar

$ ls mysupport-output
MapRBuildVersion      hostid                mfsstate_commands
cluster               hostname              roles
cluster_summary.txt   linux-release         support_dump.log
conf                  logs                  system_info
conf_file_metadata    mapr-clusters.conf
```

- **mfsstate_commands** - Contains all information collected about the state of the filesystem are stored the the `mfsstate_commands` directory.
- **cluster** - Contains information associated with `maprccli_commands`, `resourcemanager`, and `volume_dumps`.
- **system_info** - Contains all information related to the system state and configuration.
- **support_dump.log** - Contains console output of the individual commands launched by the support dump script.
- Commonly required files - `cluster_summary.txt`, `conf_file_metadata`, `hostid`, `hostname`, `linux-release`, `MapRBuildVersion`, `mapr-clusters.conf`, and `support_dump.log` are place in the dump root for easier access.

Example

Collect support information and dump it to the file `/opt/mapr/support/collect/mysupport-output.tar`:

```
/opt/mapr/support/tools/mapr-support-dump.sh -n mysupport-output
```

Example Output

```

/opt/mapr/support/tools/mapr-support-dump.sh -n mysupport-output
2015-06-25 11:51:38.397 INFO Starting Support dump collection. For
diagnostics, refer to support@dump.log inside the dump

```

maprlogin

Authenticates logins to secure HPE Ezmeral Data Fabric clusters.

The `/opt/mapr/bin/maprlogin` command line tool enables users to log into secure MapR clusters. Users authenticate themselves to the cluster with a [maprticket](#) that can be generated in the following ways:

- Run `maprlogin password` to authenticate with username and password.
- Run `maprlogin generateticket` to request a service, tenant, or cross-cluster ticket for use by an external application or user account (based on the current user's ticket).
- Run `maprlogin kerberos` after generating a Kerberos ticket with the `kinit` command.

Note: Tickets contain keys, and are used to authenticate users and MapR servers. Every user who wants to access a cluster must have a MapR user ticket (`maprticket_<uid>`) and every node in the cluster must have a MapR server ticket (`maprserverticket`).

For more details about different ways to generate tickets, see [Tickets](#).

Syntax

```
/opt/mapr/bin/maprlogin <argument> <option>
```

Arguments

| Argument | Description |
|----------|---|
| authtest | <p>Simulates runtime behavior during authentication. The following is the syntax for running the <code>maprlogin</code> command with this argument:</p> <pre> /opt/mapr/bin/maprlogin authtest [-cluster mapr cluster name] </pre> <p>For more information, see Options on page 2414.</p> |

| Argument | Description |
|----------------|--|
| end logout | <p>Logs out of the cluster. The following is the syntax for running the <code>maprlogin</code> command with this argument:</p> <pre data-bbox="488 310 1036 369">/opt/mapr/bin/maprlogin end logout [-cluster mapr cluster name]</pre> <p>For more information, see Options on page 2414.</p> |
| generateticket | <p>Generates a ticket for another user or application. The user who runs the <code>maprlogin</code> command with this option must already have a user ticket and must have <code>fc</code> (full control) ACL authorization on the cluster. See acl set.</p> <p>The following is the syntax for running the <code>maprlogin</code> command with this argument:</p> <pre data-bbox="488 611 1446 863">/opt/mapr/bin/maprlogin generateticket -type service crosscluster servicewithimpersonation tenant -user <UNIX user name> [-cluster <cluster name>] -out <ticket location> [-duration <[Days:]Hours:Minutes OR -duration Seconds>] [-renewal <[Days:]Hours:Minutes OR -duration Seconds>] [-impersonateduids <uids to impersonate>] [-impersonatedgids <gids to impersonate>]</pre> <p>For more information, see Options on page 2414.</p> |
| kerberos | <p>Indicates the presence of a Kerberos ticket. The following is the syntax for running the <code>maprlogin</code> command with this argument:</p> <pre data-bbox="488 1031 1036 1110">/opt/mapr/bin/maprlogin kerberos [-cluster <cluster name>] [-duration <ticket duration>]</pre> <p>For more information, see Options on page 2414.</p> |
| password | <p>The user's UNIX password. The following is the syntax for running the <code>maprlogin</code> command with this argument:</p> <pre data-bbox="488 1283 1036 1419">/opt/mapr/bin/maprlogin password [-cluster <cluster name>] [-user <user name>] [-duration <ticket duration>] [-out <ticket location>]</pre> <p>For more information, see Options on page 2414.</p> |
| print | <p>Prints ticket of any type and contains information including the cluster name, the user ID, the date when the ticket was created, the ticket expiration date, and whether user can impersonate other users, and whether the ticket is for a tenant.</p> <p>In the service tickets, the value for <code>CanImpersonate</code> is <code>true</code> if impersonation is enabled for user and <code>false</code> if impersonation is disabled for the user. In the regular cluster ticket for the user, the value of <code>CanImpersonate</code> is always <code>false</code>. In the tenant ticket, the value for <code>CanImpersonate</code> is always <code>true</code>.</p> <p>The following is the syntax for running the <code>maprlogin</code> command with this argument:</p> <pre data-bbox="488 1787 1214 1839">/opt/mapr/bin/maprlogin print [-ticketfile <location of ticket file>]</pre> <p>For more information, see Options on page 2414.</p> |

| Argument | Description |
|----------|--|
| renew | <p>Renews the ticket, given a duration that does not cause the ticket to exceed its maximum lifetime. The original <code>-renewal</code> value for the ticket determines its maximum lifetime. The following is the syntax for running the <code>maprlogin</code> command with this argument:</p> <pre> /opt/mapr/bin/maprlogin renew [-cluster <cluster name>] [-duration <ticket renew duration>] [-ticketfile <input ticket file>] [-out <ticket location>] </pre> <p>For more information, see Options on page 2414.</p> |

Options

| Option | Description | Default |
|------------------------|--|--|
| <code>-cluster</code> | Name of the cluster to log into. | First cluster name in the <code>/opt/mapr/conf/mapr-clusters.conf</code> file. |
| <code>-duration</code> | <p>Length of time before the ticket expires, specified in one of the following formats:</p> <pre> -duration [Days:]Hours:Minutes -duration Seconds </pre> <p>Password-generated tickets are bounded by the CLDB duration and renewal properties that are set for the cluster:</p> <ul style="list-style-type: none"> <code>cldb.security.user.ticket.duration.seconds</code> (default=1209600) is used if duration is not specified while generating the ticket. <code>cldb.security.user.ticket.max.duration.seconds</code> (default=2592000) is the maximum duration allowed for a ticket. <p>For password-generated tickets, if <code>-duration</code> is not set with the <code>maprlogin</code> command, the CLDB duration property is used by default.</p> <p>See config.</p> <p> Note: The <code>service</code>, <code>servicewithimpersonation</code>, <code>tenant</code>, and <code>crosscluster</code> tickets may have a very long lifetime; their duration is not bounded by these properties. For service and crosscluster tickets, the default value is LIFETIME.</p> | <ul style="list-style-type: none"> 1209600 seconds (14 days) for user tickets LIFETIME for service and cross-cluster tickets |

| Option | Description | Default |
|-------------------|---|---|
| -impersonatedgids | <p>The comma-separated list of GIDs to impersonate. This can only be specified when generating a servicewithimpersonation ticket. If this is specified, the ticket owner can only impersonate the specified groups or users belonging to the specified groups.</p> <p>If impersonatedgids and impersonareduids are not specified, the ticket holder can impersonate all users on the cluster except the root user or the mapr user.</p> | No default |
| -impersonateduids | <p>The comma-separated list of UIDs to impersonate. This can only be specified when generating a servicewithimpersonation ticket. If this is specified, the ticket owner can only impersonate the specified users.</p> <p>If impersonatedgids and impersonareduids are not specified, the ticket holder can impersonate all users on the cluster except the root user or the mapr user.</p> | No default |
| -out | <p>A safe directory location where the ticket will be stored. Can be used with generateticket, password, and renew commands.</p> <p>You must specify a location when generating service and tenant tickets. (This requirement ensures that other tickets are not overwritten.)</p> | <p>/tmp/ maprticket_<u id></p> <p>(default applies to non-service tickets only)</p> |
| -renewal | <p>Total lifetime of the ticket, specified in one of the following formats:</p> <pre>-renewal [Days:]Hours:Minutes</pre> <pre>-renewal Seconds</pre> <p>If -renewal is not set with the maprlogin command, the CLDB renewal property is set by default (cldb.security.user.ticket.renew.duration.seconds). You can also set the cldb.security.user.ticket.renew.max.duration.seconds property, which is the maximum duration (7776000, by default) allowed for a ticket renewal.</p> <p> Note: Service, tenant, and crosscluster tickets are not bounded by these properties.</p> <p>For example, assume that the maprlogin command passes the following options for a service ticket:</p> <pre>-duration 30:0:0 -renewal 90:0:0</pre> <p>The ticket will expire after 30 days unless it is renewed. If a maprlogin renew command is submitted for the ticket before the initial 30 days pass, the ticket's lifetime may be extended up to a total maximum lifetime of 90 days. Tickets do not renew automatically; administrators must renew them with the maprlogin renew command, specifying a valid renewal period, and they must do this before the duration period ends. The renewal period must be less than or equal to the remaining amount of time allowed on the ticket.</p> <p>Using the same example, if you renew a ticket on the 29th day of its life, you can renew it for up to 61 days. You can renew a ticket incrementally, for some number of days at a time, as long as you do not exceed the original renewal value.</p> | 2592000 seconds (30 days) |

| Option | Description | Default |
|-------------|--|--|
| -ticketfile | Optional with <code>print</code> and <code>renew</code> commands. Specifies the path to ticket file, if different from default. If this is not specified, the command looks for the ticketfile (<code>maprticket_<uid></code>) in the default location, which is <code>/tmp</code> on Linux and <code>%TEMP%</code> on Windows systems or in the location specified by the environment variable, <code>\$MAPR_TICKETFILE_LOCATION</code> . | <ul style="list-style-type: none"> Linux: <code>/tmp</code> Windows: <code>%TEMP%</code> |
| -type | Required ticket type for the <code>generateticket</code> command; value must be <code>service</code> , <code>servicewithimpersonation</code> , <code>tenant</code> , or <code>crosscluster</code> : <ul style="list-style-type: none"> <code>service</code> is used to generate service tickets for regular cluster operations. <code>servicewithimpersonation</code> is used to generate tickets for regular cluster operations, including allowing user to impersonate other users. <code>tenant</code> is used to generate tickets for tenant users/hosts. <code>crosscluster</code> is used to generate tickets for inter-cluster operations, such as remote mirroring. The <code>crosscluster</code> option only works with the <code>mapr</code> user. | No default; <code>-type</code> must be set in the <code>maprlogin generateticket</code> command. |
| -user | Required with the <code>generateticket</code> command. The UNIX user name of the user on the MapR cluster. For <code>crosscluster</code> tickets, the user must be <code>mapr</code> . | No default |

maprlogin Command Examples

Describes common scenarios associated with `maprlogin` usage.

Generating and Displaying User Ticket

Generate a user ticket:

```
$ maprlogin password
[Password for user 'juser' at cluster 'my.cluster.com': ]
MapR credentials of user 'juser' for cluster 'my.cluster.com'
are written to '/tmp/maprticket_1000'
```

Display the ticket for the current user. Sample output is shown below.

```
$ maprlogin print
Opening keyfile /tmp/maprticket_1000
my.cluster.com: user = juser,
created = 'Mon Sep 17 08:30:26 PDT 2018', expires = 'Mon Oct 01 08:30:26
PDT 2018',
RenewalTill = 'Wed Oct 17 08:30:26 PDT 2018', uid = 20001, gids = 54261,
CanImpersonate = false
```

Generating and Displaying mapr User Ticket

Generate a ticket for the `mapr` user:

```
# su mapr
$ maprlogin password
[Password for user 'mapr' at cluster 'test.cluster.com': ]
MapR credentials of user 'mapr' for cluster 'test.cluster.com'
are written to '/tmp/maprticket_5000'
```

Display the ticket for the current user. Sample output is as follows.

```
$ maprlogin print
Opening keyfile /tmp/maprticket_5000
test.cluster.com: user = mapr, created = 'Mon Sep 17 09:18:19 PDT 2018',
expires = 'Mon Oct 01 09:18:19 PDT 2018', RenewalTill = 'Wed Oct 17
09:18:19 PDT 2018',
uid = 5000, gids = 5000, 0, 5001, CanImpersonate = true
```

Generating and Displaying Service Ticket

Generate a service ticket, `longlived_ticket`, in `/tmp` for `maprUser1`:

```
$ maprlogin generateticket -type service -out /tmp/longlived_ticket
-duration 30:0:0 -renewal 90:0:0 -user maprUser1
MapR credentials of user 'maprUser1' for cluster 'JSKCluster129_secure'
are written to '/tmp/longlived_ticket'
```

Display the service ticket in a specified location:

```
$ maprlogin print -ticketfile /tmp/ticketwithduration
Opening keyfile /tmp/ticketwithduration
JSKCluster129_secure: user = maprUser1,
created = 'Tue Jun 14 11:12:01 PDT 2017', expires = 'Thu Jul 14 11:12:01
PDT 2017',
RenewalTill = 'Mon Sep 12 11:12:01 PDT 2017',
uid = 0, gids = 0, CanImpersonate = false
```

Generating and Printing Service with Impersonation Ticket

Generate a service with impersonation ticket (in `/var/tmp`) for `maprUser1`:

```
$ maprlogin generateticket -type servicewithimpersonation -user maprUser1
-out /var/tmp/impersonationTicketMapRuser1
```

After generating the ticket, ensure that `maprUser1` has read permissions on the ticket. If you move the ticketfile to a different location, set the `$MAPR_TICKETFILE_LOCATION` environment variable.

Display the service with impersonation ticket in the specified location:

```
$ maprlogin print -ticketfile /var/tmp/impersonationTicketMaprUser1
Opening keyfile /var/tmp/impersonationTicketMaprUser1
JSKCluster129_secure: user = maprUser1,
created = 'Mon Apr 18 13:46:38 PDT 2017', expires = 'Mon May 02 13:46:38
PDT 2017',
RenewalTill = 'Wed May 18 13:46:38 PDT 2017',
uid = 501, gids = 502, CanImpersonate = true
```

To allow a user to impersonate only specific users and/or groups, use the `impersonateduids` and/or `impersonatedgids` options with the `maprlogin` command. For example:

```
$ maprlogin generateticket -type servicewithimpersonation -user
mapruser1 -out /var/tmp/impersonation_ticket -duration
30:0:0 -impersonateduids 1002,1003 -impersonatedgids 1005,1006 -renewal
90:0:0
```

The command generates a service with impersonation ticket. The ticket holder can impersonate users whose UIDs are 1002 and 1003, and users in the groups with GIDs 1005 and 1006. The ticket expires after 30 days and is stored in `/var/tmp/impersonation_ticket`. The ticket may be renewed at any time within 30 days and can be extended up to a maximum of 90 days. The ticket must be renewed explicitly before its expiration date; it does not renew automatically when it expires.

Generating a Tenant Ticket that is Valid for Specific IPs

Generate a tenant ticket (in `/tmp`) for user `test` that is valid for specific IPs:

```
$ maprlogin generateticket -type tenant -out /tmp/ticketip -ips
10.9.0.1,10.9.0.2 -user test
MapR credentials of user 'test' for cluster 'my.cluster.com' are written to
'/tmp/ticketip'
```

Note: The `-ips` argument is only valid for the tenant ticket type.

Display the generated tenant ticket:

```
$ maprlogin print -ticketfile /tmp/ticketip
Opening keyfile /tmp/ticketip
my.cluster.com: user = test, created = 'Tue Aug 25 00:34:14 PDT 2020',
expires = 'Tue Aug 25 00:34:14
PDT 12020', RenewalTill = 'Tue Aug 25 00:34:14 PDT 12020', uid = 5001, gids
= 7001,
CanImpersonate = true, isExternal = true, ips = 10.9.0.1,10.9.0.2,,
IsTenant = true
```

Generating and Displaying Cross-Cluster Ticket

Generate a cross-cluster ticket (in `/tmp`) for `maprUser1`:

```
$ maprlogin generateticket -type crosscluster -out /tmp/
crossclusterTicket -user maprUser1
MapR credentials of user 'maprUser1' for cluster 'JSKCluster128_secure'
are written to '/tmp/crossclusterTicket'
```

Display the contents of a cross-cluster ticket in the specified location:

```
$ maprlogin print -ticketfile /tmp/crossclusterTicket
Opening keyfile /tmp/crossclusterTicket
ClusterSecure: user = root,
created = 'Fri May 27 14:29:40 PDT 2017', expires = 'Fri May 27 14:29:40
PDT 12017',
RenewalTill = 'Fri May 27 14:29:40 PDT 12017',
uid = 0, gids = 0, CanImpersonate = false
```

Running an Authentication Test

`authtest`: This troubleshooting option simulates the behavior of the runtime during authentication, going through the [authentication flow](#).

Options: [`-cluster`] Specifies the name of the cluster.

Ending a Session Before the Ticket Expires

`end` or `logout`: Destroys tickets and logs out.

Options: [`-cluster`] Specifies the name of the cluster. By default, deletes all tickets for all clusters.

Renewing a Ticket Before It Expires

`renew`: Renews an existing ticket for a specified time period.

Options:

- [`-cluster`] - Specifies the name of the cluster.
- [`-duration`] - Specifies the ticket duration.

The duration you specify must be valid for the ticket in question, given the original `-renewal` value for the ticket and the life of the ticket when the `renew` command is run:

- You cannot renew a ticket that has already expired.
- You can renew the same ticket multiple times.
- The renewal period (or periods) cannot exceed the available time left for the ticket.

For example, assume that a ticket is created with a duration of 10 days and a renewal of 30 days:

```
maprlogin password -duration 10:0:0 -renewal 30:0:0
```

- On the 11th day, the ticket expires and cannot be renewed at all.
- On the 9th day, you can renew the ticket for any number of days up to a maximum of 21.
- On the 23rd day, you can renew the ticket for any number of days up to a maximum of 7.

Example: Renew a ticket and display the renewed ticket in the specified location:

```
$ maprlogin renew -out /tmp/RenewedsecureClusterTicket
-ticketfile /tmp/secureClusterTicket -duration 1:0:0

$ maprlogin print -ticketfile /tmp/RenewedsecureClusterTicket
Opening keyfile /tmp/RenewedsecureClusterTicket
JSKCluster129_secure: user = root,
created = 'Tue Jun 07 11:53:29 PDT 2017',
expires = 'Wed Jun 08 11:56:56 PDT 2017',
RenewalTill = 'Thu Jul 07 11:53:29 PDT 2017',
uid = 0, gids = 0, CanImpersonate = false
```

Troubleshooting maprlogin Failures

While the root causes of most failure cases with `maprlogin` can be quickly diagnosed, the following cases can prove challenging:

- When security is enabled for a cluster, the cluster's CLDB listens for connections on port 7443. If security for the cluster is disabled, the `maprlogin` utility is unable to reach the CLDB.

- The utility's connection uses HTTPS, which requires the file `conf/ssl_truststore` to exist on the client. If the file is not present, a secure connection cannot be negotiated.

Detailed error logs for `maprlogin` connection attempts are kept at `logs/maprlogin-<USERID>-nnnn.log`.

mrconfig

The `mrconfig` commands let you create, remove, and manage storage pools, disk groups, and disks; and provide information about containers.

 **Warning:** The `mrconfig` commands provide direct control and low-level access to the HPE Ezmeral Data Fabric filesystem. If you are not careful, or do not know what you are doing, you can irrevocably destroy valuable data.

mrconfig cntr

Discusses the `mrconfig cntr` commands that allow you to manage containers and container replicas.

mrconfig cntr disablethrottle

Permits disabling throttling for resync of a container.

The `mrconfig cntr disablethrottle` command allows you to disable throttling for resync of a container (specified by ID). Run this command on the node that is the source for the resync.

 **Note:** By default, throttling is disabled if resync is not complete after 30 minutes, or when there is only one replica container.

Syntax

```
/opt/mapr/server/mrconfig cntr disablethrottle <cid>
```

Parameters

| Parameter | Description |
|-----------|--------------------------|
| cid | The ID of the container. |

Example

Command

```
/opt/mapr/server/mrconfig cntr disablethrottle 2049
```

Output

```
-----
|From Instance 5660::|
-----
Changing throttling on container 2049 throttle flag disable
```

mrconfig cntr resetthrottle

Permits resetting the throttle setting for resync of a container.

The `mrconfig cntr resetthrottle` command allows you to reset the throttle setting for resync of a container (specified by ID).

 **Note:** Run this command only after the resync operation (on the specified container) is complete.

Syntax

```
/opt/mapr/server/mrconfig cntr resetthrottle <cid>
```

Parameters

| Parameter | Description |
|-----------|--------------------------|
| cid | The ID of the container. |

Example

Command

```
# /opt/mapr/server/mrconfig cntr resetthrottle 2049
```

Output

```
-----
|From Instance 5660::|
-----
Changing throttling on container 2049 throttle flag reset
```

mrconfig cntr resyncprogress

Retrieves the status of a resync operation for containers or volumes.

The `mrconfig cntr resyncprogress` command allows you to get the status of a resync operation for containers or volumes (specified by IDs).

Syntax

```
/opt/mapr/server/mrconfig cntr resyncprogress --cids|--volid <id,...>
```

Parameters

| Parameter | Description |
|-----------|--|
| --cids | The comma-separated list of container IDs. |
| --volid | The comma-separated list of volume IDs. |

Example

Command

```
# /opt/mapr/server/mrconfig cntr resyncprogress --cids 2104
```

Output

```
-----
|From Instance 5660::|
-----
List of Source Container Ids: 2104
List of Volume Ids:
Resync Progress Info
-----
Cid: 2104, Snapshot Cid: 4069905785, Vol Id: 233969254, Location: Source,
Peer Addr: 10.20.30.40:5660
```

```
ResyncType: Container Resync, Status: Resync In Progress, Total Inodes:
4095, Resync Complete: 4095
```

mrconfig dbinfo

Each instance of the file server on a node is responsible for processing and tracking activities that result from running database commands. The `mrconfig dbinfo` command displays information about the activities, including information related to containers, tablets, storage pools, tags, and threads processing operations on tables.

See [mrconfig](#) for instructions about running `mrconfig` commands.

mrconfig dbinfo arena

The `mrconfig dbinfo arena` command displays all the database related arenas (contiguous piece of memory), including the arena count and byte allocated.

See [mrconfig](#) for instructions about running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig dbinfo arena
```

Example

Display arena information.

```
/opt/mapr/server/mrconfig dbinfo arena

mrconfig dbinfo autosegsetup

The `mrconfig dbinfo autosegsetup` command displays information about replica autosegsetup for database tables.

See [mrconfig](#) for instructions about running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig dbinfo autosegsetup
```

Example

Display replica autosegsetup information for database tables.

```
/opt/mapr/server/mrconfig dbinfo autosegsetup
-----
Time: 2020-08-18 14:49:10,4851 Instance 5660
-----
table 2049.557.263820 replicaIdx 1 replicaState 4 event 0 schedState 0

copyScheduled 1 doneRegionCount 3 retryRegionCount 1 recoveredProgressPct 0
copyProgressPct 100
backoff 0 reschedAt 0 inQuickDelayList 0 inLateDelayList 0 error 0
extendedError
```

mrconfig dbinfo cidmapcache

The `mrconfig dbinfo cidmapcache` command displays the number of entries in the container ID cache and the number of successful and unsuccessful lookups performed by each instance of the file server on the cache.

See [mrconfig](#) for instructions about running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig dbinfo cidmapcache
```

Example

Display container ID information.

```
/opt/mapr/server/mrconfig dbinfo cidmapcache
-----
Time: 2020-08-17 11:58:27,2761 Instance 5660

```

mrconfig dbinfo copyregiontrackers

The `mrconfig dbinfo copyregiontrackers` command displays information about copy region progress for tables upon a replica autsetup.

See [mrconfig](#) for instructions about running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig dbinfo copyregiontrackers
```

Example

Display the copy region progress for tables upon replica autsetup.

```
/opt/mapr/server/mrconfig dbinfo copyregiontrackers
-----
Time: 2020-08-18 14:50:32,0558 Instance 5660

mrconfig dbinfo copyregionworkers

The `mrconfig dbinfo copyregionworkers` command displays information about the worker threads for parallel copy regions.

See [mrconfig](#) for instructions about running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig dbinfo copyregionworkers
```

Example

Display the

```
/opt/mapr/server/mrconfig dbinfo copyregionworkers
-----

completionPct 50 scheduled 1 error 0
```

mrconfig dbinfo mem

The `mrconfig dbinfo mem` command displays memory information related to storage pools and buckets.

See [mrconfig](#) for instructions about running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig dbinfo mem
```

Example

Display memory information.

```
/opt/mapr/server/mrconfig dbinfo mem
-----

totalActiveBucketsSz 0
```

mrconfig dbinfo replbuckets

The `mrconfig dbinfo replbuckets` command displays the replication progress information for the data in each bucket for each replica of a table.

See [mrconfig](#) for instructions about running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig dbinfo replbuckets
```

Example

Display replication progress.

```
/opt/mapr/server/mrconfig dbinfo replbuckets
-----
Time: 2020-08-18 15:01:00,5833 Instance 5660

backoff 7 lastAttemptAt 1597788059

```

mrconfig dbinfo repltable

The `mrconfig dbinfo repltable` command displays information about all the replicas setup on a table.

See [mrconfig](#) for instructions about running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig dbinfo [-v] repltable <tableFid>
```

Parameters

| Parameter | Description |
|-----------|------------------------------------|
| -V | Sets the verbose option. |
| tableFid | The file identifier for the table. |

Example

Display the information about all the replicas setup on a table.

```

/opt/mapr/server/mrconfig dbinfo repltable 2049.557.263820
-----
Time: 2020-08-18 15:05:43,2650 Instance 5660

```

mrconfig dbinfo tablets

The `mrconfig dbinfo tablets` command displays information about tablets (table regions).

See [mrconfig](#) for instructions about running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig dbinfo tablets
```

Example

Display information about tablets.

```

/opt/mapr/server/mrconfig dbinfo tablets
-----

```

mrconfig dbinfo tabletsplits

The `mrconfig dbinfo tabletsplits` command displays information about the tablets (table regions) being split.

See [mrconfig](#) for instructions about running `mrconfig` commands.

Syntax

```

/opt/mapr/server/mrconfig dbinfo tabletsplits

```

Example

Display information about the tablets currently being split.

```

/opt/mapr/server/mrconfig dbinfo tabletsplits
-----
Time: 2020-08-18 15:09:34,9493 Instance 5660
-----

stabilizeState PAUSE_PARTITION_SPLITS

```

mrconfig dbinfo threads

The `mrconfig dbinfo threads` command displays information about the throttling queue for each thread processing BatchGet operations, such as the number of free and maximum slots. The command also displays the work areas (WA) for the RPCs being processed by the file server.

You can configure the number of operations that run in parallel in `mfs.conf` through the `mfs.db.max.concurrent.internal.ops` option. See [mrconfig](#) for instructions about running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig dbinfo threads
```

Example

Display the throttling queue information for BatchGet operations and work areas (WA) for the RPCs currently being processed by the file server.

```
/opt/mapr/server/mrconfig dbinfo threads
-----
Time: 2020-08-13 12:08:33,9402 Instance 5662

mrconfig dg

This section discusses the `mrconfig dg` commands that allow you to configure disk groups.

mrconfig dg create

Facilitates creation of disk groups.

The `mrconfig dg create` commands let you create disk groups (after you initialize disks with the `mrconfig disk init` command and add them to the node with the `mrconfig disk load` command).

You can create a disk group with one of two formats:

- Use the `mrconfig dg create raid0` command to create a striped disk group with a [RAID 0](#) format.
- Use the `mrconfig dg create concat` command to create a [concatenated](#) disk group (one disk after another).

After you create disk groups you will be ready to [create storage pools](#) on the disk groups.

See [mrconfig](#) for instructions about running `mrconfig` commands.

```
mrconfig dg create concat
```

The `mrconfig dg create concat` command creates a concatenated disk group. When a disk group is created MapR assigns one of the disks as the device path of the disk group. After you create a disk group you will be ready to [create a storage pool](#) on the disk group.

See [mrconfig](#) for instructions about running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig dg create concat <path>
```

Parameters

| Parameter | Description |
|-----------|--|
| path | The device path of each of the disks to add to the disk group; example <code>/dev/sdc /dev/sdd /dev/sde</code> |

Examples

Create a concatenated disk group on a local node

```
/opt/mapr/server/mrconfig dg create concat /dev/sdc /dev/sdd /dev/sde
```

`mrconfig dg create raid0`

Creates a disk group striped for RAID 0.

The `mrconfig dg create raid0` command creates a disk group striped for RAID 0. When you create a disk group, MapR assigns one of the disks as the device path of the disk group. After you create a disk group, you are ready to [create a storage pool](#) on the disk group.

See [mrconfig](#) for instructions about running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig dg create raid0 [-d <stripeDepth>] <path>
```

Parameters

| Parameter | Description |
|-----------|--|
| -h | host IP address; default <code>127.0.0.1</code> |
| -p | The filesystem port; default <code>5660</code> |
| -d | The stripe depth in 8K blocs; default <code>128</code> (1 MB) |
| path | The device path of each of the disks to add to the disk group; example <code>/dev/sdc /dev/sdd /dev/sde</code> |

Examples

Create a disk group striped for RAID 0 with a stripe depth of 24 on a local node

```
/opt/mapr/server/mrconfig dg create raid0 -d 24 /dev/sdc /dev/sdd /dev/sde
```

`mrconfig dg help`

The `mrconfig dg help` command displays online help for disk group commands.

See [mrconfig](#) for instructions about running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig dg help
```

Examples

Display online help for `mrconfig dg` commands on a local node

```
/opt/mapr/server/mrconfig dg help
```

mrconfig dg list

The `mrconfig dg list` command lists the disk groups on all the filesystem disks on a node.

See [mrconfig](#) for instructions about running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig dg list
```

Examples

List the disk groups on all the filesystem disks on localhost

```
/opt/mapr/server/mrconfig disk list
```

mrconfig disk

This section discusses the `mrconfig disk` commands.

mrconfig disk help

The `mrconfig disk help` command displays the help text for `mrconfig disk` commands.

See [mrconfig](#) for instructions about running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig disk help
```

Example

Display the help text for `mrconfig disk` commands on a local node

```
/opt/mapr/server/mrconfig disk help
```

mrconfig disk init

The `mrconfig disk init` command initializes a disk and formats it for the MapR filesystem.

Note:

Warning: Initializing a Disk Causes Data Loss

Initializing a disk destroys the data on the disk, so be sure that all data on a disk is backed up and replicated before initializing the disk.

After executing the `mrconfig disk init` command, add the disk to the node with the [mrconfig disk load](#) command.

See [mrconfig](#) for instructions about running `mrconfig` commands. **Tip:**

To initialize, format, and load one or more disks in one step using:

- The MapR Control System, see [Adding Disks to filesystem](#) on page 914.
- The CLI, see [disk add](#) on page 1786 command.

Syntax

```
/opt/mapr/server/mrconfig disk init <path>
[-F]
<path>
```

Parameters

| Parameter | Description |
|-----------|--|
| -F | Forces formatting of the disk for filesystem, regardless of prior formatting or existing data. |
| path | The device path of the disk; example /dev/sdc |

Examples

Initialize a disk for filesystem on a local node

```
/opt/mapr/server/mrconfig disk init /dev/sdc
```

Initialize and format a disk for filesystem on a local node

```
/opt/mapr/server/mrconfig disk init -F /dev/sdc
```

Initialize and format a disk for filesystem on a remote node with an IP address of xx.xx.xx.xx

```
/opt/mapr/server/mrconfig -h xx.xx.xx.xx disk init -F /dev/sdc
```

mrconfig disk list

The `mrconfig disk list` command lists all of the disks on a node that have a MapR filesystem.

It also shows information about the disk groups and storage pools on the node including whether or not the storage pools are online.

See [mrconfig](#) for instructions about running `mrconfig` commands.

Tip:

To list system disks and other available disks on a node in addition to filesystem disks using:

- The MapR Control System, see [Viewing the List of Disks](#) on page 911.
- The CLI, see [disk list](#) on page 1791 command.

Syntax

```
/opt/mapr/server/mrconfig disk list [<path>]
```

Parameters

| Parameter | Description |
|-----------|---|
| path | The path of the disk; if not included shows information about all disks on the node, if included only shows information about the specified disk; example: /dev/sdc |

Examples

List information about all filesystem disks on a local node

```
/opt/mapr/server/mrconfig disk list
```

List information about filesystem disk /dev/sdc on a local node

```
/opt/mapr/server/mrconfig disk list /dev/sdc
```

mrconfig disk load

After initializing a disk with the `mrconfig disk init` command, load the disk into memory with the `mrconfig disk load` command.

See [mrconfig](#) for instructions about running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig disk load <path>
<path>
```

Parameters

| Parameter | Description |
|-----------|---|
| path | The device path of the disk; example /dev/sdc |

Examples

Load a disk on a local node

```
/opt/mapr/server/mrconfig disk load /dev/sdc
```

mrconfig disk remove

The `mrconfig disk remove` command removes a disk from filesystem. A disk cannot be removed unless its storage pool is offline.

Note: Warning: Removing a Disk Causes Data Loss

Removing a disk destroys the data on the disk, so be sure that all data on a disk is backed up and replicated before removing a disk.

The `mrconfig disk remove` command is typically used when replacing a failed disk on a node.

Syntax

```
/opt/mapr/server/mrconfig disk remove [<path>]
```

Parameters

| Parameter | Description |
|-----------|---|
| path | The device path of the disk; example /dev/sdc |

Examples

Remove a disk from a local node

```
/opt/mapr/server/mrconfig disk remove /dev/sdc
```

Removing Disks Using mrconfig

Suppose one of three disks in a storage pool has failed, and the storage pool has gone offline.

To remove a disk with `mrconfig disk remove`:

1. Ensure that the data on the surviving disks is backed up/replicated.
2. Remove the failed disk from the node's disktab with the `mrconfig disk remove` command.
3. Physically remove the failed disk.
4. Physically attach the replacement disk.
5. Run the `mrconfig disk init` command on the replacement disk and on the other two disks that were in the disk group.
6. Run the `mrconfig disk load` command on each of the three disks.
7. Use the `mrconfig dg create` command to create a new disk group with the three disks.
8. Use the `mrconfig sp make` command to create a storage pool on the new disk group.

mrconfig info

The `mrconfig info` commands provide information about memory, threads, volumes, containers and other information about the MapR filesystem.

See [mrconfig](#) for instructions about running `mrconfig` commands.

mrconfig info containerchain

The `mrconfig info containerchain` command displays the containerchain for a given container.

Example:

```
$ /opt/mapr/server/mrconfig info containerchain 2050
Container 2050 prev 256000049 next 0.
Container 256000049 prev 0 next 2050.
```

See [mrconfig](#) for instructions on running `mrconfig` commands.

Syntax

```
mrconfig [-h <host>] [-p <port>] info containerchain <cid>
<cid>
```

Parameters

| Parameter | Description |
|-----------|------------------------------------|
| -h | host IP address; default 127.0.0.1 |
| -p | The filesystem port; default 5660 |
| cid | The container identifier |

Tip:

Use the `mrconfig info dumpcontainers` command to find the container identifiers on a node.

Examples

Find the containerchain for a container with a cid of 2049 on a local node

```
/opt/mapr/server/mrconfig info containerchain 2049
```

Find the containerchain for a container with a cid of 2049 on a remote node with an IP address of xx.xx.xx.xx

```
/opt/mapr/server/mrconfig -h xx.xx.xx.xx info containerchain 2049
```

mrconfig info containerlist

The `mrconfig info containerlist` command lists read/write container IDs for a specified volume.

Example:

```
$ /opt/mapr/server/mrconfig info containerlist volume1
Volume containers
2050
```

See `mrconfig` for instructions about running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig [-h <host>] [-p <port>] info containerlist
<volName>
```

Parameters

| Parameter | Description |
|-----------|------------------------------------|
| -h | host IP address; default 127.0.0.1 |
| -p | The filesystem port; default 5660 |
| volName | The name of the volume |

Tips:

You can see the names of volumes using:

- The **Volumes** view in the in the MapR Control System.
- The `maprcli volume list` command.

Examples

Display information about the containers in a volume named `marketing` on a local node

```
/opt/mapr/server/mrconfig info containerlist marketing
```

Display information about the containers on a volume named `marketing` on a remote node with an IP address of `xx.xx.xx.xx`

```
/opt/mapr/server/mrconfig -h xx.xx.xx.xx info containerlist marketing
```

mrconfig info containers

The `mrconfig info containers` command displays information about containers.

Example:

```
$ /opt/mapr/server/mrconfig info containers rw
RW containers: 1 2049 2050
$ /opt/mapr/server/mrconfig info containers resync
$ /opt/mapr/server/mrconfig info containers snapshot
Snapshot containers: 256000049
```

See [mrconfig](#) for instructions about running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig [-h <host>] [-p <port>] info containers
<container-type> [path]

    <container-type>
    [path]
```

Parameters

| Parameter | Description |
|----------------|--|
| -h | host IP address; default 127.0.0.1 |
| -p | The filesystem port; default 5660 |
| container-type | When specified, lists only containers of the specified type. Possible values: <ul style="list-style-type: none"> rw resync snapshot |
| path | The path to a service pool (obtained with mrconfig sp list). When specified, lists only containers on the specified service pool. |

Examples

Display a list of read/write containers on a local node

```
/opt/mapr/server/mrconfig info containers rw
```

Display a list of read/write containers on a remote node with an IP address of xx.xx.xx.xx

```
/opt/mapr/server/mrconfig -h xx.xx.xx.xx info containers rw
```

mrconfig info dumpcontainers

The `mrconfig info dumpcontainers` command displays information about containers including container identifiers, volume identifiers, storage pools, total and free inodes per container.

Example:

```
$ /opt/mapr/server/mrconfig info dumpcontainers
cid:2352 valid:165226505 sp:SP2:/dev/sde

maxUniq:131356 isResyncSnapshot:0 snapId:0 port:5660
```

See [mrconfig](#) for instructions about running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig [-h <host>] [-p <port>] info dumpcontainers
```

Input Parameters

| Parameter | Description |
|-----------|------------------------------------|
| -h | host IP address; default 127.0.0.1 |
| -p | The filesystem port; default 5660 |

Output Fields

| Field | Description |
|--------------|---|
| cid | Container ID |
| volid | Volume ID of the volume to which this container belongs. |
| sp | Storage pool to which this container belongs. For example: SP2:/dev/sde Here, SP2 is the name of the storage pool. /dev/sde is the disk on which the container resides. |
| spid | Storage pool ID |
| prev | Pointer to the previous snapshot cid or rw cid (for a clone container), in a snapshot chain. |
| next | Pointer to the next snapshot cid or rw cid (for a clone container), in a snapshot chain. |
| issnap | Indicates whether container is a snapshot or not, in a snapshot chain. <ul style="list-style-type: none"> • 0 - rw container (Not a snapshot container) • 1 - Snapshot |
| isclone | Indicates whether this container is a clone container created as part of the resync operation. <ul style="list-style-type: none"> • 0 - Not a clone • 1 - Is a clone |
| deleteinprog | Indicates whether this container is marked for deletion. <ul style="list-style-type: none"> • 0 - Not marked for deletion • 1 - Marked for deletion |
| fixedbyfsck | Indicates whether fsck was run on this container to fix any data or metadata errors. <ul style="list-style-type: none"> • 0 - fsck was not run on the container • 1 - fsck was run on the container |

| Field | Description |
|-------------------|---|
| stale | Indicates whether the current cid is a stale cid or not. Container is marked as stale when it is yet to be processed for cleanup. <ul style="list-style-type: none"> 0 - Not stale 1 - Stale |
| querycldb | Indicates whether the container is awaiting its role from CLDB at the time of bringing up a cluster. <ul style="list-style-type: none"> 0 - Not waiting as CLDB has already defined the role for the container 1 - Waiting for CLDB to specify the role for the container |
| resyncinprog | Indicates if the container is resyncing from another container in the container chain. <ul style="list-style-type: none"> 0 - Resyncing in progress 1 - No resyncing |
| shared | Indicates whether the container is hosting any shared data. The value is the number of shared data blocks (each of size 8K). |
| owned | Indicates the number of data blocks (each of size 8K) that the container owns. |
| logical | Indicates the number of logical data blocks (each of size 8K) that are present in the container. |
| snapusage | Indicates the number of container blocks (each of size 8K) that are used for storing snapshot data. |
| snapusageupdated | Internal field. |
| ismirror | Indicates if this container is of a mirror volume or not. 0 - Is not of a mirror volume 1 - Is of a mirror volume |
| isrwmirrorcapable | Indicates if the container belongs to a mirror volume, and if the volume can be converted to a rw volume, in case the primary volume goes down. <ul style="list-style-type: none"> 0 - Volume cannot be converted 1 - Volume can be converted |
| role | Role of the container, in the container chain. <ul style="list-style-type: none"> 0 - Master 1 - Not the master |
| totalnodes | Indicates the total number of inodes that can be created on the container. |

| Field | Description |
|--------------------|---|
| freelnodes | Indicated the number of inodes that are still available to be used. |
| dare | Indicates whether the container belongs to a volume that is dare-enabled or not. <ul style="list-style-type: none"> 0 - Volume is not dare-enabled 1 - Volume is dare-enabled |
| istiered | Indicates whether the container belongs to a tiered (either cold-tiered or EC enabled) volume. <ul style="list-style-type: none"> 0 - Container belongs to a tiered volume 1 - Container does not belong to a tiered volume |
| numtotalblocks | Applicable only for tiered volumes, this parameter indicates the total number of data blocks present in the container. |
| numpurgedblocks | Applicable only for tiered volumes, this parameter indicates the number of data blocks that are offloaded and not locally present. This value decreases in case of recalls. |
| numoffloadedblocks | Applicable only for tiered volumes, this parameter indicates the number of data blocks that are off-loaded to the tier. |
| maxUniq | Internal field. |
| isResyncSnapshot | Indicates whether the container belongs to the resync snapshot. <ul style="list-style-type: none"> 0 - Container does not belong to the resync snapshot 1 - Container belongs to the resync snapshot |
| snapId | Indicates the snapshot ID to which this container belongs, if the ID is a snap cid. |
| port | Indicates the MFS port number used by the container. |

Examples

Display information about containers on a local node

```
/opt/mapr/server/mrconfig info dumpcontainers
```

Display information about containers on a remote node with an IP address of xx.xx.xx.xx

```
/opt/mapr/server/mrconfig -h xx.xx.xx.xx info dumpcontainers
```

mrconfig info fsstate

The `mrconfig info fsstate` command displays information about the status of the MapR filesystem, for example whether or not storage pools are loaded. See [mrconfig](#) for instructions about running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig [-h <host>] [-p <port>] info fsstate
```

Parameters

| Parameter | Description |
|-----------|------------------------------------|
| -h | host IP address; default 127.0.0.1 |
| -p | The filesystem port; default 5660 |

Examples

Display information about the state of the MapR filesystem on a local node

```
/opt/mapr/server/mrconfig info fsstate
```

Display information about the state of the MapR filesystem on a remote node with an IP address of xx.xx.xx.xx

```
/opt/mapr/server/mrconfig -h xx.xx.xx.xx info fsstate
```

mrconfig info fsthreads

The `mrconfig info fsthreads` command displays information about threads running on filesystem disks on a node. See [mrconfig](#) for instructions about running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig [-h <host>] [-p <port>] info fsthreads
```

Parameters

| Parameter | Description |
|-----------|------------------------------------|
| -h | host IP address; default 127.0.0.1 |
| -p | The filesystem port; default 5660 |

Examples

Display information about MapR filesystem threads on a local node

```
/opt/mapr/server/mrconfig info fsthreads
```

Display information about MapR filesystem threads on a remote node with an IP address of xx.xx.xx.xx

```
/opt/mapr/server/mrconfig -h xx.xx.xx.xx info fsthreads
```

mrconfig info mastgateway

The `mrconfig info mastgateway` command must be run on a CLDB node. The command displays the status of the MAST Gateways, the total number of volumes assigned to them, and the number of active, inflight, and pending volumes.

See [mrconfig](#) on page 2420 for instructions about running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig info mastgateway [<gwid>]
```

Parameters

| Parameter | Description |
|-----------|--|
| gwid | The ID of the MAST Gateway for which to display information. |

Examples

Display information about MAST Gateways on the cluster:

```
# /opt/mapr/server/mrconfig -h 10.20.30.400 info mastgateway
Num MastGateways: 2

Gateway : atsq8c46.qa.lab ( 6322920922584906487 )
Active : Yes
Active Vn : 101, Inflight Vn : 101
Num Active Vols : 4
Num Inflight Vols, Adds : 0, Removes : 0
Num Pending Vols, Adds : 0, Removes : 0

Active Vols :
153675213
97789611
23539482
45553484

Gateway : atsq8c48.qa.lab ( 8723754106996643487 )
Active : Yes
Active Vn : 100, Inflight Vn : 100
Num Active Vols : 0
Num Inflight Vols, Adds : 0, Removes : 0
Num Pending Vols, Adds : 0, Removes : 0
No vols assigned to gateway.
```

mrconfig info nfsthreads

The `mrconfig info nfsthreads` command displays information about in-progress NFS operations.

Syntax

```
/opt/mapr/server/mrconfig [-h <host>] [-p <port>] info nfsthreads
```

Parameters

| Parameter | Description |
|-----------|------------------------------------|
| -h | host IP address; default 127.0.0.1 |
| -p | The NFS port; default 2049 |

Output

The output shows the NFS operations currently running (in progress) including the IP address of the client and the type of operation. For example:

```
# /opt/mapr/server/mrconfig info nfsthreads
NFS Threads in progress = 15

Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
```

Examples

Display information about the NFS processes currently running:

```
/opt/mapr/server/mrconfig info nfsthreads
```

Display information about NFS operations in-progress on a remote node with an IP address of `xx.xx.xx.xx`:

```
/opt/mapr/server/mrconfig -h xx.xx.xx.xx info nfsthreads
```

mrconfig info orphanagecount

The `mrconfig info orphanagecount` command displays orphan entries for a given container (specified by ID).

Syntax

```
/opt/mapr/server/mrconfig info orphanagecount <cid>
```

Parameters

| Parameter | Description |
|-----------|--------------------------|
| cid | The ID of the container. |

Examples

Display the number of orphan entries for container 2067:

```
~# /opt/mapr/server/mrconfig info orphanagecount 2067
-----
Time: 2017-03-31 18:00:49,1085 Instance 5660
-----
orphanagecount cid 2067 count 812
```

mrconfig info orphanlist

The `mrconfig info orphanlist` command displays information about a container's orphans. See [mrconfig](#) for instructions about running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig [-h <host>] [-p <port>] info orphanlist <cid>
<cid>
```

Parameters

| Parameter | Description |
|-----------|------------------------------------|
| -h | host IP address; default 127.0.0.1 |
| -p | The filesystem port; default 5660 |
| cid | The container identifier |

Tip:

Use the `mrconfig info dumpcontainers` command to find the container identifiers on a node.

Examples

Display information about the orphans of a container with an identifier of 2049 on a local node

```
/opt/mapr/server/mrconfig info orphanlist 2049
```

Display information about the orphans of a container with an identifier of 2049 on a remote node with an IP address of xx.xx.xx.xx

```
/opt/mapr/server/mrconfig -h xx.xx.xx.xx info orphanlist 2049
```

mrconfig info replication

The `mrconfig info replication` command displays information about container replication. See [mrconfig](#) for instructions about running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig [-h <host>] [-p <port>] info replication
```

Parameters

| Parameter | Description |
|-----------|------------------------------------|
| -h | host IP address; default 127.0.0.1 |
| -p | The filesystem port; default 5660 |

Examples

Display information about container replication on a local node

```
/opt/mapr/server/mrconfig info replication
```

Display information about container replication on a remote node with an IP address of xx.xx.xx.xx

```
/opt/mapr/server/mrconfig -h xx.xx.xx.xx info replication
```

mrconfig info slabs

The `mrconfig info slabs` command displays a report about memory usage.

This report is sometimes used for troubleshooting by MapR customer support and is typically not used by customers.

See [mrconfig](#) for instructions about running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig [-h <host>] [-p <port>] info slabs
```

Parameters

| Parameter | Description |
|-----------|------------------------------------|
| -h | host IP address; default 127.0.0.1 |
| -p | The filesystem port; default 5660 |

Examples

Display information about memory usage on a local node

```
/opt/mapr/server/mrconfig info slabs
```

Display information about memory usage on a remote node with an IP address of xx.xx.xx.xx

```
/opt/mapr/server/mrconfig -h xx.xx.xx.xx info slabs
```

mrconfig info threads

The `mrconfig info threads` command displays information about threads running on filesystem. See [mrconfig](#) for instructions about running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig [-h <host>] [-p <port>] info threads
```

Parameters

| Parameter | Description |
|-----------|------------------------------------|
| -h | host IP address; default 127.0.0.1 |
| -p | The filesystem port; default 5660 |

Examples

Display information about data-fabric filesystem threads on a local node

```
/opt/mapr/server/mrconfig info threads
```

Display information about data-fabric filesystem threads on a remote node with an IP address of xx.xx.xx.xx

```
/opt/mapr/server/mrconfig -h xx.xx.xx.xx info threads
```

mrconfig info volume snapshot

The `mrconfig info volume snapshot` command displays information about volume snapshots.

Snapshot and this command require an upgrade to a MapR Enterprise Edition license if you don't already have it. See [mrconfig](#) for instructions about running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig [-h <host>] [-p <port>] info volume snapshot
<volName> <snapName>

    <volName>
    <snapName>
```

Parameters

| Parameter | Description |
|-----------|------------------------------------|
| -h | host IP address; default 127.0.0.1 |
| -p | The filesystem port; default 5660 |
| volName | The name of the volume |
| snapName | The name of the snapshot |

Tips:

To find volume and snapshot names:

- Navigate to the **Volume** view and the **Snapshot** view respectively in the MapR Control System, or
- Execute the `maprcli volume snapshot list` command, which creates a report that displays volume names and snapshot names.

Examples

Display information about snapshot "snap-2012-01-01" of volume "myVolume" on a local node

```
/opt/mapr/server/mrconfig info volume snapshot myVolume snap-2012-01-01
```

Display information about snapshot "snap-2012-01-01" of volume "myVolume" on a remote node with an IP address of xx.xx.xx.xx

```
/opt/mapr/server/mrconfig -h xx.xx.xx.xx info volume snapshot myVolume
snap-2012-01-01
```

mrconfig info volume mastgateway

The `mrconfig info volume mastgateway` command displays the volume assignment information. This command must be run on a CLDB node.

See [mrconfig](#) on page 2420 for instructions about running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig info volume mastgateway [<volName>]
```

Parameters

| Parameter | Description |
|-----------|---|
| volName | The name of the volume for which to retrieve the volume assignment information. |

Examples

Display the volume assignment information:

```
# ./mrconfig -h 10.20.30.400 info volume mastgateway
Num volumes : 4

Volume : vol2 ( 153675213 )
State: ASSIGNED
Curr: atsq8c46.qa.lab ( 6322920922584906487 ), Active: Yes
Prop: **No Gw** ( -1 ), Active: No
Assign Suspended : No

Volume : vol1 ( 45553484 )
State: ASSIGNED
Curr: atsq8c46.qa.lab ( 6322920922584906487 ), Active: Yes
Prop: **No Gw** ( -1 ), Active: No
Assign Suspended : No

Volume : vol4 ( 97789611 )
State: ASSIGNED
Curr: atsq8c46.qa.lab ( 6322920922584906487 ), Active: Yes
Prop: **No Gw** ( -1 ), Active: No
Assign Suspended : No

Volume : vol3 ( 23539482 )
State: ASSIGNED
Curr: atsq8c46.qa.lab ( 6322920922584906487 ), Active: Yes
Prop: **No Gw** ( -1 ), Active: No
Assign Suspended : No
```

mrconfig mastgateway

This section describes the `mrconfig mastgateway` commands that allow you to test PUT, GET, and DELETE operations on the corresponding tier.

mastgateway ecgstats

Returns the list of containers under rebuild from CGManager.

Syntax

```
mrconfig mastgateway ecgstats <cgid>
```

Parameters

| Parameter | Description |
|-----------|---|
| cgid | The Container Gateway ID from which the containers under rebuild must be retrieved. |

Output

For a given EC scheme $k+m$, where k is number of data stripelets and m is number of parity stripelets, the output fields are as follows:

| | |
|--------------------------|--|
| ContainerGroupId | Container Gateway (CG) ID from which the containers under rebuild are retrieved. |
| numStripes | Total number of valid (v), invalid (i), and pre-allocated (pa) stripes minus the number of deleted (d) stripes. Calculated as: $(v+i+pa)-d$. |
| numValidStripes | Stripe that have at least k number of full stripelets. |
| numStripesToRecover | Stripes that have unelected stripelet(s), or number of full or partial stripelets less than k . |
| numStripesInRebuild | Stripes that are being rebuilt. |
| numDegradedStripes[0] | Stripes that can have no more failures. |
| numDegradedStripes[1] | Stripes that can suffer at most $m-1$ failures. |
| numMaxStripes | Maximum number of stripes in the CG. This value is calculated from the container size and the stripe size. |
| numActivePreallocStripes | Number of actual pre-allocated stripes. |
| numActiveAllocStripes | Number of allocated stripes in the CG. This value is taken from the pre-allocated list. |
| numActiveDeleteStripes | Number of valid stripes for which stripelets have been deleted by an operation such as compaction, for example. |
| numPreallocStripes | Maximum number of stripes that can be pre-allocated. Default Value: 32 |
| activeBitmap | Number of containers that are up in the CG. |
| pendingUpBitmap | Number of containers that are in the process of being brought up in the CG. |
| containersInRebuild | Number of containers that are being rebuilt. |

Example

```
# /opt/mapr/server/mrconfig mastgateway ecgstats 2351

MASTGateway service is alive on 127.0.0.1:8660
ContainerGroupId : 2351
numStripes : 189
numValidStripes : 173
numStripesToRecover : 0
numStripesInRebuild : 64
numDegradedStripes[0]: 0
numDegradedStripes[1]: 120
numMaxStripes : 8192
```

```
numActivePreallocStripes : 0
numActiveAllocStripes : 0
numActiveDeleteStripes : 0
numPreallocStripes : 32
activeBitmap : 1f
pendingUpBitmap : 0
containersInRebuild : 2353
```

Related reference

[dump ecginfo](#) on page 1814

Indicates whether rebuild is in progress for a container from CLDB.

mastgateway infomem

Returns memory information on the MAST Gateway node.

Syntax

```
mrconfig mastgateway infomem
```

Parameters

None

Output

| | |
|----------|--|
| Name | The name of the memory pool in the gateway. Each pool has a number of memory objects (not S3 objects) that are used by the MAST Gateway as needed. |
| Max Free | The maximum number of objects from this pool that can be free. |
| Active | The number of memory objects from this pool that are allocated and used by the MAST Gateway. |
| Avail | The number of memory objects that are free, and can be reused when needed. |
| Obj Size | The size of the object. |
| Num Objs | The number of objects on the tier. |
| TierType | The type of tier. Value can be: <ul style="list-style-type: none"> • Cold • Ec |

Example

```
# /opt/mapr/server/mrconfig mastgateway infomem
MASTGw mem info on 127.0.0.1:8660
  Name           Max Free  Active    Avail    Obj Size
  WriteFragBufsS3      128      0         0      8388616
  FullReadFragBufs     64       0         0      8388616
  FragReadFragBufs    1024     0         0     1048576

  Name           Num Objs    Obj Size  TierType
ColdTiering, Recall Frag      0     8388608    Cold

```

mastgateway infothreads

Returns information on the threads processing the offload or recall operation.

Syntax

```
mrconfig mastgateway infothreads
```

Parameters

None

Output

The command returns the following if it is run during an ongoing offload or recall operation.

| | |
|----------|--|
| threadId | The ID of the thread processing the operation. |
| volId | The ID of the volume being offloaded. |
| cid | The ID of the container associated with the volume. |
| cgid | The gateway ID of the container associated with the volume. |
| op | The operation being processed. Value can be: <ul style="list-style-type: none"> • VolumeOffload • VolumeRecall |

Example**Retrieve information on the threads processing the offload:**

```
~# /opt/mapr/server/mrconfig -p 8660 mastgateway infothreads
InfoThreads on 127.0.0.1:8660
threadId: 0
volId: 23315726
cid: 2128
cgid: 2078
op: VolumeOffload

threadId: 1
volId: 23315726
cid: 2130
cgid: 2054
op: VolumeOffload

threadId: 10
volId: 23315726
cid: 2127
cgid: 2096
op: VolumeOffload

threadId: 11
volId: 23315726
cid: 2129
cgid: 2082
```

```
op: VolumeOffload

threadId: 12
volId: 23315726
cid: 2131
cgid: 2091
op: VolumeOffload
```

mastgateway refreshvolassignment

Triggers CLDB to re-assign specified volume to the least utilized MAST Gateway to rebalance tiering operations.

This can be used when new MAST Gateways are added or when MAST Gateways are removed from the cluster.

Note: You must run this command once for each volume to reassign. Run this command for all volumes if MAST Gateway is either newly added to the cluster or permanently removed from the cluster.

Syntax

```
mrconfig mastgateway refreshvolassignment <volname>
```

Parameters

| Parameter | Description |
|-----------|-------------------------------------|
| volname | The name of the volume to reassign. |

Result

If the volume is successfully re-assigned, a success message (similar to the one shown in the [Examples](#) on page 2451 below) is printed on the console where the command was triggered.

In case of an error, the volume might or might not be assigned to the newly added MAST Gateway. However, the volume would either continue to be assigned to the same MAST Gateway or would be assigned to a different gateway. You can re-run the command in case of a failure.

Examples

Refresh the assignment of the containers associated with volume named vold23:

```
# /opt/mapr/server/mrconfig mastgateway refreshvolassignment vold23
volume assignment refreshed successfully.
```

mastgateway resumevolume

Resume tiering activities and allow reads and writes on the volume data.

Syntax

```
mrconfig mastgateway resumevolume <volname> [forceresume] [forcereset]
```

Parameters

| Parameter | Description |
|-----------|-------------------------|
| volname | The name of the volume. |

| Parameter | Description |
|-------------|----------------------------------|
| forceresume | This parameter is internal-only. |
| forcereset | This parameter is internal-only. |

Examples

```
# /opt/mapr/server/mrconfig mastgateway resumevolume voltSECNEW9_3
2018-08-06 02:47:14,8585 ERROR Global mrconfig.cc:2120 ResumeVolume succeed
for volume : voltSECNEW9_3
```

mastgateway suspendvolume

Revoke and suspend a volume assigned to a MAST Gateway.

When the command is run:

1. The volume assignment to the MAST Gateway is revoked.
2. All tiering activities and client reads and overwrites on the volume are suspended.
3. The volume is reassigned to another MAST Gateway.

You must manually run the `mastgateway resumevolume` on page 2451 command to resume tiering activities, including reads and overwrites, on the volume data.

Syntax

```
/opt/mapr/server/mrconfig mastgateway suspendvolume <volname>
[ignoreflusherr deletcpfiles]
```

Parameters

| Parameter | Description |
|----------------|-------------------------------------|
| volname | The name of the volume to reassign. |
| ignoreflusherr | This parameter is internal-only. |
| deletcpfiles | This parameter is internal-only. |

Examples

Revoke volume assignment to MAST Gateway and suspend tiering activities on the volume:

```
# /opt/mapr/server/mrconfig mastgateway suspendvolume voltSECNEW9_3
2018-08-06 02:38:15,9360 INFO Global mrconfig.cc:2085 SuspendVolume :
success for volume voltSECNEW9_3
```

mastgateway tierget

Test retrieving an object from the storage tier.

Syntax

```
mrconfig mastgateway tierget
  <tierName>
  <objectID>
```

```
<isSecure>
[ <objectSize> ]
```

Parameters

| Parameter | Description |
|------------|--|
| isSecure | Specifies whether to use HTTPS or HTTP protocol. Value can be one of the following: <ul style="list-style-type: none"> • true - for HTTPS protocol • false - for HTTP protocol |
| objectID | The ID of the object to get from the storage tier. The ID must be the same ID (in string format) specified when offloading the object (using tierput command). |
| objectSize | The size of the object to get from the storage tier. The default value is 64KB. |
| tierName | The name of the storage tier. If necessary, run the tier list on page 2137 command to retrieve the names of the tiers. |

Example

Retrieve the object named sampleamazonobj of size 20971520 on the tier named amazonTier:

```
# /opt/mapr/server/mrconfig mastgateway tierget amazonTier sampleamazonobj
true 20971520
time take for the operation: 8.748000 seconds
tierget successful
```

mastgateway tierdelete

Test deleting an object on the storage tier.

Syntax

```
mrconfig mastgateway tierdelete
  <tierName>
  <objectID>
  <isSecure>
```

Parameters

| Parameter | Description |
|-----------|--|
| isSecure | Specifies whether to use HTTPS or HTTP protocol. Value can be one of the following: <ul style="list-style-type: none"> • true - for HTTPS protocol • false - for HTTP protocol |
| objectID | The ID of the object to get from the storage tier. The ID must be the same ID (in string format) specified when offloading the object (using tierput command). |

| Parameter | Description |
|-----------|--|
| tierName | The name of the storage tier. If necessary, run the tier list on page 2137 command to retrieve the names of the tiers. |

Example

Delete the object named `sampleamazonobj` of size `20971520` KB in the tier named `amazonTier`:

```
# /opt/mapr/server/mrconfig mastgateway tierdelete amazonTier
sampleamazonobj true 20971520
time take for the operation: 0.339000 seconds
tierdelete successful
```

mastgateway tierput

Test offloading an object to the storage tier.

Syntax

```
mrconfig mastgateway tierput
  <tierName>
  <objectID>
  <isSecure>
  [ <objectSize> ]
```

Parameters

| Parameter | Description |
|------------|--|
| isSecure | Specifies whether to use HTTPS or HTTP protocol. Value can be one of the following: <ul style="list-style-type: none"> • <code>true</code> - for HTTPS protocol • <code>false</code> - for HTTP protocol |
| objectID | The ID of the object to put on the storage tier. Value must be a string. |
| objectSize | The size of the object to put on the storage tier. The default value is 64KB. |
| tierName | The name of the storage tier. If necessary, run the tier list on page 2137 command to retrieve the names of the tiers. |

Example

Test offload of an object, whose ID is `sapleamazonobj` and size is `20971520`, to the tier named `amazonTier`:

```
# /opt/mapr/server/mrconfig mastgateway tierput amazonTier sampleamazonobj
true 20971520
time take for the operation: 4.291000 seconds
tierput successful
```

mrconfig sp

The `mrconfig sp` commands create and control storage pools.

Storage pools are created on [disk groups](#), so disk groups must be [created](#) before storage pools can be created.

filesystem reads and writes data (and metadata) to and from logical storage units called volumes. Volumes store data in containers in storage pools.

Initially storage pools don't have any containers, the containers are automatically created for a volume as needed. When a container is created it is assigned a container identifier (cid).

Storage pools aren't associated with any particular volume – storage pools may hold containers for multiple volumes. Large files may be distributed across multiple containers, and therefore across multiple storage pools. Data replication happens at the container level.

Data cannot be written directly to containers, a volume is required.

You can create volumes in one of two ways:

- Click the **Create Volume** button in the **Data > Volumes** page in the MapR Control System, or
- Execute the `maprcli volume create` command.

See [mrconfig](#) for instructions about running `mrconfig` commands.

mrconfig sp help

The `mrconfig sp help` command displays the online help for storage pool commands.

See [mrconfig](#) for instructions on running `mrconfig` commands.

Syntax

```
mrconfig sp help
```

Examples

Display the online help for storage pools on a local node

```
/opt/mapr/server/mrconfig sp help
```

mrconfig sp list

Displays information about configured storage pools.

The `mrconfig sp list` command displays information about storage pools including the name, size, free space and path of each [storage pool](#), whether or not each [storage pool](#) is online or offline, and the total number of [storage pools](#). See [mrconfig](#) for instructions on running `mrconfig` commands.

Syntax

```
/opt/mapr/server/mrconfig sp list [-v] [sp path]
```

Parameters

| Parameter | Description |
|-----------|--|
| path | The device path of the storage pool . If you do not specify the path, information about all storage pools is displayed. If you specify the path, only information about the specified storage pool is displayed; example <code>/dev/sdc</code> |

| Parameter | Description |
|-----------|---|
| -v | Print storage pool and cluster GUID information including whether or not the storage pool is enabled for data-at-rest encryption (DARE), and service pool log (journal) size. |

Examples

Display information about all [storage pools](#) on a local node:

```
/opt/mapr/server/mrconfig sp list
```

Display information about a [storage pool](#) with a path `/dev/sdc` on a local node:

```
/opt/mapr/server/mrconfig sp list /dev/sdc
```

Display [storage pool](#) information including whether or not the [storage pool](#) is DARE-enabled:

```
# /opt/mapr/server/mrconfig sp list -v
ListSPs resp: status 0:2
No. of SPs (2), totalsize 3518339 MB, totalfree 691937 MB

SP 0: name SP1, Online, size 1761217 MB, free 377127 MB, path /dev/
sdb, log 200 MB, port 5660, guid 9dd586829e179476005b0ce23f0dae3c,
clusterUuid -7600986066553737256-4524271553806028052, disks /dev/sdb /dev/
sdd, dare 1
SP 1: name SP2, Online, size 1757121 MB, free 314809 MB, path /dev/
sde, log 200 MB, port 5660, guid daa5916af8909118005b0ce2430d6d54,
clusterUuid -7600986066553737256-4524271553806028052, disks /dev/sde /dev/
sdf, dare 1
```

Display [storage pool](#) information including the labels associated with the [storage pool](#):

```
# /opt/mapr/server/mrconfig sp list -v
ListSPs resp: status 0:1
No. of SPs (1), totalsize 294465 MB, totalfree 293940 MB
SP 0: name SP1, Online, size 294465 MB, free 293940 MB, path /dev/
sdb, log 200 MB, port 5660, guid 7d71f3739cd771cd005f910d2803b865,
clusterUuid -6879590211771954706-6360117451062264043,

disks /dev/sdb /dev/sdc /dev/sdd, dare 1, label default:0
```

mrconfig sp load

The `mrconfig sp load` command loads all of the disks associated with a storage pool.

See [mrconfig](#) for instructions on running `mrconfig` commands.

Syntax

```
mrconfig sp load <sp name>
```

Parameters

| Parameter | Description |
|-----------|---|
| sp name | The name of the storage pool; example SP2 |

Tips:

- Use the `mrconfig sp list` command to see storage pool names (examples SP1, SP2) and the device paths of the storage pools (example `/dev/sdc`).
- Use the `mrconfig disk list` command to see storage pool names (examples SP1, SP2), the device paths of the storage pools (example `/dev/sdc`), and the disks associated with each storage pool (examples `/dev/sdc`, `/dev/sdd`, `/dev/sde`).

Examples

Load the disks associated with the storage pool named SP2 on the local node

```
/opt/mapr/server/mrconfig sp load SP2
```

`mrconfig sp make`

The `mrconfig sp make` command creates a storage pool on a concat disk group.

**Warning: Creating a Storage Pool Causes Data Loss**

Creating a storage pool on a disk group destroys the data on the disks in the disk group, so be sure that all data on the disks in the disk group is backed up and replicated before creating a storage pool.

See `mrconfig` for instructions on running `mrconfig` commands.

Syntax

```
mrconfig sp make <dg path>

[ -P <yes/no> ]
[ -l <LogSize> ]
[ -s <deviceSize> ]
[ -L <Lable> ]
[ -F ]
[ -I <cid> ]
<dg path>
```

Parameters

| Parameter | Description |
|-----------|---|
| -P | Primary partition or not; yes/no |
| -l | Log size in number of blocks; Note that this is a lowercase letter "l" (ell), not the number "1". |
| -s | Disk size in GB |
| -L | Label for this storage pool |
| -F | Force the overwrite of any existing storage pool |
| -I | Initialize the storage pool with one container with the specified container identifier, one directory, and one file. Note that this is an uppercase letter "I" (eye), not the letter "l" (ell) or the number "1". |
| dg path | The device path of the disk group; example <code>/dev/sdc</code> |

Examples

Create a storage pool on a disk group with a path of `/dev/sdc` on a local node

```
/opt/mapr/server/mrconfig sp make /dev/sdc
```

Creating a Storage Pool Using mrconfig

To create a storage pool using `mrconfig`:

1. Assume the disks `/dev/sdb`, `/dev/sdc`, and `/dev/sdd` are available; initialize them with `mrconfig disk init`:

```
/opt/mapr/server/mrconfig disk init /dev/sdb
/opt/mapr/server/mrconfig disk init /dev/sdc
/opt/mapr/server/mrconfig disk init /dev/sdd
```

2. Create a disk group with `mrconfig dg create`:

```
/opt/mapr/server/mrconfig dg create raid0 -d
128 /dev/sdb /dev/sdc /dev/sdd
```

3. Create a concatenated disk group with `mrconfig dg create concat` by specifying the primary drive.

```
/opt/mapr/server/mrconfig dg create concat /dev/sdb
```

4. At this point, you can use `mrconfig dg list` to see the layout of the disk group, and which disk is the primary disk. The primary disk can be used in other commands to refer to the disk group as a whole. Example:

```
/opt/mapr/server/mrconfig dg list
```

5. From the disk group, create a storage pool with `mrconfig sp make`:

```
/opt/mapr/server/mrconfig sp make /dev/sdb
```

mrconfig sp offline

The `mrconfig sp offline` command takes a loaded storage pool offline. When a storage pool is offline it remains loaded into memory but it is not available to MapR filesystem for reads and writes.

The main use of the `mrconfig sp offline` command is to take a storage pool offline so the `fsck` (filesystem check) command can be run on one or more disks or storage pools if there are lost or corrupt containers, directories, tables, files, filelets, or blocks.

After running `fsck` the storage pool is brought back online with the `mrconfig sp online` command, and then typically the `gfsck` (global filesystem check) command would be run on the affected cluster, volumes, or snapshots.

See [mrconfig](#) for instructions on running `mrconfig` commands.

Syntax

```
mrconfig sp offline <sp path>
```

Parameters

| Parameter | Description |
|-----------|---|
| sp path | The device path of the storage pool; example /dev/sdc |

Examples

Offline a loaded storage pool with a path of /dev/sdc on localhost

```
/opt/mapr/server/mrconfig sp offline /dev/sdc
```

`mrconfig sp offline all`

The `mrconfig sp offline all` command takes all of a node's loaded storage pools offline. When a storage pool is offline it remains loaded into memory, but it is not available to MapR filesystem for reads and writes.

The main use of the `mrconfig sp offline all` command is to take all storage pools on a node offline so the `fsck` (filesystem check) command can be run on disks or storage pools if there are lost or corrupt containers, directories, tables, files, filelets, or blocks.

After running `fsck` the storage pools are brought back online with the `mrconfig sp online` command, and then typically the `gfsck` (global filesystem check) command would be run on the affected cluster, volumes, or snapshots.

See [mrconfig](#) for instructions on running `mrconfig` commands.

Syntax

```
mrconfig sp offline all
```

Examples

Offline all storage pools on a local node

```
/opt/mapr/server/mrconfig sp offline all
```

mrconfig sp online

The `mrconfig sp online` command makes an offline storage pool online.

When a storage pool is taken offline with the `mrconfig sp offline` command, the storage pool is not available for reads and writes. Typically this is done so the `fsck` (filesystem check) command can be run to check for or repair filesystem inconsistencies.

After the storage pool is put back online with the `mrconfig sp online` command, the storage pool is once again available for reads and writes, and the `gfsck` (global filesystem check) command can be run on the affected cluster, volumes or snapshots.

See [mrconfig](#) for instructions on running `mrconfig` commands.

Syntax

```
mrconfig sp online <sp path>
```

Parameters

| Parameter | Description |
|-----------|---|
| sp path | The device path of the storage pool; example /dev/sdc |

Examples

Online a storage pool with a path of /dev/sdc on a local node

```
/opt/mapr/server/mrconfig sp online /dev/sdc
```

mrconfig sp refresh

The `mrconfig sp refresh` command reloads the `disktab` file and adds any new disks to filesystem.

See [mrconfig](#) for instructions on running `mrconfig` commands.

Syntax

```
mrconfig sp refresh
```

Examples

Refresh the storage pools on the local node

```
/opt/mapr/server/mrconfig sp refresh
```

mrconfig sp shutdown

The `mrconfig sp shutdown` command offlines all storage pools and stops the MapR filesystem on their disks.

See [mrconfig](#) for instructions on running `mrconfig` commands.

Syntax

```
mrconfig sp shutdown
```

Examples

Offline all storage pools on the local node and stop MapR filesystem on their disks

```
/opt/mapr/server/mrconfig sp shutdown
```

mrconfig sp unload

The `mrconfig sp unload` command unloads all of the disks associated with a storage pool.

See [mrconfig](#) for instructions on running `mrconfig` commands.

Syntax

```
mrconfig sp unload <sp name>
```

Parameters

| Parameter | Description |
|-----------|---|
| sp name | The name of the storage pool; example SP2 |

Tips:

- Use the `mrconfig sp list` command to see storage pool names (examples SP1, SP2) and the device paths of the storage pools (example `/dev/sdc`).
- Use the `mrconfig disk list` command to see storage pool names (examples SP1, SP2), the device paths of the storage pools (example `/dev/sdc`), and the disks associated with each storage pool (examples `/dev/sdc`, `/dev/sdd`).

Examples

Unload the disks associated with the storage pool named SP2 on a local node

```
/opt/mapr/server/mrconfig sp unload SP2
```

mrdirectorystats

Prints the space usage for each directory, for a container.

The `mrdirectorystats` utility, when run for a container, prints the space usage information for all directories, starting from the root of the container. This utility is considerably faster than running `ls -R` command on the root of the container and is useful, for example, in identifying directories which need to be moved out to a different volume while trying to reduce the size of the current namespace container.

Syntax

```
/opt/mapr/server/mrdirectorystats
-c <container_id>
[ -p ]
[ -h ]
```

Parameters

| Parameter | Description |
|-----------|---|
| c | The ID of the container. |
| h | Prints help for running the command. |
| p | Prints only parent file ID (PFid) and other information about the file IDs (fids) in the container. |

Output

When you specify the `-c` option, the utility prints the following information per directory to the console:

| | |
|--------|--|
| DirFid | The directory inode number. |
| files | The number of regular files under the directory. |
| subdir | The number of sub-directories inside the directory. |
| others | The number of other types of files (except directories and regular files), such as device, symlinks, kvstores, tables, etc., inside the directory. |

| | |
|---------------|--|
| tfiles | The total number of regular files stored in the entire directory tree. |
| tsubdir | The total number of sub-directories stored in the entire directory tree. |
| tothers | The total number of other type of files stored in the entire directory tree. |
| cntrBlocks | The space occupied in block size (8k) by the direct blocks of the total regular files (tfiles) in the directory tree, for the current container. |
| fileletBlocks | A rough estimation of the sum of all the data blocks of all the filelets of regular files spread across different data containers. |

Note: The utility also shows volume links if any volume exists in the container.

The utility prints the following if `-p` is specified with `-c`:

| | |
|---------|--|
| Inode | The inode of the file. |
| PFid | The parent file ID. |
| Type | The type of entity in the container. Value can be one of the following: <ul style="list-style-type: none"> Directory — indicates the entity is a directory. VolLink — indicates entity is a volume link. KvStore — indicates entity is KvStore. |
| SubType | The sub-type of the entity in the container. Value can be one of the following: <ul style="list-style-type: none"> Directory — indicates entity is directory. VolLink — indicates entity is a volume link. Table — indicates entity is a table. Entity can be table only if type is KvStore. Tabletmap — indicates entity is a tabletmap. Entity can be tabletmap only if type is KvStore. Schema — indicates entity is a schema. Entity can be schema only if type is KvStore. |

Example

Retrieve the disk space usage information for a container by running the utility with the `-c` option:

```
# ./mrdirectorystats -c 2245
DirFid      files      subdir    others    tfiles     tsubdir    tothers
cntrBlocks  fileletBlocks
2245.16.2   5          3         3         6          4          3
0          65536
2245.39.131308 1          0         0         1          0          0
0          0
2245.40.131310 0          1         0         0          1          0
0          0
2245.41.131312 0          0         0         0          0          0
0          0
```

```
2245.45.131320 0 0 0 0 0 0
0 0
symlinks 2 fidmaps 1 tables 1 schemas 1 tabletmaps 1
```

Retrieve information about the file IDs in the container by running the utility with the `-c` and `-p` option:

```
# ./mrdirectorystats -p -c 2049
Inode :32      PFid: 2049.16.2      Type: VolLink      SubType: VolLink
Inode :33      PFid: 2049.16.2      Type: VolLink      SubType: VolLink
Inode :34      PFid: 2049.16.2      Type: Directory    SubType: Directory
Inode :35      PFid: 2049.34.131372 Type: VolLink      SubType: VolLink
Inode :36      PFid: 2049.16.2      Type: VolLink      SubType: VolLink
Inode :37      PFid: 2049.16.2      Type: VolLink      SubType: VolLink
Inode :38      PFid: 2049.16.2      Type: VolLink      SubType: VolLink
Inode :39      PFid: 2049.16.2      Type: KvStore      SubType: Table
Inode :40      PFid: 2049.16.2      Type: VolLink      SubType: VolLink
Inode :41      PFid: 2049.39.262468 Type: KvStore      SubType: Tabletmap
Inode :42      PFid: 2049.39.262468 Type: KvStore      SubType: Schema
```

mr diagnostics

Gathers node metrics.

The `mr diagnostics` utility [collects metrics on the node](#) on which it is run. Metrics include IO statistics, network throughput, CPU performance, memory consumption, swap space usage, disk usage, disk latency, and MFS throughput for the node.

Syntax

```
/opt/mapr/server/mrdiagnostics start (or) stop (or) restart
```

Parameters

| Parameter | Description |
|-----------|----------------------|
| start | Starts the utility |
| stop | Stops the utility |
| restart | Restarts the utility |

Output

The `mr diagnostics` utility logs the collected metrics as a set of log files in the `/opt/mapr/logs/stats/` directory. A sample collection is as follows:

```
ls /opt/mapr/logs/stats/
guts.m2-mapreng-vm167212.out          sar.dev.m2-mapreng-vm167212.out
gutsmfs.m2-mapreng-vm167212.out
sar.error.dev.m2-mapreng-vm167212.out

Configuration Parameters

The `/opt/mapr/conf/mrdiagnostics.conf` file contains the configuration for the `mrdiagnostics` utility. The parameters are as follows:

| | |
|---------------------------|--|
| stats.log.path | Path in which the output files (<code>*.out</code>) files are placed. The default path is <code>/opt/mapr/logs/stats</code> . |
| stats.log.interval | Frequency at which the metrics are collected. The value is in seconds. The default value is 1 second. |
| stats.log.size | The size at which the output files are rotated. The value is in KB. The default value is 1000000 KB (1 GB). If the total size of all the output files inside the <code>/opt/mapr/logs/stats</code> folder exceeds this value, the output files are compressed to a single tar file and stored in the <code>/opt/mapr/logs</code> folder. |

mrfscommand

Returns the path to the file specified by ID (`fid`).

Before running the utility, ensure that the `LD_LIBRARY_PATH` environment variable is set for the path to the `libjvm.so` file. If necessary, run the following command to set the `LD_LIBRARY_PATH`:

```
export LD_LIBRARY_PATH=/usr/lib/jvm/java/jre/lib/amd64/server/
```

Syntax

```
/opt/mapr/server/mrfscommand fid path -fid <file-ID>
```

Parameters

| Parameter | Description |
|-----------|---------------------|
| fid | The ID of the file. |

Output

On success, returns path to the file specified by ID (`fid`).

On failure, returns error.

Examples

The following examples show file path (on success) and errors returned by the utility.

```
# ./mrfscommand fid path -fid 2115.33.131412
/var/mapr/file1
```

```
# ./mrfscommand fid path -fid 2071.33.1313445
Error: Getting Path for Fid 2071.33.1313445 Failed - Stale file handle (116).
```

```
# ./mrfscommand fid path -fid 2071.33.
Error: Invalid Fid 2071.33.
```

pullcentralconfig

Pulls master configuration files from `/var/mapr/configuration` on the cluster to the local disk, on each node.

The script `/opt/mapr/server/pullcentralconfig` pulls master configuration files from `/var/mapr/configuration` on the cluster to the local disk, on each node.

- If the master configuration file is newer, the local copy is overwritten by the master copy
- If the local configuration file is newer, no changes are made to the local copy

The volume `mapr.configuration` (normally mounted at `/var/mapr/configuration`) contains directories with master configuration files:

- Configuration files in the `default` directory are applied to all nodes
- To specify custom configuration files for individual nodes, create directories corresponding to individual hostnames. For example, the configuration files in a directory named `/var/mapr/configuration/nodes/host1.r1.nyc` are applied only to the machine with the hostname `host1.r1.nyc`.

The following parameters in `warden.conf` control whether central configuration is enabled, and how often `pullcentralconfig` runs:

- `centralconfig.enabled` — Specifies whether to enable central configuration.
- `pollcentralconfig.interval.seconds` — The frequency to check for configuration updates, in seconds.

stubfuse

Simulates a FUSE mount point to determine its read and write performance.

Simulates a FUSE mount point and creates a large test file named `hello`. Use the `dd` command to print the maximum read and write performance of this mount point. The values give you a fair idea of the performance to expect from a MapR POSIX FUSE client. For more information, see [Data Fabric FUSE-Based POSIX Client](#) on page 1357

Note: Use an empty directory for the test, as the contents of this directory are emptied during the test. The files that are created during the test are not present after the test.

Attention: Export the path to `libfuse.so` before running this command. Run:

```
export LD_LIBRARY_PATH="/opt/mapr/lib"
```

Syntax

```
/opt/mapr/bin/stubfuse <mountpoint> [<options>] [-h|--help]
```

Parameters

| Parameter | Description |
|-------------------------|---|
| <code>-h --help</code> | Prints syntax and all supported options. |
| <code>mountpoint</code> | The simulated FUSE mount point. This parameter is required. |
| <code>options</code> | The options that can be specified with the command. Use <code>-h</code> or <code>--help</code> to retrieve the list of supported options. |

Example

Retrieve the read and write performance for the mount point, `/tmp/egmnt`:

- For a write test: `dd if=/dev/zero of=/tmp/egmnt/hello count=100k bs=128k oflag=direct`

Note: The name of the output file has to be `hello`. Else, the command will fail.

- For a read test: `dd if=/tmp/egmnt/hello of=/dev/null count=100k bs=128k`

Note: The name of the input file has to be `hello`. Else, the command will fail.

The output will look similar to the following results:

```
100+0 records in
100+0 records out
5120 bytes (5.1 kB) copied, 0.000233249 s, 22.0 MB/s
```

Configuration Files

This section contains reference information about various configuration files.

Configuration File Permissions

Files located in `/opt/mapr/hadoop-2.x.x/etc/hadoop` are owned by the root user account. To edit these files, you must be logged in as `root` user.

Automatic Rolloff of Old Configuration Files

Whenever you run `configure.sh`, the current `warden.conf`, `mapr-clusters.conf`, `hibernate.cfg.xml`, and `db.conf` configuration files are saved with the current timestamp appended to the name. They are saved to the following directory:

```
/opt/mapr/conf/conf.old
```

These configuration files are saved for backup purposes.

cldb.conf

Contains the configuration for CLDB nodes.

The file `/opt/mapr/conf/cldb.conf` specifies the configuration parameters for the CLDB nodes and the cluster topology.

cldb.containers.cache.entries

Default Value: 1000000

Description: The maximum number of read/write containers available in the CLDB cache.

cldb.default.topologyfileservers

Default Value: `/data`

Description: The default topology for newly-created volumes.

cldb.detect.dup.hostid.enabled

Default Value: `false`

Description: When `true`, CLDB disables *all* nodes with duplicate `hostid`, including new nodes that try to register with duplicate `hostid` *and* the existing node. Alarm `NODE_ALARM_DUPLICATE_HOSTID` is raised. This case requires administrator intervention to correct the `hostid` confusion. If duplicate `hostid` occurs on nodes running CLDB, the cluster may fail to start.

cldb.enable.memory.tracker

Therefore, the alarm is not raised, but the `cldb.log` file in `/opt/mapr/logs/` contains an error message.

Default Value: `false`

Description: Utility that monitors CLDB for memory usage and deadlocks. If `true`, memory allocations in CLDB are tracked. If memory usage of CLDB goes above certain limits, the utility generates core and shuts down the CLDB. Memory limit is configured as:

```
Xmx+non heap memory
constant(default:3072MB)
```

You can change the non-heap memory usage by setting `cldb.memory.max.nonheap.mb` to any custom value.

If CLDB memory usage goes beyond 130% of this limit, the utility dumps and shuts down CLDB. The default value is `false`.

cldb.ignore.posix.only.hb.alarm

Default Value: `1`

Description: By default, this parameter is set to `1` to consider all nodes except edge nodes (nodes that have only POSIX clients and loopback NFS installed) for the [No Heartbeat alarm](#).

Set this parameter to `0` to include both edge as well as cluster nodes for the [No Heartbeat alarm](#).

Note: The edge nodes that went down before changing this parameter are not visible in alarms. However, edge nodes that go down after changing this parameter to `0` will be visible in alarms.

See the `-nfsnodes` option of the [node list](#) on page 1911 command to view edge nodes.

cldb.ignore.stale.zk

Default Value: `false`

Description: When this setting is `true`, the CLDB ignores the ZooKeeper's information regarding the most recent copy of CLDB data. Change this setting to `true` when the ZooKeeper information is stale. Restart the CLDB with this setting. After the CLDB starts, change the setting back to `false` then restart the CLDB again.

Only change this setting on CLDB nodes that are known to have the most recent copy of the CLDB data. Shut down all CLDB processes before changing this variable.

cldb.jmxremote.port

Default Value: `7220`

Description: The CLDB JMX remote port

cldb.max.security.policies

Default Value: `10000`

Description: Defines the maximum number of configured security policies. To prevent users from arbitrarily creating numerous security policies and draining CLDB performance, the maximum number of security policies is limited to 10000 by default.

cldb.min.fileservers

Default Value: `1`

| | |
|---|---|
| cldb.numthreads | <p><i>Description:</i> Number of file servers that must register with the CLDB before the root volume is created.</p> <p><i>Default Value:</i> 10</p> <p><i>Description:</i> The number of threads reserved for use by the CLDB.</p> |
| cldb.pbs.global.master | <p><i>Default Value:</i> 0</p> <p><i>Description:</i> Indicates the global primary cluster for the global namespace. Only the global primary security policy cluster can create/modify security policies. All other secondary security policy clusters can only view or import security policies.</p> |
| cldb.port | <p><i>Default Value:</i> 7222</p> <p><i>Description:</i> The port on which the CLDB listens.</p> |
| cldb.security.blacklist.cleanup.duration.seconds | <p><i>Default Value:</i> 36000</p> <p><i>Description:</i> Ticket blacklist cleanup interval.</p> |
| cldb.security.resolve.user | <p><i>Default Value:</i> 0</p> <p><i>Description:</i> Resolve UID:GID on client OS or on CLDB.</p> |
| cldb.security.user.ticket.duration.seconds | <p><i>Default Value:</i> 1209600</p> <p><i>Description:</i> Default ticket duration</p> |
| cldb.security.user.ticket.max.duration.seconds | <p><i>Default Value:</i> 2592000</p> <p><i>Description:</i> Maximum ticket duration</p> |
| cldb.security.user.ticket.renew.duration.seconds | <p><i>Default Value:</i> 2592000</p> <p><i>Description:</i> Default ticket renew duration</p> |
| cldb.security.user.ticket.renew.max.duration.seconds | <p><i>Default Value:</i> 7776000</p> <p><i>Description:</i> Maximum ticket renew duration</p> |
| cldb.snap.cntr.count.alarm.threshold | <p><i>Default Value:</i> 100000000</p> <p><i>Description:</i> The threshold (in minutes) for raising the CLUSTER_ALARM_TOO_MANY_SNAPSHOT_CONTAINERS alarm.</p> |
| cldb.snap.cntr.count.disable.threshold | <p><i>Default Value:</i> 128000000</p> <p><i>Description:</i> The maximum number of snapshots to allow before disabling snapshot creation.</p> |
| cldb.snap.cntr.count.monitor.interval.minutes | <p><i>Default Value:</i> 60</p> <p><i>Description:</i> The interval of time (in minutes) to elapse between checking the number of snapshots on the cluster.</p> |
| cldb.v2.features.enabled | <p><i>Default Value:</i> 1</p> <p><i>Description:</i> Enables new features added in data-fabric version 2.0. Used only during the upgrade process from v1.x to 2.x to control when new features become active. Once enabled, cannot be disabled.</p> |
| cldb.v3.features.enabled | <p><i>Default Value:</i> 1</p> <p><i>Description:</i> Enables new features added in data-fabric version 3.0. Used only during the upgrade process from a pre-3.0 version to control when new features become active. Once enabled, cannot be disabled.</p> |
| cldb.web.port | <p><i>Default Value:</i> 7221</p> |

| | |
|--------------------------------------|---|
| cldb.zookeeper.servers | <p><i>Description:</i> The port that the CLDB uses for the webserver.</p> <p><i>Default Value:</i> Not Applicable</p> <p><i>Description:</i> The nodes that are running ZooKeeper, in the format <code>\<host:port\></code>.</p> |
| hadoop.version | <p><i>Default Value:</i> Not Applicable</p> <p><i>Description:</i> The version of Hadoop supported by the cluster.</p> |
| net.topology.script.file.name | <p><i>Default Value:</i> Not Applicable</p> <p><i>Description:</i> The path to a script that associates IP addresses with physical topology paths. The script takes the IP address of a single node as input and returns the physical topology that should be associated with the specified node. This association is used only at the time a node is initially added to the cluster. To change topology for nodes already in the cluster, use the <code>maprcli node move</code> command.</p> |
| net.topology.table.file.name | <p><i>Default Value:</i> Not Applicable</p> <p><i>Description:</i> The path to a text file that associates IP addresses with physical topology paths. Each line of the text file is of format <code><hostname/ip> <rack></code>, with the IP address or hostname of one node, followed by the topology to associate with the node. This association is used only at the time a node is initially added to the cluster. To change topology for nodes already in the cluster, use the <code>maprcli node move</code> command.</p> |
| num.volmirror.threads | <p><i>Default Value:</i> 1</p> <p><i>Description:</i> The number of (volume mirror) threads to create to process mirroring requests. The specified number of threads will be created to process requests in parallel; the remaining requests will be in the queue till they are picked up by volume mirror thread.</p> |

Example cldb.conf file

```
#
# CLDB Config file.
# Properties defined in this file are loaded during startup
# and are valid for only CLDB which loaded the config.
# These parameters are not persisted anywhere else.
#
# Wait until minimum number of fileserver register with
# CLDB before creating Root Volume
cldb.min.fileserver=1
# CLDB listening port
cldb.port=7222
# Number of worker threads
cldb.numthreads=10
# CLDB webport
cldb.web.port=7221
# CLDB https port
cldb.web.https.port=7443
# Disable duplicate hostid detection
cldb.detect.dup.hostid.enabled=false
# Deprecated: This param is no longer supported. To configure
# the container cache, use the param cldb.containers.cache.percent
# Number of RW containers in cache
#cldb.containers.cache.entries=1000000
```

```

#
# Percentage (integer) of Xmx setting to be used for container cache
#cldb.containers.cache.percent=20
#
#Frequency of the heartbeat interval

# Topology script to be used to determine
# Rack topology of node
# Script should take an IP address as input and print rack path
# on STDOUT. eg
# $>/home/mapr/topo.pl 10.10.10.10
# $>/mapr-rack1
# $>/home/mapr/topo.pl 10.10.10.20
# $>/mapr-rack2
#net.topology.script.file.name=/home/mapr/topo.pl
#
# Topology mapping file used to determine
# Rack topology of node
# File is of a 2 column format (space separated)
# 1st column is an IP address or hostname
# 2nd column is the rack path
# Line starting with '#' is a comment
# Example file contents
# 10.10.10.10 /mapr-rack1
# 10.10.10.20 /mapr-rack2
# host.foo.com /mapr-rack3
#net.topology.table.file.name=/home/mapr/topo.txt
#
# ZooKeeper address
#cldb.zookeeper.servers=10.10.82.22:5181
# Hadoop metrics jar version
hadoop.version=2.7.0
# CLDB JMX remote port
#cldb.jmxremote.port=7220
num.volmirror.threads=1
# Set this to set the default topology for all volumes and nodes
# The default for all volumes is /data by default
# UNCOMMENT the below to change the default topology.
# For e.g., set cldb.default.topology=/mydata to create volumes
# in /mydata topology and to place all nodes in /mydata topology
# by default
#cldb.default.topology=/mydata
enable.replicas.invariant.check=false

```

Related concepts

[Security Certificate Expiry Alarm](#) on page 2519

Describes the NODE_ALARM_CERTIFICATE_NEAR_EXPIRATION alarm.

core-site.xml

Describes the `core-site.xml` file that contains the configuration that overrides the default core parameters.

The `/opt/mapr/hadoop/hadoop-2.x.x/etc/hadoop/core-site.xml` file contains configuration that override the [default core parameters](#).

Note: `/opt/mapr/hadoop/hadoop-0.20.2/conf/core-site.xml` is a symlink to `/opt/mapr/hadoop/hadoop-2.x/etc/hadoop/core-site.xml`.

To override a default value, specify the new value within the `<configuration>` tags, using the following format:

```
<property>
  <name> </name>
  <value> </value>
  <description> </description>
</property>
```

[Default core Parameters](#) describes the possible entries to place in the `<name>` and `<value>` tags. The `<description>` tag is optional but recommended for maintainability.

 **Warning:** You can examine the current configuration information for this node by using the `hadoop conf -dump` command from a command line.

Default core-site.xml file

```
<?xml version="1.0"?>
<?xml-stylesheet type="text/xsl" href="configuration.xsl"?>

<!-- Put site-specific property overrides in this file. -->

<configuration>

</configuration>
```

Core Parameters

See [Default core Parameters](#).

daemon.conf

The file `/opt/mapr/conf/daemon.conf` specifies the user and group under which MapR services run, and whether all MapR services run as the specified user/group, or only ZooKeeper and FileServer. The configuration parameters operate as follows:

- If `mapr.daemon.user` and `mapr.daemon.group` are set, the ZooKeeper and FileServer run as the specified user/group. Otherwise, they run as `root`.
- If `mapr.daemon.runuser.warden=1`, all services started by the warden run as the specified user. Otherwise, they run as `root`.

Sample daemon.conf file

```
mapr.daemon.user=mapr
mapr.daemon.group=mapr
mapr.daemon.runuser.warden=1
```

db.conf

The file `/opt/mapr/conf/db.conf` specifies configuration parameters for the Metrics database.

 **Warning:** Any time you make changes to the `db.conf` file, you must restart the `hoststats` service and Warden for those changes to take effect.

| Field | Default | Description |
|---------------------------------|-----------------------|--|
| db.url | localhost:3306 | The URL and port for the MySQL server that stores Metrics data. This machine does not need to be a node in the cluster. |
| db.user | root | The MySQL user name. |
| db.passwd | mapr | The MySQL password. If the password contains the <code>&</code> character, it is replaced with the <code>&amp;</code> string in the <code>hibernate.cfg.xml</code> file (following XML parsing standards). |
| db.schema | metrics | The name of the MySQL schema. |
| db.mode | mysql | Reserved for future use. |
| db.driverclass | com.mysql.jdbc.Driver | Reserved for future use. |
| db.joblastaccessed.limit.hours | 48 | Task and task attempt data for a job are purged for jobs that have not been accessed in a number of hours equal to this parameter's value.  Note: Note that there is an error in this parameter's name. Instead of <code>db.joblastaccessed.limit.hours</code> , spelled as the English word <i>accessed</i> , the parameter is written <code>db.joblastaccessed.limit.hours</code> . |
| db.partition.finest.count.days | 3 | Integer number of days for which the finest data granularity is kept. Finest granularity is a ten-second resolution. |
| db.partition.fine.count.days | 15 | Integer number of days for which fine data granularity is kept. Fine granularity is a five-minute average of the finest resolution. |
| db.partition.coarse.count.years | 100 | Integer number of years for which the coarse data granularity is kept. Coarse granularity is a 24-hour average of the fine resolution. |
| metric.file.rotate | 365 | Integer number of days for which metrics files are kept in the local volume for each node. |
| metric.file.cleanupthreshold | 512 | Specifies a size in GB. When the total size of the metrics files exceeds the value of this parameter, all data over 30 days old is cleaned up. |

Example db.conf file

```
db.url=localhost:3306
db.user=root
db.passwd=mapr
db.schema=metrics
db.mode=mysql
db.driverclass=com.mysql.jdbc.Driver
db.joblastaccessed.limit.hours=48
db.partition.finest.count.days=3
db.partition.fine.count.days=15
db.partition.coarse.count.years=100
### How many files with raw node metrics data to keep
metric.file.rotate=365
```

.dfs_attributes

Each directory in MapR storage contains a hidden file called `.dfs_attributes` that controls compression and chunk size. To change these attributes, change the corresponding values in the file.

Example:

```
# lines beginning with # are treated as comments
Compression=lz4
ChunkSize=268435456
```

Valid values:

- Compression: `lz4`, `lz4`, `zlib`, or `false`
- Chunk size (in bytes): a multiple of 65535 (64 K) or zero (no chunks). Example: `131072`

You can also set compression and chunksize using the `hadoop mfs` command.

disktab

Describes the use of the `disktab` file.

On each node, the file `/opt/mapr/conf/disktab` lists all of the physical drives and partitions that have been added to the filesystem. The `disktab` file is created by the `disksetup` command, and automatically updated when disks are added or removed (either using the MapR Control System, or with the `disk add` and `disk remove` commands).

Sample disktab file

```
# MapR Disks Mon Nov 28 11:46:16 2011

exports

Access control for hosts

On each node, the file `/opt/mapr/conf/exports` lists the clusters and mount points available to mount with NFS.

Specify access control for hosts with a space-separated list of hosts, appending `(rw)` for read-write or `(ro)` for read-only access after each host. To specify a default access for all hosts not otherwise specified, add `(rw)` or `(ro)` after a space at the end of a line. The `exports` file follows the same semantics as a standard UNIX exports table. The following export options are supported:

| Export option | Definition |
|------------------|--|
| ro | Provides read-only access. |
| rw | Provides read-write access. |
| root_squash | Squashes root privileges for remote users. For example, you can use: <pre>/mapr (rw,root_squash)</pre> This entry prevents the <code>/mapr</code> directory from being written to by the root user on remote hosts. |
| no_root_squash | Turns off root squashing for remote users. |
| all_squash | Squashes every remote user, including root. |
| anonuid, anongid | Specifies user and group IDs to use with remote users from a particular host. |

Restricting clusters to specific hosts

To restrict access to a specific export path to particular hosts, use the following format:

```
<Path> <space-separated list of hosts and access rights>
```

For example, the line `/mapr/cluster1 host01(rw) host02(ro)` restricts read-write access to the cluster in `/mapr/cluster1` to host `host01`, and restricts read-only access to host `host02`. No other hosts have access.

Note: After making changes to this file, you do not have to restart the NFS server. You can run a `maprcli` command to refresh the exports definition without a restart. See [nfsmgmt](#) refresh exports.

Enabling Central Configuration

To enable [Central Configuration](#) for exports, specify a value for the `AutoRefreshExportsTimeInterval` parameter in the `/opt/mapr/conf/nfsserver.conf` file. The value of the `AutoRefreshExportsTimeInterval` parameter determines the number of minutes after which the NFS server refreshes the `exports` file. The default value of 0 disables central configuration for NFS exports.

Sample exports file

```
# Sample Exports file

# for /mapr exports
# <Path> <exports_control>

#access_control -> order is specific to default
# list the hosts before specifying a default for all
# host01(ro) host02(ro) host03(ro) (rw)
# enforces ro for a.b.c.d & 1.2.3.4 and everybody else is rw

# special path to export clusters in mapr-clusters.conf. To disable
exporting,
# comment it out. to restrict access use the exports_control
#
/mapr (rw)

#to export only certain clusters, comment out the /mapr & uncomment.
# Note: this will cause /mapr to be unexported
#/mapr/clustername (rw)

#to export /mapr only to certain hosts (using exports_control)
#/mapr a.b.c.d(rw) e.f.g.h(ro)

# export /mapr/cluster1 rw to a.b.c.d & ro to e.f.g.h (denied for others)
#/mapr/cluster1 a.b.c.d(rw) e.f.g.h(ro)

# export /mapr/cluster2 only to e.f.g.h (denied for others)
#/mapr/cluster2 e.f.g.h(rw)

# export /mapr/cluster3 rw to e.f.g.h & ro to others
#/mapr/cluster2 e.f.g.h(rw) (ro)
```

FileMigrate.properties

| Properties | | Default Value | Description |
|----------------------------|-----------------------------------|---------------|---|
| UI Setting | Property File | | |
| Full Scan Frequency | upload.fullScanFrequencyMin | 60 | <p>Frequency, in minutes, at which full scan of all files detect changes missed by lite scans and purge (per the configured policy) uploaded files.</p> <p> Note: The actual time of a full scan is computed on a per directory basis and spread randomly around the specified fullScanFrequency. Thus specifying 60 minutes does not mean that all directories get a full scan at exactly 60 minutes. Instead, directories randomly get a full scan on average every 60 minutes (somewhere between 30 and 90 minutes). This approach avoids load spikes.</p> |
| Upload Scan Frequency | upload.scanFrequencySec | 60 | <p>Frequency, in seconds, at which light scans of directories detect changes since the last scan. This value cannot be below 10 seconds.</p> |
| Completion Scan Frequency | upload.completionScanFrequencySec | 3 | <p>Frequency, in seconds, for checking upload status.</p> <p>This impacts the time delay before the queue is cleared for more uploads, the reporting time for completion, and statistics collection.</p> <p> Note: Values below the default may consume extra system resources.</p> |
| Minimum Wait Before Upload | upload.minWaitBeforeUploadSecs | 15 | <p>Length of time, in seconds, to wait for uploading a file since the file was last modified. Set a higher value to avoid uploading a file still being modified.</p> |

| Properties | | | |
|--------------------------------|---|---------------|---|
| UI Setting | Property File | Default Value | Description |
| Maximum Active Uploads | upload.maxActiveUploads | 10 | Maximum number of files to upload concurrently. The scanning component of the file migration service is paused when 10 times this many files are waiting for upload. |
| Minimum Wait After Failure | upload.minWaitAfterFailureSecs | 300 | Amount of time, in seconds, to wait (pause) before retrying if upload fails or if there is an error in the filesystem. |
| Maximum Retries Per File | upload.maxErrorsOnOneFileBeforeGiveUp | 10 | Maximum number of times to attempt to upload a file. If the limit is reached, the file is dequeued to allow other files to be uploaded and the file modification time does not change. The dequeued file is rediscovered and queued for upload during the next full scan. |
| Maximum System Retries | upload.maxErrorsBeforeAssumeSystemIssue | 10 | Maximum number of errors to allow before pausing all uploads. If this limit is reached, uploads continue only after the amount of time specified as value for the minWaitAfterFailureSecs property has elapsed. |
| Minimum Idle Time Before Error | upload.minIdleTimeBeforeErrorSec | 300 | Amount of time, in seconds, to wait before logging a warning (in the filemigrate.log file) if all uploads are not progressing. |

| Properties | | | |
|------------------------|----------------------------------|---------------|---|
| UI Setting | Property File | Default Value | Description |
| Bucket Location Region | <code>aws.region</code> | | <p>Region information as defined here. For:</p> <ul style="list-style-type: none"> Older regions, specify the short region name. New regions, specify the short region name and the region endpoint. <p>The following regions can be specified using just the region name: <code>us-east-1</code>, <code>us-west-1</code>, <code>us-west-2</code>, <code>ap-northeast-1</code>, <code>ap-southeast-1</code>, <code>ap-southeast-2</code>, <code>sa-east-1</code>, <code>eu-west-1</code>, <code>cn-north-1</code>, <code>us-gov-west-1</code>. For all other regions, you might have to specify the endpoint as well.</p> <p> Note: When you create a bucket in a region, verify that the bucket is really in that region; in some cases, buckets for one region are actually hosted elsewhere.</p> |
| Region Endpoint | <code>aws.regionendpoint</code> | | The AWS region endpoint. |
| Proxy Host | <code>aws.proxyHost</code> | | (Optional) Proxy host information. |
| Proxy Port | <code>aws.proxyPort</code> | | |
| Proxy Username | <code>aws.proxyUsername</code> | | |
| Proxy Password | <code>aws.proxyPassword</code> | | |
| Access Key | <code>aws.accessKey</code> | | Credentials to use for accessing the S3 bucket. |
| Secret Key | <code>aws.secretKey</code> | | |
| Directory Path | <code>dir<N>.path</code> | | <p>The path from which the scan of the directory or root directory starts. Replace <code><N></code> with an integer; for each additional directory tree, increment the number and specify a unique path.</p> <p> Note: Do not create multiple policies or directory configurations pointing to the same filesystem location.</p> |
| Target Bucket | <code>dir<N>.bucket</code> | | The Amazon S3 bucket to upload to. |

| Properties | | | |
|--------------------------|--------------------------------------|---------------|---|
| UI Setting | Property File | Default Value | Description |
| Purge Interval | dir<N>.purgepolicy.hours | 0 | Amount of time, in hours, after the file was last modified to wait before deleting the file. The default value is never delete (0).  Note: Deletion is delayed until after the file upload occurs, regardless of the purge time set. |
| Delete Empty Directories | dir<N>.deleteEmptyDirectoryDelayMins | 0 | Amount of time to wait, in minutes, before deleting empty directories. The default value is never delete (0). |
| Server Side Encryption | dir<N>.serverSideEncrypt | false | Specify whether (<code>true</code>) or not (<code>false</code>) S3 server side encryption should be used. If the value is <code>true</code> (enabled), the TransferManager API that specifies AES256 encryption is used automatically for each uploaded file. |

| Properties | | | |
|--------------------|-------------------------|---------------|--|
| UI Setting | Property File | Default Value | Description |
| Ignore Files Regex | dir<N>.ignoreFilesRegex | | <p>File and directory names to ignore, specified as regex pattern, as defined by <code>java.util.regex</code>. For example:</p> <ul style="list-style-type: none"> <code>.*\.TEMP\$</code> - ignore all files/directories ending in <code>.TEMP</code> <code>.*TEMP.*</code> - ignore all files/directories that contain the phrase <code>TEMP</code> <code>^TEMP.*</code> - ignore all files/directories that start with <code>TEMP</code> <p>Specify a single regular expression that matches multiple patterns, as shown in the following examples:</p> <ul style="list-style-type: none"> <code>dir2.ignoreFilesRegex=^IGNORE.* .*\.TMP\$</code> <code>dir2.ignoreFilesRegex=^IGNORE.* .*\.TMP\$.*\\.TXT\$.*\\.txt\$</code> <code>dir2.ignoreFilesRegex=^temp\$</code> |

| Properties | | Default Value | Description |
|--------------|---------------|---------------|--|
| UI Setting | Property File | | |
| X-Attributes | dir<N>.xattrs | | <p>The space-separated list of AWS S3 attributes to copy from filesystem to AWS S3 bucket when uploading a file. Make a note of the following:</p> <ul style="list-style-type: none"> • While filesystem attributes can be strings or binary, AWS S3 attributes must be strings. • While filesystem attribute names are case sensitive, AWS S3 attribute names are case insensitive. <p> Note: Only extended attributes from MapR filesystem that start with <code>user.</code> are considered for upload (since all user settable attributes begin with <code>user.</code>). The attribute must be specified without <code>user.</code>. For example, to upload a file with the extended attribute name <code>user.foo</code>, the value for this property must be <code>foo</code> because the <code>user.</code> is implicit.</p> <p>Extended attributes are uploaded when the file is first uploaded. If extended attributes are set after file upload, the extended attributes are not sent to AWS S3 unless the file modification timestamp changes.</p> |

| Properties | | | |
|-------------------|-------------------|---------------|---|
| UI Setting | Property File | Default Value | Description |
| Authorized Users | authorized.users | mapr | <p>The comma-separated list of users who can login and use the File Migration Service. The UI authorizes the following users to login and use the service:</p> <ul style="list-style-type: none"> The owner of the file migrate process (on the cluster, this is MAPR_USER). Any users belonging to the comma-separated list of authorized users specified here. Any users belonging to any group in the comma-separated list specified using <code>authorized.groups</code> property. <p>The default value is the MAPR_USER (who is mapr, by default) specified with the configure.sh on page 2331 utility.</p> |
| Authorized Groups | authorized.groups | mapr | <p>The comma-separated list of groups authorized to login and use the service. The default value is the MAPR_USER (mapr, by default) specified with the configure.sh on page 2331 utility.</p> |

gateway.conf

Describes configuration parameters for the data-fabric gateway.

The `/opt/mapr/conf/gateway.conf` file specifies configuration parameters for the gateway that supports table and stream replication.

 **Warning:** Changing the default settings in the `gateway.conf` file is not recommended and is not likely to improve performance. If you still need to make changes to the `gateway.conf` file, you must restart the gateway after doing so. See [Configuring Gateways for Table and Stream Replication](#) on page 1271.

| Field | Default | Description |
|----------------------------|---------|--|
| gateway.port | 7660 | The gateway listening port. |
| gateway.receive.numthreads | 128 | The number of worker threads to receive replication stream requests. |
| gateway.flush.numthreads | 128 | The number of flush threads to send put requests to replicas. |

| Field | Default | Description |
|-------------------------------|---------|---|
| gateway.put.mem.mb | 128 | The maximum size limit (in MB) of the putbuffer memory. |
| gateway.logfile.size.mb | 1024 | The maximum size limit (in MB) of the data-fabric gateway log file. When the size limit is reached, the logs get rolled over. |
| gateway.es.request.maxsize.kb | 128 | The maximum size limit (in KB) of replication requests distributed by data-fabric source clusters. <i>This property is no longer supported.</i> |
| gateway.es.cluster.maxClients | 1 | Max number of clients for the HPE Ezmeral Data Fabric Event Streams. <i>This property is no longer supported.</i> |

Example gateway.conf file

```
#
# Gateway Config file.
# Properties defined in this file are loaded during startup
# and are valid for only Gateway which loaded the config.
# These parameters are not persisted anywhere else.
#
# Gateway listening port
#gateway.port=7660
# Number of worker threads to receive replication stream requests
#gateway.receive.numthreads=128
# Number of flush threads to send put requests to replicas
#gateway.flush.numthreads=128
#
# Max limit on putbuffer memory in MB
#gateway.put.mem.mb=128
#
# Max limit on log file size
#gateway.logfile.size.mb=1024
#
#
# Gateway ES properties
#gateway.es.request.maxsize.kb=128
#gateway.es.cluster.maxClients=1
```

Related concepts

[Administering Data Fabric Gateways](#) on page 1269

A HPE Ezmeral Data Fabric gateway mediates one-way communication between a source HPE Ezmeral Data Fabric cluster and a destination cluster. You can replicate HPE Ezmeral Data Fabric Database tables (binary and JSON) and HPE Ezmeral Data Fabric Event Streams streams. HPE Ezmeral Data Fabric gateways also apply updates from JSON tables to their secondary indexes and propagate Change Data Capture (CDC) logs.

[Configuring Gateways for Table and Stream Replication](#) on page 1271

Configuring gateways involves installing the `mapr-gateway` package on nodes on a data-fabric destination cluster and then configuring the data-fabric source cluster to communicate with the destination cluster. The data-fabric source cluster is configured by specifying the destination cluster's CLDB node and gateway nodes.

[Gateways for Replicating HPE Ezmeral Data Fabric Database Tables](#) on page 584

In HPE Ezmeral Data Fabric Database table replication, HPE Ezmeral Data Fabric Database replicates updates to tables (binary and JSON) on source data-fabric clusters to replicas of those tables on destination data-fabric clusters. Gateways are services that receive these updates and apply them to the replicas. These gateways also propagate updates from JSON tables to their secondary indexes.

Related tasks

[Specifying the Location of Gateways](#) on page 859

Describes how to set the location of the HPE Ezmeral Data Fabric gateways using either the Control System or the CLI.

Related reference

[cluster gateway delete](#) on page 1743

Deletes the list of data-fabric gateways from a source data-fabric cluster.

[cluster gateway get](#) on page 1745

Lists the data-fabric gateways that a source data-fabric cluster is using.

[cluster gateway list](#) on page 1747

Lists all of the gateways that a source data-fabric cluster is using.

[cluster gateway local](#) on page 1748

Lists the gateways that are configured on the data-fabric cluster where this command is run.

[cluster gateway resolve](#) on page 1751

Lists the gateways configured on a data-fabric cluster that are up and running at the time that the command is issued.

[cluster gateway set](#) on page 1753

Specifies the locations of the data-fabric gateways that a source data-fabric cluster can use for table replication to a destination data-fabric cluster, or for indexing table data in an Elasticsearch cluster.

[Managing Gateways](#) on page 1273

Describes the commands for listing gateways, checking status of gateways, managing gateways if they fail, and troubleshooting gateways.

mapr.login.conf

The MapR Converged Data Platform uses the Java Authentication and Authorization Service (JAAS) to control security features. The `/opt/mapr/conf/mapr.login.conf` file specifies configuration parameters for JAAS. Contact MapR support before changing any parameters in this file other than the ones listed in this document.

The MAPR_SERVER_KERBEROS Stanza

The CLDB uses this stanza to verify users that are authenticating with Kerberos. This stanza requires the `com.sun.security.auth.module.Krb5LoginModule` module.

| Attribute | Default Value | Description |
|-----------|---|--------------------------------|
| keyTab | <code>"/opt/mapr/conf/mapr.keytab"</code> | File path to the keytab file. |
| principal | <code>"mapr/my.cluster.com"</code> | The Kerberos principal to use. |

The MAPR_WEBSERVER_KERBEROS Stanza

Web UIs on the cluster use this stanza to evaluate SPNEGO requests. This stanza requires the `com.sun.security.auth.module.Krb5LoginModule` module.

| Attribute | Default Value | Description |
|-----------|---|-------------------------------|
| keyTab | <code>"/opt/mapr/conf/mapr.keytab"</code> | File path to the keytab file. |

| Attribute | Default Value | Description |
|-----------|-----------------|--|
| principal | "HTTP/yourhost" | The principal <i>must</i> be HTTP. This principal is used to negotiate authentication for Web services over SPNEGO. You can set the value for <i>yourhost</i> manually, but be aware that you must set the principal in the <code>mapr.keytab</code> file to match this value. |

The jpamLogin Stanza

The MapR cluster uses this stanza to verify user ID and password authentication to all the servers on the cluster. You can modify this stanza to alter the PAM configuration used by the cluster. The `net.sf.jpam.jaas.JpamLoginModule` module is sufficient for this stanza. There are three provided default services. The order of the `serviceName` in the stanza (at cluster startup) determines which PAM configuration file to use. If a failure occurs with a configuration, MapR ignores the error and proceeds with the next entry.

| Attribute | Provided Default Values | Description |
|-------------|--|--|
| serviceName | <ul style="list-style-type: none"> sudo sshd mapr-admin | <p>The PAM configurations to use for validating passwords, shown in their order of use.</p> <p>The configuration files are typically in <code>/etc/pam.d</code>.</p> |

Other Stanzas

The `Server`, `Client`, `Server_simple`, `Client_simple`, and `hadoop_maprsasl` stanzas control important aspects of your cluster's stability. Consult with MapR support before modifying these stanzas.

mapr-clusters.conf

Provides information and instructions for configuring clusters to create the global namespace.

You can define one or more clusters in the `/opt/mapr/conf/mapr-clusters.conf` file on a node or client. To define a cluster, you specify the CLDB nodes in the cluster. Defining a cluster creates the global namespace. Note that the `mapr-clusters.conf` file on each node or client must have the same cluster configuration and naming convention to create the global namespace.

The following section describes the configuration format of the `mapr-clusters.conf` file:

Format:

```
<cluster-name1> secure=false <CLDB> <CLDB> ... <CLDB>
[ clustername2 <CLDB> <CLDB> <CLDB> ]
[ ... ]
```

The `<CLDB>` string format can contain multiple space-separated instances of the following:

- `host:ip:port` - Host, IP, and port (uses DNS to resolve hostnames, or provided IP if DNS is down)
- `host:port` - Hostname and IP (uses DNS to resolve host, specifies port)
- `ip:port` - IP and port (avoids using DNS to resolve hosts, specifies port)
- `host` - Hostname only (default, uses DNS to resolve host, uses default port)
- `ip` - IP only (avoids using DNS to resolve hosts, uses default port)

You can edit `mapr-clusters.conf` manually to add more clusters. For example:

```
<cluster-name3> <CLDB> <CLDB> <CLDB>
```

Security enabled, with and without Kerberos

With security enabled, without Kerberos, the format for the `mapr-clusters.conf` file is:

```
<clusternam1> secure=true <CLDB> <CLDB> ... <CLDB>
  [ <clusternam2> <CLDB> <CLDB> ... <CLDB> ]
  [ ... ]
```

With Kerberos enabled, the format for the `mapr-clusters.conf` file is:

```
<clusternam1> secure=true kerberosEnable=true <CLDB> <CLDB> ... <CLDB>
  [ <clusternam2> <CLDB> <CLDB> ... <CLDB> ]
  [ ... ]
```

Note: Before renaming a cluster using the `mapr-clusters.conf` file, stop the warden on all the nodes.

Adding multihomed CLDB entries to `mapr-clusters.conf` with `configure.sh`

In this example, the cluster `my.cluster.com` has CLDB servers at `nodeA`, `nodeB`, `nodeC`, and `nodeD`. The CLDB servers `nodeB` and `nodeD` have two NICs each at `eth0` and `eth1`. The entries in `mapr-clusters.conf` are separated by spaces for each server's entry. Within a server's entry, individual interfaces are separated by semicolons (`;`).

The command

```
configure.sh -N my.cluster.com -C nodeAeth0,nodeCeth0 -M
nodeBeth0,nodeBeth1 -M nodeDeth0,nodeDeth1 -Z zknodeA
```

generates the following entry in `mapr-clusters.conf`:

```
my.cluster.com nodeAeth0 nodeBeth0;nodeBeth1 nodeCeth0 nodeDeth0;nodeDeth1
```

Cluster Limits

There is no limit for the number of clusters for HDFS and NFSv3. However, the maximum number of clusters for FUSE is 16.

mapred-site.xml

Lists the parameters for MapReduce configuration.

MapReduce is a type of application that can run on the Hadoop 2.x framework. MapReduce configuration options are stored in the `/opt/mapr/hadoop/hadoop-2.x.x/etc/hadoop/mapred-site.xml` file and are editable by the `root` user. This file contains configuration information that overrides the default values for MapReduce parameters. Overrides of the default values for core configuration properties are stored in the [HPE Ezmeral Data Fabric Parameters](#) on page 2532 file.

To override a default value for a property, specify the new value within the `<configuration>` tags, using the following format:

```
<property>
  <name> </name>
  <value> </value>
  <description> </description>
</property>
```

Configurations for MapReduce Applications

The configuration comprises the following parameters:

| | |
|--|---|
| mapreduce.framework.name | <i>Value:</i> yarn <i>Description:</i> Execution framework set to Hadoop YARN. |
| mapreduce.input.fileinputformat.split.maxblocknum | <i>Value:</i> 0 <i>Description:</i> Number of blocks that can be added to one split. A value of 0 means that a single split is generated per node. |
| mapreduce.map.memory.mb | <i>Value:</i> 1024 <i>Description:</i> Larger resource limit for maps. |
| mapreduce.map.java.opts | <i>Value:</i> -Xmx900m --add-opens java.base/java.lang=ALL-UNNAMED -XX:+UseParallelGC <i>Description:</i> Larger heap-size for child jvms of maps. |
| mapreduce.reduce.memory.mb | <i>Value:</i> 3072 <i>Description:</i> Larger resource limit for reduces. |
| mapreduce.reduce.java.opts | <i>Value:</i> -Xmx2560m --add-opens java.base/java.lang=ALL-UNNAMED -XX:+UseParallelGC <i>Description:</i> Larger heap-size for child jvms of reduces. |
| mapreduce.task.io.sort.mb | <i>Value:</i> 512 <i>Description:</i> Higher memory limit while sorting data for efficiency. |
| mapreduce.task.io.sort.factor | <i>Value:</i> 100 <i>Description:</i> More streams merged at once while sorting files. |
| mapreduce.reduce.shuffle.parallelcopies | <i>Value:</i> 50 <i>Description:</i> Higher number of parallel copies run by reduces to fetch outputs from very large number of maps. |

Configurations for MapReduce JobHistory Server

The configuration comprises the following parameters:

| | |
|--|--|
| mapr.localspill.expiration.date | <i>Value:</i> days <i>Description:</i> Property to determine spill files expiration date in days. Default value is 30 days. |
| mapreduce.jobhistory.address | <i>Value:</i> MapReduce JobHistory Server <i>host:port</i> <i>Description:</i> Default port is 10020. |
| mapreduce.jobhistory.webapp.address | <i>Value:</i> MapReduce JobHistory Server Web UI <i>host:port</i> <i>Description:</i> Default port is 19888. |
| mapreduce.jobhistory.intermediate-done-dir | <i>Value:</i> /mr-history/tmp <i>Description:</i> Directory where history files are written by MapReduce applications. |
| mapreduce.jobhistory.intermediate-done-scan-timeout | <i>Value:</i> milliseconds |

| | |
|--|--|
| mapreduce.jobhistory.done-dir | <p><i>Description:</i> Timeout in milliseconds for rescanning the <code>done_intermediate</code> user directory to reduce JobHistory Server loading. Information about a job is received with a delay equal to the timeout. Adjust the setting based on the cluster load. Start with 5000 ms and increase timeout as needed.</p> <p><i>Value:</i> <code>/mr-history/done</code></p> <p><i>Description:</i> Directory where history files are managed by the MapReduce JobHistory Server.</p> |
| mapreduce.jobhistory.webapp.https.address | <p><i>Value:</i> Secure MapReduce JobHistory Server Web UI <code>host:port</code> (HTTPS)</p> <p><i>Description:</i> Default port is 19890.</p> |

Sample Hadoop 2.x `mapred-site.xml` File

The following `mapred-site.xml` file defines values for two job history parameters.

```
<configuration>
  <property>
    <name>mapreduce.jobhistory.address</name>
    <value>__HS_IP__:10020</value>
  </property>
  <property>
    <name>mapreduce.jobhistory.webapp.address</name>
    <value>__HS_IP__:19888</value>
  </property>
</configuration>
```

Configuration for Apache Shuffle

You can disable Direct Shuffle and enable Apache Shuffle for MapReduce applications through the following settings:

| | |
|---|---|
| mapreduce.job.shuffle.provider.services | <i>Value:</i> <code>mapreduce_shuffle</code> |
| mapreduce.job.reduce.shuffle.consumer.plugin.class | <i>Value:</i> <code>org.apache.hadoop.mapreduce.task.reduce.Shuffle</code> |
| mapreduce.job.map.output.collector.class | <i>Value:</i> <code>org.apache.hadoop.mapred.MapTask\$MapOutputBuffer</code> |
| mapred.ifile.outputstream | <i>Value:</i> <code>org.apache.hadoop.mapred.IFileOutputStream</code> |
| mapred.ifile.inputstream | <i>Value:</i> <code>org.apache.hadoop.mapred.IFileInputStream</code> |
| mapred.local.mapoutput | <i>Value:</i> <code>true</code> |
| mapreduce.task.local.output.class | <i>Value:</i> <code>org.apache.hadoop.mapred.YarnOutputFiles</code> |

mfs.conf

Lists the parameters of the MFS configuration file.

The configuration file `/opt/mapr/conf/mfs.conf` specifies the following parameters about the filesystem server on each node.

 **Warning:** You must restart the File Server after making changes to this file.

Parameters

| | |
|---|--|
| <code>mfs.server.ip</code> | <p><i>Default Value:</i> Not applicable</p> <p>Description: IP address of the File Server. For example, 192.168.10.10.</p> |
| <code>mfs.server.port</code> | <p><i>Default Value:</i> 5660</p> <p>Description: Port used for communication with the server.</p> |
| <code>mfs.cache.lru.sizes</code> | <p><i>Default Value:</i></p> <ul style="list-style-type: none"> For version 4.0.1: inode:6:log:6:meta:10:dir:40:small:15 For version 4.0.2 and later versions: inode:3:meta:6:small:27:dir:15:db:20:valc:3 <p>Description: LRU cache configuration. See the section, Notes on LRU Cache Configuration for more information.</p> |
| <code>mfs.on.virtual.machine</code> | <p><i>Default Value:</i> false</p> <p>Description: Specifies whether the filesystem is running on a virtual machine.</p> |
| <code>mfs.io.disk.timeout</code> | <p><i>Default Value:</i> 60 seconds</p> <p>Description: Timeout, in seconds, after which a disk is considered failed and taken offline. You can increase the timeout to tolerate slow disks.</p> |
| <code>mfs.max.disks</code> | <p><i>Default Value:</i> 48</p> <p>Description: Maximum number of disks supported on a single node.</p> |
| <code>mfs.max.logfile.size.in.mb</code> | <p><i>Default Value:</i> 1000 MB</p> <p>Description: The maximum amount of disk space that the MFS logs can consume before the oldest log file is deleted; based on the following calculation:</p> $\text{maxSizePerLogFile} = \text{maxLogSize} / \text{MAX_NUM_OF_LOG_FILES}$ <p>where</p> <ul style="list-style-type: none"> <code>maxLogSize</code> = total amount of space that MFS log files can consume <code>MAX_NUM_OF_LOG_FILES</code> = total number of MFS log files |
| <code>mfs.max.resync.count</code> | <p><i>Default Value:</i> 16</p> <p>Description: The number of parallel resync operations.</p> |
| <code>mfs.subnets.whitelist</code> | <p><i>Default Value:</i> Not Applicable</p> <p>Description: A list of subnets (up to 256 characters) that are allowed to make requests to the File Server service and access data on the cluster.</p> |
| <code>mfs.disk.iothrottle.count</code> | <p><i>Default Value:</i> 100</p> |

| | |
|--|--|
| | Description: The maximum number of outstanding requests on disk. |
| |  Note: You can disable throttling by setting a high value. This option is disabled if you set the value for <code>mfs.disk.is.ssd</code> to 1. |
| <code>mfs.disk.resynciothrottle.factor</code> | <i>Default Value:</i> 20 Description: Controls the amount of time to wait before submitting a request to disk. Increasing this value reduces the wait time, and decreasing this value increases the wait time. For example, setting the value to 40, halves the wait time, while setting the value to 10, doubles the wait time. |
| <code>mfs.network.resynciothrottle.factor</code> | <i>Default Value:</i> 20 Description: Controls the amount of time to wait before sending a resync operation over the network. Increasing this value reduces the wait time, and decreasing this value increases the wait time. For example, setting the value to 40, halves the wait time, while setting the value to 10, doubles the wait time. |
| <code>mfs.ssd.trim.enabled</code> | <i>Default Value:</i> 0 Description: Set this parameter to 1 to enable TRIM operations for SSD devices. |
| |  Note: Enable TRIM only if it is recommended by the SSD vendor. |
| <code>mfs.disk.is.ssd</code> | <i>Default Value:</i> 0 Description: Specifies whether (1) or not (0) the drives are SSD. If the value is 0, the drives are assumed to be rotations. If the value is 1, the noop scheduler on the SSD is automatically enabled, and I/O throttling is disabled. |
| <code>mfs.mem.debug.enabled</code> | <i>Default Value:</i> 0 Description: Specifies whether file server should (1) or should not (0) track all memory allocations. The default value is 0. If value is 1, you can determine the root cause for high memory allocation, or determine the component consuming the most memory. |
| <code>mfs.numrpthreads</code> | <i>Default Value:</i> 2 Description: Specifies the number of RPC threads per MFS instance. The valid range of values is from 1 to 4. |
| <code>mfs.db.max.concurrent.internal.ops</code> | <i>Default Value:</i> 73728 (72 * 1024) <i>Max Value:</i> 131072 (128 * 1024) <i>Min Value:</i> 36864 (36 * 1024) Description: Regulates how many BatchGet operations can run in parallel when secondary indexes are present on the table. PUT operations on tables with secondary indexes convert to BatchGet operations on the tables. PUT operations that convert to a high volume of BatchGets can degrade performance. BatchGet operations are spread equally across three threads (73728/3). Run <code>mrconfig dbinfo threads</code> to evaluate the throttling queue for each thread. |
| <code>mfs.num.compress.threads</code> | <i>Default Value:</i> 1 |

| | |
|--|---|
| <code>mfs.max.aio.events</code> | Description: Reserved for internal use. <i>Default Value:</i> 5000 |
| <code>mfs.disable.periodic.flush</code> | Description: Reserved for internal use. <i>Default Value:</i> 0 |
| <code>mfs.ignore.container.delete</code> | Description: Reserved for internal use. <i>Default Value:</i> 0 |
| <code>mfs.ignore.readdir.pattern</code> | Description: Reserved for internal use. <i>Default Value:</i> 0 |
| <code>mfs.disable.IO.affinity</code> | Description: Reserved for internal use. <i>Default Value:</i> 0 |
| <code>mfs.deserialize.length</code> | Description: Reserved for internal use. <i>Default Value:</i> 8192 |
| <code>mfs.enable.nat</code> | Description: Reserved for internal use. <i>Default Value:</i> 0 |
| <code>mfs.bulk.writes.enabled</code> | Description: Reserved for internal use. <i>Default Value:</i> 0 |

Example

```
mfs.server.ip=192.168.10.10
mfs.server.port=5660
mfs.cache.lru.sizes=inode:3:meta:6:small:27:dir:15:db:20:valc:3
mfs.on.virtual.machine=0
mfs.io.disk.timeout=60
mfs.max.disks=48
```

Notes on LRU Cache Configuration

The cache values are expressed as percentages, which vary based on the expected size of the data that the node is required to cache. The goal is to achieve a state in which most of the required data comes directly from the cache. You may need to tune the cache percentages based on your cluster configuration and the workload on specific nodes. Non-default allocations tend to work better for nodes that run only CLDB and nodes that do not have CLDB but do have a heavy HPE Ezmeral Data Fabric Database workload. Note the following recommendations.

- For CLDB-only nodes, increase the size of the cache for Dir LRU to 40%: change `dir:15` to `dir:40`. A CLDB-only node is a file server node that hosts only the CLDB volume `mapr.cldb.internal` (no user volume data is hosted on the node). Dir LRU is used to host B-tree pages.
- For non-CLDB nodes with no HPE Ezmeral Data Fabric Database workload, optimize the cache to host as many file pages as possible. Change the value of the parameter to: `inode:3:meta:6:small:27:dir:6`

The remainder of the cache is used to cache file data pages.

Note: You need to restart MFS for the change in `mfs.conf` to take effect.

`nfsserver.conf`

Lists the parameters for the data-fabric NFS server.

The file `/opt/mapr/conf/nfsserver.conf` controls parameters related to data-fabric services and the warden. Most of the parameters are not intended to be edited directly by users. The following list shows the parameters of interest:

| | |
|--------------------------|--|
| Compression | <p><i>Default Value:</i> true</p> <p><i>Description:</i> Indicates whether compression is on (true) or off (false).</p> |
| ChunkSize | <p><i>Default Value:</i> 67108864 bytes (64 MB)</p> <p><i>Description:</i> Size of each chunk.</p> |
| CompThreads | <p><i>Default Value:</i> 2</p> <p><i>Description:</i> Number of threads for compression or decompression.</p> |
| DrCacheSize | <p><i>Default Value:</i> 20480</p> <p><i>Description:</i> Duplicate request cache size.</p> |
| DrCacheTimeout | <p><i>Default Value:</i> 62 seconds</p> <p><i>Description:</i> Duplicate request cache timeout in seconds.</p> |
| DRCacheTimeOutOpt | <p><i>Default Value:</i> 0.5</p> <p><i>Description:</i> If the operations take more than $\text{DrCacheTimeout} * \text{DRCacheTimeOutOpt}$, the operations are not cached. For example, by default, if the operation takes more than 31 seconds — $(62 * .5) = 31$ seconds — the operation is not cached. A value of 0 disables the cache.</p> |
| HighMemLimitMB | <p><i>Default Value:</i> disabled (Parameter is commented out in the file)</p> <p><i>Description:</i> The maximum amount of memory (in MB) that the NFS server process can use. If the NFS server process uses more memory than this value, then the server is automatically shutdown, and a Core file is generated for debugging.</p> <p>For example: <code>HighMemLimitMB=10000</code> indicates that the NFS server is shutdown if it consumes more than 10GB of memory.</p> <p>This parameter is effective only if you enable the <code>MemDebugEnable</code> parameter.</p> |
| LogLevel | <p><i>Default Value:</i> INFO</p> <p><i>Description:</i> Sets the level of log messages displayed in the output. Levels include:</p> <ul style="list-style-type: none"> • DEBUG • INFO • WARN • ERROR • CRITICAL • OFF |

MaxLogFileSize*Default Value:* 1024 MB*Description:* The maximum amount of disk space that the NFS server logs can consume before the oldest log file is deleted, based on the following calculation:

```
maxSizePerLogFile = maxLogFileSize /
MAX_NUM_OF_LOG_FILES
```

where:

- `maxLogFileSize` is the total amount of space that NFS server log files may consume
- `MAX_NUM_OF_LOG_FILES` is the total number of NFS server log files

Logrotate support for both the `.log` and the `.err` files honor this setting.

Attention: `MaxLogFileSize` is not a combined size of `.log` and `.err` files. The `.log` and `.err` files can individually grow up to this size.

MemDebugEnabled*Default Value:* `false` (Parameter is commented out in the file)*Description:* Set this parameter to `true` to enable memory tracking for the NFS server. This parameter works along with the `HighMemLimitMB` parameter.**MinLenForDeserialization***Default Value:* 8192*Description:* Deserialize (if value is `> 0`) or do not deserialize (if value = `0`) the response in the compression thread. If value is greater than 0, MapR deserializes requests with length `>=` value in the compression thread. If value is 0, requests of length `<` value are deserialized in the RPC thread itself..**RamfsMntDir***Default Value:* `/ramfs/mapr`*Description:* Mount point for the `ramfs` file for `mmap`.**RamfsSize***Default Value:* `0.25`*Description:* Size of the ramfile to use (percent of total physical memory). A value of 0 disables the use of `ramfs`.**WindowsAceSupport***Default Value:* `false`*Description:* Allow (`true`) or deny (`false`) access to a Windows client when ACEs are set. If `true`, the mode bits are set to `777`, the Windows client is granted access, and the operation is allowed based on the permissions enforced using mode bits and/or ACEs. If value is `false`, the mode bits are set to `000` and the Windows client is denied access. For more information, see [Mounting NFS on a Windows Client](#) on page 1307.

Tip: Use separate NFS servers for Windows clients and non-Windows clients.

warden.conf

Lists the configuration parameters for Warden.

The file `/opt/mapr/conf/warden.conf` controls parameters related to MapR services and the Warden. Most of the parameters are not intended to be edited directly by users. The following list describes the parameters of interest:

Note: When defining heapsize values for services, keep in mind that `service.heapsize.percent` is bound by `service.heapsize.min`, if defined, and `service.heapsize.max`.

| | |
|---------------------------------|---|
| centralconfig.enabled | <p><i>Sample Value:</i> true</p> <p><i>Description:</i> Specifies whether to enable central configuration.</p> |
| cldb.port | <p><i>Sample Value:</i> 7222</p> <p><i>Description:</i> The port to use for communicating with the CLDB.</p> |
| enable.overcommit | <p><i>Sample Value:</i> true</p> <p><i>Description:</i> Set this value to <code>true</code> to allow services to start up, even if their memory demands exceed the memory provided by the node.</p> |
| hoststats.port | <p><i>Sample Value:</i> 5660</p> <p><i>Description:</i> The port to use for communicating with the HostStats service.</p> |
| hs.port | <p><i>Sample Value:</i> 1111</p> <p><i>Description:</i> Hoststats listening port for Metrics RPC activity.</p> |
| hs.rpcon | <p><i>Sample Value:</i> true</p> <p><i>Description:</i> Indicates whether or not to configure Job Management.</p> |
| hs.host | <p><i>Sample Value:</i> localhost</p> <p><i>Description:</i> Hoststats hostname for RPC activity.</p> |
| isDB | <p><i>Sample Value:</i> true</p> <p><i>Description:</i> Specifies if HPE Ezmeral Data Fabric Database is in use. When this value is <code>false</code>, the <code>service.command.mfs.heapsize.percent</code> is set to 20. Do not manually edit this value. For more information, see Allocating Memory for Nodes on page 895..</p> |
| kvstore.port | <p><i>Sample Value:</i> 5660</p> <p><i>Description:</i> The port for communicating with the Key/Value Store.</p> |
| log.retention.exceptions | <p><i>Sample Value:</i> <code>mfs.log-*</code></p> <p><i>Description:</i> Retains the following log files instead of removing them during the log file cleanup that occurs every ten days: <code>cldb.log</code>, <code>hoststats.log</code>, <code>configure.log</code> and <code>mfs.log-*</code>.</p> <p>You can modify the list. This parameter accepts partial file names and asterisks. Log files listed as exceptions are retained indefinitely.</p> |

To disable all exceptions, comment out this parameter, that is, `#log.retention.exceptions`. When this parameter is null, that is, `log.retention.exceptions=`, no files are picked for log cleanup.

log.retention.time

Sample Value: 864000000

Description: All `.log` and `.out` files in the cluster are kept for a time period defined in milliseconds by the value of the `log.retention.time` parameter. The default value is ten days. Restart the Warden after changing this value.

mapr.home.dir

Sample Value: `/opt/mapr`

Description: MapR installation directory.

mfs.port

Sample Value: 7222

Description: The port to use for communicating with the Fileserver.

pollcentralconfig.interval.seconds

Sample Value: 300

Description: The frequency (in seconds) to check for central configuration updates.

rpc.drop

Sample Value: false

Description: Drop outstanding metrics when the queue to send to hoststats is too large.

service.command.cldb.heapsize.max

Sample Value: 4000

Description: The maximum heap space, specified in MB, that the CLDB can use.

service.command.cldb.heapsize.min

Sample Value: 256

Description: The minimum heap space, specified in MB, that the CLDB can use.

service.command.cldb.heapsize.percent

Sample Value: 8

Description: The percentage of heap space reserved for CLDB.

service.command.cldb.retryinterval.time.sec

Sample Value: 600

Description: Specifies an interval in seconds. The warden attempts to restart a failed CLDB service when this interval expires.

Note: The warden restarts the CLDB service only if the service has been stopped unintentionally - for example, the service crashed. Warden does not restart a CLDB service that has been stopped intentionally using the `maprcli node services` command.

service.command.mfs.heapsize.maxpercent

Sample Value: 85

Description: The maximum percentage of heap space that can be allocated to the filesystem. Restart the Warden after modifying this setting.

| | |
|---|---|
| service.command.mfs.heapsize.min | <p><i>Sample Value:</i> 512</p> <p><i>Description:</i> The minimum heap space, specified in MB, that can be allocated to the filesystem. Restart the Warden after modifying this setting.</p> |
| service.command.mfs.heapsize.percent | <p><i>Sample Value:</i> 35</p> <p><i>Description:</i> The percentage of heap space reserved for the filesystem. If the value for <code>isDB</code> is <code>true</code>, you cannot set this property to a value lower than 35. If you set this parameter to a value lower than 35, the value reverts to 35 when the Warden restarts, to ensure that when the HPE Ezmeral Data Fabric Database is enabled, corresponding cache allocation occurs. If you want to lower the heapsize allocated to the filesystem, you must change <code>service.command.mfs.heapsize.maxpercent</code> instead. Restart the Warden after modifying this setting.</p> |
| service.command.nfs.heapsize.max | <p><i>Sample Value:</i> 1000</p> <p><i>Description:</i> The maximum heap space, specified in MB, that the NFS can use.</p> |
| service.command.nfs.heapsize.min | <p><i>Sample Value:</i> 64</p> <p><i>Description:</i> The minimum heap space, specified in MB, that the NFS can use.</p> |
| service.command.nfs.heapsize.percent | <p><i>Sample Value:</i> 3</p> <p><i>Description:</i> The percentage of heap space reserved for the NFS.</p> |
| service.command.os.heapsize.max | <p><i>Sample Value:</i> 750</p> <p><i>Description:</i> The maximum heap space, specified in MB, that can be used by the operating system.</p> |
| service.command.os.heapsize.min | <p><i>Sample Value:</i> 256</p> <p><i>Description:</i> The minimum heap space, specified in MB, for use by the operating system.</p> |
| service.command.os.heapsize.percent | <p><i>Sample Value:</i> 3</p> <p><i>Description:</i> The percentage of heap space reserved for the operating system.</p> |
| service.command.webserver.heapsize.min | <p><i>Sample Value:</i> 512</p> <p><i>Description:</i> The minimum heap space, specified in MB, for use by the MapR Control System.</p> |
| service.command.webserver.heapsize.percent | <p><i>Sample Value:</i> 3</p> <p><i>Description:</i> The percentage of heap space reserved for the MapR Control System.</p> |
| service.nice.value | <p><i>Sample Value:</i> -10</p> <p><i>Description:</i> The <code>nice</code> priority under which all services run.</p> |
| services.memoryallocation.alarm.threshold | <p><i>Sample Value:</i> 95</p> <p><i>Description:</i> The maximum amount of system memory that services running on the node can use before</p> |

| | |
|--|--|
| | triggering the <code>NODE_ALARM_MEMORY_ALLOCATION_EXCEEDED</code> alarm. |
| <code>services.resetretries.time.sec</code> | <p><i>Sample Value:</i> 3600</p> <p><i>Description:</i> Specifies a time interval in seconds. The <code>services.retries</code> parameter sets the number of times that the warden attempts to restart failing services within this interval.</p> |
| <code>services.retries</code> | <p><i>Sample Value:</i> 3</p> <p><i>Description:</i> The number of times the Warden tries to restart a service that fails.</p> |
| <code>services.retryinterval.time.sec</code> | <p><i>Sample Value:</i> 1800</p> <p><i>Description:</i> The number of seconds after which the warden attempts several times to start a failed service. The number of attempts after each interval is specified by the parameter <code>services.retries</code>.</p> |
| <code>warden.enable.jmxremote</code> | <p><i>Sample Value:</i> false</p> <p><i>Description:</i> Set to <code>true</code> to enable the Warden JMX server.</p> |
| <code>zookeeper.servers</code> | <p><i>Sample Value:</i> 10.250.1.61:5181 10.10.1.230:5181</p> <p><i>Description:</i> Space separated list of Zookeeper servers.</p> |

For information on configuration files for additional services, see [warden.<servicename>.conf](#).

warden.<servicename>.conf

Describes the service configuration files that Warden supports.

The `warden.conf` configuration file is associated with the standard services that are provided by HPE Ezmeral Data Fabric. Warden supports service monitoring for additional services.

Each of these supported services requires a configuration file, `warden.<servicename>.conf`, which is included with the package for that service. When you install any of these service packages, its corresponding configuration file is stored in `/opt/mapr/conf/conf.d`. The configuration files and their packages are as follows:

| | |
|----------------------|--|
| collectd | <p><i>Configuration File:</i> <code>warden.collectd.conf</code></p> <p><i>Description:</i> Installed with the <code>mapr-collectd</code> package. This package is supported only for internal HPE Ezmeral Data Fabric Monitoring uses cases.</p> |
| drill | <p><i>Configuration File:</i> <code>warden.drill-bits.conf</code></p> <p><i>Description:</i> Installed with the <code>mapr-drill</code> package.</p> |
| elasticsearch | <p><i>Configuration File:</i> <code>warden.elasticsearch.conf</code></p> <p><i>Description:</i> Installed with the <code>mapr-elasticsearch</code> package. This package is supported only for internal HPE Ezmeral Data Fabric Monitoring uses cases.</p> |
| fluentd | <p><i>Configuration File:</i> <code>warden.fluentd.conf</code></p> <p><i>Description:</i> Installed with the <code>mapr-fluentd</code> package. This package is supported only for internal HPE Ezmeral Data Fabric Monitoring uses cases.</p> |

| | |
|----------------------------|---|
| gateway | <i>Configuration File:</i> warden.gateway.conf <i>Description:</i> Installed with the mapr-gateway package. |
| grafana | <i>Configuration File:</i> warden.grafana.conf <i>Description:</i> Installed with the mapr-grafana package. This package is supported only for internal HPE Ezmeral Data Fabric Monitoring uses cases. |
| hue | <i>Configuration File:</i> warden.hue.conf <i>Description:</i> Installed with the mapr-hue package. |
| httpsfs | <i>Configuration File:</i> warden.httpsfs.conf <i>Description:</i> Installed with the mapr-httpsfs package. |
| hbase thrift server | <i>Configuration File:</i> warden.hbasethrift.conf <i>Description:</i> Installed with the mapr-hbasethrift package. |
| hbase rest gateway | <i>Configuration File:</i> warden.hbase-rest.conf <i>Description:</i> Installed with the mapr-hbase-rest package. |
| historyserver | <i>Configuration File:</i> warden.historyserver.conf <i>Description:</i> Installed with the mapr-historyserver package. |
| hive metastore | <i>Configuration File:</i> warden.hivemeta.conf <i>Description:</i> Installed with the mapr-hivemetadadata package. |
| hiveserver2 | <i>Configuration File:</i> warden.hs2.conf <i>Description:</i> Installed with the mapr-hiveserver2 package. |
| kibana | <i>Configuration File:</i> warden.kibana.conf <i>Description:</i> Installed with the mapr-kibana package. This package is supported only for internal HPE Ezmeral Data Fabric Monitoring uses cases. |
| nodemanager | <i>Configuration File:</i> warden.nodemanager.conf <i>Description:</i> Installed with the mapr-nodemanager package. |
| oozie | <i>Configuration File:</i> warden.oozie.conf <i>Description:</i> Installed with the mapr-oozie package. |
| opentsdb | <i>Configuration File:</i> warden.opentsdb.conf <i>Description:</i> Installed with the mapr-opentsdb package. This package is supported only for internal HPE Ezmeral Data Fabric Monitoring uses cases. |
| resourcemanager | <i>Configuration File:</i> warden.resourcemanager.conf |

| | |
|---------------------|---|
| sentry | <p><i>Description:</i> Installed with the <code>mapr-resourcemanager</code> package.</p> <p><i>Configuration File:</i> <code>warden.sentry.conf</code></p> <p><i>Description:</i> Installed with the <code>mapr-sentry</code> package. However, Sentry is not automatically monitored by the Warden. When Sentry is configured to use the database storage model, you can manually copy the <code>/opt/mapr/sentry/sentry-<version>/conf.d/warden.sentry.conf</code> file to the <code>/opt/mapr/conf/conf.d</code> directory to add Sentry to the list of services that the Warden monitors.</p> |
| spark master | <p><i>Configuration File:</i> <code>warden.spark-master.conf</code></p> <p><i>Description:</i> Installed with the <code>spark-master</code> package.</p> |

Configuring Service Properties

You can configure the following properties in the `warden.<servicename>.conf` file:

| | |
|---------------------------------------|--|
| services | <p><i>Description:</i> Service name and number of nodes this service should run on, along with service dependencies. Format is <code>serviceName:N[depServiceName]</code>. Values for N = 1 or all</p> |
| service.alarm.label | <p><i>Description:</i> Specifies the alarm name for this service. This is the alarm name that appears in the CLI when you do not request a terse output. Once <code>tWarden</code> starts the service, you cannot edit this value.</p> |
| service.alarm.tersename | <p><i>Description:</i> Specifies the abbreviated alarm name for this service. This is the alarm name that appears in the Control System. Once Warden starts the service, you cannot edit this value.</p> |
| service.command.monitor | <p><i>Description:</i> Monitor string (if the service monitor command does not provide sufficient monitoring).</p> |
| service.command.monitorcommand | <p><i>Description:</i> Specifies a command that checks whether the service is running.</p> |
| service.command.start | <p><i>Description:</i> Service <code>start</code> command.</p> |
| service.command.stop | <p><i>Description:</i> Service <code>stop</code> command.</p> |
| service.command.type | <p><i>Description:</i> Indicates whether the script runs in background (and exits) or inline (script does not exit). Type is either <code>BACKGROUND</code> or <code>INLINE</code>.</p> |
| service.depends.local | <p><i>Description:</i> Indicates whether the service depends on a service instance locally, or on the master. Values = 1 (local) or 0 (master).</p> |
| service.displayname | <p><i>Description:</i> The name of the service to display.</p> |
| service.env | <p><i>Description:</i> Specifies environment variables to be use by the service. By default, it may include <code>MAPR_MAPREDUCE_MODE=default</code>. You can include a comma-separated list of environment variables. For</p> |

| | |
|---------------------------------------|--|
| | example, <code>service.env=MAPR_MAPREDUCE_MODE=default,ABC=1,XYZ=2.</code> |
| <code>service.heapsize.max</code> | <i>Description:</i> Maximum heapsize in MB. |
| <code>service.heapsize.min</code> | <i>Description:</i> Minimum heapsize in MB. |
| <code>service.heapsize.percent</code> | <i>Description:</i> Specifies heapsize percent. |
| <code>service.logs.location</code> | <i>Description:</i> Location of the service log files. |
| <code>service.port</code> | <i>Description:</i> Port where the service is running (for example, the hue webserver runs on port 8888). |
| <code>service.process.type</code> | <i>Description:</i> Specifies the type of process. For example, <code>service.process.type=JAVA</code> indicates that the process is a Java process. |
| <code>service.uri</code> | <i>Description:</i> To include a link to a user interface associated with this service in the Control System, enter a Uniform Resource Identifier (URI) in this property, and specify the port in the <code>service.ui.port</code> property. For example, enter <code>/service1</code> for this property and then enter 8080 in the <code>service.ui.port</code> property to provide the following UI link for this service in the MCS: <code>http://<hostname>:8080/service1</code> |
| <code>service.uri.port</code> | <i>Description:</i> If you want to include a link to the user interface associated with this service in the Control System, enter the port in this property and also specify the URI in the <code>service.uri</code> property. |

Memory Management for Services

The following memory parameters are used to reserve memory for the service:

- The `service.<servicename>.heapsize.percent` parameter controls the percentage of system memory allocated to the named service.
- The `service.<servicename>.heapsize.max` parameter defines the maximum heapsize used when invoking the service.
- The `service.<servicename>.heapsize.min` parameter defines the minimum heapsize used when invoking the service.

For example, the `service.command.gateway.heapsize.percent`, `service.command.gateway.heapsize.max`, and `service.command.gateway.heapsize.min` parameters in the `warden.gateway.conf` file control the amount of memory that Warden allocates to the gateway service before allocating memory to other services.

The actual heap size used when invoking a service is a combination of the three parameters according to the formula `max(heapsize.min, min(heapsize.max, total-memory * heapsize.percent / 100))`.

warden.hs2.conf Example

The hiveserver2 configuration file, `warden.hs2.conf`, looks like this:

```

services=hs2:1
service.displayname=HiveServer2
service.command.start=/opt/mapr/hive/hive-0.13/bin/hive --start --service
hiveserver2
service.command.stop=/opt/mapr/hive/hive-0.13/bin/hive --stop --service
hiveserver2
service.command.type=BACKGROUND
service.command.monitorcommand=/opt/mapr/hive/hive-0.13/bin/
hive --status --service hiveserver2
service.port=9083
service.ui.port=9083
service.uri=about
service.logs.location=/tmp/mapr
service.process.type=JAVA

```

When `hiveserver2` is installed, the `warden.hs2.conf` file is placed in the directory `/opt/mapr/conf/conf.d`. If Warden is running, it detects the file and starts the service. If Warden is not running, the file is picked up when Warden starts. Warden monitors the service and displays the status on the Control System UI.

yarn-site.xml

Describes the YARN configuration options.

YARN configuration options are stored in the `/opt/mapr/hadoop/hadoop-2.x.x/etc/hadoop/yarn-site.xml` file and are editable by the `root` user. This file contains configuration information that overrides the default values for YARN parameters. Overrides of the default values for core configuration properties are stored in the Default YARN parameters file.

To override a default value for a property, specify the new value within the `<configuration>` tags, using the following format:

```

<property>
  <name> </name>
  <value> </value>
  <description> </description>
</property>

```

The following configuration lists describe the possible entries that you can place between the `<name>` tags and between the `<value>` tags. The `<description>` tag is optional but recommended for maintainability.

Configuration for ResourceManager

Comprises the following parameters:

| | |
|--|---|
| yarn.resourcemanager.hostname | The hostname of the ResourceManager. The configure.sh command automatically sets this value to the IP address that you provide with the <code>-RM</code> option. <i>Default value:</i> {IP Address} |
| yarn.resourcemanager.scheduler.address | The hostname and port of the Scheduler Interface. <i>Example value:</i> <code>#{yarn.resourcemanager.hostname}:8030</code> |
| yarn.resourcemanager.resource-tracker.address | The hostname and port of the Resource Manager. |

Example value: \$
`{yarn.resourcemanager.hostname}:8025`

yarn.resourcemanager.address

The address of the Applications Manager interface that is contained in the Resource Manager.

Example value: \$
`{yarn.resourcemanager.address}:8041`

Configuration for NodeManager

Comprises the following parameters:

yarn.nodemanager.container-localizer.log.level

Default Value: INFO

Description: You can change the log level for the container localizer by setting the configuring options in this property. Different configuring options available are INFO, DEBUG, and WARN. By default logs will be available in the Application Master logs location but based on your cluster configuration, they will be available in the application's localized log directory. This functionality is available by default starting in EEP 7.1.0. For previous EEP versions, request the patch. See [Applying a Patch](#) on page 393.

yarn.nodemanager.max-retry-file-delete

Default Value: 2

Description: Defines how many times the NodeManager can attempt to delete application-related directories from a volume when Spark is configured to use the mounted NFS directory instead of the /tmp directory on the local filesystem. Increasing the value for this property can prevent application cache data from accumulating in the volume. This functionality is available by default starting in EEP 7.1.0. For previous EEP versions, request the patch. See [Applying a Patch](#) on page 393.

yarn.nodemanager.kill-container-child-process

Default Value: false

Description: Enables NodeManager to automatically run the `kill -9` command to end processes that hang after YARN stops containers. Set to `true` to enable this behavior. This functionality is available by default starting in EEP 7.1.0. For previous EEP versions, request the patch. See [Applying a Patch](#) on page 393.

yarn.nodemanager.container-executor.class

Default Value:

`org.apache.hadoop.yarn.server.nodemanager.LinuxContainerExecutor`

Description: Identifies how containers are executed.

Set to `LinuxContainerExecutor` by default, so that jobs can run as the user that submits the job.

Note: If a system user (a user with `userID<500`) wants to submit a job, you must add the user in the `container-executor.cfg` file. The user `mapr` is already configured as an allowed system user.

yarn.nodemanager.aux-services

Default Value: `mapreduce_shuffle, mapr_direct_shuffle`

| | |
|--|---|
| <code>yarn.nodemanager.aux-services.mapreduce_shuffle.class</code> | <p><i>Description:</i> Selects a shuffle service that needs to be set for MapReduce to run.</p> <p><i>Default Value:</i> org.apache.hadoop.mapred.ShuffleHandler</p> <p><i>Description:</i> This property, in conjunction with other properties, sets <i>direct shuffle</i> as the default shuffle for MapReduce.</p> |
| <code>yarn.nodemanager.aux-services.mapr_direct_shuffle.class</code> | <p><i>Default Value:</i> com.mapr.hadoop.mapred.LocalVolumeAuxService</p> <p><i>Description:</i> This property, in conjunction with other properties, sets <i>direct shuffle</i> as the default shuffle for MapReduce.</p> |

Configuration for Timeline Server Security with MapR-SASL

Comprises the following parameter:

| | |
|---|--|
| <code>yarn.timeline-service.http-authentication.type</code> | <p><i>Default Value:</i> com.mapr.security.maprauth.MaprDelegationTokenAuthenticationHandler</p> <p><i>Description:</i> The authentication used for the timeline server HTTP endpoint.</p> |
|---|--|

Configuration for Timeline Server Security with Kerberos

Comprises the following parameter:

| | |
|---|--|
| <code>yarn.timeline-service.http-authentication.type</code> | <p><i>Default Value:</i> com.mapr.security.maprauth.MaprDelegationTokenAuthenticationHandler</p> <p><i>Description:</i> The authentication used for the timeline server HTTP endpoint.</p> |
| <code>yarn.timeline-service.http-authentication.kerberos.principal</code> | <p><i>Default Value:</i> principal(HTTP/nodex@NODEX)</p> <p><i>Description:</i> The Kerberos service principal for the timeline server HTTP endpoint.</p> |
| <code>yarn.timeline-service.http-authentication.kerberos.keytab</code> | <p><i>Default Value:</i> path to keytab(/opt/mapr/conf/mapr.keytab)</p> <p><i>Description:</i> The Kerberos keytab for the timeline server HTTP endpoint.</p> |
| <code>yarn.timeline-service.principal</code> | <p><i>Default Value:</i> mapr/nodex@NODEX</p> <p><i>Description:</i> The Kerberos principal for the timeline reader. NodeManager principal is used for the timeline collector as it runs as an auxiliary service inside NodeManager.</p> |
| <code>yarn.timeline-service.keytab</code> | <p><i>Default Value:</i> path to keytab(/opt/mapr/conf/mapr.keytab)</p> <p><i>Description:</i> The Kerberos keytab for the timeline reader. NodeManager keytab is used for the timeline collector as it runs as an auxiliary service inside NodeManager.</p> |

Configuration for MapReduce

Comprises the following parameter:

mapreduce.job.shuffle.provider.services*Default Value:* `mapr_direct_shuffle`*Description:* This is the default shuffle handler for MapReduce. Contains a value from the `yarn.nodemanager.aux-services` property.

Configuration for Container Logs

Comprises the following parameters:

yarn.nodemanager.log-dirs*Default Value:* `/opt/mapr/hadoop/hadoop-<version>/logs/userlogs/<applicationID>/<containerID>/<filename>.log`*Description:* The location to store container logs on the node. An application's log directory is `${yarn.nodemanager.log-dirs}/application_${appid}`. Individual containers' log directories are named `container_${contid}`. Each container directory will contain the files `stderr`, `stdin`, and `syslog` generated by that container.**Note:** You can find the application ID associated with your job in the Control System.**yarn.log-aggregation-enable***Default Value:* `false`*Description:* Indicates whether the logs are aggregated.**yarn.nodemanager.log.retain-seconds***Default Value:* `10800` (3 hours)*Description:* Specifies the duration for which user logs are maintained, when log aggregation is disabled.**yarn.log-aggregation.retain-seconds***Default Value:* `-1`*Description:* Specifies the number of seconds to retain logs, when log aggregation is enabled. The default value of `-1`, disables the deletion of logs.**yarn.log-aggregation.retain-check-interval-seconds***Default Value:* `-1`*Description:* The interval between aggregated log retention checks. If set to `0` or a negative value, then the value is computed as one-tenth of the aggregated log retention time.**Note:** Setting this to a low value may cause unnecessary log retention checks.**yarn.nodemanager.remote-app-log-dir***Default Value:* `/tmp/logs`*Description:* The location on the filesystem where the logs are aggregated.**yarn.nodemanager.remote-app-log-dir-suffix***Default Value:* `logs`*Description:* The suffix for the directory that stores the aggregated logs for each user.

Configuration for Oozie

Comprises the following parameter:

yarn.resourcemanager.principal*Default Value:* `mapr`

Description: The name of the administrative user.

Configuration for Apache Shuffle

You can disable Direct Shuffle and enable Apache Shuffle for MapReduce applications through the following setting:

yarn.nodemanager.aux-services *Value:* mapreduce_shuffle

zoo.cfg

Lists the ZooKeeper configuration file.

Example zoo.cfg File

The file `/opt/mapr/zookeeper/zookeeper-$version/conf/zoo.cfg` specifies ZooKeeper configuration parameters.

```
# The number of milliseconds of each tick
tickTime=2000
# The number of ticks that the initial
# synchronization phase can take
initLimit=20
# The number of ticks that can pass between
# sending a request and getting an acknowledgement
syncLimit=10
# the directory where the snapshot is stored.
dataDir=/opt/mapr/zkdata
# the port at which the clients will connect
clientPort=5181
# max number of client connections
maxClientCnxns=1000
#autopurge interval - 24 hours
autopurge.purgeInterval=24
#superuser to allow zk nodes delete
superUser=mapr
#readuser to allow read zk info for authenticated clients
readUser=anyone
# cldb key location
mapr.cldbkeyfile.location=/opt/mapr/conf/cldb.key
#security provider name
authMech=MAPR-SECURITY
# security auth provider
authProvider.1=org.apache.zookeeper.server.auth.SASLAuthenticationProvider
# use maprserverticket not userticket for auth
mapr.usemaprserverticket=true
#
# Added for 3.4.11-mapr
#
# ZK-to-ZK server authentication using MAPR-SASL
# Set quorum.auth.enableSasl=false for insecure cluster, =true for secure
cluster
quorum.auth.enableSasl=true
quorum.auth.learnerRequireSasl=true
quorum.auth.serverRequireSasl=true
quorum.auth.learner.loginContext=QuorumLearner
quorum.auth.server.loginContext=QuorumServer
quorum.cnxn.threads.size=20
#
# Added for 3.5.6-mapr
#
# ZK server-to-server SSL encryption
#
```

```

sslQuorum=true
serverCnxnFactory=org.apache.zookeeper.server.NettyServerCnxnFactory
ssl.quorum.keyStore.location=/opt/mapr/conf/ssl_keystore.p12
ssl.quorum.keyStore.password=<randomly generated password>
ssl.quorum.trustStore.location=/opt/mapr/conf/ssl_truststore.p12
ssl.quorum.trustStore.password=<randomly generated password>
ssl.quorum.protocol=TLS
ssl.quorum.enabledProtocols=TLSv1.2
# MapR uses the cluster name in the certificates, no host names
ssl.quorum.hostnameVerification=false
#
# The Jetty Admin Server allows ZK access via a URL
# Like http://localhost:8080/commands/stat
# Default port 8080 may cause conflicts; thus server disabled by default
# admin.serverPort=8080
admin.enableServer=false
#
# For upgrade from an existing 3.4.11 or older that had no snapshots
snapshot.trust.empty=true
#

```

 **Warning:** `maxClientCnxns` limits the number of concurrent ZooKeeper connections that a single client machine may make. This value does not set a limit for the whole cluster. The default is 100. If you plan to run more than 100 jobs from a single node, increase this value.

 **Attention:** By default, only **authenticated** users (users with a valid ticket) are allowed to execute ZooKeeper related commands. To allow **all** users to execute ZooKeeper related commands, add the entry `sessionRequireClientSASLAuth=false` to this file and restart ZooKeeper.

Enable Encrypted Quorum Communication

Perform the following steps to enable encrypted quorum communication between ZooKeeper nodes:

1. Copy all `*.p12` certificates from the master CLDB node to all the ZooKeeper nodes.
2. Set the user and group of all the `*.p12` certificates to `mapr` on all the ZooKeeper nodes.
3. Set `sslQuorum=true` in the `zoo.cfg` file.
4. Restart ZooKeeper and Warden:

```

service mapr-zookeeper restart
service mapr-warden restart

```

Related tasks

[Enabling Security](#) on page 1517

Describes how to enable security for the cluster, platform, ecosystem components, and network-based connections.

zookeeper-env.sh

Use this file to load or unload JMX parameters for ZooKeeper.

By default, in all MapR versions, the ZooKeeper JMX parameters are not loaded.

To load ZooKeeper JMX parameters, set the `JMXDISABLE` parameter to `false` in the `zookeeper-env.sh` file within the `/opt/mapr/zookeeper/zookeeper-$version/conf` directory.

```
JMXDISABLE=false
```

Restart the ZooKeeper process: `service mapr-zookeeper restart`.

To unload ZooKeeper JMX parameters, set:

```
JMXDISABLE=true
```

in `zookeeper-env.sh`. Restart the ZooKeeper process: `service mapr-zookeeper restart`.

Alarms Reference

The pages in this section provide details about all of the types of alarms.

User/Group Alarms

User/group alarms indicate problems with user or group quotas. The following tables describe the MapR user/group alarms.

- Entity Advisory Quota Alarm
- Entity Quota Alarm

Entity Advisory Quota Alarm

| | |
|----------------------|--|
| UI Column | User Advisory Quota Alarm |
| Logged As | AE_ALARM_AEADVISORY_QUOTA_EXCEEDED |
| Meaning | A user or group has exceeded its advisory quota. See Setting Quota Defaults for Users and Groups on page 857 for more information about user/group quotas. |
| Resolution | No immediate action is required. To avoid exceeding the hard quota, clear space on volumes created by the user or group, or stop further data writes to those volumes. |
| Configuration | Configurable when setting/modifying entity properties. See Configuring the Alarm Threshold Using the CLI on page 863 for more information. |

Entity Quota Alarm

| | |
|----------------------|--|
| UI Column | User Quota Alarm |
| Logged As | AE_ALARM_AEQUOTA_EXCEEDED |
| Meaning | A user or group has exceeded its quota. Further writes by the user or group will fail. See Setting Quota Defaults for Users and Groups on page 857 and Set or Modify Quotas for Users and/or Groups on page 1036 for more information about user/group quotas. |
| Resolution | Free some space on the volumes created by the user or group, or increase the user or group quota. |
| Configuration | Configurable when setting/modifying entity properties. See Configuring the Alarm Threshold Using the CLI on page 863 for more information. |

Cluster Alarms

Cluster alarms indicate problems that affect the cluster as a whole. The following sections describe the data-fabric cluster alarms.

CLDB Low Memory Alarm

| | |
|-------------------|---|
| UI Column | Cluster freespace above CLDB heapsize |
| Logged As | CLUSTER_ALARM_CLDB_HEAPSIZE |
| Meaning | The CLDB process needs more memory to cache containers. |
| Resolution | <p>The CLDB heap size is no longer sufficient for the CLDB to cache containers. The solution is to increase the CLDB memory settings on all CLDB nodes, using the same value for the minimum and maximum heap sizes. The text the alarm code provides will include the minimum amount of memory required to be sufficient; however, to accommodate future growth, you should set these values to a somewhat higher number. For example, if the alarm indicates that the CLDB needs 4000 MB, you should set the minimum and maximum heap sizes to a larger value such as 4400 MB.</p> <p>The CLDB memory settings are controlled by the following parameters in the <code>warden.conf</code> file located in <code>\$MAPR_HOME/conf/::</code></p> <pre>service.command.cldb.heapsize.max=<max heap size> service.command.cldb.heapsize.min=<min heap size></pre> <p>Restart the Warden service on each CLDB node after you edit the <code>warden.conf</code> file.</p> |

License Near Expiration

| | |
|----------------------|--|
| UI Column | License Near Expiration Alarm |
| Logged As | CLUSTER_ALARM_LICENSE_NEAR_EXPIRATION |
| Meaning | The Enterprise Edition license associated with the cluster is within 30 days of expiration. |
| Resolution | Renew the Enterprise Edition license. |
| Configuration | Configurable at cluster level. See Configuring the Alarm Threshold Using the CLI on page 863 for more information. |

License Expired

| | |
|-------------------|---|
| UI Column | License Expiration Alarm |
| Logged As | CLUSTER_ALARM_LICENSE_EXPIRED |
| Meaning | The Enterprise Edition license associated with the cluster has expired. Enterprise Edition features have been disabled. |
| Resolution | Renew the Enterprise Edition license. |

Cluster Almost Full

| | |
|----------------------|--|
| UI Column | Cluster Almost Full |
| Logged As | CLUSTER_ALARM_CLUSTER_ALMOST_FULL |
| Meaning | The cluster storage is almost full. The percentage of storage used before this alarm is triggered is 90% by default, and is controlled by the configuration parameter <code>cldb.cluster.almost.full.percentage</code> . |
| Resolution | Reduce the amount of data stored in the cluster. If the cluster storage is less than 90% full, check the <code>cldb.cluster.almost.full.percentage</code> parameter via the <code>config load</code> command, and adjust it if necessary via the <code>config save</code> command. |
| Configuration | Configurable at cluster level. See Configuring the Alarm Threshold Using the CLI on page 863 for more information. |

Cluster Full

| | |
|-------------------|---|
| UI Column | Cluster Full |
| Logged As | CLUSTER_ALARM_CLUSTER_FULL |
| Meaning | The cluster storage is full. MapReduce operations have been halted. |
| Resolution | Free up some space on the cluster. |

Maximum Licensed Nodes Exceeded alarm

| | |
|-------------------|---|
| UI Column | Licensed Nodes Exceeded Alarm |
| Logged As | CLUSTER_ALARM_LICENSE_MAXNODES_EXCEEDED |
| Meaning | The cluster has exceeded the number of nodes specified in the license. |
| Resolution | Remove some nodes, or upgrade the license to accommodate the added nodes. |

New Cluster Features Disabled

| | |
|-------------------|--|
| UI Column | New Cluster Features Disabled |
| Logged As | CLUSTER_ALARM_NEW_FEATURES_DISABLED |
| Meaning | Features added in version 2.0 or 3.0 are not enabled on the cluster. |
| Resolution | Enable the latest features for the data-fabric version that you are currently running. |

Upgrade in Progress

| | |
|-------------------|--|
| UI Column | Software Installation & Upgrades |
| Logged As | CLUSTER_ALARM_UPGRADE_IN_PROGRESS |
| Meaning | A rolling upgrade of the cluster is in progress. |
| Resolution | No action is required. Performance may be affected during the upgrade, but the cluster should still function |

normally. After the upgrade is complete, the alarm is cleared.

VIPAssignment Failure

| | |
|-------------------|---|
| UI Column | VIP Assignment Alarm |
| Logged As | CLUSTER_ALARM_UNASSIGNED_VIRTUAL_IPS |
| Meaning | Core software was unable to assign a VIP to any NFS servers. |
| Resolution | Check the VIP configuration, and make sure at least one of the NFS servers in the VIP pool are up and running. See Setting Up VIPs for NFS . This alarm can also indicate that a VIP's hostname exceeds the maximum allowed length of 16. Check the log file <code>/opt/mapr/logs/nfsmon.log</code> for additional information. |

DARE Enabled

| | |
|-------------------|--|
| UI Column | DARE Enabled Alarm |
| Logged As | CLUSTER_ALARM_DARE_COPY_MASTER_KEY |
| Meaning | Data-at-rest encryption (DARE) is enabled on the cluster. |
| Resolution | When DARE is enabled on the cluster, a data-at-rest encryption master key file is generated and stored in <code>/opt/mapr/conf/dare.master.key</code> on the CLDB node. Before dismissing the alarm, make a copy of the master key file because loss of the master key file can be catastrophic and irreversible and might result in loss of data. |

DARE Incompatible

| | |
|-------------------|--|
| UI Column | DARE Incompatible Alarm |
| Logged As | CLUSTER_ALARM_DARE_INCOMPATIBLE |
| Meaning | Not all nodes on the cluster are enabled for data-at-rest encryption (DARE). |
| Resolution | When DARE is enabled on certain nodes in the cluster, there may still be some nodes that are not (yet) enabled for DARE. Enable DARE on all the nodes before dismissing the alarm. |

Too Many Snapshots

| | |
|-------------------|--|
| UI Column | Too Many Snapshots |
| Logged As | CLUSTER_ALARM_TOO_MANY_SNAPSHOT_CONTAINERS |
| Meaning | There are too many snapshots on this cluster. |
| Resolution | Delete snapshots from the cluster before dismissing the alarm. |

Node Alarms

Node alarms indicate problems in individual nodes. The following tables describe the MapR node alarms.

CLDB Service Alarm

| | |
|-------------------|--|
| UI Column | CLDB Alarm |
| Logged As | NODE_ALARM_SERVICE_CLDB_DOWN |
| Meaning | The CLDB service on the node has stopped running. |
| Resolution | Go to the node information page or the Services page in the Control System to check whether the CLDB service is running. The warden will try three times to restart the service automatically. After an interval (30 minutes by default) the warden will again try three times to restart the service. The interval can be configured using the parameter <code>services.retryinterval.time.sec</code> in warden.conf on page 2494. If the warden successfully restarts the CLDB service, the alarm is cleared. If the warden is unable to restart the CLDB service, see more troubleshooting information . |

Core Present Alarm

| | |
|-------------------|--|
| UI Column | Core Present |
| Logged As | NODE_ALARM_CORE_PRESENT |
| Meaning | A service on the node has crashed and created a core dump file. When all core files are removed, the alarm is cleared. |
| Resolution | See troubleshooting information . |

Debug Logging Active

| | |
|-------------------|--|
| UI Column | Excess Logs Alarm |
| Logged As | NODE_ALARM_DEBUG_LOGGING |
| Meaning | Debug logging is enabled on the node. |
| Resolution | Debug logging generates enormous amounts of data, and can fill up disk space. If debug logging is not absolutely necessary, turn it off: use the setloglevel on page 1991 command. If it is absolutely necessary, make sure that the logs in <code>/opt/mapr/logs</code> are not in danger of filling the entire disk. |

Disk Failure

| | |
|-------------------|---|
| UI Column | Disk Failure Alarm |
| Logged As | NODE_ALARM_DISK_FAILURE |
| Meaning | A disk has failed on the node. |
| Resolution | Check the disk health log (<code>/opt/mapr/logs/faileddisk.log</code>) to determine which disk failed and view any SMART data provided by the disk. See Managing Disks on page 911. |

Duplicate Host ID

| | |
|-------------------|--|
| UI Column | Duplicate Host Id |
| Logged As | NODE_ALARM_DUPLICATE_HOSTID |
| Meaning | Two or more nodes in the cluster have the same host ID. |
| Resolution | Multiple nodes with the same host ID are prevented from joining the cluster, in order to prevent addressing problems that can lead to data loss. To correct the problem and clear the alarm, make sure all host IDs are unique and use the <code>maprcli node allow-into-cluster</code> command to un-ban the affected host IDs. |

FileServer Service Alarm

| | |
|-------------------|--|
| UI Column | FileServer Alarm |
| Logged As | NODE_ALARM_SERVICE_FILESERVER_DOWN |
| Meaning | The FileServer service on the node has stopped running. |
| Resolution | Go to the node information page or the Services page in the Control System to check whether the FileServer service is running. The warden will try three times to restart the service automatically. After an interval (30 minutes by default) the warden will again try three times to restart the service. The interval can be configured using the parameter <code>services.retryinterval.time.sec</code> in <code>warden.conf</code> on page 2494 file. If the warden successfully restarts the FileServer service, the alarm is cleared. If the warden is unable to restart the FileServer service, see more troubleshooting information . |

Heartbeat Processing Slow

| | |
|-------------------|--|
| UI Column | Heartbeat Processing Slow Alarm |
| Logged As | NODE_ALARM_HB_PROCESSING_SLOW |
| Meaning | The time that has elapsed since the CLDB processed the previous heartbeat from the filesystem node has exceeded 5 seconds. |
| Resolution | When the CLDB is processing a heartbeat from a node, it will compare the current time to the time at which the previous heartbeat from that node was processed. If the elapsed time exceeds 5 seconds then this alarm is raised. If this alarm occurs frequently, investigate what might be causing the relevant node or nodes to be busy, or whether the CLDB nodes have enough resources to handle their load. |

HBMaster Service Alarm

| | |
|------------------|----------------------------------|
| UI Column | HBase Master Alarm |
| Logged As | NODE_ALARM_SERVICE_HBMASTER_DOWN |

| | |
|-------------------|--|
| Meaning | The HBMaster service on the node has stopped running. |
| Resolution | To check whether the HBMaster service is running, go to the node information page or the Services page in the Control System. Warden will try three times to restart the service automatically. After an interval (30 minutes by default), Warden will again try three times to restart the service. The interval can be configured using the <code>services.retryinterval.time.sec</code> parameter in the <code>warden.conf</code> file. If Warden successfully restarts the HBMaster service, the alarm is cleared. If Warden is unable to restart the HBMaster service, it might be necessary to contact technical support. |

HBRegion Service Alarm

| | |
|-------------------|--|
| UI Column | Hbase RegionServer Alarm |
| Logged As | NODE_ALARM_SERVICE_HBREGION_DOWN |
| Meaning | The HBRegion service on the node has stopped running. |
| Resolution | To check whether the HBRegion service is running, go to the node information page or the Services page in the Control System. Warden will try three times to restart the service automatically. After an interval (30 minutes by default), Warden will again try three times to restart the service. The interval can be configured using the <code>services.retryinterval.time.sec</code> parameter in the <code>warden.conf</code> file. If Warden successfully restarts the HBRegion service, the alarm is cleared. If Warden is unable to restart the HBRegion service, it might be necessary to contact technical support. |

High MAST Gateway Memory Alarm

| | |
|-------------------|---|
| UI Column | High Memory Usage |
| Logged As | NODE_ALARM_HIGH_MASTGATEWAY_MEMORY |
| Meaning | Memory consumption of MAST Gateway exceeds the memory allocated for MAST Gateway. |
| Resolution | Tune the percentage of node memory allocated for MAST Gateway in the <code>/opt/mapr/conf/conf.d/warden.mastgateway.conf</code> file. See Configuring MAST Gateway for more information. If core is generated for this error, contact MapR support. |

HistoryServer Alarm

| | |
|------------------|--|
| UI Column | HistoryServer Alarm |
| Logged As | NODE_ALARM_SERVICE_HISTORYSERVER_DOW N |
| Meaning | The HistoryServer on the node has stopped running. |

| | |
|---------------------------|---|
| Resolution | <p>Go to the node information page or the Services page in the Control System to check whether HistoryServer is running. Warden will try three times to restart the service automatically ever 30 minutes (by default). This 30 minute interval can be reconfigured using the parameter <code>services.retryinterval.time.sec</code> in the <code>warden.conf</code> on page 2494 file.</p> <p>If warden successfully restarts the HistoryServer, the alarm is cleared. If Warden is unable to restart the HistoryServer, see more troubleshooting information.</p> |
| HiveMeta Alarm | |
| UI Column | HiveMeta Alarm |
| Logged As | NODE_ALARM_SERVICE_HIVEMETA_DOWN |
| Meaning | The HiveMeta service on the node has stopped running. |
| Resolution | <p>Go to the node information page or the Services page in the Control System to check whether Hive Metastore is running. Warden will try three times to restart the service automatically ever 30 minutes (by default). This 30 minute interval can be reconfigured using the parameter <code>services.retryinterval.time.sec</code> in the <code>warden.conf</code> on page 2494 file.</p> <p>If Warden successfully restarts the Hive Metastore service, the alarm is cleared. If Warden is unable to restart the Hive Metastore service, see more troubleshooting information.</p> |
| HiveServer 2 Alarm | |
| UI Column | HiveServer 2 Alarm |
| Logged As | NODE_ALARM_SERVICE_HS2_DOWN |
| Meaning | The HiveServer 2 service on the node has stopped running. |
| Resolution | <p>Go to the node information page or the Services page in the Control System to check whether HiveServer 2 is running. Warden will try three times to restart the service automatically ever 30 minutes (by default). This 30 minute interval can be reconfigured using the parameter <code>services.retryinterval.time.sec</code> in the <code>warden.conf</code> on page 2494 file.</p> <p>If Warden successfully restarts the HiveServer 2 service, the alarm is cleared. If Warden is unable to restart the HiveServer 2 service, see more troubleshooting information.</p> |
| Hoststats Alarm | |
| UI Column | HostStats |
| Logged As | NODE_ALARM_SERVICE_HOSTSTATS_DOWN |

| | |
|-------------------|--|
| Meaning | The Hoststats service on the node has stopped running. |
| Resolution | Go to the node information page or the Services page in the Control System to check whether the Hoststats service is running. The warden will try three times to restart the service automatically. After an interval (30 minutes by default) the warden will again try three times to restart the service. The interval can be configured using the parameter <code>services.retryinterval.time.sec</code> in <code>warden.conf</code> on page 2494 file. If the warden successfully restarts the service, the alarm is cleared. If the warden is unable to restart the service, review more troubleshooting information . |

Incorrect Topology Alarm

| | |
|-------------------|--|
| UI Column | CLDB Alarm |
| Logged As | NODE_ALARM_INCORRECT_TOPOLOGY_ALARM |
| Meaning | The <code>mapr.cldb.internal</code> volume's topology (normally <code>/cldb</code>) must include all CLDB nodes. This alarm signifies that one or more CLDB nodes are outside the CLDB volume's topology. |
| Resolution | There are two ways to resolve this alarm: <ul style="list-style-type: none"> • Move any stray CLDB nodes into the topology in which <code>mapr.cldb.internal</code> resides. See Setting Up Volume Topology on page 993 for more information. • Change the volume topology of <code>mapr.cldb.internal</code> to include the stray CLDB nodes. See Administering Volumes on page 933 for more information. |

Installation Directory Full Alarm

| | |
|-------------------|--|
| UI Column | Installation Directory Full |
| Logged As | NODE_ALARM_OPT_MAPR_FULL |
| Meaning | The partition <code>/opt/mapr</code> on the node is running out of space (95% full). |
| Resolution | Free up some space in <code>/opt/mapr</code> on the node. |

Instance Mismatch Alarm

| | |
|------------------|--|
| UI Column | Instance Mismatch Alarm |
| Logged As | NODE_ALARM_NUM_INSTANCES_MISMATCH |
| Meaning | The number of filesystem instances is not as configured. |

| | |
|-------------------------------------|--|
| Resolution | Restart warden on the node by running the following command: <pre>service mapr-warden restart</pre> |
| High FileServer Memory Alarm | |
| UI Column | High FileServer Memory Alarm |
| Logged As | NODE_ALARM_HIGH_MFS_MEMORY |
| Meaning | Memory consumed by fileserver service on the node is in excess of the allotted amount. |
| Resolution | Log on as root to the node for which the alarm is raised, and restart the Warden: <code>service mapr-warden restart</code> |
| Configuration | Configurable at cluster level. See Configuring the Alarm Threshold Using the CLI on page 863 for more information. |
| MapR User Mismatch | |
| UI Column | MapR User Mismatch Alarm |
| Logged As | NODE_ALARM_MAPRUSER_MISMATCH |
| Meaning | The cluster nodes are not all set up to run MapR services as the same user (for example, some nodes are running MapR as <code>root</code> while others are running as <code>mapr_user</code>). |
| Resolution | For the nodes on which the User Mismatch alarm is raised, follow the steps in Changing the User for Data Fabric Services from the Command-Line on page 909. |
| Memory Allocation Alarm | |
| UI Column | Memory Allocation Alarm |
| Logged As | NODE_ALARM_MEMORY_ALLOCATION_EXCEEDED |
| Meaning | The percentage of system memory required to run services on the node exceeds the set threshold and could potentially overload the node. If you installed a service on the node that causes the sum of memory used by the services on the node to exceed the threshold set, the system raises the alarm. |
| Resolution | To clear the alarm, you can add more memory to the node, stop a service from running on the node, or remove a service from the node. You can run the <code>service list</code> command to see the memory allocated to each service on the node. See service list for more information. The <code>services.memoryallocation.alarm.threshold</code> property in <code>warden.conf</code> defines the maximum amount of system memory that services running on |

the node can use before triggering the alarm. The default setting for this property is 95 percent:

```
services.memoryallocation.alarm.threshold=95
```

The percentage of system memory that services can use on the node should not exceed 95. Restart the Warden service on the node after you edit the `warden.conf` file.

Memory Usage Alarm

UI Column

Memory Usage Alarm

Logged As

NODE_ALARM_MEMORY_SWAPPING

Meaning

The HostStats service raises this alarm for swap space when the delta of swap in memory and the delta of swap out memory exceeds the threshold set over a specific time period.

Resolution

To clear the alarm, you can increase the physical memory or reduce the load running on the node. You can run the `service list` command to see the memory allocated to each service on the node. See [service list](#) for more information.

The memory swapping alarm is controlled by the following properties in `/opt/mapr/conf/hoststats.conf`:

- `alarm.swapping.threshold`
- `alarm.swapping.counter`

The memory threshold for swap in and swap out is defined by the `alarm.swapping.threshold` property, which is set to 100MB by default. The duration over which HostStats checks the delta of the memory is defined by the `alarm.swapping.counter`, which is set to 100 seconds by default.

NFS Gateway Alarm

UI Column

NFS Service Down

Logged As

NODE_ALARM_SERVICE_NFS_DOWN

Meaning

The NFS service on the node has stopped running.

Resolution

Go to the [node information page](#) or the **Services** page in the Control System to check whether the NFS service is running. The warden will try three times to restart the service automatically. After an interval (30 minutes by default) the warden will again try three times to restart the service. The interval can be configured using the parameter `services.retryinterval.time.sec` in `warden.conf` on page 2494 file. If the warden successfully restarts the NFS service, the alarm is cleared. If the warden is unable to restart the NFS service, see [more troubleshooting information](#).

NFSv4 Service Alarm

| | |
|-------------------|---|
| UI Column | NFSv4 Service Down |
| Logged As | NODE_ALARM_SERVICE_NFS4_DOWN |
| Meaning | The NFSv4 service on the node has stopped running. |
| Resolution | Go to the node information page or the Services page in the Control System to check whether the NFS service is running. The warden will try three times to restart the service automatically. After an interval (30 minutes by default) the warden will again try three times to restart the service. The interval can be configured using the parameter <code>services.retryinterval.time.sec</code> in warden.conf on page 2494 file. If the warden successfully restarts the NFS service, the alarm is cleared. If the warden is unable to restart the NFS service, refer to NFSv4 Troubleshooting on page 1338 to restart the service. |

NodeManager Alarm

Explains how to resolve the issue with the Node Manager service stopping on the node.

| | |
|-------------------|---|
| UI Column | NodeManager Alarm |
| Logged As | NODE_ALARM_SERVICE_NODEMANAGER_DOWN |
| Meaning | The NodeManager service on the node has stopped running. |
| Resolution | Go to the node information page or the Services page in the Control System to check whether NodeManager is running. Warden will try three times to restart the service automatically ever 30 minutes (by default). This 30 minute interval can be reconfigured using the parameter <code>services.retryinterval.time.sec</code> in the warden.conf on page 2494 file. If warden successfully restarts the NodeManager, the alarm is cleared. If warden is unable to restart the NodeManager, see more troubleshooting information . |

No Disk Attached Alarm

| | |
|-------------------|---|
| UI Column | No Disk Attached Alarm |
| Logged As | NODE_ALARM_NO_DISK_ATTACHED |
| Meaning | There are one or more filesystem instances on a node with no SP assigned to them. |
| Resolution | To clear the alarm, assign at least one SP per filesystem. |

No Heartbeat Alarm

Describes the NODE_ALARM_NO_HEARTBEAT alarm.

| | |
|------------------|-------------------------|
| UI Column | No Heartbeat Alarm |
| Logged As | NODE_ALARM_NO_HEARTBEAT |

| | |
|----------------------|--|
| Meaning | Node is not undergoing maintenance, and no heartbeat detected for over 5 minutes. |
| Resolution | Check the status of the node manually. |
| Configuration | Configurable at cluster level. See Configuring the Alarm Threshold Using the CLI on page 863 for more information. |

This alarm is raised when a node is down for more than 5 minutes. By default, this alarm is not raised if an edge node is down. To raise an alarm for edge nodes as well, set the [CLDB parameter](#) `cldb.ignore.posix.only.hb.alarm` to 0 using the command:

```
/opt/mapr/bin/maprcli config save -values
'{cldb.ignore.posix.only.hb.alarm: "0"}
```

Security Certificate Expiry Alarm

Describes the `NODE_ALARM_CERTIFICATE_NEAR_EXPIRATION` alarm.

| | |
|----------------------|--|
| UI Column | SSL Certificate Expiry |
| Logged As | <code>NODE_ALARM_CERTIFICATE_NEAR_EXPIRATION</code> |
| Meaning | SSL certificates are expiring within the number of days denoted by the CLDB setting <code>cldb.ssl.cert.expiring.alarm.days</code> . See cldb.conf on page 2466 for more information. |
| Resolution | Renew the SSL certificates. See Importing a Certificate Authority Signed (CA Signed) SSL Certificate Into a MapR Cluster for more information. |
| Configuration | None. |
| Specification | This alarm is raised when any of the first ten security certificates in <code>/opt/mapr/conf/ssl_keystore</code> or in <code>/opt/mapr/conf/ssl_truststore</code> are set to expire within the number of days denoted by the CLDB setting <code>cldb.ssl.cert.expiring.alarm.days</code> . Once the alarm is raised, the administrator needs to find out the certificates that are expiring, and renew them. To find out the certificates that are expiring, use the <code>/opt/mapr/server/getSSLExpiryCerts.py</code> Python script. For example: |

```
python /opt/mapr/server/
getSSLExpiryCerts.py -print
    Below certificates
    expiring in the next 120 days
    Truststore:
        Alias: 100day valid
    until: Mon Jul 13 04:04:15 PDT 2020
        Alias: 65day valid
    until: Mon Jun 08 03:45:44 PDT 2020
        Alias: 70day valid
    until: Sat Jun 13 03:46:00 PDT 2020
        Alias: 80day valid
    until: Tue Jun 23 03:46:14 PDT 2020
        Alias: 90day valid
    until: Fri Jul 03 04:03:57 PDT 2020
    Keystore:
```

```
Alias: 3daymay17 valid
until: Thu May 21 04:20:26 PDT 2020
```

Related reference

[cldb.conf](#) on page 2466

Contains the configuration for CLDB nodes.

Node Too Many Containers**UI Column**

Too Many Containers Alarm

Logged As

NODE_ALARM_TOO_MANY_CONTAINERS

Meaning

Number of containers on this node reached the maximum limit.

Resolution

Delete unused volumes or Snapshots. You can reset the maximum with:

```
maprcli config save -values
{ "pernode.numcntrs.alarm.thr": "<number>"
}
```

Configuration

Configurable at cluster level.

This alarm is also raised when total number of containers (including snap containers) exceed 10 times the value of `pernode.numcntrs.alarm.thr`.

See [Configuring the Alarm Threshold Using the CLI](#) on page 863 for more information.

Oozie Alarm

Important: This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

UI Column

Oozie Alarm

Logged As

NODE_ALARM_SERVICE_OOZIE_DOWN

Meaning

The Oozie service on the node has stopped running.

Resolution

Go to the [node information page](#) or the **Services** page in the Control System to check whether Oozie is running. Warden will try three times to restart Oozie automatically ever 30 minutes (by default). This 30 minute interval can be reconfigured using the parameter `services.retryinterval.time.sec` in the [warden.conf](#) on page 2494 file.

If Warden successfully restarts Oozie, the alarm is cleared. If Warden is unable to restart Oozie, see [more troubleshooting information](#).

PAM Misconfigured Alarm**UI Column**

Pam Misconfigured Alarm

Logged As

NODE_ALARM_PAM_MISCONFIGURED

| | |
|----------------------------------|--|
| Meaning | The PAM authentication on the node is configured incorrectly. |
| Resolution | See PAM Configuration . |
| ResourceManager Alarm | |
| UI Column | ResourceManager Alarm |
| Logged As | NODE_ALARM_SERVICE_RESOURCEMANAGER_DOWN |
| Meaning | The ResourceManager service on the node has stopped running. |
| Resolution | <p>Go to the node information page or the Services page in the Control System to check whether ResourceManager is running. Warden will try three times to restart the service automatically ever 30 minutes (by default). This 30 minute interval can be reconfigured using the parameter <code>services.retryinterval.time.sec</code> in the <code>warden.conf</code> on page 2494 file.</p> <p>If warden successfully restarts the ResourceManager, the alarm is cleared. If warden is unable to restart the ResourceManager, see more troubleshooting information.</p> |
| Root Partition Full Alarm | |
| UI Column | Root Partition Full |
| Logged As | NODE_ALARM_ROOT_PARTITION_FULL |
| Meaning | The root partition (/) on the node is running out of space (99% full). |
| Resolution | Free up some space in the root partition of the node. |
| Tiny Buckets Flush Alarm | |
| UI Column | Lot of Tiny Buckets Flushed |
| Logged As | NODE_ALARM_TINY_BUCKET_FLUSH |
| Meaning | Indicates lot of small buckets (<= 8mb) are getting flushed in DB resulting in performance degradation. You may see put operation performance going down during this phase and will need to take corrective actions to fix it. This will not bring down the cluster and data is still accessible. |
| Resolution | Increase memory for filesystem as number of active tablets is very high. |
| Time Skew Alarm | |
| UI Column | Time Skew Alarm |
| Logged As | NODE_ALARM_TIME_SKEW |
| Meaning | The clock on the node is out of sync with the master CLDB by more than 20 seconds. |

| | |
|--------------------------------|--|
| Resolution | Use NTP to synchronize the time on all the nodes in the cluster. |
| Version Alarm | |
| UI Column | Version Alarm |
| Logged As | NODE_ALARM_VERSION_MISMATCH |
| Meaning | One or more services on the node are running an unexpected version or there is a mismatch in the filesystem patch versions on the nodes. |
| Resolution | Stop the node, Restore the correct version of any services you have modified, and re-start the node. See Administering Nodes on page 874. |
| WebServer Service Alarm | |
| UI Column | Webserver Alarm |
| Logged As | NODE_ALARM_SERVICE_WEBSERVER_DOWN |
| Meaning | The WebServer service on the node has stopped running. |
| Resolution | Go to the node information page or the Services page in the Control System to check whether the WebServer service is running. The warden will try three times to restart the service automatically. After an interval (30 minutes by default) the warden will again try three times to restart the service. The interval can be configured using the parameter <code>services.retryinterval.time.sec</code> in <code>warden.conf</code> on page 2494. If the warden successfully restarts the WebServer service, the alarm is cleared. If the warden is unable to restart the WebServer service, see more troubleshooting information . |

Table-Replication Alarms

You can view table-replication alarms using the Control System and the CLI. See [Viewing Active Table Replication Alarms](#) on page 1440 for more information.

Table Replication Errors

Explains the alarm that is raised when there are table replication errors.

| | |
|------------------|---|
| Logged As | VOLUME_ALARM_TABLE_REPL_ERROR |
| Meaning | This alarm displays the paths and names of the source tables for which the alarms were issued. Up to ten (10) source tables, that have encountered an error, are displayed. |

Diagnostics

To identify the cause of the alarm, run the `maprcli table replica list` command. This command displays an `errors` field with additional information about the error.

```
maprcli table replica list -path <table path>
```

The `errors` field provides the following information:

- Code - table replication error code:
- Host - host that the error occurred on
- Msg - error message information

For additional information about possible causes of the error, see the following log files (located in the `/opt/mapr/logs` directory):

- `mfs.log-5` - for the nameserver node of the source table
- `mfs.log-5` - for the nameserver node of the destination table
- `gateway.log`

Error Conditions

| Possible Error Conditions | Description |
|--|--|
| A missing table or column family on the destination cluster | If a column family no longer exists in the replica, pause replication with the <code>maprcli table replica pause</code> command, recreate the column family with the <code>maprcli table cf createcommand</code> , run the CopyTable utility to copy data from the source table into the column family, and then resume replication with the <code>maprcli table replica resume</code> command. |
| A mismatch in column family names for the table on the destination cluster | If the column family still exists in the replica but the name of the column family was changed, run the <code>maprcli table cf edit</code> command with the parameter <code>-newcfname</code> set to the correct name. Replication will resume automatically. |
| Unreachable gateways on the destination cluster | This error occurs only if none of the gateways on the cluster are reachable. |
| Autosetup with directcopy has failed while copying data from the source to the replica | This error could be raised under the following conditions: <ul style="list-style-type: none"> • If this error occurs due to a connection failure, this alarm should get resolved once the connection is restored. • If this error occurs due to other error conditions such as missing tables, mis-matched column families, or an unreachable gateway, the error condition may not get resolved on its own and may need administration action. For example, if a PUT operation fails on destination cluster due to an Out-Of-Space condition, the administrator will need to add more storage before the PUT retry succeeds. |

Table Replication Lag High

Logged As

VOLUME_ALARM_TABLE_REPL_LAG_HIGH

Meaning

These alarms display the paths and names of the source tables for which the replication lag is high. High lag times might be caused by these conditions:

- High load on the source or replica

- Low network bandwidth between the source and replicas
- Miscellaneous error conditions that prevent replication from proceeding
- Replication explicitly paused on the source cluster

Configuration

Configurable at the volume level. See [volume create](#) on page 2190 for more information.

Table Replication Asynchronous**Logged As**

VOLUME_ALARM_TABLE_REPL_ASYNC

Meaning

These alarms display the pathnames of the source tables that are involved.

If HPE Ezmeral Data Fabric Database is replicating synchronously and it judges the latency of the replication stream to be too high, it will switch to asynchronous replication temporarily.

After a new gateway is created, an existing gateway is restarted, or after latency is sufficiently reduced, HPE Ezmeral Data Fabric Database switches the mode of replication back to synchronous.

You can also check whether a source table is being replicated synchronously or asynchronously by running the command [table replica list](#) on page 2117.

Elasticsearch Formatting Alarm**Logged As**

NODE_ALARM_SERVICE_ELASTICSEARCH_EXCP

Meaning

The put of primary table cannot be converted/formatted for pushing to Elasticsearch. If the primary table has Elasticsearch as one of its replicas, that may miss updates on some rows as they could not be converted to a supported format for Elasticsearch.

Resolution

Check for rows that could not be formatted for pushing to Elasticsearch in filesystem logs and insert row with data that can be pushed to Elasticsearch.

Secondary Index Alarms

Secondary index alarms indicate issues that HPE Ezmeral Data Fabric Database might encounter while updating secondary indexes. It is important that you understand what the alarms indicate, and how to resolve the issue causing them.

Secondary Index Update Lag High**Logged As**

VOLUME_ALARM_TABLE_INDEX_LAG_HIGH

Meaning

This alarm displays the paths and names of the source tables for which replication lag is high. High lag times might be caused by these conditions:

- High load on the source or replica

- Low network bandwidth between the source and replicas
- Miscellaneous error conditions that prevent replication from proceeding
- Replication explicitly paused on the source cluster

Resolution

If you have configured the threshold for this alarm too low, you can increase the threshold. You configure this lag at the volume level by specifying the `dbindexlagsecalarmthresh` parameter. See [volume modify](#) on page 2275 for more information.

Secondary Index Update Error**Logged As**

VOLUME_ALARM_TABLE_INDEX_ERROR

Meaning

This alarm occurs if the JSON table regions cannot connect to any of the internal gateways used to update fields in a secondary index. This might be caused by these conditions:

- The replication gateway failed.
- You have configured too few replication gateway instances.

Resolution

If the gateway failed, restart it. Otherwise, add more gateways. See [Managing Gateways](#) on page 1273 for further information.

Secondary Index Encoding Error**Logged As**

VOLUME_ALARM_TABLE_INDEX_ENCODING_ERROR

Meaning

This alarm occurs when any of the following encoding errors occur during index updates:

- The indexed rowkey size is too big (> 32 Kb).
- The indexed field contains a CAST function, and a failure occurs evaluating the CAST function.

Resolution

You must either correct your underlying data or redefine the index to avoid missing rows. See [Troubleshooting Secondary Index Encoding Errors](#) on page 1216 for details about how to identify these errors and possible corrective actions.

You also must manually [clear this alarm](#), even if you drop the index or the table.

Volume Alarms

Volume alarms indicate problems in individual volumes. The following sections describe the data-fabric volume alarms.

Compaction Failed**UI Column**

Volume Compaction Failed

| | |
|---|---|
| Logged As | VOLUME_ALARM_COMPACTON_FAILURE |
| Meaning | Data could not be purged as the compactor did not complete the run. |
| Resolution | Wait for the compactor to run again or manually trigger the compactor using the <code>volume compact</code> on page 2186 command. |
| Data Unavailable | |
| UI Column | Data Alarm |
| Logged As | VOLUME_ALARM_DATA_UNAVAILABLE |
| Meaning | This is a potentially very serious alarm that may indicate data loss. Some of the data on the volume cannot be located. This alarm indicates that enough nodes have failed to bring the replication factor of part or all of the volume to zero. For example, if the volume is stored on a single node and has a replication factor of one, the Data Unavailable alarm will be raised if that volume fails or is taken out of service unexpectedly. If a volume is replicated properly (and therefore is stored on multiple nodes) then the Data Unavailable alarm can indicate that a significant number of nodes is down. |
| Resolution | Investigate any nodes that have failed or are out of service. <ul style="list-style-type: none"> You can see which nodes have failed by looking at the Node Health pane in the Overview page in the Control System. Check the cluster(s) for any snapshots or mirrors that can be used to re-create the volume. <p>For additional troubleshooting information, see how to handle this alarm.</p> |
| Data Under-Replicated | |
| Describe the alarm that is triggered when a volume is under replicated. | |
| UI Column | Replication Alarm |
| Logged As | VOLUME_ALARM_DATA_UNDER_REPLICATED |
| Meaning | The volume replication factor is lower than the desired replication factor set for the volume. This can be caused by failing disks or nodes, or the cluster may be running out of storage space. |
| Resolution | Investigate any nodes that are failing. You can see which nodes have failed by looking at the Node Health pane in the Overview page on the Control System. Determine whether it is necessary to add disks or nodes to the cluster. This alarm is generally raised when the nodes that store the volumes or replicas have not sent a heartbeat for five minutes. To prevent re-replication during normal maintenance procedures, Data Fabric waits a specified interval (by default, one hour) before considering the node dead and re-replicating its data. You can control this interval |

by setting the `cldb.fs.mark.rereplicate.sec` parameter using the `config save` command. For additional troubleshooting information, see [how to handle this alarm](#).

Warm-Tier Data Node Down

Provides the resolution for the Warm-Tier Data Node Down alarm.

| | |
|-------------------|---|
| UI Column | Warm-Tier Data Node Down |
| Logged As | VOLUME_ALARM_DEGRADED_EC_STRIPES |
| Meaning | One of the nodes or SPs, on which either the data or parity fragments associated with the tiering enabled volume resides, is offline or down. |
| Resolution | MapR tolerates failure of nodes equal to the number of parity fragments. However, to ensure the availability of data, add nodes to the topology or cluster. |

Data Under-Encoded

| | |
|-------------------|---|
| UI Column | Volume Data Under-Encoded |
| Logged As | VOLUME_ALARM_CRITICALLY_DEGRADED_EC_STRIPES |
| Meaning | The number of nodes that are down is equal to the number of parity fragments. |
| Resolution | MapR tolerates failure of nodes equal to the number of parity fragments. However, to ensure the availability of data, add nodes to the topology or cluster. |

Data Below-Parity

| | |
|-------------------|--|
| UI Column | Volume Data Below-Parity |
| Logged As | VOLUME_ALARM_EC_DATA_UNAVAILABLE |
| Meaning | The number of SPs or nodes that are offline or down exceed the number of parity fragments set for the tiering-enabled volume. MapR only tolerates failure of nodes equal to the number of parity fragments set for the tiering-enabled volume. |
| Resolution | Add more nodes to the topology or cluster. |

Offload/Recall Failed

| | |
|-------------------|---|
| UI Column | Volume Offload/Recall Failed |
| Logged As | VOLUME_ALARM_OFFLOAD_RECALL_FAILURE |
| Meaning | The volume data could not be offloaded or could not be recalled. |
| Resolution | Check the log file for more information on the error. For some errors, CLDB tries to offload the data again after a brief wait. For more information, see Retrying Failed Operation on page 1020. |

Inodes Limit Exceeded

| | |
|----------------------|--|
| UI Column | Inodes Exceeded Alarm |
| Logged As | VOLUME_ALARM_INODES_EXCEEDED |
| Meaning | The volume contains too many files or the size of the namespace container size has exceeded the configured limit. |
| Resolution | <p>This alarm indicates that not enough volumes are set up to handle the number of files stored in the cluster or the size of the name container exceeds the limit. Typically, each user or project should have a separate volume. To resolve the name container issue, investigate the cause for the alarm. After careful consideration, create one or more volumes and move data into the new volumes.</p> <p>See How to handle the VOLUME_ALARM_INODES_EXCEEDED alarm in MapR for more information on resolving this alarm.</p> |
| Configuration | Configurable at cluster and volume level. See Configuring the Alarm Threshold Using the CLI on page 863 for more information. |

Large Row

| | |
|-------------------|---|
| UI Label | Large Row |
| Logged As | VOLUME_ALARM_TABLE_LARGE_ROW_WARNING |
| Meaning | A row in a table within the specified volume has reached 75% of the maximum supported row size of 2 GB. The alarm provides the rowkey and the name of the table. If the row size exceeds 2 GB, subsequent HPE Ezmeral Data Fabric Database operations on the corresponding table region will fail with an I/O error. |
| Resolution | <p>Ensure that client applications that access the table are managing row data correctly, so that no row exceeds 2 GB. The method of resolving the alarm depends on the way in which client applications were managing row data.</p> <p>For example, if client applications allowed too many versions of cell data, delete excess versions. If client applications neglected to remove old columns or column families, remove those manually.</p> |

Mirror Failure

| | |
|-------------------|---|
| UI Column | Mirror Alarm |
| Logged As | VOLUME_ALARM_MIRROR_FAILURE |
| Meaning | A mirror operation failed. |
| Resolution | Make sure the CLDB is running on both the source cluster and the destination cluster. Look at the CLDB log (<code>/opt/mapr/logs/cldb.log</code>) and the MapR filesystem log (<code>/opt/mapr/logs/mfs.log</code>) on both clusters for more information. If the attempted mirror operation was between two clusters, make sure that |

both clusters are reachable over the network. Make sure the source volume is available and reachable from the cluster that is performing the mirror operation. For more troubleshooting information, see [how to handle this alarm](#).

No Nodes in Topology

| | |
|-------------------|---|
| UI Column | No Nodes in Vol Topo |
| Logged As | VOLUME_ALARM_NO_NODES_IN_TOPOLOGY |
| Meaning | The path specified in the volume's topology no longer corresponds to a physical topology that contains any nodes, either due to node failures or changes to node topology settings. While this alarm is raised, MapR places data for the volume on nodes outside the volume's topology to prevent write failures. |
| Resolution | Add nodes to the specified volume topology, either by moving existing nodes or adding nodes to the cluster. See Understanding Topology on page 413. |

Snapshot Failure

| | |
|-------------------|--|
| UI Column | Snapshot Alarm |
| Logged As | VOLUME_ALARM_SNAPSHOT_FAILURE |
| Meaning | A snapshot operation failed. |
| Resolution | Make sure the CLDB is running. Look at the CLDB log (<code>/opt/mapr/logs/cldb.log</code>) and the MapR filesystem log (<code>/opt/mapr/logs/mfs.log</code>) on both clusters for more information. If the attempted snapshot was a scheduled snapshot that was running in the background, try a manual snapshot. For more troubleshooting information, see how to handle this alarm . |

Snapshot Restore Failure

Describes the alarm that is triggered when the Snapshot Restore operation fails repeatedly.

| | |
|-------------------|---|
| UI Column | Snapshot Restore Failure Alarm |
| Logged As | VOLUME_ALARM_SNAPRESTORE_MAXRETRIES_EXCEEDED |
| Meaning | The snapshot restore operation failed and is retried for more than five (5) times for a single container. |
| Resolution | View MFS and CLDB logs to determine the cause of failure. Ensure that the master containers for all nodes are up and running. |

Related concepts

[Restoring a Volume From a Snapshot](#) on page 442

Provides a synopsis of restoring a volume from a snapshot. Describes the implications, and the prerequisites.

Topology Almost Full

| | |
|----------------------|---|
| UI Column | Vol Topo Almost Full |
| Logged As | VOLUME_ALARM_TOPOLOGY_ALMOST_FULL |
| Meaning | The nodes in the specified topology are running out of storage space. |
| Resolution | Move volumes to another topology, enlarge the specified topology by adding more nodes, or add disks to the nodes in the specified topology. |
| Configuration | Configurable at cluster level. See Configuring the Alarm Threshold Using the CLI on page 863 for more information. |

Label Almost Full

The alarm that is triggered when Storage Pools/Nodes with the specified label are running out of space.

| | |
|----------------------|--|
| UI Column | Vol Label Almost Full |
| Logged As | VOLUME_ALARM_LABEL_ALMOST_FULL |
| Meaning | The free storage space on Storage Pools/Nodes with the specified label is lesser than the threshold value. This can disrupt creation/replication of containers with the specified label. |
| Resolution | Move volumes to another topology with sufficient free storage space on nodes with the specified label, enlarge the current topology by adding more nodes with the specified label, or add disks with the specified label to the nodes in the current topology. |
| Configuration | Configurable at cluster level. See Configuring the VOLUME_ALARM_LABEL_ALMOST_FULL alarm for more information. |

Topology Full Alarm

| | |
|-------------------|---|
| UI Column | Vol Topo Full |
| Logged As | VOLUME_ALARM_TOPOLOGY_FULL |
| Meaning | The nodes in the specified topology have out of storage space. |
| Resolution | Move volumes to another topology, enlarge the specified topology by adding more nodes, or add disks to the nodes in the specified topology. |

Label Full Alarm

The alarm that is triggered when Storage Pools/Nodes with the specified label are completely out of space.

| | |
|------------------|--|
| UI Column | Vol Label Full |
| Logged As | VOLUME_ALARM_LABEL_FULL |
| Meaning | There is no more free storage space on Storage Pools/Nodes with the specified label. This will definitely disrupt creation/replication of containers with the specified label. |

| | |
|---|--|
| Resolution | Move volumes to another topology with sufficient free storage space on nodes with the specified label, enlarge the current topology by adding more nodes with the specified label, or add disks with the specified label to the nodes in the current topology. |
| |  Note: There is a Label Almost Full on page 2530 alarm that is raised when the available storage space goes below the configured threshold. |
| Volume Advisory Quota Alarm | |
| UI Column | Vol Advisory Quota Alarm |
| Logged As | VOLUME_ALARM_ADVISORY_QUOTA_EXCEEDED |
| Meaning | A volume has exceeded its advisory quota. |
| Resolution | No immediate action is required. To avoid exceeding the hard quota, clear space on the volume or stop further data writes. |
| Configuration | Configurable in volume properties. See Configuring the Alarm Threshold Using the CLI on page 863 for more information. |
| Volume Become Master Stuck | |
| UI Column | VOLUME BECOME MASTER STUCK |
| Logged As | VOLUME_ALARM_BECOME_MASTER_STUCK |
| Meaning | This means that there are some containers (associated with the volume) that don't have Master role. The alarm description displays the containers on which Master role is not assigned. |
| Resolution | Run <code>dump containerinfo</code> on page 1805 command to determine the node on which role is not assigned and restart that node. If you see the alarm after the node is restarted, contact MapR support. |
| Volume with Non-Local Containers | |
| UI Column | Local Volume containers non-local |
| Logged As | VOLUME_ALARM_DATA_CONTAINERS_NONLOCAL |
| Meaning | This is a local volume and its containers should all reside on the same node. Some containers were created on another node, which may cause performance issues in MapReduce applications. |
| Resolution | Recreate the local volume or review information on how to handle this alarm . |
| Volume Quota Alarm | |
| UI Column | Vol Quota Alarm |
| Logged As | VOLUME_ALARM_QUOTA_EXCEEDED |

| | |
|----------------------|--|
| Meaning | A volume has exceeded its quota. Further writes to the volume will fail. |
| Resolution | Free some space on the volume or increase the volume hard quota. |
| Configuration | Configurable in volume properties. See Configuring the Alarm Threshold Using the CLI on page 863 for more information. |

MapR Environment

This section provides information associated with the MapR environment.

HPE Ezmeral Data Fabric Parameters

The following table lists user-configurable parameters and their default values. These default values reflect those in the default configuration files, plus any overrides shipped out-of-the-box in `core-site.xml`, `mapred-site.xml`, or other configuration files. You can override these values by editing or adding them in `mapred-site.xml` or `core-site.xml`, using the `-D` option to the `hadoop jar` command when submitting a job, or by setting them explicitly in your code.

| Parameter | Default |
|--|----------|
| <code>fs.mapr.bailout.on.library.mismatch</code> | true |
| <code>fs.mapr.bind.retries</code> | false |
| <code>fs.mapr.working.dir</code> | |
| <code>fs.maprfs.impl</code> | |
| <code>fs.ramfs.impl</code> | |
| <code>fs.s3.block.size</code> | 33554432 |
| <code>fs.s3.blockSize</code> | 33554432 |
| <code>fs.s3.buffer.dir</code> | |
| <code>fs.s3.impl</code> | |
| <code>fs.s3.maxRetries</code> | 4 |
| <code>fs.s3.sleepTimeSeconds</code> | 10 |
| <code>fs.s3n.block.size</code> | 33554432 |
| <code>fs.s3n.blockSize</code> | 33554432 |
| <code>fs.s3n.impl</code> | |
| <code>fs.trash.interval</code> | 0 |
| <code>hadoop.logfile.count</code> | 10 |
| <code>hadoop.logfile.size</code> | 10000000 |
| <code>hadoop.native.lib</code> | TRUE |
| <code>hadoop.proxyuser.root.groups</code> | root |
| <code>hadoop.proxyuser.root.hosts</code> | |
| <code>hadoop.rpc.socket.factory.class.default</code> | |
| <code>hadoop.security.authentication</code> | simple |

| Parameter | Default |
|---|----------|
| hadoop.security.authorization | FALSE |
| hadoop.security.group.mapping | |
| hadoop.security.uid.cache.secs | 14400 |
| hadoop.tmp.dir | |
| hadoop.util.hash.type | murmur |
| hadoop.workaround.non.threadsafe.getpwuid | FALSE |
| io.bytes.per.checksum | 512 |
| io.compression.codecs | |
| io.file.buffer.size | 8192 |
| io.mapfile.bloom.error.rate | 0.005 |
| io.mapfile.bloom.size | 1048576 |
| io.serializations | |
| io.skip.checksum.errors | FALSE |
| io.sort.factor | 256 |
| io.sort.mb | 380 |
| io.sort.record.percent | 0.17 |
| io.sort.spill.percent | 0.99 |
| ipc.client.connect.max.retries | 10 |
| ipc.client.connection.maxidletime | 10000 |
| ipc.client.idlethreshold | 4000 |
| ipc.client.kill.max | 10 |
| ipc.client.max.connection.setup.timeout | 20 |
| ipc.client.tcponodelay | TRUE |
| ipc.server.listen.queue.size | 128 |
| ipc.server.tcponodelay | TRUE |
| job.end.retry.interval | 30000 |
| jobclient.completion.poll.interval | 5000 |
| jobclient.output.filter | FAILED |
| jobclient.progress.monitor.poll.interval | 1000 |
| keep.failed.task.files | FALSE |
| local.cache.size | 1.07E+10 |
| map.sort.class | |
| mapr.centrallog.dir | logs |
| mapr.localoutput.dir | output |
| mapr.localspill.dir | spill |
| mapr.localvolumes.path | |

| Parameter | Default |
|---|---------|
| mapr.map.keyprefix.ints | 1 |
| mapr.task.diagnostics.enabled | FALSE |
| mapreduce.heartbeat.10 | 300 |
| mapreduce.heartbeat.100 | 1000 |
| mapreduce.heartbeat.1000 | 10000 |
| mapreduce.job.complete.cancel.delegation.tokens | TRUE |
| mapreduce.maprfs.use.compression | TRUE |
| mapreduce.reduce.input.limit | -1 |

Default MapR Configurations

The default values for configuration parameters can come from various sources:

- marpred-default.xml
- core-default.xml
- yarn-default.xml
- MapR code
- Hadoop code

The topics in this section include the default values for each parameter and the source of the default.

Note: For each parameter, an entry in the <name>-site.xml file overrides the default.

Default core Parameters

| Property | Description |
|------------------------------------|---|
| dfs.bytes-per-checksum | Default value: 512 Default source: code |
| dfs.ha.fencing.ssh.connect-timeout | Default value: 30000 Default source: core-default.xml |
| dfs.namenode.checkpoint.dir | Default value: \${hadoop.tmp.dir}/dfs/secondary Default source: code |
| dfs.namenode.checkpoint.edits.dir | Default value: \${fs.checkpoint.dir} Default source: code |
| dfs.namenode.checkpoint.period | Default value: 3600 Default source: code |

| | |
|-----------------------------------|---|
| file.blocksize | Default value: 67108864 Default source: core-default.xml |
| file.bytes-per-checksum | Default value: 512 Default source: core-default.xml |
| file.client-write-packet-size | Default value: 65536 Default source: core-default.xml |
| file.replication | Default value: 1 Default source: core-default.xml |
| file.stream-buffer-size | Default value: 4096 Default source: core-default.xml |
| fs.AbstractFileSystem.file.impl | Default value: org.apache.hadoop.fs.local.LocalFs Default source: core-default.xml |
| fs.AbstractFileSystem.ftp.impl | Default value: org.apache.hadoop.fs.ftp.FtpFs Default source: core-default.xml |
| fs.AbstractFileSystem.har.impl | Default value: org.apache.hadoop.fs.HarFs Default source: core-default.xml |
| fs.AbstractFileSystem.hdfs.impl | Default value: com.mapr.fs.MFS Default source: code |
| fs.AbstractFileSystem.maprfs.impl | Default value: com.mapr.fs.MFS Default source: code |
| fs.AbstractFileSystem.viewfs.impl | Default value: org.apache.hadoop.fs.viewfs.ViewFs Default source: core-default.xml |
| fs.automatic.close | Default value: TRUE Default source: core-default.xml |
| fs.checkpoint.size | Default value: 67108864 Default source: code |
| fs.client.resolve.remote.symlinks | Default value: TRUE Default source: core-default.xml |
| fs.defaultFS | Default value: maprfs:/// Default source: code |
| fs.df.interval | Default value: 60000 Default source: core-default.xml |
| fs.du.interval | Default value: 600000 Default source: core-default.xml |

| | |
|---------------------------------|---|
| fs.file.impl | Default value: org.apache.hadoop.fs.LocalFileSystem Default source: code |
| fs.ftp.host | Default value: 0.0.0.0 Default source: core-default.xml |
| fs.ftp.host.port | Default value: 21 Default source: core-default.xml |
| fs.ftp.impl | Default value: org.apache.hadoop.fs.ftp.FTPFileSystem Default source: code |
| fs.har.impl | Default value: org.apache.hadoop.fs.HarFileSystem Default source: code |
| fs.har.impl.disable.cache | Default value: TRUE Default source: core-default.xml |
| fs.hdfs.impl | Default value: com.mapr.fs.MapRFileSystem Default source: code |
| fs.hftp.impl | Default value: org.apache.hadoop.hdfs.HftpFileSystem Default source: code |
| fs.hsftp.impl | Default value: org.apache.hadoop.hdfs.HsftpFileSystem Default source: code |
| fs.kfs.impl | Default value: org.apache.hadoop.fs.kfs.KosmosFileSystem Default source: code |
| fs.mapr.flush.unaligned | Default value: false Default source: code |
| fs.mapr.rathreads | Default value: 0 Default source: code |
| fs.mapr.working.dir | Default value: /user/\$USERNAME/ Default source: code |
| fs.mapr.write.idleflush.timeout | Default value: 3 seconds Default source: code |
| fs.maprfs.impl | Default value: com.mapr.fs.MapRFileSystem Default source: code |
| fs.permissions.umask-mode | Default value: 22 Default source: core-default.xml |

| | |
|-------------------------------------|--|

Default YARN Parameters

| Parameter | Description |
|--|---|
| mapreduce.job.hdfs-servers | Default value: \${fs.defaultFS} Default source: yarn-default.xml |
| yarn.acl.enable | Indicates whether ACLs are enabled. Default value: FALSE Default source: yarn-default.xml |
| yarn.admin.acl | ACL of who can be admin of the YARN cluster. Default value: * Default source: yarn-default.xml |
| yarn.am.liveness-monitor.expiry-interval-ms | The expiry interval for application master reporting. Default value: 600000 Default source: yarn-default.xml |
| yarn.app.mapreduce.job.update-status-max-retries | The number of job status update retries. Default value: 0 (retried only 1 time) For a value N, the update is retried 1+N times. |
| yarn.app.mapreduce.job.update-status-retry-interval | The interval in milliseconds for job status update retries. Default value: 2000 (2000 millisecond or 2 seconds delay is observed before each retry attempt) |
| yarn.client.application-client-protocol.poll-interval-ms | The interval that the yarn client library uses to poll the completion status of the asynchronous API of application client protocol. Default value: 200 Default source: yarn-default.xml |
| yarn.client.failover-proxy-provider | When HA is enabled, the class to be used by Clients, AMs and NMs to failover to the Active RM. It should extend org.apache.hadoop.yarn.client.RMFailoverProxyProvider. Default value: org.apache.hadoop.yarn.client.ConfiguredRMFailoverProxyProvider Default source: yarn-default.xml When you configure failover configure.sh may change the default value by adding a value for this parameter in yarn-site.xml. For more information, see ResourceManager Configuration Properties . |

| | |
|---|--|
| yarn.client.failover-retries | <p>When HA is enabled, the number of retries per attempt to connect to a ResourceManager. In other words, it is the <code>ipc.client.connect.max.retries</code> to be used during failover attempts.</p> <p>Default value: 0</p> <p>Default source: yarn-default.xml</p> |
| yarn.client.failover-retries-on-socket-timeouts | <p>When HA is enabled, the number of retries per attempt to connect to a ResourceManager on socket timeouts. In other words, it is the <code>ipc.client.connect.max.retries.on.timeouts</code> to be used during failover attempts.</p> <p>Default value: 0</p> <p>Default source: yarn-default.xml</p> |
| yarn.client.max-nodemanager-proxies | <p>Maximum number of proxy connections for node manager. It should always be more than 1. NMClient and MRAppMaster will use this to cache connection with node manager. There will be at max one connection per node manager. Ex. configuring it to a value of 5 will make sure that client will at max have 5 connections cached with 5 different node managers. These connections will be timed out if idle for more than system wide idle timeout period. The token if used for authentication then it will be used only at connection creation time. If new token is received then earlier connection should be closed in order to use newer token. This and (<code>yarn.client.nodemanager-client-async.thread-pool-max-size</code>) are related and should be sync (no need for them to be equal).</p> <p>Default value: 0</p> <p>Default source: yarn-default.xml</p> |
| yarn.client.nodemanager-client-async.thread-pool-max-size | <p>Max number of threads in NMClientAsync to process container management events.</p> <p>Default value: 500</p> <p>Default source: yarn-default.xml</p> |
| yarn.client.nodemanager-connect.max-wait-ms | <p>Default value: 900000</p> <p>Default source: yarn-default.xml</p> |
| yarn.client.nodemanager-connect.retry-interval-ms | <p>Default value: 10000</p> <p>Default source: yarn-default.xml</p> |
| yarn.dfs-logging.dir-glob | <p>Default value: <code>maprfs:///var/mapr/local/*/logs/yarn/userlogs</code></p> <p>Default source: Code</p> |
| yarn.dfs-logging.handler-class | <p>Default value: <code>com.mapr.hadoop.yarn.util.MapRFSLoggingHandler</code></p> <p>Default source: Code</p> |
| yarn.external.token.manager | <p>Default value: <code>com.mapr.hadoop.yarn.security.MapRTicketManager</code></p> <p>Default source: Code</p> |

| | |
|--|---|
| yarn.http.policy | Configures the HTTP endpoint for YARN Daemons. The following values are supported: -HTTP_ONLY : Service is provided only on http -HTTPS_ONLY : Service is provided only on https Default value: HTTP_ONLY Default source: yarn-default.xml |
| yarn.ipc.rpc.class | RPC class implementation. Default value: org.apache.hadoop.yarn.ipc.HadoopYarnProtoRPC Default source: yarn-default.xml |
| yarn.log-aggregation.retain-check-interval-seconds | How long to wait between aggregated log retention checks. If set to 0 or a negative value, then the value is computed as one-tenth of the aggregated log retention time. Default value: -1 Default source: yarn-default.xml See YARN Log Aggregation . |
| yarn.log-aggregation.retain-seconds | How long to keep aggregation logs before deleting them. -1 disables. Default value: 2592000 Default source: code See YARN Log Aggregation . |
| yarn.log-aggregation-enable | Whether to enable log aggregation. Default value: FALSE Default source: yarn-default.xml See YARN Log Aggregation . |
| yarn.mapr.ticket.expiration | Default value: 604800000 Default source: code |
| yarn.nm.liveness-monitor.expiry-interval-ms | How long to wait until a NodeManager is considered dead. Default value: 600000 Default source: yarn-default.xml |
| yarn.nodemanager.container-localizer.log.level | Configuring container localizer logs Default value: INFO Default source: code |
| yarn.nodemanager.address | The address of the container manager in the NM. Default value: \${yarn.nodemanager.hostname}:0 Default source: yarn-default.xml |

| | |
|---|--|
| yarn.nodemanager.admin-env | <p>Environment variables that should be forwarded from the NodeManager's environment to the container's environment.</p> <p>Default value: MALLOC_ARENA_MAX=\$MALLOC_ARENA_MAX</p> <p>Default source: yarn-default.xml</p> |
| yarn.nodemanager.aux-services | <p>The valid service name should only contain a-zA-Z0-9_ and can not start with numbers.</p> <p>Default value: mapreduce_shuffle,mapr_direct_shuffle</p> <p>Default source: code</p> |
| yarn.nodemanager.aux-services.mapr_direct_shuffle.class | <p>Default value: com.mapr.hadoop.mapred.LocalVolumeAuxService</p> <p>Default source: code</p> |
| yarn.nodemanager.aux-services.mapreduce_shuffle.class | <p>Default value: org.apache.hadoop.mapred.ShuffleHandler</p> <p>Default source: yarn-default.xml</p> |
| yarn.nodemanager.check-interval-localizing-container.ms | <p>The frequency at which the ApplicationMaster checks the running time of the localizing container. Specified in milliseconds.</p> <p>Default value: -1</p> <p>Default source: YarnConfiguration</p> |
| yarn.nodemanager.container-executor.class | <p>Identifies who will execute (launch) the containers.</p> <p>Default value: org.apache.hadoop.yarn.server.nodemanager.LinuxContainerExecutor</p> <p>Default source: code</p> |
| yarn.nodemanager.container-manager.thread-count | <p>Number of threads the container manager uses.</p> <p>Default value: 20</p> <p>Default source:yarn-default.xml</p> |
| yarn.nodemanager.container-monitor.interval-ms | <p>How often to monitor containers.</p> <p>Default value: 3000</p> <p>Default source: yarn-default.xml</p> |
| yarn.nodemanager.container-monitor.procs-tree.smaps-based-rss.enabled | <p>Default value: FALSE</p> <p>Default source: yarn-default.xml</p> |

| | |
|---|--|
| yarn.nodemanager.delete.debug-delay-sec | <p>Number of seconds after an application finishes before the NodeManager's DeletionService will delete the application's localized file directory and log directory. To diagnose Yarn application problems, set this property's value large enough (for example, to 600 = 10 minutes) to permit examination of these directories. After changing the property's value, you must restart the NodeManager in order for it to have an effect. The roots of Yarn applications' work directories are configurable with the yarn.nodemanager.local-dirs property (see below), and the roots of the Yarn applications' log directories is configurable with the yarn.nodemanager.log-dirs property (see also below).</p> <p>Default value: 0</p> <p>Default source: yarn-default.xml</p> |
| yarn.nodemanager.delete.thread-count | <p>Number of threads used in cleanup.</p> <p>Default value: 4</p> <p>Default source: yarn-default.xml</p> |
| yarn.nodemanager.disk-health-checker.interval-ms | <p>Frequency of running disk health checker code.</p> <p>Default value: 1200000</p> <p>Default source: yarn-default.xml</p> |
| yarn.nodemanager.disk-health-checker.max-disk-utilization-per-disk-percentage | <p>Default value: 90</p> <p>Default source: yarn-default.xml</p> |
| yarn.nodemanager.disk-health-checker.min-free-space-per-disk-mb | <p>Default value: 0</p> <p>Default source: yarn-default.xml</p> |
| yarn.nodemanager.disk-health-checker.min-healthy-disks | <p>The minimum fraction of number of disks to be healthy for the nodemanager to launch new containers. This correspond to both yarn-nodemanager.local-dirs and yarn.nodemanager.log-dirs. i.e. If there are less number of healthy local-dirs (or log-dirs) available, then new containers will not be launched on this node.</p> <p>Default value: 0.25</p> <p>Default source: yarn-default.xml</p> |
| yarn.nodemanager.docker-container-executor.exec-name | <p>Default value: /usr/bin/docker</p> <p>Default source: yarn-default.xml</p> |
| yarn.nodemanager.env-whitelist | <p>Environment variables that containers may override rather than use NodeManager's default.</p> <p>Default value: JAVA_HOME,HADOOP_COMMON_HOME,HADOOP_HDFS_HOME,HADOOP_CONF_DIR,HADOOP_YARN_HOME</p> <p>Default source: yarn-default.xml</p> |
| yarn.nodemanager.external.token.localizer | <p>Default value: com.mapr.hadoop.yarn.nodemanager.MapRTicketLocalizer</p> <p>Default source: code</p> |

| | |
|---|--|
| yarn.nodemanager.health-checker.interval-ms | Frequency of running node health script. Default value: 600000 Default source: yarn-default.xml |
| yarn.nodemanager.health-checker.script.timeout-ms | Script time out period. Default value: 1200000 Default source: yarn-default.xml |
| yarn.nodemanager.hostname | The hostname of the NM. Default value: 0.0.0.0 Default source: yarn-default.xml |
| yarn.nodemanager.keytab | Keytab for NM. Default value: /etc/krb5.keytab Default source: yarn-default.xml |
| yarn.nodemanager.linux-container-executor.cgroups.hierarchy | The cgroups hierarchy under which to place YARN processes (cannot contain commas). If yarn.nodemanager.linux-container-executor.cgroups.mount is false (that is, if cgroups have been pre-configured), then this cgroups hierarchy must already exist and be writable by the NodeManager user, otherwise the NodeManager may fail. Only used when the LCE resources handler is set to the CgroupsLCEResourcesHandler. Default value: /hadoop-yarn Default source: yarn-default.xml |
| yarn.nodemanager.linux-container-executor.cgroups.mount | Whether the LCE should attempt to mount cgroups if not found. Only used when the LCE resources handler is set to the CgroupsLCEResourcesHandler. Default value: false Default source: yarn-default.xml |
| yarn.nodemanager.linux-container-executor.cgroups.strict-resource-usage | Default value: FALSE Default source: yarn-default.xml |
| yarn.nodemanager.linux-container-executor.nonsecure-mode.limit-users | Default value: TRUE Default source: yarn-default.xml |
| yarn.nodemanager.linux-container-executor.nonsecure-mode.local-user | Default value: nobody Default source: yarn-default.xml |
| yarn.nodemanager.linux-container-executor.nonsecure-mode.user-pattern | The allowed pattern for UNIX user names enforced by Linux-container-executor when used in nonsecure mode (use case for this is using cgroups). The default value is taken from /usr/sbin/adduser. Default value: ^[_A-Za-z0-9][-_A-Za-z0-9]{0,255}?[!\$]? Default source: yarn-default.xml |

| | |
|---|---|
| yarn.nodemanager.linux-container-executor.resources-handler.class | <p>The class which should help the LCE handle resources.</p> <p>Default value: org.apache.hadoop.yarn.server.nodemanager.util.DefaultLCEResourcesHandler</p> <p>Default source: yarn-default.xml</p> |
| yarn.nodemanager.local-cache.max-files-per-directory | <p>It limits the maximum number of files which will be localized in a single local directory. If the limit is reached then sub-directories will be created and new files will be localized in them. If it is set to a value less than or equal to 36 [which are sub-directories (0-9 and then a-z)] then NodeManager will fail to start. For example; [for public cache] if this is configured with a value of 40 (4 files + 36 sub-directories) and the local-dir is /tmp/local-dir1, then it will allow 4 files to be created directly inside /tmp/local-dir1/filecache. For files that are localized further, it will create a sub-directory "0" inside /tmp/local-dir1/filecache and will localize files inside it until it becomes full. If a file is removed from a sub-directory that is marked full, then that sub-directory will be used back again to localize files.</p> <p>Default value: 8192</p> <p>Default source: yarn-default.xml</p> |
| yarn.nodemanager.local-dirs | <p>List of directories to store localized files in. An application's localized file directory will be found in: \${yarn.nodemanager.local-dirs}/usercache/\${user}/appcache/application_\${appid}. Individual containers' work directories, called container_\${contid}, will be subdirectories of this.</p> <p>Default value: \${hadoop.tmp.dir}/nm-local-dir</p> <p>Default source: yarn-default.xml</p> |
| yarn.nodemanager.localizer.address | <p>Address where the localizer IPC is.</p> <p>Default value: \${yarn.nodemanager.hostname}:8040</p> |
| yarn.nodemanager.localizer.cache.cleanup.interval-ms | <p>Interval in between cache cleanups.</p> <p>Default value: 60000</p> <p>Default source: yarn-default.xml</p> |
| yarn.nodemanager.localizer.cache.target-size-mb | <p>Target size of localizer cache in MB, per local directory.</p> <p>Default value: 10240</p> <p>Default source: yarn-default.xml</p> |
| yarn.nodemanager.localizer.client.thread-count | <p>Number of threads to handle localization requests.</p> <p>Default value: 5</p> <p>Default source: yarn-default.xml</p> |
| yarn.nodemanager.localizer.fetch.thread-count | <p>Number of threads to use for localization fetching.</p> <p>Default value: 4</p> <p>Default source: yarn-default.xml</p> |

| | |
|---|---|
| yarn.nodemanager.log.retain-seconds | Time in seconds to retain user logs. Only applicable if log aggregation is disabled. Default value: 10800 Default source: yarn-default.xml |
| yarn.nodemanager.log-aggregation.compression-type | T-file compression types used to compress aggregated logs. Default value: none Default source: yarn-default.xml |
| yarn.nodemanager.log-aggregation.roll-monitoring-interval-seconds | Default value: -1 Default source: yarn-default.xml |
| yarn.nodemanager.log-dirs | Where to store container logs. An application's localized log directory will be found in <code>\${yarn.nodemanager.log-dirs}/application_\${appid}</code> . Individual containers' log directories will be below this, in directories named <code>container_\${scontid}</code> . Each container directory will contain the files <code>stderr</code> , <code>stdin</code> , and <code>syslog</code> generated by that container. Default value: <code>\${yarn.log.dir}/userlogs</code> Default source: yarn-default.xml |
| yarn.nodemanager.pmem-check-enabled | Whether physical memory limits will be enforced for containers. Default value: true Default source: yarn-default.xml |
| yarn.nodemanager.process-kill-wait.ms | Max time to wait for a process to come up when trying to cleanup a container. Default value: 2000 Default source: yarn-default.xml |
| yarn.nodemanager.recovery.enabled | Default value: TRUE Default source: yarn-default.xml |
| yarn.nodemanager.remote-app-log-dir | Where to aggregate logs to. Default value: <code>/tmp/logs</code> Default source: yarn-default.xml |
| yarn.nodemanager.remote-app-log-dir-suffix | The remote log dir will be created at <code>{yarn.nodemanager.remote-app-log-dir}/\${user}/{thisParam}</code> Default value: logs Default source: yarn-default.xml |
| yarn.nodemanager.resource.cpu-vcores | Number of CPU cores that can be allocated for containers. Default value: <code>\${nodemanager.resource.cpu-vcores}</code> Default source: code |

| | |
|---|---|
| yarn.nodemanager.resource.io-spindles | Default value: \${nodemanager.resource.io-spindles} Default source: code |
| yarn.nodemanager.resource.memory-mb | Amount of physical memory, in MB, that can be allocated for containers. Default value: \${nodemanager.resource.memory-mb} Default source: code |
| yarn.nodemanager.resource.percentage-physical-cpu-limit | Default value: 100 Default source: yarn-default.xml |
| yarn.nodemanager.resourcemanager.minimum.version | The minimum allowed version of a resourcemanager that a nodemanager will connect to. The valid values are NONE (no version checking), EqualToNM (the resourcemanager's version is equal to or greater than the NM version), or a Version String. Default value: NONE Default source: yarn-default.xml |
| yarn.nodemanager.sleep-delay-before-sigkill.ms | Number of ms to wait between sending a SIGTERM and SIGKILL to a container. Default value: 250 Default source: yarn-default.xml |
| yarn.nodemanager.timeout-localizing-container | Maximum time to wait to localize resources for containers. Specified in seconds. Default value: 1800 Default source: YarnConfiguration |
| yarn.nodemanager.vmem-check-enabled | Whether virtual memory limits will be enforced for containers. Default value: false Default source: yarn-default.xml |
| yarn.nodemanager.vmem-pmem-ratio | Ratio between virtual memory to physical memory when setting memory limits for containers. Container allocations are expressed in terms of physical memory, and virtual memory usage is allowed to exceed this allocation by this ratio. Default value: 2.1 Default source: yarn-default.xml |
| yarn.nodemanager.webapp.address | NM Webapp address. Default value: \${yarn.nodemanager.hostname}:8042 Default source: yarn-default.xml |
| yarn.nodemanager.windows-container.cpu-limit.enabled | Default value: FALSE Default source: yarn-default.xml |
| yarn.nodemanager.windows-container.memory-limit.enabled | Default value: FALSE Default source: yarn-default.xml |

| | |
|--|--|
| yarn.resourcemanager.address | <p>The address of the applications manager interface in the ResourceManager.</p> <p>Default value: \${yarn.resourcemanager.hostname}:8032</p> <p>Default source: yarn-default.xml</p> <p>When you configure failover configure.sh may change the default value by adding a value for this parameter in yarn-site.xml. For more information, see ResourceManager Configuration Properties on page 1695.</p> |
| yarn.resourcemanager.admin.address | <p>The address of the ResourceManager admin interface.</p> <p>Default value: \${yarn.resourcemanager.hostname}:8033</p> <p>Default source: yarn-default.xml</p> <p>When you configure failover configure.sh may change the default value by adding a value for this parameter in yarn-site.xml. For more information, see ResourceManager Configuration Properties on page 1695.</p> |
| yarn.resourcemanager.admin.client.thread-count | <p>Number of threads used to handle the ResourceManager admin interface.</p> <p>Default value: 1</p> <p>Default source: yarn-default.xml</p> |
| yarn.resourcemanager.am.max-attempts | <p>The maximum number of application attempts. This is a global setting for all ApplicationMasters. Each ApplicationMaster can specify its individual maximum number of application attempts via the API, but the individual number cannot be more than the global upper bound. If it is, the ResourceManager will override it. The default number is set to 2, to allow at least one retry for the ApplicationMaster.</p> <p>Default value: 2</p> <p>Default source: yarn-default.xml</p> |
| yarn.resourcemanager.application-tokens.master-key-rolling-interval-secs | <p>Interval for the roll over for the master key used to generate application tokens.</p> <p>Default value: 86400</p> <p>Default source: yarn-default.xml</p> |
| yarn.resourcemanager.aux-services | <p>Default value: RMVolumeManager</p> <p>Default source: code</p> |
| yarn.resourcemanager.aux-services.HSVolumeManager.class | <p>Default value: com.mapr.hadoop.yarn.resourcemanager.RMVolumeManager</p> <p>Default source: code</p> |
| yarn.resourcemanager.aux-services.RMVolumeManager.class | <p>Default value: com.mapr.hadoop.yarn.resourcemanager.RMVolumeManager</p> <p>Default source: code</p> |

| | |
|--|---|
| yarn.resourcemanager.client.thread-count | The number of threads used to handle applications manager requests. Default value: 50 Default source: yarn-default.xml |
| yarn.resourcemanager.configuration.provider-class | Default value: org.apache.hadoop.yarn.LocalConfigurationProvider Default source: yarn-default.xml |
| yarn.resourcemanager.connect.max-wait.ms | Maximum time to wait to establish connection to the ResourceManager. Default value: 900000 Default source: yarn-default.xml |
| yarn.resourcemanager.connect.retry-interval.ms | How often to retry connecting to the ResourceManager. Default value: 30000 Default source: yarn-default.xml |
| yarn.resourcemanager.container.liveness-monitor.interval-ms | How often to check that containers are still alive. Default value: 600000 Default source: yarn-default.xml |
| yarn.resourcemanager.container-tokens.master-key-rolling-interval-secs | Interval for the roll over for the master key used to generate container tokens. It is expected to be much greater than yarn.nm.liveness-monitor.expiry-interval-ms and yarn.rm.container-allocation.expiry-interval-ms. Otherwise the behavior is undefined. Default value: 86400 Default source: yarn-default.xml |
| yarn.resourcemanager.delayed.delegation-token.removal-interval-ms | Interval at which the delayed token removal thread runs. Default value: 30000 Default source: yarn-default.xml |
| yarn.resourcemanager.dir | Default value: /var/mapr/cluster/yarn/rm Default source: code |
| yarn.resourcemanager.fs.state-store.num-retries | Default value: 0 Default source: yarn-default.xml |
| yarn.resourcemanager.fs.state-store.retry-interval-ms | Default value: 1000 Default source: yarn-default.xml |
| yarn.resourcemanager.fs.state-store.retry-policy-spec | hdfs client retry policy specification. hdfs client retry is always enabled. Specified in pairs of sleep-time and number-of-retries and (t0, n0), (t1, n1), ..., the first n0 retries sleep t0 milliseconds on average, the following n1 retries sleep t1 milliseconds on average, and so on. Default value: 2000, 500 Default source: yarn-default.xml |

| | |
|---|--|
| yarn.resourcemanager.fs.state-store.uri | <p>URI pointing to the location of the FileSystem path where RM state will be stored. This must be supplied when using <code>org.apache.hadoop.yarn.server.resourcemanager.recovery.FileSystemRMStateStore</code> as the value for <code>yarn.resourcemanager.store.class</code></p> <p>Default value: <code>/var/mapr/cluster/yarn/rm/system</code></p> <p>Default source: code</p> |
| yarn.resourcemanager.ha.automatic-failover.embedded | <p>Enable embedded automatic failover. The embedded elector relies on the RM state store to handle fencing, and is primarily intended to be used in conjunction with <code>ZKRMStateStore</code>.</p> <p>Default value: TRUE</p> <p>Default source: yarn-default.xml</p> |
| yarn.resourcemanager.ha.automatic-failover.enabled | <p>Enable automatic failover.</p> <p>Default value: TRUE</p> <p>Default source: yarn-default.xml</p> |
| yarn.resourcemanager.ha.automatic-failover.zk-base-path | <p>The base znode path to use for storing leader information, when using ZooKeeper based leader election.</p> <p>Default value: <code>/yarn-leader-election</code></p> <p>Default source: yarn-default.xml</p> |
| yarn.resourcemanager.ha.custom-ha-rmaddressfinder | <p>Default value: <code>org.apache.hadoop.yarn.client.MapRZKBasedRMAddressFinder</code></p> <p>Default source: code</p> |
| yarn.resourcemanager.ha.enabled | <p>Enable RM high-availability. When enabled, (1) The RM starts in the Standby mode by default, and transitions to the Active mode when prompted to. (2) The nodes in the RM ensemble are listed in <code>yarn.resourcemanager.ha.rm-ids</code> (3) The id of each RM comes from <code>yarn.resourcemanager.ha.id</code> (4) The actual physical addresses come from the configs of the pattern - <code>{rpc-config}.{id}</code></p> <p>Default value: false</p> <p>Default source: yarn-default.xml</p> |
| yarn.resourcemanager.hostname | <p>The hostname of the ResourceManager.</p> <p>Default value: 0.0.0.0</p> <p>Default source: yarn-default.xml</p> |
| yarn.resourcemanager.keytab | <p>The keytab for the ResourceManager.</p> <p>Default value: <code>/etc/krb5.keytab</code></p> <p>Default source: yarn-default.xml</p> |
| yarn.resourcemanager.leveldb-state-store.path | <p>Default value: <code>\${hadoop.tmp.dir}/yarn/system/rmstore</code></p> <p>Default source: yarn-default.xml</p> |

| | |
|---|---|
| yarn.resourcemanager.max-completed-applications | The maximum number of completed applications RM keeps. Default value: 10000 Default source: yarn-default.xml |
| yarn.resourcemanager.nodemanager.minimum.version | The minimum allowed version of a connecting nodemanager. The valid values are NONE (no version checking), EqualToRM (the nodemanager's version is equal to or greater than the RM version), or a Version String. Default value: NONE Default source: yarn-default.xml |
| yarn.resourcemanager.nodemanager.heartbeat-interval-ms | The heart-beat interval in milliseconds for every NodeManager in the cluster. Default value: 1000 Default source: yarn-default.xml |
| yarn.resourcemanager.principal | The Kerberos principal for the ResourceManager. Default value:mapr Default source: code |
| yarn.resourcemanager.proxy-user-privileges.enabled | Default value: FALSE Default source: yarn-default.xml |
| yarn.resourcemanager.recovery.enabled | Enable RM to recover state after starting. If true, then yarn.resourcemanager.store.class must be specified. Default value: false When you configure failover configure.sh may change the default value by adding a value for this parameter in yarn-site.xml. For more information, see ResourceManager Configuration Properties on page 1695. |
| yarn.resourcemanager.resource-tracker.address | Default value: \${yarn.resourcemanager.hostname}:8031 Default source: yarn-default.xml When you configure failover configure.sh may change the default value by adding a value for this parameter in yarn-site.xml. For more information, see ResourceManager Configuration Properties on page 1695. |
| yarn.resourcemanager.resource-tracker.client.thread-count | Number of threads to handle resource tracker calls. Default value: 50 Default source: yarn-default.xml |

| | |
|---|--|
| yarn.resourcemanager.scheduler.address | <p>The address of the scheduler interface.</p> <p>Default value: <code>\${yarn.resourcemanager.hostname}:8030</code></p> <p>Default source: yarn-default.xml</p> <p>When you configure failover <code>configure.sh</code> may change the default value by adding a value for this parameter in <code>yarn-site.xml</code>. For more information, see ResourceManager Configuration Properties on page 1695.</p> |
| yarn.resourcemanager.scheduler.class | <p>The class to use as the resource scheduler.</p> <p>Default value: <code>org.apache.hadoop.yarn.server.resourcemanager.scheduler.fair.FairScheduler</code></p> <p>Default source: code</p> |
| yarn.resourcemanager.scheduler.client.thread-count | <p>Number of threads to handle scheduler interface.</p> <p>Default value: 50</p> <p>Default source: yarn-default.xml</p> |
| yarn.resourcemanager.scheduler.monitor.enable | <p>Enable a set of periodic monitors (specified in <code>yarn.resourcemanager.scheduler.monitor.policies</code>) that affect the scheduler.</p> <p>Default value: false</p> <p>Default source: yarn-default.xml</p> |
| yarn.resourcemanager.scheduler.monitor.policies | <p>The list of <code>SchedulingEditPolicy</code> classes that interact with the scheduler. A particular module may be incompatible with the scheduler, other policies, or a configuration of either.</p> <p>Default value: <code>org.apache.hadoop.yarn.server.resourcemanager.monitor.capacity.ProportionalCapacityPreemptionPolicy</code></p> <p>Default source: yarn-default.xml</p> |
| yarn.resourcemanager.staging | <p>Default value: <code>/var/mapr/cluster/yarn/rm/staging</code></p> <p>Default source: code</p> |
| yarn.resourcemanager.state-store.max-completed-applications | <p>The maximum number of completed applications RM state store keeps, less than or equals to <code>\${yarn.resourcemanager.max-completed-applications}</code>. By default, it equals to <code>\${yarn.resourcemanager.max-completed-applications}</code>. This ensures that the applications kept in the state store are consistent with the applications remembered in RM memory. Any values larger than <code>\${yarn.resourcemanager.max-completed-applications}</code> will be reset to <code>\${yarn.resourcemanager.max-completed-applications}</code>. Note that this value impacts the RM recovery performance. Typically, a smaller value indicates better performance on RM recovery.</p> <p>Default value: <code>\${yarn.resourcemanager.max-completed-applications}</code></p> <p>Default source: yarn-default.xml</p> |

| | |
|--|--|
| yarn.resourcemanager.store.class | <p>The class to use as the persistent store. If org.apache.hadoop.yarn.server.resourcemanager.recovery.ZKRMStateStore is used, the store is implicitly fenced; meaning a single ResourceManager is able to use the store at any point in time. More details on this implicit fencing, along with setting up appropriate ACLs is discussed under yarn.resourcemanager.zk-state-store.root-node.acl.</p> <p>Default value: org.apache.hadoop.yarn.server.resourcemanager.recovery.FileSystemRMStateStore</p> <p>Default source: yarn-default.xml</p> |
| yarn.resourcemanager.system | <p>Default value: /var/mapr/cluster/yarn/rm/system</p> <p>Default source: code</p> |
| yarn.resourcemanager.system-metrics-publisher.dispatcher.pool-size | <p>Default value: 10</p> <p>Default source: yarn-default.xml</p> |
| yarn.resourcemanager.system-metrics-publisher.enabled | <p>Default value: FALSE</p> <p>Default source: yarn-default.xml</p> |
| yarn.resourcemanager.webapp.address | <p>The http address of the ResourceManager web application.</p> <p>Default value: \${yarn.resourcemanager.hostname}:8088</p> <p>Default source: yarn-default.xml</p> <p>When you configure failover configure.sh may change the default value by adding a value for this parameter in yarn-site.xml. For more information, see ResourceManager Configuration Properties on page 1695.</p> |
| yarn.resourcemanager.webapp.delegation-token-auth-filter.enabled | <p>Default value: TRUE</p> <p>Default source: yarn-default.xml</p> |
| yarn.resourcemanager.webapp.https.address | <p>The https address of the ResourceManager web application.</p> <p>Default value: \${yarn.resourcemanager.hostname}:8090</p> <p>Default source: yarn-default.xml</p> <p>When you configure failover configure.sh may change the default value by adding a value for this parameter in yarn-site.xml. For more information, see ResourceManager Configuration Properties on page 1695.</p> |
| yarn.resourcemanager.work-preserving-recovery.enabled | <p>Default value: TRUE</p> <p>Default source: yarn-default.xml</p> |
| yarn.resourcemanager.work-preserving-recovery.scheduling-wait-ms | <p>Default value: 10000</p> <p>Default source: yarn-default.xml</p> |
| yarn.resourcemanager.zk-acl | <p>ACL's to be used for ZooKeeper znodes.</p> <p>Default value: world:anyone:rwcd</p> <p>Default source: yarn-default.xml</p> |

| | |
|---|--|
| yarn.resourcemanager.zk-num-retries | Number of times RM tries to connect to ZooKeeper. Default value: 1000 Default source: yarn-default.xml |
| yarn.resourcemanager.zk-retry-interval-ms | Retry interval in milliseconds when connecting to ZooKeeper. Default value: 1000 Default source: yarn-default.xml |
| yarn.resourcemanager.zk-state-store.parent-path | Full path of the ZooKeeper znode where RM state will be stored. This must be supplied when using <code>org.apache.hadoop.yarn.server.resourcemanager.recovery.ZKRMStateStore</code> as the value for <code>yarn.resourcemanager.store.class</code> Default value: /rmstore Default source: yarn-default.xml |
| yarn.resourcemanager.zk-timeout-ms | ZooKeeper session timeout in milliseconds. Session expiration is managed by the ZooKeeper cluster itself, not by the client. This value is used by the cluster to determine when the client's session expires. Expirations happens when the cluster does not hear from the client within the specified session timeout period (i.e. no heartbeat). Default value: 10000 Default source: yarn-default.xml |
| yarn.scheduler.maximum-allocation-mb | The maximum allocation for every container request at the RM, in MBs. Memory requests higher than this won't take effect, and will get capped to this value. Default value: 8192 Default source: yarn-default.xml |
| yarn.scheduler.maximum-allocation-vcores | The maximum allocation for every container request at the RM, in terms of virtual CPU cores. Requests higher than this won't take effect, and will get capped to this value. Default value: 4 Default source: yarn-default.xml |
| yarn.scheduler.minimum-allocation-mb | The minimum allocation for every container request at the RM, in MBs. Memory requests lower than this won't take effect, and the specified value will get allocated at minimum. Default value: 1024 Default source: yarn-default.xml |
| yarn.scheduler.minimum-allocation-vcores | The minimum allocation for every container request at the RM, in terms of virtual CPU cores. Requests lower than this won't take effect, and the specified value will get allocated the minimum. Default value: 1 Default source: yarn-default.xml |

Environment Variables

Describes the environment variables specific to the HPE Ezmeral Data Fabric.

For core release 6.0 and later, environment variables should be set in `/opt/mapr/conf/env_override.sh`. Editing `/opt/mapr/conf/env.sh` is no longer recommended. For more information, see [About `env_override.sh`](#) on page 2576.

| Variable | Example Values | Description |
|---------------------------|--|--|
| CLDB_EXTERNAL_RPC_PORT | 5000 | If clients outside the cluster cannot reach CLDB on the default port, use the <code>CLDB_EXTERNAL_RPC_PORT</code> environment variable to specify the port on which CLDB can be reached. |
| JAVA_HOME | <code>/usr/lib/jvm/java-7-sun</code> | The directory where the correct version of Java is installed. |
| MAPR_HOME | <code>/opt/mapr</code> (default) | The directory in which the core software is installed. |
| MAPR_EXTERNAL | <code>10.10.123.25,10.10.123.30</code> | If your cluster nodes have multiple NICs, use the <code>MAPR_EXTERNAL</code> environment variable to grant external clients access to a cluster node on specific IP addresses. The value of the <code>MAPR_EXTERNAL</code> environment variable on a node is a comma-separated list of up to four IP addresses with no spaces. |
| MAPR_SUBNETS | <code>10.10.123.0/24,10.10.124.0/24</code> | <code>MAPR_SUBNETS</code> is used for data-fabric RPC to RPC communication. The MFS, CLDB, NFS, and LOOPBACKNFS modules use this environment variable. The NFS and LOOPBACKNFS modules use this environment variable when registering with CLDB. If you do not want data-fabric to use all NICs on each node, use this environment variable to restrict data-fabric traffic to specific NICs. Set <code>MAPR_SUBNETS</code> to a comma-separated list of up to four subnets in CIDR notation with no spaces. If you do not set <code>MAPR_SUBNETS</code> , data-fabric uses all NICs present on the node. When <code>MAPR_SUBNETS</code> is set, make sure that the node can reach all nodes in the cluster (servers and clients) using the specified subnets. |
| MAPR_USER | <code>mapr</code> (default) | Used with configure.sh on page 2331 to specify the user under which data-fabric runs its services. If not explicitly set, it defaults to the user <code>mapr</code> . After <code>configure.sh</code> is run, the value is stored in daemon.conf on page 2471. |
| MAPR_ECOSYSTEM_LOGIN_OPTS | <code>*hybrid*</code> | Specifies the JAAS configuration to use with installed open source components. |

About `env_override.sh`

Describes the purpose of the `env_override.sh` file.

`env_override.sh` is a file that you can create to store custom settings for environment variables. By default, `/opt/mapr/conf/env.sh` contains environment variables for a data-fabric cluster, but upgrading

to a new data-fabric release causes the `env.sh` file to be replaced. (A backup is stored as `/opt/mapr/conf/env.sh<timestamp>`). When `env.sh` is replaced, any custom settings are removed.

For release 6.0 and later, keep any custom settings in `/opt/mapr/conf/env_override.sh`. It is no longer necessary to modify `env.sh`.

Upgrading a cluster does not remove or modify `env_override.sh`. `/opt/mapr/conf/env.sh` reads the `env_override.sh` file at the end of its execution. If the same parameter is listed in both `env.sh` and `env_override.sh`, the value specified in `env_override.sh` is used. If `env_override.sh` is not present, the values in `env.sh` are used.

You create `env_override.sh` from a blank file and insert `export` statements into the file. For example:

Sample `env_override.sh` File

```
export CLDB_EXTERNAL_RPC_PORT=5000
export JAVA_HOME=/usr/lib/jvm/java-11-openjdk-11.0.8.10-0.e18_2.x86_64
export MAPR_HOME=/opt/mapr
export MAPR_EXTERNAL=10.10.123.25,10.10.123.30
export MAPR_SUBNETS=10.10.123.0/24,10.10.124.0/24
export MAPR_USER=mapr
export MAPR_ECOSYSTEM_LOGIN_OPTS=*hybrid*
```

Controlling Access to JMX Metrics

Environment variables and `configure.sh` options introduced in release 6.2.0 let you control how metrics are collected and who can access the metrics from JMX-enabled services.

JMX is a technology for monitoring system services. In the HPE Ezmeral Data Fabric, you can use environment variables or `configure.sh` options to enable or disable access to JMX metrics. The JMX-enabled services are:

- CLDB
- Drill
- Hive
- NodeManager
- Oozie
- ResourceManager
- Spark

Understanding the `MAPR_JMX` Variables

The following table describes the environment variables. For release 6.2.0, JMX is enabled by default, and local binding is enabled by default:

| Environment Variable | Default Value | | Description |
|----------------------------|----------------|--------------------|---|
| | Secure Cluster | Non-Secure Cluster | |
| <code>MAPR_JMXAUTH*</code> | true | false | Enables or disables authentication for JMX metrics for a node. <code>JMXAUTH</code> is only used in conjunction with <code>MAPR_JMXLOCALHOST</code> or <code>MAPR_JMXREMOTEHOST</code> . <code>JMXAUTH</code> is ignored when <code>MAPR_JMXRLOCALBINDING</code> is true. |

| Environment Variable | Default Value | | Description |
|-----------------------|----------------|--------------------|---|
| | Secure Cluster | Non-Secure Cluster | |
| MAPR_JMXDISABLE* | false | false | If set to true, disables JMX for the entire node. In this scenario, Collectd does not receive JMX metrics. |
| MAPR_JMXLOCALBINDING* | true | true | If set to true, disables TCP/IP listening on the the local JMX port. There is no TCP/IP listener at all when you turn on local binding. In this scenario, you can only get JMX metrics from the node itself by configuring a process that attaches to the Java process such as a debugger tool. And you can connect only to processes that you own. |
| MAPR_JMXLOCALHOST | false | false | Enables the JMX server in the Java processes to listen on the local host and on the JMX port number. The local host is a TCP/IP listener that listens on the local host only. It doesn't let you connect remotely. |
| MAPR_JMXREMOTEHOST | false | false | Enables the JMX server to listen on the JMX port and allows users from outside the cluster to connect to that port. You can turn on REMOTEHOST if you want to have a cluster with both LOCALBINDING and REMOTEHOST so that you can use JConsole or Virtual VM or any of these other tools to log in and look at what the Java processes do. When MAPR_JMXREMOTEHOST is true, the system always uses SSL and authentication. |
| MAPR_JMXSSL* | false | false | Enables or disables SSL for JMX metrics for a node. This variable is ignored when MAPR_JMXREMOTEHOST is true. |

*For internal use only. Manually changing the the value of this environment variable is not recommended.

Changing the MAPR_JMX Environment Variables

Suppose you wanted to change the value of MAPR_JMXREMOTEHOST to true. Doing so would allow you to use a tool such as JConsole to log in remotely and monitor the Java processes. To change the MAPR_JMXREMOTEHOST setting:

1. Export the new value of MAPR_JMXREMOTEHOST in /opt/mapr/conf/env_override.sh:

```
export MAPR_JMXREMOTEHOST=true
```

2. Run /opt/mapr/server/configure.sh -R, and restart all services. For example:
 - a. Stop Warden by using the `systemctl stop mapr-warden` command.
 - b. Stop ZooKeeper by using the `systemctl stop mapr-zookeeper` command.
 - c. Restart ZooKeeper by using the `systemctl start mapr-zookeeper` command.
 - d. Restart Warden by using the `systemctl start mapr-warden` command.

Using the JMX Options for `configure.sh`

The following `configure.sh` options are supported for managing JMX on individual nodes:

| Option | Description |
|--------------------------------------|---|
| <code>-JMXEnable</code> | Enables JMX support for every service on the node where JMX is configured to be enabled. JMX is enabled by default. |
| <code>-JMXDisable</code> | Globally disables JMX support for all JMX-enabled services on the node. |
| <code>-JMXLocalBindingEnable</code> | Enables local binding for JMX connections. Local binding is enabled by default |
| <code>-JMXLocalBindingDisable</code> | Disables local binding for JMX connections. |
| <code>-JMXLocalHostEnable</code> | Enables the local-host TCP port for JMX. This setting is mutually exclusive with <code>JMXRemoteHostEnable</code> . |
| <code>-JMXLocalHostDisable</code> | Disables the local-host TCP port for JMX. |
| <code>-JMXRemoteHostEnable</code> | Enables the remote TCP port for JMX. This setting is mutually exclusive with <code>JMXLocalHostEnable</code> . |
| <code>-JMXRemoteHostDisable</code> | Disables the remote TCP port for JMX. |

To use the `-JMX` options, run `configure.sh -R` with the `-JMX` option on the desired node. For example:

```
/opt/mapr/server/configure.sh -R -JMXRemoteHostEnable
```

Ports Used by HPE Ezmeral Data Fabric Software

Lists the ports used by HPE Ezmeral Data Fabric services.

Avoiding Port Conflicts

To avoid trouble with port conflicts on your HPE Ezmeral Data Fabric clusters, try these tips:

- Remap the ports for the HBaseMaster and HBaseRegionServer services to ports below 32768.
- Set the ephemeral port range to stop at 50029 by changing the value in the file `/proc/sys/net/ipv4/ip_local_port_range`. Note that this setting changes the available number of ephemeral ports from the default of 28233 ports to 17233.

Ports Needed for POSIX Clients and File System to Communicate With Each Other

POSIX clients communicate with the CLDB and server components of the HPE Ezmeral Data Fabric filesystem. You need to open the relevant ports for TCP connectivity from POSIX clients to the HPE Ezmeral Data Fabric file-system cluster nodes. Open the CLDB, file-system server, and file-system server instances ports, as detailed in the following section.

Services and Ports Quick Reference

The following list defines the ports used by a HPE Ezmeral Data Fabric cluster, along with the default port numbers. All the ports used by HPE Ezmeral Data Fabric software are **TCP** ports.

| | |
|-------------------------------|--|
| Airflow Webserver | <p><i>Source IP:</i> Nodes/clients accessing Airflow webserver</p> <p><i>Destination IP:</i> Nodes running Airflow webserver</p> <p><i>Ports:</i> 8780</p> <p><i>Purpose:</i> Used by Airflow webserver clients to access the Airflow webserver</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p> |
| Airflow Scheduler | <p><i>Source IP:</i> Airflow webserver</p> <p><i>Destination IP:</i> Nodes running Airflow scheduler</p> <p><i>Ports:</i> 8793</p> <p><i>Purpose:</i> Used by Airflow webserver to access the Airflow scheduler</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p> |
| API Server (apiserver) | <p><i>Source IP:</i> Cluster nodes running apiserver</p> <p><i>Destination IP:</i> Cluster nodes running apiserver</p> <p><i>Ports:</i></p> <ul style="list-style-type: none"> • 5701 • 5702 <p><i>Purpose:</i> Clustering support</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p> |
| CLDB | <p><i>Source IP:</i> Nodes running any HPE Ezmeral Data Fabric services, clients interacting with the file system</p> <p><i>Destination IP:</i> Cluster nodes running CLDB services</p> <p><i>Ports:</i> 7222</p> <p>A client reads CLDB IP and port number from the <code>/opt/mapr/conf/mapr-clusters.conf</code> file. The client initially tries to communicate with CLDB on port 7222. Once it establishes the connection, it fetches the additional CLDB IPs and ports from the connected CLDB.</p> <p>By default, CLDB listens on ports 7222 and 7223. For performance reasons, additional ports may be opened, depending on the configuration parameter <code>cldb.num.rpc.threads</code> in the <code>/opt/mapr/conf/cldb.conf</code> file. For example, setting <code>cldb.num.rpc.threads=3</code>, opens up ports 7222, 7223 and 7224.</p> <p> Note: The <code>cldb.num.rpc.threads</code> parameter is hard-coded with a default value of 3. To change this value, add this parameter with the new value to the <code>/opt/mapr/conf/cldb.conf</code> file.</p> <p> Note: When you upgrade from Core 5.2.x or Core 6 to Core 6.1 and above, the value of <code>cldb.num.rpc.threads</code> is not changed. The default remains as 3, which means three ports are open for each CLDB node.</p> |

The client tries connecting to the CLDBs till timeout occurs in the case of soft mount, while the client indefinitely retries in the case of hard mount. If a client cannot connect to a CLDB port, the CLDB is marked unreachable. For example, assume a CLDB with IP 10.10.10.10 and 3 ports 7222, 7223 and 7224. If a client fails to connect to the CLDB say on port 7223, the CLDB 10.10.10.10 is marked unreachable, and the client will not try the two other ports for the next few minutes. It tries to connect with the next CLDB entry in the list.

For load balancing at CLDB, a client will always pick a random port among the available CLDB ports.

Purpose: filesystem API calls

Parameter and File where Port is Configured:

- /opt/mapr/conf/cldb.conf
- /opt/mapr/conf/warden.conf
- /opt/mapr/conf/mapr-clusters.conf

CLDB JMX Monitor Port

Source IP: Nodes running CLDB services

Destination IP: CLDB JMX monitor port

Ports: 7220

Purpose: The port on which Collectd gathers CLDB metrics through JMX.

Parameter and File where Port is Configured: Not Applicable

CLDB web port

Source IP: Nodes/clients connecting to the CLDB GUI

Destination IP: Cluster nodes running CLDB services

Ports: 7221

Purpose: CLDB GUI for a cluster with security disabled. For a secure cluster, the port is 7443 as defined by the maprlogin utility.

Parameter and File where Port is Configured: /opt/mapr/conf/cldb.conf

maprlogin utility

Source IP: Connections using the maprlogin utility

Destination IP: Cluster nodes running CLDB services

Ports: 7443

Purpose: When security is enabled for a cluster, the CLDB listens for connections on port 7443. If security is disabled, the maprlogin utility is unable to reach the CLDB.

Parameter and File where Port is Configured: Not Applicable

Data Access Gateway

Source IP: Clients using the HPE Ezmeral Data Fabric Database JSON REST API with HTTPS

Destination IP: Not Applicable

Ports: 8243

Purpose: The port used to connect to the Data Access Gateway using HTTPS

| | |
|----------------------------|---|
| Data Access Gateway | <p><i>Parameter and File where Port is</i> <i>Configured:</i> <code>rest.https.port</code> in <code>/opt/mapr/data-access-gateway/conf/properties.cfg</code></p> <p><i>Source IP:</i> Node.js OJAI client</p> <p><i>Destination IP:</i> Cluster nodes running the Data Access Gateway service</p> <p><i>Ports:</i> 5678</p> <p><i>Purpose:</i> The port used to connect the OJAI client to the Data Access Gateway</p> |
| Data Access Gateway | <p><i>Parameter and File where Port is</i> <i>Configured:</i> <code>grpc.service.port</code> in <code>/opt/mapr/data-access-gateway/conf/properties.cfg</code></p> <p><i>Source IP:</i> Python OJAI client</p> <p><i>Destination IP:</i> Cluster nodes running the Data Access Gateway service</p> <p><i>Ports:</i> 5678</p> <p><i>Purpose:</i> The port used to connect the OJAI client to the Data Access Gateway</p> |

| Drill (User Port) | <p><i>Source IP:</i> Nodes running the Drillbit service and clients using JDBC/ODBC</p> <p><i>Destination IP:</i> Nodes running the Drillbit service</p> <p><i>Ports:</i> 31010</p> <p><i>Purpose:</i> TCP user port address. Used between nodes in a Drill cluster. Needed for an external client, such as Tableau, to connect into the cluster nodes. Also needed for the Drill Web UI. You can also use this port to connect directly to a Drillbit.</p> <p><i>Parameter and File where Port is Configured:</i> <code>drill.exec.rpc.user.server.port</code> in <code>/opt/mapr/drill/drill-<version>/conf/drill-override.conf</code></p> |
| Drill (Control Port) | <p><i>Source IP:</i> Nodes running the Drillbit service</p> <p><i>Destination IP:</i> Nodes running the Drillbit service</p> <p><i>Ports:</i> 31011</p> <p><i>Purpose:</i> TCP port that controls the port address. Used between nodes in a Drill cluster. Needed for multi-node installation of Drill.</p> <p><i>Parameter and File where Port is Configured:</i> <code>drill.exec.rpc.bit.server.port</code> in <code>/opt/mapr/drill/drill-<version>/conf/drill-override.conf</code></p> |
| Drill (Data Port) | <p><i>Source IP:</i> Nodes running the Drillbit service</p> <p><i>Destination IP:</i> Nodes running the Drillbit service</p> <p><i>Ports:</i> 31012</p> <p><i>Purpose:</i> TCP data port address. Used between nodes in a Drill cluster. Needed for multi-node installation of Drill.</p> <p><i>Parameter and File where Port is Configured:</i> <code>drill.exec.rpc.bit.server.port + 1</code> in <code>/opt/mapr/drill/drill-<version>/conf/drill-override.conf</code></p> |
| Drill (ZooKeeper Port) | <p><i>Source IP:</i> Clients using JDBC/ODBC and nodes running ZooKeeper services</p> <p><i>Destination IP:</i> Nodes running the Drillbit service</p> <p><i>Ports:</i> 5181</p> <p><i>Purpose:</i> ZooKeeper port used to connect to Drill through the JDBC driver.</p> |

| | |
|--|--|
| Elasticsearch (Components Communication Port) | <i>Parameter and File where Port is Configured:</i> See the ZooKeeper entry in this list. |
| | <i>Source IP:</i> Non-Elasticsearch components, such as a web browser, curl, and Kibana, that connect to Elasticsearch. |
| | <i>Destination IP:</i> Nodes running Elasticsearch for monitoring use cases |
| | <i>Ports:</i> 9200 |
| | <i>Purpose:</i> Non-Elasticsearch components use this port when communicating with Elasticsearch. |
| | <i>Parameter and File where Port is Configured:</i> You can configure a different port for monitoring use cases when you run the configure.sh on page 2331 script with the <code>-ES</code> parameter. |
| Elasticsearch (Daemons Communication Port) | <i>Source IP:</i> Nodes running Elasticsearch |
| | <i>Destination IP:</i> Nodes running Elasticsearch for monitoring use cases |
| | <i>Ports:</i> 9300 |
| | <i>Purpose:</i> Elasticsearch uses this port for communications between Elasticsearch daemons. |
| | <i>Parameter and File where Port is Configured:</i> Not Applicable |
| File Migration Service | <i>Source IP:</i> Not Applicable |
| | <i>Destination IP:</i> Not Applicable |
| | <i>Ports:</i> 9444 |
| | <i>Purpose:</i> File Migration service UI |
| | <i>Parameter and File where Port is Configured:</i> <code>/opt/mapr/conf/conf.d/warden.filemigrate.conf</code> |
| Gateway | <i>Source IP:</i> Nodes sending operations to replicate |
| | <i>Destination IP:</i> Nodes running the gateway service |
| | <i>Ports:</i> 7660 |
| | <i>Purpose:</i> The port used by gateway services to listen for incoming replication operations. |
| | <i>Parameter and File where Port is Configured:</i> Not Applicable |
| Grafana | <i>Source IP:</i> Web Browsers |
| | <i>Destination IP:</i> Nodes running Grafana for monitoring |
| | <i>Ports:</i> 3000 |
| | <i>Purpose:</i> Web browsers use this port when connecting to Grafana. |
| | <i>Parameter and File where Port is Configured:</i> Not Applicable |
| HBase Master | <i>Source IP:</i> HBase Clients |
| | <i>Destination IP:</i> Nodes running HBase Master services |
| | <i>Ports:</i> 16000 |
| | <i>Purpose:</i> HBase API and HBase shell use this port to connect to HBase Master |
| | <i>Parameter and File where Port is Configured:</i> <code>/opt/mapr/hbase/hbase-<version>/conf/hbase-site.xml</code> |

| | |
|------------------------------|---|
| HBase Master Web UI | <p><i>Source IP:</i> HBase Master Web UI clients</p> <p><i>Destination IP:</i> Nodes running HBase Master services</p> <p><i>Ports:</i> 16010</p> <p><i>Purpose:</i> Information Web UI of HBase Master</p> <p><i>Parameter and File where</i> <i>Port is Configured:</i> /opt/mapr/hbase/hbase-<version>/conf/hbase-site.xml</p> |
| HBase Thrift Server | <p><i>Source IP:</i> HBase Thrift Server clients</p> <p><i>Destination IP:</i> Nodes running HBase Thrift Server</p> <p><i>Ports:</i> 9090</p> <p><i>Purpose:</i> The HBase client uses this port to connect to HBase, using the Thrift protocol</p> <p><i>Parameter and File where</i> <i>Port is Configured:</i> /opt/mapr/hbase/hbase-<version>/conf/hbase-site.xml</p> |
| HBase Thrift Web UI | <p><i>Source IP:</i> HBase Thrift Web UI clients</p> <p><i>Destination IP:</i> Nodes running HBase Thrift</p> <p><i>Ports:</i> 9095</p> <p><i>Purpose:</i> Information Web UI of HBase Thrift</p> <p><i>Parameter and File where</i> <i>Port is Configured:</i> /opt/mapr/hbase/hbase-<version>/conf/hbase-site.xml</p> |
| HBase REST Server | <p><i>Source IP:</i> HBase REST Server clients</p> <p><i>Destination IP:</i> Nodes running HBase REST Server</p> <p><i>Ports:</i> 8080</p> <p><i>Purpose:</i> The HBase client uses this port to connect to HBase using the HTTP protocol</p> <p><i>Parameter and File where</i> <i>Port is Configured:</i> /opt/mapr/hbase/hbase-<version>/conf/hbase-site.xml</p> |
| HBase REST Web UI | <p><i>Source IP:</i> HBase REST Web UI clients</p> <p><i>Destination IP:</i> Nodes running HBase REST</p> <p><i>Ports:</i> 8086</p> <p><i>Purpose:</i> Information Web UI of HBase REST</p> <p><i>Parameter and File where</i> <i>Port is Configured:</i> /opt/mapr/hbase/hbase-<version>/conf/hbase-site.xml</p> |
| HBase Regionserver | <p><i>Source IP:</i> HBase Clients</p> <p><i>Destination IP:</i> Nodes running HBase Regionserver services</p> <p><i>Ports:</i> 16020</p> <p><i>Purpose:</i> HBase API and HBase shell use this port to connect to HBase RegionServer</p> <p><i>Parameter and File where</i> <i>Port is Configured:</i> /opt/mapr/hbase/hbase-<version>/conf/hbase-site.xml</p> |
| HBase Regionserver UI | <p><i>Source IP:</i> HBase Regionserver Web UI clients</p> <p><i>Destination IP:</i> Nodes running HBase Regionserver</p> <p><i>Ports:</i> 16030</p> |

| | |
|---|---|
| | <p><i>Purpose:</i> Information Web UI of HBase Regionserver</p> <p><i>Parameter and File where Port is Configured:</i> /opt/mapr/hbase/hbase-<version>/conf/hbase-site.xml</p> |
| HistoryServer RPC | <p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Nodes running MapReduce JobHistory Server</p> <p><i>Ports:</i> 10020</p> <p><i>Purpose:</i> Not Applicable</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p> |
| HistoryServer Web UI and REST APIs | <p><i>Source IP:</i> Clients that access Job History Server UI in a non-secure cluster</p> <p><i>Destination IP:</i> Secure nodes running MapReduce JobHistory Server in a non-secure cluster</p> <p><i>Ports:</i> 19888</p> <p><i>Purpose:</i> Non-secure HistoryServer Web UI and REST APIs</p> <p><i>Parameter and File where Port is Configured:</i> See mapred-site.xml on page 2486</p> |
| HistoryServer Web UI and REST APIs | <p><i>Source IP:</i> Clients that access Job History Server UI in a secure cluster</p> <p><i>Destination IP:</i> Secure nodes running MapReduce JobHistory Server in a secure cluster</p> <p><i>Ports:</i> 19890</p> <p><i>Purpose:</i> Secure HistoryServer Web UI and REST APIs</p> <p><i>Parameter and File where Port is Configured:</i> See mapred-site.xml on page 2486</p> |
| Hive Metastore | <p><i>Source IP:</i> Nodes/clients performing Hive queries/operations</p> <p><i>Destination IP:</i> Nodes running the Hive metastore services</p> <p><i>Ports:</i> 9083</p> <p><i>Purpose:</i> Used by Hive clients to query/access the Hive metastore</p> <p><i>Parameter and File where Port is Configured:</i> /opt/mapr/hive/hive-<version>/conf/hive-site.xml</p> |
| Hiveserver2 | <p><i>Source IP:</i> Nodes or clients performing hive queries using JDBC/ODBC</p> <p><i>Destination IP:</i> Nodes running Hiveserver2</p> <p><i>Ports:</i> 10000</p> <p><i>Purpose:</i> Port through which clients perform hive queries</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p> |
| Hiveserver2 Web UI | <p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Nodes running Hiveserver2 Web UI</p> <p><i>Ports:</i> 10002</p> |

| | |
|------------------------------|--|
| | <p><i>Purpose:</i> Provides access to Hive configuration settings, local logs, metrics, and information about active sessions and queries.</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p> |
| Hoststats | See <code>hoststats.port</code> and <code>hs.port</code> in the Warden configuration file . |
| Httpfs | <p><i>Source IP:</i> Nodes/clients accessing httpfs services</p> <p><i>Destination IP:</i> Nodes running httpfs services</p> <p><i>Ports:</i> 14000</p> <p><i>Purpose:</i> Used by httpfs file clients to access the httpfs server</p> <p><i>Parameter and File where Port is Configured:</i></p> <ul style="list-style-type: none"> • <code>/opt/mapr/httpfs/httpfs-<version></code> • <code>/etc/hadoop/httpfs-env.sh</code> |
| Hue Webserver | <p><i>Source IP:</i> Nodes/clients accessing Hue web services</p> <p><i>Destination IP:</i> Nodes running Hue web services</p> <p><i>Ports:</i> 8888</p> <p><i>Purpose:</i> Used by Hue webserver clients to access the Hue webserver</p> <p><i>Parameter and File where Port is Configured:</i> <code>/opt/mapr/hue/hue*/desktop/conf/hue.ini</code></p> |
| Impala Catalog Daemon | <p><i>Source IP:</i> Nodes running Impala Daemon</p> <p><i>Destination IP:</i> Nodes running Impala Catalog Daemon</p> <p><i>Ports:</i> 25020</p> <p><i>Purpose:</i> Catalog service web interface for monitoring and troubleshooting. Available in Impala 1.2 and higher.</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p> |
| Impala Daemon | <p><i>Source IP:</i> Clients using JDBC/ODBC and nodes running Impala Daemon</p> <p><i>Destination IP:</i> Nodes running Impala Daemon</p> <p><i>Ports:</i> 21000</p> <p><i>Purpose:</i> Used to transmit commands and receive results by <code>impala-shell</code></p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p> |
| Impala Daemon | <p><i>Source IP:</i> Nodes running Impala Daemon</p> <p><i>Destination IP:</i> Nodes running Impala Daemon</p> <p><i>Ports:</i> 21050</p> <p><i>Purpose:</i> Used by applications, such as Business Intelligence tools, to transmit commands and receive results using JDBC.</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p> |

| | |
|--------------------------------|--|
| Impala Daemon | <p><i>Source IP:</i> Nodes running Impala Daemon</p> <p><i>Destination IP:</i> Nodes running Impala Daemon</p> <p><i>Ports:</i> 25000</p> <p><i>Purpose:</i> Impala web interface for monitoring and troubleshooting.</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p> |
| Impala StateStoreDaemon | <p><i>Source IP:</i> Nodes running Impala Daemon</p> <p><i>Destination IP:</i> Nodes running Impala StateStore Daemon</p> <p><i>Ports:</i> 25010</p> <p><i>Purpose:</i> StateStore web interface for monitoring and troubleshooting</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p> |
| KSQL | <p><i>Source IP:</i> All cluster nodes</p> <p><i>Destination IP:</i> Nodes running KSQL</p> <p><i>Ports:</i> 8084</p> <p><i>Purpose:</i> KSQL</p> <p><i>Parameter and File where Port is Configured:</i> \$KSQL_INSTALL_DIR/etc/ksql/ksqlserver.properties</p> |
| Kafka Connect | <p><i>Source IP:</i> All cluster nodes</p> <p><i>Destination IP:</i> Nodes running Kafka Connect</p> <p><i>Ports:</i> 8083</p> <p><i>Purpose:</i> Kafka Connect REST API calls</p> <p><i>Parameter and File where Port is Configured:</i> /opt/mapr/kafka/kafka-<version>/config/connect-distributed.properties</p> |
| Kafka REST | <p><i>Source IP:</i> All cluster nodes</p> <p><i>Destination IP:</i> Nodes running Kafka REST</p> <p><i>Ports:</i> 8082</p> <p><i>Purpose:</i> Kafka Connect REST API calls</p> <p><i>Parameter and File where Port is Configured:</i> /opt/mapr/kafka-rest/kafka-rest-<version>/config/kafka-rest.properties</p> |
| Kafka Schema Registry | <p><i>Source IP:</i> All cluster nodes</p> <p><i>Destination IP:</i> Nodes running Kafka Schema Registry</p> <p><i>Ports:</i> 8087</p> <p><i>Purpose:</i> Kafka Schema Registry API calls</p> <p><i>Parameter and File where Port is Configured:</i> /opt/mapr/schema-registry/schema-registry-<version>/config/schema-registry.properties</p> |
| Kibana | <p><i>Source IP:</i> Web browsers</p> <p><i>Destination IP:</i> Nodes running Kibana for monitoring use cases</p> <p><i>Ports:</i> 5601</p> |

| | |
|------------------------------------|--|
| | <p><i>Purpose:</i> Web browsers use this port when connecting to Grafana.</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p> |
| MAST Gateway | <p><i>Source IP:</i> Nodes running MAST Gateway service</p> <p><i>Destination IP:</i> Nodes running MAST Gateway service</p> <p><i>Ports:</i> 8660</p> <p><i>Purpose:</i> Data Fabric clients use this port to connect to the MAST Gateway</p> <p><i>Parameter and File where Port is Configured:</i> <code>/opt/mapr/conf/mastgateway.conf</code></p> |
| filesystem server | <p><i>Source IP:</i> Nodes running any HPE Ezmeral Data Fabric services, clients interacting with the file system</p> <p><i>Destination IP:</i> Nodes running FileServer services</p> <p><i>Ports:</i> 5660, 5692, 5724, and 5756</p> <p><i>Purpose:</i> The filesystem is a random read-write distributed filesystem that allows applications to concurrently read and write directly to disk. Clients use these ports to access the file-system server.</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p> |
| filesystem server | <p><i>Source IP:</i> Nodes running the gateway service</p> <p><i>Destination IP:</i> Nodes running the filesystem</p> <p><i>Ports:</i> 6660</p> <p><i>Purpose:</i> The port on which gateway nodes send replicated operations to nodes in destination clusters.</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p> |
| filesystem server instances | <p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> See Working with Multiple Instances of the File System on page 867</p> <p><i>Purpose:</i> Multiple filesystem instances</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p> |
| Object Store | <p><i>Source IP:</i> Nodes accessing the MOSS server</p> <p><i>Destination IP:</i> Nodes running the MOSS server</p> <p><i>Ports:</i> 9000</p> <p><i>Purpose:</i> Port for the MOSS server</p> <p><i>Parameter and File where Port is Configured:</i> The <code>moss.port</code> option in <code>/opt/mapr/conf/moss.conf</code>.</p> <p> CAUTION: The default port for S3 Gateway is also 9000. If you run S3 Gateway and Object Store, change one of the ports to avoid conflicts.</p> |
| S3 Gateway | <p><i>Source IP:</i> Nodes accessing the S3 Gateway server</p> <p><i>Destination IP:</i> Nodes running the S3 Gateway server</p> <p><i>Ports:</i> 9000</p> <p><i>Purpose:</i> Port for the S3 Gateway server</p> |

| | |
|---|---|
| NFS | <p><i>Parameter and File where Port is Configured:</i> The <i>ports</i> option in <code>/opt/mapr/objectstore-client/objectstore-client-<version>/conf/minio.json</code></p> <p><i>Source IP:</i> Nodes/clients accessing the filesystem via the NFS protocol</p> <p><i>Destination IP:</i> Nodes running HPE Ezmeral Data Fabric NFS Services</p> <p><i>Ports:</i> 2049</p> <p><i>Purpose:</i> NFSv3 or NFSv4 access to the filesystem</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p> |
| NFS | <p><i>Source IP:</i> Nodes running NFS services</p> <p><i>Destination IP:</i> Nodes running NFS services</p> <p><i>Ports:</i> 9997, 9998</p> <p><i>Purpose:</i> NFS VIP Management</p> <p><i>Parameter and File where Port is Configured:</i> <code>/opt/mapr/conf/nfsserver.conf</code></p> |
| NodeManager JMX Port | <p><i>Source IP:</i> Nodes running NodeManager</p> <p><i>Destination IP:</i> NodeManager JMX Port</p> <p><i>Ports:</i> 8027</p> <p><i>Purpose:</i> The port on which Collectd gathers metrics from NodeManager nodes via JMX.</p> <p><i>Parameter and File where Port is Configured:</i>Not Applicable</p> |
| NodeManager | <p><i>Source IP:</i> Nodes running NodeManager</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> 8099</p> <p><i>Purpose:</i> The node manager manages the health of each node in the cluster.</p> <p><i>Parameter and File where Port is Configured:</i><code>yarn.nodemanager.address</code> in <code>/opt/mapr/hadoop/hadoop-<version>/etc/hadoop/yarn-site.xml</code></p> |
| NodeManager Localizer RPC | <p><i>Source IP:</i> Nodes running NodeManager</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> 8040</p> <p><i>Purpose:</i> The port that node manager uses to localize resources for a node. With localization, remote resources are downloaded to the local filesystem for access.</p> <p><i>Parameter and File where Port is Configured:</i><code>yarn.nodemanager.localizer.address</code> in <code>/opt/mapr/hadoop/hadoop-<version>/etc/hadoop/yarn-site.xml</code></p> |
| NodeManager Web UI and REST APIs | <p><i>Source IP:</i> External Web browsers and REST clients accessing NodeManager services in a non-secure cluster</p> <p><i>Destination IP:</i> Nodes running NodeManager services in a non-secure cluster</p> <p><i>Ports:</i> 8042</p> |

| | |
|---|--|
| | <p><i>Purpose:</i> NodeManager HTTP port</p> <p><i>Parameter and File where Port is Configured:</i> <code>yarn.nodemanager.webapp.address</code> in <code>/opt/mapr/hadoop/hadoop-<version>/etc/hadoop/yarn-site.xml</code></p> |
| NodeManager Web UI and REST APIs | <p><i>Source IP:</i> External Web browsers and REST clients accessing NodeManager services in a secure cluster</p> <p><i>Destination IP:</i> Nodes running NodeManager services in a secure cluster</p> <p><i>Ports:</i> 8044</p> |
| | <p><i>Purpose:</i> NodeManager HTTPS port</p> <p><i>Parameter and File where Port is Configured:</i> <code>yarn.nodemanager.webapp.https.address</code> in <code>/opt/mapr/hadoop/hadoop-<version>/etc/hadoop/yarn-site.xml</code></p> |
| Oozie | <p><i>Source IP:</i> Nodes/clients accessing Oozie services in a non-secure cluster</p> <p><i>Destination IP:</i> Nodes running Oozie services in a non-secure cluster</p> <p><i>Ports:</i> 11000</p> <p><i>Purpose:</i> Used by Oozie clients to access the Oozie server in a non-secure cluster</p> <p><i>Parameter and File where Port is Configured:</i> <code>/opt/mapr/oozie/oozie-<version>/conf/oozie-env.sh</code></p> |
| Oozie | <p><i>Source IP:</i> Nodes/clients accessing Oozie services in a secure cluster</p> <p><i>Destination IP:</i> Nodes running Oozie services in a secure cluster</p> <p><i>Ports:</i> 11443</p> <p><i>Purpose:</i> Used by Oozie clients to access the Oozie server in a secure cluster</p> <p><i>Parameter and File where Port is Configured:</i> <code>/opt/mapr/oozie/oozie-<version>/conf/oozie-env.sh</code></p> |
| OpenTSDB | <p><i>Source IP:</i> OpenTSDB clients, such as <code>Collectd</code>.</p> <p><i>Destination IP:</i> Nodes running OpenTSDB for monitoring use cases.</p> <p><i>Ports:</i> 4242</p> <p><i>Purpose:</i> <code>Collectd</code> uses this port to write metrics to OpenTSDB.</p> <p><i>Parameter and File where Port is Configured:</i> You can configure a different port for monitoring use cases when you run configure.sh on page 2331 script with the <code>-OT</code> parameter.</p> |
| Port Mapper | <p><i>Source IP:</i> Nodes running HPE Ezmeral Data Fabric NFS Services</p> <p><i>Destination IP:</i> Nodes/clients accessing the filesystem using the NFS protocol</p> <p><i>Ports:</i> 111</p> <p><i>Purpose:</i> RPC Portmap services used to connect to the filesystem using NFSv3</p> |

| | |
|--|---|
| ResourceManager JMX Port | <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p> <p><i>Source IP:</i> Nodes running ResourceManager</p> <p><i>Destination IP:</i> ResourceManager JMX port</p> <p><i>Ports:</i> 8025</p> <p><i>Purpose:</i> The port on which Collectd gathers metrics from the ResourceManager using JMX.</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p> |
| ResourceManager Admin RPC | <p><i>Source IP:</i> Applications that access the ResourceManager</p> <p><i>Destination IP:</i> Nodes running ResourceManager</p> <p><i>Ports:</i> 8033</p> <p><i>Purpose:</i> The port that applications use to access the ResourceManager RPC</p> <p><i>Parameter and File where Port is Configured:</i> <code>yarn.resourcemanager.admin.address</code> in <code>/opt/mapr/hadoop/hadoop-<version>/etc/hadoop/yarn-site.xml</code></p> |
| ResourceManager Client RPC | <p><i>Source IP:</i> Clients that submit YARN applications</p> <p><i>Destination IP:</i> Nodes running ResourceManager</p> <p><i>Ports:</i> 8032</p> <p><i>Purpose:</i> The port that clients use to access the YARN applications</p> <p><i>Parameter and File where Port is Configured:</i> <code>yarn.resourcemanager.address</code> in <code>/opt/mapr/hadoop/hadoop-<version>/etc/hadoop/yarn-site.xml</code></p> |
| ResourceManager Resource Tracker RPC (for NodeManagers) | <p><i>Source IP:</i> Applications that access the ResourceManager</p> <p><i>Destination IP:</i> Nodes running ResourceManager</p> <p><i>Ports:</i> 8031</p> <p><i>Purpose:</i> The port that applications use to access the Resource Manager Tracker RPC</p> <p><i>Parameter and File where Port is Configured:</i> <code>yarn.resourcemanager.resource-tracker.address</code> in <code>/opt/mapr/hadoop/hadoop-<version>/etc/hadoop/yarn-site.xml</code></p> |
| ResourceManager Scheduler RPC (for ApplicationMasters) | <p><i>Source IP:</i> Applications that access the ResourceManager</p> <p><i>Destination IP:</i> Nodes running ResourceManager</p> <p><i>Ports:</i> 8030</p> <p><i>Purpose:</i> The port on which the applications in the cluster talk to the ResourceManager.</p> <p><i>Parameter and File where Port is Configured:</i> <code>yarn.resourcemanager.scheduler.address</code> in <code>/opt/mapr/hadoop/hadoop-<version>/etc/hadoop/yarn-site.xml</code></p> |
| ResourceManager Web UI (HTTP) | <p><i>Source IP:</i> Clients that access ResourceManager UI in a non-secure cluster</p> |

| | |
|---|--|
| | <p><i>Destination IP:</i> Nodes running ResourceManager master in a non-secure cluster</p> <p><i>Ports:</i> 8088</p> <p><i>Purpose:</i> ResourceManager Web UI</p> <p><i>Parameter and File where Port is Configured:</i> <code>yarn.resourcemanager.webapp.address</code> in <code>/opt/mapr/hadoop/hadoop-<version>/etc/hadoop/yarn-site.xml</code></p> |
| ResourceManager Web UI (HTTPS) | <p><i>Source IP:</i> Clients that access ResourceManager UI in a secure cluster</p> <p><i>Destination IP:</i> Nodes running ResourceManager master in a secure cluster</p> <p><i>Ports:</i> 8090</p> <p><i>Purpose:</i> ResourceManager Web UI</p> <p><i>Parameter and File where Port is Configured:</i> <code>yarn.resourcemanager.webapp.address</code> in <code>/opt/mapr/hadoop/hadoop-<version>/etc/hadoop/yarn-site.xml</code></p> |
| Shuffle HTTP | <p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Shuffle HTTP</p> <p><i>Ports:</i> 13562</p> <p><i>Purpose:</i> The port that MapReduce Shuffle uses. Transferring the map outputs to reducer inputs in sorted form is the shuffle operation.</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p> |
| Spark Standalone Master (RPC) | <p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> 7077</p> <p><i>Purpose:</i> The port on which to submit jobs in a Spark standalone cluster.</p> <p><i>Parameter and File where Port is Configured:</i> <code>SPARK_MASTER_PORT</code> in <code>SPARK_HOME/conf/spark-env.sh</code></p> |
| Spark Standalone Master (Web UI) | <p><i>Source IP:</i> Nodes/clients accessing Spark services in a non-secure cluster</p> <p><i>Destination IP:</i> Nodes running Spark services in a non-secure cluster</p> <p><i>Ports:</i> 8580</p> <p><i>Purpose:</i> The port on which browsers connect to Spark master in a non-secure Spark standalone cluster.</p> <p><i>Parameter and File where Port is Configured:</i> <code>SPARK_MASTER_WEBUI_PORT</code> in <code>SPARK_HOME/conf/spark-env.sh</code></p> |
| Spark Standalone Master (Web UI) | <p><i>Source IP:</i> Nodes/clients accessing Spark services in a secure cluster</p> <p><i>Destination IP:</i> Nodes running Spark services in a secure cluster</p> <p><i>Ports:</i> 8980</p> <p><i>Purpose:</i> The port on which browsers connect to a Spark master in a secure Spark standalone cluster.</p> |

| | |
|---|--|
| Spark Standalone Worker | <p><i>Parameter and File where Port is Configured:</i> SPARK_MASTER_WEBUI_PORT in SPARK_HOME/ conf/spark-env.sh</p> <p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> 8081</p> <p><i>Purpose:</i> The port on which browsers connect to Spark workers in a Spark standalone cluster.</p> |
| Spark Thrift Server (if start and stop server using Spark scripts) | <p><i>Parameter and File where Port is Configured:</i> SPARK_WORKER_WEBUI_PORT in SPARK_HOME/ conf/spark-env.sh</p> <p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> 10000</p> <p><i>Purpose:</i> The port on which JDBC clients connect to Spark Thrift server.</p> |
| Spark Thrift Server (if start and stop server through Warden, starting in EEP 4.0) | <p><i>Parameter and File where Port is Configured:</i> hive.server2.thrift.port in SPARK_HOME/ conf/hive-site.xml</p> <p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> 2304</p> <p><i>Purpose:</i> The port on which JDBC clients connect to Spark Thrift server.</p> |
| Spark History Server | <p><i>Parameter and File where Port is Configured:</i> hive.server2.thrift.port in SPARK_HOME/ conf/hive-site.xml</p> <p><i>Source IP:</i> Clients that access Spark Job History in a non-secure cluster</p> <p><i>Destination IP:</i> Nodes running Spark History Server in a non-secure cluster</p> <p><i>Ports:</i> 18080</p> <p><i>Purpose:</i> The port on which browsers connect to a non-secure Spark history server.</p> |
| Spark History Server | <p><i>Parameter and File where Port is Configured:</i> spark.history.ui.port in SPARK_HOME/conf/ spark-default.conf "</p> <p><i>Source IP:</i> Clients that access Spark Job History in a secure cluster</p> <p><i>Destination IP:</i> Nodes running Spark History Server in a secure cluster</p> <p><i>Ports:</i> 18480</p> <p><i>Purpose:</i> The port on which browsers connect to a secure Spark history server.</p> |
| Spark External Shuffle Service | <p><i>Parameter and File where Port is Configured:</i> spark.ssl.historyServer.port in SPARK_HOME/conf/spark-defaults.conf (starting from Spark-2.2.1)</p> <p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> 7337</p> |

| | |
|--|---|
| Tez Shuffle | <p><i>Purpose:</i> The port on which Spark jobs connect to External Shuffle server.</p> <p><i>Parameter and File where Port is Configured:</i> <code>spark.shuffle.service.port</code> in <code>SPARK_HOME/conf/spark-default.conf</code></p> <p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> 13563</p> <p><i>Purpose:</i> Port to communicate with the Tez Shuffler. A Tez specific shuffle handler allows data to be shuffled in a way that takes advantage of the new features in Tez</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p> |
| Timeline Server | <p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> 10200</p> <p><i>Purpose:</i> Hadoop IPC port used for internal communication in Hadoop</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p> |
| Timeline Server Web Interface (HTTP) | <p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> 8188</p> <p><i>Purpose:</i> Non-secure web access for the Timeline Server. The Timeline Server allows storage and retrieval of an application's current and historic information in a generic fashion.</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p> |
| Timeline Server Web Interface (HTTPS) | <p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> 8190</p> <p><i>Purpose:</i> Secure web access for the Timeline Server</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p> |
| Tomcat Port (Hive-on-Tez UI) | <p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> 9383</p> <p><i>Purpose:</i> The non-secure port to access the Tez UI. Hive-on-Tez speeds up execution of Hive queries.</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p> |
| Tomcat SSL Port (Hive-on-Tez UI) | <p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> 9393</p> <p><i>Purpose:</i> The secure port to access the Tez UI.</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p> |

| | |
|---|---|
| Web UI | <p><i>Source IP:</i> External web browser accessing either a <i>non-secure</i> or a <i>secure</i> cluster</p> <p><i>Destination IP:</i> Nodes running the Control System Web UI in a non-secure or a secure cluster</p> <p><i>Ports:</i> 8443</p> <p><i>Purpose:</i> Control System Web UI</p> <p><i>Parameter and File where Port is Configured:</i> /opt/mapr/apiserver/conf/properties.cfg</p> |
| Zeppelin | <p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> 9995</p> <p><i>Purpose:</i> The port to connect to the Zeppelin Docker container</p> <p><i>Parameter and File where Port is Configured:</i> Configurable by setting ZEPPELIN_SSL_PORT when running the Zeppelin Docker image</p> |
| ZooKeeper | <p><i>Source IP:</i> Nodes running ZooKeeper services, clients executing ZooKeeper API calls</p> <p><i>Destination IP:</i> Nodes running ZooKeeper services</p> <p><i>Ports:</i> 5181</p> <p><i>Purpose:</i> ZooKeeper API calls</p> <p><i>Parameter and File where Port is Configured:</i></p> <ul style="list-style-type: none"> • /opt/mapr/zookeeper/zookeeper-<version>/conf/zoo.cfg • /opt/mapr/conf/warden.conf, /opt/mapr/conf/cldb.conf • /opt/mapr/hbase/hbase-<version>/conf/hbase-site.xml • /opt/mapr/hive/hive-<version>/conf/hive-site.xml |
| ZooKeeper follower-to-leader Communication | <p><i>Source IP:</i> Nodes running ZooKeeper services</p> <p><i>Destination IP:</i> Nodes running ZooKeeper services</p> <p><i>Ports:</i> 2888</p> <p><i>Purpose:</i> ZooKeeper Server > Server Communication</p> <p><i>Parameter and File where Port is Configured:</i> /opt/mapr/zookeeper/zookeeper-<version>/conf/zoo.cfg</p> |
| ZooKeeper Leader Election | <p><i>Source IP:</i> Nodes running ZooKeeper services</p> <p><i>Destination IP:</i> Nodes running ZooKeeper services</p> <p><i>Ports:</i> 3888</p> <p><i>Purpose:</i> ZooKeeper Server > Server Communication</p> <p><i>Parameter and File where Port is Configured:</i> /opt/mapr/zookeeper/zookeeper-<version>/conf/zoo.cfg</p> |

Log Files

Lists the log files for each HPE Ezmeral Data Fabric component.

The table below provides information on the log files for the components.

| Component | Type of Log | Log File | Configuration File | Rotation | Maximum File Size | # of Backups | Expiration Period |
|-----------|--|-------------------------------------|--------------------------------------|----------|-------------------|--------------|-------------------|
| CLDB | Main | /opt/mapr/logs/cldb.log | /opt/mapr/conf/log4j.cldb.properties | By Size | 100MB | 9 | - |
| | Disk Balancer | /opt/mapr/logs/cldbdiskbalancer.log | /opt/mapr/conf/log4j.cldb.properties | Daily | - | - | 10 days |
| | Role Balancer | /opt/mapr/logs/cldbrolebalancer.log | /opt/mapr/conf/log4j.cldb.properties | Daily | - | - | 10 days |
| | Time Skew | /opt/mapr/logs/timeskew.log | /opt/mapr/conf/log4j.cldb.properties | Daily | - | - | 10 days |
| | HPE Ezmeral Data Fabric filesystem Summary | /opt/mapr/logs/cldbfssummary.log | /opt/mapr/conf/log4j.cldb.properties | Daily | - | - | 10 days |
| | Audit | /opt/mapr/logs/cldbaudit.log.json | /opt/mapr/conf/log4j.cldb.properties | Daily | - | - | - |
| | Guts | /opt/mapr/logs/cdbguts.log | /opt/mapr/conf/log4j.properties | - | - | - | 10 days |
| | Proxy | /opt/mapr/logs/cdbproxy.log | /opt/mapr/conf/log4j.properties | - | - | - | 10 days |

| Component | Type of Log | Log File | Configuration File | Rotation | Maximum File Size | # of Backups | Expiration Period |
|-----------|--|--|---|---------------|-------------------|--------------|-------------------|
| WebServer | Main | /opt/mapr/apiserver/logs/apiserver.log | /opt/mapr/apiserver/conf/properties.cfg | Every Startup | - | 10 | 10 days |
| | | | /opt/mapr/conf/log4j.mcs.properties | Daily | - | - | |
| | Authentication Audit | /opt/mapr/logs/authaudit.log.json | /opt/mapr/conf/log4j.mcs.properties | Daily | - | - | - |
| | PAM | /opt/mapr/logs/pam.log | /opt/mapr/conf/log4j.properties | Daily | - | - | 10 days |
| maprcli | /opt/mapr/apiserver/logs/apiserver-maprcli.log | <ul style="list-style-type: none"> /opt/mapr/apiserver/conf/properties.cfg /opt/mapr/apiserver/conf/log4j2.xml | Daily | - | - | 10 days | |
| Warden | Main | /opt/mapr/logs/warden.log | /opt/mapr/initscripts/mapr-warden | Every Startup | - | 10 | 10 days |
| | | | /opt/mapr/conf/log4j.properties | Daily | - | - | |
| | System Volume Initialization | /opt/mapr/logs/createsystemvolumes.log | /opt/mapr/server/createsystemvolumes.sh | - | - | - | 10 days |

| Component | Type of Log | Log File | Configuration File | Rotation | Maximum File Size | # of Backups | Expiration Period |
|------------|----------------------------------|--------------------------------------|---------------------------------|----------|-------------------------------|--------------|-------------------|
| filesystem | CLDB Connection Initialization | /opt/mapr/logs/mfs.log-0 | /opt/mapr/conf/mfs.conf | By Size | 200MB per file (1GB in total) | 5 | - |
| | filesystem | /opt/mapr/logs/mfs.log-3 | /opt/mapr/conf/mfs.conf | By Size | 200MB per file (1GB in total) | 5 | - |
| | HPE Ezmeral Data Fabric Database | /opt/mapr/logs/mfs.log-5 | /opt/mapr/conf/mfs.conf | By Size | 200MB per file (1GB in total) | 5 | - |
| | stderr on startup | /opt/mapr/logs/mfs.err | - | - | - | - | - |
| | stdout on startup | /opt/mapr/logs/mfs.out | - | - | - | - | 10 days |
| | Initialization | /opt/mapr/logs/mfsinit.log | /opt/mapr/initscripts/mapr-mfs | - | - | - | 10 days |
| | Audit Initialization | /opt/mapr/logs/initaudit.log | /opt/mapr/server/initaudit.sh | - | - | - | 10 days |
| NFS | Main | /opt/mapr/logs/nfsserver.log | /opt/mapr/conf/nfsserver.conf | By Size | 200MB | 5 | - |
| | NFS Monitoring | /opt/mapr/logs/nfsmon.log | - | - | - | - | 10 days |
| | Local Mount | /opt/mapr/logs/mount_local_fs.log | /opt/mapr/bin/mount_local_fs.pl | - | - | - | 10 days |
| NFSv4 | NFS Ganesha Server | /opt/mapr/logs/nfs4/nfs4server.log | /opt/mapr/conf/nfs4server.conf | By Size | - | - | - |
| | NFSv4Server filesystem logs | /opt/mapr/logs/nfs4/fsal.log-0, 1, 2 | - | By Size | 200MB | 5 | - |
| | VIP | /opt/mapr/logs/nfs4/nfs4mon.log | - | - | - | - | - |
| HostStats | Main | /opt/mapr/logs/hoststats.log | - | By Size | 20MB | 5 | - |
| | stderr on startup | /opt/mapr/logs/hoststats.err | - | - | - | - | - |

| Component | Type of Log | Log File | Configuration File | Rotation | Maximum File Size | # of Backups | Expiration Period |
|--------------------------------|----------------|--|---|----------|-------------------|--------------|-------------------|
| Gateway | Main | /opt/mapr/logs/gateway.log | /opt/mapr/conf/log4j.properties | By Size | 256MB | 20 | 10 days |
| | Initialization | /opt/mapr/logs/gatewayinit.log | /opt/mapr/initscripts/mapr-gateway | - | - | - | 10 days |
| Loopbacknfs POSIX Client | Main | /usr/local/mapr-loopbacknfs/logs/loopbacknfs.log | /usr/local/mapr-loopbacknfs/conf/nfsserver.conf | By Size | 200MB | 5 | - |
| | NFS Monitoring | /usr/local/mapr-loopbacknfs/logs/nfsmon.log | - | - | - | - | - |
| | Local Mount | /usr/local/mapr-loopbacknfs/logs/mount_local_fs.log | /usr/local/mapr-loopbacknfs/bin/mount_local_fs.pl | - | - | - | - |

Increasing Log Retention

To increase log retention for specific component, you can modify the configuration file and reset the value of the properties.

Increasing Log Retention for filesystem

In the `/opt/mapr/conf/mfs.conf` file, increase the value for the `mfs.max.logfile.size.in.mb` property. The value for this property is computed using the following formula:

```
maxSizePerLogFile = maxLogSize / MAX_NUM_OF_LOG_FILES
```

Here:

- `maxLogSize` specifies the total amount of space that filesystem log files can consume.
- `MAX_NUM_OF_LOG_FILES` specifies the total number of filesystem log files (5 hard coded).

For example, for a value of 10 GB, there will be 5 log files (`mfs.log-3` to `mfs.log-3.4`) of 2GB each.

Increasing Log Retention for CLDB

In the `/opt/mapr/conf/log4j.cldb.properties` file, modify the value for the following properties:

- `log4j.appender.R.MaxFileSize` — specifies the size of each `cldb.log` before rolling over
- `log4j.appender.R.MaxBackupIndex` — specifies the number of `cldb.log*` before the oldest one is deleted.

For example, suppose the following configuration:

- `log4j.appender.R.MaxFileSize = 1024MB`
- `log4j.appender.R.MaxBackupIndex = 10`

The CLDB log files will grow to 10GB before they are purged.

Note: This setting does not impact audit logging.

Increasing Log Retention for Hadoop Services

You can increase log retention for ResourceManager, NodeManager, HistoryServer, and TimelineServer by modifying the following properties in the `/opt/mapr/hadoop/hadoop-<Version>/etc/hadoop/log4j.properties` file:

- `hadoop.log.maxfilesize` — specifies the size of each `<service-name>-hostname.log` before rolling over.
- `hadoop.log.maxbackupindex` — specifies the number of `<service-name>-hostname.log*` before the oldest one is deleted.

For example, suppose the following configuration:

- `hadoop.log.maxfilesize = 1024Mb`
- `hadoop.log.maxbackupindex = 10`

There will be 10 GB of total service-specific logs (1GB per file) before the oldest file is purged.

Setting the Tracing Level

To check all the modules and their current logging levels, run the following command:

```
maprcli trace info
```

To set the tracing level for a module, run the `maprcli trace setlevel` command. For example:

```
maprcli trace setlevel -module FuseMonitor -level DEBUG
```

Configuring Profiling for Operations

To check the amount of time it took to complete each operation (from the time of submission), enable profiling for client RPC and filesystem operations. To enable profiling for:

- Client RPC, run the following command:

```
fcdebug -s <shmid> -m ClntProfileRpc -l DEBUG
```

Tip: For more information, see [fcdebug](#).

Enabling profiling for the client RPC will allow you to determine, for each RPC, the amount of time it took to receive a response after submitting the request.

- filesystem operations, run the following command:

```
maprcli trace setlevel -module FSProfile -level debug
```

Tip: For more information, see [maprcli](#).

Enabling profiling for filesystem operations will allow you to determine the amount of time it took filesystem to process each operation.

By default, profiling is disabled for both client RPC and filesystem operations. Once enabled, the log for:

- Client RPC should look similar to the following:

```
2016-06-16 10:58:04,6404 DEBUG ClntProfileRpc
fs/client/fileclient/cc/client.cc:3483 Thread: 32188 Profile: CltRpcDone:

```

Archiving CLDB Logs

The CLDB logs can be archived by setting the value for the configuration parameter, `cldb.logarchiver.enabled`, using the `maprccli config save` command. The value can be:

- 0 — disable
- 1 — enable

To:

- Enable archiving, run the following command:

```
maprccli config save -values '{"cldb.logarchiver.enabled":"1"}'
```

- Disable archiving, run the following command:

```
maprccli config save -values '{"cldb.logarchiver.enabled":"0"}'
```

The default value for this parameter is 2, which indicates that the CLDB log archiving is disabled; but on clusters with 50 or more filesystem nodes, the CLDB log archiving will be automatically enabled unless the value is explicitly set to 0.

If/when archiving is enabled:

- All static CLDB log files, except the active `cldb.log` file, are periodically scanned and archived in `/var/mapr/cldblog/<hostname> directory`.

- The filename for the archived log file is autogenerated based on the date and timestamp on the first log line in the file chosen for archival.

For example, suppose a log file with the following first line:

```
2017-04-06 12:42:16,020 INFO CLDB [main]: Loading properties file : /opt/
mapr/conf/clldb.conf
```

The archived log filename in `/var/mapr/clddblog/<hostname>` directory will be:
2017-04-06_12.42.16.020

Enabling Runtime Logging

To enable logging at runtime for the file client (`libfsalmapr.so` library), run the `fcdebug` utility:

```
/opt/mapr/server/tools/fcdebug -s <shmid> -m <module> [-l <level>]
/opt/mapr/server/tools/fcdebug -i -s <shmid>
```

Before running this command, make a note of the following:

- If necessary, run `maprcli trace info` to retrieve the list of modules.
The default value for module is all.
- Level should be one of FATAL, ERROR, WARN, INFO, DEBUG.
If level is not specified, default level is applied for the module.
- The `-i` lists the current debug level of all modules.
- The `shmid` is available in the `fsal.log-*` files when `libMapRClient` is loaded.

For example, the first line in the log file is something similar to the following:

```
2017-02-13 11:56:32,6809 ERROR FuseAPI fs/client/fileclient/cc/
fuse_api.cc:1371
Thread: 428 Shmid to be used by fcdebug 512720897
```

This `shmid` can be used with `fcdebug`.

Note: Run `fcdebug` once for every library (every library has a separate shared memory). The `shmid`s can be found in the respective `fsal` log files.

Viewing Audit Logs

The following sections describe audit logs for execution of any `maprcli` command, REST API call, or action in Control System, and audit logs for cluster administration, filesystem, table, and stream operations.

Viewing Log Entries for Audited maprcli Command Executions

Describes where audit records of operations performed using the CLI are stored and how to view them.

The execution of any `maprcli` command on the cluster is logged in the local filesystem on the node on which the execution happened. The log file is `/opt/mapr/mapr-cli-audit-log/audit.log.json`. Auditing of CLI operations is always enabled, whether or not auditing is enabled for cluster-level operations with the `maprcli audit cluster` command.

Typical log entries provide a timestamp of the execution, the UID of the user who ran the command, the IP address from which the user ran the command, the command itself, and the status of the execution. Status codes are 0 for success and 1 for failure. The error messages field provides the reasons for failures.

Below are some typical log entries:

```
{ "timestamp" :
  { "$date" : "2015-06-15T11:45:56.434Z" }, "uid" : 2147483632, "ipAddress" :
  "10.10.20.12", "command" : "volume info", "arguments" :
  { "name" : "mapr.opt" }, "status" :
  1, "errors" : [ "Volume lookup of mapr.opt failed, No such volume" ] }
{ "timestamp" :
  { "$date" : "2015-06-15T11:49:34.434Z" }, "uid" : 2147483632, "ipAddress" :
  "10.10.20.12", "command" : "alarm add", "arguments" : { "baseService" : "1", "alarm" :
  "NODE_ALARM_SERVICE_GATEWAY_DOWN", "service" : "gateway", "displayName" : "Gateway
  ServiceDown",
  "serviceName" : "GatewayService", "terse" : "nagwsd" }, "status" : 1, "errors" :
  [ "Terse name of
  nagwsd already exists in the system.", "Alarm
  NODE_ALARM_SERVICE_GATEWAY_DOWN already
  exists in the system." ] }
{ "timestamp" :
  { "$date" : "2015-06-15T11:49:52.598Z" }, "uid" : 2147483632, "ipAddress" :
  "10.10.20.12", "command" : "volume create", "arguments" :
  { "name" : "mapr.hbase", "path" : "/hbase",
  "replicationtype" : "low_latency" }, "status" : 1, "errors" : [ "Volume Name
  mapr.hbase, Already In Use" ] }
```

Viewing Audit Logs for Cluster Administration

Describes where audit records of cluster administration operations are stored and how to view them.

Entries for audit logs are initially held in memory until 128 operations have been logged or 10 seconds have elapsed, whichever happens first. At that point, the new log entries are flushed to disk.

Audit logs are in JSON format, so they can be queried by Drill or processed by other third-party tools or your own scripts.

Audit logs are readable only by the `mapr` and `root` users on the cluster where the logs are located. These users can also copy and delete audit logs.

The `status` field in every log entry shows the status of the attempted operation. The status codes are taken from the Linux `errno.h` file. For a list of these codes, see [Status Codes That Can Appear in Audit Logs](#).

Audit logs use Coordinated Universal Time (UTC) in the records of audited operations.

The cleanup of old audit log files is handled by Warden either when they are older than 10 days (the default retention time) or when they are older than the number of days set for the `log.retention.time` parameter in the `/opt/mapr/conf/warden.conf` file. To prevent Warden from removing the log files, by default, `cldbaudit*` and `authaudit*` are listed under the `log.retention.exceptions` parameter in the `warden.conf` file.

To enable Warden to automatically cleanup log files, remove `cldbaudit*` and `authaudit*` from the `log.retention.exceptions` parameter in the `warden.conf` file and, if you want a shorter cleanup time, set the value for `log.retention.time` parameter in the `warden.conf` file. The value for `log.retention.time` must be specified in milliseconds.

To disable all exceptions, comment out the `log.retention.exceptions` parameter, that is, `#log.retention.exceptions`. When this parameter is null, that is, `log.retention.exceptions=`, no files are picked for log cleanup.

Viewing Audit Logs for File System, Table, and Stream Operations

Describes where filesystem, HPE Ezmeral Data Fabric Database, and HPE Ezmeral Data Fabric Event Streams audit logs are stored and how to view them.

Operations on data-fabric file, database, and event data are captured and recorded in the audit logs. The operations take place within volumes and have effects at the level of the file system.

These audit logs are stored in a system volume created specifically to store them. This volume is created automatically during cluster installations and upgrades. Operations are logged on the nodes on which the operations are executed, which could differ from the nodes where operations are initiated. Logs are stored in the file system at `/var/mapr/local/<node_name>/audit/`. By default, only root and the cluster administrator (typically `mapr`) can read the log files. To allow other users to read the logs, set ACEs on the directory granting `readfile` (`rf`), `readdir` (`rd`), and `lookupdir` (`ld`) permissions to the users. For example:

```
~# hadoop mfs -setace -R -aces "rf:u:root|u:mapr|u:m7user1,rd:u:root|u:mapr|u:m7user1,ld:u:root|u:mapr|u:m7user1" /var/mapr/local/sample.qa.lab/audit/
```

Note: For more information, see [Enabling Volume, Directory, and File Authorizations with ACEs](#) on page 1569.

Audit logs for operations on directories and files

Operations on directories and files, as well as the deletion of HPE Ezmeral Data Fabric Database tables, are logged in files that have this naming convention: `FSAudit.log.json-dd-mm-yyyy-<001-999>`

To see what information is recorded in typical log entries, see [Example Log Entries for Audited File System Operations](#).

Audit logs for operations on HPE Ezmeral Data Fabric Database tables and MapR streams

All operations on HPE Ezmeral Data Fabric Database tables and streams are logged in files that have this naming convention: `DBAudit.log.json-dd-mm-yyy-<001-999>`

Operations that result from `maprcli` commands, REST calls, or activity in MCS are also logged in `/opt/mapr/mapr-cli-audit-log/audit.log.json` in the local file system on the nodes where the operations are processed.

To see what information is recorded in typical log entries, see [Example Log Entries for Audited Operations on HPE Ezmeral Data Fabric Database Tables](#).

Note: Due to the way that the creation of tables is processed internally, sometimes the creation of tables is logged in `FSAudit.log.json`, rather than in `DBAudit.log.json`.

Common Features of Audit Logs for File System, Table, and Stream Operations

Entries for audit logs are initially held in memory until 128 operations have been logged or 10 seconds have elapsed, whichever happens first. At that point, the new log entries are flushed to disk, depending on the `coalesce` interval.

The `coalesce` interval represents the interval of time during which `READ`, `WRITE`, or `GETATTR` operations on one file from one client IP address and UID/GID are logged only once for a particular operation, if auditing is enabled.

For example, suppose that a client application reads a single file three times in 6 minutes, so that there is one read at 0 minutes, another at 3 minutes, and a final read at 6 minutes. If the `coalesce` interval is at least 6 minutes, then only the first read operation is logged. However, if the interval is between 4 minutes, then only the first and third read operations are logged. If the interval is 2 minutes, all three read operations are logged.

Now however, if the client was also writing to the file, irrespective of the coalesce interval for the read operation in the example stated previously, the write operation is logged, as it is a different operation from reading.

The default value is 60 minutes. Setting this field to a larger number helps prevent audit logs from growing quickly. To change the coalesce interval, see [volume audit](#) on page 2181.

Audit logs are in JSON format, so they can be queried by Drill or processed by other third-party tools or your own scripts.

Audit logs are readable only by the `mapr` and `root` users on the cluster where the logs are located. These users can also copy and delete audit logs.

The status field in every log entry shows the status of the attempted operation. The status codes are taken from the Linux `errno.h` file. For a list of these codes, see [Status Codes That Can Appear in Audit Logs](#).

Audit logs use Coordinated Universal Time (UTC) in the records of audited operations.

When operations are performed on directories, files, or tables that are being audited, the full names for those objects, as well as the current volume and the name of the user performing the operation, are not immediately available to the auditing feature. What are immediately available are IDs for those objects and users. Converting IDs to names at run-time would be costly for performance. Therefore, audit logs contain file identifiers (FIDs) for directories, files, and tables; volume identifiers for volume; and user identifiers (UIDs) for users.

You can resolve identifiers into names by using the [expandaudit](#) utility. This utility creates a copy of the log files for a specified volume, and in that copy are the names of the file system objects, users, and volumes that are in the audit log records. You can then query or process the copy.

A sample of the logs is as follows:

```
{ "timestamp" :
  { "$date" : "2021-07-14T13:05:01.506Z" }, "resource" : "test-audit-logs", "operation" :
  "volumeMirrorPermCheck", "username" : "root", "uid" : 0, "clientip" : "10.163.167.214", "status" : 0 }
{ "timestamp" :
  { "$date" : "2021-07-14T08:44:01.553Z" }, "resource" : "255", "operation" : "volumeLookup", "username" : "root", "uid" : 0, "clientip" : "10.163.167.214", "status" : 2 }
```

Note: There will be an entry in the audit log for each IP address on a node. For example, suppose there is a node with multiple IP addresses. The audit log on this node may show multiple entries of the same operation, each associated with a different IP address.

Note: The number of bytes read or written is not recorded.

Example Log Entries for Audited File System Operations

When auditing of file system operations is enabled at the cluster level, volume level, and file system level, each operation on a directory or file is logged on the node on which the operation was initiated.

Typical log entries provide a timestamp of the operation, the type of operation, the UID of the user who ran the command, the IP address from which the user ran the command, identifiers of the affected resources, the volume identifier, and the status of the operation. Status codes come from the Linux `errno.h` file. For a list of these codes, see [Status Codes That Can Appear in Audit Logs](#).

Note: Due to the way that the creation of tables is processed internally, sometimes the creation of tables is logged in `FSAudit.log.json`, rather than in `DBAudit.log.json`.

Below are some typical log entries:

```
{ "timestamp" :
  { "$date" : "2015-06-06T10:44:22.800Z" }, "operation" : "MKDIR", "uid" : 0, "ipAddress" :
  :
```

```

"10.10.104.51", "parentFid": "2049.51.131248", "childFid": "2049.56.131258", "childName":
"ycsbTmp_1433587462796", "volumeId": 68048396, "status": 0}
{"timestamp":
{"$date": "2015-06-06T10:44:22.823Z"}, "operation": "LOOKUP", "uid": 0, "ipAddress":
"10.10.105.51", "srcFid": "2049.56.131258", "srcName": "range0", "volumeId": 68048396, "status": 2}
{"timestamp":
{"$date": "2015-06-06T10:44:22.824Z"}, "operation": "CREATE", "uid": 0, "ipAddress":
"10.10.104.51", "parentFid": "2049.56.131258", "childFid": "2049.57.131260", "childName": "range0",
"volumeId": 68048396, "status": 0}
{"timestamp":
{"$date": "2015-06-06T10:44:22.838Z"}, "operation": "WRITE", "uid": 0, "ipAddress":
"10.10.105.51", "srcFid": "2049.57.131260", "volumeId": 68048396, "status": 0}
{"timestamp":
{"$date": "2015-06-06T10:44:48.628Z"}, "operation": "READ", "uid": 0, "ipAddress":
"10.10.105.51", "srcFid": "2049.63.131272", "volumeId": 68048396, "status": 0}

```

To convert the user IDs to usernames, file identifiers to pathnames, and volume IDs to volume names, run the [expandaudit](#) on page 2376 utility. For example, here are the same audit records after they were processed by this utility:

```

{"timestamp": {"$date=2015-06-06T10:44:22.800Z"}, "operation": "MKDIR", "user": "root", "uid": "0", "ipAddress":
"10.10.104.51", "parentPath": "/ycsb1433587356934", "childPath": "/ycsb1433587356934/ycsbTmp_1433587462796",
"childName": "ycsbTmp_1433587462796", "VolumeName": "mapr.cluster.root", "volumeId": "68048396", "status": "0"}
{"timestamp": {"$date=2015-06-06T10:44:22.823Z"}, "operation": "LOOKUP", "user": "root", "uid": "0", "ipAddress":
"10.10.105.51", "srcPath": "/ycsb1433587356934/ycsbTmp_1433587462796", "srcName": "range0", "VolumeName":
"mapr.cluster.root", "volumeId": "68048396", "status": "2"}
{"timestamp": {"$date=2015-06-06T10:44:22.824Z"}, "operation": "CREATE", "user": "root", "uid": "0", "ipAddress":
"10.10.104.51", "parentPath": "/ycsb1433587356934/ycsbTmp_1433587462796", "childPath":
"/ycsb1433587356934/ycsbTmp_1433587462796/ycsbTmp_1433587462796/
range0", "childName": "range0", "VolumeName": "mapr.cluster.root",
"volumeId": "68048396", "status": "0"}
{"timestamp": {"$date=2015-06-06T10:44:22.838Z"}, "operation": "WRITE", "user": "root", "uid": "0", "ipAddress":
"10.10.105.51", "srcPath": "/ycsb1433587356934/ycsbTmp_1433587462796/
range0", "VolumeName": "mapr.cluster.root",
"volumeId": "68048396", "status": "0"}
{"timestamp": {"$date=2015-06-06T10:44:48.628Z"}, "operation": "READ", "user": "root", "uid": "0", "ipAddress":

range6", "VolumeName": "mapr.cluster.root",
"volumeId": "68048396", "status": "0"}

```

Example Log Entries for Audited Operations on HPE Ezmeral Data Fabric Database Binary and JSON Tables

When auditing of table operations is enabled at the cluster level, volume level, and file system level, each operation on a table is logged on the node where the operation was executed, which could differ from the node where the operation was initiated.

Typical log entries provide a timestamp of the operation, the type of operation, the UID of the user who ran the command, the IP address from which the user ran the command, identifiers of the affected resources,

and the status of the operation. Fields such as “ColumnFamily” and “Column” for some operations are also included when applicable. Row keys are not included. Status codes come from the Linux `errno.h` file. For a list of these codes, see [Status Codes That Can Appear in Audit Logs](#).

Note: Due to the way that the creation of tables is processed internally, sometimes the creation of tables is logged in `FSAudit.log.json`, rather than in `DBAudit.log.json`.

Note: Audit logs do not display the indices of array elements when there are put or update operations on arrays that are in documents within JSON tables.

Below are some typical log entries:

```
{ "timestamp" :
  { "$date" : "2015-06-06T11:31:02.621Z" }, "operation" : "DB_GET", "uid" : 0, "ipAddress" :
  "10.10.105.51", "volumeId" : 48210891, "tableFid" : "2751.77.131402", "status" : 0 }
{ "timestamp" :
  { "$date" : "2015-06-06T11:31:02.623Z" }, "operation" : "DB_SCAN", "uid" : 0, "ipAddress" :
  "10.10.104.51", "volumeId" : 48210891, "tableFid" : "2751.77.131402", "status" : 0 }
{ "timestamp" :
  { "$date" : "2015-06-06T11:31:02.624Z" }, "operation" : "DB_PUT", "uid" : 0, "ipAddress" :
  "10.10.104.51", "volumeId" : 48210891, "columnFamily" : "cf0", "columnQualifier" : "c0", "tableFid" :
  "2751.77.131402", "status" : 0 }
```

To convert the user IDs to usernames, file identifiers to pathnames, and volume IDs to volume names, run the [expandaudit](#) utility. For example, here are the same audit records after they were processed by this utility:

```
{ "timestamp" :
  { "$date" : "2015-06-06T11:31:02.621Z" }, "operation" : "DB_GET", "uid" : 0, "ipAddress" :
  "10.10.105.51", "VolumeName" : "mapr.cluster.root", "volumeId" : 48210891, "tablePath" :
  "/ycsb1433588330006/ycsbTable0", "status" : 0 }
{ "timestamp" : " { $date=2015-06-06T11:03:16.721Z } ", "operation" : "DB_SCAN", "user" :
  "root", "uid" :
  "0", "ipAddress" : "10.10.105.51", "VolumeName" : "mapr.cluster.root", "volumeId" : "
  48210891", "tablePath" :
  "/ycsb1433588330006/ycsbTable0", "status" : "0" }
{ "timestamp" :
  { "$date" : "2015-06-06T11:31:02.624Z" }, "operation" : "DB_PUT", "uid" : 0, "ipAddress" :
  "10.10.104.51", "VolumeName" : "mapr.cluster.root", "volumeId" : 48210891, "columnF
  amily" : "cf0",
  "columnQualifier" : "c0", "tablePath" : "/ycsb1433588330006/
  ycsbTable0", "status" : 0 }
```

Managing Audit Logs for File System and Table Operations

There are three parameters that you can use to manage audit logs for file system and table operations:

- `-maxSize`
- `-retention`
- `-coalesce`

You can set the first two parameters with the `maprccli audit data` command. You can set the third parameter with the `maprccli volume audit` command.

Effects of the `-maxSize` parameter

When you enable auditing with the `audit data` on page 1733`maprcli audit data` command, you can use the `-maxSize` parameter to specify the size at which an alarm is raised concerning the size of the audit volume. The alarm is displayed on the dashboard in the Control System and in the output of the `alarm list` on page 1724`maprcli alarm list` command. This alarm simply means that the threshold size has been reached. Audited operations are still logged to the audit volume in question.

There are three actions that you can take:

- If you decide that you want to be notified when the audit volume reaches a smaller or larger size, you can change the threshold by running the `maprcli audit data` command and changing the value of the `-maxSize` parameter.
- If you want to try preventing audit log files from growing as quickly as they are, you can change the number of identical operations that are logged within a number of minutes. Run the `maprcli audit data` command and increase the value of the `-coalesce` parameter. This parameter is described subsequently.
- If you are concerned about longer-term space requirements for storing audit log files, you can change the number of days to keep old log files before they are deleted. Run the `maprcli audit data` command and decrease the value of the `-retention` parameter. This parameter is also described below.

Effects of the `-retention` parameter

When you enable auditing with the `maprcli audit data` command, you can use the `-retention` parameter to specify how many days to keep old log files.

Audit logs are rotated every night at midnight UTC time . The saved audit logs are kept until the retention period expires.

For example, suppose the retention period is 30 days. The node 192.168.10.15 in the volume `/myVolume` contains 30 days of saved log files for file-system operations and the current date is March 30, 2016. The directory `/var/mapr/local/102.168.10.15/audit/` contains these log files:

```
FSAudit.log.json-30-03-2016-001
FSAudit.log.json-29-03-2016-001
FSAudit.log.json-28-03-2016-001
...
FSAudit.log.json-01-03-2016-001
```

Note: If MFS is restarted on the same day, audit logs gets rotated, and new files with convention -002, -003, and so on are created with each restart.

If there is no more disk space for new entries in audit logs, audit logging stops.

If the size of the audit log volume exceeds its quota, an alarm is raised, though logging continues. The alarm is `VOLUME_ALARM_ADVISORY_QUOTA_EXCEEDED`. You can view alarms in [the Control System](#) or by running the command `maprcli alarm list`. The default quota is 32 GB.

Effects of the `-coalesce` parameter

The `coalesce` on page 6792parameter represents the interval of time during which READ, WRITE, or GETATTR operations on one file from one client IP address and UID/GID are logged only once for a particular operation, if auditing is enabled.

For example, suppose that a client application reads a single file three times in 6 minutes, so that there is one read at 0 minutes, another at 3 minutes, and a final read at 6 minutes. If the coalesce interval is at

least 6 minutes, then only the first read operation is logged. However, if the interval is between 4 minutes, then only the first and third read operations are logged. If the interval is 2 minutes, all three read operations are logged.

Now however, if the client was also writing to the file, irrespective of the coalesce interval for the read operation in the example stated previously, the write operation is logged, as it is a different operation from reading.

The default value is 60 minutes. Setting this field to a larger number helps prevent audit logs from growing quickly.

Status Codes That Can Appear in Audit Logs

In the `status` field in entries in audit logs, numeric codes other than 0 for success can appear. For the list of possible codes, their keyword equivalents, and descriptions, refer to the standard Linux `errno-base.h` and `errno.h` files. The `authaudit.log.json` file contains HTTP status codes. See [HTTP Status Codes](#) for more information.

Viewing Application Logs

You can use logs to view the status and analyze the execution of applications in a cluster.

To view the status or to access logs for running applications, you can use the user interface associated with the YARN framework.

- For MapReduce version 2 or non-MapReduce applications, access the ResourceManager user interface from the Control System to view the status and logs for a particular application.

For completed applications, the distributed nature of YARN frameworks can make analyzing the execution of applications difficult because tasks and containers are scattered throughout the cluster. Without centralized or aggregated logging, you must manually access all the log files for a completed application by merging the log details for a particular application across multiple nodes in the cluster. With centralized or aggregated logging, you can access all the logs for a completed application in a centralized location. However, the steps to access logs for completed applications differ based on the configured logging option.

Logging Options

In a data-fabric cluster, the logging option that you configure defines how the logs are stored and accessed.

- **Centralized logging.** The logs are written to local volumes on the file system.
- **YARN log aggregation.** The logs are written to the local file system and then the container logs from each node are aggregated and stored on the file system.
- **Local logging.** The log files for each job or application are written to the local file system. This is the default behavior for MapReduce version 2 (MRv2) applications and non-MapReduce applications.
 - For MRv2 or other applications that run on YARN, the logs are written to the following directory on the local file system: `/opt/mapr/hadoop/hadoop-2.x.x/logs/userlogs/`

The logging options that you can choose from are determined by the type of jobs or applications that you run:

| Type of Job or Application | Available Logging Options |
|----------------------------|--|
| MRv2 | <ul style="list-style-type: none"> • Centralized logging • YARN log aggregation • Local logging (default) |

| Type of Job or Application | Available Logging Options |
|-----------------------------------|---|
| YARN applications (non-MapReduce) | <ul style="list-style-type: none"> • YARN log aggregation • Local logging (default) |

If you enable centralized logging for MRv2, the MapReduce applications will use centralized logging, while the other YARN applications in the cluster will use local logging.

Note: Select a logging option that stores the logs on the file system for the following reasons:

- Prevent job or application failures due to a lack of space on the local file system for logs.
- Prevent the loss or inaccessibility of logs due to node failure. Logs stored in a local volume are two-way replicated.

YARN Log Aggregation

The YARN Log Aggregation option aggregates and moves log files for completed applications from the local filesystem to the filesystem. This allows users to view the entire set of logs for a particular application using the HistoryServer UI or by running the `yarn logs` command.

By default, YARN container logs are not aggregated on the filesystem. Instead, the logs are retained for 3 hours on the local filesystem before they are deleted. To enable YARN log aggregation or to edit the configuration of YARN log aggregation, you must edit the `yarn-site.xml` file in the following directory: `/opt/mapr/hadoop/hadoop-2.x.x/etc/hadoop/`

Enabling YARN Log Aggregation

To enable YARN log aggregation, add or edit the following properties in `yarn-site.xml`:

- Set the value of the `yarn.log-aggregation-enable` to `true`.
- Configure the `yarn.log.server.url` property to contain the URL of the YARN HistoryServer, which should look like the following:

| | |
|--------------------|---|
| secure cluster | <code>https://<historyserver-host>:19890/jobhistory/logs</code> |
| non-secure cluster | <code>http://<historyserver-host>:19888/jobhistory/logs</code> |

- Optional: Set the value of `yarn.nodemanager.remote-app-log-dir` to a location in the MapR filesystem. By default, the location is `maprfs:///tmp/logs`.
- Optional: Set the value of `yarn.nodemanager.remote-app-log-dir-suffix` to the name of the folder that should contain the logs for each user. By default, the folder name is `logs`.

On a non-secure cluster, you also need to add the following property to `/opt/mapr/hadoop/hadoop-2.x/etc/hadoop/yarn-env.sh` on the Node Manager nodes:

```
export MAPR_IMPERSONATION_ENABLED=1
```

Then restart the Node Manager services. This setting enables impersonation for Node Manager processes so that log files can be created with the correct user ownership.

Aggregated logs are owned by the user who runs the job. For example, when user `admin` runs a job, the logs are stored to `maprfs:///tmp/logs/admin`. If user `analyst` runs a job, the logs are stored to `maprfs:///tmp/logs/analyst`. If these two users do not share the same UNIX group, they will not be able to see each other's logs.

 **Note:** If centralized logging and YARN log aggregation are enabled, the logs for MapReduce version 2 applications will be managed by Centralized Logging while the logs for non-MapReduce applications will be managed by YARN log aggregation.

Enabling YARN Local-Node Log Aggregation

The steps in this procedure configure log aggregation for NodeManager processes, enabling you to store the logs on nodes (node-local volumes) where the YARN containers are launched.

To enable YARN local-node log aggregation, add or edit the following properties in the `yarn-site.xml` file:

1. Set the value of `yarn.node-local-log-aggregation.enable` to `true`.

 **Note:** The default setting for YARN Log Aggregation (`yarn.log-aggregation-enable`) should be removed or set to `false` in the `yarn-site.xml` file.

2. Optional: Set the value of `yarn.node-local-log-aggregation.metadata-path` to a location in the system. By default the location is `maprfs:///NM_REMOTE_APP_LOG_DIR/<user>/logsMeta`. `NM_REMOTE_APP_LOG_DIR` should match the `yarn.nodemanager.remote-app-log-dir` property.

 **Note:** The location should not be an absolute path (the location begins from `/`). In the filesystem (`maprfs`), the default setting for `NM_REMOTE_APP_LOG_DIR` is `/tmp/logs`.

3. Optional: Set the value of `node-local-log-aggregation.metadata-filename` to the name of the metafile that should contain the information about containers for each node. By default, the file name is `containers.seq`, so if you use the default paths, the file will be stored at `/tmp/logs/{user}/logsMeta/<appId>/<nodeName>/containers.seq`.
4. Restart the NodeManager and HistoryServer services.

Aggregated logs are owned by the user who runs the job.

Different users cannot see each other's logs. For example, when the data-fabric user `admin` runs a job, the logs are stored in `maprfs:///var/mapr/local/<nodeName>/mapred/nodeManager/logs/admin/<appId>`. If a user `analyst` runs a job, the logs are stored in `maprfs:///var/mapr/local/<nodeName>/mapred/nodeManager/logs/analyst/<appId>`.

Viewing Logs for Completed Applications

With YARN log aggregation, you can use `yarn` commands or the HistoryServer UI to access logs for completed applications.

View Application Logs from the Command Line

Get the application ID and then view log files for the application.

Get the Application ID

To get the application ID for an application that is in a "running" state, you can run the following command:

```
yarn application -list
```

However, if you run `yarn application -list` after a job completes, the command will not return any information.

To get the application ID for an application in any state (submitted, accepted, or running), run the following command:

```
yarn application -list -appStates ALL
```

The `yarn application -list` command returns information similar to the following, including the application ID:

```
20/10/19 14:57:51 INFO
client.MapRZKBasedRMFailoverProxyProvider: Updated RM address to
node1.cluster.com/192.168.33.11:8032
Total number of applications
(application-types: [] and states:
[SUBMITTED, ACCEPTED, RUNNING]):1
Application-Id Application-Name
Application-Type User Queue State
Final-State Progress Tracking-URL
application_1603118361219_0002
QuasiMonteCarlo MAPREDUCE mapr
root.mapr ACCEPTED UNDEFINED 0% N/A
```

View Application Logs

Run the following command to view log files for an application:

```
yarn logs -applicationId
<application-ID>

//Example: yarn logs -applicationId
application_1603118361219_0002
```

Using UI to View Logs for Completed Applications

Explains how to view HistoryServer logs using the graphical interface.

You can view the logs for completed applications through the Control System and by directly accessing the HistoryServer UI.

Using the Control System to View the HistoryServer Logs for Completed Applications

1. Log on to the Control System and click **Services** to display the list of services.

Note: The **Services** menu is not available on the Kubernetes version of the Control System.

2. Click the **History Server** link in the list of services to display the **JobHistory** page in a new tab.
3. Click the job ID link for the job you want to view the logs for.
4. Click the logs link in the **Logs** column of the **Application Master** section.

Using the HistoryServer UI to View Logs for Completed Applications

1. Open a browser and go to the following URL to open the JobHistory page:

Non-secure cluster

```
http://<IP address of HistoryServer
node>:19888
```

Secure cluster

```
https://<IP address of
HistoryServer node>:19890
```

2. Click the job ID link for the job for which you want to view the logs.
3. Click the logs link in the **Logs** column of the **Application Master** section.

Editing the Retention Settings of Aggregated Logs

By default, aggregate logs are stored on the MapRHPE Ezmeral Data Fabric filesystem for 30 days. The retention time for aggregated logs also applies to centralized logs.

To edit the retention settings, add or edit the following properties in the *yarn-site.xml* file:

1. Set the value of `yarn.log-aggregation.retain-seconds` to set the duration that the logs are maintained. If you set a negative value for `yarn.log-aggregation.retain-seconds`, logs will not be deleted.

Note: The duration specified by `yarn.log-aggregation.retain-seconds` starts from the time that the application starts running. Therefore, when you configure the duration, consider how long you want the log to remain in addition to the amount of time that the application will take to run. For example, if you expect most applications to take 20 seconds to run, do not set the value of this property to 20 seconds because the log might be deleted as soon as the applications completes.

2. Optionally, set the `yarn.log-aggregation.retain-check-interval-seconds` to specify how often the log retention check should be run. By default, it is one-tenth of the log retention time.

For more details about the properties that impact the YARN container logs and the aggregation option, see [yarn-site.xml](#).

Centralized Logging

Describes the centralized logging feature of data-fabric.

Data Fabric's Centralized Logging feature provides a job-centric or application-centric view of all log files generated by a MapReduce program. With centralized logging, the log files are written to local volumes in the data-fabric filesystem. You can run the `maprcli job linklogs` command for running or completed jobs to create a centralized log directory populated with symbolic links to all log files pertaining to the specified jobs or to the application.

Managing Centralized Logs for MapReduce Version 2 Applications

To manage centralized logs for MapReduce Version 2 applications, enable centralized logging, configure log retention, and view application logs.

Enabling Centralized Logging for MapReduce Version 2

Describes how to enable central logging for MapReduce version 2 applications.

As of data-fabric version 4.0.2, you can use centralized logging for MapReduce version 2 applications. However, this feature is disabled by default. In data-fabric version 4.0.1, centralized logging is not supported for MapReduce version 2 applications.

- Configure the `yarn.use-central-logging-for-mapreduce-only` property in the `yarn-site.xml` file to enable or disable centralized logging.

The `yarn-site.xml` file is located in the following directory: `/opt/mapr/hadoop/hadoop-2.x.x/etc/hadoop/`.

- To disable centralized logging, remove the property `yarn.use-central-logging-for-mapreduce-only` from the `yarn-site.xml` file, or set the value of `yarn.use-central-logging-for-mapreduce-only` to `false` in the `yarn-site.xml` file.
- To enable centralized logging, set the value of `yarn.use-central-logging-for-mapreduce-only` to `true` in the `yarn-site.xml` file. If you enable centralized logging while applications are running, restart all ResourceManagers. In a production cluster, restart ResourceManagers one at a time to prevent interruption to the running applications. The applications running during this process may not have centralized logging enabled.

Configuring Log Retention Time for MapReduce Version 2 Applications

Lists the parameter that controls the log retention time for MapReduce applications.

- Set the value of `yarn.log-aggregation.retain-seconds` to the number of seconds you want to retain the logs once the application starts in the `yarn-site.xml` file.

The value defaults to 30 days. The value that you set for this property also applies to the retention of aggregated YARN logs.

The `yarn-site.xml` file is in the following directory: `/opt/mapr/hadoop/hadoop-2.x.x/etc/hadoop`.

Viewing Logs for Completed MapReduce Version 2 Applications

With centralized logging, you can use `maprccli` or the HistoryServer user interface to access completed logs.

Using the Command Line to View Logs for Completed Applications

Describes how to view logs from the CLI.

1. Use the `maprccli job linklogs` command to create centralized logs for completed applications. For example, you can run the following `maprccli job linklogs` command to create centralized logs for `application_1434605941718_0001`:

```
maprccli job linklogs -jobid application_1434605941718_0001 -todir /logsdire
```

The centralized log directory contains symbolic links that are organized by hostname and containerID.
2. To determine where the logs are located, run the following command on the directory that contains the symlinks to the log files for a specific container:

```
hadoop mfs -ls <todir>/<applicationID>/hosts/<hostName>/<containerID>
```

For example, if you specified `logsdire` as the directory, you might issue a command similar to the following example. The system then displays the location of the log files:

```
hadoop mfs -ls /logsdire/application_1434605941718_0001/hosts/
qa-node178.qa.lab/container_e02_1434605941718_0001_01_000003

Found 1 items
lrwxrwxrwx U U U 3 root root 138 2015-06-18 05:50 0
/logsdire/application_1434605941718_0001/hosts/qa-node178.qa.lab/
container_e02_1434605941718_0001_01_000003
->
../../../../var/mapr/local/qa-node178.qa.lab/logs/yarn/userlogs/
application_1434605941718_0001/container_e02_1434605941718_0001_01_000003
p 2068.40.262432 qa-node178.qa.lab:5660 qa-node175.qa.lab:5660
```

The link location appears after the arrow.

3. To determine the types of log files that are available for this container and the path to each available log file, run the following command:

```
hadoop fs -ls <link location>
```

For example:

```
hadoop fs -ls ../../../../var/mapr/local/qa-node178.qa.lab/logs/yarn/
userlogs/application_1434605941718_0001/
container_e02_1434605941718_0001_01_000003

-rw-r-----    2 root root          2337 2015-06-18 05:48
../../../../var/mapr/local/qa-node178.qa.lab/logs/yarn/userlogs/
application_1434605941718_0001/
container_e02_1434605941718_0001_01_000003/syslog
```

In this example, the path to the syslog is the only one that is displayed in the output. However, the stdout or stderr may also be available depending on what is generated by the application.

4. Run one of the following options to view the contents of a log file:

- a) To view the end of the log file, run `hadoop fs -tail <path to log file>`.

```
hadoop fs -tail ../../../../var/mapr/local/
qa-node178.qa.lab/logs/yarn/userlogs/application_1434605941718_0001/
container_e02_1434605941718_0001_01_000003/syslog
```

- b) To view the entire log file, run `hadoop fs- cat <path to log file>`.

```
hadoop fs- cat ../../../../var/mapr/local/
qa-node178.qa.lab/logs/yarn/userlogs/application_1434605941718_0001/
container_e02_1434605941718_0001_01_000003/syslog
```

Using the HistoryServer UI to View Logs for Completed Applications

Describes how to view logs using the HistoryServer interface.

You can view the logs in the HistoryServer interface.

View Logs in the HistoryServer Interface Launched Using the Control System

1. Log on to the Control System and click **Services** to display the list of services installed on the cluster.
2. Click the HistoryServer link in the list of services to open the **Job History** page in a new tab.
3. Click the Job ID link for the job for which you want to view the logs.
4. Click the logs link in the **Logs** column of the **Application Master** section.

View Logs Using the HistoryServer Interface

1. Go the URL similar to the following example, to open the Job History page:

```
<IP address of HistoryServer node>:19888
```

2. Click the Job ID link for the job for which you want to view the logs.
3. Click the logs link in the **Logs** column of the **Application Master** section.

Viewing the Service Log

Explains how to view service logs using Kibana.

If Kibana is installed on the node, you can view the service log in the Kibana UI from the Control System. To view the log in the Kibana UI from the Control System:

1. Log in to the Control System and do one of the following:
 - Click **Services** to display the list of services installed on the cluster.
 - Go to the **Summary** tab in the [service information page](#) for the service.
2. Click  in the **Log Viewer** column to view the log for the associated service in the Kibana UI. See [Kibana User Guide](#) for more information.

Cluster Maintenance Schedule

Lists a sample maintenance schedule for the cluster.

A maintenance schedule shows which tasks a cluster administrator should perform daily, weekly, monthly, and quarterly, along with the initial setup tasks. This sample schedule is offered as a template that you can customize to suit your needs.

| Initial Setup | Daily | Weekly | Monthly | Quarterly |
|--|--------------------------------------|-------------------------------------|---|------------------------------|
| Perform hardware checks | Check alarms | Check logs (cluster and job logs) | Clean up logs | Audit storage use |
| Check Prerequisites | Onboard new users | Check for zombie jobs | Reevaluate node and volume topology | Perform security audit |
| Verify Installation | Offboard users | Perform simple performance test | Check performance (jobs, I/O) | Upgrade core, Hive, HCatalog |
| High Availability planning | Check cluster health | Verify snapshots | Verify mirrors | |
| Set up VIPs for NFS for the HPE Ezmeral Data Fabric | Perform hardware maintenance (disks) | Remove old snapshots | Clean up data | |
| Benchmark and tuning | | Failbacks to restore service layout | filesystem balancing | |
| Set up node and volume topologies | | | | |
| Capacity planning | | | Upgrade ecosystem components (other than Hive and HCatalog, which are done quarterly) | |
| Set up user permissions (ACLs, directory permissions, users, home directories) | | | | |
| Set up quotas | | | | |
| Set up compression | | | | |
| Configure cluster queues for MapReduce jobs | | | | |

| Initial Setup | Daily | Weekly | Monthly | Quarterly |
|--|-------|--------|---------|-----------|
| Set up schedules (fair scheduler, capacity scheduler, job placement) | | | | |
| Set up snapshots and mirrors | | | | |
| Configure NICs | | | | |
| Set up monitoring tools | | | | |
| Set up security | | | | |
| Create a disaster recovery plan | | | | |

Language Support for HPE Ezmeral Data Fabric Database Tables

This section lists the human languages that HPE Ezmeral Data Fabric Database tables can store, retrieve, and process.

HPE Ezmeral Data Fabric Database tables can store, retrieve, and process data in the following languages:

A

Abaza Abkhazian Achinese Acoli Adangme Adyghe Afar Afrikaans Aghem Ainu Akan Akkadian Akoose Albanian Aleut Amharic Amo Ancient Egyptian Ancient Greek Angika Arabic Aragonese Aramaic Arapaho Arawak Armenian Aromanian Assamese Assyrian Neo-Aramaic Asturian Asu Atikamekw Atsam Avaric Avestan Awadhi Aymara Azerbaijani

Troubleshooting Cluster Administration

Lists the common errors and their solutions.

The following list identifies how to address several cluster administration issues:

The URL reported by YARN for tracking job details does not load.

This URL uses the output of the `hostname -f` command, which must be the fully qualified domain name (FQDN) for the node. On Ubuntu, make sure that the `/etc/hostname` file is configured with the node's FQDN. On CentOS/Redhat, make sure that the `/etc/sysconfig/network` file is configured with the node's FQDN, then restart the node.

The ResourceManager does not start.

If the ResourceManager does not come up, check the following:

- Check that you supplied the correct ResourceManager hostname or IP address in the `-RM` parameter when running `configure.sh` on each node at installation time. If you are not sure, you can re-run `configure.sh` to correct the problem.

- Do not specify a ResourceManager port with the hostname or IP address in the `-RM` parameter; there is no `<port>` option.
- Make sure that you specified the same ResourceManager hostname or IP address on all nodes when running `configure.sh`.
- For more information about what might be causing a problem, check the ResourceManager logs: `/opt/mapr/hadoop/hadoop-<version>/logs`

The NodeManager does not start.

If the NodeManager does not come up, check the following:

- Make sure that the fileserver role is installed on the node by looking in the `/opt/mapr/roles` directory.
- Make sure that the fileserver service is running, using either the `service list` command or the Control System.
- For more information about what might be causing a problem, check the NodeManager logs: `/opt/mapr/hadoop/hadoop-2.3.0/logs`

Job history is not available.

If job history is not recorded, check the following:

- Make sure that the HistoryServer role is installed on the desired node by looking in the `/opt/mapr/roles` directory. Note that only one node in the cluster can have the HistoryServer role.
- Make sure the HistoryServer is running on the desired node, using either the `service list` command or the Control System.
- Check that you supplied the correct HistoryServer hostname or IP address in the `-HS` parameter when running `configure.sh` on each node at installation time. If you are not sure, you can re-run `configure.sh` to correct the problem.

Submitted applications do not show up in the ResourceManager.

If you submit an application and it does not appear in the ResourceManager, check the following:

- Make sure the application is running in YARN and not as a local application (check for `app_local` or `job_local` in the application output).
- Check the class path on which the application was invoked, and make sure that `/opt/mapr/hadoop/hadoop-<version>/etc/hadoop` includes the class paths.
- Make sure that you are running the correct version of Hadoop. Example:

```
ls -l /usr/bin/hadooplrwxrwxrwx 1
root root 40
Mar
4 11:38 /usr/bin/hadoop -> /opt/
mapr/hadoop/hadoop-2.3.0/bin/hadoop
```

The application throws a `ClassNotFoundException` exception at job submission time.

If you submit an application and it throws the `ClassNotFoundException` exception, check the following:

- Check that the application jar is correctly packaged with the required class.
- Make sure that you are running the correct version of Hadoop. Example:

```
ls -l /usr/bin/hadooplrwxrwxrwx 1
root root 40
Mar
4 11:38 /usr/bin/hadoop -> /opt/
mapr/hadoop/hadoop-2.3.0/bin/hadoop
```

I want to move the `HistoryServer` and `ResourceManager` to different nodes.

If you have installed the `HistoryServer` and the `ResourceManager` on the same node (when you initially ran `configure.sh` you did not specify the `-HS` parameter, or you specified the same IP address or hostname for both the `-RM` and `-HS` parameters), you can use `configure.sh` to move one or both services to different nodes. Make sure to specify both the `-HS` parameter and the `-RM` parameter, because if you only specify the `-RM` parameter the `HistoryServer` will move to the `ResourceManager` node.

Timing issue prevents services from starting on a secure cluster.

If your cluster has security features enabled, you may encounter a timing issue that results in services failing to start during initial configuration with the `-F` option. (This issue does not arise if you are bringing up a cluster that has already been installed and configured.)

When you run the `configure.sh` script with the `-F` option, the `ZooKeeper` and `Warden` services start up on the primary node first, then as other nodes are installed, services are automatically started on those nodes. However, because of this timing issue, `Warden` may fail to communicate with `ZooKeeper`, and the cluster may fail to come up.

If you encounter this problem, do not use the `-F` option. Instead, stop all `ZooKeeper` and `Warden` services on all nodes, then start the `ZooKeeper` services on all of the `ZooKeeper` nodes (that is, the nodes where the `ZooKeeper` packages are installed). Finally, start the `Warden` services on all nodes.

How to find a node's `serverid`.

Some `maprcli` commands take an argument `serverid`, which is a unique identifier for each node in a cluster. This id is also sometimes referred to as the *node id*.

To find the `serverid`, use the `maprcli node list` command, which lists information about all nodes in a cluster. The `id` field is the value to use for `serverid`.

For example:

```
maprcli node list -columns hostname,id
id hostname
ip
4800813424089433352 node-28.lab
10.10.20.28
6881304915421260685 node-29.lab
```

```

10.10.20.29
    4760082258256890484 node-31.lab
10.10.20.31
    8350853798092330580 node-32.lab
10.10.20.32
    2618757635770228881 node-33.lab
10.10.20.33

```

You can also get this listing as a JSON object by using the `-json` option. For example:

```

maprcli node list -columns
id,hostname -json
{
  "timestamp":1358537735777,
  "status":"OK",
  "total":5,
  "data":[
    {
      "id":"4800813424089433352",
      "ip":"10.10.20.28",
      "hostname":"node-28.lab"
    },
    {
      "id":"6881304915421260685",
      "ip":"10.10.20.29",
      "hostname":"node-29.lab"
    },
    {
      "id":"4760082258256890484",
      "ip":"10.10.20.31",
      "hostname":"node-31.lab"
    },
    {
      "id":"8350853798092330580",
      "ip":"10.10.20.32",
      "hostname":"node-32.lab"
    },
    {
      "id":"2618757635770228881",
      "ip":"10.10.20.33",
      "hostname":"node-33.lab"
    }
  ]
}

```

Error 'mv Failed to rename maprfs...' when moving files across volumes.

Prior to version 2.1, you cannot move files across volume boundaries in the HPE Ezmeral Data Fabric Platform. You can move files within a volume using the `hadoop fs -mv` command, but attempting to move files to a different volume results in an error of the form "mv: Failed to rename maprfs://<source path> to <destination path>".

As a workaround, you can copy the file(s) from source volume to destination volume, and then remove the source files.

The example below shows the failure occurring. In this example directories `/a` and `/b` are mount-points for two distinct volumes.

```
hadoop fs -ls /
  Found 2 items
  drwxrwxrwx - root root
  0 2011-12-02 15:14 /a
  drwxrwxrwx - root root
  0 2011-12-02 15:09 /b

hadoop fs -put testfile /a
hadoop fs -ls /a
  Found 1 items
  -rwxrwxrwx 3 root root
  2048000 2011-12-02 15:18 /a/testfile

root@node1:~# hadoop fs -mv /a/
testfile /b
  mv: Failed to rename maprfs://
  10.10.80.71:7222/a/testfile to /b
```

The following example shows the work-around, moving a file `/a/testfile` to directory `/b`, and then removing the source file.

```
hadoop fs -cp /a/testfile /b/testfile
hadoop fs -ls /b
  Found 1 items
  -rwxrwxrwx 3 root root
  2048000 2011-12-02 15:19 /b/testfile

hadoop fs -rmr /a/testfile
  Deleted maprfs://
  10.10.80.71:7222/a/testfile

hadoop fs -ls /a
```

This workaround is only necessary if `/a` and `/b` correspond to different volumes.

'ERROR com.mapr.baseutils.cldbutils.CLDBRpcCommonUtils' in cldb.log, caused by mixed-case cluster name in mapr-clusters.conf.

HPE Ezmeral Data Fabric cluster names are case sensitive. However, some versions of MapR v1.2.x have a bug in which the cluster names specified in `/opt/mapr/conf/mapr-clusters.conf` are not treated as case sensitive. If you have a cluster with a mixed-case name, after upgrading from v1.2 to v2.0+, you may experience CLDB errors (in particular for

mirror volumes) which generate messages like the following in `cldb.log`:

```
2012-07-31 04:43:50,716 ERROR
com.mapr.baseutils.cldbutils.CLDBRpcCommonUtils
[VolumeMirrorThread]: Unable to reach
cluster with name: qacluster1.2.9. No
entry found in file /conf/
mapr-clusters.conf for cluster
qacluster1.2.9.
Failing the CLDB RPC with status 133
```

(The path given in this message is relative to `/opt/mapr/`, which might be misleading.)

As a work-around after upgrading, to continue working with mirror volumes created in v1.2, duplicate any lines with upper-case letters in `mapr-clusters.conf`, converting all letters to lower case.

Mirror volumes created in v2.0+ do not exhibit this behavior.

HPE Ezmeral Data Fabric Control System does not display on Internet Explorer.

The HPE Ezmeral Data Fabric Control System supports Internet Explorer version 9 and above. In IE9, **Compatibility View** under the **Tools** menu must be turned off, or else the user interface will not display correctly.

Unable to kill a job using the Metrics UI.

The following error displays when the root user tries to kill a job using the Metrics UI: Failed to get Job information for job_x, Error: mapr is not allowed to impersonate root

To resolve this issue, add the following properties to [core-site.xml](#) in directory `/opt/mapr/hadoop/hadoop-0.20.2/etc/`:

```
<property>
<name>hadoop.proxyuser.mapr.groups</
name>
<value>*</value>
<description>Allow the superuser mapr
to impersonate any member of any
group</description>
</property>

<property>
<name>hadoop.proxyuser.mapr.hosts</
name>
<value>*</value>
<description>The superuser can
connect from any host to impersonate a
user</description>
</property>
```

YARN logs are deleted before the application completes.

The duration that YARN container logs are maintained starts from the time that the application starts running.

When YARN container logs are not aggregated, the YARN container logs are retained for 3 hours on each node. To update the duration, edit the value of

`yarn.nodemanager.log.retain-seconds` in the [yarn-site.xml](#) file.

When YARN container log aggregation is enabled, by default, the aggregated logs are not deleted. However, this setting can be overridden in [yarn-site.xml](#) file. To update the duration, edit the value of `log-aggregation.retain-seconds` in the [yarn-site.xml](#) file.

You must consider how long you want the log to remain past the amount of time that the application will take to run. For example, if you expect most applications to take 20 seconds to run, do not set the value of this property to 20 seconds because the log may be deleted before the applications completes.

YARN applications fail because /tmp subdirectories have been deleted.

Some RHEL and CentOS platforms include the `tmpwatch` service by default. This service cleans up the `/tmp` directory on a regular basis. However, this operation causes the deletion of directories that are needed for applications to run (for example, `nm-local-dir` for YARN). The running NodeManager process does not re-create these missing directories, causing applications to fail.

Jobs fail when the timeline server is down

The timeline server for the Hive-on-Tez user interface does not support high availability. Jobs fail when the resource manager cannot connect to the timeline server. However, you can change the `yarn.timeline-service.client.best-effort` property to `TRUE` in the [yarn-site.xml](#) file to allow applications to run successfully even when the timeline server is down.

Best Practices for Backing Up HPE Ezmeral Data Fabric Information

Lists the best practices and performance considerations to follow when backing up HPE Ezmeral Data Fabric information.

To back up configuration information and data from your HPE Ezmeral Data Fabric cluster, you must install the appropriate Linux backup client from your backup software provider on your servers in your HPE Ezmeral Data Fabric cluster. Your backup client user must have the proper filesystem, and volume permissions. For details on how to configure HPE Ezmeral Data Fabric volume permissions see [Creating Volume-level ACLs](#) on page 1564 and [Managing Access Controls](#) on page 1562.

Backup Configuration Data

By default, all installation files on the cluster, for each server in the cluster, are stored in a single directory on each server in the HPE Ezmeral Data Fabric cluster. To ensure that you backup all the configuration files, HPE Ezmeral Data Fabric supported applications, as well as log files, back up the `/opt/mapr` directory for all servers in the cluster.

Note that the `/opt/mapr` location includes all log files. Log files can add a significant amount of data to your backup environment, so evaluate if they are needed for your business continuity requirements. To backup just the configuration files for the cluster, backup the `/opt/mapr/conf` directory from all servers in the cluster.

Backup Volume Data

HPE Ezmeral Data Fabric's recommended way to backup and restore data, is to enable and configure snapshots and volume mirroring for your data, to another HPE Ezmeral Data Fabric cluster. This step ensures that your business continuity and disaster recovery needs are met.

See the following links for setting up Snapshots, Mirroring, Table and Streams replications.

- Snapshots: [Managing Snapshots](#) on page 1028
- Mirrors: [Mirror Volumes](#) on page 415
- MapR-DB Table Replication: [Managing Table Replication](#) on page 1180
- MapR-ES Streams Replication: [Stream Replication](#) on page 619

If you do not have a secondary cluster to mirror your data, back up your volumes by specifying the following path in your Linux backup agent: `/mapr/cluster_name/` - For example: `/mapr/my.cluster.com/`.

Performance Considerations When Backing Large Data Sets

You could run into bandwidth and performance limitations when you specify only one path to your HPE Ezmeral Data Fabric cluster, where your data in your volumes is stored on only one Linux host agent. The bottleneck can occur due to the size of that data you are backing up (large file sizes), or due to the number of files you have in your directory structure (millions of files in one directory).

To mitigate performance issues, break up the volumes across multiple Linux backup agents, with specific mount paths. For example:

```
HPE Ezmeral Data Fabric Linux Host 1 (hostname1):
  /mapr/my.cluster.com/volume1
  /mapr/my.cluster.com/volume2
  /mapr/my.cluster.com/volume3
```

```
HPE Ezmeral Data Fabric Linux Host 2 (hostname2):
  /mapr/my.cluster.com/volume4
  /mapr/my.cluster.com/volume5
  /mapr/my.cluster.com/volume6
```

```
HPE Ezmeral Data Fabric Linux Host 3 (hostname3):
  /mapr/my.cluster.com/volume7
  /mapr/my.cluster.com/volume8
  /mapr/my.cluster.com/volume9
```

Preserve Metadata About the Volumes

To preserve metadata such as permissions and [ACE](#) rules, run a pre-script process as the `mapr` user, in your backup agent. For example in your pre-script configuration for your host agent for your cluster, you would run:

```
maprcli volume dump create
  -name volumel -dumpfile volumel_fulldump1 -e statefile1
```

Some backup software may need "stderr" or "stdout" codes to run pre or post processing scripts within their product. In that case, you may need to write a bash script to dump the file to a location of your choice, and ensure that your backup agent is configured to backup that directory. Consult your backup software provider's documentation. For information on creating volume dumps, see [Create and Maintain Volume Dump File](#) on page 2224.

6.2 Development

This section contains information related to application development for Ezmeral ecosystem components and HPE Ezmeral Data Fabric products, including Filesystem, Database (Key-Value and JSON), and Event Streams.

Application Development Process

Before you start developing applications on the HPE Ezmeral Data Fabric platform, consider how you will get the data into the platform, the storage format of the data, the type of processing or modeling that is required, and how the data will be accessed.

At a high-level, building an application comes down to the following steps:

1. [Step 1: Select a Data Storage Format](#) on page 2641
2. [Step 2: Write Data to HPE Ezmeral Data Fabric](#) on page 2644
3. [Step 3: Explore Ways to Work With the Data](#) on page 2644
4. [Step 4: Set Up the Development Environment](#) on page 2648
5. [Step 5: Build the Application](#) on page 2656

Step 1: Select a Data Storage Format

Consider the data format options and determine how you want to use to store your data.

Keep in mind that a single application can access data from a variety of data formats. The following data formats are available.

HPE Ezmeral Data Fabric File Store

HPE Ezmeral Data Fabric File Store is a random read-write distributed filesystem that allows applications to concurrently read and write directly to files. This data store is great for storing and scanning large data sets of historical data, and for sharing files between various services and applications. Any node with access to the filesystem can access files on it.

Consider the following examples:

- Write large amounts of user click-stream data for a web site in a simple directory structure based on the date, and then process that data using tools like Spark, Drill, Hive or another MapReduce application.
- Store various types of images, audio files, and video files in one shared directory so that web or mobile applications can render the content as required.
- Share configuration files or internationalized resources among various applications by storing these files in a shared directory.
- Simplify the deployment of new applications by adding java libraries (.jar files) to a shared directory and then including the directory in the classpath of one or more applications.
- Store the Docker files and images in a shared location which can be accessed by various servers. This provides a single, shared location from which users can launch containers.

When you store large data sets, use a file format in which the data can be consumed efficiently. For example, Parquet, ORC, sequence files are good for storing and scanning. Parquet is great for storing data on the filesystem because it stores data in columnar format, which can be partitioned. Parquet also works well for use cases where you query the data with Drill or process the data with Spark applications. Note that you can use CSV or JSON formats, but they scanning these formats is less efficient.

For more information about the filesystem, see [File System](#) on page 408.

HPE Ezmeral Data Fabric Database

HPE Ezmeral Data Fabric Database is an enterprise-grade, high performance, NoSQL database management system that supports both binary and JSON tables. Consider using HPE Ezmeral Data Fabric Database tables when you want to query and organize large amounts data. It also integrates with Drill, Apache Spark, Hive and other MapReduce tools to provide applications the ability to scan or query large data sets in an efficient, distributed way.

HPE Ezmeral Data Fabric Database provides the following features:

- **A flexible schema.** Each row or document can have its own set of attributes.
- **Efficient random access.** Applications can quickly access one or more records using a row key, document ID, or a conditional queries.
- **Easy and efficient data mutation.** Applications can insert, update, and delete rows or documents.

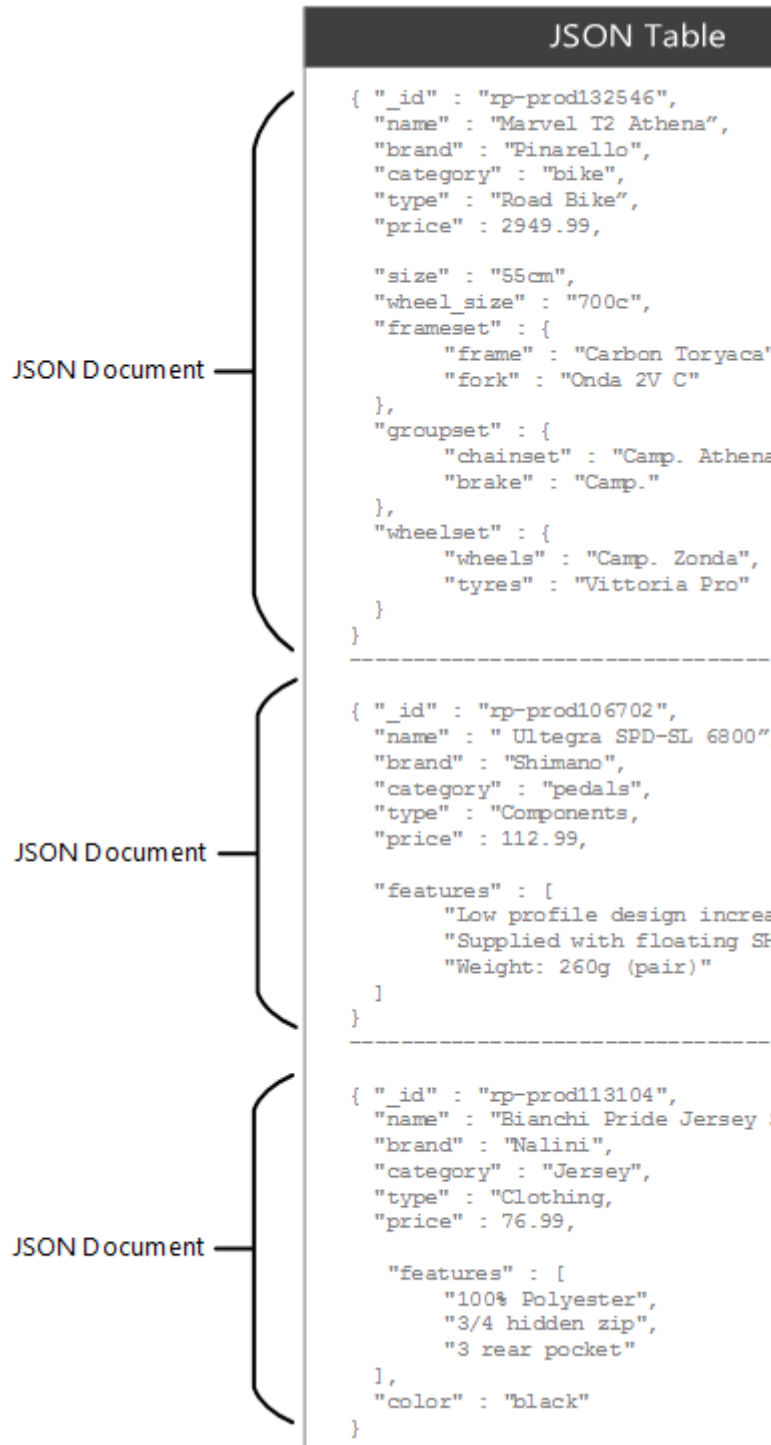

HPE Ezmeral Data Fabric Database Binary Tables

HPE Ezmeral Data Fabric Database binary tables consist of rows that are identified by primary keys and row data is identified by key/value pairs. HPE Ezmeral Data Fabric Database tables are similar to HBase tables in that HPE Ezmeral Data Fabric Database does not determine or store the datatype of each value in the table. But, HPE Ezmeral Data Fabric Database tables perform operations more efficiently than HBase table. You might want to use binary tables when you want to create or use an existing HBase application. However, on the Converged Data Platform, JSON tables are usually preferred due to their flexibility.

HPE Ezmeral Data Fabric Database JSON Tables

A HPE Ezmeral Data Fabric Database JSON tables provide a flexible, powerful schema that you can customize based on the data that you want to represent. Each row in a JSON table corresponds to an JSON document with an unique `_id` and each JSON document can have a different set of columns. HPE Ezmeral Data Fabric Database JSON tables determine the datatype of each value based on the type of data written to the document.

The following example lists three JSON documents from a single JSON table. Note that the attributes associated with each document varies.

For more information, see [HPE Ezmeral Data Fabric Database](#) on page 458.

HPE Ezmeral Data Fabric Event Streams

HPE Ezmeral Data Fabric Event Streams is a publish/subscribe messaging solution that uses the Apache Kafka API. HPE Ezmeral Data Fabric Event Streams writes events as messages in a topic and topics are part of a stream. Producer applications can publish events to a stream and consumer applications can read

all or a subset of the messages in a stream. By default, messages are stored in a topic for 7 days and then automatically purged. However, you can shorten or extend the time-to-live (ttl) for messages in a stream based on your use case.

For more information, see [HPE Ezmeral Data Fabric Event Streams](#) on page 590.

Step 2: Write Data to HPE Ezmeral Data Fabric

Depending on your use case, move existing data onto the HPE Ezmeral Data Fabric platform or write data directly to the platform.

You can write batch data or streaming data to HPE Ezmeral Data Fabric. Batch data refers to data that is already in a data-store while streaming data refers to the continuous flow of real-time messages that have yet to be written to a data-store. Streaming data is generally processed as it is received while batch data is processed after a set of data is written to the datastore. There are many ways to write batch and streaming data to the platform, the following sections provide a few examples.

Write Batch Data to the Platform

You can use an NFS client, hadoop command, or ecosystem components to write batch data to filesystem. Basic POSIX filesystem operations can be used to move data to filesystem. For example, you can use NFS clients, POSIX clients, or applications that utilize libraries such as java.io to access the filesystem. Hadoop commands and hdfs APIs can be used to add or update files on the filesystem. For example, you can use the hadoop `distcp` command to [copy data from HDFS to filesystem](#). Hadoop Ecosystem components, such as Apache Flume, can also be used to push log files to filesystem.

You can also write, update, or delete batch data to HPE Ezmeral Data Fabric Database tables. Applications can use the OJAI API to write to JSON tables or the HBase API to write to binary tables.

Write Streaming Data to the Platform

Write streaming event data as messages in HPE Ezmeral Data Fabric Event Data Streams topics using Kafka APIs or a REST client application. [C](#), [Java](#), or [Python](#) applications can produce messages to one or more topics in event streams. Additionally, applications written in any language can use the [REST Proxy](#) to produce messages to one or more topics in an event stream. For example, a financial service application, written in Java, could produce messages about stock market activity to an event stream topic.

Step 3: Explore Ways to Work With the Data

Once the data is in the HPE Ezmeral Data Fabric platform, explore the various features and components available on the platform and determine your path. You may want to access data in its initial format or perform some data modeling or processing prior to accessing the data.

The following sections provide some examples to help you determine which approach will work for your particular use case.

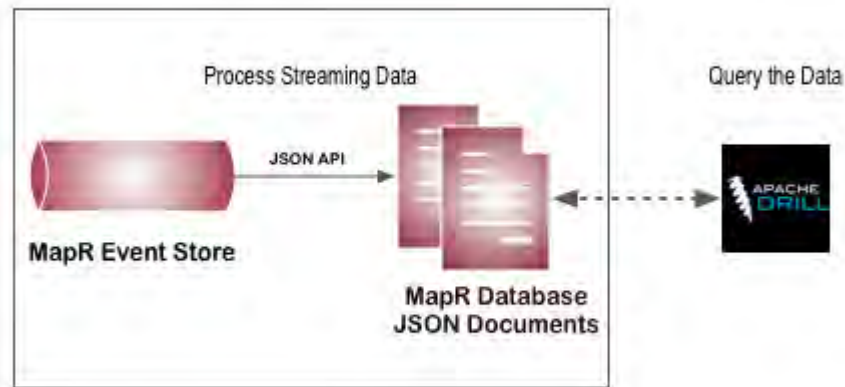

Process Data

When developing applications that ingest data, consider if the data requires some processing before the data can be consumed or stored.

Consider the following scenarios:

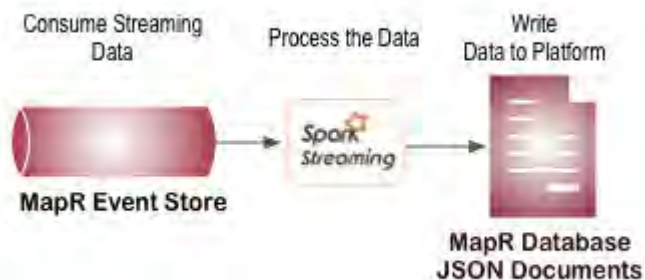

- **Process the Data Before Querying the Data**

To efficiently query data, you may want to convert the data into a different format. For example, if you want to use Drill to query event data, you can convert streaming data from topics to a JSON table to enable more efficient querying. To do this, ingest event data using HPE Ezmeral Data Fabric Event Streams, use the HPE Ezmeral Data Fabric Event Streams API to read the data from topics and the JSON API to store the data in a JSON table, then use Drill to query the JSON tables.

- **Process Data before Storing the Data**

You may also want to process the data based on business needs to perform some pre-processing before long term storage. For example, you can consume streaming data from a HPE Ezmeral Data Fabric Event Streams topic with a Spark Streaming application which performs calculations or adds additional data before storing the data in a different data-store such as a HPE Ezmeral Data Fabric Database JSON table.

- **Perform Calculations as the Data is Stored**

You may want to modify a single row in a table and then incrementally aggregate data. For example, you can use HPE Ezmeral Data Fabric Database tables to store large amounts of customer information or product catalog data and then read and write to a subset of that data. Then, modify a single row in a table to incrementally aggregate data. For example, to aggregate the number of clicks on a page, you can have a row key for each date and page. Internally, you can design the table to increment based on timestamp. The following example shows a row of data for the info page on 2017-02-22:

```

2017-01-22-info.html => key
Total : 1230 +1
H00 : 100
M1:1
M2: 5
...
M30 : 10
...
H20 : 50 +1
M1:1
...
M25: 1

```

- **Process Large Sets of Data**

There are also many methods to process files in their initial state. To process large sets of data on the HPE Ezmeral Data Fabric File Store, it is common to use Spark or MapReduce applications. MapReduce applications perform parallel, distributed processing of data in batches and are therefore a great way to process large datasets. Spark applications can be used to iteratively process large sets of data with machine learning algorithms. For an example of using a machine learning algorithm with a Spark application, see [Building a Recommendation Engine with Spark](#).

Access Data

There are many use cases for why you might want to access data and many methods to access the data. Operational applications or E-commerce services may want to access data on the HPE Ezmeral Data Fabric platform to provide customers a view of transactional data. Business users may want to view user profile data or submit queries through a BI tool to visually analyze the data.

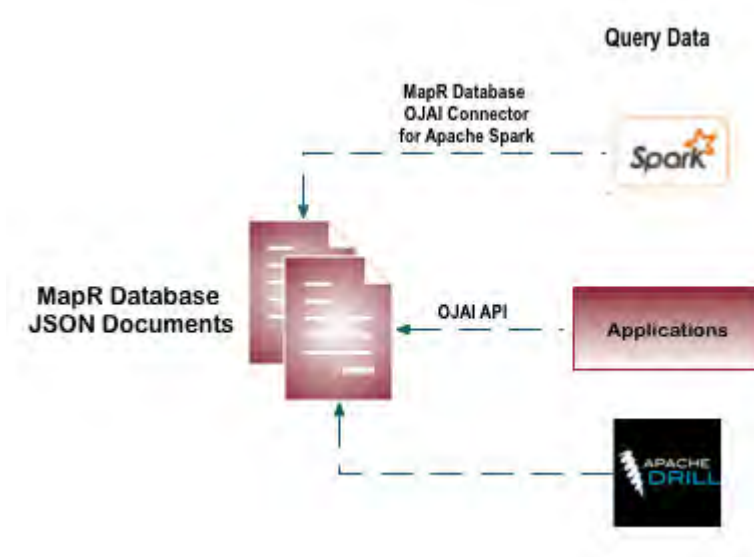

The following sections will provide some examples for how to access the data so that you can envision that will work for your use case.

- **Access Data in HPE Ezmeral Data Fabric File Store**

The most common way to access data in the HPE Ezmeral Data Fabric File Store is via a NFS mount point that is remote or local to the cluster. You can use HDFS commands as well but they are generally only used for migrating hadoop applications to the HPE Ezmeral Data Fabric platform. If you require high throughput, security, and scalability, consider installing the [MapR POSIX client](#) as this provides a more efficient way to access data in the HPE Ezmeral Data Fabric File Store. You can also query the data directly using Drill.

- **Access Data in HPE Ezmeral Data Fabric Database**

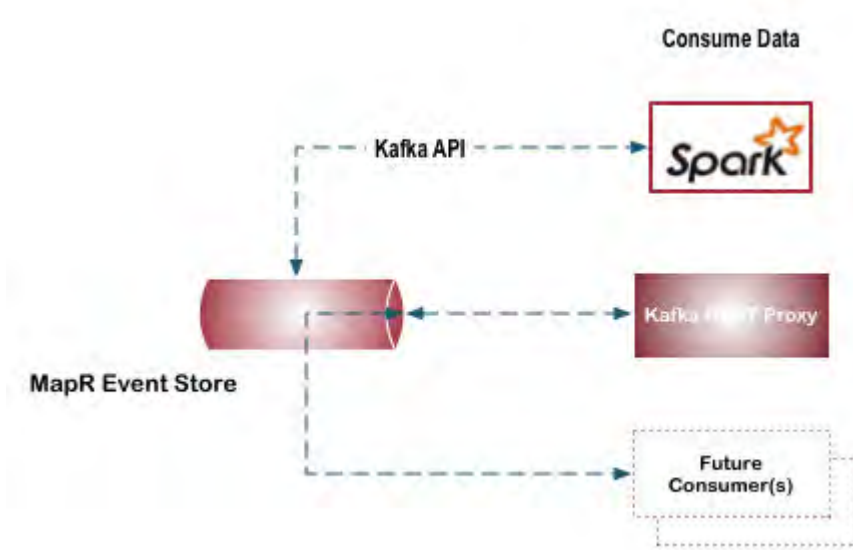

The methods that you can use to access HPE Ezmeral Data Fabric Database table data differs based on the table type. You can access HPE Ezmeral Data Fabric Database binary table data with the HBase shell and applications that use the HBase API. You can access HPE Ezmeral Data Fabric Database JSON table data with the `mapr dbshell`, and java applications that use the OJAI API. You can also use Drill or Spark to query HPE Ezmeral Data Fabric Database binary and JSON table data directly.

- **Access Data in HPE Ezmeral Data Fabric Event Streams**

Data in HPE Ezmeral Data Fabric Event Streams can be accessed by one or more stream consumers and the number of consumers can change over time depending on business needs.

Similar to the various ways you can write data to topics a stream, data in stream topics can be accessed by applications that utilize the Kafka API or a REST interface. You can also use Spark to query streams for new messages at a given interval and access any new messages that are available.

HPE Ezmeral Data Fabric Event Streams provides flexibility to add new consumers without making changes to the producer application. For example, you have a HPE Ezmeral Data Fabric Event Streams producer that writes all twitter feeds to a stream. Today, this stream is accessed by a single consumer application that provides access to twitter feeds with content related to IOT. The next week, there may be a request check for how many tweets originate from a specific account. Providing access to different data in an existing stream can be achieved by creating a new consumer which reads from the same stream.

Step 4: Set Up the Development Environment

Before you start building the application, figure out how your the application will connect to the cluster and what the library dependencies and installation requirements are.

Applications are often run on edge nodes which are nodes that are not part of the cluster. Setting up an edge node so that it can be used to develop and run applications consists of the following steps:

- Selecting a client that you will use to connect to the cluster.
- Installing additional clients required for your use case.
- Determining the application dependencies.

Note: The dependencies to build and run applications differ based on your use case and the various types of data or tools that are part of an application.

The following sub-topics include the various methods to connect to the cluster, and minimal requirements to build and run applications.

Connect to the Cluster

Application are often run on nodes that are not part of the Data Fabric cluster. There are many methods to connect to a MapR cluster; this section briefly describes each option.

Data Fabric Client

The Data Fabric client includes the libraries and utilities required on an edge node to perform the following: connect to the cluster, submit MapReduce applications, submit YARN applications, run hadoop fs commands, and run hadoop mfs commands. However, to run applications that access data from HPE Ezmeral Data Fabric Database or HPE Ezmeral Data Fabric Event Streams, you must configure additional dependencies. For more information about the Data Fabric client, see [HPE Ezmeral Data Fabric Client](#) on page 340 and [How HPE Ezmeral Data Fabric clients Connect to the cluster](#) on page 821.

Note: Although it is not recommended, you can include the filesystem JAR file in the application instead of installing the Data Fabric client. However, there are caveats and specific requirements to make this work. For information, see [Using the File System JAR to Connect to the Cluster](#) on page 2649.

Data Fabric Persistent Application Client Container (PACC)

The Data Fabric Persistent Application Client Container (PACC) is a Docker-based container image that includes a container-optimized Data Fabric client. The PACC provides seamless access to Data Fabric Converged Data Platform services, including filesystem, HPE Ezmeral Data Fabric Database, and HPE Ezmeral Data Fabric Event Streams. The PACC includes the POSIX client, the Data Fabric client, and the libraries required to build HPE Ezmeral Data Fabric Database and HPE Ezmeral Data Fabric Event Streams applications. For more information, see [About the Persistent Application Client Container \(PACC\)](#) on page 357.

Data Fabric POSIX Clients

Data Fabric POSIX clients enable app servers, web servers, and other client nodes and applications to read and write directly and securely to the filesystem. For more information about the POSIX clients, see [POSIX Clients](#) on page 454 and [MapR POSIX Clients](#) on page 353.

Data Fabric NFS Clients

You can mount the cluster itself via NFS so that your applications can read and write data directly. For more information, see [Managing the HPE Ezmeral Data Fabric NFS Service](#) on page 1295.

Using the File System JAR to Connect to the Cluster

The filesystem JAR file includes the data-fabric client libraries required to connect to the cluster. While this is strongly discouraged, application developers can bundle the filesystem JAR file in data-fabric file system, HPE Ezmeral Data Fabric Database, and HPE Ezmeral Data Fabric Event Streams applications instead of installing the data-fabric client on the edge node (node that runs the application). Applications should not bundle the filesystem JAR file unless the application meets certain requirements.

! **Important:** When bundling the filesystem JAR file, if there is a binary mismatch between the bundled JAR file and the version that the cluster expects, this can result in failures. In release 5.2.2 and later, the system detects the mismatch and prevents the application from starting. In releases earlier than 5.2.2, nodes running applications may run out of memory or shut down unexpectedly.

Requirements

You can bundle the filesystem JAR (`maprfs-<version>-mapr.jar`) with applications that meet all of the following requirements:

- The application communicates directly with the filesystem, HPE Ezmeral Data Fabric Database, or HPE Ezmeral Data Fabric Event Streams
- The application does not run as a MapReduce or YARN job/application on the cluster.
- The application does not include filesystem JARs on the local machine in its classpath.
- The application accesses a cluster that is not secure.

Configuring the Cluster Connection

When you include the filesystem JAR in an application instead of installing the data-fabric client on the edge node, you must create and configure a `mapr-clusters.conf` file on node that runs the application.

1. Set a `MAPR_HOME` environment variable to a location such as `/opt/mapr`.
2. Create the `mapr-clusters.conf` file in the `$MAPR_HOME/conf` directory.
3. Configure the `mapr-clusters.conf` file with the cluster name and the list of CLDB nodes.

For example, the `mapr-clusters.conf` on an edge node would contain the following content if it was connecting to a cluster named `my.cluster` with CLDB nodes on `centos765`, `centos234`, and `centos123`:

```
my.cluster secure=false centos765 centos234 centos123
```

For more information about how to configure `mapr-clusters.conf`, see [mapr-clusters.conf](#) on page 2485.

For more information about how the data-fabric client connects to the cluster, see [How HPE Ezmeral Data Fabric clients Connect to the cluster](#) on page 821.

Using Maven to Include filesystem JAR as a Dependency

If you use Maven to bundle the filesystem JAR file with an application and you plan to run the application on a data-fabric cluster where a patch has been applied, ensure that you specify both a system scope and a local system path to the file.

For example, to bundle the filesystem JAR file, the `pom.xml` file may include the following:

```
...
<groupId>com.mapr.hadoop</groupId>
  <artifactId>maprfs</artifactId>
  <version>${mapr.core.version}</version>
  <scope>system</scope>
  <systemPath>/opt/mapr/lib/maprfs-5.2.0-mapr.jar</systemPath>
...
```

By default, the data-fabric Maven repository includes JAR files from <https://repository.mapr.com/maven/>. This default Maven repository includes JAR files associated with the GA packages for each data-fabric release. Therefore, when a patch has been applied to the cluster, failure to specify a system scope may result in errors due to a binary mismatch between the filesystem JAR files used by the application and the cluster.

Known Issues

Nodes running applications with a bundled filesystem JAR file may run out of memory or shut down unexpectedly in the following scenarios:

The version of the filesystem JAR included in the application differs from the version that is available on the cluster.

This may occur when a patch was applied to some, but not all the nodes in the cluster. It can also occur when Maven is bundling the GA version of the JAR file when the cluster expects a newer, patched version.

Two versions of the JAR are available on the node.

For YARN applications, the NodeManager nodes that run the tasks or containers store local versions of the dependencies included with the application. In this scenario, since both the cluster's filesystem JAR and the version included in the application are available on the node, it is unknown which JAR will be used when processing the application.

HPE Ezmeral Data Fabric Database JSON Application Requirements

The following tables include the minimal node requirements for building and running HPE Ezmeral Data Fabric Database JSON table applications.

Java Applications

| Node Requirements | Method(s) to Meet Requirement |
|-------------------------------------|---|
| A connection to the MapR cluster. | Select one of the following options: <ul style="list-style-type: none"> • Install and configure the MapR client. • Install the PACC and run an application container. • Use the filesystem JAR to connect to the cluster. For more information, see Connect to the Cluster on page 2648. |
| The OJAI Query Service is installed | To use secondary indexes, you may need to enable this service. See Preparing Clusters for Querying using Secondary Indexes on JSON Tables on page 1204 for more information. |

| Node Requirements | Method(s) to Meet Requirement |
|--|--|
| HPE Ezmeral Data Fabric Database libraries are configured as a dependency. | <p>When you build an application, use the Maven Repository to determine the dependencies. The POM file should include the MapR Repository and the MapR OJAI Driver project.</p> <p>When you run the application, provide the dependencies in the application's classpath.</p> <p>For more information, see Compiling and Running Java OJAI Applications on page 2942</p> |
| Other items to consider. | <p>If an ecosystem component, such as Spark, runs or integrates with the application, you may need to include additional dependencies in the POM file.</p> <p>For example, to use the HPE Ezmeral Data Fabric Database OJAI Connector for Apache Spark, see Configuring the HPE Ezmeral Data Fabric Database OJAI Connector for Apache Spark on page 4274</p> |

HPE Ezmeral Data Fabric Database Binary Application Requirements

The following tables include the minimal node requirements for building and running HPE Ezmeral Data Fabric Database binary table applications.

Java Applications

| Node Requirement | Method(s) to Meet Requirement |
|---|--|
| A connection to the MapR cluster. | <p>Select one of the following options:</p> <ul style="list-style-type: none"> • Install and configure the MapR client. • Install the PACC and run an application container. • Use the filesystem JAR to connect to the cluster. <p>For more information, see Connect to the Cluster on page 2648.</p> |
| The HBase client is installed. | <p>Install the HBase client. The HBase client is as part of the EEP installation. For more information, see 6.2 Installation on page 66.</p> <p> Note: The HBase client is include when you install PACC.</p> |
| HBase client library files are configured as an application dependency. | <p>When you build the application, use the Maven Repository to determine the dependencies. The POM file should include the MapR Repository and the HBase client dependency.</p> <p>When you run an application, include the <code>hbase classpath</code> script and additional dependencies in the application's classpath.</p> <p>For more information, see Compiling and Running HPE Ezmeral Data Fabric Database Binary Applications on page 2760</p> |
| Other Items | <p>If an ecosystem component, such as Spark, runs or integrates with the application, you may need to include additional dependencies in the POM file.</p> |

C Applications

| Node Requirement | Method(s) to Meet Requirement |
|--|---|
| A connection to the MapR cluster. | Select one of the following options: <ul style="list-style-type: none"> • Install and configure the MapR client. • Install the PACC and run an application container. • Use the filesystem JAR to connect to the cluster. For more information, see Connect to the Cluster on page 2648. |
| The HBase Client is installed. | Install the HBase client. The HBase client is as part of the EEP installation. For more information, see 6.2 Installation on page 66.  Note: The HBase client is include when you install PACC. |
| The libMapRClient library and libjvm shared libraries are in the application's library search path and the libMapRClient header files are in this directory: /opt/mapr/include/hbase | For more information, see Building and Launching C Applications on page 2754. |

HPE Ezmeral Data Fabric Event Streams Application Requirements

The following tables include the minimal node requirements for building and running HPE Ezmeral Data Fabric Event Streams consumer and producer applications.

Java Applications

| Node Requirement | Method(s) to Meet Requirement |
|--|---|
| A connection to the MapR cluster. | Select one of the following options: <ul style="list-style-type: none"> • Install and configure the MapR client. • Install the PACC and run an application container. • Use the filesystem JAR to connect to the cluster. For more information, see Connect to the Cluster on page 2648. |
| The MapR Streams Java Client is installed. | Install the HPE Ezmeral Data Fabric Event Streams Java Client. The HPE Ezmeral Data Fabric Event Streams Java client (mapr-kafka) is available as part of the EEP installation. For more information, see 6.2 Installation on page 66.  Note: The MapR Streams Java Client is include when you install PACC. |

| Node Requirement | Method(s) to Meet Requirement |
|--|--|
| MapR Streams Java client and the MapR Streams project library files are configured as an application dependency. | <p>When you build the application, use the Maven Repository to determine the dependencies. The POM file should include the MapR Repository, the HPE Ezmeral Data Fabric Event Streams Java Client dependency, and the HPE Ezmeral Data Fabric Event Streams project dependency.</p> <p>When you run an application, include the dependencies in the application's classpath.</p> <p>For more information, see Compiling and Running HPE Ezmeral Data Fabric Event Streams Java Apps on page 3051</p> |
| Other Items | If an ecosystem component, such as Spark, runs or integrates with the application, you may need to include additional dependencies in the POM file. |

filesystem Application Requirements

The following tables include the minimal node requirements for building and running filesystem applications.

Java Applications

| Node Requirement | Method(s) to Meet Requirement |
|-----------------------------------|---|
| A connection to the MapR cluster. | <p>Select one of the following options:</p> <ul style="list-style-type: none"> • Install and configure the MapR client. • Install the PACC and run an application container. • Use the filesystem JAR to connect to the cluster. <p>For more information, see Connect to the Cluster on page 2648.</p> |

| Node Requirement | Method(s) to Meet Requirement |
|--|---|
| Include hadoop-common libraries as a dependency. | <p>When you compile the application, use the Maven Repository to determine the dependencies. The POM file should include the MapR Repository and the hadoop-common dependency:</p> <pre data-bbox="833 352 1414 919"> <repositories> <repository> <id>mapr-releases</id> <url>https://repository.mapr.com/maven/</url> <snapshots><enabled>>false</enabled></snapshots> <releases><enabled>>true</enabled></releases> </repository> </repositories> <dependencies> <dependency> <groupId>org.apache.hadoop</groupId> <artifactId>hadoop-common</artifactId> <version>\${hadoop.version}</version> </dependency> </dependencies> </pre> <p>When you run the application, include the following in the application's classpath: `hadoop classpath`</p> <p>For more information, see Compiling and Running a Java Application on page 2719.</p> |

**Note:**

When you develop a Java application, you can use a dependency management tool such as Maven to compile your application. However, it is recommended that do the following instead:

1. Compile the Java application without including dependencies
2. Specify the required classpath when you submit the application to the cluster

If you choose to bundle the JAR file, and there is a mismatch between the bundled JAR file and the version that your MapR cluster expects, this can result in failures. The failures differ depending on the version of MapR you are using. For more information, see [Using the File System JAR to Connect to the Cluster](#) on page 2649.

C Applications

| Node Requirement | Method(s) to Meet Requirement |
|-----------------------------------|--|
| A connection to the MapR cluster. | <p>Select one of the following options:</p> <ul style="list-style-type: none"> • Install and configure the MapR client. • Install the PACC and run an application container. <p>For more information, see Connect to the Cluster on page 2648.</p> |

| Node Requirement | Method(s) to Meet Requirement |
|---|---|
| <p>Include the libhdfs libraries and MapR libraries when you compile the application.</p> | <p>The MapR libraries are available in the following location: <code>/opt/mapr/lib</code></p> <p>Link to the libhdfs libraries in the following location: <code>MAPR_HOME/hadoop/hadoop-2.x/</code></p> <p>For more information, see Compiling and Running C Applications on File System Clients on page 2661</p> |

YARN Application Requirements

The following tables include the minimal node requirements for building and running YARN applications.

| Node Requirement | Method(s) to Meet Requirement |
|--|--|
| <p>A connection to the MapR cluster.</p> | <p>Select one of the following options:</p> <ul style="list-style-type: none"> • Install and configure the MapR client. • Install the PACC and run an application container. <p>For more information, see Connect to the Cluster on page 2648.</p> |
| <p>Hadoop libraries are configured as an application dependency.</p> | <p>When you compile the application, use the Maven Repository to determine the dependencies. The POM file should include the MapR Repository and the hadoop-common dependency:</p> <pre data-bbox="834 1003 1414 1539"> <repositories> <repository> <id>mapr-releases</id> <url>https:// repository.mapr.com/maven/</url> <snapshots><enabled>>false</enabled></ snapshots> <releases><enabled>>true</enabled></ releases> </repository> </repositories> <dependencies> <dependency> <groupId>org.apache.hadoop</groupId> <artifactId>hadoop-common</ artifactId> <version>\${hadoop.version}</version> </dependency> </dependencies> </pre> <p>When you run the application, include the following in the application's classpath: <code>`hadoop classpath`</code></p> <p>Note: Based on how you submit the application, the classpath locations and requirements differ. See External Applications and Classpath on page 3305 and Classpath Construction on page 3306.</p> |

| Node Requirement | Method(s) to Meet Requirement |
|------------------|--|
| Other Items | <ul style="list-style-type: none"> • If an ecosystem component, such as Spark, runs or integrates with the application, you may need to include additional dependencies in the POM file. • Any third-party library that is required by a MapReduce program must be accessible to this node and the data node that processes the job or application. For more information, see Managing Third-Party Libraries on page 3306. |

Step 5: Build the Application

Start building an application! This section lists a few of the sample applications available in HPE Ezmeral Data Fabric.

Note: When building and running your application, you may want to use a classpath for printing to standard output. The following classpaths are available:

mapr classpath

Prints CLASSPATH to standard output. This classpath could be used to build your application classpath to run HPE Ezmeral Data Fabric applications for YARN and other components.

mapr clientclasspath

Prints CLASSPATH for HPE Ezmeral Data Fabric Database clients to standard output. The clientclasspath could be used to build the classpath to run your HPE Ezmeral Data Fabric Database (binary and JSON) and HPE Ezmeral Data Fabric Event Streams applications.

HPE Ezmeral Data Fabric Database JSON

[Managing JSON Tables](#) on page 2798

This section describes how to create, list, and delete JSON tables as well as set permissions and manage column families using either the Data Fabric Java API library or the HPE Ezmeral Data Fabric Database Shell commands.

[Creating JSON Documents in Java OJAI](#) on page 2821

This section provides several Java examples of creating a document.

[Examples: Inserting JSON Documents](#) on page 2830

This section shows how to insert a document or data into a document store (HPE Ezmeral Data Fabric Database JSON table) with Java and dbshell.

[Examples: Querying JSON Documents](#) on page 2900

This section provides several examples of querying documents.

[HPE Ezmeral Data Fabric Database JSON MapReduce: Sample App](#) on page 2992

This sample Java application extends the Apache Hadoop MapReduce framework to read records (JSON documents) from a JSON table and inserts new documents into another JSON table. This API library allows you to write your own MapReduce applications to write data from one JSON table to another.

HPE Ezmeral Data Fabric Database Binary

[C API Examples](#) on page 2738

This section provides examples using the HPE Ezmeral Data Fabric Database libMapRClient C API to operate on HPE Ezmeral Data Fabric Database binary tables.

[HPE Ezmeral Data Fabric Database Sample C Application](#) on page 2742

This section provides additional sample C applications that accesses and performs operations on HPE Ezmeral Data Fabric Database binary tables.

HPE Ezmeral Data Fabric Event Streams Streams

[Sample Java Consumer](#) on page 2998

This sample Java consumer application iterates through the returned records, extracts the value of each message, and prints the value to standard output.

[Sample Java Producer](#) on page 2999

This sample Java producer application publishes messages to a stream topic.

[Developing a HPE Ezmeral Data Fabric Event Streams C Application](#) on page 3072

These sample C applications publish messages to a stream topic and consumes the messages.

[Developing HPE Ezmeral Data Fabric Event Streams Python Applications](#) on page 3274

These sample Python applications publish messages to a stream topic and consumes the messages.

filesystem

[Sample Applications](#) on page 2723

This sample Java application demonstrates how to set, get, modify, and delete ACEs on files using the Java APIs.

[hdfs_write_revised.c](#) on page 2666

This C application demonstrates how to write to files by using the `hdfsWrite()` and `hdfsPwrite()` APIs.

[hdfs_read_revised.c](#) on page 2674

This C application demonstrates how to read from files by using the `hdfsRead()` and `hdfsPread()` APIs.

[hdfs_connect_as_user.c](#) on page 2681

This C application demonstrates how to create and write to files impersonating another user by using the `hdfsConnectAsUser()` API.

Github Repo

You can find additional sample code on the [MapR Demos Github repository](#).

File Store and Apps

The following sections provide information about accessing the File Store with C and Java applications.

Copying Data from Apache Hadoop to a Data Fabric Cluster

Describes the procedure to copy data from an Apache Hadoop to a Data Fabric cluster.

You can use the `hdfs` protocol, `webhdfs` protocol, or NFS for the HPE Ezmeral Data Fabric to copy data from Apache Hadoop to a data-fabric cluster.

The following table describes these methods:

| Method | Description |
|-------------------------------|--|
| <code>hdfs://</code> protocol | You can use the <code>hadoop distcp</code> command with the <code>hdfs://</code> protocol to copy data from a HDFS cluster into a data-fabric cluster if the HDFS cluster and the data-fabric cluster use the same RPC protocol version. For all other scenarios, use the <code>webhdfs://</code> protocol or NFS for the HPE Ezmeral Data Fabric gateway to copy data to a data-fabric cluster. |

| Method | Description |
|---------------------|--|
| webhdfs:// protocol | You can use the <code>hadoop distcp</code> command with the <code>webhdfs://</code> protocol to copy data from a HDFS cluster into a data-fabric cluster. |
| NFS | You can mount a data-fabric cluster to a HDFS cluster using NFS for the HPE Ezmeral Data Fabric mount and then use the <code>hadoop distcp</code> command to copy data between the two clusters. |

Refer to the following sections for information about how to copy data from Hadoop to a data-fabric cluster:

Copy Data Using the `hdfs://` Protocol

Describes the procedure to copy data from a HDFS cluster to a HPE Ezmeral Data Fabric cluster using the `hdfs://` protocol.

Before you can copy data from an HDFS cluster to a HPE Ezmeral Data Fabric cluster using the `hdfs://` protocol, you must configure the HPE Ezmeral Data Fabric cluster to access the HDFS cluster. To do this, complete the steps listed in [Configuring a HPE Ezmeral Data Fabric Cluster to Access an HDFS Cluster](#) for the security scenario that best describes your HDFS and HPE Ezmeral Data Fabric clusters, and then complete the steps listed under [Verifying Access to an HDFS Cluster](#).

You also need the following information:

- `<NameNode>` - the IP address or hostname of the NameNode in the HDFS cluster
- `<NameNode Port>` - the port for connecting to the NameNode in the HDFS cluster
- `<HDFS path>` - the path to the HDFS directory from which you plan to copy data
- `<MapRFilesystem path>` - the path in the HPE Ezmeral Data Fabric cluster to which you plan to copy HDFS data
- `<file>` - a file in the HDFS path

To copy data from HDFS to HPE Ezmeral Data Fabric filesystem using the `hdfs://` protocol, complete the following steps:

1. Run the following Hadoop command to determine if the HPE Ezmeral Data Fabric cluster can read the contents of a file in a specified directory on the HDFS cluster:

```
hadoop fs -cat <NameNode>:<NameNode port>/<HDFS path>/<file>
```

Example

```
hadoop fs -cat hdfs://nn1:8020/user/sara/contents.xml
```

2. If the HPE Ezmeral Data Fabric cluster can read the contents of the file, run the `distcp` command to copy the data from the HDFS cluster to the HPE Ezmeral Data Fabric cluster:

```
hadoop distcp hdfs://<NameNode>:<NameNode Port>/<HDFS path> maprfs://<MapRFilesystem path>
```

Example

```
hadoop distcp hdfs://nn1:8020/user/sara maprfs:///user/sara
```

Copying Data Using the webhdfs:// Protocol

Describes how to copy data from a HDFS cluster to a HPE Ezmeral Data Fabric cluster using the `webhdfs://` protocol.

Before you can copy data from an HDFS cluster to a HPE Ezmeral Data Fabric cluster using the `webhdfs://` protocol, you must configure the HPE Ezmeral Data Fabric cluster to access the HDFS cluster. To do this, complete the steps listed in [Configuring a HPE Ezmeral Data Fabric Cluster to Access an HDFS Cluster](#) for the security scenario that best describes your HDFS and HPE Ezmeral Data Fabric clusters, and then complete the steps listed under [Verifying Access to an HDFS Cluster](#).

The HDFS cluster must have WebHDFS enabled. Verify that the following parameter exists in the `hdfs-site.xml` file and that the value is set to `true`.

```
<property>
<name>dfs.webhdfs.enabled</name>
<value>true</value>
</property>
```

You also need the following information:

- `<NameNode>` - the IP address or hostname of the NameNode in the HDFS cluster
- `<NameNode HTTP Port>` - the HTTP port on the NameNode in the HDFS cluster
- `<HDFS path>` - the path to the HDFS directory from which you plan to copy data
- `<MapR filesystem path>` - the path in the HPE Ezmeral Data Fabric cluster to which you plan to copy HDFS data

To copy data from the HDFS to the HPE Ezmeral Data Fabric filesystem using the `webhdfs://` protocol, complete the following step:

Run the following command from a node in the HPE Ezmeral Data Fabric cluster:

```
hadoop distcp webhdfs://<NameNode>:<NameNode HTTP Port>/<HDFS path>
maprfs:///<MapR filesystem path>
```

Example

```
hadoop distcp webhdfs://nn2:50070/user/sara maprfs:///user/sara
```

Note: The triple slashes in `maprfs:///...` are required.

Copying Data Using NFS for the HPE Ezmeral Data Fabric

Describes how to copy files from one data-fabric cluster to another using NFS for the HPE Ezmeral Data Fabric.

If NFS for the HPE Ezmeral Data Fabric is installed on the data-fabric cluster, you can mount the data-fabric cluster to the HDFS cluster and then copy files from one cluster to the other using `hadoop distcp`. If you do not have NFS for the HPE Ezmeral Data Fabric installed and a mount point configured, see [Accessing Data with NFS v3](#) on page 1302 and [Managing the HPE Ezmeral Data Fabric NFS Service](#) on page 1295.

To perform a copy using `distcp` via NFS for the HPE Ezmeral Data Fabric, you need the following information:

- `<MapR NFS Server>` - the IP address or hostname of the NFS server in the data-fabric cluster
- `<maprfs_nfs_mount>` - the NFS export mount point configured on the data-fabric cluster; default is `/mapr`

- `<hdfs_nfs_mount>` - the NFS for the HPE Ezmeral Data Fabric mount point configured on the HDFS cluster
- `<NameNode>` - the IP address or hostname of the NameNode in the HDFS cluster
- `<NameNode Port>` - the port on the NameNode in the HDFS cluster
- `<HDFS path>` - the path to the HDFS directory from which you plan to copy data
- `<MapR filesystem path>` - the path in the data-fabric cluster to which you plan to copy HDFS data

To copy data from HDFS to the data-fabric filesystem using NFS for the HPE Ezmeral Data Fabric, complete the following steps:

1. Mount HDFS.

Issue the following command to mount the data-fabric cluster to the HDFS NFS for the HPE Ezmeral Data Fabric mount point:

```
mount <Data Fabric NFS Server>:/<maprfs_nfs_mount> /<hdfs_nfs_mount>
```

Example

```
mount 10.10.100.175:/mapr /hdfsmount
```

2. Copy data.

- Issue the following command to copy data from the HDFS cluster to the data-fabric cluster:

```
hadoop distcp hdfs://<NameNode>:<NameNode Port>/<HDFS path> file:///
<hdfs_nfs_mount>/<MapR filesystem path>
```

Example

```
hadoop distcp hdfs://nn1:8020/user/sara/file.txt file:///hdfsmount/
user/sara
```

- Issue the following command from the data-fabric cluster to verify that the file was copied to the data-fabric cluster:

```
hadoop fs -ls /<MapR filesystem path>
```

Example

```
hadoop fs -ls /user/sara
```

Accessing the File System with C Applications

HPE Ezmeral Data Fabric provides a modified version of `libhdfs` that supports access to the data-fabric file system. You can develop applications with C that read files, write to files, change file permissions and file ownership, create and delete files and directories, rename files, and change the access and modification times of files and directories.

`libMapRClient` supports and makes modifications to hadoop-2.x version of `libhdfs`. The API reference notes which APIs are supported by hadoop-2.x.

`libMapRClient`'s version of `libhdfs` contains the following changes and additions:

- There are no calls to a JVM, so applications run faster and more efficiently.

- Changes to APIs
 - *hadoop-2.x*: Support for `hdfsBuilder` structures for connections to HDFS is limited. Some of the parameters are ignored.
 - *hadoop-2.x*: `hdfsGetDefaultBlockSize()`: If the file system that the client is connected to is an instance of `filesystem`, the returned value is 256 MB, regardless of the actual setting.
 - *hadoop-2.x*: `hdfsCreateDirectory()`: The parameters for buffer size, replication, and block size are ignored for connections to the data-fabric file system.
 - *hadoop-2.x*: `hdfsGetDefaultBlockSizeAtPath()`: If the file system that the client is connected to is an instance of `filesystem`, the returned value is 256 MB, regardless of the actual setting.
 - *hadoop-2.x*: `hdfsOpenFile()`: The parameters for buffer size and replication are ignored for connections to the data-fabric file system.
- APIs that are unique to `libMapRClient` for *hadoop-2.x*
 - `hdfsCreateDirectory2()`
 - `hdfsGetNameContainerSizeBytes()`
 - `hdfsOpenFile2()`
 - `hdfsSetRpcTimeout()`
 - `hdfsSetThreads()`

Installing and Configuring filesystem C Clients

Install the `mapr-client` package on the nodes on which you plan to build and run client applications. This package installs the `libMapRClient` library. See [Setting Up the Client](#).

Note: The package `mapr-core` contains the files that are in the `mapr-client` package. If you have installed the `mapr-core` package, you do not need to install the `mapr-client` package.

The modified versions of `libhdfs` are installed in this directory:

```
MAPR_HOME/hadoop/hadoop-2.x/
```

Compiling and Running C Applications on File System Clients

`filesystem` exposes the HDFS API; if you already have a client program built to use `libhdfs`, you do not have to relink your program just to access the MapR file system. However, re-linking to the MapR-specific shared library `libMapRClient.so` will give you better performance on MapR file system, because it does not make any Java calls to access the file system (unlike `libhdfs.so`).

The script below sets environment variables to necessary values and compiles one of the sample applications. Use this script as an example for building and launching your own applications.

When you set `HADOOP_HOME` for your own client applications, set it to the path for the version of `libhdfs` that your application uses. The path is:

```
MAPR_HOME/hadoop/hadoop-2.x/
```

Also, set the path to your application in the `gcc` command, of course.

This script assumes that `MAPR_HOME` is set to the default value of `/opt/mapr`.

```
#!/bin/bash
#Setup environment
```

```

export HADOOP_HOME=${MAPR_HOME}/hadoop/hadoop-2.7.0/
export LD_LIBRARY_PATH=${LD_LIBRARY_PATH}:${MAPR_HOME}/lib/native/
export LD_RUN_PATH=${LD_RUN_PATH}:${MAPR_HOME}/lib
GCC_OPTS="-Wl,--allow-shlib-undefined -I. -I${HADOOP_HOME}/include/"

#Compile and Link
gcc ${GCC_OPTS} ${HADOOP_HOME}src/c++/libhdfs/hdfs_read.c -o hdfs_read -L$
{MAPR_HOME}/lib -lMapRClient

#Launch the application
./hdfs_read

```

**Note:**

- The compiled `libMapRClient` is statically linked to the following third-party libraries:
 - Crypto++: `libcryptoapp.a` (v5.6.2)
 - Protobuf: `libprotobuf-lite.a` (v2.5.0)
- If a client application connects to the local fileserver, before launching the application you can set the `MAPR_CLIENT_SHMEM` environment variable to control how much of the local system's memory should be devoted to the resources and buffers used for communication between the client application and the local fileserver. By default, the size of the shared memory is 20 MB. If you want to change this value, specify it as a number of pages. For example, to set the shared memory at 128 MB, multiply 128 by 10242 bytes and then divide the product by 8192 bytes. In this case, the value would be 16384 pages.

Overview of the File System C APIs in libMapRClient

Although you can use the file system C APIs to perform other tasks, the most common use of the file system C APIs is to write to and read from files.

Review the following information for an overview of the steps required to use filesystem C APIs in `libMapRClient`:

1. Create a connection to the MapR file system running on a MapR cluster. For information about connections, see [Establishing Connections to Filesystems](#).
2. Create or open a file. You can create explicitly or by calling one of the `hdfsOpen()` APIs and specifying a file that doesn't exist. Opening a file sets the current offset to 0, the first byte in the file. You can move file offset explicitly with the `hdfsSeek()` API. Writes done by `hdfsWrite()` and reads done by `hdfsRead()` increment the offset by the number of bytes written or read.

Use `hdfsTell()` to find out what the current offset is.

For information about how to specify the location of a file to create or open, see [Specifying Paths to Files and Directories](#).

3. Write to or read from the file. When you write to a file, you pass a buffer that contains the data that you want to write. Writes can be done from the default offset, which is 0 when the file is opened, appended to the end of the file, or done from an offset that you specify. Write buffers are flushed to the server periodically. For more information about writes, see [Writing to Files](#).

When you read from a file, you pass a pointer to a buffer for storing the data that is read. Reads can be done from the default offset or from an offset that you specify. For more information about reads, see [Reading from Files](#).

4. Close the file.

Closing a file implicitly flushes any remaining write buffers to the server. It also frees resources that are associated with the file.

5. Disconnect from the file system.

For more detailed information about these steps, see:

Establishing Connections to the File System

The APIs for establishing connections to the filesystem and returning file system handles are:

- `hadoop-2.x: hdfsConnect()`
- `hadoop-2.x: hdfsConnectAsUser()`

Note: This API ignores the impersonation request and therefore is equivalent to `hdfsConnect()`.

- `hadoop-2.x: hdfsConnectNewInstance()`

The API `hdfsConnectAsNewUserInstance()` is not supported for connections to filesystem file servers.

These APIs behave in the same way:

- If “default” is specified for the `host` parameter, the APIs connect to the first cluster listed in the file `MAPR_HOME/conf/mapr-clusters.conf`. (`MAPR_HOME` defaults to `/opt/mapr`.)
- If a hostname or IP address is specified for the `host` parameter:
 1. Look in `MAPR_HOME/conf/mapr-clusters.conf` on the client node to match the specified hostname or IP address to a CLDB host and port.
 2. If they find a match, they try to connect to the cluster and all standard features for connections to MapR clusters are available. These features include high availability across CLDBs and secure connections.
 3. If they do not find a match or if they cannot locate a `mapr-clusters.conf` file, they try to connect to the CLDB host specified in the call to create the connection. However, the standard features for connections to MapR clusters are not available. For example, if the cluster is secured, the connection will fail.

It is possible to have more than one open connection at a time. For each connection, simply return the file system handle to a different instance of `hdfsFS`, as in this example:

```
//Connect to Cluster 1 (picked up from /opt/mapr/conf/
mapr-clusters.conf)
    hdfsFS fs1 = hdfsConnectNewInstance("default", 7222);
//Connect to Cluster 2
    hdfsFS fs2 = hdfsConnectNewInstance("n1c", 7222);
//Connect to Cluster 3
    hdfsFS fs3 = hdfsConnectNewInstance("n1d", 7222);
```

You can then obtain file handles for files in each connected cluster, as in this example. For each cluster, this example code calls `hdfsOpenFile()`, passing in the handle to the file system, the absolute path to a file (and the file is created before being opened, if it doesn't already exist) and a file-access flag that specifies to open the file in write-only mode. This mode truncates existing files to offset 0, deleting their content.

Ignore the last three parameters for this example. `hdfsOpenFile()` returns a handle to the file or an error message, if the open operation fails.

```
//Create files for write operations on all clusters
const char* writePath = "/tmp/write-file1.txt";
hdfsFile writeFile1 = hdfsOpenFile(fs1, writePath, O_WRONLY, 0, 0,
0);
    if (!writeFile1) {
        fprintf(stderr, "Failed to open %s for writing on Cluster 1!\n",
writePath);
        exit(-2);
    }
    hdfsFile writeFile2 = hdfsOpenFile(fs2, writePath, O_WRONLY, 0, 0,
0);
    if (!writeFile2) {
        fprintf(stderr, "Failed to open %s for writing on Cluster 2!\n",
writePath);
        exit(-2);
    }
    hdfsFile writeFile3 = hdfsOpenFile(fs3, writePath, O_WRONLY, 0, 0,
0);
    if (!writeFile3) {
        fprintf(stderr, "Failed to open %s for writing on Cluster 3!\n",
writePath);
        exit(-2);
    }
    fprintf(stderr, "Opened %s for writing successfully on all 3
clusters...\n", writePath);
```

After working with the files, close them and disconnect from the file systems, as in this example:

```
// Close all files
if (writeFile1)
    hdfsCloseFile(fs1, writeFile1);
if (writeFile2)
    hdfsCloseFile(fs2, writeFile2);
if (writeFile3)
    hdfsCloseFile(fs3, writeFile3);

// Disconnect from all clusters
hdfsDisconnect(fs1);
hdfsDisconnect(fs3);
hdfsDisconnect(fs3);
```

Specifying Paths to Files and Directories

Many of the APIs require clients to pass a path to a file or directory. You can specify absolute paths or relative paths. Absolute paths must begin with a forward slash. Relative paths are relative to the working directory, which you can set by calling `hdfsSetWorkingDirectory()` and find out by calling `hdfsGetWorkingDirectory()`. Any path that does not begin with a forward slash is considered to be relative to the working directory.

The maximum length of paths is 4096 bytes.

You cannot specify paths to a cluster other than the cluster for the current connection. All paths are local to the cluster connected to. You can, however, explicitly connect to multiple clusters, as described in [Establishing Connections to the File System](#) on page 2663.

Writing to Files

There are two APIs for writing to files: `hdfsWrite()` and `hdfsPwrite()`. With both APIs, you pass a buffer that contains the data to write. You also pass the length of the buffer in bytes. There maximum length

of the buffer is the maximum size of the datatype that is used to specify the buffer length. The datatype is a custom datatype: `tSize`, a signed 32-bit integer.

Both APIs return the number of bytes that were written. Flushes to the server happen automatically at intervals during a write operation. After a write operation is finished, either call `hdfsFlush()` explicitly or call `hdfsFlush()` implicitly by calling `hdfsCloseFile()` to be sure that any data remaining in the write buffer is flushed.

For an example of both APIs in action, see [hdfs_write_revised.c](#).

Note: The `core-site.xml` flags:

- `fs.mapr.flush.unaligned` default setting (`false`) enables flushes to the server in 8K boundaries. Unaligned flushes can happen only if idle flusher (`fs.mapr.write.idleflush.timeout`) is triggered. If this behavior is not desired, set the value for `fs.mapr.flush.unaligned` to `true`, which will enable flushing of unaligned write buffers (so that even small writes can be flushed on every subsequent write call).
- `fs.mapr.write.idleflush.timeout` automatically flushes the buffer, by default, after 3 seconds for all the open files. This can be disabled by setting the value to 0. If value is specified, buffer is flushed automatically between n to $n+1$ seconds. For example, if value is 3 seconds, the write buffer is not cached after 4 seconds.

See also: [Default core Parameters](#).

Using `hdfsWrite()`

When a file is opened in write-only mode or read-write mode, the file is truncated from offset 0, effectively deleting the content of the file. Therefore, the initial write to the file begins at offset 0. You can start subsequent writes anywhere in the file after first calling `hdfsSeek()` to move to the desired offset. After a write operation, the offset is located at the last written byte.

If the file is opened in append mode, data is appended to the end of the file only.

If a call to `hdfsSeek()` moves the offset past the end of the file before a call to `hdfsWrite()`, the result is a hole in the file between the previous end of the file and the offset at which the write begins.

You can obtain the size of a file in bytes by calling `hdfsGetPathInfo()`.

On error, pending write buffers are flushed to the server.

Using `hdfsPwrite()`

Whereas `hdfsWrite()` increments the current offset by the amount of bytes returned by the API (except in case of error), `hdfsPwrite()` does not change the value of current offset. If the current offset before the call to `hdfsPwrite()` is 0 and you specify the offset 10 for the write operation, after the write the current offset remains 0.

If a call to `hdfsPwrite()` specifies an offset that is past the end of the file, the result is a hole in the file between the previous end of the file and the offset at which the write begins.

You can obtain the size of a file in bytes by calling `hdfsGetPathInfo()`.

On error, pending write buffers are flushed to the server.

Reading from Files

There are two APIs for reading from files: `hdfsRead()` and `hdfsPread()`. With both `hdfsRead()` and `hdfsPread()`, you pass a pointer to a buffer for the runtime to read bytes into and the length of the buffer. There maximum length of the buffer is the maximum size of the datatype that is used to specify the buffer length. The datatype is a custom datatype: `tSize`, a signed 32-bit integer.

Both functions return the number of bytes that are actually read.

For an example of both APIs in action, see [hdfs_read_revised.c](#).

Using `hdfsRead()`

Whenever you open a file, the file pointer is placed at offset 0. If you want to start reading at an offset other than 0, call `hdfsSeek()` to move the file pointer forward to that offset before you call `hdfsRead()`.

When you call `hdfsSeek()`, you specify the offset as a value of type `tOffset`, which is a fixed-width, signed 64-byte integer type for storing offsets. `tOffset` is defined in `hdfs.h`.

If a file is already open and you are not sure what the current offset is, you can find out by calling `hdfsTell()`.

After `hdfsRead()` finishes a read operation, the current offset is set to the last byte read plus one.

Using `hdfsPread()`

With `hdfsPread()`, you specify the offset at which you want to start reading, so you don't first have to call `hdfsSeek()` to move to that offset.

However, the offset that you specify does not change the current offset in the file. After `hdfsPread()` finishes the read operation, the current offset is not set to the last byte read plus one. Instead, the current offset remains as it was before the read operation.

Sample Applications

The following applications demonstrate how to write to and read from files using the APIs:

`hdfs_write_revised.c`

Sample Application

This application demonstrates how to write to files by using the APIs `hdfsWrite()` and `hdfsPwrite()`: `hdfs_write_revised.c`

Before running this application:

- Ensure that you have access either to a cluster running filesystem.
- Ensure that a text-based file that you have access to exists on the cluster. Note the path to the file and the size of the file in bytes.
- The content of the file will be deleted before the first write is performed by the application.
- Decide on the length in bytes of a string to write to the file.

To build and run it, download it from this page to a MapR client or to a system with the `mapr-core` package installed. Then, modify the `run.sh` script in [Building and Running C Applications on filesystem Clients](#) to point to this sample application. Run the script and then run the application.

The application includes these header files:

- `stdio.h`
- `hdfs.h`
- `errno.h`
- `fcntl.h`

The APIs are defined in `hdfs.h`. The file `fcntl.h` defines the file-access flags.

The application performs the actions that are described in the following sections.

Takes a filename, file size, and buffer size as input

When you launch the application, provide the path and name of the file, the size of the file, and the number of bytes to write.

```
hdfs_write <filename> <filesize>
<bufferSize>
```

Sets an RPC timeout

`hdfsSetRpcTimeout()` is specific to the `libMapRClient` version of `libhdfs` and takes a value that is specified in seconds. The default is 99 seconds. If you change this value, set it either to 0 (which eliminates timeouts) or to a value greater than 30.

```
int err = hdfsSetRpcTimeout(30);
if (err) {
    fprintf(stderr, "Failed to set rpc
timeout!\n");
    exit(-1);
}
```

Connects to a filesystem, using an API that is supported in the hadoop-2.x version of libhdfs

The application tries to connect to the first filesystem cluster that is specified in the `mapr-clusters.conf` file in the `MAPR_HOME/conf` directory on the client. After connecting to the filesystem, the application returns a handle to the filesystem.

```
hdfsFS fs = hdfsConnect("default", 0);
if (!fs) {
    fprintf(stderr, "Oops! Failed to
connect to hdfs!\n");
    exit(-1);
}
```

Stores the values of the arguments

The application stores the values of the arguments in a character array and in two variables of type `tSize`. This datatype is defined in `hdfs.h` and is a fixed-width, signed 32-byte integer type for storing the size of data for read or write operations.

```
const char* rfile = argv[1];
tSize fileSize = strtoul(argv[2],
NULL, 10);
tSize bufferSize = strtoul(argv[3],
NULL, 10);
```

Opens the file that you specified

The application opens the specified file, passing the following values to the `hdfsOpenFile()` function:

- The handle to the filesystem
- The name of the file, which you supplied when you launched the application.

- A flag to indicate the mode in which to open the file. In this case, the flag is `O_WRONLY`. This flag creates the file if the file does not exist and truncates the file if the file does exist. If the file existed and you wanted to preserve the content of the file, you would specify `O_WRONLY | O_APPEND` for flag. These flags are defined in the header file `fcntl.h`.
- The default chunk size for the directory in which the file is either located or will be created. This value is specified by the 0 in the last parameter.

Although there are two other parameters in the `hdfsOpenFile()` function – the fourth and fifth, the `libMapRClient` version of `libhdfs` ignores them.

```
hdfsFile writeFile = hdfsOpenFile(fs,
rfile, O_WRONLY, 0, 0, 0);
if (!writeFile) {
    fprintf(stderr, "Failed to open %s
for writing!\n", rfile);
    exit(-2);
}
```

Creates a buffer of the size that you specified and populates the buffer

At this point that the application, creates a string to populate the buffer. This is the data that the application will write.

```
char* buffer = malloc(sizeof(char) *
bufferSize);
if(buffer == NULL) {
    fprintf(stderr, "Failed to allocate
memory!\n");
    return -2;
}
int i;
for (i=0; i<bufferSize; i++) {
    buffer[i] = 'a' + i%26;
}
```

Writes an entire file with `hdfsWrite()`

The application calls the function `writeLength()`:

```
int ret = writeLength(fs, writeFile,
buffer, bufferSize, fileSize);
if (ret < 0) {
    goto done;
}
```

This function writes the content of the buffer to the file, starting at offset 0.

```
int
writeLength(hdfsFS fs, hdfsFile
writeFile, char *buffer, tSize
bufferSize, tSize writeSize)
{
    tSize writeBytes = 0;
    tSize ret = 0;
    uint64_t totalWrite = 0;
    if (fs == NULL || writeFile == NULL
```

```

|| buffer == NULL) {
    return -1;
}
if (writeSize == 0) {
    return 0;
}
for
(writeBytes=0; writeBytes<writeSize;
writeBytes+=bufferSize) {
    ret = hdfsWrite(fs, writeFile,
(void*)buffer, bufferSize);
    if (ret > 0) {
        totalWrite += ret;
    } else {
        fprintf(stderr, "hdfsWrite
failed with error %d \n", errno);
        hdfsCloseFile(fs, writeFile);
        return -1;
    }
}
return 0;
}

```

Seeks an offset and writes from that offset with hdfsWrite()

The application next calls the function `writeAtOffse()`:

```

tSize writeBytes =
writeAtOffset(fs, writeFile, 0,
buffer, bufferSize);
if (writeBytes < 0) {
    goto done;
}

```

This function writes the content of the buffer to the file, starting at the specified offset. If the file already exists, the file is first truncated to this offset before the write operation begins. In this case, the specified offset is 0.

The difference between this function and the previous function is that, before writing, it calls `hdfsSeek()` to move to the specified offset in the file.

```

tSize
writeAtOffset(hdfsFS fs, hdfsFile
writeFile, tOffset offset,
char *buffer, tSize
bufferSize)
{
    tSize ret = 0;
    if (fs == NULL || writeFile == NULL
|| buffer == NULL) {
        return -1;
    }
    ret = hdfsSeek(fs, writeFile,
offset);
    if (!ret) {
        //hdfsWrite will return -1 if
ret != number of bytes asked to
//be written.
        ret = hdfsWrite(fs, writeFile,
buffer, bufferSize);
        if (ret < 0) {

```

```

        fprintf(stderr, "hdfsWrite
failed with error %d \n", errno);
    }
    } else {
        fprintf(stderr, "hdfsSeek failed
with error %d \n", errno);
    }
    if (ret < 0) {
        //hdfsWrite does a flush in case
of an error, explicit flush
        //is not required.
        hdfsCloseFile(fs, writeFile);
    }
    //Current offset within the file
will be positioned at (offset +
writeBytes)th byte.
    return ret;
}

```

Performs a positional write with hdfsPwrite()

The application next calls the function `positionalWrite()`:

```

writeBytes = positionalWrite(fs,
writeFile, 20, buffer, bufferSize);
if (writeBytes < 0) {
    goto done;
}

```

This function writes the content of the buffer to the file, starting at the offset that you specify.

```

tSize
positionalWrite(hdfsFS fs, hdfsFile
writeFile, tOffset offset,
                char *buffer, tSize
bufferSize)
{
    tSize writeBytes = 0;
    if (fs == NULL || writeFile == NULL
|| buffer == NULL) {
        return -1;
    }
    writeBytes = hdfsPwrite(fs,
writeFile, offset, buffer,
bufferSize);
    if (writeBytes < 0) {
        fprintf(stderr, "hdfsPwrite
failed with error %d \n", errno);
        hdfsCloseFile(fs, writeFile);
    }
    //Current offset within the file
will not be advanced if hdfsPwrite is
used
    return writeBytes;
}

```

Closes the file

```

hdfsCloseFile(fs, writeFile);

```

Frees the buffer

```
free(buffer);
```

Disconnects from the filesystem

```
hdfsDisconnect(fs);
```

hdfs_read_revised.c

Sample Application

This application demonstrates how to read from files by using the APIs `hdfsRead()` and `hdfsPread()`: `hdfs_read_revised.c`

Before running this application:

- Ensure that you have access to a cluster running filesystem.
- Ensure that a text-based file that you have access to exists on the cluster. Note the path to the file.
- Decide on the number of bytes to read from the file.

To build and run it, download it from this page and copy it to a MapR client. Then, modify the `run.sh` script in [Building and Running C Applications on filesystem Clients](#) to point to this sample application. Run the script and then run the application.

The application includes these header files:

- `stdio.h`
- `hdfs.h`
- `errno.h`
- `fcntl.h`

The APIs are defined in `hdfs.h`. The file `fcntl.h` defines the file-access flags.

The application performs the actions that are described in the following sections.

Takes a filename and buffer size as input

After compiling the application, type the following command to launch the application and pass in the path and name of the file, as well as the size of the buffer to read data into:

```
hdfs_read <filename> <buffer size>
```

Sets an RPC timeout

`hdfsSetRpcTimeout()` is specific to the `libMapRClient` version of `libhdfs` and takes a value that is specified in seconds. The default is 99 seconds. If you change this value, set it either to 0 (which eliminates timeouts) or to a value greater than 30.

```
int err = hdfsSetRpcTimeout(30);
if (err) {
    fprintf(stderr, "Failed to set rpc
timeout!\n");
    exit(-1);
}
```

Connects to a filesystem, using an API that is supported in the hadoop-2.x version of libhdfs

The application tries to connect to the first filesystem cluster that is specified in the `mapr-clusters.conf` file in the `MAPR_HOME/conf` directory on the client.

After connecting to the filesystem, the application returns a handle to the filesystem.

```
hdfsFS fs = hdfsConnect("default", 0);
if (!fs) {
    fprintf(stderr, "Oops! Failed to
connect to hdfs!\n");
    exit(-1);
}
```

Stores the values of the arguments

The application stores them in a character array and in a variable of type `tSize`. This datatype is defined in `hdfs.h` and is a fixed-width, signed 32-byte integer type for storing the size of data for read or write operations.

```
const char* rfile = argv[1];
tSize bufferSize = strtoul(argv[2],
NULL, 10);
```

Opens the file that you specified

The application opens the specified file, passing the following values to the `hdfsOpenFile()` function:

- The handle to the filesystem
- The name of the file, which you supplied when you launched the application.
- A flag to indicate the mode in which to open the file. In this case, the flag is `O_RDONLY`, which specifies read-only mode.
- The default chunk size for the directory in which the file is either located or will be created. This value is specified by the 0 in the last parameter.

Although there are two other parameters in the `hdfsOpenFile()` function – the fourth and fifth, the `libMapRClient` version of `libhdfs` ignores them.

```
hdfsFile readFile = hdfsOpenFile(fs,
rfile, O_RDONLY, 0, 0, 0);
if (!readFile) {
    fprintf(stderr, "Failed to open %s
for reading!\n", rfile);
    exit(-2);
}
```

Creates a buffer of the size that you specified

This is the buffer that the application will read data into.

```
char* buffer = malloc(sizeof(char)
* bufferSize);
if(buffer == NULL) {
    fprintf(stderr, "Failed to allocate
memory!\n");
    return -2;
}
```

Reads an entire file with hdfsRead

The application calls the function `readEntireFile()`:

```
//Read entire file from the beginning
int ret = readEntireFile(fs,
readFile, buffer, bufferSize);
if (ret < 0) {
    goto done;
}
```

This function uses a WHILE loop. In each loop iteration, the function reads an amount of data that is equal to the size of the buffer. When the amount of bytes read is less than the size of the buffer, the end of the file has been reached and the function breaks the loop. The number of bytes read is added to a total in each iteration.

```
int
readEntireFile(hdfsFS fs, hdfsFile
readFile, char *buffer, tSize
bufferSize)
{
    tSize readBytes = bufferSize;
    uint64_t totalRead = 0;
    if (fs == NULL || readFile == NULL
|| buffer == NULL) {
        return -1;
    }
    while (readBytes == bufferSize) {
        readBytes = hdfsRead(fs,
readFile, (void*)buffer, bufferSize);
        if (readBytes > 0) {
            totalRead += readBytes;
        } else {
            if (readBytes < 0) {
                fprintf(stderr, "hdfsRead
failed with error %d \n", errno);
                hdfsCloseFile(fs, readFile);
                return -1;
            }
            break;
        }
    }
    return 0;
}
```

Seeks an offset and reads from that offset with hdfsRead()

The application next calls the function `readAtOffset()`, passing in 0 as the offset from which to start reading the file.

```
//Read file at a particular offset
//In this case, we are reading from
offset 0
tSize readBytes = readAtOffset(fs,
readFile, 0, buffer, bufferSize);
if (readBytes < 0) {
    goto done;
}
```

This function calls `hdfsSeek()` to move to the specified offset in the file.

If the seek is successful, the function reads from that offset until the buffer is full. The function then returns the number of bytes that were read.

If the seek or the read is not successful (meaning `hdfsSeek()` or `hdfsRead()` returned -1), the function closes the file and returns -1.

The offset in the file is the next byte after the end of the data that was read.

```
tSize
readFromOffset(hdfsFS fs, hdfsFile
readFile, tOffset offset,
               char *buffer, tSize
bufferSize)
{
    tSize ret = 0;
    if (fs == NULL || readFile == NULL
|| buffer == NULL) {
        return -1;
    }
    ret = hdfsSeek(fs, readFile,
offset);
    if (!ret) {
        ret = hdfsRead(fs, readFile,
buffer, bufferSize);
        if (ret < 0) {
            fprintf(stderr, "hdfsRead
failed with error %d \n", errno);
        }
    } else {
        fprintf(stderr, "hdfsSeek failed
with error %d \n", errno);
    }
    if (ret < 0) {
        hdfsCloseFile(fs, readFile);
    }
    //Current offset within the file
will be positioned at (offset +
readBytes)th byte.
    return ret;
}
```

Performs a positional read with `hdfsPread()`

The application calls `positionalRead()`, passing 100 as the offset from which to start the read.

```
readBytes = positionalRead(fs,
readFile, 100, buffer, bufferSize);
if (readBytes < 0) {
    goto done;
}
```

The function reads data into the buffer, starting at offset 100, without first calling `hdfsSeek()` to move the offset to that position. The offset is not moved to 100 before the read begins. The offset stays where it is, the read begins at offset 100, and (after the read) the offset remains where it was before the read. The offset in the file is ignored by the positional read.

```
tSize
positionalRead(hdfsFS fs, hdfsFile
```

```

readFile, tOffset offset,
        char *buffer, tSize
bufferSize)
{
    tSize readBytes = 0;
    if (fs == NULL || readFile == NULL
    || buffer == NULL) {
        return -1;
    }
    readBytes = hdfsPread(fs, readFile,
offset, buffer, bufferSize);
    if (readBytes < 0) {
        fprintf(stderr, "hdfsPread failed
with error %d \n", errno);
        hdfsCloseFile(fs, readFile);
    }
    //Current offset within the file
will not be advanced if hdfsPread is
used
    return readBytes;
}

```

Closes the file

```
hdfsCloseFile(fs, readFile);
```

Frees the buffer

```
free(buffer);
```

Disconnects from the filesystem

```
hdfsDisconnect(fs);
```

hdfs_connect_as_user.c

Sample Application

This application demonstrates how to create and write to files impersonating another user by using the API `hdfsConnectAsUser()`.

Before running this application, ensure that you have access to a cluster running MapR filesystem.

To build and run it, download it from this page and copy it to a MapR client or to a system with the `mapr-core` package installed. Then, modify the `run.sh` script in [Building and Running C Applications on filesystem Clients](#) to point to this sample application. Run the script and then run the application.

The application includes these header files:

- `stdio.h`
- `hdfs.h`
- `stdlib.h`
- `string.h`

Note: The impersonation APIs are defined in `hdfs.h`.

The application performs the actions that are described in the following sections.

Takes two usernames and a hostname as input

After compiling the application, type the following command to launch the application and pass in the two usernames (to impersonate) and host name:

```
hdfs_connect_as_user <username1>
<username2> <hostname>if (argc < 4) {
    fprintf(stderr, "Provide two
usernames to impersonate and the host
name\n");
    printf("USAGE: ./
hdfs_connect_as_user mapruser1
mapruser2 10.10.xx.xxx\n");
    exit(EXIT_FAILURE);
}
```

Stores the values of the arguments

The application stores the values of the arguments in character arrays. The application uses the port, 7222, to connect to the given host, and uses character arrays for user directory and file path.

```
char *impersonate_user1 = argv[1];
char *impersonate_user2 = argv[2];
char *host_addr = argv[3];
```

Populates the directory path and file path

```
int port_num = 7222;
char user1_dir[100];
char writePath[100];
int ret_val;
```

The application creates a default path for the user directory and file.

```
sprintf(user1_dir, "/tmp/%s_dir",
impersonate_user1);
sprintf(writePath, "%s/test_file",
user1_dir);
```

Sets an RPC timeout

The `hdfsSetRpcTimeout()` is specific to the `libMapRClient` version of `libhdfs` and takes a value that is specified in seconds. The default is 99 seconds. If you change this value, set it either to 0 (which eliminates timeouts) or to a value greater than 30.

```
int err = hdfsSetRpcTimeout(30);
if (err) {
    fprintf(stderr, "Failed to set rpc
timeout!\n");
    exit(-1);
}
```

Connects to the filesystem as the impersonated user

The application connects to the filesystem as the impersonated user (<username1>) using `hdfsConnectAsUser()`. If successful, this operation returns a handle to the filesystem.

```
printf("Impersonate user: %s\n",
impersonate_user1);
printf("Connecting using
hdfsConnectAsUser() as user %s\n",
impersonate_user1);
hdfsFS fs_handle =
hdfsConnectAsUser(host_addr,
port_num, impersonate_user1);
if (fs_handle == NULL) {
    printf("hdfsConnectAsUser()
failed.\n");
    exit(EXIT_FAILURE);
}
```

Creates a directory as the impersonated user

The application creates a directory under `/tmp` as the impersonated user (<username1>).

```
printf("User1: Create a directory :
%s\n", user1_dir);
ret_val =
hdfsCreateDirectory(fs_handle,
user1_dir);
if (ret_val != EXIT_SUCCESS) {
    printf("hdfsCreateDirectory()
failed.\n");
    exit(EXIT_FAILURE);
}
```

Creates and opens a file

The application creates a file and opens the file, passing the following values to the `hdfsOpenFile()` function:

- The handle to the filesystem.
- A flag to indicate the mode in which to open the file. In this case, the flag is `O_WRONLY|O_CREAT`. This flag creates the file and opens it for writing.

For more details, see `hdfsOpenFile()` documentation.

```
printf("User1: Create and write to
the file as user1 : %s\n", writePath);
hdfsFile writeFile =
hdfsOpenFile(fs_handle, writePath,
O_WRONLY|O_CREAT, 0, 0, 0);
if(!writeFile) {
    printf("hdfsOpenFile() failed.\n");
    exit(EXIT_FAILURE);
}
```

Writes to the open file

The application writes to the open file as the impersonated user (<username1>).

```
char* buffer = "Hello, from user 1!";
tSize num_written_bytes =
hdfsWrite(fs_handle, writeFile,
(void*)buffer, strlen(buffer)+1);
if (hdfsFlush(fs_handle, writeFile)) {
    printf("failed to flush %s\n",
writePath);
    exit(EXIT_FAILURE);
}
```

Closes the file

The application closes the file after successfully writing to the file as the impersonated user (<username1>).

```
printf("User1: Close file %s.\n",
writePath);
hdfsCloseFile(fs_handle, writeFile);
```

Connects to the filesystem as the impersonating user

The application connects to the filesystem as the second user (<username2>) using `hdfsConnectAsUser()` and returns a handle to the filesystem.

```
printf("Impersonate user: %s\n",
impersonate_user2);
printf("Connecting using
hdfsConnectAsUser() as user %s\n",
impersonate_user2);
hdfsFS fs_handle2 =
hdfsConnectAsUser(host_addr,
port_num, impersonate_user2);
if (fs_handle2 == NULL) {
    printf("hdfsConnectAsUser()
failed.\n");
}
```

Tries to write to the file as the impersonating user

```
    exit(EXIT_FAILURE);
}
```

The application tries to open the file created by the impersonated user (<username1>) and write to the file as the impersonating user (<username2>). This operation fails as the impersonating user (<username2>) is denied access to the file created by the impersonated user (<username1>) and the application returns error EACCES.

```
printf("User2: Try opening file
created by user1 for writing : %s\n",
writePath);
hdfsFile writeFile2 =
hdfsOpenFile(fs_handle2, writePath,
O_WRONLY, 0, 0, 0);
int errNum = errno;
if(writeFile2) {
    printf("User2: hdfsOpenFile()
should have failed for %s.\n",
impersonate_user2);
    exit(EXIT_FAILURE);
} else {
    if (errNum == EACCES) {
        printf("User2: As expected
hdfsOpenFile() with EACCES.\n");
    } else {
        printf("User2: hdfsOpenFile()
failed with errno:%d expected %d.\n",
errNum, EACCES);
        exit(EXIT_FAILURE);
    }
}
```

Deletes a directory

The application deletes a directory as the impersonated user (<username1>) using the filesystem handle created for this user.

```
printf("Delete directory : %s\n",
user1_dir);
ret_val = hdfsDelete(fs_handle,
user1_dir, 1);
if (ret_val != EXIT_SUCCESS) {
    printf("hdfsDelete() failed.\n");
    exit(EXIT_FAILURE);
}
```

Disconnects the impersonating user

The application disconnect the impersonating user (<username2>) from the filesystem.

```
printf("Disconnect the impersonation
user2.\n");
ret_val = hdfsDisconnect(fs_handle2);
if (ret_val != EXIT_SUCCESS) {
    printf("hdfsDisconnect()
failed.\n");
    exit(EXIT_FAILURE);
}
```

Disconnects the impersonated user

The application disconnect the impersonated user (<username1>) from the filesystem.

```
printf("Disconnect the impersonation
user1.\n");
ret_val = hdfsDisconnect(fs_handle);
if (ret_val != EXIT_SUCCESS) {
    printf("hdfsDisconnect()
failed.\n");
    exit(EXIT_FAILURE);
}
```

```

Reference for the filesystem C APIs

The following sections describe the custom datatypes, structures, and APIs in the `libMapRClient` version of `libhdfs`:

Type Definitions

`libhdfs` defines the following custom data types, which are supported by `libMapRClient`:

tObjectKind

An enumeration, the values of which are 'F' for file and 'D' for directory. Used to specify whether an object is a file or directory.

tOffset

A signed 64-bit integer that is used to specify an offset within a file and the size of a file.

tPort

An unsigned 16-bit integer that is used to specify a port to use in connections to filesystems.

tSize

A signed 32-bit integer that is used to specify the size of data in bytes to read or write.

tTime

A data type of `time_t` that is used to specify a time in seconds.

Structures

`libhdfs` defines these structures, which are supported by `libMapRClient`.

hdfsBuilder

Supported by `libhdfs` for `hadoop-2.x`

This structure can be passed to `hdfsBuilderConnect()` for creating connections to filesystem clusters. In the `libMapRClient`, four of the parameters are ignored. `forceNewInstance` is ignored, though the header file does not indicate this.

```
struct hdfsBuilder {
    int forceNewInstance;
    const char *nn;
    tPort port;
    const char *kerbTicketCachePath; // Ignored
    const char *userName;           // Ignored
    struct hdfsBuilderConfOpt *opts; // Ignored
};
```

Parameters

`nn`

Specifies the CLDB node to connect to when `hdfsBuilderConnect()` is called. This value is set by `hdfsBuilderSetNameNode()`.

- If `default` is specified for the `host` parameter, `hdfsBuilderConnect()` will connect to the first cluster listed in the file `MAPR_HOME/conf/mapr-clusters.conf`. (`MAPR_HOME` defaults to `/opt/mapr`.)
- If a hostname or IP address is specified for the `host` parameter, `hdfsBuilderConnect()`, look in `MAPR_HOME/conf/mapr-clusters.conf` on the client node to match the specified hostname or IP address to a CLDB host and port.
 - If they find a match, they try to connect to the cluster and all standard features for connections to MapR clusters are available. These features include high availability across CLDBs and secure connections.
 - If they do not find a match or if they cannot locate a `mapr-clusters.conf` file, they try to connect to the CLDB host specified in the call to create the connection. However, the standard features for connections to MapR clusters are not available. For example, if the cluster is secured, the connection will fail.

`port`

Specifies the port to connect to on the CLDB node. This value is set by `hdfsBuilderSetNameNodePort()`.

hdfsFileInfo

Supported by `libhdfs` for `hadoop-2.x`

This structure is returned by `hdfsGetPathInfo()` and deleted by `hdfsFreeFileInfo()`. It contains information about the file or directory that is specified in the call to `hdfsGetPathInfo()`.

`ParameterstObjectKind mKind`

Specifies whether the object is a file or directory.

```
char *mName
```

Specifies the name of the object.

```
tTime mLastMod
```

Specifies the epoch time in milliseconds of the last modification to the object.

```
tOffset mSize
```

Specifies the size of the object in bytes.

```
short mReplication
```

Specifies the count of replicas of the object.

```
tOffset mBlockSize
```

Specifies the block size for the object.

```
char *mOwner
```

Specifies the owner of the object.

```
char *mGroup
```

Specifies the group that is associated with the object.

```
short mPermissions
```

Specifies the permissions on the object.

```
tTime mLastAccess
```

Specifies the epoch time in milliseconds at which the object was created.

APIs

The following sections provide information about the hdfs APIs:

hdfsAvailable()

Supported by libMapRClient for hadoop-2.x

Returns the number of bytes that can be read from an input stream without blocking. This number is simply the size of the file in bytes.

Signature

```
int hdfsAvailable(hdfsFS fs, hdfsFile file)
```

Parameters

| Parameter | Description |
|-----------|---|
| fs | The handle of the filesystem where the file is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs. |
| file | The file handle. Obtain this handle with one of the <code>hdfsOpenFile()</code> APIs. |

Return Value

Returns the size of the file in bytes, -1 on error.

Check `errno` for error codes and meanings.

errno is set to EINVAL if the arguments provided are invalid.

hdfsBuilderConnect()

Supported by libMapRClient for hadoop-2.x

Connects to a MapR filesystem using the parameters that are specified in an `hdfsBuilder` structure.

Signature

```
hdfsFS hdfsBuilderConnect(struct hdfsBuilder *bld)
```

Parameters

| Parameter | Description |
|-----------|---|
| bld | The builder to use for the connection. This value cannot be NULL. |

Return Value

Returns the handle to the filesystem or NULL on error.

hdfsBuilderSetForceNewInstance()

Not supported for filesystem

This API is ignored.

hdfsBuilderSetKerbTicketCachePath()

Not supported for filesystem

This API is ignored.

hdfsBuilderSetNameNode()

Supported by libMapRClient for hadoop-2.x

Specifies a CLDB node for an `hdfsBuilder` structure.

Signature

```
void hdfsBuilderSetNameNode(struct hdfsBuilder *bld, const char *nn)
```

Parameters

| Parameter | Description |
|-----------|---|
| bld | An <code>hdfsBuilder</code> structure. This value cannot be NULL. |
| nn | The hostname or IP address of a name node. Use NULL to connect to the local filesystem. Use default to connect to the first filesystem cluster that is listed in the <code>MAPR_HOME/conf/mapr-clusters.conf</code> file on the client. |

hdfsBuilderSetNameNodePort()

Supported by libMapRClient for hadoop-2.x

Sets the port in an `hdfsBuilder` structure.

Signature

```
void hdfsBuilderSetNameNodePort(struct hdfsBuilder *bld, tPort port)
```

Parameters

| Parameter | Description |
|-----------|---|
| bld | An <code>hdfsBuilder</code> structure. This value cannot be NULL. |
| port | The port to use for connections. If the CLDB node is set to NULL or default, use 0. |

hdfsBuilderSetUserName()

Not supported for filesystem

This API is ignored.

hdfsChmod()

Supported by libMapRClient for hadoop-2.x

Changes permissions on a file or directory in the manner of the `chmod` command.

Signature

```
int hdfsChmod(hdfsFS fs, const char* path, short mode)
```

Parameters

| Parameter | Description |
|-----------|---|
| fs | The handle to the filesystem. Obtain this handle with one of the <code>hdfsConnect()</code> APIs. |
| path | The path to the file or directory. |
| mode | The bitmask for the new permissions. |

Return Value

Returns 0 on success, -1 on error.

Check `errno` for error codes and meanings.

`errno` is set to `EINVAL` if the input arguments are invalid.

`errno` is set to `EPERM` if the process does not have enough privileges to perform the operation.

hdfsChown()

Supported by libMaprClient for hadoop-2.x

Changes ownership of a file or directory in the manner of the `chown` command.

**Attention:**

- To permit a client to resolve user or group from a server, set the `fs.mapr.server.resolve.user` parameter to `true` in `core-site.xml`, for both secure and non secure clusters. Setting this is essential when the client does not belong to the same domain as the mapr cluster nodes, and does not have any knowledge of users present in that domain.
- To permit CLDB to resolve user or group, set the `cldb.security.resolve.user` configuration parameter to `1` on a non-secure cluster as follows:

```
maprcli config save -values {"cldb.security.resolve.user":1}
```

You do not have to set this parameter for a secure cluster, as it is already set to 1.

Signature

```
int hdfsChown(hdfsFS fs, const char* path, const char *owner, const char *group)
```

Parameters

| Parameter | Description |
|-----------|---|
| fs | The handle to the filesystem. Obtain this handle with one of the <code>hdfsConnect()</code> APIs. |
| path | The path to the file or directory |
| owner | The user to own the file or directory. Set to NULL to keep the owner as is. |
| group | The group to own the file or directory. Set to NULL to keep the owner as is. |

Return Value

Returns 0 on success, -1 on error.

Check `errno` for error codes and meanings.

`errno` is set to `EINVAL` if the input arguments are invalid.

`errno` is set to `EPERM` if the process does not have enough privileges to perform the operation.

hdfsCloseFile()

Supported by `libMapRClient` for `hadoop-2.x`

Closes an open file. Flushes all pending write buffers for the file and releases resources that are associated with the file.

Signature

```
int hdfsCloseFile(hdfsFS fs, hdfsFile file)
```

Parameters

| Parameter | Description |
|-----------|---|
| fs | The handle of the filesystem where the file is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs. |
| file | The file handle. Obtain this handle with one of the <code>hdfsOpenFile()</code> APIs. |

Return Value

Returns 0 on success, -1 on error.

Check `errno` for error codes and meanings.

hdfsConnect()

Supported by `libMapRClient` for `hadoop-2.x`

Connects to a filesystem cluster.

If a connection to the cluster in which the remote host is located already exists, the functions return a handle to this existing connection.

If a connection to the cluster does not already exist, the functions return a handle to a new connection instance.

Note that if `default` is used for the `host` parameter, this means connect to the first cluster listed in the `MAPR_HOME/conf/mapr-clusters.conf` file on the client.

For more information about connections, see [Establishing Connections to filesystem](#).

Signature

```
hdfsFS hdfsConnect(const char* host, tPort port)
```

Parameters

| Parameter | Description |
|-----------|---|
| host | A string containing either a hostname or an IP address of a CLDB node of a filesystem cluster. To connect to the first filesystem cluster that is specified in <code>MAPR_HOME/conf/mapr-clusters.conf</code> on the client, pass the value <code>default</code> and use the port number 0. This parameter does not accept NULL as a value. |
| port | The port on which the host is listening. |

Return Value

Returns a handle to the connected filesystem, or NULL on error.

Check `errno` for error codes and meanings.

hdfsConnectAsUser()

Supported by `libMapRClient` for `hadoop-2.x`

Connects to a filesystem cluster as specified user.

If a connection to the cluster in which the remote host is located already exists, the functions return a handle to this existing connection.

If a connection to the cluster does not already exist, the functions return a unique handle to a connection instance for each user.

Note: If `default` is used for the `host` parameter, this means connect to the first cluster listed in the `MAPR_HOME/conf/mapr-clusters.conf` file on the client.

For more information about connections, see [Establishing Connections to filesystem](#).

Signature

```
hdfsFS hdfsConnectAsUser(const char* host, tPort port, const char* user)
```

Parameters

| Parameter | Description |
|-------------------|---|
| <code>host</code> | A string containing either a hostname or an IP address of a CLDB node of a filesystem cluster. To connect to the first filesystem cluster that is specified in <code>MAPR_HOME/conf/mapr-clusters.conf</code> on the client, pass the value <code>default</code> and use the port number 0. This parameter does not accept NULL as a value. |
| <code>port</code> | The port on which the host is listening. |
| <code>user</code> | The user connected to the cluster. |

Return Value

Returns a handle to the connected filesystem, or NULL on error.

hdfsConnectAsUid()

Connects to a filesystem cluster as specified user ID.

Supported by libMapRClient for hadoop-2.x

If a connection to the cluster in which the remote host is located already exists, the function returns a handle to this existing connection.

If a connection to the cluster does not already exist, the function returns a unique handle to a connection instance for the specified user ID.

Note: To connect to the first cluster listed in the `MAPR_HOME/conf/mapr-clusters.conf` file on the client, use `default` as the value for the `host` parameter.

For more information about connections, see [Establishing Connections to the File System](#) on page 2663.

Signature

```
hdfsFS hdfsConnectAsUid(const char* host, tPort port, uid_t uid)
```

Parameters

| Parameter | Description |
|-----------|--|
| host | A string containing either a hostname or an IP address of a CLDB node of a filesystem cluster. To connect to the first filesystem cluster that is specified in <code>MAPR_HOME/conf/mapr-clusters.conf</code> on the client, pass the value default and use the port number 0. This parameter does not accept NULL as a value. |
| port | The port on which the host is listening. |
| user ID | The ID of the user connected to the cluster. |

Return Value

Returns a handle to the connected filesystem, or NULL on error.

hdfsConnectAsUserNewInstance()

Supported by libMapRClient for hadoop-2.x

Connects to a filesystem cluster as specified user.

The function returns a handle to a new connection instance.

Note: If default is used for the host parameter, this means connect to the first cluster listed in the `MAPR_HOME/conf/mapr-clusters.conf` file on the client.

For more information about connections, see [Establishing Connections to filesystem](#).

Signature

```
hdfsFS hdfsConnectAsUserNewInstance(const char* host, tPort port, const char* user)
```

Parameters

| Parameter | Description |
|-----------|--|
| host | A string containing either a hostname or an IP address of a CLDB node of a filesystem cluster. To connect to the first filesystem cluster that is specified in <code>MAPR_HOME/conf/mapr-clusters.conf</code> on the client, pass the value default and use the port number 0. This parameter does not accept NULL as a value. |
| port | The port on which the host is listening. |

Return Value

Returns a handle to the connected filesystem, or NULL on error.

hdfsConnectNewInstance()

Supported by libMapRClient for hadoop-2.x

Connects to a filesystem cluster.

The function returns a handle to a new connection instance.

Note: If `default` is used for the host parameter, this means connect to the first cluster listed in the `MAPR_HOME/conf/mapr-clusters.conf` file on the client.

For more information about connections, see [Establishing Connections to filesystem](#).

Signature

```
hdfsFS hdfsConnectNewInstance(const char* host, tPort port)
```

Parameters

| Parameter | Description |
|-----------|---|
| host | A string containing either a hostname or an IP address of a CLDB node of a filesystem cluster. To connect to the first filesystem cluster that is specified in <code>MAPR_HOME/conf/mapr-clusters.conf</code> on the client, pass the value <code>default</code> and use the port number 0. This parameter does not accept NULL as a value. |
| port | The port on which the host is listening. |
| user | The user connected to the cluster. |

Return Value

Returns a handle to the connected filesystem, or NULL on error.

hdfsCopy()

This API is not supported.

hdfsCreateDirectory()

Supported by libMapRClient for hadoop-2.x

Creates a file or directory at the specified path. Intermediate directories in the path that do not exist are created.

Signature

```
int hdfsCreateDirectory(hdfsFS fs, const char* path)
```

Parameters

| Parameter | Description |
|-----------|--|
| fs | The handle of the filesystem in which to create the file or directory. Obtain this handle with one of the <code>hdfsConnect()</code> APIs. |
| path | The path of the directory. |

Return Value

Returns 0 on success, -1 on error.

Check `errno` for error codes and meanings.

errno is set to EINVAL if the input arguments are not valid, EEXIST if the directory already exists, or EACCES if the parent directory does not allow the user write permission.

hdfsCreateDirectory2()

Supported by libMapRClient for hadoop-2.x

Makes the given file and all non-existent parents into directories. Stores the size of the name container in a location that you pass a pointer into, so that you can keep track of this size. The size is in bytes.

Keeping track of the size of the name container is useful when you are creating files that are less than or equal to 64 KB. When the size of all of the such files together for one name container exceeds 64 GB, operations on the name container can become inefficient. If the size of a name container reaches 64 GB, you can switch to a new or different volume.

Signature

```
int hdfsCreateDirectory2(hdfsFS fs, const char* path, tSize
*nameSizeInBytes)
```

Parameters

| Parameter | Description |
|-----------------|--|
| fs | The handle of the filesystem in which to create the file or directory. Obtain this handle with one of the <code>hdfsConnect()</code> APIs. |
| path | The path of the directory. |
| nameSizeInBytes | A pointer to a memory buffer that can store the size in bytes of the name container. |

Return Value

Returns 0 on success, -1 on error.

Check errno for error codes and meanings.

hdfsDelete()

Supported by libMapRClient for hadoop-2.x

Deletes the specified directory or file.

Signature

```
int hdfsDelete(hdfsFS fs, const char* path, int recursive)
```

Parameters

| Parameter | Description |
|-----------|--|
| fs | The handle of the filesystem where the file or directory to delete is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs. |
| path | The path of the file. |

| Parameter | Description |
|-----------|---|
| recursive | <p>A value of 0 deletes the specified directory, if the directory is empty. If the directory is not empty, an error is returned.</p> <p>A non-zero value deletes the specified directory and all of its subdirectories.</p> <p>If the specified object is a file, not a directory, this parameter is ignored.</p> |

Return Value

Returns 0 on success, -1 on error.

Check errno for error codes and meanings. Some of the key errors are ESTALE, EACCES, and EPERM.

hdfsDisconnect()

Supported by libMapRClient for hadoop-2.x

Disconnects from the specified filesystem.

Even if there is an error, the resources that are associated with the filesystem handle are freed.

Signature

```
int hdfsDisconnect(hdfsFS fs)
```

Parameter

| Parameter | Description |
|-----------|--|
| fs | The handle of the filesystem to disconnect from. Obtain this handle with one of the <code>hdfsConnect()</code> APIs. |

Return Value

Returns 0 on success, -1 on error.

Check errno for error codes and meanings.

hdfsExists()

Supported by libMapRClient for hadoop-2.x

Checks whether a given directory or file exists on the filesystem.

Signature

```
int hdfsExists(hdfsFS fs, const char* path)
```

Parameters

| Parameter | Description |
|-----------|--|
| fs | The filesystem handle. Obtain this handle with one of the <code>hdfsConnect()</code> APIs. |
| path | The directory or file to check the existence of. |

Return Value

Returns 0 if the directory or file exists, -1 on error.

Check errno for error codes and meanings.

hdfsExists2()

Supported by libMapRClient for hadoop-2.x

Checks the filesystem directly (avoiding a client cache) to determine whether a given file or directory exists.

Signature

```
int hdfsExists2(hdfsFS fs, const char* path)
```

Parameters

| Parameter | Description |
|-----------|--|
| fs | The filesystem handle. Obtain this handle with one of the <code>hdfsConnect()</code> APIs. |
| path | The directory or file to check the existence of. |

Return Value

Returns 0 if the directory or file exists, -1 on error.

Check errno for error codes and meanings.

hdfsFileFreeReadStatistics()

This API is not supported.

hdfsFileGetReadStatistics()

This API is not supported.

hdfsFileIsOpenForRead()

This API is not supported.

hdfsFileIsOpenForWrite()

This API is not supported.

hdfsFlush()

Supported by libMapRClient for hadoop-2.x

Flushes the write buffer for the specified file to the server

Signature

```
int hdfsFlush(hdfsFS fs, hdfsFile file)
```

Parameters

| Parameter | Description |
|-----------|--|
| fs | The filesystem handle. Obtain this handle with one of the <code>hdfsConnect()</code> APIs. |

| Parameter | Description |
|-----------|---|
| file | The file handle. Obtain this handle with one of the <code>hdfsOpenFile()</code> APIs. |

Return Value

Returns 0 on success, -1 on error.

Check `errno` for error codes and meanings.

`errno` is set to `EINVAL` if the input arguments are invalid.

hdfsFreeBuilder()

Supported by *libMapRClient* for *hadoop-2.x*

Frees the memory that was used by an `hdfsBuilder` structure and its parameter values.

Signature

```
void hdfsFreeBuilder(struct hdfsBuilder *bld)
```

Parameters

| Parameter | Description |
|-----------|--|
| bld | An <code>hdfsBuilder</code> structure. The value cannot be <code>NULL</code> . |

hdfsFreeFileInfo()

Supported by *libMapRClient* for *hadoop-2.x*

Frees up the array of `hdfsFileInfo` structures that is returned by `hdfsListDirectory()`, including allocated fields.

Signature

```
void hdfsFreeFileInfo(hdfsFileInfo *hdfsInfo, int numEntries)
```

Parameters

| Parameter | Description |
|------------|--|
| hdfsInfo | The array of dynamically-allocated <code>hdfsFileInfo</code> structures. |
| numEntries | The size of the array. |

hdfsFreeHosts()

Supported by *libMapRClient* for *hadoop-2.x*

Frees an array that was returned by `hdfsGetHosts()`.

Signature

```
void hdfsFreeHosts(char ***blockHosts)
```

Parameters

| Parameter | Description |
|------------|--|
| blockHosts | The two-dimensional array that was returned by <code>hdfsGetHosts()</code> . |

hdfsGetCapacity()

Supported by libMapRClient for hadoop-2.x

Returns the capacity in bytes of the connected filesystem.

Signature

```
tOffset hdfsGetCapacity(hdfsFS fs)
```

Parameters

| Parameter | Description |
|-----------|--|
| fs | The filesystem handle. Obtain this handle by calling one of the <code>hdfsConnect()</code> APIs. |

Return Value

Returns the capacity in bytes of the connected filesystem, -1 on error.

Check `errno` for error codes and meanings.

`errno` can be set to `EINVAL` in case of error.

hdfsGetDefaultBlockSize()

Supported by libMapRClient for hadoop-2.x

Gets the default size of blocks for the connected filesystem.

Signature

```
tOffset hdfsGetDefaultBlockSize(hdfsFS fs)
```

Parameters

| Parameter | Description |
|-----------|---|
| fs | The handle of filesystem. Obtain this handle with one of the <code>hdfsConnect()</code> APIs. |

Return Value

Returns 256 MB.

Returns -1 on error.

Check `errno` for error codes and meanings.

hdfsGetDefaultBlockSizeAtPath()

Supported by libMapRClient for hadoop-2.x

Gets the block size of a file at the specified path.

Signature

```
tOffset hdfsGetDefaultBlockSizeAtPath(hdfsFS fs, const char *path)
```

Parameters

| Parameter | Description |
|-----------|---|
| fs | The handle of the filesystem. Obtain this handle with one of the <code>hdfsConnect()</code> APIs. |
| path | The location and name of the file. |

Return Value

Returns 256 MB.

Check `errno` for error codes and meanings.

hdfsGetHosts()

Supported by libMapRClient for hadoop-2.x

Gets hostnames where a particular block, as determined by the offset and block size, is stored. Due to replication, a single block could be present on multiple hosts.

This function can be useful for understanding the performance implications of file access, and to validate or verify changes to the replication factor.

Signature

```
char*** hdfsGetHosts(hdfsFS fs, const char* path, tOffset start, tOffset length)
```

Parameters

| Parameter | Description |
|-----------|---|
| fs | The handle of the filesystem where the file is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs. |
| path | The path of the file. |
| start | The start of the block. |
| length | The length of the block. |

Return Value

If successful, returns a dynamically-allocated two-dimensional array of hostnames. The last element in the array is NULL.

Returns NULL on error.

Check `errno` for error codes and meanings.

hdfsGetNameContainerSizeBytes()

Unique to libMapRClient

Get the size of the container hosting the path.

Keeping track of the size of the name container is useful when you are creating files that are less than or equal to 64 KB. When the size of all of the such files together for one name container exceeds 64 GB, operations on the name container can become inefficient. If the size of a name container reaches 64 GB, you can switch to a new or different volume.

Signature

```
int tSize hdfsGetNameContainerSizeBytes(hdfsFS fs, const char *path)
```

Parameters

| Parameter | Description |
|-----------|--|
| path | Path of the file or directory residing on the container. |

Return Value

Returns size of the container on success; -1 on error.

Check errno for error codes and meanings.

errno is set to EINVAL if the input arguments are invalid.

hdfsGetPathInfo()

Supported by libMapRClient for hadoop-2.x

Returns a dynamically-allocated `hdfsFileInfo` structure that contains information about the given path.

Call `hdfsFreeFileInfo()` when the structure is no longer needed.

See `hdfsFileInfo()` for information about the information that this object contains.

Signature

```
hdfsFileInfo * hdfsGetPathInfo(hdfsFS fs, const char* path)
```

Parameters

| Parameter | Description |
|-----------|---|
| fs | The filesystem handle. Obtain this by calling one of the <code>hdfsConnect()</code> APIs. |
| path | The path of the file. |

Return Value

Returns a dynamically-allocated `hdfsFileInfo` structure on success, and NULL on error.

errno is set to EINVAL for invalid arguments and to EACCES for invalid access.

hdfsGetUsed()

Supported by libMapRClient for hadoop-2.x

Returns the total number of bytes bytes that are being used by all of the files in the filesystem.

Signature

```
tOffset hdfsGetUsed(hdfsFS fs)
```

Parameters

| Parameter | Description |
|-----------|------------------------|
| fs | The filesystem handle. |

Return Value

Returns the total size in bytes or -1 on error.

Check errno for error codes and meanings.

hdfsGetWorkingDirectory()

Supported by libMapRClient for hadoop-2.x

Gets the current working directory for the filesystem. Before calling this method, the application must have called `hdfsSetWorkingDirectory()`.

Signature

```
char* hdfsGetWorkingDirectory(hdfsFS fs, char *buffer, size_t bufferSize)
```

Parameters

| Parameter | Description |
|------------|--|
| fs | The filesystem handle. |
| buffer | The buffer in which to copy path of current working directory. |
| bufferSize | The length of user-buffer. |

Return Value

Returns the buffer on success, NULL on error.

errno is set to EINVAL for invalid arguments.

hdfsGetXattr()

Supported by libMapRClient for hadoop-2.x

Gets extended attribute values from a file.

Signature

```
int hdfsGetXattr(hdfsFS fs, const char* path, const char *name, char *value, size_t size);
```

Parameters

| Parameter | Description |
|-----------|---|
| fs | The handle of the filesystem where the file is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs. |
| name | The name of the extended attribute. |
| path | The path to the file. |
| size | The size of the buffer. |

| Parameter | Description |
|-----------|--|
| value | The value for the extended attribute that is read from the system and written to the buffer. |

Return Value

Returns:

- Current size of the value of the extended attribute on success
- -1 on error

Check `errno` for error codes and meanings.

hdfsListDirectory()

Supported by libMapRClient for hadoop-2.x

Gets list of files and directories for a given path. Returns the information in a dynamically allocated array of `hdfsFileInfo` structures.

`hdfsFreeFileInfo()` should be called to deallocate memory when this structure is no longer needed.

This method is the equivalent of the `ls -l` command.

Signature

```
hdfsFileInfo *hdfsListDirectory(hdfsFS fs, const char* path, int
*numEntries)
```

Parameters

| Parameter | Description |
|------------|---|
| fs | The handle of the filesystem. Obtain this handle with one of the <code>hdfsConnect()</code> APIs. |
| path | The path of the directory. |
| numEntries | Set to the number of files/directories in path. Cannot be 0 or NULL. |

Return Value

Returns a dynamically-allocated array of `hdfsFileInfo` structures on success and NULL on error.

Check `errno` for error codes and meanings.

hdfsMove()

This API is not supported.

hdfsNewBuilder()

Supported by libMapRClient for hadoop-2.x

Returns an `hdfsBuilder` structure. You can set values for its parameters and then pass it to `hdfsBuilderConnect()`.

Signature

```
struct hdfsBuilder *hdfsNewBuilder(void)
```

Return Value

Returns a new `hdfsBuilder` structure.

Returns `ENOMEM` if unable to allocate memory for a new `hdfsBuilder` structure.

hdfsOpenFile()

Supported by libMapRClient for hadoop-2.x

Opens a file in the specified mode. Creates the file and intermediate directories if they do not exist.

Requires a valid filesystem handle, which one of the `hdfsConnect()` APIs can provide.

Before the call to `hdfsOpenFile()`, `hdfsExists()` can check that the file exists, if a check is needed.

After finishing work on a file, call `hdfsCloseFile()` to free the memory that is associated with the file.

Signature

```
hdfsFile hdfsOpenFile(hdfsFS fs, const char* path, int flags, int
bufferSize, short replication, tSize blockSize)
```

Parameters

| Parameter | Description |
|-----------|---|
| fs | The handle of the filesystem where the file is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs. |
| path | The full path to the file. |

| Parameter | Description |
|-------------|---|
| flags | <p>One of the following values. These flags are included in the <code>fcntl.h</code> header file.</p> <p>O_RDONLY Opens the file in read-only mode with the current offset at 0.</p> <p>O_RDWR Opens the file in read-write mode. If the file already exists, it is truncated to offset 0, effectively deleting the content of the file to offset 0.</p> <p>O_RDWR O_APPEND Opens the file in read-write mode with the current offset at 0. Writing to the file with <code>hdfsWrite()</code> appends the written data to the end of the file. Data written with <code>hdfsPwrite()</code> is not appended, but written starting at the offset specified in the call to that API.</p> <p>O_WRONLY Opens the file in write-only mode. If the file already exists, it is truncated to offset 0, effectively deleting the content of the file.</p> <p>O_WRONLY O_APPEND Opens the file in write-only mode with the current offset at 0. Writing to the file with <code>hdfsWrite()</code> appends the written data to the end of the file. Data written with <code>hdfsPwrite()</code> is not appended, but written starting at the offset specified in the call to that API.</p> |
| bufferSize | <i>Ignored for files on MapR filesystem</i> |
| replication | <i>Ignored for files on MapR filesystem</i> |
| blocksize | The size of chunks for the file in bytes. Specify 0 if you want to use the value that is specified for the <code>fs.mapr.block.size</code> parameter in the <code>/opt/mapr/hadoop/hadoop-2.x/etc/hadoop/core-site.xml</code> file on the client (if the client is using the <code>libMapRClient</code> version of <code>hadoop-2.x</code>). If this parameter is not set in <code>core-site.xml</code> , the default value is taken from the directory's <code>.dfs_attributes</code> file. |

Return Value

Returns the handle to the open file or NULL on error.

Check `errno` for error codes and meanings.

hdfsOpenFile2()

Supported by *libMapRClient* for *hadoop-2.x*

Opens a file in a given mode. Creates the file if the file does not exist.

If `hdfsOpenFile2()` creates a file, it stores the size of the name container in a location that you pass a pointer into, so that you can keep track of this size. The size is in bytes.

Keeping track of the size of the name container is useful when you are creating files that are less than or equal to 64 KB. When the size of all of the such files together for one name container exceeds 64 GB, operations on the name container can become inefficient. If the size of a name container reaches 64 GB, you can switch to a new or different volume.

Before the call to `hdfsOpenFile2()`, `hdfsExists()` can check that the file exists, if a check is needed.

After finishing work on a file, call `hdfsCloseFile()` to free the resources that are associated with the file.

Signature

```
hdfsFile hdfsOpenFile2(hdfsFS fs, const char* path, int flags, int
bufferSize, short replication, tSize blockSize, tSize *nameSizeInBytes)
```

Parameters

| Parameter | Description |
|-----------|---|
| fs | The handle of the filesystem where the file is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs. |
| path | The full path to the file. |

| Parameter | Description |
|-----------------|---|
| flags | <p>One of the following values. These flags are included in the <code>fcntl.h</code> header file.</p> <p>O_RDONLY Opens the file in read-only mode with the current offset at 0.</p> <p>O_RDWR Opens the file in read-write mode. If the file already exists, it is truncated to offset 0, effectively deleting the content of the file.</p> <p>O_RDWR O_APPEND Opens the file in read-write mode with the current offset at 0. Writing to the file with <code>hdfsWrite()</code> appends the written data to the end of the file. Data written with <code>hdfsPwrite()</code> is not appended, but written starting at the offset specified in the call to that API.</p> <p>O_WRONLY Opens the file in write-only mode. If the file already exists, it is truncated to offset 0, effectively deleting the content of the file.</p> <p>O_WRONLY O_APPEND Opens the file in write-only mode with the current offset at 0. Writing to the file with <code>hdfsWrite()</code> appends the written data to the end of the file. Data written with <code>hdfsPwrite()</code> is not appended, but written starting at the offset specified in the call to that API.</p> |
| bufferSize | <i>Ignored for files on MapR filesystem</i> |
| replication | <i>Ignored for files on MapR filesystem</i> |
| blocksize | The size of chunks for the file in bytes. Use 0 if you want to use the value that is specified for the <code>fs.mapr.block.size</code> parameter in the <code>/opt/mapr/hadoop/hadoop-2.x/etc/hadoop/core-site.xml</code> file on the client (if the client is using the <code>libMapRClient</code> version of <code>hadoop-2.x</code>). If this parameter is not set in <code>core-site.xml</code> , the default value is taken from the directory's <code>.dfs_attributes</code> file. |
| nameSizeInBytes | A pointer to a memory buffer that can store the size in bytes of the name container. The value is returned only if <code>hdfsOpenFile2()</code> creates the specified file because the file does not already exist. |

Return Value

Returns the handle to the open file or NULL on error.

Check `errno` for error codes and meanings.

`hdfsPread()`

Supported by `libMapRClient` for `hadoop-2.x`

Reads an open file from a specified offset.

Whereas `hdfsRead()` increments the current offset in the file by the number of bytes that are read, `hdfsPread()` does not change the current offset. For example, if the current offset is 0 and `hdfsPread()` starts reading from offset 100, after the read the current offset is still 0.

Signature

```
tSize hdfsPread(hdfsFS fs, hdfsFile file, tOffset position, void* buffer,
tSize length)
```

Parameters

| Parameter | Description |
|-----------------------|---|
| <code>fs</code> | The handle of the filesystem where the file is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs. |
| <code>file</code> | The file handle. Obtain this handle with one of the <code>hdfsOpenFile()</code> APIs. |
| <code>position</code> | Offset from which to read. |
| <code>buffer</code> | The buffer to copy read bytes into. |
| <code>length</code> | The length of the buffer. The maximum size of <code>tSize</code> is the maximum buffer length. |

Return Value

Returns the number of bytes actually read, which can be less than than the length of the buffer if the end of the file is reached during the read. Returns -1 on error.

On error, `errno` is set to one of the following values:

- `EACCES` if the access permissions are violated.
- `ESTALE` if the file doesn't exist on the server.
- `EINVAL` if the arguments are invalid or if the file type doesn't support read operations.

To recover from errors, close the file by calling `hdfsCloseFile()`.

`hdfsPwrite()`

Supported by `libMapRClient` for `hadoop-2.x`

Writes starting at a specified position in an open file.

Whereas `hdfsWrite()` increments the current offset by the amount of bytes returned by the API (except in case of error), `hdfsPwrite()` does not change the value of current offset. If the current offset before the call to `hdfsPwrite()` is 0 and you specify the offset 10 for the write operation, after the write the current offset remains 0.

If a call to `hdfsPwrite()` specifies an offset that is past the end of the file, the result is a hole in the file between the previous end of the file and the offset at which the write begins.

You can obtain the size of a file in bytes by calling `hdfsGetPathInfo()`.

Flushes to the server happen automatically at intervals during a write operation. After a write operation is finished, either call `hdfsFlush()` explicitly or call `hdfsFlush()` implicitly by calling `hdfsCloseFile()` to be sure that any data remaining in the write buffer is flushed.

On error, pending write buffers are flushed to the server.

Signature

```
tSize hdfsPwrite(hdfsFS fs, hdfsFile file, tOffset position, const void*
buffer, tSize length)
```

Parameters

| Parameter | Description |
|-----------|---|
| fs | The handle of the filesystem where the file is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs. |
| file | The handle of the file. Obtain this handle with one of the <code>hdfsOpenFile()</code> APIs. |
| position | The offset at which to start writing. |
| buffer | The data to write. |
| length | The number of bytes to write. The maximum length is the maximum size of <code>tSize</code> . |

Return Value

Returns the number of bytes written, -1 on error.

Check `errno` for error codes and meanings.

hdfsRead()

Supported by libMapRClient for hadoop-2.x

Reads data from the current offset in an open file. After the read, the current offset is incremented by the number of bytes read.

To read from a specific offset, first call `hdfsSeek()` to move to that offset in the file. Then, call `hdfsRead()`.

Alternatively, call `hdfsPread()`, specifying an offset in the call. `hdfsPread()` does not increment the current offset in the file. The offset that you specify in the call is used only for the read.

Signature

```
tSize hdfsRead(hdfsFS fs, hdfsFile file, void* buffer, tSize length)
```

Parameters

| Parameter | Description |
|-----------|--|
| fs | The filesystem handle. Filesystem handle can be obtained using one of the <code>hdfsConnect()</code> APIs. |

| Parameter | Description |
|-----------|--|
| file | The file handle. Obtain this handle with one of the <code>hdfsOpenFile()</code> APIs. |
| buffer | The buffer to copy bytes into during the read. |
| length | The length of the buffer. The maximum length of the buffer is the maximum size of <code>tSize</code> . |

Returned Value

Returns the number of bytes actually read, which can be less than than the length of the buffer if the end of the file is reached during the read. Returns -1 on error.

Check `errno` for error codes and meanings.

hdfsReadStatisticsGetRemoteBytesRead()

This API is not supported.

hdfsRename()

Supported by libMapRCient for hadoop-2.x

Renames the specified file. For information about the format to use for paths, see [Specifying Paths to Files and Directories](#).

Signature

```
int hdfsRename(hdfsFS fs, const char* oldPath, const char* newPath)
```

Parameters

| Parameter | Description |
|-----------|---|
| fs | The handle of the filesystem where the file is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs. |
| oldPath | The path of the source file. |
| newPath | The path of the destination file. |

Return Value

Returns 0 on success, -1 on error.

Check `errno` for error codes and meanings.

hdfsSeek()

Supported by libMapRClient for hadoop-2.x

Moves the current offset to another offset in the specified file.

Signature

```
int hdfsSeek(hdfsFS fs, hdfsFile file, tOffset desiredPos)
```

Parameters

| Parameter | Description |
|------------|--|
| fs | The handle for the filesystem where the file is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs. |
| file | The handle to the file. Obtain this handle with one of the <code>hdfsConnect()</code> APIs. |
| desiredPos | The offset to move forward to. |

Return Value

Returns 0 on success, -1 on error.

Check `errno` for error codes and meanings.

hdfsSetTicketAndKeyFile()

Dynamically loads a ticket file

Supported by libMapRClient for hadoop-2.x

Use this API to dynamically load a ticket file to connect to newly added clusters and nodes, without restarting your application.

Signature

```
int hdfsSetTicketAndKeyFile(const char *fname)
```

Parameters

| Parameter | Description |
|-----------|--|
| fname | The name of the ticket file to reload. |

Return Value

Returns 0 on success, -1 on error.

Check `errno` for error codes and meanings.

hdfsSetReplication()

This API is not supported.

hdfsSetRpcTimeout()

Unique to libMapRClient

Sets the RPC timeout in seconds. Before creating a connection to a filesystem cluster, you can set an RPC timeout for your connections to CLDB nodes and file servers, passing the number of seconds for the timeout as an integer.

Signature

```
int hdfsSetRpcTimeout(int seconds)
```

Parameters

| Parameter | Description |
|-----------|--|
| seconds | The time in seconds to wait before timing out. The default is 99 seconds. If you change the value, set it either to 0 or to greater than 30 seconds. If RPC timeout is set to 0, remote procedure calls will continue to be retried until they are successful. |

Return Value

Returns 0 on success, -1 on error.

Check errno for error codes and meanings.

hdfsSetThreads()

Unique to libMapRClient

Configures the number of threads for flushing write buffers. This number is specific to individual clients. The default number is 8.

The number of threads must be positive. If it isn't, EINVAL is returned.

Signature

```
int hdfsSetThreads(int threads)
```

Parameters

| Parameter | Description |
|-----------|---|
| threads | The number of threads for flushing write buffers. |

Return Value

Returns the current number of flush threads for the client, -1 on error. Check errno for error codes and meanings.

hdfsSetWorkingDirectory()

Supported by libMapRClient for hadoop-2.x

Set the working directory. All relative paths will be resolved relative to it.

For example, if you call this API to set the working directory to `/mycluster/myvolume` and subsequently call `hdfsOpenFile()` with the path `/temp/tmp.txt`, the full path to the file to open is assumed to be `/mycluster/myvolume/temp/tmp.txt`.

Signature

```
int hdfsSetWorkingDirectory(hdfsFS fs, const char* path)
```

Parameters

| Parameter | Description |
|-----------|--|
| fs | The handle of the filesystem where the directory is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs. |
| path | The path of the new working directory. |

Return Value

Returns 0 on success, -1 on error.

Check `errno` for error codes and meanings.

`errno` is set to `EINVAL` for invalid arguments.

hdfsSetXattr()

Supported by libMapRClient for hadoop-2.x

Sets extended attribute on a file.

Signature

```
int hdfsSetXattr(hdfsFS fs, const char* path, const char *name, int
nameLen, char *value, int valueLen);
```

Parameters

| Parameter | Description |
|-----------|---|
| fs | The handle of the filesystem where the file is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs. |
| name | The name of the extended attribute. |
| nameLen | The length of the name of the extended attribute. |
| path | The path to the file. |
| value | The value for the extended attribute. |
| valueLen | The length of the value of the extended attribute. |

Return Value

Returns 0 on success, -1 on error.

Check `errno` for error codes and meanings.

hdfsTell()

Supported by libMapRClient for hadoop-2.x

Gets the current offset in the file in bytes.

Signature

```
tOffset hdfsTell(hdfsFS fs, hdfsFile file)
```

Parameters

| Parameter | Description |
|-----------|---|
| fs | The handle of the filesystem where the file is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs. |
| file | The file handle. Obtain this handle with one of the <code>hdfsOpenFile()</code> APIs. |

Return Value

Returns the current offset in bytes, or -1 on error.

Check `errno` for error codes and meanings.

hdfsUtime()

Changes the access and modification times of a file or directory.

Supported by libMapRClient for hadoop-2.x

Signature

```
int hdfsUtime(hdfsFS fs, const char* path, tTime mtime, tTime atime)
```

Parameters

| Parameter | Description |
|-----------|---|
| fs | The handle of the filesystem where the file or directory is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs. |
| path | The path to the file or directory. |
| mtime | The new modification time or 0 (if you want to set only the access time) in seconds. |
| atime | The new access time or 0 (if you want to set only the modification time) in seconds. For more information, see the <code>atimeUpdateTimeInterval</code> entry in volume create on page 2190. |

Return Value

Returns 0 on success, -1 on error.

`errno` is set to `EINVAL` if the input arguments are invalid.

`errno` is set to `EPERM` if the process does not have enough privileges to perform the operation.

hdfsWrite()

Supported by libMapRClient for hadoop-2.x

Writes to the specified open file.

If the file is opened in write-only mode, writes start at offset 0 because write-only mode causes the content of the file to be truncated when the file is opened.

If the file is opened in append mode, data is appended to the end of the file.

If there are concurrent writes that start at the same offset, only the last write to finish persists.

If a call to `hdfsSeek()` moves the offset past the end of the file before a call to `hdfsWrite()`, the result is a hole in the file between the previous end of the file and the offset at which the write begins.

You can obtain the size of a file in bytes by calling `hdfsGetPathInfo()`.

Flushes to the server happen automatically at intervals during a write operation. After a write operation is finished, either call `hdfsFlush()` explicitly or call `hdfsFlush()` implicitly by calling `hdfsCloseFile()` to be sure that any data remaining in the write buffer is flushed.

On error, pending write buffers are flushed to the server.

Signature

```
tsize hdfsWrite(hdfsFS fs, hdfsFile file, const void* buffer, tSize length)
```

Parameters

| Parameter | Description |
|-----------|--|
| fs | The handle of the filesystem where the file is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs. |
| file | The handle of the file. Obtain this handle with one of the <code>hdfsOpenFile()</code> APIs. |
| buffer | The buffer containing the data to be written. |
| length | The number of bytes to write. This value cannot be zero. The maximum length of the buffer is the maximum size of the <code>tSize</code> data type. |

Return Value

Returns the number of bytes written, -1 on error.

Check `errno` for error codes and meanings.

Accessing HPE Ezmeral Data Fabric File Store in Java Applications

As a high-performance filesystem, portions of the HPE Ezmeral Data Fabric File Store file client are based on a native `maprfs` library. When developing an application, specifying dependence on the JAR file that includes the `maprfs` library enables you to build applications without having to manage platform-specific dependencies.

The following sections describe how to access the HPE Ezmeral Data Fabric File Store in a Java program.

Writing a Java Application

In your Java application, you will use a Configuration object to interface with the filesystem. When you instantiate a Configuration object, it is created with values from Hadoop configuration files.

If the program is built with JAR files from the Data Fabric installation, the Hadoop 1 configuration files are in the `$MAPR_HOME/hadoop/hadoop-<version>/conf` directory, and the Hadoop 2 configuration files are in the `$HADOOP_HOME/etc/hadoop` directory. This Hadoop configuration directory is in the `hadoop` classpath that you include when you compile and run the Java program.

If the program is built through maven using `mapr` maven artifacts, the default Hadoop configuration files are included in the maven artifacts. The user needs to programmatically update the Hadoop configuration to match the Hadoop configuration files on the Data Fabric cluster.

Sample Code

The following sample code shows how to interface with MapR filesystem using Java. The example creates a directory, writes a file, then reads the contents of the file.

```

/* Copyright (c) 2009 & onwards. MapR
Tech, Inc., All rights reserved */

//package com.mapr.fs;

import java.net.*;
import org.apache.hadoop.fs.*;
import org.apache.hadoop.conf.*;

/**
 * Assumes mapr installed in /opt/mapr
 *
 * Compilation:
 * javac -cp $(hadoop classpath)
MapRTest.java
 *
 * Run:
 * java -cp .:$(hadoop classpath)
MapRTest /test
 */
public class MapRTest
{
    public static void main(String
args[]) throws Exception {
        byte buf[] = new
byte[ 65*1024];
        int ac = 0;
        if (args.length != 1) {

System.out.println("usage: MapRTest
pathname");
            return;
        }

        // maprfs:/// -> uses
the first entry in /opt/mapr/conf/
mapr-clusters.conf
        // maprfs:///mapr/
my.cluster.com/
        // /mapr/my.cluster.com/

        // String uri = "maprfs:///";
String dirname = args[ac++];

        Configuration conf = new
Configuration();

        //FileSystem fs =
FileSystem.get(URI.create(uri),
conf); // if wanting to use a
different cluster
        FileSystem fs =
FileSystem.get(conf);

        Path dirpath = new
Path( dirname + "/dir");
        Path wfilepath = new

```

```

Path( dirname + "/file.w");
    //Path rfilepath = new
Path( dirname + "/file.r");
    Path rfilepath = wfilepath;

    // try mkdir
    boolean res =
fs.mkdirs( dirpath);
    if (!res) {

System.out.println("mkdir failed,
path: " + dirpath);
    return;
    }

    System.out.println( "mkdir( "
+ dirpath + ") went ok, now writing
file");

    // create wfile
    FSDataOutputStream ostr =
fs.create( wfilepath,
            true, // overwrite
            512, // buffersize
            (short) 1, //
replication
                (long)
(64*1024*1024) // chunksize
            );
    ostr.write(buf);
    ostr.close();

    System.out.println( "write( "
+ wfilepath + ") went ok");

    // read rfile
    System.out.println( "reading
file: " + rfilepath);
    FSDataInputStream istr =
fs.open( rfilepath);
    int bb = istr.readInt();
    istr.close();
    System.out.println( "Read
ok");
    }
}

```

Compiling and Running a Java Application

You can compile and run the Java application using JAR files from the mapr maven repository or from the Data Fabric installation.

Using JARs from the Maven Repository

Maven artifacts from version 2.1.2 onward are published to <https://repository.mapr.com/maven/>. When compiling for Data Fabric core version 6.1, add the following dependency to the `pom.xml` file for your project:

```

<dependency>
  <groupId>org.apache.hadoop</

```

```

groupId>
  <artifactId>hadoop-common</
artifactId>
  <version>2.7.0-mapr-1808</version>
</dependency>

```

This dependency adds the dependencies from the mapr maven repository the next time you do a `mvn clean install`. The JAR that includes the `maprfs` library is a dependency for the `hadoop-common` artifact.

For a complete list of artifacts and further details, see [Maven Artifacts for the HPE Ezmeral Data Fabric](#) on page 4371.

Using JARs from the Data Fabric Installation

The `maprfs` library is included in the `hadoop` classpath. Add the `hadoop` classpath to the JAVA classpath when you compile and run the Java application.

- To compile the sample code, use the following command:

```

javac -cp $(hadoop classpath)
MapRTest.java

```

- To run the sample code, use the following command:

```

java -cp .:$(hadoop classpath)
MapRTest /test

```

Loading the Data Fabric Native Library

By default, the root class loader will load the native library to allow all children to see and access it. If the native library is loaded by a child class, other classes will not be able to access the library. To allow applications and associated child classes to access the symbols and variables in the native library, we recommend loading the native library via the root loader.

The loading of the native library via the root class loader is accomplished by injecting code into the root loader. If Data Fabric runs on top of applications (such as Tomcat) where it does not have access to the root class loader, the native library will not be loaded. Child classes that try to access the symbols under the assumption that the root class loader successfully loaded the native library will fail.

The parameter `-Dmapr.library.flatclass`, when specified with Java, disables the injection of code via the root class loader, thus disabling the loading of the native library using the root class loader. Instead, the application trying to access the symbols can load the native library themselves. However, since the native library can be loaded only once and can only be seen by the application loading it, ensure that only one application within the JVM attempts to load and access the native library.

Garbage Collection in Data Fabric

The garbage collection (GC) algorithms in Java provide opportunities for performance optimizations for your application. Java provides the following GC algorithms:

- *Serial GC*. This algorithm is typically used in client-style applications that don't require low pause times. Specify `-XX:+UseSerialGC` to use this algorithm.

- *Parallel GC*, which is optimized to maximize throughput. Specify `-XX:+UseParNewGC` to use this algorithm.
- *Mostly-Concurrent* or *Concurrent Mark-Sweep GC*, which is optimized to minimize latency. Specify `-XX:+UseConcMarkSweepGC` to use this algorithm.
- *Garbage First GC*, a new GC algorithm intended to replace Concurrent Mark-Sweep GC. Specify `-XX:+UseG1GC` to use this algorithm.

Consider testing your application with different GC algorithms to determine their effects on performance.

Flags for GC Debugging

Set the following flags in Java to log the GC algorithm's behavior for later analysis:

```
-verbose:gc
-Xloggc:<filename>
-XX:+PrintGCDetails
-XX:+PrintGCDateStamps
-XX:+PrintTenuringDistribution
-XX:+PrintGCApplicationConcurrentTime
-XX:+PrintGCApplicationStoppedTime
```

For more information, see the Java [Garbage Collection Tuning](#) document or the Java [Garbage Collection](#) links.

Converting fid and volid

The following filesystem APIs are available in `com.mapr.fs.MapRFileSystem` for converting fid to file path and volid to volume name:

- `public String getMountPathFidCached(String fidStr) throws IOException`
- `public String getVolumeNameCached(int volId) throws IOException`
- `public String getVolumeName(int volId) throws IOException`
- `public String getMountPathFid(String fidStr) throws IOException`

Converting fid to File Path

The `getMountPathFid(string)` and `getMountPathFidCached(string)` APIs can be used for converting file ID to the full path to the file. The `getMountPathFid()` API makes a call to CLDB and filesystem to get the file path from the fid. Because this API does not cache or store this information locally, it might make repeated requests to CLDB and filesystem for the same fid and this might result in many RPCs to both CLDB and filesystem. The `getMountPathFidCached()` API makes a call the CLDB and filesystem one time and stores the information locally in the shared library of the client. For subsequent calls, it uses the locally stored information to retrieve the file path from the fid. However, if there are many files in the volume, there might still be a large number of calls to CLDB and filesystem to determine the file path for each fid in the volume. The caching is useful if the API attempts to determine the file path for the same fid repeatedly. The cache is purged after 15 seconds. If the file name changes before the cache is purged, you will see the old name for the file until the cache expires. You can use these APIs to convert the fid to the file path.

For example, the [sample consumer application](#) and the sample [uncached consumer application](#) for consuming audit logs as stream messages use these methods as shown below.

- **Sample Cached Consumer**

```
{
    String token =
    stl.nextToken();
    /* If the field has fid,
    expand it using Cached API */
    if (token.endsWith("Fid")) {
        String lfidStr =
        stl.nextToken();
        String path= null;
        try {
            path =
            fs.getMountPathFidCached(lfidStr);
            // Expand FID to path
        } catch (IOException e){
        }
        lfidPath =
        "\"FidPath\\\": \""+path+"\"";
        // System.out.println("\nPATH
        for fid " + lfidStr + " is " +
        path);
    }
}
```

- **Sample Uncached Consumer**

```
{
    String token =
    stl.nextToken();
    if (token.endsWith("Fid")) {
        String lfidStr =
        stl.nextToken();
        String path= null;
        try {
            path =
            fs.getMountPathFid(lfidStr); //
            Expand FID to path
        } catch (IOException e){
        }
        lfidPath =
        "\"FidPath\\\": \""+path+"\"";
        // System.out.println("\nPATH
        for fid " + lfidStr + " is " +
        path);
    }
}
```

Converting volid to Volume Name

The `getVolumeName()` and `getVolumeNameCached()` APIs can be used for converting volume IDs to volume name. The `getVolumeName()` API makes a call to the CLDB every time to get the volume name from the volid and this may result in too many RPCs to CLDB. The `getVolumeNameCached()` API makes a call to the CLDB one time and stores the information locally in the shared library of the client. For subsequent calls, it uses the locally stored information to retrieve the

volume name from the valid. The cache is purged after 15 seconds. You can use these APIs to convert the valid to volume name.

For example, the [sample consumer application](#) and the sample [uncached consumer application](#) for consuming audit logs as stream messages uses these methods as shown below.

- **Sample Cached Consumer**

```
if (token.endsWith("volumeId")) {
    String valid =
    stl.nextToken();
    String name= null;
    try {
        int volumeId =
        Integer.parseInt(valid);
        // Cached API to
        convert volume Id to volume Name
        name =
        fs.getVolumeNameCached(volumeId);
    }
    catch (IOException e){
    }
    lvolName =
    "\"VolumeName\": \""+name+"\", ";
    //
    System.out.println("\nVolume Name
    for valid " + valid + " is " +
    name);
}
```

- **Sample Uncached Consumer**

```
if (token.endsWith("volumeId")) {
    String valid =
    stl.nextToken();
    String name= null;
    try {
        int volumeId =
        Integer.parseInt(valid);
        // API to convert
        volume Id to volume Name
        name =
        fs.getVolumeName(volumeId);
    }
    catch (IOException e){
    }
    lvolName =
    "\"VolumeName\": \""+name+"\", ";
    //
    System.out.println("\nVolume Name
    for valid " + valid + " is " +
    name);
}
```

Sample Applications

Demonstrates how to set ACEs using the Java APIs.

Sample Application

The sample application demonstrates how to set, get, modify, and delete ACES on files using the Java APIs.

Before running this application, verify that you have access to a cluster running filesystem. To build and run this application:

1. Set the classpath:

```
export CLASSPATH=`hadoop classpath`
```

2. Compile the java file:

```
javac FileAceTest.java
```

3. Run the final `FileAceTest.class` file.

The application imports the following libraries:

- `java.io.*`
- `java.net.*`
- `java.util.*`

The application performs the actions described in the following sections.

Connects to a filesystem

The application tries to connect to the first filesystem cluster that is specified in the `mapr-clusters.conf` file in the `$MAPR_HOME/conf` directory on the client. After connecting to the filesystem, the application returns a handle to the filesystem.

```
Configuration conf = new
Configuration();
FileSystem fs = FileSystem.get(conf);
//MapRFileSystem fs =
getMapRFileSystem();
```

Creates a new directory and a new file in the directory

The application creates a new directory and a file in the directory.

```
Path testDir = new Path(rootDir +
"FileAceTest");
mkdir(fs, testDir);

Path testFile = new Path(testDir + "/"
testFile");
createFile(fs, testFile);
```

Sets ACEs on the new directory and the file

The application then sets ACEs to grant `m7user1` user or the root user permissions to list the contents of the directory, which is required for the user to write and/or execute files in the directory. In addition, the

application sets ACEs on the file in the directory to grant the m7user1 user read access on the file.

```
MapRFileAce ace = new
MapRFileAce(MapRFileAce.AccessType.REA
DFILE);
ace.setBooleanExpression("u:m7user1");
aces.add(ace);
ace = new
MapRFileAce(MapRFileAce.AccessType.REA
DDIR);
ace.setBooleanExpression("u:m7user1 |
u:root");
aces.add(ace);
((MapRFileSystem)fs).setAces(testDir,
aces);
((MapRFileSystem)fs).setAces(testFile,
aces);
```

Verifies the ACEs set on the directory and file

The application then prints the ACEs set on the directory and file.

```
List<MapRFileAce> newDirAces =
((MapRFileSystem)fs).getAces(testDir);
System.out.println("Path: " +
testDir);
for (int i = 0; i <
newDirAces.size(); ++i) {

System.out.println(newDirAces.get(i).g
etAccessType() + ": " +

newDirAces.get(i).getBooleanExpressio
n());
}

List<MapRFileAce> newFileAces =
((MapRFileSystem)fs).getAces(testFile)
;
System.out.println("Path: " +
testFile);
for (int i = 0; i <
newFileAces.size(); ++i) {

System.out.println(newFileAces.get(i).
getAccessType() + ": " +

newFileAces.get(i).getBooleanExpressio
n());
}
```

Modifies the ACEs on the directory and file

The application modifies the ACEs on the directory to grant m7user2 user also permissions to list the contents of the directory, which is required for the users to write and/or execute files in the directory. It also modifies the ACEs on the file to grant write access on the file to m7user2 user. Please note that when modifying ACEs on the file to grant write access

to m7user2 user, the application does not change read access, which was granted to m7user1 user.

```
aces = new ArrayList<MapRFileAce>();
ace = new
MapRFileAce(MapRFileAce.AccessType.REA
DDIR);
ace.setBooleanExpression("u:m7user1 |
u:root|u:m7user2");
aces.add(ace);
ace = new
MapRFileAce(MapRFileAce.AccessType.WRI
TEFILE);
ace.setBooleanExpression("u:m7user2");
aces.add(ace);
((MapRFileSystem)fs).modifyAces(testDi
r, aces);
((MapRFileSystem)fs).modifyAces(testFi
le, aces);
```

Verifies the changes to ACEs on the directory and file

The application prints the changes in ACEs on the directory and the file.

```
newDirAces =
((MapRFileSystem)fs).getAces(testDir);
System.out.println("Path: " +
testDir);
for (int i = 0; i <
newDirAces.size(); ++i) {

System.out.println(newDirAces.get(i).g
etAccessType() + ": " +

newDirAces.get(i).getBooleanExpressio
n());
}

newFileAces =
((MapRFileSystem)fs).getAces(testFile)
;
System.out.println("Path: " +
testFile);
for (int i = 0; i <
newFileAces.size(); ++i) {

System.out.println(newFileAces.get(i).
getAccessType() + ": " +

newFileAces.get(i).getBooleanExpressio
n());
}
```

Deletes ACEs on directory and file

The application deletes all ACEs on the directory and the file.

```
((MapRFileSystem)fs).deleteAces(testDi
r);
((MapRFileSystem)fs).deleteAces(testFi
le);
```

Verifies the ACEs on the directory and the file

The application prints the ACEs on the directory and the file after they are deleted.

```
newDirAces =
((MapRFileSystem)fs).getAces(testDir);
System.out.println("Path: " +
testDir);
if (newDirAces == null ||
newDirAces.size() == 0)
    System.out.println("AceCount: 0");
else
    System.out.println("AceCount: " +
newDirAces.size());
System.out.println("");
newFileAces =
((MapRFileSystem)fs).getAces(testFile)
;
System.out.println("Path: " +
testFile);
if (newFileAces == null ||
newFileAces.size() == 0)
    System.out.println("AceCount: 0");
else
    System.out.println("AceCount: " +
newFileAces.size());
```

Example FileAceTest.java File

```
import java.io.*;
import java.net.*;
import java.util.*;

import org.apache.hadoop.fs.*;
import org.apache.hadoop.conf.*;

import com.mapr.fs.MapRFileAce;
import com.mapr.fs.MapRFileSystem;

public class FileAceTest {
    public FileSystem fs = null;

    public static void mkdir(FileSystem fs, Path path) throws IOException {
        boolean res = fs.mkdirs(path);
        if (!res) {
            throw new IOException("mkdir failed, path: " + path);
        }
    }

    public static void createFile(FileSystem fs, Path path) throws Exception {
        byte buf[] = new byte[1024];

        FSDataOutputStream ostr = fs.create(path,
            true, // overwrite
            512, // buffersize
            (short) 1, // replication
            (long)(64*1024*1024) // chunksize
        );

        ostr.write(buf);
        ostr.close();
    }
}
```

```

public static void rmR(FileSystem fs, Path path) throws IOException {
    boolean res = fs.delete(path, true /*recursive*/);
    if (!res) {
        throw new IOException("rmR failed, path: " + path);
    }
}

for (int i = 0; i < newFileAces.size(); ++i) {
    System.out.println(newFileAces.get(i).getAccessType() + ": " +
        newFileAces.get(i).getBooleanExpression());
}

// Remove path
rmR(fs, testDir);
}
}

```

Troubleshooting

My application that includes maprfs-0.1.jar is now missing dependencies and fails to link.

As of version 2.1.2, the contents of maprfs-0.1.jar are now in two JAR files:

- maprfs-`<version>`.jar

- `maprfs-jni-<version>.jar`

The `<version>` refers to the version of the distribution. For example, if you have an existing application written for `maprfs-0.1.jar` and you update it to load `maprfs-2.1.2.jar`, you must also include `maprfs-jni-2.1.2.jar`. This change was made to enable loading on distributed class-loader environments that use the `maprfs` libraries to access the filesystem from multiple contexts.

These JAR files are installed in the `/opt/mapr/hadoop/hadoop<version>/lib/` directory, or can be accessed via the Maven Central Repository.

HPE Ezmeral Data Fabric Database and Apps

This section contains information about developing client applications for JSON and key-value tables.

Why use HPE Ezmeral Data Fabric Database?

From a developer's point-of-view, HPE Ezmeral Data Fabric Database provides the following capabilities:

- **Extreme scale for CRUD operations:** Enabled by the integration of HPE Ezmeral Data Fabric Database with the HPE Ezmeral Data Fabric Filesystem, CRUD operations are extremely fast and efficient.
- **Flexible data model:** HPE Ezmeral Data Fabric Database can be used as both a [document database](#) and a [column-oriented database](#). So if the content structure changes, the applications do not need to be re-written.
- **Rich query:** Integration with [Apache Drill](#) on page 3401 for HPE Ezmeral Data Fabric Database provides a low-latency distributed query engine for large-scale datasets, including structured and semi-structured/nested data.
- **Integration with Apache Spark:** HPE Ezmeral Data Fabric Database provides [HPE Ezmeral Data Fabric Database Connectors for Apache Spark](#) on page 4272 that allow you to access HPE Ezmeral Data Fabric Database tables through Spark applications.
- **Strong data consistency:** Consistently fast response with strong data consistency with row/document level ACID transactions and in-memory database options for faster speeds.

HPE Ezmeral Data Fabric Database JSON provides additional benefits:

- **High performance via [Secondary Indexes on page 506](#):** No memory copying. No need to retrieve the full document to make updates due the log-based database architecture. No application changes needed to leverage secondary indexes for efficient query execution.
- **Easy application development:** JSON constructs such as maps, arrays, and data types are supported natively.
- **Language-specific client APIs:** Java, Python, and Node.js client APIs

Note: HPE Ezmeral Data Fabric has a universal namespace which means that the same namespace is used for files, tables, and streams. A universal namespace streamlines application development for different operations.

How Do I Get Started with HPE Ezmeral Data Fabric Database JSON?

The following diagram illustrates an end-to-end flow associated with getting started with HPE Ezmeral Data Fabric Database JSON.

 **Note:** *This flow is not the only way to get started!*

You can also run through end-to-end examples using preconfigured, single node HPE Ezmeral Data Fabric clusters. The following table describes an option:

Container for Developers

[Development Environment for HPE Ezmeral Data Fabric](#) on page 58 is a Docker container that runs a single node cluster. Using [HPE Ezmeral Data Fabric Database JSON: Getting Started](#), you can do the following:

- Set up the Docker container
- Import data into HPE Ezmeral Data Fabric Database JSON tables
- Use HPE Ezmeral Data Fabric Database Shell to query, insert, and update JSON documents in HPE Ezmeral Data Fabric Database JSON tables
- Use Drill to query HPE Ezmeral Data Fabric Database JSON tables
- Run sample Java OJAI applications
- Run a sample Spark application using the HPE Ezmeral Data Fabric Database OJAI Connector for Apache Spark

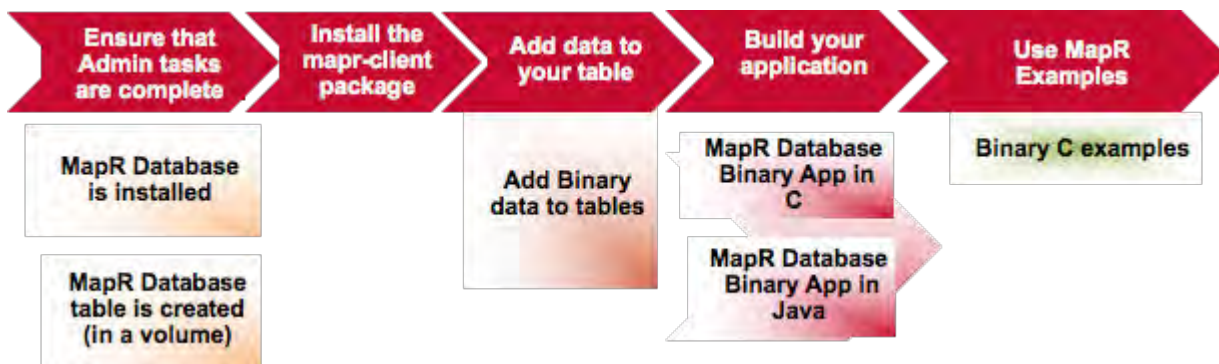

Useful HPE Ezmeral Data Fabric Database JSON Developer Resources

| | Apache Drill on page 3401 | |
| | HPE Ezmeral Data Fabric Database Binary Connector for Apache Spark on page 4324 | |

Installing the mapr-client Package

The `mapr-client` package must be installed on each node where you will be building and running your applications. This package installs all of the MapR Libraries needed for application development regardless of programming language or type of HPE Ezmeral Data Fabric Database table (binary or JSON).

Note: The package `mapr-core` contains the files that are in the `mapr-client` package. If you have installed the `mapr-core` package, you do not need to install the `mapr-client` package.

Complete the following steps to install the `mapr-client` package from a repository:

1. Configure the repository to point to <https://package.mapr.hpe.com/releases/<release version>/<operating system>>
For example, if your VM has a CentOS operating system, edit the `/etc/yum.repos.d/mapr_core.repo` file and add the location.
2. Based on your operating system, run one of the following commands to install the package:
 - On Red Hat /Centos: `yum install mapr-client`
 - On Ubuntu: `apt-get install mapr-client`
 - On SLES: `zypper install mapr-client`

Passing the HPE Ezmeral Data Fabric Database Table Path

This topic describes the methods for passing a HPE Ezmeral Data Fabric Database table name. Binary table names can be passed by either specifying the table path in the API or by setting the table path in the `core-site.xml` file. JSON table names are passed by specifying the table path in the API.

Specifying the Table Path in the API

With this method, you provide the complete path to the table using the following format: `/mapr/<cluster>/<volume>/<table>`

 **Note:** This format is independent of the programming language. This method is used for both HPE Ezmeral Data Fabric Database binary and JSON tables.

For example, if you were adding a new column family to a table and you had the following information:

- Cluster name: `newyork`
- Volume name: `vol1`
- Table name: `table1`

The table path would be `/mapr/newyork/vol1/table1`

Specifying the Table Path in the `core-site.xml` File

With this method, you specify the table path with `hbase.table.namespace.mappings` property in the `/opt/mapr/hadoop/hadoop-2.7.0/etc/hadoop/core-site.xml` file.

 **Note:** This method is specific to HPE Ezmeral Data Fabric Database binary tables only. This method is independent of the programming language.

In the following example, all tables that you create and access via the API, will be in the `/tables_dir1` directory. If you specified the table name `table1` in the API, the full path to the table would be `/tables_dir1/table1`.

```
<property>
  <name>hbase.table.namespace.mappings</name>
  <value>*:/tables_dir1</value>
</property>
```

Tuning Parameters for Client Apps

Though tuning client applications is generally not necessary, MapR does offer tuning parameters to change the behavior of client-side caching.

Client application cache pending puts in buffers that are unique to each tablet (*region*, in HBase terminology). Individual put buffers are flushed when they are full or idle. As a result of this architecture and behavior, client applications tend to send RPCs of 128KB when flushing puts to disk, which results in better performance than flushing a single global buffer would, as that could result in a large number of small RPCs.

You can change the values of parameters that affect how put buffers are flushed. Set values for them in the `hbase-site.xml` file or `core-site.xml` file in your MapR installation. If a non-default value for a parameter is set in both files, the value in the `hbase-site.xml` file is used.

db.mapr.putbuffer.threshold.mb

Specifies the size of the cumulative put buffer for all tablets in the client application. When this threshold is reached, the put buffer that is most full is flushed to its tablet.

The default value is 32MB.

Increasing this value can improve performance when an application performs operations on very large tables or on a very large number of tables.

| | |
|--|--|
| db.mapr.putbuffer.threshold.sec | <p>Specifies the number of seconds that HPE Ezmeral Data Fabric Database should wait before flushing an idle put buffer.</p> <p>The default value is 3.</p> <p>This parameter has no effect if automatic flushing is enabled.</p> |
| fs.mapr.tablethru.size.kb | <p>Specifies the size of the metadata cache for all tables in a client application..</p> <p>The metadata for each tablet is 128 bytes.</p> <p>The default value of this parameter is 512KB, which allows for the caching of the metadata of 4,096 tablets.</p> <p>When this metadata cache is full, any operation on a tablet for which the metadata is not cached requires an RPC to fetch that tablet's metadata. Moreover, caching the newly retrieved metadata removes from the cache the metadata of a different tablet.</p> <p>Increasing this value can improve performance when an application performs operations on very large tables or on a very large number of tables.</p> |
| fs.mapr.threads | <p>Specifies the number of threads to use when flushing put buffers. Each thread makes synchronous RPCs when flushing.</p> <p>The default value is 64.</p> |

Developing Applications for Binary Tables

HPE Ezmeral Data Fabric Database provides a C API, `libMapRClient` and partially supports the Apache HBase 1.1 Java APIs for performing operation on HPE Ezmeral Data Fabric Database binary tables.

The HPE Ezmeral Data Fabric Database C API, `libMapRClient`, runs more efficiently on HPE Ezmeral Data Fabric Database and performs faster against HPE Ezmeral Data Fabric Database tables than the open source library of C APIs, `libhbase`, that is used to create and access Apache HBase tables. The `libMapRClient` header files are in this directory: `/opt/mapr/include/hbase`

HPE Ezmeral Data Fabric Database also supports all of the Apache HBase 1.1 Java APIs, except where noted in this documentation. For a number of critical Java APIs, for filters, and for comparators, this documentation explicitly lists what is supported, rather than what is not supported.

You can easily port existing applications that use the open-source version of `libhbase` or the HBase Java APIs to use HPE Ezmeral Data Fabric Database binary tables.

Current Limitations

- Custom HBase filters are not supported.
- HBase co-processors are not supported.

Note: Filters used with Scan operations support regular expressions. When you filter scans on HPE Ezmeral Data Fabric Database tables, you can use regular expressions that comprise the Perl Compatible Regular Expressions (PCRE) library as well as a subset of the regular expressions that are supported in `java.util.regex.pattern`. See [HBase Java Regular Expressions Support](#) on page 2788 for a list of supported regular expressions.

Creating C Apps - Binary Tables

MapR provides a library of C APIs – `libMapRClient` – for performing operations on HPE Ezmeral Data Fabric Database binary tables.

The HPE Ezmeral Data Fabric Database `libMapRClient` C API library is MapR's extension of the `libhbase` C API library. The `libMapRClient` header files are in this directory: `/opt/mapr/include/hbase`

`libMapRClient` uses the following conventions:

- All data types are prefixed with 'hb_'.
- All exported functions are annotated with `HBASE_API`, prefixed with 'hb_' and named using the following convention: 'hb_<subject>_<operation>_[<object>|<property>]'
- All asynchronous APIs take a callback which is triggered when a request completes. This callback can be triggered in the caller's thread or in another thread. To avoid any potential deadlock or starvation, applications should not block in the callback routine.
- All callbacks take a void pointer for application developers to supply their own data. This void pointer is passed when callback is triggered.

Note: No explicit batching is supported for asynchronous APIs.

Warning: It is the responsibility of applications to free up all backing data buffers. However, for asynchronous APIs, applications must wait before freeing buffers until after receiving callbacks or manipulating results. For better performance of asynchronous APIs, `libMapRClient` does not copy data buffers that are allocated for mutations, gets, and scans. These buffers hold table names, name space identifiers, row keys, column-family names, and column names or qualifiers. Instead, `libMapRClient` temporarily takes ownership of the buffers and references them with pointers until the callback is triggered. Therefore, applications should not free memory buffers before receiving callbacks for mutations. Applications also should not free memory buffers before receiving results for gets and scans. If applications must read results, the applications should not free memory buffers until the results are destroyed.

Note: When one of these asynchronous APIs is invoked, a work item is created and queued for processing on the client:

- `hb_client_destroy()`
- `hb_get_send()`
- `hb_mutation_send()`
- `hb_scanner_destroy()`
- `hb_scanner_next()`

The work item is picked up as soon as possible by a thread in a thread pool.

Client applications can often call these asynchronous APIs faster than the work items are processed. To ensure that the queue of work items does not grow without bound, the configuration parameter `fs.mapr.pool.queue.max_size` is set by default to 10,000. You can modify this parameter in the `/opt/mapr/conf/dbclient.conf` file for a client.

Whenever the number of work items in the queue reaches this limit, `libMapRClient` returns the `ENOBUFFS` error for each asynchronous call. Client applications are expected to handle this error, and can try the call again later.

libMapRClient C APIs

This section provides the HPE Ezmeral Data Fabric Database `libMapRClient` C API library. This library is MapR's extension of the `libhbase` C API library. The `libMapRClient` header files are in the directory: `/opt/mapr/include/hbase`.

The `libMapRClient` API implements functions in addition to the functions in the `libhbase` API.

Note: Your applications need include only the `hbase.h` header file. The header files are provided for display purposes.

| | |
|---------------------|---|
| admin.h | Describes the APIs for Apache HBase table administration operations such as creating and enabling tables, checking if tables exist, and deleting tables, to name a few . |
| client.h | Describes the APIs for Apache HBase client side operations such as creating and terminating client connections, and flushing buffered client-side writes to Apache HBase. |
| coldesc.h | Describes the APIs for performing operations such as creation, deletion, and setting the maximum and minimum number of cell versions to be retained for each Apache HBase column family. |
| connection.h | <p><code>libMapRClient</code> includes a function in the <code>connection.h</code> header file: <code>hb_connection_create_as_user()</code>. This function provides support for impersonation, so that you can connect to a HPE Ezmeral Data Fabric cluster and access HPE Ezmeral Data Fabric Database tables by using a specific username.</p> <p>The user that is passed with the <code>hb_connection_create_as_user()</code> API must have permissions on the tables that the application accesses. For example, to read from a table, the user must have the <code>readperm</code> permission. To write to a table, the user must have the <code>writeperm</code> permission. See Enabling Table and Stream Authorizations with ACEs on page 1578.</p> <p>For <code>hb_connection_create()</code> and <code>hb_connection_create_as_user()</code>, the standard C APIs for Apache HBase require a list of ZooKeeper nodes. For HPE Ezmeral Data Fabric Database, this list is interpreted as a list of CLDB nodes. The <code>zk_root</code> parameter is ignored. If <code>zk_quorum</code> is NULL, then the connection is created to the default cluster that is listed in the <code>mapr-clusters.conf</code> file.</p> |
| get.h | Describes the APIs to query and fetch data from Apache HBase tables. |
| hbase.h | Describes the APIs and data structures of a C client for Apache HBase. |
| log.h | Describes the APIs to manage Apache HBase logs. |
| macros.h | Defines internal macros that Apache HBase uses for its operations. |
| multiget.h | Describes the APIs to queue and manage multiple GET requests to fetch data from Apache HBase tables. |
| mutations.h | Describes the APIs for row and column mutations on Apache HBase tables. |

| | |
|------------------|---|
| result.h | Describes the buffers for internal temporary storage of results. |
| scanner.h | Describes the APIs for the client side scanner to scan and request rows from the Apache HBase server. |
| types.h | Defines the data types and error codes that Apache HBase uses. |

C API Examples

This section provides examples using the HPE Ezmeral Data Fabric Database `libMapRClient` C API to operate on HPE Ezmeral Data Fabric Database binary tables.

The HPE Ezmeral Data Fabric Database `libMapRClient` C API library is MapR's extension of the `libhbase` C API library. The `libMapRClient` header files are in this directory: `/opt/mapr/include/hbase`

Filtering SCAN Operation Results Example

This example shows filtering on the results of a SCAN operation.

```
for (uint32_t i = 0; i < num_filters; ++i) {
    hb_scanner_t scanner = NULL;
    hb_scanner_create(client, &scanner);
    hb_scanner_set_table(scanner, table_name, table_name_len);
    hb_scanner_set_num_max_rows(scanner, 3); // maximum 3 rows at a time
    hb_scanner_set_num_versions(scanner, 10); // up to 10 versions of the
cell
    hb_scanner_set_filter(scanner, (byte_t *)filters[i],
strlen(filters[i]));
    hb_scanner_next(scanner, scan_callback, NULL); // dispatch the call
    wait_for_scan();
}
```

This example uses the following array of filters:

```
static char filters[][200] = {"RandomRowFilter(0.5)",
    "ColumnCountGetFilter(2)",
    "ColumnPaginationFilter(1)",
    "ColumnPrefixFilter('column-a')",
    "FamilyFilter(=, 'binaryprefix:f')",
    "PrefixFilter('row_') AND QualifierFilter(<, 'binaryprefix:g')",
    "SKIP TimestampsFilter(1392222222222)",
    "WHILE ValueFilter(=, 'binaryprefix:cell2_value_v1')",
    "FuzzyRowFilter('row00', '00001')",
    "TimestampsFilter(1430937732000, 1431024132000)"};
}
```

Note: For more information about support for HBase Java Filters by the HPE Ezmeral Data Fabric Database C API, see [HBase Java Filters Support](#) on page 2755

Filtering GET Operation Results Example

This example shows filtering on the results of a GET operation.

```
{
    bytebuffer rowKey = bytebuffer_strcpy("row_with_two_cells");
    hb_get_t get = NULL;
    hb_get_create(rowKey->buffer, rowKey->length, &get);
    hb_get_add_column(get, FAMILIES[0], 1, NULL, 0);
    hb_get_add_column(get, FAMILIES[1], 1, NULL, 0);
    hb_get_set_table(get, table_name, table_name_len);
    hb_get_set_num_versions(get, 10); // up to ten versions of each column
    hb_get_set_filter(get, (byte_t *)filters[9], strlen(filters[9]));
}
```

```

get_done = false;
hb_get_send(client, get, get_callback, rowKey);
wait_for_get();
}

```

This example uses the following array of filters:

```

static char filters[][200] = {"RandomRowFilter(0.5)",
    "ColumnCountGetFilter(2)",
    "ColumnPaginationFilter(1)",
    "ColumnPrefixFilter('column-a')",
    "FamilyFilter(=, 'binaryprefix:f')",
    "PrefixFilter('row_') AND QualifierFilter(<, 'binaryprefix:g')",
    "SKIP TimestampsFilter(1392222222222)",
    "WHILE ValueFilter(=, 'binaryprefix:cell2_value_v1')",
    "FuzzyRowFilter('row00', '00001')",
    "TimestampsFilter(1430937732000, 1431024132000)"};
}

```

Note: For more information about support for HBase Java Filters by the HPE Ezmeral Data Fabric Database C API, see [HBase Java Filters Support](#) on page 2755

Impersonation Example

This sample application demonstrates the capabilities of the new C API for impersonation.

The sample also shows how to use the API in your own programs. The application is located in the `/opt/mapr/examples/interactive` directory.

Prerequisite for compiling and running this sample application

Install the `mapr-client` package on the node where you will build the application. See [Installing the Data Fabric Client](#) on page 340. If the `mapr-core` package is already installed, you do not need to install the `mapr-client` package.

Compiling this sample application

To compile and run this sample application, set the `MAPR_IMPERSONATION_ENABLED` environment variable to `true` and then read the instructions in the `README` file in the `/opt/mapr/examples/interactive` directory.

Though the application links against `libjvm`, a Java virtual machine (JVM) is not spawned. However, the `libMapRClient` does have Java dependencies.

Set Time Range Example

This example scans HPE Ezmeral Data Fabric Database binary tables and sets the time range.

```

int32_t scanWithTimeranges( std::string table_name, int32_t num_versions,
    uint64_t max_num_rows, std::string start_row_key,
    std::string end_row_key, int64_t min_ts, int64_t max_ts,
    std::string name_space, std::string column_name) {
    hb_scanner_t scanner = NULL;
    int32_t retCode;

    scan_num_rows = 0;
    scan_cell_count = 0;
    scan_done = false;
    // scanner object create
    hb_scanner_create(client, &scanner);

    scan_data_t *scan_data = (scan_data_t *) calloc(1,
    sizeof(scan_data_t));
}

```

```

        // set the table to scan
        scan_data->table_name_ = bytebuffer_printf("%s",
table_name.c_str());
        hb_scanner_set_table(scanner, (char *)
scan_data->table_name_->buffer, scan_data->table_name_->length));

        // start and end row - optional
        scan_data->start_row_key_ = bytebuffer_printf("%s",
start_row_key.c_str());
        hb_scanner_set_start_row(scanner, scan_data->start_row_key_->buffer,
scan_data->start_row_key_->length);

        scan_data->end_row_key_ = bytebuffer_printf("%s",
end_row_key.c_str());
        hb_scanner_set_end_row(scanner, scan_data->end_row_key_->buffer,
scan_data->end_row_key_->length);

        // add columns
        bytebuffer cfName = bytebuffer_printf("%s",
data_qualifier[0].c_str());
        bytebuffer columnName = bytebuffer_printf("%s",
data_qualifier[1].c_str());
        retCode=hb_scanner_add_column(scanner, (byte_t
*)cfName->buffer, cfName->length, columnName->buffer, columnName->length);

        // set versions
        hb_scanner_set_num_versions(scanner, num_versions);

        // set timerange
        hb_scanner_set_timerange(scanner, min_ts, max_ts);

        // scan data
        retCode = hb_scanner_next(scanner, scan_callback, scan_data);
        return retCode;
}

```

Set Time Stamp Example

This example scans HPE Ezmeral Data Fabric Database binary tables and sets the time stamp.

```

int32_t scanWithTimestamp( std::string table_name, int32_t num_versions,
uint64_t max_num_rows, std::string start_row_key,
                        std::string end_row_key, int64_t ts, std::string
name_space, std::string column_name) {
    hb_scanner_t scanner = NULL;
    int32_t retCode;

    scan_num_rows = 0;
    scan_cell_count = 0;
    scan_done = false;

    // scanner object create
    hb_scanner_create(client, &scanner);

    scan_data_t *scan_data = (scan_data_t *) calloc(1,
sizeof(scan_data_t));

    // set the table to scan
    scan_data->table_name_ = bytebuffer_printf("%s",
table_name.c_str());
    hb_scanner_set_table(scanner, (char *)
scan_data->table_name_->buffer, scan_data->table_name_->length));

```

```

        // start and end row - optional
        scan_data->start_row_key_ = bytebuffer_printf("%s",
start_row_key.c_str());
        hb_scanner_set_start_row(scanner, scan_data->start_row_key_->buffer,
            scan_data->start_row_key_->length);

        scan_data->end_row_key_ = bytebuffer_printf("%s",
end_row_key.c_str());
        hb_scanner_set_end_row(scanner, scan_data->end_row_key_->buffer,
            scan_data->end_row_key_->length);

        // add columns
        bytebuffer cfName = bytebuffer_printf("%s",
data_qualifier[0].c_str());
        bytebuffer columnName = bytebuffer_printf("%s",
data_qualifier[1].c_str());
        retCode=hb_scanner_add_column(scanner, (byte_t
*)cfName->buffer, cfName->length, columnName->buffer, columnName->length);

        // set versions
        hb_scanner_set_num_versions(scanner, num_versions);

        // set timestamp
        hb_scanner_set_timestamp(scanner, ts);

        // scan data
        retCode = hb_scanner_next(scanner, scan_callback, scan_data);
        return retCode;
}

```

Delete Specific Cells Example

This example deletes specific cells that correspond to a specific timestamp.

```

nt32_t deleteRowExactTS(std::string table_name, std::string row_key,
    std::vector<std::string> data, int64_t ts) {

    int32_t retCode = 0;
    // initialize delete object
    hb_delete_t del = NULL;

    row_data_t *row_data = (row_data_t *) calloc(1, sizeof(row_data_t));
    row_data->key = bytebuffer_printf("%s", row_key.c_str());
    row_data->tablename = bytebuffer_printf("%s", table_name.c_str());

    // create delete object
    hb_delete_create(row_data->key->buffer, row_data->key->length,
&del);

    cell_data_t *prevCell=NULL;
    // add cells that needs to be deleted
    for(int t=0; t < (int)data.size(); t++) {
        vector<string> data_qualifier = split(data.at(t), ':');
        cell_data_t *cell_data= new_cell_data();
        if(t==0)
            row_data->first_cell = cell_data;
        else
            prevCell->next_cell = cell_data;

        cell_data->columnFamily =
bytebuffer_printf("%s", data_qualifier[0].c_str());
        cell_data->columnName =
bytebuffer_printf("%s", data_qualifier[1].c_str());
    }
}

```

```

        //add column, fam/column/ts to delete the exact version
        retCode=hb_delete_add_column_exact(del,
        cell_data->columnFamily->buffer, cell_data->columnFamily->length,
        cell_data->columnName->buffer, cell_data->columnName->length, ts);
        prevCell = cell_data;
    }

    // set the table name in delete mutation object
    hb_mutation_set_table(del, (const char
*)row_data->tablename->buffer, row_data->tablename->length);

    //send the delete request
    retCode = hb_mutation_send(client, del, delete_callback, row_data);
    return retCode;
}

```

HPE Ezmeral Data Fabric Database Sample C Application

MapR provides a sample C application that accesses and performs operations on HPE Ezmeral Data Fabric Database binary tables. This section describes the various operation performed by the application.

The sample C application is located in the `/opt/mapr/examples/sample` directory.

Prerequisites

In order to compile and run the sample application, install the `mapr-client` package on the node where you will build the application. See [Impersonation Example](#) on page 2739. If the `mapr-core` package is already installed, you do not need to install the `mapr-client` package.

Compiling

To compile and run the sample application, read the instructions in the `README` file in the `/opt/mapr/examples/sample` directory.

Set the log level and specify the log stream

APIs used

These two APIs are defined in the header file `log.h`:

- `hb_log_set_level()`: Sets the log output level. The levels are defined in the header file `types.h`.
- `hb_log_set_stream()`: Sets the location of the log output. By default, log messages are sent to `stderr`.

Code

```

hb_log_set_level(HBASE_LOG_LEVEL_DEBUG); // defaults to INFO
const char *logFilePath = getenv("HBASE_LOG_FILE");
if (logFilePath != NULL) {
    FILE* logFile = fopen(logFilePath, "a");
    if (!logFile) {
        retCode = errno;
        fprintf(stderr, "Unable to open log file \"%s\"", logFilePath);
        perror(NULL);
        goto cleanup;
    }
    hb_log_set_stream(logFile); // defaults to stderr
}
}

```

Log levels are specified in the header file `types.h`.

```
/**
 * Log levels
 */
typedef enum {
    HBASE_LOG_LEVEL_INVALID = 0,
    HBASE_LOG_LEVEL_FATAL   = 1,
    HBASE_LOG_LEVEL_ERROR   = 2,
    HBASE_LOG_LEVEL_WARN    = 3,
    HBASE_LOG_LEVEL_INFO    = 4,
    HBASE_LOG_LEVEL_DEBUG   = 5,
    HBASE_LOG_LEVEL_TRACE   = 6
} HBaseLogLevel;
```

Create a connection

API used: `hb_connection_create()`

Use this function to connect to the MapR cluster.

This API takes three parameters:

```
const char *zk_ensemble,      /* [in] NULL terminated, comma separated
                              * string of CLDB servers. e.g.
                              * "<server1[:port]>,..." */
const char *zk_root,         /* [in] Ignored for MapR-DB. */
hb_connection_t *connection_ptr); /* [out] pointer to hb_connection_t */
```

There are two methods by which you can use the `zk_ensemble` parameter to determine how the MapR client connection locates the MapR cluster to connect to:

Set `zk_ensemble` to NULL to connect to the default cluster that is defined in the `mapr-clusters.conf` file.

Set `zk_ensemble` to a string that includes hostnames or IP addresses.

MapR recommends this method, which uses the configuration information that is listed for the cluster in the `mapr-clusters.conf` file.

With this method, the client application can connect to a non-default cluster explicitly. The client application searches through the `mapr-clusters.conf` file to find a cluster entry with a matching hostname/IP address. The first entry that is found to contain a matching `hostname[:port]/IP address[:port]` is used for the connection, as is the configuration information for that entry.

If none of the hostnames or IP addresses specified for `zk_ensemble` are located in entries in `mapr-clusters.conf`, or if `mapr-clusters.conf` does not exist, the client application tries to connect to the first specified `hostname[:port]/IP address[:port]`. If the client application cannot make a connection, it moves to the next specified `hostname[:port]/IP address[:port]`.

Warning: Because no `mapr-clusters.conf` file is involved, no additional configuration information is used for connections. For example, connections made in this way cannot be secure because no security parameters are provided.

Examples

```
//connect to default cluster specified in mapr-clusters.conf (preferred)
if ((err = hb_connection_create(NULL,
                               NULL,
                               &connection)) != 0) {
    HBASE_LOG_ERROR("Could not create MapR-DB connection : errorCode = %d.",
err);
    goto cleanup;
}

//Connect directly to cluster with these specified IP addresses.
//Typically this means there is no mapr-clusters.conf and security not used.
if ((err = hb_connection_create("192.168.1.1:7222,192.168.1.2:7222",
                               NULL /* ignored */,
                               &connection)) != 0) {
    HBASE_LOG_ERROR("Could not create MapR-DB connection : errorCode = %d.",
err);
    goto cleanup;
}
```

Code in the sample application

```
if ((retCode = hb_connection_create(zk_ensemble,
                                   zk_root_znode,
                                   &connection)) != 0) {
    HBASE_LOG_ERROR("Could not create HBase connection : errorCode = %d.",
retCode);
    goto cleanup;
}
```

This API is defined in the header file `connection.h`:

Create a table

The sample application creates a table by calling a function named `ensureTable`.

APIs used

The definition of this function uses these APIs:

APIs defined in the header file `admin.h`.

- `hb_admin_table_create()`: Creates a table. Returns 0 on success or an error code.
- `hb_admin_table_delete()`: Deletes a table. Returns 0 on success or an error code.
- `hb_admin_destroy()`: Disconnects the `hb_admin` object, releasing any internal objects or connections that were created in the background.
- `hb_admin_table_disable()`: Disables an HBase table. Returns 0 on success or an error code. Only sets a flag in memory to say that the table is disabled.

Note: Tables never need to be disabled or enabled in HPE Ezmeral Data Fabric Database, which has no notion of disabling or enabling tables. However, applications ported from HBase to HPE Ezmeral Data Fabric Database will attempt to disable and enable tables. By placing a flag in memory, HPE Ezmeral Data Fabric Database allows those applications to proceed without error when performing admin functions on tables.

- `hb_admin_table_enable()`: Enables an HBase table. Returns 0 on success or an error code. As with `hb_admin_table_enable`, this function sets a flag in memory and performs no other operation.

- `hb_admin_table_enabled()`: Checks whether an HBase table is enabled. Returns 0 if the table is enabled. If the table is disabled, returns either the error message `HBASE_TABLE_DISABLED` or an error code, if an error occurs. In HPE Ezmeral Data Fabric Database, this API only checks for the existence of an in-memory flag that indicates whether to consider a table as disabled or enabled.
- `hb_admin_table_exists()`: Checks whether a table exists. Returns 0 on success or an error code.

APIs defined in the header file `coldesc.h`.

- `hb_coldesc_create()`: Creates a column-family descriptor. Returns a handle to an `hb_columndesc` object or `NULL`, if unsuccessful.
- `hb_coldesc_set_maxversions()`: Sets the maximum number of cell versions to be retained for the column family. The default is 3.
- `hb_coldesc_set_minversions()`: Sets the minimum number of cell versions to be retained for the column family. The default is 0.
- `hb_coldesc_set_ttl()`: Sets the time-to-live value in seconds for data in column cells. The default is forever.
- `hb_coldesc_set_inmemory()`: Boolean. Determines whether preference is given to values of this column family for storage with row keys. Because row keys are cached in memory in preference to row data, column-family data that is stored inline with the row keys is also cached in memory.

For all column families in a table together, up to 200 bytes of row data will be stored inline with each row key. Storing data inline with a row key might speed retrieval of the data from a column family because disk access can often be avoided. For each column family, up to 32 bytes can be stored inline with each row key even if its `inmemory` parameter is set to `false`, but preference will be given to column families where this parameter is set to `true`. A column family can have more than 32 bytes stored inline if its `inmemory` parameter is set to `true`.

If the total number of bytes for all column families together exceeds 200 for a row, then preference for inclusion within the inline storage for that row is given to column families that have the `inmemory` parameter set to `true`. All of the data for a column family will be stored in-line with the row key, or none will be. If the contents in a column family for a particular row are larger than the maximum number of bytes that are allowed to be stored for that column family, no data at all will be stored in-line for that column family.

The default value for the `inmemory` parameter is `false`.

- `hb_coldesc_destroy()`: Releases resources that are held by a column-family descriptor.

Sequence of steps in the `ensureTable` function

1. Create an admin handle from the connection.
2. Using the admin handle, check whether the specified table exists.
3. If the table exists, delete it.
4. Specify columns and column families for the table.
5. Create the table.
6. Check whether the table is enabled. If it isn't enabled, enable it.
7. Disable the table and then enable it again.
8. Destroy the column descriptors.

9. Destroy the hb_admin structure.

Code for the ensureTable function at line 325

```

static int
ensureTable(hb_connection_t connection, const char *table_name) {
    int32_t retCode = 0;
    hb_admin_t admin = NULL;

    if ((retCode = hb_admin_create(connection, &admin)) != 0) {
        HBASE_LOG_ERROR("Could not create HBase admin : errorCode = %d.",
retCode);
        goto cleanup;
    }

    if ((retCode = hb_admin_table_exists(admin, NULL, table_name)) == 0) {
        HBASE_LOG_INFO("Table '%s' exists, deleting...", table_name);
        if ((retCode = hb_admin_table_delete(admin, NULL, table_name)) != 0) {
            HBASE_LOG_ERROR("Could not delete table %s[%d].", table_name,
retCode);
            goto cleanup;
        }
    } else if (retCode != ENOENT) {
        HBASE_LOG_ERROR("Error while checking if the table exists: errorCode =
%d.", retCode);
        goto cleanup;
    }

    hb_coldesc_create(FAMILIES[0], 1, &HCD[0]);
    hb_coldesc_set_maxversions(HCD[0], 2);
    hb_coldesc_set_minversions(HCD[0], 1);
    hb_coldesc_set_ttl(HCD[0], 2147480000);
    hb_coldesc_set_inmemory(HCD[0], 1);

    hb_coldesc_create(FAMILIES[1], 1, &HCD[1]);

    HBASE_LOG_INFO("Creating table '%s'...", table_name);
    if ((retCode = hb_admin_table_create(admin, NULL, table_name, HCD, 2)) ==
0) {
        HBASE_LOG_INFO("Table '%s' created, verifying if enabled.", table_name);
        retCode = hb_admin_table_enabled(admin, NULL, table_name);
        CHECK_API_ERROR(retCode,
            "Table '%s' is %senabled, result %d.", table_name, retCode?"not
":"");
        retCode = hb_admin_table_disable(admin, NULL, table_name);
        CHECK_API_ERROR(retCode,
            "Attempted to disable table '%s', result %d.", table_name);
        retCode = hb_admin_table_disable(admin, NULL, table_name);
        CHECK_API_ERROR(retCode,
            "Attempted to disable table '%s' again, result %d.", table_name);
        retCode = hb_admin_table_enable(admin, NULL, table_name);
        CHECK_API_ERROR(retCode,
            "Attempted to enable table '%s', result %d.", table_name);
        retCode = hb_admin_table_enable(admin, NULL, table_name);
        CHECK_API_ERROR(retCode,
            "Attempted to enable table '%s' again, result %d.", table_name);
    }
    hb_coldesc_destroy(HCD[0]);
    hb_coldesc_destroy(HCD[1]);

cleanup:
    if (admin) {
        hb_admin_destroy(admin, NULL, NULL);
    }
}

```

```

    }
    return retCode;
}

```

Code to call the ensureTable function

```

if ((retCode = ensureTable(connection, table_name)) != 0) {
    HBASE_LOG_ERROR("Failed to ensure table %s : errorCode = %d", table_name,
retCode);
    goto cleanup;
}

```

Create a client

API used

`hb_client_create()`: Initializes a handle to `hb_client_t` object that can be passed to other APIs. You need to use this method only once per cluster. The returned handle is thread-safe. This API is defined in the `client.h` header file.

Code

```

if ((retCode = hb_client_create(connection, &client)) != 0) {
    HBASE_LOG_ERROR("Could not connect to HBase cluster : errorCode = %d.",
retCode);
    goto cleanup;
}

```

Asynchronously put ten rows of one cell each

APIs used in this operation

The first 6 APIs are defined in the header file `mutations.h`:

- `hb_put_create()`: Creates a structure for the put operation and returns its handle.
- `hb_mutation_set_table()`: Sets the name of the table for the put operation.
- `hb_mutation_set_bufferable()`: Sets whether or not the RPC call for the put operation can be buffered on the client side.
- `hb_put_add_cell()`: Adds a cell to the put structure. The row key of the cell must be the same as the row key of the put structure.
- `hb_mutation_send()`: Queues the put operation for sending to the server. Mutations are not performed atomically and can be batched in a non-deterministic way on either the client side or the server side. Any buffer attached to a mutation object (put or delete) must not be altered until the callback has been received.

The last API is defined in the header file `client.h`:

- `hb_client_flush()`: Flushes any buffered client-side write operations to the server. The callback is invoked after everything that was buffered at the time of the call is flushed. Invocation of the callback is a guarantee that all outstanding RPC calls are complete.

Sequence of steps in this code extract

1. Create a row object named `row_data`.

2. Create a put object.
3. Specify the name of the table.
4. Set whether or not the RPC call for the put operation can be buffered on the client side.
5. Create cell data.
6. Create a cell.
7. Add the cell to the row.
8. Queue the put.
9. After following the steps above 10 times, flush the puts to the server.
10. Wait for the RPC calls to complete.

Code

```
// let's send a batch of 10 puts with single cell asynchronously
outstanding_puts_count += num_puts;
for (int i = 0; i < num_puts; ++i) {
    row_data_t *row_data = (row_data_t *) calloc(1, sizeof(row_data_t));
    row_data->key = bytebuffer_printf("%s%02d", rowkey_prefix, i);
    hb_put_create(row_data->key->buffer, row_data->key->length, &put);
    hb_mutation_set_table(put, table_name, table_name_len);
    hb_mutation_set_durability(put, DURABILITY_SKIP_WAL);
    hb_mutation_set_bufferable(put, false);

    cell_data_t *cell_data = new_cell_data();
    row_data->first_cell = cell_data;
    cell_data->value = bytebuffer_printf("%s%02d", value_prefix, i);

    hb_cell_t *cell = (hb_cell_t*) calloc(1, sizeof(hb_cell_t));
    cell_data->hb_cell = cell;

    cell->row = row_data->key->buffer;
    cell->row_len = row_data->key->length;
    cell->family = FAMILIES[rand() % 2];
    cell->family_len = 1;
    cell->qualifier = column_a->buffer;
    cell->qualifier_len = column_a->length;
    cell->value = cell_data->value->buffer;
    cell->value_len = cell_data->value->length;
    cell->ts = HBASE_LATEST_TIMESTAMP;

    hb_put_add_cell(put, cell);
    HBASE_LOG_INFO("Sending row with row key : '%.*s'.",
                  cell->row_len, cell->row);
    hb_mutation_send(client, put, put_callback, row_data);
}
hb_client_flush(client, client_flush_callback, NULL);
wait_for_flush();

wait_for_puts(); // outside the loop, wait for 10 puts to complete
```

Asynchronously put two cells in a single row

APIs used

These APIs are defined in the header file `mutations.h`:

- `hb_put_create()`: Creates a structure for the put operation and returns its handle.
- `hb_mutation_set_table()`: Sets the table name for the mutation.
- `hb_put_add_cell()`: Adds a cell to the put structure. The row key of the cell must be the same as the row key of the put structure.
- `hb_mutation_send()`: Queues the put operation for sending to the server. Mutations are not performed atomically and can be batched in a non-deterministic way on either the client side or the server side. Any buffer attached to a mutation object (put or delete) must not be altered until the callback has been received.

Sequence of steps

1. Create a row object named `row_data`.
2. Create a put object.
3. Specify the name of the table.
4. Create cell data for the first cell.
5. Create the first cell.
6. Add the data to the first cell.
7. Add the first cell to the row.
8. Create cell data for the second cell.
9. Create the second cell.
10. Add the data to the second cell.
11. Add the second cell to the row.
12. Queue the put.
13. Wait 3 seconds, flush the queue, and wait for the RPC calls to complete.

`wait_for_puts()` without `hb_client_flush()`: Waits for all outstanding put requests to be flushed. If `hb_client_flush()` is not called before `wait_for_puts()`, it can take up to three seconds for outstanding put requests to be flushed.

Code

```
// now, let's put two cells in a single row
outstanding_puts_count++;
{
    row_data_t *row_data = (row_data_t *) calloc(1, sizeof(row_data_t));
    row_data->key = bytearray_printf("row_with_two_cells");
    hb_put_create(row_data->key->buffer, row_data->key->length, &put);
    hb_mutation_set_table(put, table_name, table_name_len);
    hb_mutation_set_durability(put, DURABILITY_SYNC_WAL);

    // first cell
    cell_data_t *cell1_data = new_cell_data();
    row_data->first_cell = cell1_data;
    cell1_data->value = bytearray_printf("cell1_value_v1");
}
```

```

hb_cell_t *cell1 = (hb_cell_t*) calloc(1, sizeof(hb_cell_t));
cell1_data->hb_cell = cell1;

cell1->row = row_data->key->buffer;
cell1->row_len = row_data->key->length;
cell1->family = FAMILIES[0];
cell1->family_len = 1;
cell1->qualifier = column_a->buffer;
cell1->qualifier_len = column_a->length;
cell1->value = cell1_data->value->buffer;
cell1->value_len = cell1_data->value->length;
cell1->ts = 1391111111111L;
hb_put_add_cell(put, cell1);

// second cell
cell_data_t *cell2_data = new_cell_data();
cell1_data->next_cell = cell2_data;
cell2_data->value = bytearray_printf("cell2_value_v1");

hb_cell_t *cell2 = (hb_cell_t*) calloc(1, sizeof(hb_cell_t));
cell2_data->hb_cell = cell2;

cell2->row = row_data->key->buffer;
cell2->row_len = row_data->key->length;
cell2->family = FAMILIES[1];
cell2->family_len = 1;
cell2->qualifier = column_b->buffer;
cell2->qualifier_len = column_b->length;
cell2->value = cell2_data->value->buffer;
cell2->value_len = cell2_data->value->length;
cell2->ts = 1391111111111L;
hb_put_add_cell(put, cell2);

HBASE_LOG_INFO("Sending row with row key : '%.*s'.",
                cell1->row_len, cell1->row);
hb_mutation_send(client, put, put_callback, row_data);
wait_for_puts();
}

```

Asynchronously put a second version in one column of one row

APIs used

These APIs are defined in the header file mutations.h:

- `hb_put_create()`: Creates a structure for the put operation and returns its handle.
- `hb_mutation_set_table()`: Sets the table name for the mutation.
- `hb_put_add_cell()`: Adds a cell to the put structure. The row key of the cell must be the same as the row key of the put structure.
- `hb_mutation_send()`: Queues the put operation for sending to the server. Mutations are not performed atomically and can be batched in a non-deterministic way on either the client side or the server side. Any buffer attached to a mutation object (put or delete) must not be altered until the callback has been received.

Sequence of steps

1. Create a row object named `row_data`.
2. Create a put object.

3. Specify the name of the table.
4. Create cell data for the first cell.
5. Create the first cell.
6. Add the data to the cell, using a later timestamp than in the previous operation.
7. Add the first cell to the row.
8. Queue the put.
9. Wait 3 seconds, flush the queue, and wait for the RPC calls to complete.

Code

```
// now, let's put second version in one column
outstanding_puts_count++;
{
    row_data_t *row_data = (row_data_t *) calloc(1, sizeof(row_data_t));
    row_data->key = bytebuffer_printf("row_with_two_cells");
    hb_put_create(row_data->key->buffer, row_data->key->length, &put);
    hb_mutation_set_table(put, table_name, table_name_len);
    hb_mutation_set_durability(put, DURABILITY_SYNC_WAL);

    // first cell
    cell_data_t *cell1_data = new_cell_data();
    row_data->first_cell = cell1_data;
    cell1_data->value = bytebuffer_printf("cell1_value_v2");

    hb_cell_t *cell1 = (hb_cell_t*) calloc(1, sizeof(hb_cell_t));
    cell1_data->hb_cell = cell1;

    cell1->row = row_data->key->buffer;
    cell1->row_len = row_data->key->length;
    cell1->family = FAMILIES[0];
    cell1->family_len = 1;
    cell1->qualifier = column_a->buffer;
    cell1->qualifier_len = column_a->length;
    cell1->value = cell1_data->value->buffer;
    cell1->value_len = cell1_data->value->length;
    cell1->ts = 1392222222222L;
    hb_put_add_cell(put, cell1);

    HBASE_LOG_INFO("Sending row with row key : '%.*s'.",
                  cell1->row_len, cell1->row);
    hb_mutation_send(client, put, put_callback, row_data);
    wait_for_puts();
}
```

Scan the entire table

APIs used

These APIs and more are defined in the header file `scanner.h`:

- `hb_scanner_create()`: Creates a client side row scanner. The returned scanner is not thread safe. No RPC will be invoked until the call to fetch the next set of rows is made. You can set the various attributes of this scanner until that point. @returns 0 on success, non-zero error code in case of failure.
- `hb_scanner_next()`: Request the next set of results from the server. You can set the maximum number of rows returned by this call using `hb_scanner_set_num_max_rows()`.

- `hb_scanner_num_max_rows()`: Sets the maximum number of rows to scan per call to `hb_scanner_next()`.
- `hb_scanner_num_versions()`: Sets the maximum versions of a column to fetch.
- `hb_scanner_set_table()`: Sets the name of the table to scan.

Sequence of steps

1. Create the scanner object.
2. Set the name of the table to scan.
3. Set the number of rows to scan at a time.
4. Set the number of versions to scan.
5. Request the next set of results from the server.
6. `wait_for_scan()`: wait for the rpc call to complete.

Code

```
// now, scan the entire table
{
    hb_scanner_t scanner = NULL;
    hb_scanner_create(client, &scanner);
    hb_scanner_set_table(scanner, table_name, table_name_len);
    hb_scanner_set_num_max_rows(scanner, 3); // maximum 3 rows at a time
    hb_scanner_set_num_versions(scanner, 10); // up to 10 versions of the
cell
    hb_scanner_next(scanner, scan_callback, NULL); // dispatch the call
    wait_for_scan();
}
```

Fetch a row that has two cells

APIs used

- `hb_get_add_column()`: Adds a column family and optionally a column qualifier to an `hb_get_t` object.
- `hb_get_create()`: Creates an `hb_get_t` object and populates the handle `get_ptr`.
- `hb_get_send()`: Queues the get request. The callback specified by `cb` is called on completion. Any buffers attached to the get object can be reclaimed only after the callback is received.
- `hb_get_set_num_versions()`: Sets maximum number of latest values of each column to be fetched. This API is optional.
- `hb_get_set_table()`: Sets the name of the table to get data from.

Sequence of steps

1. Create a row object named `rowKey`.
2. Create a get object.
3. Specify the column families and optional column qualifiers to get values from.

4. Specify the name of the table.
5. Specify the number of versions of the column values to get.
6. Queue the get request.
7. Wait for the get to complete.

Code

```
// fetch a row with row-key="row_with_two_cells"
{
  bytearray rowKey = bytearray_strcpy("row_with_two_cells");
  hb_get_t get = NULL;
  hb_get_create(rowKey->buffer, rowKey->length, &get);
  hb_get_add_column(get, FAMILIES[0], 1, NULL, 0);
  hb_get_add_column(get, FAMILIES[1], 1, NULL, 0);
  hb_get_set_table(get, table_name, table_name_len);
  hb_get_set_num_versions(get, 10); // up to ten versions of each column
  get_done = false;
  hb_get_send(client, get, get_callback, rowKey);
  wait_for_get();
}
```

Delete a specific version of a column in the row that was fetched

APIs used

The APIs that are used are defined in the header file `mutations.h`.

- `hb_delete_add_column()`: Set the column criteria for `hb_delete_t` object. Set the qualifier to `NULL` to delete all columns of a family. Only the cells with timestamp less than or equal to the specified timestamp are deleted. Set the timestamp to `INT64_MAX` to delete all versions of the column. This API is optional for deletes.
- `hb_delete_create()`: Creates a structure for delete operation and return its handle.
- `hb_mutation_set_table()`: Sets the table name for the mutation.
- `hb_mutation_send()`: Queues the put operation for sending to the server. Mutations are not performed atomically and can be batched in a non-deterministic way on either the client side or the server side. Any buffer attached to a mutation object (put or delete) must not be altered until the callback has been received.

Sequence of steps

1. Create a delete object for a row with a particular row key.
2. Add a column to the delete object.
3. Specify the name of the table from which to delete the cell version.
4. Queue the delete.
5. Wait three seconds for the delete to be flushed, then wait for the RPC call to complete.

Code

```
// delete a specific version of a column
{
  bytearray rowKey = bytearray_strcpy("row_with_two_cells");
  hb_delete_t del = NULL;
  hb_delete_create(rowKey->buffer, rowKey->length, &del);
  hb_delete_add_column(del, FAMILIES[0], 1,
    column_a->buffer, column_a->length, 1391111111112L);
  hb_mutation_set_table(del, table_name, table_name_len);
  delete_done = false;
  hb_mutation_send(client, del, delete_callback, rowKey);
  wait_for_delete();
}
```

Destroy the client and the connection

APIs used

- `hb_client_destroy()`: Cleans up `hb_client_t` handle and releases any held resources. The callback is called after the connections are closed, but just before the client is freed. This API is defined in the header file `client.h`.
- `hb_connection_destroy()`: Destroys the connection and frees all resources allocated at creation time. This API is defined in the header file `connection.h`.

Sequence of steps

1. Destroy the client.
2. Destroy the connection.

Code

```
if (client) {
  HBASE_LOG_INFO("Disconnecting client.");
  hb_client_destroy(client, client_disconnection_callback, NULL);
  wait_client_disconnection();
}
if (connection) {
  hb_connection_destroy(connection);
}
```

Building and Launching C Applications

This topic describes basic setup for building and launching C application using the MapR `libMapRClient` C API library

Prerequisites

The HPE Ezmeral Data Fabric Database `libMapRClient` C API library is MapR's extension of the `libhbase` C API library). The `libMapRClient` header files are in this directory: **`/opt/mapr/include/hbase`**

- Verify that the `mapr-client` package is installed on the node. The `mapr-client` package must be installed on each node that builds an application. The `libMapRClient` header files are in this directory: `/opt/mapr/include/hbase`.
- Verify that both the `libMapRClient` library and `libjvm` shared libraries are in the application's library search path.

Building Applications

When building applications that use `libMapRClient`, run this command:

```
gcc -o <application_name> <source_file> -I/opt/mapr/include/hbase -L/opt/mapr/lib/ -lMapRClient -L/usr/lib/jvm/java-7-sun/jre/lib/amd64/server -ljvm
```

For example, the following command builds the `hello_hbase` application with the `hello_hbase.c` source code:

```
gcc -o hello_hbase hello_hbase.c -I/opt/mapr/include/hbase -L/opt/mapr/lib/ -lMapRClient -L/usr/lib/jvm/java-7-sun/jre/lib/amd64/server -ljvm
```

Note:

- The compiled `libMapRClient` is statically linked to the following third-party libraries: `Crypto++: libcryptoapp.a (v5.6.2)` `Protobuf: libprotobuf-lite.a (v2.5.0)`
- The `libMapRClient` library has dependencies on `libjvm`, though a JVM is not instantiated. In general, the `libjvm` library is located within the JDK/JRE installation directory.

Launching Applications

Before launching an application, set this value for the environment variable `LD_LIBRARY_PATH`:

```
/opt/mapr/lib:/usr/lib/jvm/java-6-openjdk-amd64/jre/lib/amd64/server
```

If the client is on Windows, append the following directories to the `PATH` environment variable:

- `$MAPR_HOME/lib`
- `$JAVA_HOME/bin/server`

If the application uses the `hb_connection_create_as_user` API for impersonation, set the `MAPR_IMPERSONATION_ENABLED` environment variable to `true`.

What To Do Next

Launch the application!

HBase Java Filters Support

The `hb_get_set_filter()` and `hb_scanner_set_filter()` C APIs are used to filter the results of GET and SCAN operations. These APIs are in the `get.h` and `scanner.h` header files.

They both take filters that are passed as strings, as well as the length of these strings. HPE Ezmeral Data Fabric Database parses the strings to construct filters.

Their signatures are:

```
int32_t hb_get_set_filter(hb_get_t get, const byte_t *filter, const int32_t filterLen);
int32_t hb_scanner_set_filter(hb_scanner_t scanner, const byte_t *filter, const int32_t filterLen);
```

For examples, see [Filtering GET Operation Results Example](#) on page 2738 and [Filtering SCAN Operation Results Example](#) on page 2738.

Filter Format and Arguments

Filters are specified in the Thrift Filter Language and are in this format: `FilterName (argument, argument, ... , argument)`. Arguments that represent strings are enclosed in single quotation marks

(`'`). Arguments that represent booleans, integers, or comparison operators (`<`, `<=`, `=`, `!=`, `>`, `>=`) are not enclosed in single quotation marks.

Binary Operators

You can combine filters by using the binary operators `AND` and `OR`. For example, `PrefixFilter ('Row') AND PageFilter (1) AND FirstKeyOnlyFilter ()` returns all key-value pairs that match the following conditions:

- The row containing the key-value must start with the prefix "Row".
- The key-value must be located in the first row of the table.
- The key-value must be the first key-value pair in the row.

For another example, `(RowFilter (=, 'binary:Row 1') AND TimeStampsFilter (74689, 89734)) OR ColumnRangeFilter ('abc', true, 'xyz', false)` returns all key-value pairs that

Match both of the following conditions:

- The key-value is in a row for which the row key is "Row 1".
- The key-value has a timestamp of either 74689 or 89734.

Or match this condition:

- The key-value is located in a column that is lexicographically greater than or equal to "abc" and less than "xyz".

Unary Operators

You can also use the following unary operators with filters:

- `SKIP`

For a particular row, if any of the key-values don't pass the filter condition, the entire row is skipped. For example, `SKIP ValueFilter (0)` omits rows in which any values are not 0.

- `WHILE`

Rows are tested in order against the filter condition. Rows that meet the condition are included in the result set. When a row fails to meet the condition, filter processing stops and no more rows are tested.

Evaluation of Filters

When filters are combined with the binary operators, unary operators, or both, they are evaluated according to these rules:

1. First, evaluate the contents of parentheses.
2. Next, evaluate filters that use unary operators. Both `SKIP` and `WHILE` operators have the same precedence.
3. Finally, evaluate filters that use the binary operators. `AND` has higher precedence than `OR`.

For example, in a filter of the form `Filter1 AND Filter2 OR Filter3`, `Filter1 AND Filter2` is evaluated and the result is `X`. Then, `X OR Filter3` is evaluated.

For another example, a filter of the form `Filter1 AND SKIP Filter2 OR Filter3` is evaluated in these steps:

1. Evaluate `SKIP Filter2` with the result being `X`.

2. Evaluate `Filter1 AND X` with the result being `Y`.
3. Evaluate `Y OR Filter3`.

Compare Operators and Comparators

This topic describes the compare operators and comparators for comparison filters.

The comparison filters `DependentColumnFilter`, `FamilyFilter`, `QualifierFilter`, `RowFilter`, and `ValueFilter` use the following syntax:

```
filter(<compareOperator>, <comparatorType:Value>)
```

Compare Operators

The following compare operators are supported: `<`, `<=`, `=`, `!=`, `>`, `>=`

Comparators

There are four comparators:

| Comparator | Description |
|------------------------|---|
| BinaryComparator | This comparator lexicographically compares against the specified byte array . Values are byte arrays. For example, <code>binary:abc</code> matches values that are lexicographically greater than "abc". |
| BinaryPrefixComparator | This comparator lexicographically compares against a specified byte array. It only compares up to the length of this byte array. Values are byte arrays. For example, <code>binaryprefix:abc</code> matches values in which the first 3 characters are lexicographically equal to "abc" |
| RegexStringComparator | This comparator compares against the specified byte array using the given regular expression. You can use only the <code>=</code> and <code>!=</code> compare operators with this comparator. Values are regular expressions. For example, <code>regexstring:ab*yz</code> matches values that begin with "ab" and end with "yz". |
| SubStringComparator | This comparator tests whether the given substring appears in a specified byte array. The comparison is case insensitive. You can use only the <code>=</code> and <code>!=</code> compare operators with this comparator. Values are strings. For example, <code>substring:abc123</code> matches values that contains the substring "abc123". |

Supported Filters

| Filter | Format | Description |
|---------------------------------------|--|---|
| ColumnCountGetFilter | <code>ColumnCountGetFilter(x)</code> | Returns the first x columns in a row. Used for GET operations. |
| ColumnPaginationFilter | <code>ColumnPaginationFilter(x,y)</code> | Returns the first x columns after the number y of columns that is specified for the offset. |
| ColumnPrefixFilter | <code>ColumnPrefixFilter('prefix')</code> | Returns only those key-values in columns that have names that start with the specified prefix. The column prefix must be of the form "qualifier". |
| ColumnRangeFilter | <code>ColumnRangFilter('minColumn', 'maxColumn', boolean, boolean)</code> | <p>Returns only those key-values that are in columns that have names between minColumn and maxColumn.</p> <p>For example, if minColumn is 'an', and maxColumn is 'be', the filter returns key-values from columns named 'ana', 'bad', but not from columns named 'bed' or 'eye' If minColumn is null, there is no lower bound. If maxColumn is null, there is no upper bound.</p> <p>This filter also takes two boolean variables to indicate whether to include the minColumn and maxColumn.</p> |
| DependentColumnFilter | <code>DependentColumnFilter('family', 'qualifier')</code> | Tries to locate the specified column in each row and returns all key-values that have the same timestamp in that column. If a row does not contain the specified column, none of the key-values in that row are returned. |
| FamilyFilter | <code>FamilyFilter(compareOperator, 'comparator:value')</code> | Filters by column family. If the comparison returns true, the filter returns all of the key-values in the matching column family. |
| FirstKeyOnlyFilter | <code>FirstKeyOnlyFilter()</code> | Returns the first key-value from each row. |
| FirstKeyValueMatchingQualifiersFilter | <code>FirstKeyValueMatchingQualifier('qualifier_1', 'qualifier_2', ... 'qualifier_n')</code> | Serially compares each qualifier in a row with the given qualifiers. If the current qualifier matches any of the given qualifiers, the filter stops and includes the current row (up to the current qualifier) in the result set. |

| Filter | Format | Description |
|----------------------------|--|--|
| FuzzyRowFilter | <code>FuzzyRowFilter('rowkey', 'fuzzy_info')</code> | <p>Filters data based on fuzzy row key. Performs fast-forwards during scanning. It takes pairs (row key, fuzzy info) to match row keys. Where fuzzy info is a byte array with 0 or 1 as its values:</p> <p>0 - means that this byte in provided row key is fixed, i.e. row key's byte at same position must match</p> <p>1 - means that this byte in provided row key is NOT fixed, i.e. row key's byte at this position can be different from the one in provided row key</p> <p>Example: Let's assume row key format is <code>userId_actionId_year_month</code>. Length of <code>userId</code> is fixed and is 4, length of <code>actionId</code> is 2 and year and month are 4 and 2 bytes long respectively. Let's assume that we need to fetch all users that performed certain action (encoded as "99") in Jan of any year. Then the pair (row key, fuzzy info) would be the following: row key = <code>????_99_????_01</code> (one can use any value instead of "?") fuzzy info = <code>"\x01\x01\x01\x01\x00\x00\x00\x00\x01\x01\x01\x01\x00\x00\x00"</code> i.e. fuzzy info tells the matching mask is <code>????_99_????_01</code>, where at ? can be any value.</p> |
| InclusiveStopFilter | <code>InclusiveStopFilter('rowKey')</code> | Returns all key-values that are in the rows up to and including the specified row that has the specified row key. |
| KeyOnlyFilter | <code>KeyOnlyFilter()</code> | Returns the key component of each key-value. |
| MultipleColumnPrefixFilter | <code>MultipleColumnPrefixFilter('prefix_1', 'prefix_2', ..., 'prefix_n')</code> | Returns the key-values from columns that have names that begin with any of the specified prefixes. |
| PageFilter | <code>PageFilter(pageSize)</code> | Returns the number of rows that is equivalent to the specified page size.. |
| PrefixFilter | <code>PrefixFilter('rowKey_prefix')</code> | Returns the key-values from a row that has a key which starts with the specified row-key prefix. |
| QualifierFilter | <code>QualifierFilter(compareOperator, 'comparator:value')</code> | Filters by column. If the comparison returns true, the filter returns all of the key-values in the matching column. |
| RandomRowFilter | <code>RandomRowFilter(probability)</code> | Filters by probability. For example, <code>RandomRowFilter(0.25)</code> means that there is a 1 in 4 chance that the filter will pick the first row, a 1 in 4 chance that the filter will pick the next row, and so on until all rows in the table have been processed in this way. |

| Filter | Format | Description |
|--------------------------------|---|---|
| RowFilter | <code>RowFilter(compareOperator, 'comparator:value')</code> | Filters by row key. If the comparison returns true, the filter returns all of the key-values in the matching row. |
| SingleColumnValueExcludeFilter | <code>SingleColumnValueExcludeFilter('columnFamily', 'qualifier', compareOperator, 'comparator:value')</code> | This filter takes the same arguments and behaves the same as <code>SingleColumnValueFilter</code> : however, if the column is found and the condition passes, all of the columns of the row will be returned except for the tested column value. |
| SingleColumnValueFilter | <code>SingleColumnValueFilter('columnFamily', 'qualifier', compareOperator, 'comparator:value')</code> | This filter takes a column family, a qualifier, a compare operator and a comparator. If the specified column is not found: all of the columns of that row will be emitted. If the column is found and the comparison with the comparator returns true, all of the columns of the row will be emitted. If the condition fails, the row will not be returned. |
| SkipFilter | <code>SKIP filter</code> | See the description of the SKIP unary operator above . |
| TimeStampsFilter | <code>TimeStampsFilter('timestamp_1', 'timestamp_2', ..., 'timestamp_n')</code> | Returns the key-values that have timestamps that match any of the specified timestamps. |
| ValueFilter | <code>ValueFilter(compareOperator, 'comparator:value')</code> | Filters by key-value. If the comparison returns true, the filter returns the matching key-value. |
| WhileMatchFilter | <code>WHILE filter</code> | See the description of the WHILE unary operator above . |

Creating Java Apps - Binary Tables

This topic describes the supported Apache HBase Java APIs used for CRUD operations on HPE Ezmeral Data Fabric Database binary tables.

HPE Ezmeral Data Fabric Database supports all of the Apache HBase 1.0 Java APIs, except where noted in this documentation. For a number of critical Java APIs, for filters, and for comparators, this documentation explicitly lists what is supported, rather than what is not supported.

Code written for Apache HBase can be easily ported to use HPE Ezmeral Data Fabric Database binary tables.

HPE Ezmeral Data Fabric Database binary tables do not support low-level HBase API calls that are used to manipulate the state of an Apache HBase cluster. HBase API calls that are not supported by HPE Ezmeral Data Fabric Database tables report successful completion to allow legacy code written for Apache HBase to continue executing, but do not perform any actual operations.

Note: For the list of supported HBase v0.98 APIs, refer to the [HBase Java API Support](#) on page 2762.

Compiling and Running HPE Ezmeral Data Fabric Database Binary Applications

For applications that use the HPE Ezmeral Data Fabric Database Java API for binary tables, use Maven to compile and determine the application's dependencies. Then, when you run the application, specify those dependencies in the application's classpath.

Compile and Determine Dependencies

1. Add MapR's maven repository to the list of repositories in your application's `pom.xml`, if it is not there already:

```
<repository>
  <id>mapr-releases</id>
  <url>https://repository.mapr.com/maven/</url>
  <snapshots><enabled>true</enabled></snapshots>
  <releases><enabled>true</enabled></releases>
</repository>
```

2. Add a dependency to the HBase client project:

```
<dependencies>
<dependency>
  <groupId>org.apache.hbase</groupId>
  <artifactId>hbase-client</artifactId>
  <version><version selected from the repository></version>
</dependency>
</dependencies>
```

Note:

- The `hbase-client` version mentioned above is an example. The actual version that your application requires is based on the current EEP and MapR version that you are running. The file versions are listed in the following location: <https://repository.mapr.com/nexus/content/groups/mapr-public/org/apache/hbase/hbase-client/> Ensure that the version tags include reference to `m7-<maprversion>`. Otherwise, your applications will not be able to access HPE Ezmeral Data Fabric Database binary tables.
- If your application uses both the HPE Ezmeral Data Fabric Database JSON and HPE Ezmeral Data Fabric Database Binary APIs, you may encounter a conflict in the `netty` library used by each API. To avoid this, exclude the `netty` library from your `hbase-client` dependency as follows:

```
<dependency>
  <groupId>org.apache.hbase</groupId>
  <artifactId>hbase-client</artifactId>
  <version><version selected from the repository></version>
  <exclusions>
    <exclusion>
      <artifactId>netty-all</artifactId>
      <groupId>io.netty</groupId>
    </exclusion>
  </exclusions>
</dependency>
```

3. Use Maven to compile the application and resolve dependencies. For example, you can run `mvn clean package`.

Running Applications

When you develop a Java application, you can use a dependency management tool such as Maven to compile your application. However, it is recommended that do the following instead:

1. Compile the Java application without including dependencies
2. Specify the required classpath when you submit the application to the cluster

If you choose to bundle the JAR file, and there is a mismatch between the bundled JAR file and the version that your MapR cluster expects, this can result in failures. The failures differ depending on the version of MapR you are using. For more information, see [Using the File System JAR to Connect to the Cluster](#) on page 2649.

If the cluster is secure, the node must also have a mapr ticket configured for the user that runs the application.

You can use the following command to launch HPE Ezmeral Data Fabric Database binary applications:

```
java -cp <classpath>:. -Djava.library.path=/opt/mapr/lib <main class JAR>
<command line arguments>
```

Note: The classpath should include items that are part of the 'hbase classpath' script plus any other required dependencies.

HBase Java API Support

This topic describes the methods in the Apache HBase Java API library that are supported for HPE Ezmeral Data Fabric Database tables.

Admin Method Support

This topic lists the methods that the HPE Ezmeral Data Fabric Database supports in the HBase interface Admin.

The HPE Ezmeral Data Fabric Database tables support the following HBase methods, except where noted.

`abort(String why, Throwable e)`

Modifier and Type: void

Purpose: Aborts the server or client

Supported: No

`addColumn(TableName tableName, HColumnDescriptor column)`

Modifier and Type: void

Purpose: Adds a column to an existing table

Supported: Yes

`assign(byte[] regionName)`

Modifier and Type: void

Purpose: Assigns a region

Supported: No

`balancer()`

Modifier and Type: boolean

Purpose: Invokes the balancer

Note: The HPE Ezmeral Data Fabric Database does not require balancing. Therefore, the method is ignored.

Supported: No

`cloneSnapshot(byte[] snapshotName, TableName tableName)`

Modifier and Type: void

Purpose: Creates a new table by cloning the snapshot content

Supported: No

`cloneSnapshot(String snapshotName, TableName tableName)`

Modifier and Type: void

Purpose: Creates a new table by cloning the snapshot content

Supported: No

| | |
|---|---|
| <code>close()</code> | <i>Modifier and Type:</i> void <i>Purpose:</i> Releases any resources held <i>Supported:</i> Yes |
| <code>closeRegion(byte[] regionname, String serverName)</code> | <i>Modifier and Type:</i> void <i>Purpose:</i> Closes a region <i>Supported:</i> No |
| <code>closeRegion(ServerName sn, HRegionInfo hri)</code> | <i>Modifier and Type:</i> void <i>Purpose:</i> Closes a region <i>Supported:</i> No |
| <code>closeRegion(String regionname, String serverName)</code> | <i>Modifier and Type:</i> void <i>Purpose:</i> Closes a region <i>Supported:</i> No |
| <code>closeRegionWithEncodedRegionName(String encodedRegionName, String serverName)</code> | <i>Modifier and Type:</i> boolean <i>Purpose:</i> For expert administrators. <i>Supported:</i> No |
| <code>compact(TableName tableName, byte[] columnFamily)</code> | <i>Modifier and Type:</i> void <i>Purpose:</i> Compacts a column family within a table <i>Supported:</i> No |
| <code>compact(TableName tableName)</code> | <i>Modifier and Type:</i> void <i>Purpose:</i> Compacts a table <i>Supported:</i> No |
| <code>compactRegion(byte[] regionName, byte[] columnFamily)</code> | <i>Modifier and Type:</i> void <i>Purpose:</i> Compacts a column family within a region <i>Supported:</i> No |
| <code>compactRegion(byte[] regionName)</code> | <i>Modifier and Type:</i> void <i>Purpose:</i> Compacts an individual region <i>Supported:</i> No |
| <code>compactRegionServer(ServerName sn, boolean major)</code> | <i>Modifier and Type:</i> void <i>Purpose:</i> Compacts all regions on the region server <i>Supported:</i> No |
| <code>coprocessorService()</code> | <i>Modifier and Type:</i> CoprocessorRpcChannel <i>Purpose:</i> Creates and returns a RpcChannel instance connected to the active master <i>Supported:</i> No |
| <code>coprocessorService(ServerName sn)</code> | <i>Modifier and Type:</i> CoprocessorRpcChannel <i>Purpose:</i> Creates and returns a RpcChannel instance connected to the active master <i>Supported:</i> No |
| <code>createNamespace(NamespaceDescriptor descriptor)</code> | <i>Modifier and Type:</i> void <i>Purpose:</i> Creates a new namespace <i>Supported:</i> No |
| <code>createTable(HTableDescriptor desc, byte[] startKey, byte[] endKey, int numRegions)</code> | <i>Modifier and Type:</i> void |

| | |
|--|---|
| | <i>Purpose:</i> Creates a new table with the specified number of regions |
| | <i>Supported:</i> Yes |
| <code>createTable(HTableDescriptor desc, byte[][] splitKeys)</code> | <i>Modifier and Type:</i> void |
| | <i>Purpose:</i> Creates a new table with an initial set of empty regions defined by the specified split keys |
| | <i>Supported:</i> Yes |
| <code>createTable(HTableDescriptor desc)</code> | <i>Modifier and Type:</i> void |
| | <i>Purpose:</i> Creates a new table |
| | <i>Supported:</i> Yes |
| <code>createTableAsync(HTableDescriptor desc, byte[][] splitKeys)</code> | <i>Modifier and Type:</i> void |
| | <i>Purpose:</i> Creates a new table but does not block and wait for it to come online |
| |  Note: The HPE Ezmeral Data Fabric Database treats this method as synchronous and returns null when the table is created. |
| | <i>Supported:</i> Yes |
| <code>deleteColumn(String tableName, String columnName)</code> | <i>Modifier and Type:</i> void |
| | <i>Purpose:</i> Deletes a column from a table |
| | <i>Supported:</i> Yes |
| <code>deleteColumn(TableName tableName, byte[] columnName)</code> | <i>Modifier and Type:</i> void |
| | <i>Purpose:</i> Deletes a column from a table |
| | <i>Supported:</i> Yes |
| <code>deleteNamespace(String name)</code> | <i>Modifier and Type:</i> void |
| | <i>Purpose:</i> Deletes an existing namespace. |
| | <i>Supported:</i> No |
| <code>deleteSnapshot(byte[] snapshotName)</code> | <i>Modifier and Type:</i> void |
| | <i>Purpose:</i> Deletes an existing snapshot |
| | <i>Supported:</i> No |
| <code>deleteSnapshot(String snapshotName)</code> | <i>Modifier and Type:</i> void |
| | <i>Purpose:</i> Deletes an existing snapshot |
| | <i>Supported:</i> No |
| <code>deleteSnapshots(Pattern pattern)</code> | <i>Modifier and Type:</i> void |
| | <i>Purpose:</i> Deletes existing snapshots whose names match the specified pattern |
| | <i>Supported:</i> No |
| <code>deleteSnapshots(String regex)</code> | <i>Modifier and Type:</i> void |
| | <i>Purpose:</i> Deletes existing snapshots whose names match the specified pattern |
| | <i>Supported:</i> No |
| <code>deleteTable(String tableName)</code> | <i>Modifier and Type:</i> void |
| | <i>Purpose:</i> Deletes a table |
| | <i>Supported:</i> Yes |
| <code>deleteTable(byte[] tableName)</code> | <i>Modifier and Type:</i> void |

| | |
|---|---|
| | <i>Purpose:</i> Deletes a table |
| | <i>Supported:</i> Yes |
| <code>deleteTable(TableName tableName)</code> | <i>Modifier and Type:</i> void |
| | <i>Purpose:</i> Deletes a table |
| | <i>Supported:</i> Yes |
| <code>deleteTables(Pattern pattern)</code> | <i>Modifier and Type:</i> HTableDescriptor[] |
| | <i>Purpose:</i> Delete tables that match the passed-in pattern, and waits on completion |
| | <i>Supported:</i> Yes |
| <code>deleteTables(String regex)</code> | <i>Modifier and Type:</i> HTableDescriptor[] |
| | <i>Purpose:</i> Delete tables that match the passed-in regular expression, and waits on completion |
| | <i>Supported:</i> Yes |
| <code>disableTable (String tableName)</code> | <i>Modifier and Type:</i> void |
| | <i>Purpose:</i> Disables table, and waits for completion |
| |  Note: The HPE Ezmeral Data Fabric Database does not require disabling of tables. Therefore, although it supports these methods, it only flags the table as disabled, and does not perform any other operation. |
| | <i>Supported:</i> Yes |
| <code>disableTable(TableName tableName)</code> | <i>Modifier and Type:</i> void |
| | <i>Purpose:</i> Disables table, and waits for completion |
| |  Note: The HPE Ezmeral Data Fabric Database does not require disabling of tables. Therefore, although it supports these methods, it only flags the table as disabled, and does not perform any other operation. |
| | <i>Supported:</i> Yes |
| <code>disableTableAsync (String tableName)</code> | <i>Modifier and Type:</i> void |
| | <i>Purpose:</i> Disables the table, but does not block and wait for it be completely disabled |
| | <i>Supported:</i> Yes |
| <code>disableTableAsync(TableName tableName)</code> | <i>Modifier and Type:</i> void |
| | <i>Purpose:</i> Disables the table, but does not block and wait for it be completely disabled |
| | <i>Supported:</i> Yes |
| <code>disableTables(Pattern pattern)</code> | <i>Modifier and Type:</i> HTableDescriptor[] |
| | <i>Purpose:</i> Disables tables that match the passed-in pattern, and waits on completion |
| | <i>Supported:</i> Yes |
| <code>disableTables(String regex)</code> | <i>Modifier and Type:</i> HTableDescriptor[] |
| | <i>Purpose:</i> Disable tables that match the passed-in regular expression, and waits on completion |
| | <i>Supported:</i> Yes |
| <code>enableCatalogJanitor(boolean enable)</code> | <i>Modifier and Type:</i> boolean |

| | |
|---|--|
| <code>enableTable(String tableName)</code> | <p><i>Purpose:</i> Enables/Disables the catalog janitor</p> <p><i>Supported:</i> No</p> <p><i>Modifier and Type:</i> void</p> <p><i>Purpose:</i> Enables a table</p> <p> Note: The HPE Ezmeral Data Fabric Database does not require enabling of tables. Therefore, although it supports this method, it only flags the table as enabled, and does not perform any other operation.</p> <p><i>Supported:</i> Yes</p> |
| <code>enableTable(byte[] tableName)</code> | <p><i>Modifier and Type:</i> void</p> <p><i>Purpose:</i> Enables a table</p> <p> Note: The HPE Ezmeral Data Fabric Database does not require enabling of tables. Therefore, although it supports this method, it only flags the table as enabled, and does not perform any other operation.</p> <p><i>Supported:</i> Yes</p> |
| <code>enableTable(TableName tableName)</code> | <p><i>Modifier and Type:</i> void</p> <p><i>Purpose:</i> Enables a table</p> <p> Note: The HPE Ezmeral Data Fabric Database does not require enabling of tables. Therefore, although it supports this method, it only flags the table as enabled, and does not perform any other operation.</p> <p><i>Supported:</i> Yes</p> |
| <code>enableTableAsync (String tableName)</code> | <p><i>Modifier and Type:</i> void</p> <p><i>Purpose:</i> Enables the table, but does not block and wait for it be completely enabled</p> <p><i>Supported:</i> Yes</p> |
| <code>enableTableAsync(TableName tableName)</code> | <p><i>Modifier and Type:</i> void</p> <p><i>Purpose:</i> Enables the table, but does not block and wait for it be completely enabled</p> <p><i>Supported:</i> Yes</p> |
| <code>enableTables(Pattern pattern)</code> | <p><i>Modifier and Type:</i> HTableDescriptor[]</p> <p><i>Purpose:</i> Enable tables that match the passed-in pattern, and waits on completion</p> <p><i>Supported:</i> Yes</p> |
| <code>enableTables(String regex)</code> | <p><i>Modifier and Type:</i> HTableDescriptor[]</p> <p><i>Purpose:</i> Enable tables that match the passed-in regular expression. and waits on completion</p> <p><i>Supported:</i> Yes</p> |
| <code>execProcedure(String signature, String instance, Map<String,String> props)</code> | <p><i>Modifier and Type:</i> void</p> <p><i>Purpose:</i> Executes a distributed procedure on a cluster</p> <p><i>Supported:</i> No</p> |

| | |
|--|---|
| <code>execProcedureWithRet(String signature, String instance, Map<String,String> props)</code> | <p><i>Modifier and Type:</i> >byte[]</p> <p><i>Purpose:</i> Executes a distributed procedure on a cluster.</p> <p><i>Supported:</i> No</p> |
| <code>flush(TableName tableName)</code> | <p><i>Modifier and Type:</i> >void</p> <p><i>Purpose:</i> Flushes a table</p> <p><i>Supported:</i> Yes</p> |
| <code>flush(byte[] tableNameOrRegionName)</code> | <p><i>Modifier and Type:</i> >void</p> <p><i>Purpose:</i> Flushes a table</p> <p><i>Supported:</i> Yes</p> |
| <code>flush(String tableNameOrRegionName)</code> | <p><i>Modifier and Type:</i> >void</p> <p><i>Purpose:</i> Flushes a table</p> <p><i>Supported:</i> Yes</p> |
| <code>flushRegion(byte[] regionName)</code> | <p><i>Modifier and Type:</i> >void</p> <p><i>Purpose:</i> Flushes an individual region</p> <p><i>Supported:</i> Yes</p> |
| <code>getAlterStatus(byte[] tableName)</code> | <p><i>Modifier and Type:</i> Pair<Integer, Integer></p> <p><i>Purpose:</i> Gets the status of the alter command - indicates the number of regions that have received the updated schema Asynchronous operation</p> <p> Note: The HPE Ezmeral Data Fabric Database always returns (0,0).</p> <p><i>Supported:</i> No</p> |
| <code>getAlterStatus(TableName tableName)</code> | <p><i>Modifier and Type:</i> Pair<Integer, Integer></p> <p><i>Purpose:</i> Gets the status of the alter command - indicates the number of regions that have received the updated schema Asynchronous operation</p> <p> Note: The HPE Ezmeral Data Fabric Database always returns (0,0).</p> <p><i>Supported:</i> No</p> |
| <code>getClusterStatus()</code> | <p><i>Modifier and Type:</i> ClusterStatus</p> <p><i>Purpose:</i> Gets the status of the cluster</p> <p><i>Supported:</i> No</p> |
| <code>getCompactionState(String tableNameOrRegionName)</code> | <p><i>Modifier and Type:</i> CompactionState</p> <p><i>Purpose:</i> Get the current compaction state of a table</p> <p><i>Supported:</i> No</p> |
| <code>getCompactionState(TableName tableName)</code> | <p><i>Modifier and Type:</i> org.apache.hadoop.hbase.protobuf.generated.AdminProtos.GetRegionInfoResponse.CompactionState</p> <p><i>Purpose:</i> Gets the current compaction state of a table</p> <p><i>Supported:</i> No</p> |
| <code>getCompactionStateForRegion(byte[] regionName)</code> | <p><i>Modifier and Type:</i> org.apache.hadoop.hbase.protobuf.generated.AdminProtos.GetRegionInfoResponse.CompactionState</p> |

| | |
|--|--|
| | <i>Purpose:</i> Gets the current compaction state of a region |
| | <i>Supported:</i> No |
| <code>getConfiguration()</code> | <i>Modifier and Type:</i> <code>org.apache.hadoop.conf.Configuration</code> |
| | <i>Purpose:</i> Gets the configuration used by the instance |
| | <i>Supported:</i> Yes |
| <code>getConnection()</code> | <i>Modifier and Type:</i> <code>Connection</code> |
| | <i>Purpose:</i> Gets the connection used by this object |
| | <i>Supported:</i> Yes |
| <code>getMasterCoproprocessors()</code> | <i>Modifier and Type:</i> <code>String[]</code> |
| | <i>Purpose:</i> Helper delegate to <code>getClusterStatus().getMasterCoproprocessors()</code> |
| | <i>Supported:</i> No |
| <code>getMasterInfoPort()</code> | <i>Modifier and Type:</i> <code>int</code> |
| | <i>Purpose:</i> Gets the information port of the current master, if one is available |
| | <i>Supported:</i> No |
| <code>getNamespaceDescriptor(String name)</code> | <i>Modifier and Type:</i> <code>NamespaceDescriptor</code> |
| | <i>Purpose:</i> Gets a namespace descriptor by name |
| | <i>Supported:</i> No |
| <code>getOnlineRegions(ServerName sn)</code> | <i>Modifier and Type:</i> <code>List<HRegionInfo></code> |
| | <i>Purpose:</i> Gets all the online regions on a region server |
| | <i>Supported:</i> No |
| <code>getOperationTimeout()</code> | <i>Modifier and Type:</i> <code>int</code> |
| | <i>Purpose:</i> The HPE Ezmeral Data Fabric Database never uses the timeout value |
| |  Note: If you use the v1.1 API with the HPE Ezmeral Data Fabric Database, the method is ignored. |
| | <i>Supported:</i> No |
| <code>getQuotaRetriever(QuotaFilter filter)</code> | <i>Modifier and Type:</i> <code>QuotaRetriever</code> |
| | <i>Purpose:</i> Returns a <code>QuotaRetriever</code> to list the quotas based on the filter |
| | <i>Supported:</i> No |
| <code>getTableDescriptor(byte[] tableName)</code> | <i>Modifier and Type:</i> <code>HTableDescriptor</code> |
| | <i>Purpose:</i> Gets the table descriptor |
| | <i>Supported:</i> Yes |
| <code>getTableDescriptor(TableName tableName)</code> | <i>Modifier and Type:</i> <code>HTableDescriptor</code> |
| | <i>Purpose:</i> Gets the table descriptor |
| | <i>Supported:</i> Yes |
| <code>getTableDescriptors(List<String> names)</code> | <i>Modifier and Type:</i> <code>HTableDescriptor[]</code> |
| | <i>Purpose:</i> Gets table descriptors |
| | <i>Supported:</i> Yes |

| | |
|--|--|
| <code>getTableDescriptorsByTableName(List<TableName> tableNames)</code> | <p><i>Modifier and Type:</i> HTableDescriptor[]</p> <p><i>Purpose:</i> Gets table descriptors</p> <p><i>Supported:</i> Yes</p> |
| <code>getTableRegions(byte[] tableName)</code> | <p><i>Modifier and Type:</i> List<HRegionInfo></p> <p><i>Purpose:</i> Gets the regions of a given table</p> <p><i>Supported:</i> Yes</p> |
| <code>getTableRegions(TableName tableName)</code> | <p><i>Modifier and Type:</i> List<HRegionInfo></p> <p><i>Purpose:</i> Gets the regions of a given table</p> <p><i>Supported:</i> Yes</p> |
| <code>isAborted()</code> | <p><i>Modifier and Type:</i> boolean</p> <p><i>Purpose:</i> Queries on the catalog janitor state. The HPE Ezmeral Data Fabric Database always returns false.</p> <p><i>Supported:</i> No</p> |
| <code>isCatalogJanitorEnabled()</code> | <p><i>Modifier and Type:</i> boolean</p> <p><i>Purpose:</i> Queries on the catalog janitor state. The HPE Ezmeral Data Fabric Database always returns false.</p> <p><i>Supported:</i> No</p> |
| <code>isProcedureFinished(String signature, String instance, Map<String,String> props)</code> | <p><i>Modifier and Type:</i> boolean</p> <p><i>Purpose:</i> Checks the current state of the specified procedure</p> <p><i>Supported:</i> No</p> |
| <code>isSnapshotFinished(org.apache.hadoop.hbase.protobuf.generated.HBaseProtos.SnapshotDescription snapshot)</code> | <p><i>Modifier and Type:</i> boolean</p> <p><i>Purpose:</i> Checks the current state of the passed snapshot</p> <p><i>Supported:</i> No</p> |
| <code>isTableAvailable(String tableName)</code> | <p><i>Modifier and Type:</i> boolean</p> <p><i>Purpose:</i> Checks if all regions of the table are available</p> <p><i>Supported:</i> Yes</p> |
| <code>isTableAvailable(TableName tableName, byte[][] splitKeys)</code> | <p><i>Modifier and Type:</i> boolean</p> <p><i>Purpose:</i> Checks if the table has been created with the specified number of splitkeys that was used while creating the given table</p> <p><i>Supported:</i> No</p> |
| <code>isTableAvailable(TableName tableName)></code> | <p><i>Modifier and Type:</i> boolean</p> <p><i>Purpose:</i> Returns true if all regions of the table are available</p> <p><i>Supported:</i> Yes</p> |
| <code>isTableDisabled(String tableName)</code> | <p><i>Modifier and Type:</i> boolean</p> <p><i>Purpose:</i> Checks if the table is offline</p> |
| | <p> Note: Although the HPE Ezmeral Data Fabric Database supports this method, it only checks the flag.</p> |
| | <p><i>Supported:</i> Yes</p> |

| | |
|--|---|
| <code>isTableDisabled(TableName tableName)</code> | <p><i>Modifier and Type:</i> boolean</p> <p><i>Purpose:</i> Checks if the table is offline</p> <p> Note: Although the HPE Ezmeral Data Fabric Database supports this method, it only checks the flag.</p> <p><i>Supported:</i> Yes</p> |
| <code>isTableEnabled(String tableName)</code> | <p><i>Modifier and Type:</i> boolean</p> <p><i>Purpose:</i> Checks if the table is online</p> <p> Note: Although the HPE Ezmeral Data Fabric Database supports this method, it only checks the flag, and does not change the flag.</p> <p><i>Supported:</i> Yes</p> |
| <code>isTableEnabled(TableName tableName)</code> | <p><i>Modifier and Type:</i> boolean</p> <p><i>Purpose:</i> Checks if the table is online</p> <p> Note: Although the HPE Ezmeral Data Fabric Database supports this method, it only checks the flag, and does not change the flag.</p> <p><i>Supported:</i> Yes</p> |
| <code>listNamespaceDescriptors()</code> | <p><i>Modifier and Type:</i> NamespaceDescriptor[]</p> <p><i>Purpose:</i> Lists available namespace descriptors</p> <p><i>Supported:</i> No</p> |
| <code>listSnapshots()</code> | <p><i>Modifier and Type:</i> List<org.apache.hadoop.hbase.protobuf.generated.HBaseProtos.SnapshotDescription></p> <p><i>Purpose:</i> Lists completed snapshots</p> <p><i>Supported:</i> No</p> |
| <code>listSnapshots(Pattern pattern)</code> | <p><i>Modifier and Type:</i> List<org.apache.hadoop.hbase.protobuf.generated.HBaseProtos.SnapshotDescription></p> <p><i>Purpose:</i> Lists all the completed snapshots that match the given pattern</p> <p><i>Supported:</i> No</p> |
| <code>listSnapshots(String regex)</code> | <p><i>Modifier and Type:</i> List<org.apache.hadoop.hbase.protobuf.generated.HBaseProtos.SnapshotDescription></p> <p><i>Purpose:</i> Lists all the completed snapshots that match the given regular expression</p> <p><i>Supported:</i> No</p> |
| <code>listTableDescriptorsByNamespace(String name)</code> | <p><i>Modifier and Type:</i> HTableDescriptor[]</p> <p><i>Purpose:</i> Gets the list of table descriptors by namespace</p> <p><i>Supported:</i> No</p> |
| <code>listTableNames()</code> | <p><i>Modifier and Type:</i> TableName[]</p> <p><i>Purpose:</i> Lists all the names of userspace tables</p> <p><i>Supported:</i> Yes</p> |
| <code>listTableNames(Pattern pattern, boolean includeSysTables)</code> | <p><i>Modifier and Type:</i> TableName[]</p> |

| | |
|---|---|
| | <p><i>Purpose:</i> Lists all the names of userspace tables that match the specified pattern</p> <p><i>Supported:</i> Yes</p> |
| <code>listTableNames(Pattern pattern)</code> | <p><i>Modifier and Type:</i> TableName[]</p> <p><i>Purpose:</i> Lists all the names of userspace tables that match the specified pattern</p> <p><i>Supported:</i> Yes</p> |
| <code>listTableNames(String regex, boolean includeSysTables)</code> | <p><i>Modifier and Type:</i> TableName[]</p> <p><i>Purpose:</i> Lists all the names of userspace tables that match the specified regular expression</p> <p><i>Supported:</i> Yes</p> |
| <code>listTableNames(String regex)</code> | <p><i>Modifier and Type:</i> TableName[]</p> <p><i>Purpose:</i> Lists all the names of userspace tables that match the specified regular expression</p> <p><i>Supported:</i> Yes</p> |
| <code>listTableNamesByNamespace(String name)</code> | <p><i>Modifier and Type:</i> TableName[]</p> <p><i>Purpose:</i> Gets the list of table names by namespace</p> <p><i>Supported:</i> Yes</p> |
| <code>listTables()</code> | <p><i>Modifier and Type:</i> HTableDescriptor[]</p> <p><i>Purpose:</i> Lists all the userspace tables</p> <p><i>Supported:</i> Yes</p> |
| <code>listTables(Pattern pattern, boolean includeSysTables)</code> | <p><i>Modifier and Type:</i> HTableDescriptor[]</p> <p><i>Purpose:</i> Lists all the tables that match the given pattern.</p> <p> Note: The HPE Ezmeral Data Fabric Database does not have system tables and therefore, the boolean value is ignored.</p> <p><i>Supported:</i> Yes</p> |
| <code>listTables(Pattern pattern)</code> | <p><i>Modifier and Type:</i> HTableDescriptor[]</p> <p><i>Purpose:</i> Lists all the userspace tables matching the given pattern.</p> <p><i>Supported:</i> Yes</p> |
| <code>listTables(String regex, boolean includeSysTables)</code> | <p><i>Modifier and Type:</i> HTableDescriptor[]</p> <p><i>Purpose:</i> Lists all the tables matching the given pattern.</p> <p> Note: The HPE Ezmeral Data Fabric Database does not have system tables and therefore, the boolean value is ignored.</p> <p><i>Supported:</i> Yes</p> |
| <code>listTables(String regex)</code> | <p><i>Modifier and Type:</i> HTableDescriptor[]</p> <p><i>Purpose:</i> Lists all the userspace tables that match the given regular expression.</p> <p><i>Supported:</i> Yes</p> |
| <code>majorCompact(byte[] tableNameOrRegionName)</code> | <p><i>Modifier and Type:</i> void</p> <p><i>Purpose:</i> Compacts a table, or an individual region.</p> <p><i>Supported:</i> Deprecated</p> |

| | |
|---|---|
| <code>majorCompact(String tableNameOrRegionName)</code> | <i>Modifier and Type:</i> void <i>Purpose:</i> Compacts a table, or an individual region. <i>Supported:</i> Deprecated |
| <code>majorCompact(byte[] tableNameOrRegionName, byte[] columnFamily)</code> | <i>Modifier and Type:</i> void <i>Purpose:</i> Compacts a column family within a table, or a region <i>Supported:</i> Deprecated |
| <code>majorCompact(String tableNameOrRegionName, String columnFamily)</code> | <i>Modifier and Type:</i> void <i>Purpose:</i> Compact a column family within a table, or a region <i>Supported:</i> Deprecated |
| <code>majorCompactRegion(byte[] regionName, byte[] columnFamily)</code> | <i>Modifier and Type:</i> void <i>Purpose:</i> Compacts a column family within a region <i>Supported:</i> No |
| <code>majorCompactRegion(byte[] regionName)</code> | <i>Modifier and Type:</i> void <i>Purpose:</i> Compacts a table, or an individual region <i>Supported:</i> No |
| <code>mergeRegions(byte[] nameOfRegionA, byte[] nameOfRegionB, boolean forcible)</code> | <i>Modifier and Type:</i> void <i>Purpose:</i> Merges two regions <i>Supported:</i> No |
| <code>modifyColumn(TableName tableName, HColumnDescriptor columnFamily)</code> | <i>Modifier and Type:</i> void <i>Purpose:</i> Modifies an existing column family on a table <i>Supported:</i> Yes |
| <code>modifyColumn(TableName tableName, HColumnDescriptor columnFamily)</code> | <i>Modifier and Type:</i> void <i>Purpose:</i> Modifies an existing column family on a table <i>Supported:</i> Yes |
| <code>modifyNamespace(NamespaceDescriptor descriptor)</code> | <i>Modifier and Type:</i> void <i>Purpose:</i> Modifies an existing namespace <i>Supported:</i> No |
| <code>modifyTable (byte[] tableName, HTableDescriptor htd)</code> | <i>Modifier and Type:</i> void <i>Purpose:</i> Modifies an existing table <i>Supported:</i> Yes |
| <code>modifyTable(final String tableName, final HTableDescriptor htd)</code> | <i>Modifier and Type:</i> void <i>Purpose:</i> Modifies an existing table <i>Supported:</i> Yes |
| <code>modifyTable(TableName tableName, HTableDescriptor htd)</code> | <i>Modifier and Type:</i> void <i>Purpose:</i> Modifies an existing table. This method is the more IRB friendly version. <i>Supported:</i> Yes |
| <code>move(byte[] encodedRegionName, byte[] destServerName)</code> | <i>Modifier and Type:</i> void <i>Purpose:</i> Moves the region to the destination <i>Supported:</i> No |
| <code>offline(byte[] regionName)</code> | <i>Modifier and Type:</i> void |

| | |
|--|---|
| | <i>Purpose:</i> Offlines specified region from master's in-memory state |
| | <i>Supported:</i> No |
| <code>restoreSnapshot(byte[] snapshotName, boolean takeFailSafeSnapshot)</code> | <i>Modifier and Type:</i> void |
| | <i>Purpose:</i> Restores the specified snapshot on the original table |
| | <i>Supported:</i> No |
| <code>restoreSnapshot(byte[] snapshotName)</code> | <i>Modifier and Type:</i> void |
| | <i>Purpose:</i> Restores the specified snapshot on the original table |
| | <i>Supported:</i> No |
| <code>restoreSnapshot(String snapshotName, boolean takeFailSafeSnapshot)</code> | <i>Modifier and Type:</i> void |
| | <i>Purpose:</i> Restores the specified snapshot on the original table |
| | <i>Supported:</i> No |
| <code>restoreSnapshot(String snapshotName)</code> | <i>Modifier and Type:</i> void |
| | <i>Purpose:</i> Restores the specified snapshot on the original table |
| | <i>Supported:</i> No |
| <code>rollWALWriter(ServerName serverName)</code> | <i>Modifier and Type:</i> void |
| | <i>Purpose:</i> Rolls the log writer. |
| | <i>Supported:</i> No |
| <code>runCatalogScan()</code> | <i>Modifier and Type:</i> int |
| | <i>Purpose:</i> Requests a scan of the catalog table |
| | <i>Supported:</i> No |
| <code>setBalancerRunning(boolean on, boolean synchronous)</code> | <i>Modifier and Type:</i> boolean |
| | <i>Purpose:</i> Turns the load balancer on or off |
| |  Note: The HPE Ezmeral Data Fabric Database does not require balancing. Therefore, the method just sets a flag. There is no impact on the MapR table. |
| | <i>Supported:</i> No |
| <code>setQuota(QuotaSettings quota)</code> | <i>Modifier and Type:</i> void |
| | <i>Purpose:</i> Applies the new quota settings |
| | <i>Supported:</i> No |
| <code>shutdown()</code> | <i>Modifier and Type:</i> void |
| | <i>Purpose:</i> Shuts down the HBase cluster |
| | <i>Supported:</i> No |
| <code>snapshot(byte[] snapshotName, TableName tableName)</code> | <i>Modifier and Type:</i> void |
| | <i>Purpose:</i> Creates a timestamp consistent snapshot for the given table |
| | <i>Supported:</i> No |
| <code>snapshot(org.apache.hadoop.hbase.protobuf.generated.HBaseProtos.SnapshotDescription snapshot)</code> | <i>Modifier and Type:</i> void |
| | <i>Purpose:</i> Takes a snapshot, and waits for the server to complete that snapshot (blocking). |

| | |
|---|--|
| <code>snapshot(String snapshotName, TableName tableName, org.apache.hadoop.hbase.protobuf.generated.HBaseProtos.SnapshotDescription.Type type)</code> | <i>Supported:</i> No <i>Modifier and Type:</i> void <i>Purpose:</i> Creates a typed snapshot of the table <i>Supported:</i> No |
| <code>snapshot(String snapshotName, TableName tableName)</code> | <i>Modifier and Type:</i> void <i>Purpose:</i> Takes a snapshot for the given table <i>Supported:</i> No |
| <code>split(byte[] tableNameOrRegionName)</code> | <i>Modifier and Type:</i> void <i>Purpose:</i> Splits a table  Note: The <code>tableNameOrRegionName</code> parameter has a different format when used with MapR tables than with Apache HBase tables. With MapR tables, specify both the table path and the FID as a comma-separated list. |
| <code>split(TableName tableName, byte[] splitPoint)</code> | <i>Supported:</i> Yes <i>Modifier and Type:</i> void <i>Purpose:</i> Splits a table.  Note: The <code>tableNameOrRegionName</code> parameter has a different format when used with MapR tables than with Apache HBase tables. With MapR tables, specify both the table path and the FID as a comma-separated list. |
| <code>split(TableName tableName)</code> | <i>Supported:</i> No <i>Modifier and Type:</i> void <i>Purpose:</i> Splits a table.  Note: The <code>tableNameOrRegionName</code> parameter has a different format when used with MapR tables than with Apache HBase tables. With MapR tables, specify both the table path and the FID as a comma-separated list. |
| <code>splitRegion(byte[] regionName, byte[] splitPoint)</code> | <i>Supported:</i> Yes <i>Modifier and Type:</i> void <i>Purpose:</i> Splits an individual region. |
| <code>splitRegion(byte[] regionName)</code> | <i>Supported:</i> No <i>Modifier and Type:</i> void <i>Purpose:</i> Splits an individual region <i>Supported:</i> Yes |
| <code>stopMaster()</code> | <i>Modifier and Type:</i> void <i>Purpose:</i> Shuts down the current HBase master only <i>Supported:</i> No |
| <code>stopRegionServer(String hostnamePort)</code> | <i>Modifier and Type:</i> void <i>Purpose:</i> Stops the designated region server <i>Supported:</i> No |
| <code>tableExists(TableName tableName)</code> | <i>Modifier and Type:</i> boolean |

`tableExists(byte[] tableName)` *Purpose:* Returns whether a table with the specified name exists
Supported: Yes
Modifier and Type: boolean

`tableExists(String tableName)` *Purpose:* Returns whether a table with the specified name exists
Supported: Yes
Modifier and Type: boolean

`takeSnapshotAsync(org.apache.hadoop.hbase.protobuf.generated.HBaseProtos.SnapshotDescription snapshot)` *Modifier and Type:* org.apache.hadoop.hbase.protobuf.generated.MasterProtos.SnapshotResponse
Purpose: Takes a snapshot without waiting for the server to complete that snapshot (asynchronous). Ensure that you take only a single snapshot at a time, or the results may be undefined.
Supported: No

`truncateTable(TableName tableName, boolean preserveSplits)` *Modifier and Type:* void
Purpose: Truncates a table
Supported: Yes

`unassign(byte[] regionName, boolean force)` *Modifier and Type:* void
Purpose: Unassigns a region from the current hosting region server
Supported: No

`updateConfiguration()` *Modifier and Type:* void
Purpose: Updates the configuration, and triggers an online configuration change on all the region servers
Supported: No

`updateConfiguration(ServerName server)` *Modifier and Type:* void
Purpose: Updates the configuration, and triggers an online configuration change on all the region servers
Supported: No

BufferedMutator Method Support

This table indicates which methods HPE Ezmeral Data Fabric Database supports in the HBase interface BufferedMutator.

The following HBase methods are supported with HPE Ezmeral Data Fabric Database tables, except where noted.

| Method Name | Modifier and Type | Description | Supported? |
|-------------|-------------------|--|------------|
| close() | void | Performs a flush() and releases any resources held. | Yes |
| flush() | void | Executes all the buffered, asynchronous Mutation operations and waits until they are done. | Yes |

| Method Name | Modifier and Type | Description | Supported? |
|--|--------------------------------------|--|------------|
| getConfiguration() | org.apache.hadoop.conf.Configuration | Returns the Configuration object used by this instance. | Yes |
| getName() | TableName | Gets the fully qualified table name instance of the table that this BufferedMutator writes to. | Yes |
| getWriteBuffer() | long | Get the internal write buffer. | No |
| getWriteBufferSize() | long | Returns the maximum size in bytes of the write buffer for this HTable. | No |
| mutate(List<? extends Mutation> mutations) | void | Send some Mutation objects to the table. | Yes |
| mutate(Mutation mutation) | void | Sends a Mutation to the table. | Yes |
| setWriteBufferSize() | long | Sets the maximum size (in bytes) of the write buffer for this HTable | No |

Connection Method Support

This table indicates which methods HPE Ezmeral Data Fabric Database supports in the HBase interface Connection.

The following HBase methods are supported with HPE Ezmeral Data Fabric Database tables, except where noted. For full details about this interface, see [Interface Connection](#).

| Method Name | Modifier and Type | Description | Supported? |
|---|--------------------------------------|---|------------|
| close() | void | Close this connection. | Yes |
| getAdmin() | Admin | Retrieve an Admin implementation to administer an HBase cluster. | Yes |
| getBufferedMutator(BufferedMutatorParams params) | BufferedMutator | Retrieve a BufferedMutator for performing client-side buffering of writes. | Yes |
| getBufferedMutator(TableName tableName) | BufferedMutator | | Yes |
| getConfiguration() | org.apache.hadoop.conf.Configuration | Retrieve the Configuration object used by this connection. | Yes |
| getRegionLocator(TableName tableName) | RegionLocator | Retrieve a RegionLocator implementation to inspect region information on a table. | Yes |
| getTable(TableName tableName) | Table | Retrieve a Table implementation for accessing a table. | Yes |
| getTable(TableName tableName, ExecutorService pool) | Table | | Yes |

| Method Name | Modifier and Type | Description | Supported? |
|-------------|-------------------|--|------------|
| isClosed() | boolean | Returns whether the connection is closed or not. | Yes |

ConnectionFactory Method Support

This table indicates which methods HPE Ezmeral Data Fabric Database supports in the HBase class `ConnectionFactory`.

The following HBase methods are supported with HPE Ezmeral Data Fabric Database tables, except where noted. For full details about this class, see the [ConnectionFactory class in the Client package](#).

| Method Name | Modifier and Type | Description | Supported? |
|---|-------------------|--|------------|
| <code>createConnection()</code> | static Connection | Create a new Connection instance using default HBaseConfiguration. | Yes |
| <code>createConnection(org.apache.hadoop.conf.Configuration conf)</code> | static Connection | Create a new Connection instance using the passed conf instance. | Yes |
| <code>createConnection(org.apache.hadoop.conf.Configuration conf, ExecutorService pool)</code> | static Connection | Create a new Connection instance using the passed conf instance. | Yes |
| <code>createConnection(org.apache.hadoop.conf.Configuration conf, ExecutorService pool, User user)</code> | static Connection | Create a new Connection instance using the passed conf instance. | Yes |
| <code>createConnection(org.apache.hadoop.conf.Configuration conf, User user)</code> | static Connection | Create a new Connection instance using the passed conf instance. | Yes |

RegionLocator Method Support

This table indicates which methods HPE Ezmeral Data Fabric Database supports in the HBase interface `RegionLocator`.

The following HBase methods are supported with HPE Ezmeral Data Fabric Database tables, except where noted. For full details about this interface, see [Interface RegionLocator](#) interface in the Client package.

| Method Name | Modifier and Type | Description | Supported? |
|--------------------------------------|------------------------|---|------------|
| <code>close()</code> | void | Close this connection. | Yes |
| <code>getAllRegionLocations()</code> | List<HRegionLocations> | Retrieves all of the regions associated with this table. | Yes |
| <code>getConfiguration()</code> | Configuration | Retrieve the Configuration Object used by this RegionLocator. | Yes |
| <code>getEndKeys()</code> | byte[][] | Gets the ending row key for every region in the currently open table. | Yes |
| <code>getName()</code> | TableName | Gets the fully qualified table name instance of this table. | Yes |

| Method Name | Modifier and Type | Description | Supported? |
|--|-----------------------|---|------------|
| <code>getRegionLocation(byte[] row)</code> | HRegionLocation | Finds the region on which the given row is being served. | Yes |
| <code>getRegionLocation(byte[] row, boolean reload)</code> | HRegionLocation | | Yes |
| <code>getStartEndKeys()</code> | Pair<byte[][],byte[]> | Gets the starting and ending row keys for every region in the currently open table. | Yes |
| <code>getStartKeys()</code> | byte[][] | Gets the starting row key for every region in the currently open table. | Yes |

Table Method Support

This table indicates which methods HPE Ezmeral Data Fabric Database supports in the HBase interface Table.

The following HBase methods are supported with HPE Ezmeral Data Fabric Database tables, except where noted. For full details about this interface, see [Interface Table](#) in the Client package.

| Method Name | Modifier and Type | Description | Supported? |
|--|-------------------|--|--------------------------|
| <code>append(Append append)</code> | Result | Appends values to one or more columns within a single row. | Yes |
| <code>batch(List<? extends Row> actions)</code> | Object[] | A batch call on Deletes, Gets, Puts, Increments, Appends and RowMutations. | Deprecated |
| <code>batch(List<? extends Row> actions, Object[] results)</code> | void | Method that does a batch call on Deletes, Gets, Puts, Increments and Appends. | Yes |
| <code>batchCallback(List<? extends Row> actions, org.apache.hadoop.hbase.client.coprocessor.Batch.Callback<R> callback)</code> | Object[] | Method that does a batch call on Deletes, Gets, Puts, Increments and Appends with a callback. | Yes ^{Footnote.} |
| <code>batchCallback(List<? extends Row> actions, Object[] results, org.apache.hadoop.hbase.client.coprocessor.Batch.Callback<R> callback)</code> | <R> void | Same as <code>batch(List, Object[])</code> , but with a callback. HPE Ezmeral Data Fabric Database ignores the callback. | Yes ^{Footnote.} |

¹ Not fully supported. When used with HPE Ezmeral Data Fabric Database, the callback is ignored.

² Not fully supported. When used with HPE Ezmeral Data Fabric Database, the durability is ignored.

| Method Name | Modifier and Type | Description | Supported? |
|--|---|--|------------|
| <code>batchCoproprocessorService(com.google.protobuf.Descriptors.MethodDescriptor, com.google.protobuf.Message request, byte[] startKey, byte[] endKey, R responsePrototype, org.apache.hadoop.hbase.client.coprocessor.Batch.Callback<R> callback)</code> | <R extends com.google.protobuf.Message> void | Creates an instance of the given Service subclass for each table region spanning the range from the startKey row to endKey row (inclusive), all the invocations to the same region server will be batched into one call. | No |
| <code>batchCoproprocessorService(com.google.protobuf.Descriptors.MethodDescriptor, com.google.protobuf.Message request, byte[] startKey, byte[] endKey, R responsePrototype)</code> | <R extends com.google.protobuf.Message> Map<byte[],R> | | No |
| <code>checkAndDelete(byte[] row, byte[] family, byte[] qualifier, byte[] value, Delete delete)</code> | boolean | Atomically checks if a row/family/qualifier value matches the expected value. | Yes |
| <code>checkAndDelete(byte[] row, byte[] family, byte[] qualifier, CompareFilter.CompareOp compareOp, byte[] value, Delete delete)</code> | boolean | | Yes |
| <code>checkAndMutate(byte[] row, byte[] family, byte[] qualifier, CompareFilter.CompareOp compareOp, byte[] value, RowMutations mutation)</code> | boolean | | Yes |
| <code>checkAndPut(byte[] row, byte[] family, byte[] qualifier, byte[] value, Put put)</code> | boolean | | Yes |
| <code>checkAndPut(byte[] row, byte[] family, byte[] qualifier, CompareFilter.CompareOp compareOp, byte[] value, Put put)</code> | boolean | | Yes |

| Method Name | Modifier and Type | Description | Supported? |
|--|---|--|------------|
| close() | void | Releases any resources held or pending changes in internal buffers. | Yes |
| coprocessorService(byte[] row) | CoprocessorRpcChannel | Creates and returns a RpcChannel instance connected to the table region containing the specified row. | No |
| coprocessorService(Class<T> service, byte[] startKey, byte[] endKey, org.apache.hadoop.hbase.client.coprocessor.Batch.Call<T,R> callable, org.apache.hadoop.hbase.client.coprocessor.Batch.Callback<R> callback) | <T extends com.google.protobuf.Service,R> void | Creates an instance of the given Service subclass for each table region spanning the range from the startKey row to endKey row (inclusive), and invokes the passed Batch.Call.call(T) method with each Service instance. | No |
| coprocessorService(Class<T> service, byte[] startKey, byte[] endKey, org.apache.hadoop.hbase.client.coprocessor.Batch.Call<T,R> callable) | <T extends com.google.protobuf.Service,R> Map<byte[],R> | | No |
| delete(Delete delete) | void | Deletes the specified cells/row. | Yes |
| delete(List<Delete> deletes) | void | Deletes the specified cells/rows in bulk. | Yes |
| exists(Get get) | boolean | Test for the existence of columns in the table, as specified by the Get. | Yes |
| existsAll(List<Get> gets) | boolean[] | Test for the existence of columns in the table, as specified by the Gets, in batch. | Yes |
| get(Get get) | Result | Extracts certain cells from a given row. | Yes |
| get(List<Get> gets) | Result[] | Extracts certain cells from the given rows, in batch. | Yes |
| getConfiguration() | org.apache.hadoop.conf.Configuration | Returns the Configuration object used by this instance. | Yes |
| getName() | TableName | Gets the fully qualified table name instance of this table. | Yes |
| getScanner(byte[] family, byte[] qualifier) | ResultScanner | Gets a scanner on the current table for the given family and qualifier. | Yes |
| getScanner(byte[] family) | ResultScanner | Gets a scanner on the current table for the given family. | Yes |

| Method Name | Modifier and Type | Description | Supported? |
|--|-------------------|---|--------------------------------|
| <code>getScanner(Scan scan)</code> | ResultScanner | Returns a scanner on the current table as specified by the Scan object. | Yes |
| <code>getTableDescriptor()</code> | HTableDescriptor | Gets the table descriptor for this table. | Yes |
| <code>getWriteBufferSize()</code> | long | Returns the maximum size in bytes of the write buffer for this HTable. | No |
| <code>increment(Increment increment)</code> | Result | Increments one or more columns within a single row. | Yes |
| <code>incrementColumnValue(byte[] row, byte[] family, byte[] qualifier, long amount, Durability durability)</code> | long | Atomically increments a column value. | Yes Footnote . |
| <code>incrementColumnValue(byte[] row, byte[] family, byte[] qualifier, long amount)</code> | long | See <code>incrementColumnValue(byte[], byte[], byte[], long, Durability)</code> . | Yes |
| <code>mutateRow(RowMutations rm)</code> | void | Performs multiple mutations atomically on a single row. | Yes |
| <code>put(List<Put> puts)</code> | void | Puts some data in the table, in batch. | Yes |
| <code>put(Put put)</code> | void | Puts some data in the table. | Yes |
| <code>setWriteBufferSize(long writeBufferSize)</code> | void | Sets the size of the buffer in bytes. | No |

HColumnDescriptor and HTableDescriptor Support

This section describes the supported fields in the HColumnDescriptor and the HTableDescriptor classes.

HPE Ezmeral Data Fabric Database supports all of the methods that are in these classes. However, it supports only a subset of their fields.

HColumnDescriptor Class

| Field | Description |
|--------------|--|
| BLOCKSIZE | Size of blocks in files stored to the filesystem (hfiles). |
| BLOOMFILTER | Whether or not to use bloomfilters. |
| COMPRESSION | Compression type. |
| IN_MEMORY | Whether to serve from memory or not. |
| MIN_VERSIONS | Minimum number of versions to keep. |
| NAME | Name of the column family. |
| TTL | Time to live of cell contents. |
| VERSIONS | Number of versions to keep. |

HTableDescriptor Class

| Field | Description |
|-----------|---|
| AUTOSPLIT | Specifies whether to split the table into regions automatically as the table grows. The average size of each region is determined by the <code>regionsize</code> parameter. The default value is <code>true</code> . |
| BULKLOAD | Boolean. Specifies whether to perform a full bulk load of the table. The default is <code>false</code> . For more information, see Bulk Loading and MapR Tables . |

| Field | Description |
|------------|--|
| DELETE_TTL | <p>Used for multi-master replication.</p> <p>Normally, delete operations are purged after the affected table cells are updated. Whereas the result of an update is saved in a table until another change overwrites or deletes it, the result of a delete is not saved. In multi-master replication, this difference can lead to tables being unsynchronized.</p> <p>Example</p> <p>Suppose that you have set up multi-master replication between table <code>customers</code> in the cluster <code>sanfrancisco</code> and table <code>customers</code> in the cluster <code>newyork</code>. Client applications then make these two changes:</p> <ol style="list-style-type: none"> 1. On <code>/mapr/sanfrancisco/customers</code>, put row A at 10:00:00 AM. 2. On <code>/mapr/newyork/customers</code>, delete row A at 10:00:01 AM. <p>On <code>/mapr/sanfrancisco/customers</code>, the order of operations is:</p> <ol style="list-style-type: none"> 1. Put row A with a timestamp of 10:00:00 AM 2. Delete row A with a timestamp of 10:00:01 AM (This operation is replicated from <code>/mapr/newyork/customers</code>.) <p>On <code>/mapr/newyork/customers</code>, the order of operations is:</p> <ol style="list-style-type: none"> 1. Delete row A with a timestamp of 10:00:01 AM 2. Put row A with a timestamp of 10:00:00 AM (This operation is replicated from <code>/mapr/sanfrancisco/customers</code>.) <p>Now, though the put happened on <code>/mapr/sanfrancisco/customers</code> at 10:00:00 AM, the put reaches <code>/mapr/newyork/customers</code> several seconds after that. Suppose that the actual time that the put arrives at <code>/mapr/newyork/customers</code> is 10:00:03 AM.</p> <p>To ensure that both tables stay synchronized, <code>/mapr/newyork/customers</code> should preserve the delete until after the put is replicated. Then, the delete can be applied after the put. Therefore, the time-to-live for the delete should be at least long enough for the put to arrive at <code>/mapr/newyork/customers</code>. In this case, the time-to-live should be at least 3 seconds.</p> <p>In general, the time-to-live for deletes should be greater than the amount of time that it takes replicated operations to reach replicas. By default, the value is 24 hours.</p> <p>For example, suppose (to extend the scenario above) that you pause replication during weekdays and resume it on weekends. The put takes place on Monday morning <code>/mapr/sanfrancisco/customers</code> at 10:00:00 AM and the delete takes place at <code>/mapr/newyork/customers</code> at 10:00:01 AM. Replication does not resume until 12:00:00 AM Saturday morning. Given the volume of operations to be replicated and the potential for network problems, it is possible that these operations will not be replicated until Sunday. In this scenario, a value of 7 days for <code>DELETE_TTL</code> (7 multiplied by 24 hours) should provide sufficient margin.</p> |

| Field | Description |
|-------|--------------------|
| NAME | Name of the table. |

Support for HBase Java Filters Support

HPE Ezmeral Data Fabric Database supports the following Java filters, which work identically to their Apache HBase versions. See the [Apache HBase API](#) for more information, specifically, the [Apache HBase Filter](#) package.

| Filter | Description |
|-------------------------------------|--|
| <code>ColumnCountGetFilter</code> | Simple filter that returns first N columns on row only. This filter was written to test filters in Get and as soon as it gets its quota of columns, <code>filterAllRemaining()</code> returns true. This makes this filter unsuitable as a Scan filter. |
| <code>ColumnPaginationFilter</code> | A filter, based on the <code>ColumnCountGetFilter</code> , takes two arguments: limit and offset. This filter can be used for row-based indexing, where references to other tables are stored across many columns, in order to efficient lookups and paginated results for end users. Only most recent versions are considered for pagination. |
| <code>ColumnPrefixFilter</code> | This filter is used for selecting only those keys with columns that matches a particular prefix. For example, if prefix is 'an', it will pass keys with columns like 'and', 'anti' but not keys with columns like 'ball', 'act'. |
| <code>ColumnRangeFilter</code> | This filter is used for selecting only those keys with columns that are between minColumn to maxColumn. For example, if minColumn is 'an', and maxColumn is 'be', it will pass keys with columns like 'ana', 'bad', but not keys with columns like 'bed', 'eye' If minColumn is null, there is no lower bound. If maxColumn is null, there is no upper bound. minColumnInclusive and maxColumnInclusive specify if the ranges are inclusive or not. |
| <code>DependentColumnFilter</code> | A filter for adding inter-column timestamp matching Only cells with a correspondingly timestamped entry in the target column will be retained Not compatible with <code>Scan.setBatch</code> as operations need full rows for correct filtering |
| <code>FamilyFilter</code> | This filter is used to filter based on the column family. It takes an operator (equal, greater, not equal, etc) and a byte [] comparator for the column family portion of a key. This filter can be wrapped with <code>WhileMatchFilter</code> and <code>SkipFilter</code> to add more control. Multiple filters can be combined using <code>FilterList</code> . If an already known column family is looked for, use <code>Get.addFamily(byte[])</code> directly rather than a filter. |

| Filter | Description |
|---------------------------------------|---|
| FilterList | Implementation of <code>Filter</code> that represents an ordered List of Filters which will be evaluated with a specified boolean operator <code>FilterList.Operator.MUST_PASS_ALL</code> (AND) or <code>FilterList.Operator.MUST_PASS_ONE</code> (OR). Since you can use Filter Lists as children of Filter Lists, you can create a hierarchy of filters to be evaluated. <code>FilterList.Operator.MUST_PASS_ALL</code> evaluates lazily: evaluation stops as soon as one filter does not include the <code>KeyValue</code> . <code>FilterList.Operator.MUST_PASS_ONE</code> evaluates non-lazily: all filters are always evaluated. Defaults to <code>FilterList.Operator.MUST_PASS_ALL</code> . |
| FirstKeyOnlyFilter | A filter that will only return the first KV from each row. This filter can be used to more efficiently perform row count operations. |
| FirstKeyValueMatchingQualifiersFilter | The filter looks for the given columns in <code>KeyValue</code> . Once there is a match for any one of the columns, it returns <code>ReturnCode.NEXT_ROW</code> for remaining <code>KeyValues</code> in the row. Note: It may emit KVs which do not have the given columns in them, if these KVs happen to occur before a KV which does have a match. Given this caveat, this filter is only useful for special cases like <code>RowCounter</code> . |
| FuzzyRowFilter | Filters data based on fuzzy row key. Performs fast-forwards during scanning. It takes pairs (row key, fuzzy info) to match row keys. Where fuzzy info is a byte array with 0 or 1 as its values: <ul style="list-style-type: none"> • 0 - means that this byte in provided row key is fixed, i.e. row key's byte at same position must match • 1 - means that this byte in provided row key is NOT fixed, i.e. row key's byte at this position can be different from the one in provided row key Example: Let's assume row key format is <code>userId_actionId_year_month</code> . Length of <code>userId</code> is fixed and is 4, length of <code>actionId</code> is 2 and <code>year</code> and <code>month</code> are 4 and 2 bytes long respectively. Let's assume that we need to fetch all users that performed certain action (encoded as "99") in Jan of any year. Then the pair (row key, fuzzy info) would be the following: row key = "????_99_????_01" (one can use any value instead of "?") fuzzy info = "\x01\x01\x01\x01\x00\x00\x00\x00\x01\x01\x01\x01\x00\x00" i.e. fuzzy info tells the matching mask is "????_99_????_01", where at ? can be any value. |
| InclusiveStopFilter | A Filter that stops after the given row. There is no "RowStopFilter" because the Scan spec allows you to specify a stop row. Use this filter to include the stop row, eg: [A,Z]. |
| KeyOnlyFilter | A filter that will only return the key component of each KV (the value will be rewritten as empty). This filter can be used to grab all of the keys without having to also grab the values. |

| Filter | Description |
|---|---|
| <code>MultipleColumnPrefixFilter</code> | This filter is used for selecting only those keys with columns that matches a particular prefix. For example, if prefix is 'an', it will pass keys will columns like 'and', 'anti' but not keys with columns like 'ball', 'act'. |
| <code>PageFilter</code> | Implementation of Filter interface that limits results to a specific page size. It terminates scanning once the number of filter-passed rows is > the given page size. Note that this filter cannot guarantee that the number of results returned to a client are <= page size. This is because the filter is applied separately on different region servers. It does however optimize the scan of individual HRegions by making sure that the page size is never exceeded locally. |
| <code>PrefixFilter</code> | Pass results that have same row prefix. |
| <code>QualifierFilter</code> | This filter is used to filter based on the column qualifier. It takes an operator (equal, greater, not equal, etc) and a byte [] comparator for the column qualifier portion of a key. This filter can be wrapped with <code>WhileMatchFilter</code> and <code>SkipFilter</code> to add more control. Multiple filters can be combined using <code>FilterList</code> . If an already known column qualifier is looked for, use <code>Get.addColumn(byte[], byte[])</code> directly rather than a filter. |
| <code>RandomRowFilter</code> | A filter that includes rows based on a chance. |
| <code>RowFilter</code> | This filter is used to filter based on the key. It takes an operator (equal, greater, not equal, etc) and a byte [] comparator for the row, and column qualifier portions of a key. This filter can be wrapped with <code>WhileMatchFilter</code> to add more control. Multiple filters can be combined using <code>FilterList</code> . If an already known row range needs to be scanned, use <code>CellScanner</code> start and stop rows directly rather than a filter. |
| <code>SingleColumnValueExcludeFilter</code> | A Filter that checks a single column value, but does not emit the tested column. This will enable a performance boost over <code>SingleColumnValueFilter</code> , if the tested column value is not actually needed as input (besides for the filtering itself). |

| Filter | Description |
|-------------------------|---|
| SingleColumnValueFilter | <p>This filter is used to filter cells based on value. It takes a <code>CompareFilter.CompareOp</code> operator (equal, greater, not equal, etc), and either a byte [] value or a <code>ByteArrayComparable</code>.</p> <p>If we have a byte [] value then we just do a lexicographic compare. For example, if passed value is 'b' and cell has 'a' and the compare operator is LESS, then we will filter out this cell (return true). If this is not sufficient (eg you want to deserialize a long and then compare it to a fixed long value), then you can pass in your own comparator instead.</p> <p>You must also specify a family and qualifier. Only the value of this column will be tested. When using this filter on a <code>CellScanner</code> with specified inputs, the column to be tested should also be added as input (otherwise the filter will regard the column as missing).</p> <p>To prevent the entire row from being emitted if the column is not found on a row, use <code>setFilterIfMissing(boolean)</code>. Otherwise, if the column is found, the entire row will be emitted only if the value passes. If the value fails, the row will be filtered out.</p> <p>In order to test values of previous versions (timestamps), set <code>setLatestVersionOnly(boolean)</code> to false. The default is true, meaning that only the latest version's value is tested and all previous versions are ignored.</p> <p>To filter based on the value of all scanned columns, use <code>ValueFilter</code>.</p> |
| SkipFilter | <p>A wrapper filter that filters an entire row if any of the Cell checks do not pass.</p> <p>For example, if all columns in a row represent weights of different things, with the values being the actual weights, and we want to filter out the entire row if any of its weights are zero. In this case, we want to prevent rows from being emitted if a single key is filtered. Combine this filter with a <code>ValueFilter</code>:</p> <pre data-bbox="820 1318 1458 1430">scan.setFilter(new SkipFilter(new ValueFilter(CompareOp.NOT_EQUAL, new BinaryComparator(Bytes.toBytes(0))));</pre> <p>Any row which contained a column whose value was 0 will be filtered out (since <code>ValueFilter</code> will not pass that Cell). Without this filter, the other non-zero valued columns in the row would still be emitted.</p> |
| TimestampsFilter | <p>Filter that returns only cells whose timestamp (version) is in the specified list of timestamps (versions).</p> <p>Note: Use of this filter overrides any time range/time stamp options specified using <code>Get.setTimeRange(long, long)</code>, <code>Scan.setTimeRange(long, long)</code>, or <code>Scan.setTimeStamp(long)</code>. See the Apache HBase API, Client package for detailed information.</p> |

| Filter | Description |
|------------------|---|
| ValueFilter | <p>This filter is used to filter based on column value. It takes an operator (equal, greater, not equal, etc) and a byte [] comparator for the cell value.</p> <p>This filter can be wrapped with <code>WhileMatchFilter</code> and <code>SkipFilter</code> to add more control. Multiple filters can be combined using <code>FilterList</code>. To test the value of a single qualifier when scanning multiple qualifiers, use <code>SingleColumnValueFilter</code>.</p> |
| WhileMatchFilter | <p>A wrapper filter that returns true from <code>filterAllRemaining()</code> as soon as the wrapped filters <code>Filter.filterRowKey(byte[], int, int)</code>, <code>Filter.filterKeyValue(org.apache.hadoop.hbase.Cell)</code>, <code>Filter.filterRow()</code> or <code>Filter.filterAllRemaining()</code> methods returns true.</p> |

HBase Java Regular Expressions Support

This topic defines the subset of Java regular expressions that are supported for HPE Ezmeral Data Fabric Database tables.

Filters used with Scan operations support regular expressions. When you filter scans on HPE Ezmeral Data Fabric Database tables, you can use regular expressions that comprise the [Perl-Compatible Regular Expressions library](#), as well as a subset of the regular expressions that are supported in `java.util.regex.pattern`.

Characters

| Pattern | Description |
|---------|--|
| x | The character x |
| \\ | The backslash character |
| \\On | The character with octal value 0n (0 <= n <= 7) |
| \\Onn | The character with octal value 0nn (0 <= n <= 7) |
| \\xhh | The character with hexadecimal value 0xhh |
| \\t | The tab character ('\\u0009') |
| \\n | The newline (line feed) character ('\\u000A') |
| \\r | The carriage-return character ('\\u000D') |
| \\f | The form-feed character ('\\u000C') |
| \\a | The alert (bell) character ('\\u0007') |
| \\e | The escape character ('\\u001B') |
| \\cx | The control character corresponding to x |

Character Classes

| Pattern | Description |
|--|---|
| [abc] | a, b, or c (simple class) |
| [Supported Regular Expressions in MapR Tables^abc] | Any character except a, b, or c (negation) |
| [a-zA-Z] | a through z or A through Z, inclusive (range) |

Predefined Character Classes

| Pattern | Description |
|---------|---|
| . | Any character (may or may not match line terminators) |
| \d | A digit: [0-9] |
| \D | A non-digit: [Supported Regular Expressions in MapR Tables^0-9] |
| \s | A whitespace character: [\t\n\x0B\r] |
| \S | A non-whitespace character: [Supported Regular Expressions in MapR Tables^\s] |
| \w | A word character: [a-zA-Z_0-9] |
| \W | A non-word character: [Supported Regular Expressions in MapR Tables^\w] |

Classes for Unicode Blocks and Categories

| Pattern | Description |
|---------|---------------------------------------|
| \p{Lu} | An uppercase letter (simple category) |
| \p{Sc} | A currency symbol |

Boundaries

| Pattern | Description |
|---------|---|
| ^ | The beginning of a line |
| \$ | The end of a line |
| \b | A word boundary |
| \B | A non-word boundary |
| \A | The beginning of the input |
| \G | The end of the previous match |
| \Z | The end of the input but for the final terminator, if any |

| Pattern | Description |
|---------|----------------------|
| \z | The end of the input |

Greedy Quantifiers

| Pattern | Description |
|---------|---|
| X? | X, once or not at all |
| X* | X, zero or more times |
| X+ | X, one or more times |
| X{n} | X, exactly n times |
| X{n,} | X, at least n times |
| X{n,m} | X, at least n but not more than m times |

Reluctant Quantifiers

| Pattern | Description |
|---------|---|
| X?? | X, once or not at all |
| X*? | X, zero or more times |
| X+? | X, one or more times |
| X{n}? | X, exactly n times |
| X{n,}? | X, at least n times |
| X{n,m}? | X, at least n but not more than m times |

Possessive Quantifiers

| Pattern | Description |
|---------|---|
| X?+ | X, once or not at all |
| X*+ | X, zero or more times |
| X++ | X, one or more times |
| X{n}+ | X, exactly n times |
| X{n,}+ | X, at least n times |
| X{n,m}+ | X, at least n but not more than m times |

Logical Operators

| Pattern | Description |
|---------|-------------------------|
| XY | X followed by Y |
| X Y | Either X or Y |
| (X) | X, as a capturing group |

Back References

| Pattern | Description |
|---------|--|
| \n | Whatever the nth capturing group matches |

Quotation

| Pattern | Description |
|---------|---|
| \ | Nothing, but quotes the following character |
| \Q | Nothing, but quotes all characters until \E |
| \E | Nothing, but ends quoting started by \Q |

Special Constructs

| Pattern | Description |
|---------|---|
| (?:X) | X, as a non-capturing group |
| (?=X) | X, via zero-width positive lookahead |
| (?!X) | X, via zero-width negative lookahead |
| (?<=X) | X, via zero-width positive lookbehind |
| (?<!X) | X, via zero-width negative lookbehind |
| (?>X) | X, as an independent, non-capturing group |

HBase Java Comparators Support

HPE Ezmeral Data Fabric Database supports the following Java filters, which work identically to their Apache HBase versions. See the [Apache HBase API](#) for more information, specifically, the [Apache HBase Filter](#) package.

| Comparator | Description |
|------------------------|--|
| >BinaryComparator | A binary comparator which lexicographically compares against the specified byte array using <code>Bytes.compareTo(byte[], byte[])</code> . |
| BinaryPrefixComparator | A comparator which compares against a specified byte array, but only compares up to the length of this byte array. For the rest it is similar to BinaryComparator. |

| Comparator | Description |
|-----------------------|--|
| BitComparator | A bit comparator which performs the specified bitwise operation on each of the bytes with the specified byte array. Then returns whether the result is non-zero. |
| NullComparator | A binary comparator which lexicographically compares against the specified byte array using <code>Bytes.compareTo(byte[], byte[])</code> . |
| RegexStringComparator | <p>This comparator is for use with <code>CompareFilter</code> implementations, such as <code>RowFilter</code>, <code>QualifierFilter</code>, and <code>ValueFilter</code>, for filtering based on the value of a given column. Use it to test if a given regular expression matches a cell value in the column.</p> <p>Only <code>EQUAL</code> or <code>NOT_EQUAL</code> comparisons are valid with this comparator.</p> <p>For example:</p> <pre>ValueFilter vf = new ValueFilter(CompareOp.EQUAL, new RegexStringComparator(// v4 IP address "(((25[0-5] 2[0-4][0-9] [01]? [0-9][0-9]?)\\.){3,3}" + "(25[0-5] 2[0-4][0-9] [01]? [0-9][0-9]?)\\.([0-9]+)?" + " " + // v6 IP address "((([\\dA-Fa-f]{1,4}:){7}[\\ \\dA-Fa-f]{1,4}) (:([\\d]{1,3})" + "{3}[\\d]{1,3})?)\\.([0-9]+)?");</pre> |
| SubstringComparator | <p>This comparator is for use with <code>SingleColumnValueFilter</code>, for filtering based on the value of a given column. Use it to test if a given substring appears in a cell value in the column. The comparison is case insensitive.</p> <p>Only <code>EQUAL</code> or <code>NOT_EQUAL</code> tests are valid with this comparator.</p> <p>For example:</p> <pre>SingleColumnValueFilter scvf = new SingleColumnValueFilter("col", CompareOp.EQUAL, new SubstringComparator("substr"));</pre> |

Unsupported HBase Java Methods

This topic identifies the HBase Java methods that are not supported for HPE Ezmeral Data Fabric Database tables. Attempts to call any of these methods results in an `UnsupportedOperationException` exception.

Methods for ACLs for cells:

- `Put.setACL(String user, org.apache.hadoop.hbase.security.access.Permission perms)`

- `Append.setACL(Map<String,org.apache.hadoop.hbase.security.access.Permission> perms)`
- `Delete.setACL(Map<String,org.apache.hadoop.hbase.security.access.Permission> perms)`
- `Increment.setACL(Map<String,org.apache.hadoop.hbase.security.access.Permission> perms)`

Methods for cell visibility:

- `Put.setCellVisibility(org.apache.hadoop.hbase.security.visibility.CellVisibility expression)`
- `Append.setCellVisibility(org.apache.hadoop.hbase.security.visibility.CellVisibility expression)`
- `Delete.setCellVisibility(org.apache.hadoop.hbase.security.visibility.CellVisibility expression)`
- `Increment.setCellVisibility(org.apache.hadoop.hbase.security.visibility.CellVisibility expression)`

Methods for time-to-live for cell values:

- `Put.setTTL(long ttl)`
- `Append.setTTL(long ttl)`
- `Delete.setTTL(long ttl)`
- `Increment.setTTL(long ttl)`

Other methods

- `Delete.deleteFamilyVersion(byte[] family, long timestamp)`
- `Scan.setReversed(boolean reversed)`
- `Scan.setBatch()`
- `Scan.setCaching()`
- `Scanner.next(int nbRows)`

Impersonation via HBase REST Gateway

Impersonation enables access to tables via user IDs other than the user that runs the Gateway.

You can enable user impersonation to access HPE Ezmeral Data Fabric Database tables via the HBase REST Gateway. This feature is not supported in earlier combinations of MapR and HBase packages.

Impersonation is only supported if the REST Gateway is running as the `mapr` user (`MAPR_USER`).

You can enable impersonation via the Gateway on both non-secure and secure MapR clusters (secured using either MapR SASL or Kerberos). HPE Ezmeral Data Fabric Database does not support gateway impersonation using a Thrift interface.

Note: Impersonation for HBase REST Gateway is enabled by default on secure clusters.

Enabling Impersonation on a Non-Secure Cluster

To enable impersonation on a non-secure cluster, follow these steps:

1. Install the `mapr-hbase` package on a cluster that is running version 4.0.2 or later. This package contains all of the HBase binaries. For installation details, see [HBase Client and HPE Ezmeral Data Fabric Database](#).
2. Enable simple authentication via the REST Gateway by appending the following property to the `hbase-site.xml` file (`/opt/mapr/hbase/hbase<hbase_version>/conf/hbase-site.xml`): The simple authentication protocol is a Hadoop pseudo authenticator that serves as an example and is part of the `hadoop-common` package.

```
<property>
<name>hbase.rest.authentication.type</name>
<value>simple</value>
</property>
```

3. Set the following environment variable to enable impersonation:

```
export MAPR_IMPERSONATION_ENABLED=1
```

4. Start the REST Gateway server as the `MAPR_USER`.

```
/opt/mapr/hbase/hbase<hbase_version>/bin/hbase-daemon.sh start rest -p
port
```

Using Custom Authentication

This section describes how to use Hadoop pseudo authentication for custom authentication.

Editing the `hbase-site.xml` file is the procedure to follow if you want to use Hadoop pseudo authentication. Alternatively, you can write and use your own authenticator to substitute for the "simple" configuration by implementing the Hadoop AuthenticationHandler interface. If you are using custom authentication, place your authenticator jar in the following directory:

```
/opt/mapr/hbase/hbase-<hbase_version>/lib/
```

Then start the REST Gateway.

Mapping to HBase Table Namespaces

This section describes mapping table namespaces between Apache HBase tables and HPE Ezmeral Data Fabric Database binary tables.

The MapR implementations of the HBase Java API and `libhbase` differentiate between Apache HBase tables and HPE Ezmeral Data Fabric Database tables according to table names. In certain cases, such as migrating code from Apache HBase tables to HPE Ezmeral Data Fabric Database tables, users need to force the API they are using to access a HPE Ezmeral Data Fabric Database table, even though the table name could map to an Apache HBase table. The `hbase.table.namespace.mappings` property allows you to map Apache HBase table names to HPE Ezmeral Data Fabric Database tables. This property is typically set in the configuration file `/opt/mapr/hadoop/hadoop-<version>/etc/hadoop/core-site.xml`.

In general, if a table name includes a slash (`/`), the name is assumed to be a path to a HPE Ezmeral Data Fabric Database table, because slash is not a valid character for Apache HBase table names. In the case of "flat" table names without a slash, namespace conflict is possible, and you might need to use table mappings.

Table Mapping Naming Conventions

A table mapping takes the form `name:map`, where `name` is the table name to redirect and `map` is the modification made to the name. The value in `name` can be a literal string or contain the `*` wildcard. When mapping a name with a wild card, the mapping is treated as a directory. Requests to tables with names that match the wild card are sent to the directory in the mapping.

When mapping a name that is a literal string, you can choose from two different behaviors:

- End the mapping with a slash to indicate that this mapping is to a directory. For example, the mapping `mytable1:/user/aaa/` sends requests for table `mytable1` to the full path `/user/aaa/mytable1`.
- End the mapping without a slash, which creates an alias and treats the mapping as a full path. For example, the mapping `mytable1:/user/aaa` sends requests for table `mytable1` to the full path `/user/aaa`.

Mappings and Table Listing Behaviors

When you use the `list` command without specifying a directory, the command's behavior depends on two factors:

- Whether a table mapping exists
- Whether Apache HBase is installed and running

Here are three different scenarios and the resulting `list` command behavior for each.

- There is a table mapping for `*`, as in `*:/tables`. In this case, the `list` command lists the tables in the mapped directory.
- There is no mapping for `*`, and Apache HBase is installed and running. In this case, the `list` command lists the HBase tables.
- There is no mapping for `*`, and Apache HBase is not installed or is not running.
 - For HBase 0.98.12, the shell will try to connect to an HBase cluster but it will return an error instead.
 - For HBase 1.1 or above, if the `mapr.hbase.default.db` property in the `hbase-site.xml` is set to `hbase`, the `list` command will return an error stating that HBase is not available. If the `mapr.hbase.default.db` property is set to `maprdb`, `list` command will list the HPE Ezmeral Data Fabric Database tables under the user's home directory.

Example 1: Map all HBase tables to HPE Ezmeral Data Fabric Database tables in a directory

In this example, any flat table name `foo` is treated as a HPE Ezmeral Data Fabric Database table in the directory `/tables_dir/foo`.

```
<property>
  <name>hbase.table.namespace.mappings</name>
  <value>*:/tables_dir</value>
</property>
```

Example 2: Map specific Apache HBase tables to specific HPE Ezmeral Data Fabric Database tables

In this example, the Apache HBase table name `mytable1` is treated as a HPE Ezmeral Data Fabric Database table at `/user/aaa/mytable1`. The Apache Hbase table name `mytable2` is treated as a HPE

Ezmeral Data Fabric Database table at `/user/bbb/mytable2`. All other Apache HBase table names are treated as stock Apache HBase tables.

```
<property>
  <name>hbase.table.namespace.mappings</name>
  <value>mytable1:/user/aaa/,mytable2:/user/bbb/</value>
</property>
```

Example 3: Combination of specific table names and wildcards

Mappings are evaluated in order. In this example, the flat table name `mytable1` is treated as a HPE Ezmeral Data Fabric Database table at `/user/aaa/mytable1`. The flat table name `mytable2` is treated as a HPE Ezmeral Data Fabric Database table at `/user/bbb/mytable2`. Any other flat table name `foo` is treated as a HPE Ezmeral Data Fabric Database table at `/tables_dir/foo`.

```
<property>
  <name>hbase.table.namespace.mappings</name>
  <value>mytable1:/user/aaa/,mytable2:/user/bbb/,*/tables_dir</value>
</property>
```

Thread-pool Settings for Performance

The HPE Ezmeral Data Fabric Database C APIs internally have one thread pool per client. Threads work on the async tasks enqueued by a client application. There are two thread-pool parameters that you can modify in the `/opt/mapr/conf/dbclient.conf` file for better application performance.

fs.mapr.pool.threads

This parameter controls the number of connections that a client application makes with HPE Ezmeral Data Fabric Database for append, increment, read, and scan requests. For a higher rate of throughput to HPE Ezmeral Data Fabric Database, you can increase this value. The default value is 10.

fs.mapr.highpri.pool.threads

This parameter controls the number of threads that invoke application-provided callbacks. If an application's callbacks are not lightweight but instead perform complex calculations that require significant processing, increase this value to avoid delays in invoking callbacks. The default value is 2.

Building MapReduce Applications

This section provides information about building and running custom MapReduce application that access HPE Ezmeral Data Fabric Database binary tables.

The steps for building and running custom MapReduce applications that run against HPE Ezmeral Data Fabric Database are the same as the steps for building and running custom MapReduce applications that run against Apache HBase. The steps are documented in the Apache HBase Reference Guide at <http://hbase.apache.org/book.html#mapreduce>.

However, you must use an HBase JAR file from MapR's Maven repository at <https://repository.mapr.com/nexus/content/groups/mapr-public/org/apache/hbase/hbase-server/>. The name of the JAR file that you use must contain the version of HBase and the version of MapR that you are using.

For example, if you are using HBase 1.1 and MapR version 5.1, you would use the file `hbase-server-1.1.1-mapr-1602.jar`.

Performing Bulkloads with MapReduce

This section describes custom MapReduce applications used to perform bulkloads for HPE Ezmeral Data Fabric Database binary tables.

You can use the `HFileOutputFormat configureIncrementalLoad()` method for writing custom MapReduce applications to perform bulk loads. Although the name of the method implies that you can use

it only for incremental bulk loads, the method also works for full bulk loads, provided that the `-bulkload`, `BULKLOAD`, or `BulkLoad` parameter for a table is set to true, as described in [Bulk Loading and HPE Ezmeral Data Fabric Database Tables](#).

If you have a custom MapReduce applications that does not use `HFileOutputFormat.configureIncrementalLoad()`, simply use the path to the HPE Ezmeral Data Fabric Database table that you want to load. Using `HFileOutputFormat.configureIncrementalLoad()` provides at least two advantages:

This method performs a number of tasks that your application would otherwise need to do explicitly:

1. Inspects the table to configure a total order partitioner
2. Uploads the partitions file to the cluster and adds it to the DistributedCache
3. Sets the number of reduce tasks to match the current number of regions
4. Sets the output key/value class to match `HFileOutputFormat`'s requirements
5. Sets the reducer up to perform the appropriate sorting (either `KeyValueSortReducer` or `PutSortReducer`)

This method turns off Speculative Execution automatically. For details, see the note below.

Warning: Turning off Speculative Execution

Speculative Execution of MapReduce tasks is on by default. For custom applications that load HPE Ezmeral Data Fabric Database binary tables, it is recommended to turn Speculative Execution off. When it is on, the tasks that import data might run multiple times. Multiple tasks for an incremental bulkload could insert one or more versions of a record into a table. Multiple tasks for a full bulkload could cause loss of data if the source data continues to be updated during the load.

If your custom MapReduce application uses `HFileOutputFormat.configureIncrementalLoad()`, you do not have to turn off Speculative Execution manually.

`HFileOutputFormat.configureIncrementalLoad()` turns it off automatically. Speculative Execution is automatically turned off for MapReduce utilities such as `CopyTable` and `ImportTsv`.

If you are writing a custom MapReduce application that does not use the `HFileOutputFormat.configureIncrementalLoad()` method for bulk loading, you must turn off Speculative Execution manually.

Turn off Speculative Execution by setting the following MapReduce version 2 parameter to false:
`mapreduce.map.speculative`

If the job is programmatically written, you can turn off Speculative Execution at the code level:
`job.setSpeculativeExecution(false);`

Setting for OJAI Applications to Use Data Fabric Client Features

Describes how to set the classpath for OJAI applications to use data-fabric client features.

When you launch an OJAI application that needs to submit MapReduce or YARN applications, or to run `hadoop fs` or `hadoop mfs` commands, ensure that you prefix the classpath with `/opt/mapr/conf:/opt/mapr/hadoop/hadoop-2.7.0/etc/hadoop`. Alternatively, copy the `core-site.xml` file to the `/src/main/resources/` folder.

Developing Applications for JSON Tables

As part of its support for JSON tables, HPE Ezmeral Data Fabric Database implements the OJAI API. The OJAI API provides methods for creating, reading, updating, and deleting JSON documents in HPE Ezmeral Data Fabric Database JSON tables. It is available in Java, and starting in EEP 6.0, also available

in Node.js, Python, C#, and Go. HPE Ezmeral Data Fabric Database also provides a HPE Ezmeral Data Fabric Database JSON Client API for managing JSON tables and a HPE Ezmeral Data Fabric Database JSON REST API for performing basic operations using HTTP calls.

The following shows the general flow for developing an OJAI client application that accesses HPE Ezmeral Data Fabric Database JSON tables:

1. Make a connection to HPE Ezmeral Data Fabric Database using the OJAI Connection and Driver interfaces.
2. Request a HPE Ezmeral Data Fabric Database JSON table using the JSON DocumentStore.
3. Specify the table, document, or column family operation.
4. Perform the operation on the table.
5. Return the results.

For additional information about OJAI, refer to the following:

- [OJAI wiki page](#)
- [OJAI github repository](#) - The README file provides an introduction to OJAI

The HPE Ezmeral Data Fabric Database JSON Client API, implemented in Java, enables you to create, drop, and alter HPE Ezmeral Data Fabric Database JSON tables and column families.

You can also use HTTP calls to create, delete, and query HPE Ezmeral Data Fabric Database JSON tables [Using the HPE Ezmeral Data Fabric Database JSON REST API](#) on page 2973.

API Documentation

The following are links to the detailed API pages:

- [Java OJAI Client API](#)
- [Node.js OJAI Client API](#)
- [Python OJAI Client API](#)
- [C# OJAI Client API](#)
- [Go OJAI Client API](#)
- [HPE Ezmeral Data Fabric Database JSON Client API](#)

Note: Beginning with MapR version 6.0, the HPE Ezmeral Data Fabric Database `Table` interface in the HPE Ezmeral Data Fabric Database JSON Client API is deprecated and replaced by the `DocumentStore` interface in the OJAI API.

Managing JSON Tables

This section describes how to create, list, and delete JSON tables, alter JSON table attributes, set permissions, and manage column families. You can perform these operations using either the HPE Ezmeral Data Fabric Database JSON Client API library or HPE Ezmeral Data Fabric Database Shell commands.

HPE Ezmeral Data Fabric Database JSON Client API

The HPE Ezmeral Data Fabric Database JSON Client API is a Java library. There is not a Python implementation of the library, but you can create and drop HPE Ezmeral Data Fabric Database JSON tables in the Python OJAI client.

Admin API

Use the methods in this interface to perform these tasks:

- Create JSON tables
- Alter JSON tables
- Delete JSON tables
- List JSON tables in a folder
- See if a JSON table exists

For a full list of methods, see the [MapR Admin interface](#)

TableDescriptor API

Use the methods in this interface to perform these tasks:

- Create tables with non-default values for one or more of their parameters
- Alter tables

For a full list of interfaces and methods, see the [MapR TableDescriptor interface](#).

HPE Ezmeral Data Fabric Database Shell

The `mapr dbshell` is a tool for the creation and lightweight manipulation of JSON tables and documents. To run `dbshell`, enter `mapr dbshell` on the command line after logging into a node in a MapR cluster. See [HPE Ezmeral Data Fabric Database Shell \(JSON Tables\)](#) on page 5488 for more information.

Creating JSON Tables

This topic describes how to create HPE Ezmeral Data Fabric Database JSON tables using either programmatic APIs or `dbshell`.

Note: Before creating a table, you typically create a directory and MapR volume. This is not required; however, it is a good practice. For example, assuming both the directory and volume names are `sample`, the command would be:

```
// Create directories with hadoop
hadoop fs -mkdir /sample

// Create a MapR volume using maprcli create volume
maprcli volume create -name sample -path /sample -type rw
```

Java

The following Java code examples show you how to create a table in the following ways:

- By using the default values for the table attributes,
- By setting specific values for the table attributes.

See the [Admin](#) and [TableDescriptor](#) APIs for more information.

The following example shows how to create a table by calling an `Admin` object's `createTable()` method and passing, as an argument, the path that you want to use for the new table:

```
public void createJSONTable(String tablePath) throws DBException {
    try (Admin admin = MapRDB.newAdmin()) {
        if (!admin.tableExists(tablePath)) {
```

```

        admin.createTable(tablePath);
    }
}

```

Tables created with this version of the `createTable()` method use the default values for their attributes.

Alternatively, the following example shows how to create a table by passing a `TableDescriptor` object as an argument to the `createTable()` method:

```

/* Create a TableDescriptor for the table to create,
 * passing in the path of the table.
 */
TableDescriptor tableDescriptor = MapRDB.newTableDescriptor(tablePath);

/* Pass the TableDescriptor object and the path to the table
 * to the Admin.createTable() method.
 */
public void createJSONTable(String tablePath, TableDescriptor
tableDescriptor) throws DBException {
    try (Admin admin = MapRDB.newAdmin()) {
        if (!admin.tableExists(tablePath)) {
            admin.createTable(tableDescriptor);
        }
    }
}

```

This alternative allows you to set values for some of the table's attributes.

Node.js

To create a table in the Node.js OJAI client, call the `Connection.createStore()` method:

```

connection.createStore(table_path)
    .then((store) => {
        // Process result
        ...
    });

```

The method returns a `DocumentStore` object.

Python

To create a table in the Python OJAI client, call the `Connection.create_store()` method:

```

store = connection.create_store(store_path=table_path)

```

The method returns a `DocumentStore` object.

dbshell

The following **dbshell** command shows code syntax for creating a table:

```

# mapr dbshell
maprdb root:> create /<tablePath>/<tableName>

```

C#

To create a table in the C# OJAI client, call the `connection.CreateStore(string storePath)` method:

```
var store = connection.CreateStore(string storePath);
```

The method returns a `DocumentStore` object.

Go

To create a table in the Go OJAI client, call the `connection.CreateStore()` function:

```
store, error := connection.CreateStore("/store_path")
```

The function returns a new `DocumentStore` and an error.

Listing JSON Tables

This topic describes how to list the JSON tables by using either the HPE Ezmeral Data Fabric Database JSON Client API or HPE Ezmeral Data Fabric Database Shell.

Permission Required

The `readAce` permission on the volumes where the JSON tables are located. [Setting Whole Volume ACEs](#) on page 1576

Java

The table is listed by calling HPE Ezmeral Data Fabric Database JSON Client API `Admin` object's `listTables()` method and passing, as an argument, the path of the folder.

Use a conditional loop to iterate through the returned list and retrieve the names of the tables.

```
public void listTables(String parentFolder) throws DBException {
    try (Admin admin = MapRDB.newAdmin()) {
        for(Path tablePath : admin.listTables(parentFolder)) {
            System.out.println(tablePath);
        }
    }
}
```

Note: The parameter `parentFolder` provides a path to a folder that is in the MapR filesystem. See "[Table Paths](#)" in [HPE Ezmeral Data Fabric Database JSON Tables](#) for examples.

dbshell

```
# mapr dbshell
maprdb root:> list /demo
/demo/user
/demo/checkin
/demo/review
/demo/business
/demo/tip
5 table(s) found.
```

See [dbshell list](#) on page 5506 for further details.

Altering JSON Table Attributes

This topic describes how to change the values of table attributes by using the HPE Ezmeral Data Fabric Database JSON Client API.

In this example, the code turns off the `bulkload` flag on the table. Applications will typically need to turn off this flag after a bulk load of the table with the `import`, `importJSON`, or `copytable` utility.

Create a `TableDescriptor` object for an existing table by passing the path of the table to the `Admin` interface's `getTableDescriptor()` method.

Permissions Required

The `readAce` and `writeAce` permissions on the volumes where the JSON tables are located. For information about how to set permissions on volumes, see [Setting Whole Volume ACEs](#) on page 1576.

Example

Tables are altered a by using the `TableDescriptor` object and then passing that object to the `Admin` interface's `altertable()` method.

```
public void alterTable(String tablePath) throws DBException {
    try (Admin admin = MapRDB.newAdmin()) {
        TableDescriptor tableDesc = admin.getTableDescriptor(tablePath);
        // set bulk load to false
        tableDesc.setBulkLoad(false);
        admin.alterTable(tableDesc);
    }
}
```

Deleting JSON Tables

This topic describes how to delete HPE Ezmeral Data Fabric Database JSON tables using either programmatic APIs or `dbshell`.

Java

To delete a table in the Java OJAI client, call an `Admin` object's `deleteTable()` method and pass, as an argument, the path of the table to delete:

```
public void deleteTable(String tablePath) throws DBException {
    try (Admin admin = MapRDB.newAdmin()) {
        if (admin.tableExists(tablePath)) {
            admin.deleteTable(tablePath);
        }
    }
}
```

Node.js

To delete a table in the Node.js OJAI client, call the `Connection.deleteStore()` method:

```
connection.deleteStore(table_path)
    then((deleteResponse) => {
        // Process deleteReponse
        ...
    });
```

Python

To delete a table in the Python OJAI client, call the `Connection.delete_store()` method:

```
rc = connection.delete_store(store_path=table_path)
```

dbshell

```
# mapr dbshell
maprdb root:> drop <table path>
```

See [dbshell drop](#) on page 5492 for additional details.

C#

To delete a table in the C# OJAI client, call the `connection.DeleteStore(string storePath)` method:

```
connection.DeleteStore(string storePath);
```

Go

To delete a table in the Go OJAI client, call the `connection.DeleteStore()` function:

```
err := connection.DeleteStore("/store_path")
```

Permissions Required

You must have both the `readAce` and `writeAce` permissions on the volumes where the JSON tables are located to delete it. For information about how to set permissions on volumes, see [Setting Whole Volume ACEs](#) on page 1576.

Permission Types for Fields and Column Families in JSON Tables

By using access-control expressions (ACEs), you can grant or deny access to fields and column families that are in JSON tables.

For an explanation of the syntax of ACEs, see [ACE Syntax](#).

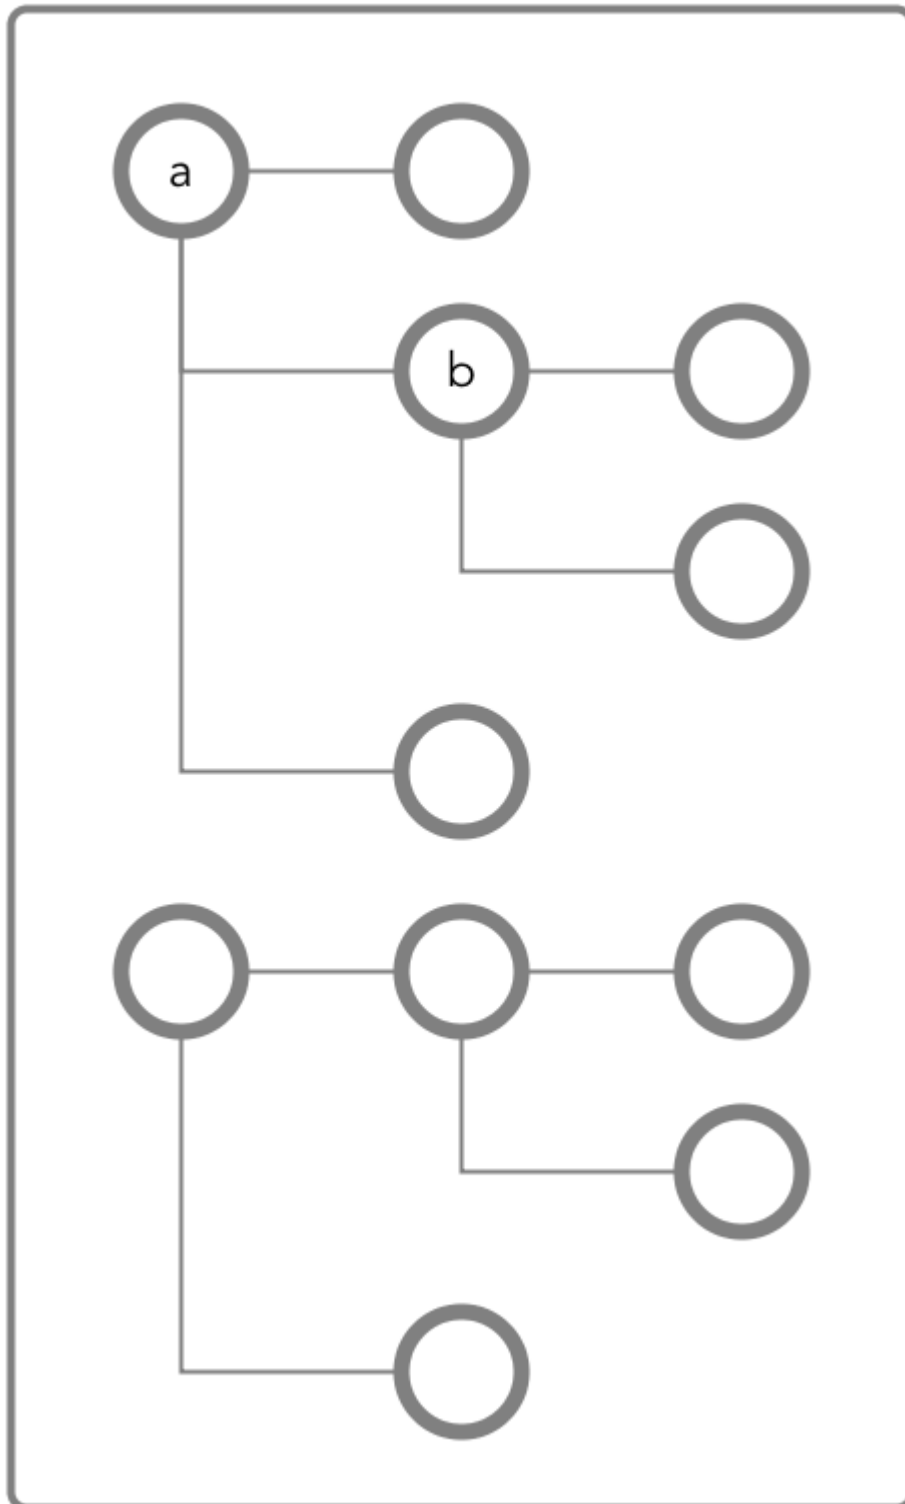

There are three types of permission:

- `Traverse` (`traverseperm`)
- `Read` (`readperm`)
- `Write` (`writeperm`)

Traverse (traverseperm)

This permission allows the grantee to descend a hierarchy of fields to access the fields that the grantee has write or read permission on.

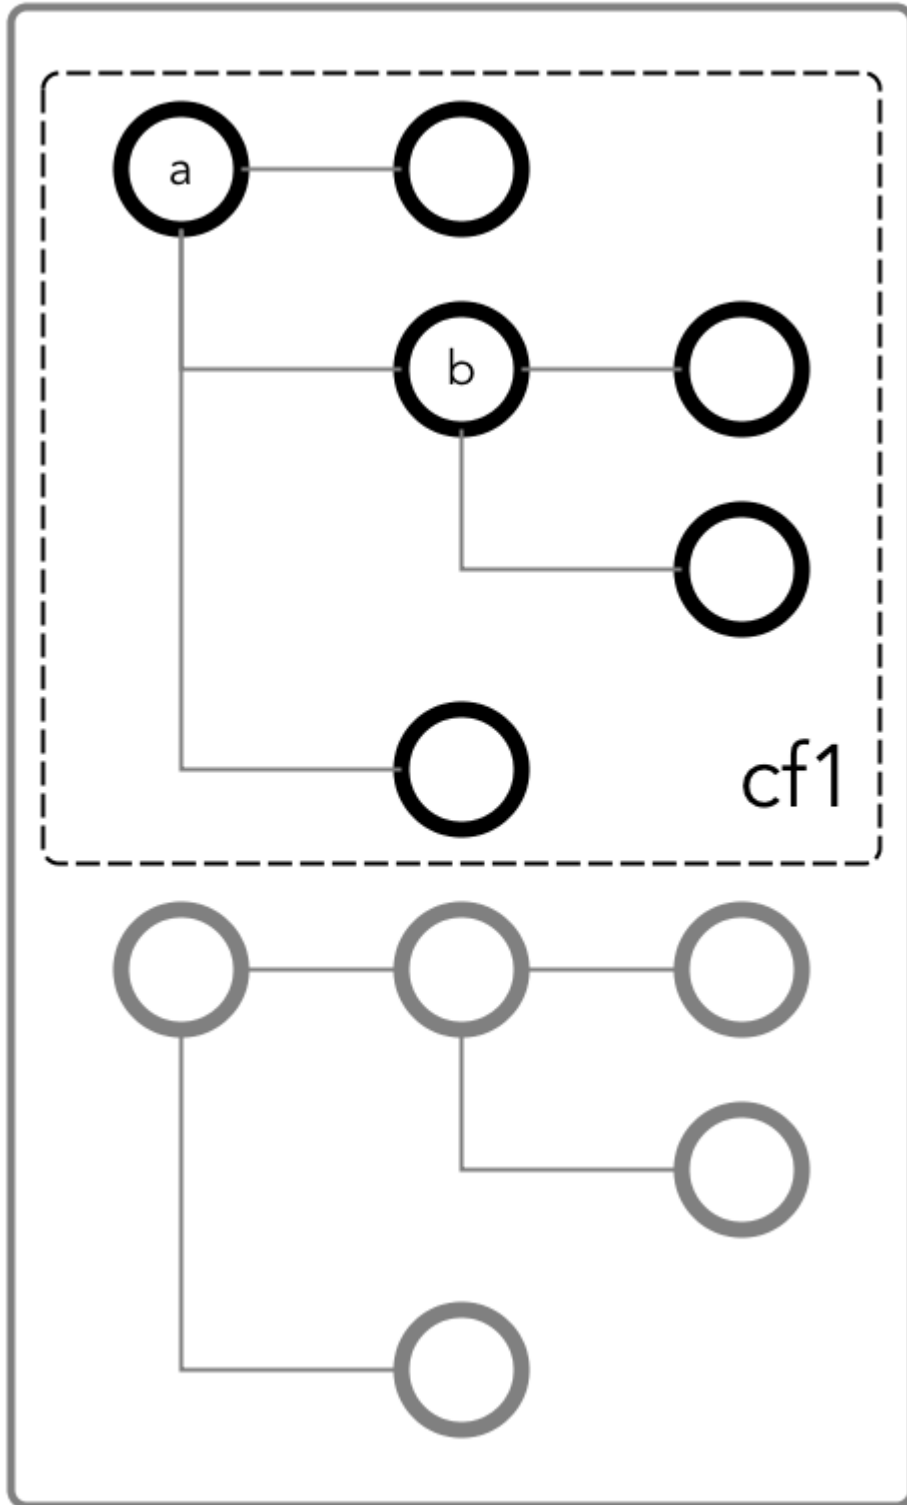

For example, suppose that a user has read and write access only on field `b` in this document.

To access field **b**, the user would need to be able to traverse (pass through) field **a**. In this case, because the entire document is in the default column family, the user could be granted traverse permission on the default column family. Field **a** would inherit the traverse permission.

If traverse permission on the default column family were denied the user, it would not be possible for the user to access field **b**. Granting traverse permission on field **a** in this case would have no effect.

In the next example, field `a` is a column family named `cf1`.

To be able to read and write at field `b`, the user could be granted the traverse permission on the column family.

Read (readperm)

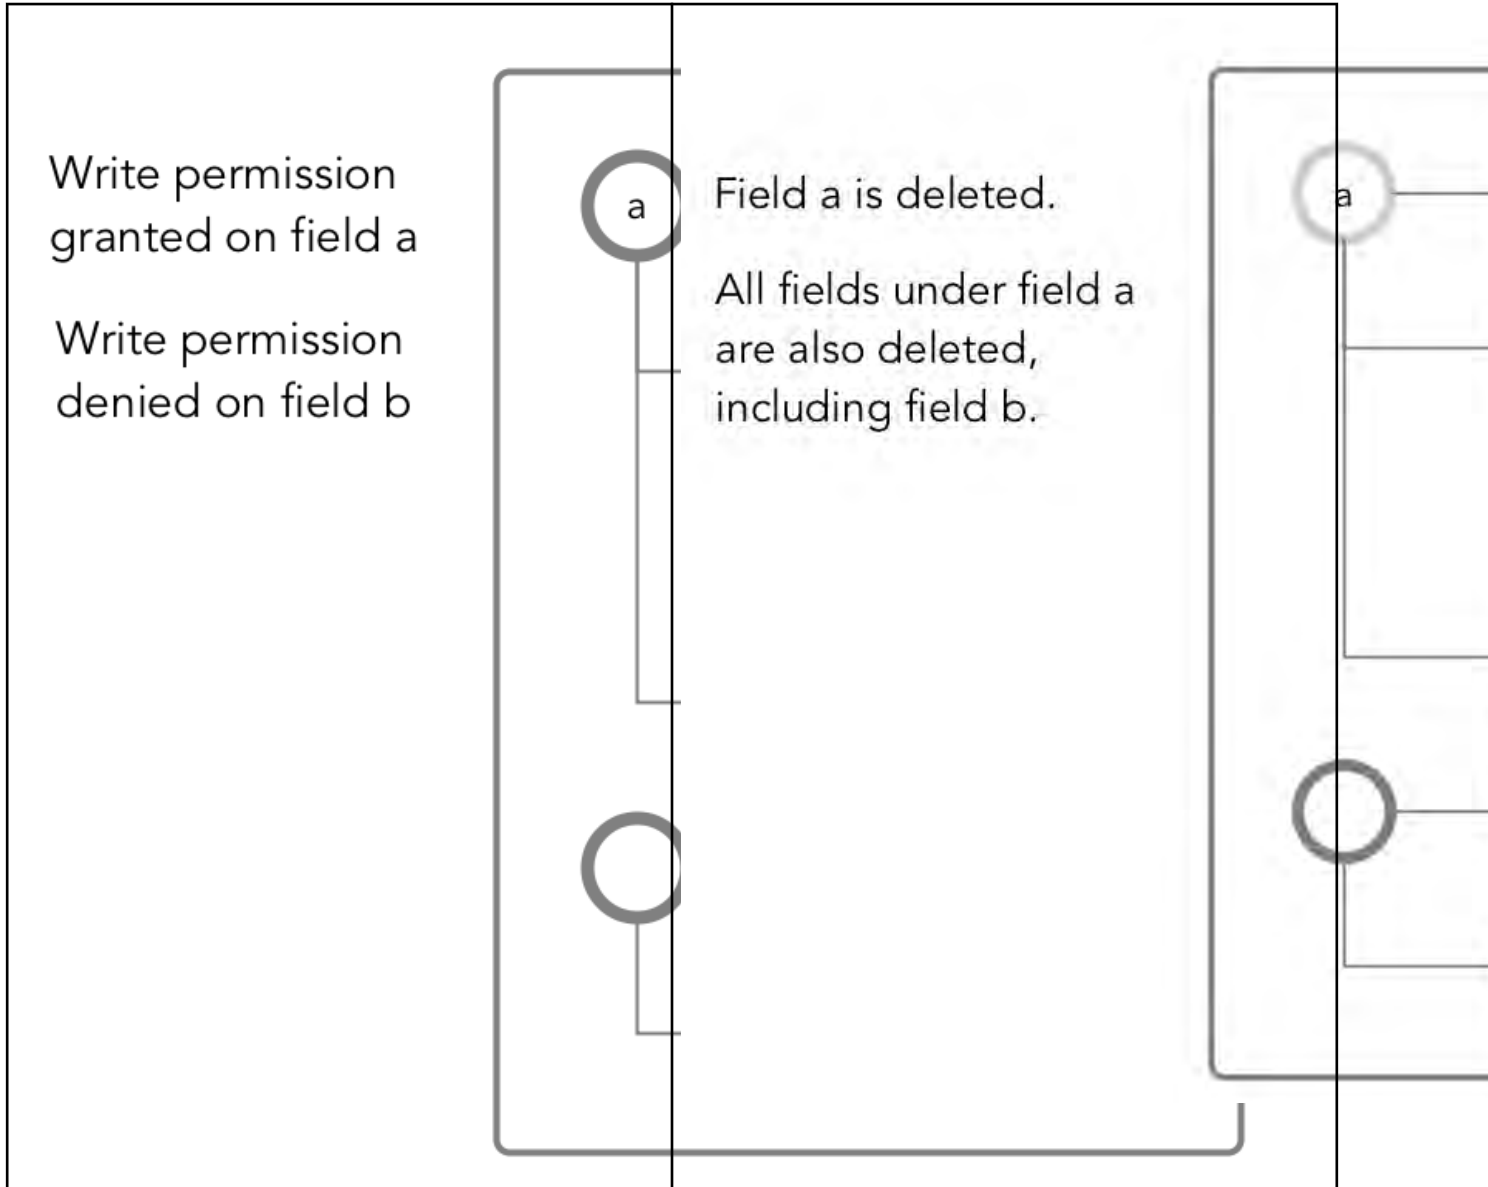

This permission allows the grantee to read from a field.

This permission extends to fields that are nested below the field that the permission was granted on. However, grantees can be explicitly denied the permission on any of the nested fields.

Write (writeperm)

This permission allows the grantee to delete a field, insert a value into a field, or overwrite a field's value.

As illustrated in the following two diagrams, deleting a field also deletes all fields that are nested within that field, even those fields on which the write permission is explicitly denied.

Obtaining readperm and writeperm on Fields

In this scenario, you want to perform an operation on a field, and the operation requires that you have readperm and writeperm permissions on that field. How you obtain these permissions depends on whether the field is in the default column family or a non-default column family.

When the field is in the default column family

In the document below, you want to perform an operation on field `c`, which is in the default column family. The operation requires you to have `readperm` and `writeperm` on field `c`.

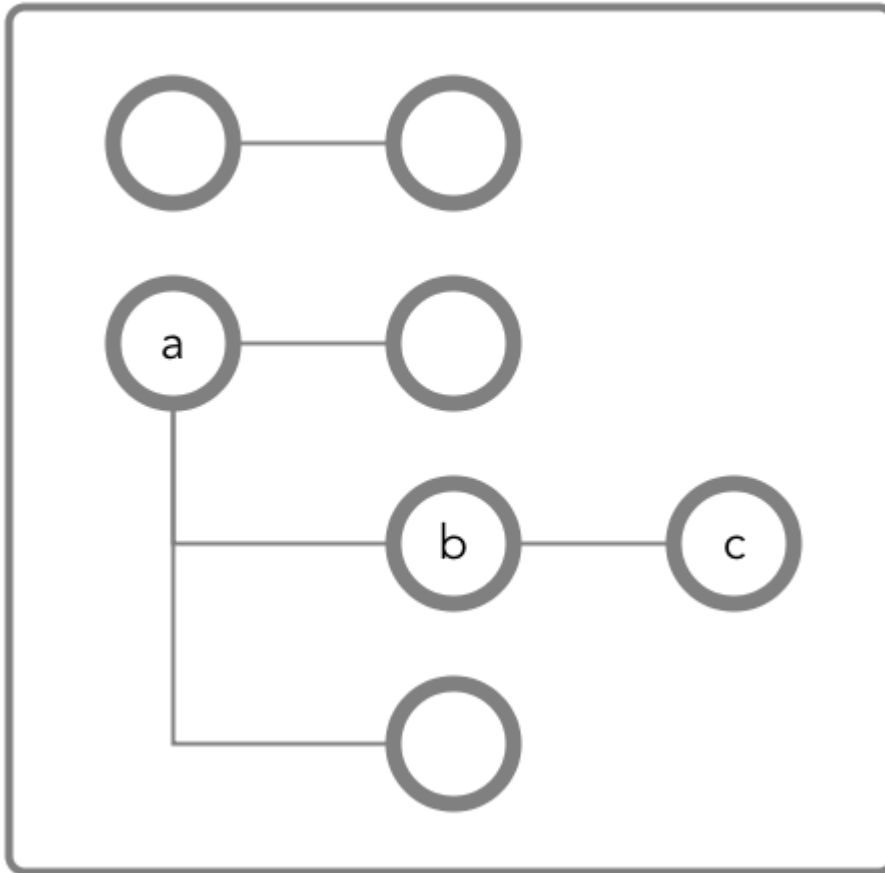

Figure 27: Schematic diagram of an JSON document in which all fields are in the default column family

Case 1: You have `readperm` and `writeperm` on the default column family

In this case, field `c` inherits these permissions, assuming that the permissions were not denied on field `a` or `b`.

If you do not have `readperm` and `writeperm` on field `a` or `b`, you need `traverseperm` on the field that denied you those permissions. You also need `readperm` and `writeperm` explicitly granted to you on field `c`. You could be granted these permissions with the `maprcli table cf colperm set` command, as in these examples:

```

maprcli table cf colperm set -path
<path to JSON table>
-cfname default -name
a.b -traverseperm u:<user ID> |
<existing ACE for this field>
maprcli table cf colperm set -path
<path to JSON table> -cfname default
  
```

```
-name a.b.c -readperm u:<user ID>
| <existing ACE for this
field> -writeperm
u:<user ID> | <existing ACE for this
field>
```

Case 2: You do not have `readperm` and `writeperm` on the default column family

In this case, you need the `traverseperm` permission on the default column family. Fields `a` and `b` inherit this permission. You also need `readperm` and `writeperm` on field `c`.

You could be granted these permissions with commands similar to these:

```
maprcli table cf edit -path
<path to JSON table> -cfname
default -traverseperm
u:<user ID> | <existing ACE for this
field>
maprcli table cf colperm set -path
<path to JSON table> -cfname
default -name a.b.c
-readperm u:<user ID> | <existing ACE
for this field> -writeperm u:<user
ID> |
<existing ACE for this field>
```

When the field is in a non-default column family

Note: Non-default column families are an advanced feature of HPE Ezmeral Data Fabric Database's native JSON support. For information about them, see [Column Families in JSON table](#).

In the following document, you want to perform an operation on field `c`, which is in the column family `cf1` that is defined at field `b` with the path `a.b`.

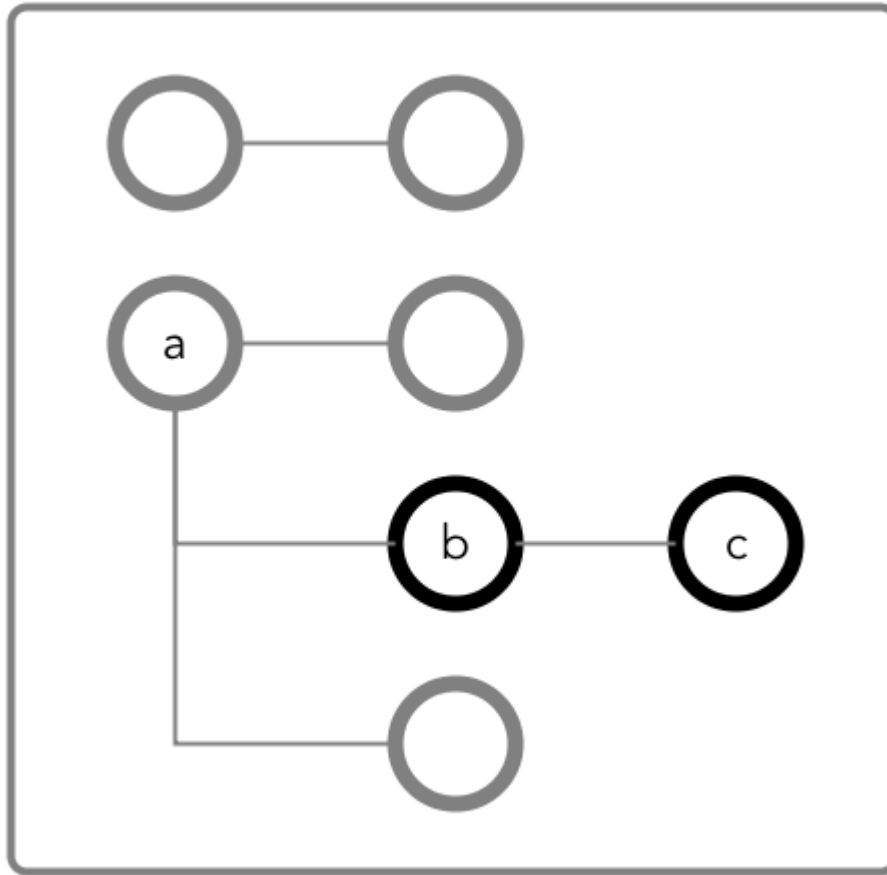

Figure 28: Schematic diagram of an JSON document in which fields `b` and `c` are in a column family that has the path `a.b`

Case 1: You do not have `readperm` and `writeperm` on field `b`

You need `traverseperm` on field `b` and both `readperm` and `writeperm` on field `c`. You can be granted these permissions with commands similar to these:

```
/opt/mapr/bin/maprcli table cf
edit -path <path to JSON
table> -cfname cf1
-traverseperm u:<user ID> | <existing
ACE for this field>
maprcli table cf colperm set -path
<path to JSON table> -cfname
cf1 -name a.b.c
-readperm u:<user ID> | <existing ACE
for this field> -writeperm u:<user
ID> |
<existing ACE for this field>
```

Case 2: You do have `readperm` and `writeperm` on field `b`

You do not need any further permissions. Field `c` inherits your `readperm` and `writeperm` permissions from field `b`.

Obtaining readperm or writeperm on Fields

In this scenario, you want to perform an operation on a field, and the operation requires that you have `readperm` or `writeperm` permissions on that field. How you obtain either permission depends on whether the field is in the default column family or a non-default column family.

When the field is in the default column family

In the following document, you want to perform an operation on field `c`, which is in the default column family. The operation requires you to have `readperm` or `writeperm` on field `c`.

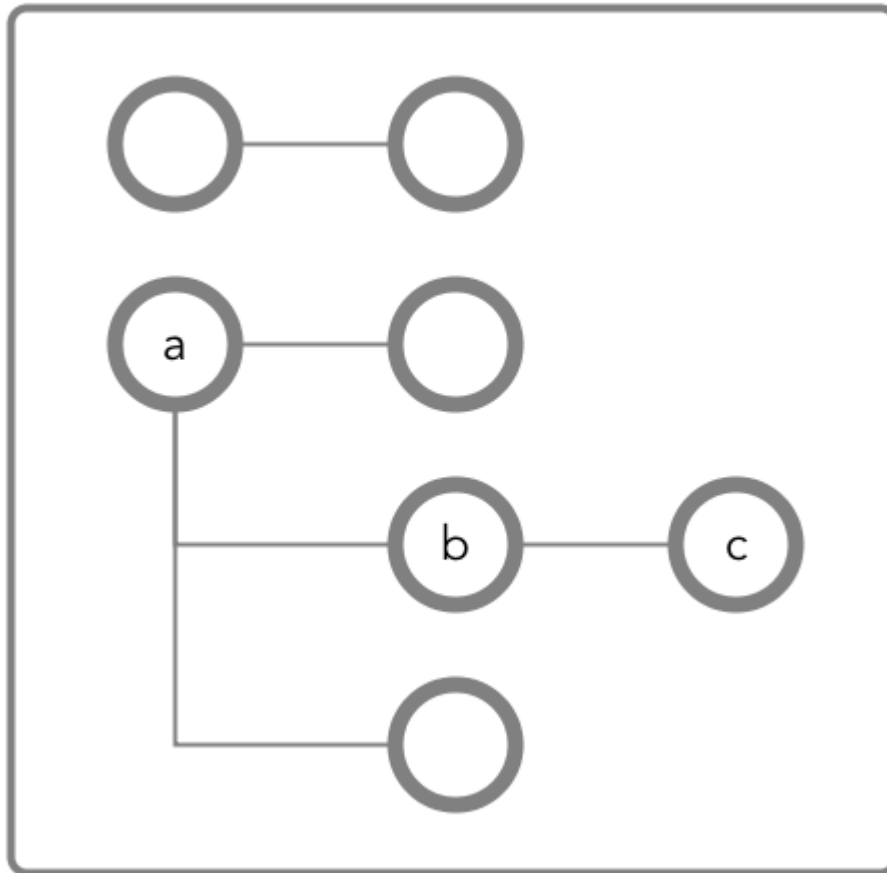

Figure 29: Schematic diagram of an JSON document in which all fields are in the default column family

Case 1: You have the same permission (`readperm` or `writeperm`) on the default column family

In this case, field `c` inherits the permission, assuming that the permission was not denied on field `a` or `b`.

If you do not have `readperm` or `writeperm` on field `a` or `b`, you need `traverseperm` on the field that denied you the permission that you need. You also need `readperm` or `writeperm` explicitly granted to you on field `c`.

Example commands to grant these permissions:

```

/opt/mapr/bin/maprcli table cf
colperm set -path <path to JSON
table> -cfname
  
```

```
default -name a.b -traverseperm
u:<user ID> | <existing ACE for this
field>
```

The next example command grants `readperm`:

```
/opt/mapr/bin/maprcli table cf
colperm set -path <path to JSON
table> -cfname
default -name a.b.c -readperm u:<user
ID> | <existing ACE for this field>
```

Case 2: You do not have the same permission (`readperm` or `writeperm`) on the default column family

In this case, you need the `traverseperm` permission on the default column family. You also need `readperm` or `writeperm` explicitly granted to you on field `c`.

Example commands to grant these permissions:

```
/opt/mapr/bin/maprcli table cf
edit -path <path to JSON
table> -cfname cf1
-traverseperm u:<user ID> | <existing
ACE for this field>
```

This next example command grants `readperm`:

```
/opt/mapr/bin/maprcli table cf
colperm set -path <path to JSON
table> -cfname cf1
-name a.b.c -readperm u:<user ID> |
<existing ACE for this field>
```

When the field is in a non-default column family

Note: Non-default column families are an advanced feature of HPE Ezmeral Data Fabric Database's native JSON support. For information about them, see [Column Families in JSON Tables](#).

In the following document, you want to perform an operation on field `c`, which is in the column family that is defined at field `b` with the path `a.b`. The operation requires you to have `readperm` or `writeperm` on field `c`.

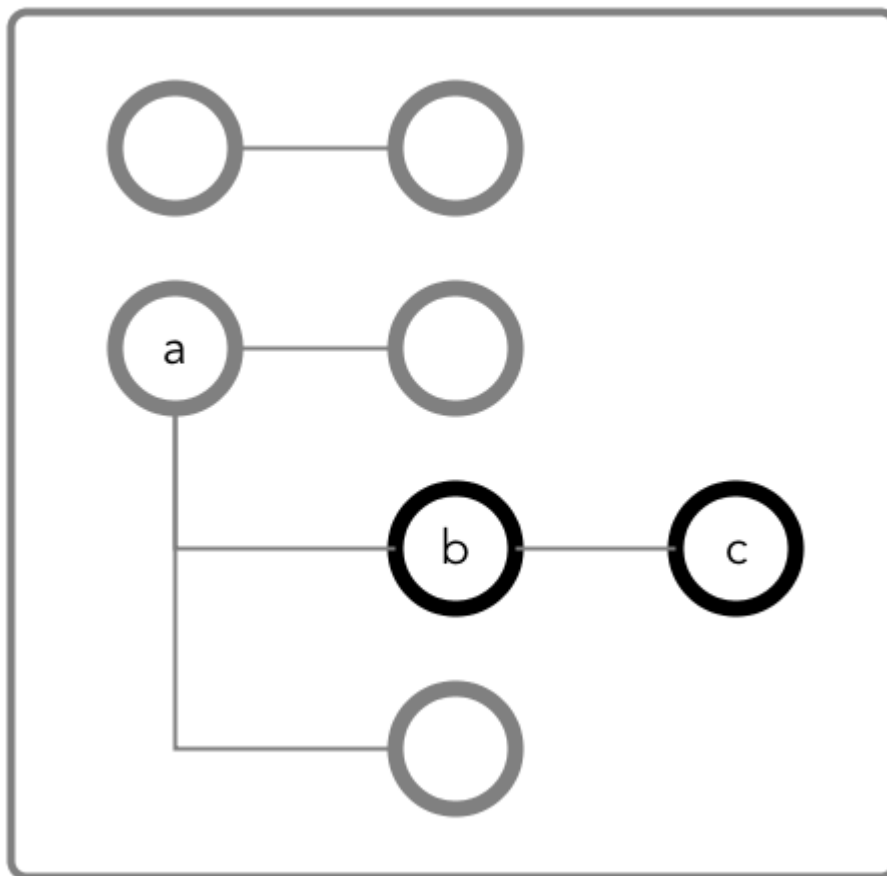

Figure 30: Schematic diagram of an JSON document in which fields `b` and `c` are in a column family that has the path `a.b`

Case 1: You do not have the permission you need (`readperm` or `writeperm`) on field `b`

You need `traverseperm` on field `b`, and you need `readperm` or `writeperm` granted to you explicitly on field `c`.

Example commands to grant these permissions:

```
/opt/mapr/bin/maprcli table cf
edit -path <path to JSON
table> -cfname cf1
-traverseperm u:<user ID> | <existing
ACE for this field>
maprcli table cf colperm set -path
<path to JSON table> -cfname cf1
-name a.b.c -readperm u:<user ID> |
<existing ACE for this field>
```

Case 2: You do have the permission you need (`readperm` or `writeperm`) on field `b`

You do not need any further permissions. Field `c` inherits your `readperm` and `writeperm` permissions from field `b`.

Setting Permissions on Arrays

When granting permissions on a field, if the field contains array data, you must grant the permission on the array field. This grants access not only to array data in the field, but also nested documents and scalar data. It is also possible to set permissions on subfields within nested documents that are stored in an array.

Note: This topic describes the behavior of permissions in HPE Ezmeral Data Fabric Database version 6.1 and later, regardless of the data-fabric version you used to grant the permissions.

Granting Permissions on Array Elements

Suppose you have the following documents where `person` is:

- An array of nested documents in document `id001`
- A single nested document in document `id002`
- A scalar value in document `id003`

```
{
  "_id" : "id001",
  "person" : [
    { "name" : { "last" : "Smith", "first" : "John" } },
    { "name" : { "last" : "Subramanium", "first" : "Ananya" } }
  ]
}
{
  "_id" : "id002",
  "person" : { "name" : { "last" : "Doe", "first" : "Jane" } }
}
{
  "_id" : "id003",
  "person" : "Unknown"
}
```

If you grant a user read permission on the array `person[]`, that user can read every field in every nested document within the array in document `id001`. The permission also enables the user to read the `person` field in documents `id002` and `id003`.

If you receive an error when trying to grant permission on `person[]` because you previously granted permission on `person`, then you (or an administrator with the appropriate permissions) must first remove the existing permission on `person`. If you expect the schema of the `person` field to evolve to include non-array and array data, then you should grant the permission on `person[]` rather than `person`, to avoid having to remove the conflicting `person` permission.

You cannot grant permissions on individual elements in an array; for example: `person[1]`. Granting permission on an array enables access to the entire array.

Granting Permissions on Nested Document Fields in an Array

If you want to restrict read access to only specific fields in `person`, whether the field is an array of nested documents or a single nested document, perform the following steps:

1. Deny the user read permission on the array `person[]`.
2. Grant the user traverse permission on the array `person[]`.
3. Grant the user read permission on the specific fields.

For example, to grant the user read permission on only the first names in the nested documents, for the third step, grant read permission on `person[].name.first`. The permission enables the user to read the field in all nested documents in documents `id001` and `id002`.

If permissions already exist on `person.name.first`, then all attempts to define permissions on `person[].name.first` fails. You (or an administrator with the appropriate permissions) must first remove the existing permission on `person.name.first`. Similar to the scenario described in the

previous section, if you expect the schema of the `person` field to evolve to include individual nested documents as well as arrays of nested documents, then you should grant the permission on `person[].name.first` to avoid having to remove the conflicting permission.

If you already have permissions on `person[].name.first`, then attempting to define permissions on `person.name.first` fails. There is no need to add this permission.

Granting Permissions on JSON Tables

This page summarizes the default access-control expressions for the supported ways of setting read, traverse, and write permissions.

The default permissions for column families are determined when tables are created. The default permissions for fields are inherited from the column family where the fields are located.

| Action | Method | Permissions | Default Access-Control Expressions |
|--|---|---|---|
| Set default permissions on new column families when creating a JSON table. | Java API | -defaultreadperm -defaulttraverseperm -defaultwriteperm | u:<ID of the process> |
| | <code>maprcli table create</code> | | u:<user ID of table creator> |
| | <code>mapr dbshell</code> | | |
| | Control System | | |
| Set default permissions on new column families when editing a JSON table. | <code>maprcli table edit</code> | | Current ACEs |
| | Control System | | |
| Set permissions on a column family when creating the column family. | <code>maprcli table cf create</code> | -readperm -traverseperm -writeperm -indexperm | ACEs for -defaultreadperm, -defaulttraverseperm, and -defaultwriteperm |
| | Control System | | |
| Set permissions on a column family when editing the column family. | <code>maprcli table cf edit</code> | | Current ACEs |
| | Control System | | |
| Set permissions on individual fields. | <code>maprcli table cf colperm set</code> | | Inherited from column family or parent field |
| | Control System | | |

Managing Column Families

JSON tables store data in column families, which are collections of fields that are stored together on disk.

Each table has a default column family, which is default storage for all fields in the documents of a table. You can create additional column families to store data for a collection of fields in a separate location on disk. Queries that operate only on data that is stored in a column family are more efficient and better performing than queries on the same data when that data is stored with other data in a table. You can also cache values from a column family in memory.

Applications do not need to be aware of the existence of column families. They perform CRUD operations by using the paths of fields in a document. For example, to update any of the fields below `a.c`, an application does not need to be aware that the field is in the column family at the path `a.c`. The application simply moves through the document along the path to the field.

For more information, see [Column Families in JSON Tables](#) on page 489.

Creating Column Families

You can create column families with the HPE Ezmeral Data Fabric Database JSON Java API library by using the `Admin.createTable(TableDescriptor tableDescriptor)` method.

Add a column family to the `TableDescriptor` object before passing that object to the `createTable()` method.

Restriction

If any existing column family in a JSON table, including the default column family, uses a time-to-live that is greater than 0, you cannot create any additional column families in that table. See [Setting TTL for Data](#).

Permissions Required

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `createrenamefamilyperm` on the table

Example

Here is an example of using the API to create two column families -- the default column family and a custom column family -- during the creation of a table:

```

/* Create a TableDescriptor for the table to create,
   passing in the path of the table. */
TableDescriptor tableDescriptor = MapRDB.newTableDescriptor(tablePath);

/* Create a FamilyDescriptor for the default column family.
   When you create a table with the API, you must also create
   the default column family.
   After creating the FamilyDescriptor, add it to
   the TableDescriptor. */
FamilyDescriptor defaultfamilyDesc = MapRDB.newDefaultFamilyDescriptor();
tableDescriptor.addFamily(defaultfamilyDesc);

/* Create a FamilyDescriptor for the custom column family
   to create. The setJsonFieldPath() method specifies the field
   at which to create the column family.
   After creating the FamilyDescriptor, add it to
   the TableDescriptor. */
FamilyDescriptor familyDescriptor = MapRDB.newFamilyDescriptor()
    .setName("CF1")
    .setJsonFieldPath("a.b");
tableDescriptor.addFamily(familyDescriptor);

// Pass the TableDescriptor to the Admin.createTable() method.
public void createJSONTable(String tablePath, TableDescriptor
tableDescriptor) throws DBException {
    try (Admin admin = MapRDB.newAdmin()) {
        if (!admin.tableExists(tablePath)) {
            admin.createTable(tableDescriptor);
        }
    }
}

```

Alternative Method

You can also create column families in JSON tables by running the command `table cf create`.

Altering Column Families

You can alter column families, including the default column family for a table, by using the `Admin.alterFamily()` method in the HPE Ezmeral Data Fabric Database JSON Java API library.

Permissions Required

- [readAce](#) and [writeAce](#) on the volume
- [lookupdir](#) on directories in the path
- [createrenamefamilyperm](#) on the table

Example

Here is an example of using the API to change the name of a column family:

```
public void alterColumnFamily(String tablePath, String familyName,
    String newFamilyName) throws DBException {
    try (Admin admin = MapRDB.newAdmin()) {

        /* Get a TableDescriptor object for the table. This object
           gives access to the column families that are in the table. */
        TableDescriptor tableDesc = admin.getTableDescriptor(tablePath);

        /* Get a FamilyDescriptor object for the column family to
           change the name of. /
        FamilyDescriptor familyDesc = tableDesc.getFamily(familyName);

        // Rename the column family.
        familyDesc.setName(newFamilyName);

        /* Call alterFamily(), passing in the path of the table,
           the original name of the column family, and the
           FamilyDescriptor in which the new name was set. */
        admin.alterFamily(tablePath, familyName, familyDesc);
    }
}
```

Alternative Method

You can also edit column families in JSON tables by running the command [table cf edit](#).

Deleting Column Families

You can delete a column family (except for the default column family) in a JSON table with the `Admin.deleteFamily()` Java method.

 **Important:** Starting in the 6.0 release, you cannot delete a column family from a JSON table.

Permissions Required

The `readAce` and `writeAce` permissions on the volumes where the JSON tables are located. For information about how to set permissions on volumes, see [Setting Whole Volume ACEs](#) on page 1576.

Behavior

The data that is in the specified column family is deleted. If the column family is followed by one or more column families in a hierarchy, the other column families in the hierarchy are unaffected and still accessible. For example, if column family `CF1` at path `a.c` is followed by column family `CF2` at path `a.c.f`, `CF2` remains accessible and only the data in `CF1` is deleted.

| Before deleting the column family CF1 at a.c | After deleting the column family CF1 at a.c |
|--|--|
| <pre> { "a" : { "b" : "value_b", "c" : { "d" : "value_d", "e" : "value_e", "f" : { "g" : "value_g", "h" : "value_h" } } } } </pre> | <pre> { "a" : { "b" : "value_b", "c" : { "d" : "", "e" : "", "f" : { "g" : "value_g", "h" : "value_h" } } } } </pre> |

Example of using the Admin.deleteFamily() method

```

public void deleteColumnFamily(String tablePath, String familyName) throws
DBException {
  try (Admin admin = MapRDB.newAdmin()) {
    if (admin.tableExists(tablePath)) {
      admin.deleteFamily(tablePath, familyName);
    }
  }
}

```

| Parameter | Description |
|------------|--|
| tablePath | The path of the table in the MapR filesystem. See the "Table Paths" section in HPE Ezmeral Data Fabric Database JSON Tables on page 486. |
| familyName | The name of the column family to delete. You cannot delete the default column family. If familyName is equal to "default", the API returns an exception. |

Setting TTL for Data

You can delete stale JSON documents in JSON tables automatically by setting a time-to-live (TTL) value on the column family.

TTL is set only on the default column family in a JSON table. The duration that you set applies to each entire JSON document in the JSON table.

 **Note:** Only the default column family can exist in order to set TTL; no other column families can exist in the JSON table. You also cannot set the TTL for a JSON table if it has secondary indexes.

Data can become stale. If the data in an JSON document has not been updated within a certain period of time, you might want to delete the document. In the case of a large amount of JSON documents, applications should not have to track the time between updates and then delete the expired documents.

Because the time-to-live that is set on a column family affects an entire JSON table, only the default column family is allowed to have a non-default time-to-live value. In addition, to prevent multiple column families from having non-default time-to-live values, additional column families can not be created in a table if the default column family has a non-default value. This is because if more than one column family had a non-default TTL value, fragments of documents would expire at different times, leading to inconsistent views of data.

Permission Required

The `writeAce` permission on the volumes where the JSON tables are located. For information about how to set permissions on volumes, see [Setting Whole Volume ACEs](#) on page 1576.

Example: Setting the default column family to a non-default time-to-live value

If you set the time-to-live parameter for the default column family to 864,000 seconds, JSON documents in that table are considered to be stale if the document's data has not been updated within 10 days and are automatically deleted.

The following code example creates a JSON table, the default column family and sets the TTL to a non-default value of 10 days (864,000 seconds).

```
/* Create a TableDescriptor for the table to create,
   passing in the path of the table. */
TableDescriptor tableDescriptor = MapRDB.newTableDescriptor(tablePath);

/* Create a FamilyDescriptor for the default column family.
   When you create a table with the API, you must also create
   the default column family.
   Set the TTL to 10 days.
   After creating the FamilyDescriptor, add it to
   the TableDescriptor. */
FamilyDescriptor defaultfamilyDesc = MapRDB.newDefaultFamilyDescriptor()
    .setTTL(864000);
tableDescriptor.addFamily(defaultfamilyDesc);

// Pass the TableDescriptor to the Admin.createTable() method.
public void createJSONTable(String tablePath, TableDescriptor
tableDescriptor) throws DBException {
    try (Admin admin = MapRDB.newAdmin()) {
        if (!admin.tableExists(tablePath)) {
            admin.createTable(tableDescriptor);
        }
    }
}
```

Managing JSON Documents

To perform CRUD operations (create, read, update, and delete) on JSON documents in HPE Ezmeral Data Fabric Database JSON tables using the OJAI API, you use `Document`, `DocumentStore`, and `DocumentMutation` objects.

You can also perform these operations using [HPE Ezmeral Data Fabric Database Shell \(JSON Tables\)](#) on page 5488.

Document

To create a JSON document, you must create a `Document` object. See the following for information specific to each language:

Java

To create a JSON document in Java OJAI, use the [Document](#) interface.

See [Creating JSON Documents in Java OJAI](#) on page 2821 to learn about the different ways to create `Document` objects in Java.

Node.js

To create a `Document` object in Node.js OJAI, simply create a JSON object.

| | |
|---------------|---|
| | See Sample OJAI Code for Creating JSON Documents on page 2826 for an example of how to do this. |
| Python | <p>The preferred approach is to create a <code>Document</code> object in Python is to create a Python dictionary. You can also use the Document interface.</p> <p>See Creating JSON Documents in Python OJAI on page 2825 to learn about these two ways to create JSON documents in Python.</p> |
| C# | <p>To create a <code>Document</code> object in C# OJAI, create a C# object.</p> <p>See Sample OJAI Code for Creating JSON Documents on page 2826 for an example of how to do this.</p> <p>For C# OJAI examples, see this Github page.</p> |
| Go | <p>To create a <code>Document</code> object in Go OJAI, create a Go structure.</p> <p>See Sample OJAI Code for Creating JSON Documents on page 2826 for an example of how to do this.</p> |

DocumentStore

After you create a `Document` object, you can pass it to the `DocumentStore` interface. The interface has methods to perform the following tasks:

- Delete documents from tables
- Insert documents into tables
- Replace documents in tables

See the following for API links to the `DocumentStore` interface in each language:

| | |
|----------------|--|
| Java | <p>DocumentStore</p> <p> Note: By default, OJAI implements non-buffered writes. If you want buffered writes instead, use the <code>ojai.mapr.documentstore.buffer-writes</code> option and with the <code>Document</code> object. This option is available only in the Java OJAI API. See Enabling Buffered Writes in Java OJAI on page 2946 for more information.</p> |
| Node.js | DocumentStore |
| Python | DocumentStore |
| C# | <p>DocumentStore</p> <p>For C# OJAI examples, see this Github page.</p> |
| Go | DocumentStore |

DocumentMutation

To make changes to JSON documents, create a `DocumentMutation` object. A `DocumentMutation` enables you to perform OJAI mutations, which includes replacing, updating, combining, and deleting fields in a JSON document. For a list of available mutations, see [Using OJAI Mutation Syntax](#) on page 2837.

Java

To create a `DocumentMutation` object, call the methods in the `DocumentMutation` class corresponding to the mutation operations you want to perform. See [DocumentMutation](#) for a list of available methods.

Pass the `DocumentMutation` object to either the [DocumentStore.checkAndUpdate](#) or [DocumentStore.update](#) method to apply the changes to the document. The first method accepts a [QueryCondition](#) parameter that must evaluate to true for the mutation to be applied. Both methods have an `_id` parameter corresponding to the document to be updated.

Node.js

To create a `DocumentMutation` object, create a JSON object [Using OJAI Mutation Syntax](#) on page 2837.

Pass the `DocumentMutation` object to either the [DocumentStore.checkAndUpdate](#) or [DocumentStore.update](#) method to apply the changes to the document. The `DocumentStore.checkAndUpdate()` method accepts an OJAI query condition parameter that must evaluate to true for the mutation to be applied. Both methods have an `_id` parameter corresponding to the document to be updated.

Python

To create a `DocumentMutation` object, create a Python dictionary object [Using OJAI Mutation Syntax](#) on page 2837.

Pass the `DocumentMutation` object to either the [DocumentStore.check_and_update](#) or [DocumentStore.update](#) method to apply the changes to the document. The `DocumentStore.check_and_update()` method accepts an OJAI query condition parameter that must evaluate to true for the mutation to be applied. Both methods have an `_id` parameter corresponding to the document to be updated.

C#

To create a `DocumentMutation` object, create a C# object [Using OJAI Mutation Syntax](#) on page 2837.

Pass the `DocumentMutation` object to either the [DocumentStore.CheckAndUpdate](#) or [DocumentStore.Update](#) method to apply the changes to the document. The [DocumentStore.CheckAndUpdate](#) method accepts an OJAI query condition parameter that must evaluate to true for the mutation to be applied. Both methods have an `_id` parameter corresponding to the document to be updated.

For C# OJAI examples, see this [Github page](#).

Go

To create a `DocumentMutation` object, create a Go structure [Using OJAI Mutation Syntax](#) on page 2837.

Pass the `DocumentMutation` structure to either the `DocumentStore.CheckAndUpdate` or `DocumentStore.Update` method to apply the changes to the document. The `DocumentStore.CheckAndUpdate` method accepts an OJAI query condition parameter that must evaluate to true for the mutation to be applied. Both methods have an `_id` parameter corresponding to the document to be updated.

By default, the default maximum size of a JSON document is 32 MB. A `DocumentMutation` does not enforce this limit. HPE Ezmeral Data Fabric Database enforces the limit when you pass your `DocumentMutation` object to the `DocumentStore` method. See [JSON Document Size](#) on page 472 for information about how to increase this limit.

See [Examples: Updating JSON Documents](#) on page 2845 for examples that use mutations.

Creating JSON Documents in OJAI

The way you create a JSON document in your OJAI application depends on the language you use.

Creating JSON Documents in Java OJAI

There are several ways to create JSON documents in your Java OJAI application. They all require you to call the `Connection.newDocument` method to create a `Document` object.

Related information

[Connection](#)

[Document](#)

Create a Document Using a Document Object in Java OJAI

You can create a new JSON document in your Java OJAI client by first calling the `Connection.newDocument()` method to create a `Document` object, and then calling methods on the object to specify document fields and values.

The following shows the detailed sequence of steps:

1. Create a new JSON document by calling the `newDocument()` method in the `Connection` class.
2. Specify the ID of the document with the `setId()` method.
3. Specify field names and their values with the `set()` or `setArray()` method.
4. Return the results in a `Document` object.

For example, suppose you want to create the following JSON document:

```
{
  "_id" : "movie00000001",
  "title" : "OJAI -- The Documentary",
  "studio" : "MapR Technologies, Inc.",
  "release_date" : "2015-09-29",
  "trailers" : {
    "teaser" : "https://10.10.21.90/trailers/teaser",
    "theatrical" : "https://10.10.21.90/trailers/theatrical"
  },
  "characters" : [
    "Heroic Developer",
    "Evil Release Manager",
    "Mad Development Manager"
  ],
  "box_office_gross" : 1000000000L
}
```

The following method creates the document:

```
public Document buildDocument() {
    return connection.newDocument()
        .setId("movie0000001")
        .set("title", "OJAI -- The Documentary")
        .set("studio", "MapR Technologies, Inc.")
        .set("release_date", Values.parseDate("2015-09-29"))
        .set("trailers.teaser", "https://10.10.21.90/trailers/teaser")
        .set("trailers.theatrical", "https://10.10.21.90/trailers/
theatrical")
        .setArray("characters",
            ImmutableList.of(
                "Heroic Developer", "Evil Release Manager", "Mad
Development Manager"))
        .set("box_office_gross", 1000000000L);
}
```

Create a Document from a JSON String in Java OJAI

You can create a new JSON document in your Java OJAI client by passing a JSON string to the `Connection.newDocument()` method.

To create the following JSON document:

```
{
  "_id": "id001",
  "a": 1,
  "b": "aString",
  "array": [
    1,
    2,
    "arrStr",
    {
      "c": "arrMapStr"
    }
  ]
}
```

Call `Connection.newDocument()`, passing in a JSON string with escaped quotes:

```
Document pojoDoc = connection.newDocument(
    "{ \"_id\": \"id001\", \"a\": 1, \"b\": \"aString\", \"array\": [1, 2, \"arrStr\", { \"c\": \"arrMapStr\" } ] }");
```

Create a Document from a JavaBean

You can create a new JSON document in your Java OJAI client by passing a JavaBean to the `Connection.newDocument(Object bean)` method. Through an example, the content shows you a sample JavaBean class, how to create a bean for that class, how to create a JSON document from the bean, and how to convert a JSON document back to a bean.

Sample JavaBean Class

Suppose that you are using a JavaBean class named `ExampleJson`:

```
package com.example;

import java.util.ArrayList;
import java.util.HashMap;
import java.util.List;
import java.util.Map;
import javax.annotation.Generated;
```

```

import com.fasterxml.jackson.annotation.JsonAnyGetter;
import com.fasterxml.jackson.annotation.JsonAnySetter;
import com.fasterxml.jackson.annotation.JsonIgnore;
import com.fasterxml.jackson.annotation.JsonInclude;
import com.fasterxml.jackson.annotation.JsonProperty;
import com.fasterxml.jackson.annotation.JsonPropertyOrder;

@JsonInclude(JsonInclude.Include.NON_NULL)
@Generated("org.jsonschema2pojo")
@JsonPropertyOrder({
    "a",
    "b",
    "array"
})

public class ExampleJson {

    @JsonProperty("a")
    private Double a;
    @JsonProperty("b")
    private String b;
    @JsonProperty("array")
    private List<Object> array = new ArrayList<Double>();
    @JsonIgnore
    private Map<String, Object> additionalProperties = new HashMap<String,
Object>();

    /**
     *
     * @return
     * The a
     */
    @JsonProperty("a")
    public Double getA() {
        return a;
    }

    /**
     *
     * @param a
     * The a
     */
    @JsonProperty("a")
    public void setA(Double a) {
        this.a = a;
    }

    /**
     *
     * @return
     * The b
     */
    @JsonProperty("b")
    public String getB() {
        return b;
    }

    /**
     *
     * @param b
     * The b
     */
    @JsonProperty("b")
    public void setB(String b) {

```

```

        this.b = b;
    }

    /**
     *
     * @return
     * The array
     */
    @JsonProperty("array")
    public List<Object> getArray() {
        return array;
    }

    /**
     *
     * @param array
     * The array
     */
    @JsonProperty("array")
    public void setArray(List<Object> array) {
        this.array = array;
    }

    @JsonAnyGetter
    public Map<String, Object> getAdditionalProperties() {
        return this.additionalProperties;
    }

    @JsonAnySetter
    public void setAdditionalProperty(String name, Object value) {
        this.additionalProperties.put(name, value);
    }
}

```

Create a Bean

You can create a bean for the `ExampleJson` class with the following code:

```

ExampleJson bean = new ExampleJson();

bean.setA(1);
bean.setB("aString");

List arrList = new ArrayList();
arrList.add(1);
arrList.add(2);
arrList.add("arrStr");

Map arrMap = new HashMap();
arrMap.put("c", "arrMapStr");
arrList.add(arrMap);
bean.setArray(arrList);

```

Create a New Document from a Bean

After creating the `ExampleJson` bean, you can create a JSON document using the bean with the following call:

```

Document.pojoDoc = connection.newDocument(bean);

```

The document will have the following structure:

```
{
  "a":1,
  "b":"aString",
  "array":[
    1,
    2,
    "arrStr",
    {
      "c":"arrMapStr"
    }
  ]
}
```

Create a JavaBean from a JSON Document

You can also create a JavaBean from a JSON document. For example, suppose you modify the document that you created earlier:

```
pojoDoc.set("d","10");
```

The following converts the modified document back into an `ExampleJson` bean:

```
ExampleJson bean =.pojoDoc.toJavaBean(ExampleJson.class);
```

Creating JSON Documents in Python OJAI

There are two ways to create JSON documents in your Python OJAI application, one of which is the preferred approach.

The preferred way to create a Python dictionary object and then pass it to the `Connection.new_document()` method:

```
json_dict = {
  "_id" : "movie0000001",
  "title" : "OJAI -- The Documentary",
  "studio" : "MapR Technologies, Inc.",
  "release_date" : "2015-09-29",
  "trailers" : {
    "teaser" : "https://10.10.21.90/trailers/teaser",
    "theatrical" : "https://10.10.21.90/trailers/theatrical"
  },
  "characters" : [
    "Heroic Developer",
    "Evil Release Manager",
    "Mad Development Manager"
  ],
  "box_office_gross" : 1000000000L
}
new_document = connection.new_document(dictionary=json_dict)
```

Alternatively, you can call `Document` interface methods to set fields and values:

```
doc = connection.new_document()
    .set_id("movie0000001")
    .set('title', 'OJAI - The Documentary')
    .set('studio', 'MapR Technologies, Inc.')
    .set('release_date', ODate.parse(date_str='2015-09-29'))
    .set('trailers.teaser', 'https://10.10.21.90/trailers/teaser')
    .set('trailers.theatrical', 'https://10.10.21.90/trailers/
theatrical')
```

```

        .set('characters', ['Heroic Developer', 'Evil Release Manager',
            'Mad Development Manager'])
        .set('box_office_gross', 1000000000)

```

See the following for more details about the APIs:

- [Connection](#)
- [Document](#)

Sample OJAI Code for Creating JSON Documents

The sample code in this section shows you how to create a JSON document.

Java

The code is available at [OJAI_001_GetConnectionCreateDocument.java](#).

```

                    @"{" +
                        @"""street"":""555 Moon Way""," +
                        @"""city"":""Gotham"" +
                    @"}" +
                @"}";
    }
}

```

```

// Create a document from jsonStr
var documentJson = connection.NewDocument(jsonStr);

// Print the OJAI Document
Console.WriteLine(documentJson.ToJsonString());

// Create new document with the same fields using constructor
var documentConstructed = connection.NewDocument()
    .SetID("id001")
    .Set("name", "Joe")
    .Set("age", 50)
    .Set("address.street", "555 Moon Way")
    .Set("address.city", "Gotham");

// Print the OJAI Document
Console.WriteLine(documentConstructed.ToJsonString());

// Close the OJAI connection
connection.Close();
}
}

```

Go

The code is available at [001_get_connection_create_document.go](#).

```

package main

import (
    "fmt"
    client "github.com/mapr/private-maprdb-go-client"
)

func main() {
    // Create connection string
    connectionString := "192.168.33.11:5678?" +
        "auth=basic;" +
        "user=mapr;" +
        "password=mapr;" +
        "ssl=true;" +
        "sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
        "sslTargetNameOverride=nodel.cluster.com"

    // Create a connection to data access server
    connection, err := client.MakeConnection(connectionString)
    if err != nil {
        panic(err)
    }

    // Json string or map from which the Document will be created
    newMap := map[string]interface{}{
        "_id": "id001",
        "name": "Joe",
        "age": 50,
        "address": map[string]interface{}{
            "street": "555 Moon Way",
            "city": "Gotham",
        },
    },

    // Create new document from json_document
    newDocument := connection.CreateDocumentFromMap(newMap)
}

```

```

// Print the new OJAI Document
fmt.Println(newDocument.AsJsonString())

// Close connection
connection.Close()
}

```

Examples: Inserting JSON Documents

This section contains sample code that inserts a JSON document into a HPE Ezmeral Data Fabric Database JSON table. It also shows the HPE Ezmeral Data Fabric Database Shell syntax for inserting documents.

Java

The following code is available at [OJAI_002_GetStoreAndInsertDocuments.java](#).

After you create the JSON document, call the `DocumentStore.insertOrReplace` method to insert the document into HPE Ezmeral Data Fabric Database.

```

        var document = connection.NewDocument(doc);

        // Print the OJAI Document
        Console.WriteLine(document.ToJsonString());

        // Insert the OJAI Document into the DocumentStore
        store.InsertOrReplace(document);
    }

    // Close the OJAI connection
    connection.Close();
}
}

```

Go

The following code is available at [002_get_store_and_insert_documents.go](https://github.com/002_get_store_and_insert_documents.go).

The following code creates a list of JSON dictionary objects, creates [Document](#) objects, and calls the [DocumentStore.InsertOrReplaceDocument](#) function to insert the documents into HPE Ezmeral Data Fabric Database.

```
package main

import (
    "fmt"
    client "github.com/mapr/private-maprdb-go-client"
)

func main() {
    // Create connection string
    connectionString := "192.168.33.11:5678?" +
        "auth=basic;" +
        "user=mapr;" +
        "password=mapr;" +
        "ssl=true;" +
        "sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
        "sslTargetNameOverride=node1.cluster.com"

    storeName := "/demo_table"

    // Create a connection to DAG
    connection, err := client.MakeConnection(connectionString)
    if err != nil {
        panic(err)
    }

    // Get a store and assign it as a DocumentStore struct
    isExists, err := connection.IsStoreExists(storeName)
    if err != nil {
        panic(err)
    }
    var store *client.DocumentStore
    if isExists {
        store, err = connection.GetStore(storeName)
        if err != nil {
            panic(err)
        }
    } else {
        store, err = connection.CreateStore(storeName)
        if err != nil {
            panic(err)
        }
    }

    // Slice of maps from which the Document will be created
    documentArray := []map[string]interface{}{
        {
            "_id": "user0000",
            "age": 35,
            "firstName": "John",
            "lastName": "Doe",
            "address": map[string]interface{}{
                "street": "350 Hoyer Way",

"542-5656" },
    },
    },
}

for __, docMap := range documentArray {
    // Create new document from json_document
    newDocument := connection.CreateDocumentFromMap(docMap)
    // Print the new OJAI Document
    fmt.Println(newDocument.AsJsonString())
    //Insert the OJAI Document into the DocumentStore
    store.InsertOrReplaceDocument(newDocument)
}

// Close connection
connection.Close()
}

```

Using OJAI Mutation Syntax

To perform updates using OJAI, you specify the document you want to update using its `_id` field, create *mutations* for that document, and then update it in your document store. OJAI defines a syntax for specifying mutations. Mutations allow you to append, decrement, delete, increment, combine, replace, and update fields in a document. This topic describes the syntax for the supported mutation operations and provides examples.

The following table lists the mutations OJAI supports. Each entry in the table contains a brief description of the mutation and a link to a section in this topic that describes the mutation in more detail.

| Mutation Operation | Description |
|---------------------------|--|
| Append | Appends values to binary, string, and array fields |
| Decrement | Decrements field values |
| Delete | Deletes fields |
| Increment | Increments field values |
| Merge | Combines a nested document with an existing document |
| Put | Replaces field values or adds new fields |
| Set | Updates field values or adds new fields |

The examples in this topic use the following sample JSON document:

```
{
  "_id" : "id1",
  "a" : {
    "b" : [ { "boolean" : false }, { "decimal" : 123.456 } ],
    "c" : {
      "d" : 10,
      "e" : "Hello"
    }
  },
  "m" : "MapR wins"
}
```

OJAI Append Mutations

Syntax

```
{"$append": {"fieldpath": value}}
```

```
{"$append": [{"fieldpath1": value1}, {"fieldpath2": value2}, ...]}
```

Description

The `$append` mutation is a read-modify-write operation. Use it to append specified values to existing binary, string, or array type fields. If there is type mismatch in any intermediate field specified in a *fieldpath* for the document, the mutation fails with an error. For example, an append mutation on field path `a.b.c` fails if the field `a` is a scalar.

To append multiple field paths, use an array notation to list the field paths.

Example

The following mutation appends an element to the array `a.b` and appends the string " MapR" to the end of the string already in the field path `a.c.e`:

```
{"$append": [{"a.b": {"appd": 1}}, {"a.c.e": " MapR"}]}
```

The mutation results in the following document, with the field updates highlighted in bold:

```
{
  "_id" : "id1",
  "a" : {
```

```

    "b" : [ { "boolean" : false },
    { "decimal" : 123.456 }, { "appd" :
    1 } ],
    "c" : {
        "d" : 10,
        "e" : "Hello MapR"
    }
  },
  "m" : "MapR wins"
}

```

OJAI Decrement Mutations

Syntax

```

{"$decrement": "fieldpath"}

```

```

{"$decrement":
{"fieldpath": decrementValue}}

```

```

{"$decrement":
[{"fieldpath1": decrementValue1},
{"fieldpath2": decrementValue2}, ...]}

```

Description

The `$decrement` mutation decrements the value in the *fieldpath*. To decrement multiple field paths, use an array notation to list the field paths.

If the *fieldpath* does not exist, the mutation adds a new field to the document with the value *decrementValue*.

The *decrementValue* is optional and defaults to -1.

The mutation fails if there is a type mismatch in the field.

Example

The following updates the value 10 in `a.c.d` to 5 by using the decrement mutation:

```

{"$decrement": {"a.c.d": 5}}

```

The mutation results in the following document, with the field update highlighted in bold:

```

{
  "_id" : "id1",
  "a" : {
    "b" : [ { "boolean" : false },
    { "decimal" : 123.456 } ],
    "c" : {
      "d" : 5,
      "e" : "Hello"
    }
  },
  "m" : "MapR wins"
}

```

OJAI Delete Mutations

Syntax

```
{"$delete": "fieldpath"}
```

```
{"$delete":  
  [ "fieldpath1", "fieldpath2", ... ]}
```

Description

The `$delete` mutation removes either a single field or a list of fields from a document. If the field does not exist, the delete ignores that field.

Example

The following mutation removes two fields from the document:

```
{"$delete": [ "a.b[1]", "a.c.e" ]}
```

The mutation results in the following document:

```
{  
  "_id" : "id1",  
  "a" : {  
    "b" : [ { "boolean" : false } ],  
    "c" : {  
      "d" : 10  
    }  
  },  
  "m" : "MapR wins"  
}
```

OJAI Increment Mutations

Syntax

```
{"$increment": "fieldpath"}
```

```
{"$increment":  
  { "fieldpath": incrementValue }}
```

```
{"$increment":  
  [ { "fieldpath1": incrementValue1 },  
    { "fieldpath2": decrementValue2 }, ... ]}
```

Description

The `$increment` mutation increments the value in the *fieldpath*. To increment multiple field paths, use an array notation to list the field paths.

If the *fieldpath* does not exist, the mutation adds a new field to the document with the value *incrementValue*.

The *incrementValue* is optional and defaults to 1.

The mutation fails if there is a type mismatch in the field.

Example

The following updates the value 10 in `a.c.d` to 15 by using the increment mutation:

```
{"$increment": { "a.c.d": 5 }}
```

The mutation results in the following document, with the field update highlighted in bold:

```
{
  "_id" : "id1",
  "a" : {
    "b" : [ { "boolean" : false },
    { "decimal" : 123.456 } ],
    "c" : {
      "d" : 15,
      "e" : "Hello"
    }
  },
  "m" : "MapR wins"
}
```

OJAI Merge Mutations

Syntax

```
{ "$merge" :
  { "$fieldpath" : nestedDocument } }
```

Description

The `$merge` mutation combines a *nestedDocument* with an existing document at a specified *fieldpath*. If the original document already contains subfields specified in the *nestedDocument*, then the mutation replaces the values for those subfields. Otherwise, it adds new subfields to the document.

Note: The `$merge` mutation does not support the array notation that other mutation operations provide.

To specify more than one merge operation in a single mutation, use the syntax described at either [Specifying Multiple Mutation Operations](#) on page 2844 or [OJAI Mutations Without Explicit Mutation Operation Names](#) on page 2845. When using these syntax variations, avoid specifying overlapping field paths. HPE Ezmeral Data Fabric Database treats these as [conflicting mutations](#) and discards conflicts.

Examples

The following mutation replaces the pre-existing field path `a.c.d` with the value 11. It adds a new subfield `y` to the nested document `a.c`.

```
{ "$merge" : { "a.c" : { "d" : 11, "y" : "yo" } } }
```

The mutation results in the following document, with the field updates highlighted in bold:

```
{
  "_id" : "id1",
  "a" : {
    "b" : [ { "boolean" : false },
    { "decimal" : 123.456 } ],
    "c" : {
      "d" : 11,
      "e" : "Hello",
      "y" : "yo"
    }
  }
}
```

```
    },
    "m" : "MapR wins"
  }
}
```

The following mutation replaces the value in the field path `a.b` and adds a new subfield `a.d`:

```
{ "$merge": { "a": { "b": 1, "d": "MapR" } } }
```

The mutation results in the following document, with the field updates highlighted in bold:

```
{
  "_id" : "id1",
  "a" : {
    "b" : 1,
    "c" : {
      "d" : 10,
      "e" : "Hello"
    },
    "d" : "MapR"
  },
  "m" : "MapR wins"
}
```

OJAI Put Mutations

Syntax

```
{ "$put": { "fieldpath": value } }
```

```
{ "$put": [ { "fieldpath1": value1 },
  { "fieldpath2": value2 }, ... ] }
```

Description

The `$put` mutation is a replace operation. It is not a read-modify-write operation; it does no validation on the data. If the specified *fieldpath* exists, the mutation replaces the *fieldpath*'s value with the new *value*, regardless of the type of the original value. For example, you can update a field `a.b` from an array to a nested document. If the *fieldpath* does not exist, the mutation creates a new field with the given *value*. Because the operation does no data validation, it is significantly faster than the [set](#) operation.

To replace multiple field paths, use an array notation to list the field paths.

Example

The following example replaces the pre-existing fields `a.b` and `a.c.d` with values whose types differ from the original types. It also adds a new field `a.x`.

```
{ "$put": [ { "a.b": { "boolean": true } },
  { "a.c.d": "eureka" }, { "a.x": 1 } ] }
```

The mutation results in the following document, with the field updates highlighted in bold:

```
{
  "_id" : "id1",
  "a" : {
    "b" : { "boolean": true },
    "c.d" : "eureka",
    "x" : 1
  }
}
```

```

    "b" : { "boolean" : true },
    "c" : {
      "d" : "eureka",
      "e" : "Hello"
    },
    "x" : 1
  },
  "m" : "MapR wins"
}

```

The mutation behaves as follows for the pre-existing fields:

- For a.b, the mutation replaces the original array of nested documents with a single nested document.
- For a.c.d, the mutation changes the field from an integer to a string.

OJAI Set Mutations

Syntax

```

{"$set":{"fieldpath":value}}

```

```

{"$set":[{"fieldpath1":value1},
{"fieldpath2":value2},...]}

```

Description

The `$set` mutation updates one or more fields in a document. It is a read-modify-write operation. It validates the type of the existing value before applying the mutation. If the specified *fieldpath* does not exist in a document, the mutation creates a new field. If the *fieldpath* exists but is not of the same type as the type of new *value*, then the entire mutation fails.

To update multiple field paths, use an array notation to list the field paths.

Example

The following example updates the pre-existing fields a.b.[0] and a.c.d. It also adds a new field a.x.

```

{"$set":[{"a.b[0].boolean":true},
{"a.c.d":11},{"a.x":1}]}

```

The mutation results in the following document, with the field updates highlighted in bold:

```

{
  "_id" : "id1",
  "a" : {
    "b" : [ { "boolean" : true },
    { "decimal" : 123.456 } ],
    "c" : {
      "d" : 11,
      "e" : "Hello"
    },
    "x" : 1
  },
  "m" : "MapR wins"
}

```

Specifying Multiple Mutation Operations

You can specify more than one operation in a single mutation by specifying each operation separated by a comma.

The following is a mutation with six operations:

```
{
  "$set": {"x": [1, 2, 3]},
  "$put": {"a.c.e": {"$binary": "AAAADg==" }},
  "$increment": "a.b[1].decimal",
  "$delete": "a.b[0]",
  "$merge": {"newDoc": {"k": "MapR DBShell rocks!!"}},
  "$append": {"m": "!!!"}
}
```

It results in the following document, with the field updates highlighted in bold:

```
{
  "_id" : "id1",
  "a" : {
    "b" : [ { "decimal" : 124.456 } ],
    "c" : {
      "d" : 10,
      "e" : { "$binary" : "AAAADg==" }
    }
  },
  "m" : "MapR wins!!!",
  "newDoc" : { "k" : "MapR DBShell rocks!!" },
  "x" : [ 1, 2, 3 ]
}
```

The mutation applies the updates in the following manner:

- The `$set` mutation adds a new array field `x` with the value `[1, 2, 3]`.
- The `$put` mutation replaces the string `"Hello"` with the nested document `{"$binary": "AAAADg=="}`.
- The `$increment` mutation increments the value `123.456` in the second element of the array `a.b`.
- The `$delete` mutation deletes the field path `a.b[0]`, resulting in a single element array `a.b`.
- The `$merge` mutation adds a new field `newDoc` with the nested document `{"k": "MapR DBShell rocks!!"}` as its value.
- The `$append` mutation appends the string `"!!!"` to the end of the string `"MapR wins"`.

Conflicting Mutations

When you specify a mutation with field paths that are overlapping, HPE Ezmeral Data Fabric Database detects the conflict, discards the previous conflicting operation, and proceeds with the next operation.

For example, suppose you have the following document:

```
{"_id": "id1", "a": {"b": {"c": 5}}}
```

The following mutation has two operations with overlapping fields `a.b`:

```
{"$delete": "a.b", "$set": {"a.b.d": 10}}
```

You may have intended for the mutation to first delete `a.b` and then to replace it with `a.b.d` as follows:

```
{ "_id": "id1", "a": { "b": { "d": "10" } } }
```

But the *actual* result is the following:

```
{ "_id": "id1", "a": { "b": { "c": 5, "d": "10" } } }
```

In this case, the set operation on `a.b.d` causes the delete operation on `a.b` to be discarded.

Note: In the earlier example in this section, the `$increment` and `$delete` operations are not conflicting because one operates on `a.b[1]`, while the other operates on `a.b[0]`. On the other hand, the following are conflicting operations:

```
{ "$increment": "a.b[1].decimal", "$delete": "a.b" }
```

OJAI Mutations Without Explicit Mutation Operation Names

You can specify a mutation without using an explicit mutation name. These mutations run as merge operations.

For example, the following mutation merges the fields `k` and `a.c.d` to the document by adding a new field `k` and updating `a.c.d`:

```
{ "k": "eureka", "a": { "c": { "d": 1234 } } }
```

The mutation results in the following document, with updates highlighted in bold:

```
{
  "_id" : "id1",
  "a" : {
    "b" : [ { "boolean" : false }, { "decimal" : 123.456 } ],
    "c" : {
      "d" : 1234,
      "e" : "Hello"
    }
  },
  "k" : "eureka",
  "m" : "MapR wins"
}
```

Examples: Updating JSON Documents

This section contains sample code that updates a JSON document in a HPE Ezmeral Data Fabric Database JSON table using an OJAI mutation. It also shows the HPE Ezmeral Data Fabric Database Shell syntax for updating documents.

See [Using OJAI Mutation Syntax](#) on page 2837 for more details about OJAI mutations.

Java

The following code is available at [OJAI_012_UpdateDocument.java](#). It does the following:

- Finds a document using the [DocumentStore.findById](#) method
- Creates a [DocumentMutation](#) that updates a field

- Updates the document by calling the [DocumentStore.update](#) method

```

import org.ojai.store.DocumentMutation;
import org.ojai.store.DocumentStore;
import org.ojai.store.DriverManager;

public class OJAI_012_UpdateDocument {

    public static void main(String[] args) {

        System.out.println("==== Start Application ===");

        // Create an OJAI connection to MapR cluster
        final Connection connection = DriverManager.getConnection("ojai:mapr:");

        // Get an instance of OJAI DocumentStore
        final DocumentStore store = connection.getStore("/demo_table");

        String docId = "user0002";

        // Print the document before update
        System.out.println( "\t"+
store.findById(docId).getMap("address").toString() );

        // Create a DocumentMutation to update the zipCode field
        DocumentMutation mutation = connection.newMutation()
            .set("address.zipCode", 95196L);

        System.out.println("\tUpdating document "+ docId);

        // Update the Document with '_id' = "user0002"
        store.update(docId, mutation);

        // Print the document after update
        System.out.println( "\t"+
store.findById(docId).getMap("address").toString() );

        // Close this instance of OJAI DocumentStore
        store.close();
    }
}

```

```

    // close the OJAI connection and release any resources held by the
connection
    connection.close();

    System.out.println("==== End Application ===");
}
}

```

Node.js - Update

The following code is available at [OJAI_011_UpdateDocument.js](#). It does the following:

- Finds a document using the [DocumentStore.findById](#) method
- Creates an OJAI mutation that updates a field
- Updates the document by calling the [DocumentStore.update](#) method

```

```

Python - Update

The following code is available at [012_update_document.py](#). It does the following:

- Finds a document using the [DocumentStore.find_by_id](#) method
- Creates an OJAI mutation that updates a field
- Updates the document by calling the [DocumentStore.update](#) method

```

from mapr.ojai.storage.ConnectionFactory import ConnectionFactory

# Create a connection to data access server
connection_str = "localhost:5678?auth=basic;user=mapr;password=mapr;" \
                "ssl=true;" \
                "sslCA=/opt/mapr/conf/ssl_truststore.pem;" \
                "sslTargetNameOverride=node1.mapr.com"
connection = ConnectionFactory.get_connection(connection_str=connection_str)

# Get a store and assign it as a DocumentStore object
store = connection.get_store('/demo_table')

doc_id = 'user0002'

# Print the document before update
document_before_update = store.find_by_id(doc_id)
print("Document with id {0} before update".format(doc_id))
print(document_before_update)

# Create mutation to update the zipCode field

```

```

mutation = {'$set': {'address.zipCode': 95196}}

# Execute update
store.update(_id=doc_id, mutation=mutation)

document_after_update = store.find_by_id(doc_id)
print('Document with id {0} after update'.format(doc_id))
print(document_after_update)

```

Python - Check and Update

The following code is available at [013_check_and_update_document.py](#). It does the following:

- Finds a document using the [DocumentStore.find_by_id](#) method
- Creates an OJAI mutation that updates a field
- Creates an OJAI condition to apply in the check and update
- Performs the check and update on the document by calling the [DocumentStore.check_and_update](#) method

```

from mapr.ojai.storage.ConnectionFactory import ConnectionFactory

# Create a connection to data access server
connection_str = "localhost:5678?auth=basic;user=mapr;password=mapr;" \
                 "ssl=true;" \
                 "sslCA=/opt/mapr/conf/ssl_truststore.pem;" \
                 "sslTargetNameOverride=nodel.mapr.com"
connection = ConnectionFactory.get_connection(connection_str=connection_str)

# Get a store and assign it as a DocumentStore object
store = connection.get_store('/demo_table')

doc_id = 'user0001'

# Print the document before update
document_before_update = store.find_by_id(doc_id)
print("Document with id {0} before update".format(doc_id))
print(document_before_update)

# Create mutation to update the zipCode field
mutation = {'$put': {'address.zipCode': 99999}}

# Create condition
condition = {'$eq': {'address.street': '320 Blossom Hill Road'}}

# Execute check_and_update.
# Returns True if condition True and document was updated.
update_result = store.check_and_update(_id=doc_id,
                                       mutation=mutation,
                                       query_condition=condition)

print(update_result)

document_after_update = store.find_by_id(doc_id)
print('Document with id {0} after update'.format(doc_id))
print(document_after_update)

```

dbshell

The following dbshell command is equivalent to the code examples. See [dbshell update](#) on page 5507 for more information and examples.

```
# mapr dbshell
maprdb root:> update /demo_table --id user002 --m {"$set":
{"address.zipCode":95196}}
```

C# - Update

The following code is available at [012_UpdateDocument.cs](#). It does the following:

- Finds a document using the [DocumentStore.FindById](#) method to print the document before update.
- Creates an OJAI mutation that updates a field.
- Updates the document by calling the [DocumentStore.Update](#) method.

```
using System;
using MapRDB.Driver;

public class UpdateDocument
{
    public void UpdateDocument()
    {
        // Create a connection to data access server
        var connectionStr = $"localhost:5678?auth=basic;" +
            $"user=mapr;" +
            $"password=mapr;" +
            $"ssl=true;" +
            $"sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
            $"sslTargetNameOverride=nodel.mapr.com";
        var connection = ConnectionFactory.CreateConnection(connectionStr);

        // Get a store and assign it as a DocumentStore object
        var store = connection.GetStore("/demo_table");

        var docId = "user0002";

        // Print the document before update
        var documentBeforeUpdate = store.FindById(docId);
        Console.WriteLine($"Document with id {docId} before update:");
        Console.WriteLine(documentBeforeUpdate);

        // Create mutation to update the zipCode field
        var mutation =
connection.NewDocumentMutation().Set("address.zipCode", (long)95196);

        // Execute update
        store.Update(docId, mutation);

        // Print the document after update
        var documentAfterUpdate = store.FindById(docId);
        Console.WriteLine($"Document with id {docId} after update:");
        Console.WriteLine(documentAfterUpdate);

        // Close the OJAI connection
        connection.Close();
    }
}
```

C# - Check and Update

The following code is available at [013_CheckAndUpdateDocument.cs](#). It does the following:

- Finds a document using the `DocumentStore.FindById` method to print the document before update.
- Creates an OJAI mutation that updates a field.
- Creates an OJAI condition to apply in the check and update.
- Performs the check and update on the document by calling the `DocumentStore.CheckAndUpdate` method.

```
using System;
using MapRDB.Driver;
using MapRDB.Driver.Ojai;

public class CheckAndUpdateDocument
{
    public void CheckAndUpdateDocument()
    {
        // Create a connection to data access server
        var connectionStr = $"localhost:5678?auth=basic;" +
            $"user=mapr;" +
            $"password=mapr;" +
            $"ssl=true;" +
            $"sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
            $"sslTargetNameOverride=nodel.mapr.com";
        var connection = ConnectionFactory.CreateConnection(connectionStr);

        // Get a store and assign it as a DocumentStore object
        var store = connection.GetStore("/demo_table");

        var docId = "user0001";

        // Print the document before update
        var documentBeforeUpdate = store.FindById(docId);
        Console.WriteLine($"Document with id {docId} before update:");
        Console.WriteLine(documentBeforeUpdate);

        // Create mutation to update the zipCode field
        var mutation =
            connection.NewDocumentMutation().SetOrReplace("address.zipCode", 99999);

        // Create condition
        var condition = connection
            .NewQueryCondition()
            .Is("address.street", QueryOp.EQUAL, "320 Blossom Hill
Road")
            .Close()
            .Build();

        // Execute CheckAndUpdate.
        // Returns True if condition True and document was updated
        var updateResult = store.CheckAndUpdate(docId, condition, mutation);

        Console.WriteLine(updateResult);

        // Print the document after update
        var documentAfterUpdate = store.FindById(docId);
        Console.WriteLine($"Document with id {docId} after update:");
        Console.WriteLine(documentAfterUpdate);
    }
}
```

```

        // Close the OJAI connection
        connection.Close();
    }
}

```

Go - Update

The following code is available at [012_update_document.go](https://github.com/mapr/private-maprdb-go-client). It does the following:

- Finds a document using the `DocumentStore.FindByIdString` function to print the document before update
- Creates an OJAI mutation that updates a field
- Updates the document by calling the `DocumentStore.Update` function

```

package main

import (
    "fmt"
    client "github.com/mapr/private-maprdb-go-client"
)

func main() {
    // Create connection string
    connectionString := "192.168.33.11:5678?" +
        "auth=basic;" +
        "user=mapr;" +
        "password=mapr;" +
        "ssl=true;" +
        "sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
        "sslTargetNameOverride=nodel.cluster.com"

    storeName := "/demo_table"
    documentId := "user0002"

    // Create a connection to DAG
    connection, err := client.MakeConnection(connectionString)
    if err != nil {
        panic(err)
    }

    // Get a store and assign it as a DocumentStore struct
    store, err := connection.GetStore(storeName)
    if err != nil {
        panic(err)
    }

    // Print the document before update
    documentBeforeUpdate, err := store.FindByIdString(documentId)
    if err != nil {
        panic(err)
    }
    fmt.Printf("Document with id %v before update.\n %v", documentId,
    documentBeforeUpdate.AsJsonString())

    // Create mutation to update the zipCode field
    mutation := map[string]interface{}{"$set": map[string]interface{}{
    {"address.zipCode": 95196}}

    // Execute update
    err = store.Update(client.BosiFromString(documentId),

```

```

client.MosmFromMap(mutation))
    if err != nil {
        panic(err)
    }

    // Print the document after update
    documentAfterUpdate, err := store.FindByIdString(documentId)
    if err != nil {
        panic(err)
    }
    fmt.Printf("Document with id %v after update.\n %v", documentId,
documentAfterUpdate.AsJsonString())

    // Close connection
    connection.Close()
}

```

Go - Check and Update

The following code is available at [013_check_and_update_document.go](#). It does the following:

- Finds a document using the `DocumentStore.FindByIdString` function to print the document before update
- Creates an OJAI mutation that updates a field
- Creates an OJAI condition to apply in the check and update
- Performs the check and update on the document by calling the `DocumentStore.CheckAndUpdate` function

```

package main

import (
    "fmt"
    client "github.com/mapr/private-maprdb-go-client"
)

func main() {
    // Create connection string
    connectionString := "192.168.33.11:5678?" +
        "auth=basic;" +
        "user=mapr;" +
        "password=mapr;" +
        "ssl=true;" +
        "sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
        "sslTargetNameOverride=node1.cluster.com"

    storeName := "/demo_table"
    documentId := "user0001"

    // Create a connection to DAG
    connection, err := client.MakeConnection(connectionString)
    if err != nil {
        panic(err)
    }

    // Get a store and assign it as a DocumentStore struct
    store, err := connection.GetStore(storeName)
    if err != nil {
        panic(err)
    }
}

```

```

// Print the document before update
documentBeforeUpdate, err := store.FindByIdString(documentId)
if err != nil {
    panic(err)
}
fmt.Printf("Document with id %v before update.\n %v\n", documentId,
documentBeforeUpdate.AsJsonString())

// Create mutation to update the zipCode field
mutation := map[string]interface{}{"$put": map[string]interface{}
{"address.zipCode": 99999}}

// Create condition
condition := map[string]interface{}{"$eq": map[string]interface{}
{"address.street": "320 Blossom Hill Road"}}

// Execute update
// Returns True if condition True and document was updated.
res, err := store.CheckAndUpdate(
    client.BosiFromString(documentId),
    client.MoscFromMap(condition),
    client.MosmFromMap(mutation))
if err != nil {
    panic(err)
}

// Print the document after update
documentAfterUpdate, err := store.FindByIdString(documentId)
if err != nil {
    panic(err)
}
fmt.Printf("Update result: %v.\nDocument with id %v after update.\n
%v\n",
    res,
    documentId,
    documentAfterUpdate.AsJsonString())

// Close connection
connection.Close()
}

```

Querying JSON Documents

This section describes how to query JSON documents in HPE Ezmeral Data Fabric Database JSON tables using the OJAI API library and HPE Ezmeral Data Fabric Database Shell. It includes sample programs using the OJAI API library and shows how to run the same queries in HPE Ezmeral Data Fabric Database Shell.

Querying in OJAI Applications

To query HPE Ezmeral Data Fabric Database JSON tables in your OJAI applications, you use the OJAI `Query` interface. The typical flow of your application involves creating a connection, obtaining a handle to the HPE Ezmeral Data Fabric Database JSON table you want to query, constructing the query, performing the query, and then processing the results.

Note: The Node.js, Python, C#, and Go OJAI clients are supported starting in EEP 6.0.

Description

The `DocumentStore` interface includes a `Query` interface. The `Query` interface allows you to build a query programmatically.

| | |
|----------------|--|
| Java | <p>To construct an OJAI query, call the following methods in the <code>Query</code> interface:</p> <ul style="list-style-type: none">• Query.select• Query.where• Query.orderBy• Query.offset• Query.limit <p>To run the query, pass the <code>Query</code> object to the DocumentStore.find method.</p> |
| Node.js | <p>To construct an OJAI query, create a Node.js JSON object using OJAI Query Syntax on page 2879.</p> <p>To run the query, pass the <code>Query</code> object to the DocumentStore.find method.</p> |
| Python | <p>To construct an OJAI query, create a Python dictionary object using OJAI Query Syntax on page 2879.</p> <p>To run the query, pass the <code>Query</code> object to the DocumentStore.find method.</p> <p> Note: The following <code>Query</code> methods are available in the Python OJAI API, but creating a Python dictionary is the preferred approach:</p> <ul style="list-style-type: none">• Query.select• Query.where• Query.order_by• Query.offset• Query.limit |
| C# | <p>To construct an OJAI query, create a C# object.</p> <p>To run the query, pass the <code>Query</code> object to the DocumentStore.Find method.</p> <p> Note: The following <code>Query</code> methods are available in the C# OJAI API:</p> <ul style="list-style-type: none">• Query.Select• Query.Where• Query.OrderBy• Query.Offset• Query.Limit |
| Go | <p>To construct an OJAI query, create a Go object.</p> <p>To run the query, pass the <code>Query</code> object to the DocumentStore.FindQuery function.</p> |

Note: The following `Query` functions are available in the Go OJAI API:

- `Query.Select`
- `Query.WhereCondition`
- `Query.OrderBy`
- `Query.Offset`
- `Query.Limit`

Basic Application Flow

The following steps describe the basics in developing client applications that query HPE Ezmeral Data Fabric Database JSON tables using the OJAI API.

Java

1. Create a `Connection` instance to your MapR cluster using the `DriverManager` class:

```
Connection connection =
  DriverManager.getConnection("ojai:m
  apr:");
```

Note: Do not omit the ending colon in the connection string.

2. Obtain a `DocumentStore` handle to a HPE Ezmeral Data Fabric Database JSON table using the connection object:

```
DocumentStore store =
  connection.getStore(tablePath);
```

3. Create a `Query` object using the connection object:

```
Query query =
  connection.newQuery();
```

4. Perform the query operation on the table:

```
QueryResult result =
  store.find(query);
```

5. Process the results.

The following code snippet iterates through the [QueryResult](#) and prints each document as a JSON string:

```
for (final Document userDocument :
result) {
    // Print the OJAI Document

System.out.println(userDocument.asJ
sonString());
}
```

To process individual fields within a document, use the [DocumentReader](#) interface. The following code snippet iterates through the fields in a document and prints the fields that are strings:

```
Iterable it =
result.documentReaders();
for (DocumentReader reader : it) {
    EventType et = null;
    while ((et = reader.next()) !=
null) {
        if (et ==
EventType.STRING) {

System.out.println("Value of field
" + reader.getFieldName() + ": " +
reader.getString());
        }
    }
}
```

6. Close the result stream, the connection to the document store, and the connection to MapR:

```
result.close();
store.close;
connection.close();
```

Node.js**1. Create a connection:**

```
ConnectionFactory.getConnection('lo
calhost:5678?;user=mapr;password=ma
pr;ssl=false')
    .then((connection) => {
        // Process connection
        ...
    });
```

2. Obtain a handle to a HPE Ezmeral Data Fabric Database JSON table using the connection object:

```
connection.getStore(tablePath)
  .then((store) => {
    // Process store
    ...
  });
```

3. Create a query object:

```
const query = {};
```

4. Perform the query operation on the table:

```
const stream = store.find(query)
```

5. Process the results:

```
stream.on('data', (document) =>
  console.log(document));
```

6. Close the connection to MapR:

```
stream.on('end', () => {
  console.log('end');
  connection.close();
});
```

Python

1. Create a [Connection](#) instance to your MapR cluster using the `ConnectionFactory` class:

```
connection_str =
'localhost:5678?;user=mapr;password
=mapr;ssl=false'
connection =
ConnectionFactory.get_connection(co
nnection_str=connection_str)
```

2. Obtain a [DocumentStore](#) handle to a HPE Ezmeral Data Fabric Database JSON table using the connection object:

```
store =
connection.get_store(table_path)
```

3. Create a [Query](#) object using the connection object:

```
query =
connection.new_query().build()
```

4. Perform the query operation on the table:

```
query_result = store.find(query)
```

5. Process the results.

The following code snippet iterates through the [QueryResult](#) and prints each document as a Python dictionary:

```
for doc in query_result:
    print(doc)
```

6. Close the connection to MapR:

```
connection.close()
```

C#

1. Create a [Connection](#) instance to your MapR cluster using the [ConnectionFactory](#) class:

```
var connectionStr =
    $"localhost:5678?auth=basic;" +
        $"user=mapr;" +
        $"password=mapr;" +
        $"ssl=true;" +
        $"sslCA=/opt/mapr/conf/
ssl_truststore.pem;" +

    $"sslTargetNameOverride=node1.mapr.
com";
var connection =
    ConnectionFactory.CreateConnection(
        connectionStr);
```

2. Obtain a [DocumentStore](#) handle to a HPE Ezmeral Data Fabric Database JSON table using the connection object:

```
var store =
    connection.GetStore(storePath);
```

3. Create a [Query](#) object using the connection object:

```
var query =
    connection.NewQuery().Build();
```

4. Perform the query operation on the table:

```
var queryResult =
    store.Find(query);
```

5. Process the results.

The following code snippet iterates through the [QueryResult](#) and prints each document as a JSON:

```
var documentStream = await
queryResult.GetDocumentAsyncStream(
).GetAllDocuments();
foreach (var document in
documentStream)
{

Console.WriteLine(document.ToJsonSt
ring());
}
```

6. Close the connection to MapR:

```
connection.Close();
```

Go**1. Create a [Connection](#) instance to your MapR cluster:**

```
connectionString :=
"localhost:5678?
auth=basic;user=mapr;password=mapr;
ssl=false"
connection, error :=
client.MakeConnection(connectionString)
```

2. Obtain a [DocumentStore](#) handle to a HPE Ezmeral Data Fabric Database JSON table using the connection object:

```
store,
error := connection.CreateStore("/
store_path")
```

3. Create a [Query](#) object:

```
query, err := client.MakeQuery()
query.Build()
```

4. Perform the query operation on the table:

```
queryResult, err :=
store.FindQuery(query,
&client.FindOptions{ })
```

5. Process the results.

The following code snippet iterates through the [QueryResult](#) and prints each document as a JSON:

```
for _, doc := range
queryResult.DocumentList() {
    fmt.Println(doc)
}
```

6. Close the connection to MapR:

```
connection.Close()
```

See [Examples: Querying JSON Documents](#) on page 2900 for complete code examples.

Related concepts

[OJAI Distributed Query Service](#) on page 467

OJAI queries either directly access HPE Ezmeral Data Fabric Database JSON or leverage the OJAI Distributed Query Service. The OJAI Distributed Query Service provides distributed query support for HPE Ezmeral Data Fabric Database JSON, powered by Apache Drill. The data-fabric client automatically determines whether OJAI queries benefit from using the OJAI Distributed Query Service, when the service is available. This section describes the architecture, including the code paths and components involved. It also discusses queries that originate from Drill SQL, which leverage the full functionality of Drill.

Comparisons and Sorts in OJAI Queries

When running OJAI queries with comparisons and sorts, you need to be aware of how different data types behave. You also need to understand how sorting works in MapR-DB queries. Depending on the component that runs the sort, you may encounter unexpected behavior.

OJAI supports comparisons using the `QueryCondition` interface. For information about how to use this interface, see [Query Conditions in OJAI Applications](#) on page 2866.

When using the OJAI `query where` and `orderby`, and comparing and sorting across different data types, there are subtleties you should take into consideration. See [Using Comparable JSON Document Data Types in Comparisons and Sorts](#) on page 476 and [Using Non-comparable JSON Document Data Types in Comparisons and Sorts](#) on page 477 for more information.

If you do not have a secondary index defined that can generate your query's specified `orderby`, then your query requires an explicit sort. If you have installed the [OJAI Distributed Query Service](#) on page 467, the service performs the sort. If you have not, the MapR client performs the sort, but restricts the amount of data it can sort. The default sort limit is 5000 documents. For example, if your query returns 10,000 documents, and you specify a query result `limit` of 5000 documents, the MapR client can perform the sort.

Important: The MapR client returns an error if your query result size exceeds the client's sort limit.

You can avoid errors due to the client sort limitation by adhering to the following guidelines:

- If you know the largest possible query result size when your queries specify an `order by`, you can increase the sort limit of your client to that maximum size by setting the `ojai.mapr.query.max-client-sort-limit` parameter.

The following code snippets increase the limit to 6000:

Java

```
query.setOption("ojai.mapr.query.max-client-sort-limit", 6000);
```

Note: This option is not applicable to the Java OJAI Thin Client.

Node.js

```
const query
= { "$select": "col", "$options":
  { "ojai": { "mapr": { "query":
    { "max-client-sort": 6000 } } } } }
const stream = store.find(query)
```

Python

```
query = { "$select": "col", "$options":
  { "ojai": { "mapr": { "query":
    { "max-client-sort": 6000 } } } } }
query_result = store.find(query)
```

C#

```
var query =
connection.NewQuery()
    .Select("col")
    .SetMaxClientSortLimit(6000)
    .Build();

var queryResult =
store.Find(query);
```

Go

```
query := map[string]interface{}{
    "$select": "col",
    "$options": map[string]interface{}{
        {
            "ojai": map[string]interface{}{
                {
                    "mapr": map[string]interface{}{
                        "query": map[string]interface{}{
                            "max-client-sort": 6000 } } } } } } }
queryResult, err :=
store.FindQueryMap(query,
&client.FindOptions{ })
```

You can also set this option across all your OJAI clients by modifying a data access gateway property. See [Administering the MapR Data Access Gateway - Application Properties](#) for details.

- If you do not know the largest possible query result size, specify a `limit` in your queries. If your query result size exceeds that `limit`, the client sorts the entire result set but returns only a subset of the rows up to the specified limit. This avoids the error, but may result in unintended behavior if your application is not expecting a truncated result. You should take corrective action if necessary.

See [Querying with Order By](#) on page 2931 for an example of how to set a query `limit`.

Permissions and OJAI Queries

You need to understand permission requirements because they affect filter conditions in your OJAI queries.

HPE Ezmeral Data Fabric Database enforces permissions when your application processes the query result. In the basic application flow shown in the previous section, this corresponds to step 5. In an application, if user1 performs the query while user2 processes the result, then the result corresponds to user2's permissions.

You should create a separate OJAI connection for each unique user. Sharing a connection across users can result in non-optimal queries or invalid permission errors.

The following permissions are required to query documents:

- The `readAce` permission on the volumes where the JSON tables that contain the documents are located. See [Setting Whole Volume ACEs](#) on page 1576.
- The `readperm` permission on the JSON table's column families containing fields being queried. See [Enabling Table and Stream Authorizations with ACEs](#) on page 1578.

If the user does not have the `readperm` permission on a field, HPE Ezmeral Data Fabric Database treats the field as non-existent for that user. When a query selects a non-existent field, HPE Ezmeral Data Fabric Database ignores the field. If a query filters on a non-existent field, the query behaves as follows:

| Filter Condition on Non-existent Field | Behavior |
|---|--|
| Filter for specific values in the field | No documents qualify the filter because a non-existent field does not match any value. |
| Filter for non-matches in the field | All documents qualify the filter because a non-match on a non-existent field is a no-op. |

The exception is the rowkey field. Access control on the rowkey is not available. Users can always select and filter on rowkey.

For information about setting permissions, see [Permission Types for Fields and Column Families in JSON Tables](#) on page 1157.

OJAI Query Options

OJAI supports query options that enable you to modify the behavior of your queries. This includes an option to force secondary index usage and options to influence the behavior of sorts.

Available Query Options

The following table lists available query options. Some options may or may not apply, depending on whether your query uses the OJAI Distributed Query Service. The detailed descriptions make a note of this.

| Option Name | Description | Details |
|---|---|--|
| <code>ojai.mapr.query.hint-using-index</code> | Forces the MapR client to use a particular index, regardless of cost considerations | Forcing Secondary Index Usage in OJAI on page 2865 |
| <code>ojai.mapr.query.force-noncovering-sort</code> | Enables sort behavior to avoid partial sorts due to secondary index lags | Avoiding Partial Sorts with Secondary Indexes in OJAI on page 2865 |

| Option Name | Description | Details |
|---|--|--|
| <code>ojai.mapr.query.max-client-sort-limit</code> | Sets the MapR client sort limit | Comparisons and Sorts in OJAI Queries on page 2862 |
| <code>ojai.mapr.query.force-drill</code> | When set to <code>true</code> , forces the MapR client to use the OJAI Distributed Query Service | Forcing Usage of the OJAI Distributed Query Service on page 2865 |
| <code>ojai.mapr.drill.<OJAI Distributed Query Service Property Name></code> | Sets options for the OJAI Distributed Query Service | Setting OJAI Distributed Query Service Properties on page 2866 |

Setting Query Options

To set these options in your OJAI application, see the following topics:

| | |
|----------------|---|
| Java | Setting Query Options in Java OJAI on page 2946 |
| Node.js | Setting Query Options in Node.js Using OJAI Query Syntax on page 2954 |
| Python | Setting Query Options in Python Using OJAI Query Syntax on page 2964 |
| C# | Setting Query Options in C# OJAI on page 2968 |
| Go | Setting Query Options in Go OJAI on page 2972 |

Forcing Secondary Index Usage in OJAI

To force the MapR client to use an index, specify the name of the index with the `ojai.mapr.query.hint-using-index` option.

Regardless of cost considerations, the MapR client attempts to use the specified index. To use the index, the index must benefit filter conditions, the order by, or projections in the query as described at [Queries that Benefit from Secondary Indexes](#) on page 532. Otherwise, the MapR client ignores the option.

To force the MapR client to *not* use any indexes, specify the table name without the full path as the second parameter in the calls shown earlier. For example, if the full path of your table is `/mapr/sanfrancisco/volume1/customer`, pass the name `customer` as the second parameter.

Note: Setting this option in your OJAI application has no effect if you are using the OJAI Distributed Query Service.

Avoiding Partial Sorts with Secondary Indexes in OJAI

Partial sorts can occur due to secondary index lags. To avoid these lags, set the `ojai.mapr.query.force-noncovering-sort` option to `TRUE`.

This option forces the OJAI Distributed Query Service to explicitly sort the data. Do not set this option if you do not expect to encounter index lags. Otherwise, you lose the ordering advantage that secondary indexes provide.

For more information about why partial sorts occur, see [Partial Sorts with Non-Covering Indexes](#) on page 542.

Forcing Usage of the OJAI Distributed Query Service

When set to `true`, the MapR client uses the OJAI Distributed Query Service execution path, rather than selecting an execution path that it determines to be most optimal. See [OJAI Distributed Query Service](#) on page 467 for more information about the different query execution paths.

Setting OJAI Distributed Query Service Properties

OJAI queries may leverage the OJAI Distributed Query Service. To modify OJAI Distributed Query Service property settings in your OJAI application, prefix the OJAI Distributed Query Service property name with `ojai.mapr.drill`.

For example, the option `ojai.mapr.drill.planner.enable_index_planning` disables using secondary indexes when queries use the Query Service.

See [Index Planning and Execution Configuration Options](#) on page 3564 for the list of available OJAI Distributed Query Service properties.

Related concepts

[OJAI Distributed Query Service](#) on page 467

OJAI queries either directly access HPE Ezmeral Data Fabric Database JSON or leverage the OJAI Distributed Query Service. The OJAI Distributed Query Service provides distributed query support for HPE Ezmeral Data Fabric Database JSON, powered by Apache Drill. The data-fabric client automatically determines whether OJAI queries benefit from using the OJAI Distributed Query Service, when the service is available. This section describes the architecture, including the code paths and components involved. It also discusses queries that originate from Drill SQL, which leverage the full functionality of Drill.

Query Conditions in OJAI Applications

You can create a query condition in an OJAI application in either of two ways. One way is to create an OJAI `QueryCondition` object and call methods in the class to construct your query condition. Another way is to create an OJAI query condition in a JSON format.

Creating an OJAI QueryCondition Object

The Java and Python OJAI clients support a `QueryCondition` interface. After you create a `QueryCondition` object, call methods in the class to construct your query condition.

Creating a QueryCondition Object

Java

Java OJAI provides a `QueryCondition.is()` method for specifying query conditions. The method takes three arguments:

- The field path to apply the condition to
- The condition operator, represented as a `QueryCondition.Op`
- The value to compare the field path against

The field path is either a field in a JSON document, a subfield within a nested document, or an array element.

Depending on the type of the field path, you specify the comparison value as follows:

Scalar Data

You can specify the value using either a Java typed value (for example, `int`, `float`, or `String`) or a Java OJAI object. The API supports the following OJAI types:

- `ODate`
- `OInterval`
- `OTime`

- OTimestamp

Nested Documents You can specify only equality and non-equality conditions on nested documents. You specify the nested document using a Java Map object. In the case of equality, all of the fields in the nested document must match. The order of the fields is not relevant.

Arrays You can specify only equality and non-equality conditions on arrays. You specify an array using a Java List object. In the case of equality, the order of the elements and the element values must match.

In addition to `QueryCondition.is()`, `QueryCondition` also supports the following methods:

| QueryCondition Method | Description |
|---|---|
| <code>equals()</code> <code>notequals()</code> | Match for equality or non-equality on nested documents and arrays |
| <code>in()</code> | Search for individual elements in an array |
| <code>like()</code> | Search for string values using SQL LIKE expressions |
| <code>matches()</code> | Search for string values using regular expressions. You can use regular expressions that compose the Perl-Compatible Regular Expressions (PCRE) library as well as a subset of the regular expressions that are supported in <code>java.util.regex.pattern</code> . See HBase Java Regular Expressions Support on page 2788 for a list of supported regular expressions. |
| <code>and()</code> | Begins a new AND condition block |
| <code>or()</code> | Begins a new OR condition block |
| <code>elementAnd()</code> | Begins a new <code>elementAnd</code> block. See OJAI Query Condition Operators on page 2882 for a detailed description of this operator. |

| QueryCondition Method | Description |
|-----------------------|-----------------------------------|
| close() | Closes a compound condition block |
| build() | Builds the condition |

Note: The material described in this section is a subset of the `QueryCondition` API. It introduces you to the basics of the API. For the complete API, see the [QueryCondition](#) interface.

Python

Python OJAI provides a `QueryCondition.is_()` method for specifying query conditions. The method takes three arguments:

- The field path to apply the condition to
- The condition operator, represented as a `QueryConditionOp`
- The value to compare the field path against

The field path is either a field in a JSON document, a sub-field within a nested document, or an array element. Starting in MapR 6.1, you can also specify a container field path. See [OJAI Query Conditions Using Container Field Paths](#) on page 2891 for details.

Depending on the type of the field path, you specify the comparison value as follows:

Scalar Data

You can specify the value using either a Python scalar value (for example, `int`, `float`, or `str`) or a Python OJAI object. The API supports the following OJAI types:

- `ODate`
- `OInterval`
- `OTime`
- `OTimestamp`

Nested Documents

You can specify only equality and non-equality conditions on nested documents. You specify the nested document using a Python dictionary object. In the case of equality, all of the fields in the nested document must match. The order of the fields is not relevant.

Arrays

You can specify only equality and non-equality conditions on arrays. You

specify an array using a Python `list` object. In the case of equality, the order of the elements and the element values must match.

In addition to `QueryCondition.is_()`, `QueryCondition` also supports the following methods:

| QueryCondition Method | Description |
|--|--|
| <code>equals_()</code> <code>not_equals_()</code> | Match for equality or non-equality on nested documents and arrays |
| <code>in_()</code> | Search for individual elements in an array |
| <code>like_()</code> | Search for string values using SQL LIKE expressions |
| <code>matches_()</code> | Search for string values using regular expressions. You can use regular expressions that comprise the Perl-Compatible Regular Expressions (PCRE) library as well as a subset of the regular expressions that are supported in <code>java.util.regex.pattern</code> . See HBase Java Regular Expressions Support on page 2788 for a list of supported regular expressions. |
| <code>and_()</code> | Begins a new AND condition block |
| <code>or_()</code> | Begins a new OR condition block |
| <code>element_and_()</code> | Begins a new <code>elementAnd</code> block. See OJAI Query Condition Operators on page 2882 for a detailed description of this operator. |
| <code>close_()</code> | Closes a compound condition block |
| <code>build_()</code> | Builds the condition |

**Note:**

- The material described in this section is a subset of the `QueryCondition` API. It introduces you to the basics of the API. For the complete API, see the [QueryCondition](#) interface.
- The preferred approach for creating query conditions in Python is to create the condition in a JSON format. See [Creating an OJAI Query Condition Using a JSON String](#) on page 2877

C#

C# OJAI provides a `QueryCondition.ls()` method for specifying query conditions. The method takes three arguments:

- The field path to apply the condition to
- The condition operator, represented as a `QueryOp`
- The value to compare the field path against

The field path is either a field in a JSON document, a sub-field within a nested document, or an array element. Starting in MapR 6.1, you can also specify a container field path. For details, see [OJAI Query Conditions Using Container Field Paths](#) on page 2891.

Depending on the type of the field path, you specify the comparison value as follows:

Scalar Data

You can specify the value using either a C# scalar value (for example, `int`, `float`, or `string`) or a C# OJAI object. The API supports the following OJAI types:

- `OjaiDate`
- `OjaiInterval`
- `OjaiTime`
- `OjaiTimestamp`

Nested Documents

You can specify only equality and non-equality conditions on nested documents. You specify the nested document using a C# object. In the case of equality, all of the fields in the nested document must match. The order of the fields is not relevant.

Arrays

You can specify only equality and non-equality conditions on arrays. You specify an array using

a C# list of values of the specified type. In the case of equality, the order of the elements and the element values must match.

In addition to `QueryCondition.ls()`, `QueryCondition` also supports the following methods:

| QueryCondition Method | Description |
|---|--|
| <code>Condition()</code> | Search for values using a specific condition. |
| <code>Equals()</code> <code>NotEquals()</code> | Match for equality or non-equality on nested documents and arrays. |
| <code>Exists()</code> <code>NotExists()</code> | Search for a field if the given field path exists, or verify that a field path does not exist. |
| <code>In()</code> <code>NotIn()</code> | Search for individual elements in an array or verify their absence. |
| <code>Like()</code> <code>NotLike()</code> | Search for string values using SQL LIKE expressions or verify they do not match the specified SQL LIKE expression. |
| <code>Matches()</code> <code>NotMatches()</code> | Search for string values using regular expressions. You can use regular expressions that comprise the Perl-Compatible Regular Expressions (PCRE) library, as well as a subset of the regular expressions that are supported in <code>java.util.regex.pattern</code> . For a list of supported regular expressions, see HBase Java Regular Expressions Support on page 2788. |
| <code>SizeOf()</code> | Search for a value of the specified size. The value must be one of the following types: <ul style="list-style-type: none"> • string • binary • iDictionary • iList |
| <code>TypeOf()</code> <code>NotTypeOf()</code> | Search for value of the specified Type or verify its absence. |

| QueryCondition Method | Description |
|-----------------------|--|
| And() | Begins a new AND condition block. |
| Or() | Begins a new OR condition block. |
| ElementAnd() | Begins a new ElementAnd block. For a detailed description of this operator, see OJAI Query Condition Operators on page 2882. |
| Close() | Closes a compound condition block. |
| Build() | Builds the condition. |

**Note:**

- The material described in this section is a subset of the [QueryCondition](#) API. It introduces you to the basics of the API. For the complete API, see the [QueryCondition](#) interface.
- The preferred approach for creating query conditions in C# is to create the condition in a JSON format. See [009_FindQueryWithSelectAndCondition.cs](#) or [Example: Creating a QueryCondition Object](#) on page 2874.

Go

Go OJAI provides a `QueryCondition.ls()` function for specifying query conditions. The function takes three arguments:

- The field path to apply the condition to
- The condition operator, represented as a `QueryOp`
- The value to compare the field path against

The field path is either a field in a JSON document, a sub-field within a nested document, or an array element. Starting in MapR 6.1, you can also specify a container field path. For details, see [OJAI Query Conditions Using Container Field Paths](#) on page 2891.

Depending on the type of the field path, you specify the comparison value as follows:

Scalar Data

You can specify the value using either a Go scalar value (for example, `int`, `float64`, or `string`) or a Go OJAI object. The API supports the following OJAI types:

- `OjaiDate`
- `OjaiTime`

- `OjaiTimestamp`

Nested Documents You can specify only equality and non-equality conditions on nested documents. You specify the nested document using a Go object. In the case of equality, all of the fields in the nested document must match. The order of the fields is not relevant.

Arrays You can specify only equality and non-equality conditions on arrays. You specify an array using a Go list of values of the specified type. In the case of equality, the order of the elements and the element values must match.

In addition to `QueryCondition.ls()`, `QueryCondition` also supports the following functions:

| QueryCondition Function | Description |
|---|--|
| <code>AddCondition()</code> | Search for values using a specific condition. |
| <code>Equals()</code> <code>NotEquals()</code> | Match for equality or non-equality on nested documents and arrays. |
| <code>Exists()</code> <code>NotExists()</code> | Search for a field if the given field path exists, or verify that it does not exist. |
| <code>In()</code> <code>NotIn()</code> | Search for individual elements in an array or verify their absence. |
| <code>Like()</code> <code>NotLike()</code> | Search for string values using SQL LIKE expressions or verify they do not match the specified SQL LIKE expression. |
| <code>Matches()</code> <code>NotMatches()</code> | Search for string values using regular expressions. You can use regular expressions that comprise the Perl-Compatible Regular Expressions (PCRE) library, as well as a subset of the regular expressions that are supported in <code>java.util.regex.pattern</code> . For a list of supported regular expressions, see HBase Java Regular Expressions Support on page 2788. |

| QueryCondition Function | Description |
|-------------------------|--|
| TypeOf() NotTypeOf() | Search for value of the specified Type or verify its absence. |
| And() | Begins a new AND condition block. |
| Or() | Begins a new OR condition block. |
| ElementAnd() | Begins a new ElementAnd block. For a detailed description of this operator, see OJAI Query Condition Operators on page 2882. |
| Close() | Closes a compound condition block. |
| Build() | Builds the condition. |

**Note:**

- The material described in this section is a subset of the Query API. It introduces you to the basics of the API. For the complete API, see the [Query](#) interface.
- The preferred approach for creating query conditions in Go is to create the condition in a JSON format. See [009_find_query_with_select_and_condition.go](#) or [Example: Creating a QueryCondition Object](#) on page 2874.

Example: Creating a QueryCondition Object

The following example shows how to define a QueryCondition object for this query condition:

```
(a.b.[0].boolean == false && (a.c.d != 5 || a.b[1].decimal > 1 ||
a.b[1].decimal < 10))
```

Java

```
QueryCondition qc =
connection.newCondition()
    .and()
        .is("a.b[0].boolean",
Op.EQUAL, false)
    .or()
        .is("a.c.d",
Op.NOT_EQUAL, 5)
        .is("a.b[1].decimal",
Op.GREATER, 1)
        .is("a.b[1].decimal",
Op.LESS, 10)
    .close()
    .close()
    .build();
```

Pass the `QueryCondition` object to the `Query.where` method. For a complete Java code example, see the [Java - OJAI QueryCondition Object](#) example at [Querying with Conditions](#) on page 2918.

Python

```
qc = connection.new_condition()
    .and_()
        .is_('a.b[0].boolean',
QueryConditionOp.EQUAL, False)
    .or_()
        .is_('a.c.d',
QueryConditionOp.NOT_EQUAL, 5)
        .is_('a.b[1].decimal',
QueryConditionOp.GREATER, 1)
        .is_('a.b[1].decimal',
QueryConditionOp.LESS, 10)
    .close()
    .close()
    .build()
```

Pass the `QueryCondition` object to the `Query.where` method. For a complete Python code example, see the [Python - OJAI QueryCondition Object](#) example at [Querying with Conditions](#) on page 2918.

C#

```
var condition =
connection.NewQueryCondition()
    .And()
        .Is("a.b[0].boolean",
QueryOp.EQUAL, false)
    .Or()
        .Is("a.c.d",
QueryOp.NOT_EQUAL, 5)
        .Is("a.b[1].decimal",
QueryOp.GREATER, 1)
        .Is("a.b[1].decimal",
QueryOp.LESS, 10)
    .Close()
    .Close()
    .Build();
```

Pass the `Condition` object to the `Query.Where` method. For a complete C# code example, see the [C# - OJAI QueryCondition Object](#) example at [Querying with Conditions](#) on page 2918.

Go

```
condition, err :=
client.MakeCondition(
    client.And(),

    client.Is("a.b[0].boolean",
client.EQUAL, false),
    client.Or(),
        client.Is("a.c.d",
client.NOT_EQUAL, 5),

    client.Is("a.b[1].decimal",
client.GREATER, 1),

    client.Is("a.b[1].decimal",
```

```

client.LESS, 10),
    client.Close(),
    client.Close())
condition.Build()

```

Pass the [Condition](#) object to the [Query.WhereCondition](#) function. For a complete Go code example, see the [Go - OJAI QueryCondition Object](#) example at [Querying with Conditions](#) on page 2918.

Examples: Using the `QueryCondition.elementAnd` Method

The following example shows how to write the `elementAnd` condition described at [Using elementAnd with Nested Documents](#) on page 2895, using a `QueryCondition` object:

Java

```

QueryCondition qc =
connection.newCondition()
    .elementAnd("grades[]")
    .is("course",
QueryConditionOp.EQUALS, "history")
    .is("score",
QueryConditionOp.EQUALS, 12)
    .close()
    .build();

```

Python

```

qc = connection.new_condition()
    .element_and("grades[]")
    .is_("course",
QueryConditionOp.EQUALS, "history")
    .is_("score",
QueryConditionOp.EQUALS, 12)
    .close()
    .build()

```

C#

```

var condition =
connection.NewQueryCondition()
    .ElementAnd("grades[]")
    .Is("course", QueryOp.EQUALS,
"history")
    .Is("score", QueryOp.EQUALS,
12)
    .Close()
    .Build();

```

Go

```

condition, err :=
client.MakeCondition(
    client.ElementAnd("grades[]"),
    client.Is("course",
client.EQUAL, "history"),
    client.Is("score",
client.EQUAL, 12),
    client.Close())
condition.Build()

```

The following code corresponds to the example described at [Using elementAnd with Scalar Values](#) on page 2896 using a QueryCondition object:

Java

```
QueryCondition qc =
connection.newCondition()
    .elementAnd("values[]")
        .is("$",
QueryConditionOp.GREATER, 7)
        .is("$",
QueryConditionOp.LESS, 14)
    .close()
    .build();
```

Python

```
qc = connection.new_condition()
    .element_and("values[]")
        .is_("$",
QueryConditionOp.GREATER, 7)
        .is_("$",
QueryConditionOp.LESS, 14)
    .close()
    .build()
```

C#

```
var condition =
connection.NewQueryCondition()
    .ElementAnd("values[]")
        .Is("$", QueryOp.GREATER, 7)
        .Is("$", QueryOp.LESS, 14)
    .Close()
    .Build();
```

Go

```
condition, err :=
client.MakeCondition(
    client.ElementAnd("values[]"),
    client.Is("$",
client.EQUAL, 7),
    client.Is("$",
client.EQUAL, 14),
    client.Close())
condition.Build()
```

Creating an OJAI Query Condition Using a JSON String

You can create a query condition using OJAI syntax to specify the condition in JSON format. This is the preferred approach for the Node.js, Python, C#, and Go OJAI clients.

The following example shows you how to create the following query condition using the syntax:

```
(a.b.[0].boolean == false && (a.c.d != 5 || a.b[1].decimal > 1 ||
a.b[1].decimal < 10))
```

Java

This is a Java string for the condition:

```
String jc = new String(
    '{ \
    "$and": [ \
        {"$eq": \
        {"a.b[0].boolean": false}}, \
```

```

        {"$or": [ \
            {"$ne": {"a.c.d": 5}}, \
            {"$gt": \
                {"a.b[1].decimal": 1}}, \
            {"$lt": \
                {"a.b[1].decimal": 10}} \
        ]} \
    ];

```

Pass the string to the [Query.where](#) method. See the [Java - OJAI Query Condition in JSON Format](#) example at [Querying with Conditions](#) on page 2918 for a complete Java code example.

Node.js

This is a Node.js JSON object for the condition:

```

query =
  {"$where":
    {"$and": [
      {"$eq":
        {"a.b[0].boolean": false}},
      {"$or": [
        {"$ne": {"a.c.d": 5}},
        {"$gt":
          {"a.b[1].decimal": 1}},
        {"$lt":
          {"a.b[1].decimal": 10}}
      ]}
    ]}
};

```

See the [Node.js - OJAI Query Condition in JSON Format](#) example at [Querying with Conditions](#) on page 2918 for a complete Node.js code example.

Python

This is a Python dictionary for the condition:

```

query =
  {"$where":
    {"$and": [
      {"$eq":
        {"a.b[0].boolean": false}},
      {"$or": [
        {"$ne": {"a.c.d": 5}},
        {"$gt":
          {"a.b[1].decimal": 1}},
        {"$lt":
          {"a.b[1].decimal": 10}}
      ]}
    ]}
}

```

See the [Python - OJAI Query Condition in JSON Format](#) example at [Querying with Conditions](#) on page 2918 for a complete Python code example.

C#

This is a JSON string for the condition:

```

var query =
  @"{"$where": " +
    @"{"$and": [ " +

```

```

        @{"$eq":
{"a.b[0].boolean":false}}, " +
        @{"$or":["
+
        @{"$ne":{"a.c.d":
{"$numberInt":"5"}}}, " +
@{"$gt":{"a.b[1].decimal":
{"$decimal":"1"}}}, " +
@{"$lt":{"a.b[1].decimal":
{"$decimal":"10"}}}" +
        @]} " +
        @]" +
        @"}";

```

Go

This is a JSON string for the condition:

```

query := "{ \"$where\": +
          { \"$and\": [ +
            { \"$eq\":
              { \"a.b[0].boolean\":false } }, +
            { \"$or\": [ +
              { \"$ne\":
                { \"a.c.d\":5 } }, +
              { \"$gt\":
                { \"a.b[1].decimal\":1 } }, +
              { \"$lt\":
                { \"a.b[1].decimal\":10 } } +
            ] } +
          ] }"

```

To learn about the complete OJAI syntax for query conditions, see [OJAI Query Condition Syntax](#) on page 2882.

Note: The OJAI clients are supported starting in EEP 6.0.0.

OJAI Query Syntax

OJAI defines a syntax for specifying queries on JSON documents. You can use this syntax in Node.js and Python OJAI client applications and HPE Ezmeral Data Fabric Database shell.

See [Query with --query](#) on page 5495 to learn about how to use this syntax in HPE Ezmeral Data Fabric Database shell.

An OJAI query can include the following components:

- [Projection](#)
- [Condition](#)
- [Order by](#)
- [Limit](#)
- [Offset](#)
- [Options](#)

You can specify some or all these components in a query, separating each component with a comma.

OJAI Query Projection

Syntax

```
"$select": "fieldpath"
```

```
"$select":
["fieldpath1", "fieldpath2", ...]
```

Description

The projection is the list of field paths to select in your query. You can specify a single field path or multiple. When specifying multiple, use an array notation to list the field paths.

See [JSON Document Field Paths](#) on page 478 for more information about the syntax of different JSON document field paths.

Examples

Single field path:

```
"$select": "a.c.d"
```

Multiple field paths:

```
"$select": ["a.c.d", "a.c.e", "m[0]"]
```

OJAI Query Condition

Syntax

```
"$where": OJAIQueryCondition
```

Description

The condition filters your query result. See [OJAI Query Condition Syntax](#) on page 2882 for more information about the syntax of an *OJAIQueryCondition*.

Example

If you have the following condition:

```
(a.b[0].boolean == false && (a.c.d != 5 || a.b[1].decimal > 1 || a.b[1].decimal < 10))
```

This is the OJAI JSON syntax for the condition:

```
"$where": {
  "$and": [
    { "$eq": { "a.b[0].boolean": false } },
    { "$or": [
      { "$ne": { "a.c.d": 5 } },
      { "$gt": { "a.b[1].decimal": 1 } },
      { "$lt": { "a.b[1].decimal": 10 } }
    ]
  }
}
```

OJAI Query Order By

Syntax

```
"$orderby": "fieldpath"
```

```
"$orderby": { "fieldpath": "order" }
```

```
"$orderby": [fieldpath1, fieldpath2, ...]
```

```
"$orderby": [ { "fieldpath1": "order" },  
              { "fieldpath2": "order" }, ... ]
```

Description

The order by specifies the field paths on which to sort your query result. You can specify a single field path or multiple. When specifying multiple, use an array notation to list the field paths. For each field path, you can optionally specify an *order* of either *asc* or *desc*. Both *order* keywords are case insensitive. The default is *asc*. When specifying an *order*, enclose the *fieldpath* and *order* with curly braces.

Examples

Order on a single field path in the default *asc* order:

```
"$orderby": "a.c.e"
```

Order on a single field path in the *desc* order:

```
"$orderby": { "a.c.e": "desc" }
```

Order on two field paths, where the second specifies a *desc* order:

```
"$orderby": [ "a.c.d", { "a.c.e": "desc" } ]
```

OJAI Query Limit

Syntax

```
"$limit": positive-integer
```

Description

The number of documents to return from the query.

Example

Return only ten documents:

```
"$limit": 10
```

OJAI Query Offset

Syntax

```
"$offset": positive-integer
```

Description

The number of documents to skip before returning results to the client. The offset value has a direct effect on query time; as the offset value increases, query time also increases.

Example

Process the query and skip the first five documents in the result set before returning the results to the client.

```
"$offset":5
```

OJAI Query Options**Syntax**

```
"$options":{optionName:optionValue}
```

```
"$options":
[ {optionName1:optionValue1},
  {optionName2:optionValue2},...]
```

Description

Settings that influence a query's execution path. See [OJAI Query Options](#) on page 2864 for a list of available options.

When specifying the *optionName*, you must separate the components of the option name, replacing the dots with curly braces and colons and enclosing each component in quotes.

Example

Force the query to use the OJAI Distributed Query Service by setting the `ojai.mapr.query.force-drill` option:

```
"$options":{"ojai":{"mapr":{"query":{"force-drill":true}}}}
```

OJAI Query Condition Syntax

OJAI defines a syntax for specifying query conditions that allows you to express query conditions in a JSON format. This topic describes the supported operators and provides examples of these query conditions.

When writing an OJAI application, you can also apply query conditions by calling OJAI API methods, corresponding to specific operators. This section does not discuss this alternative. For details on that alternative, see [Query Conditions in OJAI Applications](#) on page 2866.

Note: Using the JSON format is the preferred approach for Python and Node.js OJAI clients.

OJAI Query Condition Operators

OJAI supports comparison, existence, between, match, like, type of, size of, in, and logical operators.

Click the name in the following box to navigate to the section that provides details on each operator.

- [Equals](#)
- [Greater Than](#)
- [Greater Than or Equals](#)
- [Less Than](#)
- [Less Than or Equals](#)
- [Not Equals](#)
- [Exists](#)
- [Not Exists](#)
- [Between](#) on page 2884
- [Matches](#)
- [Not Matches](#)
- [Like](#)
- [Not Like](#)
- [Type Of](#)
- [Not Type Of](#)
- [Size Of](#) on page 2886
- [In](#)
- [Not In](#)
- [And](#)
- [Or](#)
- [Element And](#)

Comparison Operators

Operators

| Operator | Syntax |
|------------------------|---|
| Equals | <pre>{ "\$eq" : { "fieldpath" : value } }</pre> |
| Greater Than | <pre>{ "\$gt" : { "fieldpath" : value } }</pre> |
| Greater Than or Equals | <pre>{ "\$ge" : { "fieldpath" : value } }</pre> |
| Less Than | <pre>{ "\$lt" : { "fieldpath" : value } }</pre> |
| Less Than or Equals | <pre>{ "\$le" : { "fieldpath" : value } }</pre> |
| Not Equals | <pre>{ "\$ne" : { "fieldpath" : value } }</pre> |

Description

Compares the data in *fieldpath* against *value* for the specified operator.

Float and double data are approximate representations of decimal values. They may not return true in equality comparisons against their equivalent decimal values.

You can specify only equality and non-equality conditions on nested documents and arrays.

In the case of equality on nested documents, all of the fields in the nested document must match. The order of the fields is not relevant.

In the case of equality on arrays, both the order of the elements and the element values must match.

Existence Operators

Exists

Syntax

```
{ "$exists": "fieldpath" }
```

Description

Checks for existence of *fieldpath*.

Not Exists

Syntax

```
{ "$notexists": "fieldpath" }
```

Description

Checks for non-existence of *fieldpath*.

See [Existence Conditions with Container Field Paths](#) on page 2893 for details about how these operators behave when you use them with container field paths.

Between

Syntax

```
{ "$between": { "fieldpath": [startValue, endValue] } }
```

Description

Checks if the value in *fieldpath* is in the range specified by *startValue* and *endValue*, where the values are inclusive.

Matches Operators

Operators

| Operator | Syntax |
|-------------|--|
| Matches | <pre>{ "\$matches": { "<i>fieldpath</i>": <i>matchValue</i> } }</pre> |
| Not Matches | <pre>{ "\$notmatches": { "<i>fieldpath</i>": <i>matchValue</i> } }</pre> |

Description

Performs a regular expression match on *fieldPath* using *matchValue*.

You can use regular expressions that compose the Perl-Compatible Regular Expressions (PCRE) library as well as a subset of the regular expressions that are supported in `java.util.regex.pattern`. See [HBase Java Regular Expressions Support](#) for a list of supported regular expressions.

Like Operators

Operators

| Operator | Syntax |
|----------|--|
| Like | <pre>{ "\$like": { "fieldpath": likeValue } }</pre> |
| Not Like | <pre>{ "\$notlike": { "fieldpath": likeValue } }</pre> |

Description

Performs a SQL LIKE comparison on `fieldPath` where `likeValue` is a string with wildcard characters `'%'` and `'_'`.

Special-Purpose Characters for the Like Operators

The OJAI API allows you to use four special-purpose characters or patterns with `$like` operator expressions:

| Special-Purpose Character | Description | Example |
|---------------------------|--|---|
| <code>%</code> | Matches any string of zero or more characters. | "abc%" matches "abc", "abcd", "abcde232136", etc. "%abc" matches "abc", "pqrabc", etc. |
| <code>_</code> | Matches a single character. | "_am" matches "ram", "sam", "Sam", "cam". |
| <code>[]</code> | Matches a single character in the specified set or range. | "[r-t]am" matches "ram", "sam", and "tam" but not "Sam" or "cam". |
| <code>[^]</code> | Matches a single character not in the specified set or range. | "[^r-t]am" matches "Sam", "pam", "jam", or "cam" but not "ram", "sam" and "tam". |

When any of these special characters is used as a literal, the character can be enclosed within `[]`:

| Literal | Corresponding Like Expression |
|--------------------|-------------------------------|
| <code>"[a]"</code> | <code>"[[a]"</code> |

| Literal | Corresponding Like Expression |
|---------------|-------------------------------|
| "a %" | "a[%]" |
| "a _c " | "a[_]c" |

Note that "^" and "]" need not be escaped.

Type of Operators

Type Of

Syntax

```
{ "$typeof" :
  { "fieldpath" : "typeValue" } }
```

Description

Checks whether *fieldpath* is of type *typeValue*.

Not Type Of

Syntax

```
{ "$nottypeof" :
  { "fieldpath" : "typeValue" } }
```

Description

Checks whether *fieldpath* is not of type *typeValue*.

typeValue can be any of map, array, binary, date, time, timestamp, interval, double, float, long, int, short, byte, string, boolean, or null.

Size Of

Syntax

```
{ "$sizeof" : { "fieldpath" :
  { "comparisonOp" : intValue } } }
```

Description

Compares the size of the data in *fieldpath* against *intValue*, using *comparisonOp*. The size varies depending on the type of *fieldPath*:

| | |
|------------------------|--|
| String | Length of string |
| Array | Number of elements in the array |
| Nested document | Number of subfields in the nested document |

comparisonOp can be any of `$eq`, `$lt`, `$le`, `$gt`, `$ge`, or `$ne`.

In Operators

In

Syntax

```
{ "$in":
  { "fieldpath": inOp
    Values}}
```

Description

Checks whether the data in *fieldpath* is in the list specified by *inOpValues*.

Not In

Syntax

```
{ "$notin":
  { "fieldpath": inOp
    Values}}
```

Description

Checks whether the data in *fieldpath* is not in the list specified by *inOpValues*.

Logical Operators

And

Syntax

```
{ "$and":
  [OJAIQueryCondi
    tions]}
```

Description

Applies logical AND on a list of conditions. *OJAIQueryConditions* is a comma-separated list of OJAI query conditions.

Or

Syntax

```
{ "$or":
  [OJAIQueryCondi
    tions]}
```

Description

Applies logical OR on a list of conditions. *OJAIQueryConditions* is a comma-separated list of OJAI query conditions.

Element And

Syntax

```
{
  "$elementAnd": {
```

```
"containerFieldPath":
[OJAIQueryConditions]
}
```

Note: Supported starting in MapR 6.1.

Description

Applies multiple conditions as part of a group. All conditions must be true for a common array element.

OJAIQueryConditions is the comma-separated list of the OJAI query conditions.

containerFieldPath exhibits the following behaviors:

- *containerFieldPath* specifies the container path prefix of the common container element.
- If *containerFieldPath* refers to a container of nested documents, then you must use field paths relative to the common prefix in your *OJAIQueryConditions*.
- If the *containerFieldPath* refers to a container of scalar values, then you use the \$ symbol to refer to individual elements in your *OJAIQueryConditions*.

Note: There is no `elementOr` operator because it is semantically equivalent to an OR operator.

[OJAI Query Conditions Using Container Field Paths](#) on page 2891

Starting in MapR 6.1, HPE Ezmeral Data Fabric Database supports the notion of a *container field path*. A container field path enables you to perform comparisons on a field path that is either a single value or an arbitrary array element. You can use container field paths with arrays and nested documents, including nested documents with multiple levels of nesting and multidimensional arrays.

[OJAI Query Conditions Using elementAnd](#) on page 2895

The `elementAnd` operator allows you to specify multiple conditions on the same array element using a container field path. This is in contrast to the `and` operator where conditions can refer to any array element. You can use `elementAnd` with both nested documents and scalar values. You can also use it in combination with other operators, including `between`, `and`, and `or`.

OJAI Query Condition Examples

This section contains examples that show you how to use different OJAI query condition operators in combination with different field references and data types.

The examples in this section use the following JSON documents:

```
{ "_id" : "001", "name" : "Ipod 001", "tags" : [ "electronics", "ipod", "apple" ] }
{ "_id" : "002", "name" : "Ipod 002", "tags" : "ipod" }
{ "_id" : "003", "name" : "Ipod 003", "tags" : 10 }
{ "_id" : "004", "name" : "Ipod 004", "tags" : [ 10, "ipod", { "t" : "ipod" } ] }
{ "_id" : "005", "name" : "Ipod 005", "tags" : { "t" : "ipod" } }
{ "_id" : "006", "name" : "Ipod 006", "tags" : [ { "t" : "ipod" }, { "t" : "apple" } ] }
{ "_id" : "007", "name" : "Ipod 007", "tags" : [ { "t" : "ipod", "v" : 10 }, { "t" : "apple", "v" : 9 } ] }
{ "_id" : "008", "name" : "Ipod 008", "tags" : { "t" : "ipod", "v" : 10 } }
```

| Example | Documents Returned |
|---|--------------------|
| <pre>{ "\$exists": "tags.v" }</pre> <p>Matches documents where <code>tags</code> is a nested document that has a <code>v</code> subfield.</p> | 008 |
| <pre>{ "\$eq": { "tags": 10 } }</pre> <p>Matches documents where <code>tags</code> equals the scalar value 10.</p> | 003 |
| <pre>{ "\$eq": { "tags.t": "ipod" } }</pre> <p>Matches documents where <code>tags</code> is a nested document with a subfield <code>t</code> equal to "ipod".</p> | 005, 008 |
| <pre>{ "\$eq": { "tags": { "t": "ipod" } } }</pre> <p>Matches documents where <code>tags</code> is a nested document with a single subfield <code>t</code> equal to "ipod".</p> | 005 |
| <pre>{ "\$eq": { "tags": { "v": 10, "t": "ipod" } } }</pre> <p>Matches documents where <code>tags</code> is a nested document with two subfields, <code>v</code> and <code>t</code>. <code>v</code> is equal to 10, and <code>t</code> is equal to "ipod". The order of subfields in the condition does not matter.</p> | 008 |

| Example | Documents Returned |
|--|--------------------|
| <pre data-bbox="175 258 885 289">{"\$eq":{"tags":["electronics","ipod","apple"]}}</pre> <p data-bbox="159 317 992 348">Matches documents where <code>tags</code> is an array with the three elements listed.</p> | 001 |
| <pre data-bbox="175 394 885 426">{"\$eq":{"tags":["ipod","electronics","apple"]}}</pre> <p data-bbox="159 453 1214 512">This example does not match any document, whereas the previous does, because the order of the elements in this example does not match the order in document 001.</p> | None |
| <pre data-bbox="175 558 597 590">{"\$between":{"tags":[5,15]}}</pre> <p data-bbox="159 617 927 648">Matches documents where <code>tags</code> is a scalar value between 5 and 15.</p> | 003 |
| <pre data-bbox="175 695 581 726">{"\$like":{"tags[1]":"ip%"}}</pre> <p data-bbox="159 753 1195 785">Matches documents where the first array element in <code>tags</code> qualifies the wildcard string "ip%"</p> | 001, 004 |
| <pre data-bbox="175 831 565 863">{"\$typeof":{"tags":"map"}}</pre> <p data-bbox="159 890 781 921">Matches documents where <code>tags</code> is a nested document.</p> | 005, 008 |
| <pre data-bbox="175 968 597 999">{"\$typeof":{"tags":"array"}}</pre> <p data-bbox="159 1026 656 1058">Matches documents where <code>tags</code> is an array.</p> | 001, 004, 006, 007 |
| <pre data-bbox="175 1104 630 1136">{"\$sizeof":{"tags":{"\$ge":3}}}</pre> <p data-bbox="159 1163 1138 1194">Matches documents where the size of the data in <code>tags</code> is greater than or equal to three.</p> <ul data-bbox="159 1205 906 1352" style="list-style-type: none"> • 001 matches because the array has three elements • 002 matches because the string is of length four • 004 matches because the nested document has three subfields | 001, 002, 004 |
| <pre data-bbox="175 1409 824 1440">{"\$in":{"tags":["ipod", 10, {"t":"ipod"}]}}</pre> <p data-bbox="159 1467 1224 1526">Matches documents where <code>tags</code> equals any of the values listed. Note that the values can be of different types.</p> | 002, 003, 005 |
| <pre data-bbox="175 1572 808 1745">{ "\$and":[{"\$lt":{"tags[1].v":10}}, {"\$matches":{"tags[1].t":"ap{2}"}}] }</pre> <p data-bbox="159 1772 1243 1831">Matches documents where the first array element in <code>tags</code> has a nested document with a subfield <code>v</code> less than one, and the same nested document also matches the regular expression "ap{2}".</p> | 007 |

| Example | Documents Returned |
|--|--------------------|
| <pre data-bbox="175 260 734 428"> { "\$or": [{"\$exists": "tags.v"}, {"\$typeof": {"tags": "string"}}] } </pre> <p data-bbox="159 457 1185 512">Matches documents where either <code>tags</code> is a nested document with a subfield <code>v</code>, or <code>tags</code> is a scalar string.</p> | 002, 008 |

Note: You can improve the performance of queries with conditions by using secondary indexes. See [Queries that Benefit from Secondary Indexes](#) on page 532 for more details.

OJAI Query Conditions Using Container Field Paths

Starting in MapR 6.1, HPE Ezmeral Data Fabric Database supports the notion of a *container field path*. A container field path enables you to perform comparisons on a field path that is either a single value or an arbitrary array element. You can use container field paths with arrays and nested documents, including nested documents with multiple levels of nesting and multidimensional arrays.

Conditions with Container Field Paths on Arrays

If you have a field that has a single value rather than an array of values, when using the container notation, HPE Ezmeral Data Fabric Database treats the single value as an array with one element. This enables you to use a container field path to access a field that has both array elements and scalar values. The array elements and scalar values can be of any type.

Suppose you have the following set of documents:

```

{ "_id" : "001", "name" : "Ipod 001", "tags" : [ "electronics", "ipod",
"apple" ] }
{ "_id" : "002", "name" : "Ipod 002", "tags" : "ipod" }
{ "_id" : "003", "name" : "Ipod 003", "tags" : 10 }
{ "_id" : "004", "name" : "Ipod 004", "tags" : [ 10, "ipod", { "t" :
"ipod" } ] }
{ "_id" : "005", "name" : "Ipod 005", "tags" : { "t" : "ipod" } }
{ "_id" : "006", "name" : "Ipod 006", "tags" : [ { "t" : "ipod" }, { "t" :
"apple" } ] }
{ "_id" : "007", "name" : "Ipod 007", "tags" : [ { "t" : "ipod", "v" :

```

```
10 }], { "t" : "apple", "v" : 9 } ] ] }
{ "_id" : "008", "name" : "Ipod 008", "tags" : { "t" : "ipod", "v" : 10 } }
```

To find all documents that contain the tag named "ipod", you can use the following OJAI query condition, where you reference `tags` using a container field path:

```
{ "$eq" : { "tags[]" : "ipod" } }
```

The expression matches the following documents, with the matching condition highlighted in bold:

```
{ "_id" : "001", "name" : "Ipod 001", "tags" : [ "electronics", "ipod",
"apple" ] }
{ "_id" : "002", "name" : "Ipod 002", "tags" : "ipod" }
{ "_id" : "004", "name" : "Ipod 004", "tags" : [ 10, "ipod", { "t" :
"ipod" } ] }
```

Note that the matching documents have the following characteristics:

- In 001 and 004, `tags` are array fields.
- In 002, `tags` is a scalar value.
- In 001 and 004, the `tags` arrays have elements in addition to "ipod".

You can also use the AND operator to match multiple container field path conditions.

For example, the following condition finds all documents that have both "ipod" and "apple" tags:

```
{
  "$and" : [
    { "$eq" : { "tags[]" : "ipod" } },
    { "$eq" : { "tags[]" : "apple" } }
  ]
}
```

The expression matches the following document, with the matching conditions highlighted in bold:

```
{ "_id" : "001", "name" : "Ipod 001", "tags" : [ "electronics", "ipod",
"apple" ] }
```

Conditions with Container Field Paths on Nested Documents

You can also use the container field path in combination with a nested document subfield reference.

For example, using the same set of documents shown earlier, the following OJAI query condition finds all documents in which "ipod" is specified in the subfield named `t` within the `tags` nested document:

```
{ "$eq" : { "tags[].t" : "ipod" } }
```

This expression returns the following documents, with the matching condition highlighted in bold:

```
{ "_id" : "004", "name" : "Ipod 004", "tags" : [ 10, "ipod", { "t" : "ipod"
} ] ] }
{ "_id" : "005", "name" : "Ipod 005", "tags" : { "t" : "ipod" } }
{ "_id" : "006", "name" : "Ipod 006", "tags" : [ { "t" : "ipod" }, { "t" :
"apple" } ] ] }
{ "_id" : "007", "name" : "Ipod 007", "tags" : [ { "t" : "ipod", "v" :
10 }, { "t" : "apple", "v" : 9 } ] ] }
{ "_id" : "008", "name" : "Ipod 008", "tags" : { "t" : "ipod", "v" : 10 } }
```

Note that the matching documents have the following characteristics:

- In 005 and 008, `tags` is a single nested document.
- In 006 and 007, `tags` is an array of nested documents.
- In 004, the `tags` array has both scalar data and a nested document.
- In 004 and 006, the `tags` array have other array elements that do not match the nested document subfield `t`.

Existence Conditions with Container Field Paths

[Existence Operators](#) on page 2884 check for the existence and non-existence of a specified field path. When you use `$exists` with a container field path, the specified field path can be any element in an array.

Using the same set of documents shown earlier, the following OJAI query condition finds all documents where the `tags` array has a nested document with a subfield `t`:

```
{ "$exists": "tags[ ].t" }
```

The expression matches the following documents with the matching condition highlighted in bold:

```
{ "_id": "004", "name": "Ipod 004", "tags": [10, "ipod", {"t": "ipod"}] }
{ "_id": "005", "name": "Ipod 005", "tags": {"t": "ipod"} }
{ "_id": "006", "name": "Ipod 006", "tags": [{"t": "ipod"}, {"t": "apple"}] }
{ "_id": "007", "name": "Ipod 007", "tags": [{"t": "ipod", "v": 10}, {"t": "apple", "v": 9}] }
```

When you use `$notexists` with a container field path, it matches *any* element in the array that does not meet the existence condition:

```
{ "$notexists": "tags[ ].t" }
```

The expression returns the following documents with the matching condition highlighted in bold:

```
{ "_id": "001", "name": "Ipod 001", "tags": ["electronics", "ipod", "apple"] }
{ "_id": "002", "name": "Ipod 002", "tags": "ipod" }
{ "_id": "003", "name": "Ipod 003", "tags": 10 }
{ "_id": "004", "name": "Ipod 004", "tags": [10, "ipod", {"t": "ipod"}] }
```

Even document 004 has a `tags[].t` element, the other elements in that document's `tags` array do not; therefore, the document qualifies the condition.

Conditions with Container Field Paths Across Multiple Levels of Nested Documents

The following are examples of query conditions that match the sample document shown at [Container Field Paths Across Multiple Levels of Nested Documents](#):

```
{ "$eq": { "projects[ ].customer.contacts[ ].emails[ ].value": "jdoe@gmail.com" } }
```

```
{ "$eq": { "projects[ ].customer.contacts[ ].role": "CEO" } }
```

Conditions with Container Field Paths on Multidimensional Arrays

The following examples reference documents that store the high and low temperatures for each day in a week. They use a two-dimensional array to store this data. The first element of each nested array element is the high temperature for a day, and the second element is the low. Typically, the two-dimensional array

has seven array pairs, one for each day of the week. But in cases where data is unavailable, the document has only the days available.

For example, document 002 has a single dimensional array because it has data for only one day that week.

```
{
  "_id" : "001",
  "temps" : [[61,49],[74,51],[75,51],[74,52],[78,54],[75,53],[75,54]],
  "weekOf" : "4/29/2018"
}
{
  "_id" : "002",
  "temps" : [81,60],
  "weekOf" : "5/12/2018"
}
{
  "_id" : "003",
  "temps" : [[80,55],[78,54],[79,54],[77,53],[79,54],[77,54],[78,54]],
  "weekOf" : "5/13/2018"
}
```

As described at [Container Field Paths with Multidimensional Arrays](#), you can specify a container field path in a dimension only if it does not precede a dimension that specifies an explicit element. For example, the following condition is not allowed because the first dimension specifies a container field path and precedes element 1 in the second dimension:

```
// Invalid condition
{"$ge":{"temps[][1]":60}}
```

The following table shows examples of conditions on multidimensional arrays that HPE Ezmeral Data Fabric Database supports:

| Example | Documents Returned |
|--|--------------------|
| <pre>{"\$ge":{"temps[][]":60}}</pre> <p>Matches documents that have any temperature greater than 60.</p> <ul style="list-style-type: none"> Documents 001 and 003 match because all days have high temperatures above 60. Document 002 matches because day 1 has a low temperature of 60. <p>Although <code>temps</code> in this document is a one-dimensional array, the container notation treats it as a two-dimensional array.</p> | 001, 002, 003 |
| <pre>{"\$ge":{"temps[1][]":75}}</pre> <p>Matches documents that have any temperature greater than 75 on the second day of the week</p> | 003 |
| <pre>{"\$eq":{"temps[]":[78,54]}}</pre> <p>Matches documents that have a high and low temperature of 78 and 54 on the same day.</p> <ul style="list-style-type: none"> Day 5 from document 001 matches this condition. Days 2 and 7 from document 003 match this condition. | 001, 003 |

OJAI Query Conditions Using `elementAnd`

The `elementAnd` operator allows you to specify multiple conditions on the same array element using a container field path. This is in contrast to the `and` operator where conditions can refer to any array element. You can use `elementAnd` with both nested documents and scalar values. You can also use it in combination with other operators, including `between`, `and`, and `or`.

Using `elementAnd` with Nested Documents

Assume that you have the following set of documents that reflect student scores on courses. Each document has an array of `grades`. `Grades` is a nested document that reflects how the students scored on each course they took.

```
{ "_id": "001", "grades": [ { "course": "math", "score": 15.5 },
  { "score": 12, "course": "history" }, { "course": "english", "score": 8 } ] }
{ "_id": "002", "grades": [ { "course": "math", "score": 4 },
  { "course": "history", "score": 12, "cmts": "..."},
  { "course": "english", "score": 18 } ] }
{ "_id": "003", "grades": [ { "course": "math", "score": 11 },
  { "course": "history", "score": 15 }, { "course": "english", "score": 12 },
  { "course": "sports", "score": 4 } ] }
{ "_id": "004", "grades": [ { "course": "math", "score": 15.5 },
  { "course": "history", "score": 12, "details": { "info": "..."} } ] }
{ "_id": "005", "grades": [ { "course": "math", "score": 15.5 },
  { "course": "history", "score": 10 }, { "course": "physics", "score": 11 } ] }
```

If you want to find the students who scored 12 in history, you use the following `elementAnd` condition:

```
{
  "$elementAnd": {
    "grades[]": [
      { "$eq": { "course": "history" } },
      { "$eq": { "score": 12 } }
    ]
  }
}
```

The condition matches the following documents, with the matching conditions highlighted in bold:

```
{ "_id": "001", "grades": [ { "course": "math", "score": 15.5 },
  { "course": "history", "score": 12 }, { "course": "english", "score": 8 } ] }
{ "_id": "002", "grades": [ { "course": "math", "score": 4 },
  { "course": "history", "score": 12, "cmts": "..."},
  { "course": "english", "score": 18 } ] }
{ "_id": "004", "grades": [ { "course": "math", "score": 15.5 },
  { "course": "history", "score": 12, "details": { "info": "..."} } ] }
```

The example illustrates the following behavior:

- The positions of the subfields in the nested document are not significant.

- In document 002, there are other subfields in the nested document that do not match the specified conditions.

In contrast, the following example expresses a different condition, using `and` instead of `elementAnd`:

```
{
  "$and": [
    { "$eq": { "grades[] .course": "history" } },
    { "$eq": { "grades[] .score": 12 } }
  ]
}
```

This condition returns documents corresponding to students who have taken history and scored 12 on *any* course. The following are the matching documents, with the matching conditions highlighted in bold:

```
{ "_id": "001", "grades": [ { "course": "math", "score": 15.5 },
  { "course": "history", "score": 12 }, { "course": "english", "score": 8 } ] }
{ "_id": "002", "grades": [ { "course": "math", "score": 4 },
  { "course": "history", "score": 12, "cmts": "..."},
  { "course": "english", "score": 18 } ] }
{ "_id": "003", "grades": [ { "course": "math", "score": 11 },
  { "course": "history", "score": 15 }, { "course": "english", "score": 12 },
  { "course": "sports", "score": 4 } ] }
{ "_id": "004", "grades": [ { "course": "math", "score": 15.5 },
  { "course": "history", "score": 12, "details": { "info": "..."} } ] }
```

The example illustrates the following behavior:

- Besides returning the same documents as the previous `elementAnd` example, this condition also returns document 003.
- Document 003 matches because that student took history and scored 12 on english, rather than history.
- Document 005 does not match because although the student took history, the student did not score 12 on any courses.

Using `elementAnd` with Scalar Values

If you apply `elementAnd` to a container of scalar values, you use the `$` symbol to denote an unspecified container element.

Suppose you have the following documents:

```
{ "_id" : "001", "name" : "a", "values" : [1, 2, 3, 6, 15] }
{ "_id" : "002", "name" : "b", "values" : [3, 6, 9, 10, 15] }
{ "_id" : "003", "name" : "c", "values" : [14] }
{ "_id" : "004", "name" : "c", "values" : 11 }
```

To find all documents where `values[]` contains a number between 7 and 11 (inclusive), you can use the following condition:

```
{
  "$elementAnd": {
    "values[]": [
      { "$ge": { "$": 7 } },
      { "$le": { "$": 11 } }
    ]
  }
}
```

The condition returns the following documents, with the matching numbers highlighted in bold:

```
{ "_id": "002", "name": "b", "values": [3, 6, 9, 10, 15] }
{ "_id": "004", "name": "c", "values": 11 }
```

The example illustrates the following behavior:

- In document 002, multiple elements in the array match the condition.
- In document 004, `values` is a scalar value.

Suppose you apply the following condition that uses `and` instead of `elementAnd`:

```
{
  "$and": [
    { "$ge": { "values[]": 7 } },
    { "$le": { "values[]": 11 } }
  ]
}
```

All documents except 003 match this `and` condition because in the matching documents, `values[]` contains *some* number greater than or equal to 7 and *some* number less than or equal to 11. The difference is that the same number does not need to match both conditions, which is the case for document 001.

Using `between` with `elementAnd`

You cannot use a container field path in a `between` condition. To use the `between` operator to match against an arbitrary array element, you must include the `between` condition in an `elementAnd` condition.

The following table shows the proper way to specify a `between` condition that is equivalent to the `elementAnd` example from the previous section:

| Correct Condition | Incorrect Condition |
|---|---|
| <pre>{ "\$elementAnd": { "values[]": [{ "\$between": { "\$": [7, 11] } }] } }</pre> | <pre>{ "\$between": { "values[]": [7, 11] } }</pre> |

This example uses `between` to match against an arbitrary scalar array element. You can also use `between` to match against a subfield in a nested document, in which the nested document is an arbitrary array element.

For example, using the sample documents shown earlier, the following table shows the correct way to apply the `between` operator on the subfield `score` in the nested documents that are elements in the `grades` array:

| Correct Condition | Incorrect Condition |
|--|--|
| <pre>{ "\$elementAnd": { "grades[]": [{"\$between": {"score": [15.5,20]}}] } }</pre> | <pre>{"\$between": {"grades[] .score": [15.5,20]}}</pre> |

The condition returns the following documents, with the matching conditions highlighted in bold:

```
{ "_id": "001", "grades": [ {"course": "math", "score": 15.5},
{ "course": "history", "score": 12 }, { "course": "english", "score": 8 } ] }
{ "_id": "002", "grades": [ {"course": "math", "score": 4},
{ "course": "english", "score": 18 } ] }
{ "_id": "004", "grades": [ {"course": "math", "score": 15.5},
{ "course": "history", "details": { "info": "...", "score": 12 } } ] }
{ "_id": "005", "grades": [ {"course": "math", "score": 15.5},
{ "course": "history", "score": 10 }, { "course": "physics", "score": 11 } ] }
```

Using Other Operators in elementAnd Conditions

You can also use operators like `or` in `elementAnd`'s query condition list.

For example, the following condition finds all students who scored 12 in either history or english:

```
{
  "$elementAnd": {
    "grades[]": [
      {"$or": [
        {"$eq": {"course": "history"}},
        {"$eq": {"course": "english"}}
      ]},
      {"$eq": {"score": 12}}
    ]
  }
}
```

The condition returns the following documents, with the matching conditions highlighted in bold:

```
{ "_id": "001", "grades": [ {"course": "math", "score": 15.5},
{ "course": "history", "score": 12 }, { "course": "english", "score": 8 } ] }
{ "_id": "002", "grades": [ {"course": "math", "score": 4},
{ "course": "english", "score": 18 } ] }
{ "_id": "003", "grades": [ {"course": "math", "score": 11},
{ "course": "history", "score": 15 }, { "course": "english", "score": 12 },
{ "course": "sports", "score": 4 } ] }
{ "_id": "004", "grades": [ {"course": "math", "score": 15.5},
{ "course": "history", "score": 12, "details": { "info": "..."} } ] }
```

Combining elementAnd with Other Operators

You can combine `elementAnd` with other operators like `and`.

For example, using the sample documents shown earlier, suppose you want to find all students who scored 12 in history as well as scored 15.5 in math. The following condition expresses this criteria:

```
{
  "$and": [
    {
      "$elementAnd": {
        "grades[]": [
          {"$eq": {"course": "history"}},
          {"$eq": {"score": 12}}
        ]
      }
    },
    {
      "$elementAnd": {
        "grades[]": [
          {"$eq": {"course": "math"}},
          {"$eq": {"score": 15.5}}
        ]
      }
    }
  ]
}
```

The condition returns the following documents, with the matching conditions highlighted in bold:

```
{ "_id": "001", "grades": [ { "course": "math", "score": 15.5 },
  { "course": "history", "score": 12 }, { "course": "english", "score": 8 } ] }
{ "_id": "004", "grades": [ { "course": "math", "score": 15.5 },
  { "course": "history", "score": 12, "details": { "info": "..."} } ] }
```

Querying with HPE Ezmeral Data Fabric Database Shell

This section describes how to query JSON documents using either the `find` or `findbyid` command in HPE Ezmeral Data Fabric Database Shell (dbshell). It introduces the functionality the `find` command supports and describes the two ways to specify your queries. It also provides links to reference pages and examples.

The `findbyid` command allows you to retrieve a single document with a specified id from a HPE Ezmeral Data Fabric Database JSON table.

The `find` command allows you to specify projections and filter conditions (using JSON strings) to retrieve specific documents. It also allows you to specify the following options:

- Range of document IDs to retrieve
- Offset from which to start retrieval
- Order by to sort fields in the document
- Limit on the number of documents to retrieve

To invoke HPE Ezmeral Data Fabric Database shell, run the following command on a MapR cluster node:

```
% mapr dbshell
```

For a complete list and description of options available, see [dbshell find or findbyid](#) on page 5492.

Alternatives for Writing Dbshell Query Commands

You can construct your dbshell queries in one of two ways:

- Use individual options in the `find` command
- Use the `--query` option in the `find` command and specify keywords as arguments to `--query`

The following example illustrates the differences between the two alternatives.

Suppose you want to query the table `/apps/tab` with the following criteria:

- Select fields `f1` and `f2`
- Limit the result to ten documents
- Skip the first two documents
- Filter documents where the field `f3` equals 15
- Sorts on field `f1`

Click on each of the following tabs to see the syntax for each alternative:

Use Individual Options in `find`

```
find /apps/tab --fields f1,f2 --limit
10 --offset 2 --where {"$eq":
{"f3":15}} --orderby f1
```

Use the `--query` Option in `find`

```
find /apps/tab --query {"$select":
["f1","f2"],"$limit":10,"$offset":2,"$
where":{"$eq":
{"f3":15}},"$orderby":"f1"}
```

For more examples on how to use the two query alternatives, see the following links:

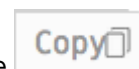

| Use Individual Options in <code>find</code> | Use the <code>--query</code> Option in <code>find</code> |
|--|--|
| Query Examples with Other Options on page 5500 | <ul style="list-style-type: none"> • Query with <code>--query</code> on page 5495 • Query with <code>--orderby</code> on page 5499 |

Note: With both options, you need to specify the query condition using [OJAI Query Condition Syntax](#) on page 2882.

Examples: Querying JSON Documents

This section provides query examples using the OJAI API. The examples include querying by document ID, retrieving all documents in a store, selecting individual fields, specifying query conditions, and ordering your query result. For reference, the examples also include the equivalent HPE Ezmeral Data Fabric Database Shell (dbshell) commands.

If you hover over the right hand side of all code examples, you can use the  icon to copy and paste the code.

You can also download the code examples from github at <https://github.com/mapr-demos/ojai-examples.git>.

Querying By ID

The examples in this section show you how to query for a single document ID.

Java

This example retrieves a single document identified by the ID `user001`.

Note: To query for a range of document IDs, you must specify an OJAI [QueryCondition](#). See [Querying with Conditions](#) on page 2918 for examples of the syntax.

const { ConnectionManager } = require('node-maprdb');

const connectionString = 'localhost:5678?' +
  'auth=basic;' +
  'user=mapr;' +
  'password=mapr;' +
  'ssl=true;' +
  'sslCA=/opt/mapr/conf/ssl_truststore.pem;' +
  'sslTargetNameOverride=nodel.mapr.com';

let connection;

ConnectionManager.getConnection(connectionString)
  .then((conn) => {
    connection = conn;
    // Get a store
    return connection.getStore('/demo_table');
  })
  .then((store) => {
    // fetch the OJAI Document by its '_id' field
    return store.findById('user0001');
  })
  .then((doc) => {
    // Print the OJAI Document
    console.log(doc);
    connection.close();
  });

```

Python

This example retrieves a single document identified by the ID `user0001`.

Note: To query for a range of document IDs, you must specify an OJAI [QueryCondition](#). See [Querying with Conditions](#) on page 2918 for examples of the syntax.

```

from mapr.ojai.storage.ConnectionFactory import ConnectionFactory

# Create a connection to data access server
connection_str = "localhost:5678?auth=basic;user=mapr;password=mapr;" \

```

```

        "ssl=true;" \
        "sslCA=/opt/mapr/conf/ssl_truststore.pem;" \
        "sslTargetNameOverride=nodel.mapr.com"
connection = ConnectionFactory.get_connection(connection_str=connection_str)

# Get a store and assign it as a DocumentStore object
store = connection.get_store('/demo_table')

# fetch the OJAI Document by its '_id' field
doc = store.find_by_id("user0001")

# Print the OJAI Document
print(doc)

# close the OJAI connection
connection.close()

```

dbshell

The following is the equivalent of the code examples using dbshell. See [dbshell find or findbyid](#) on page 5492 for more details about the syntax dbshell provides.

```

# mapr dbshell
maprdb root:> findbyid /demo_table --id user0001

```

C#

This example retrieves a single document identified by the ID user0001.

Note: To query for a range of document IDs, you must specify an OJAI [QueryCondition](#). See [Querying with Conditions](#) on page 2918 for examples of the syntax.

```

using System;
using MapRDB.Driver;

public class FindById
{
    public void FindById()
    {
        // Create a connection to data access server
        var connectionStr = $"localhost:5678?auth=basic;" +
            $"user=mapr;" +
            $"password=mapr;" +
            $"ssl=true;" +
            $"sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
            $"sslTargetNameOverride=nodel.mapr.com";
        var connection = ConnectionFactory.CreateConnection(connectionStr);

        // Get a store and assign it as a DocumentStore object
        var store = connection.GetStore("/demo_table");

        // Fetch the OJAI Document by its '_id' field
        var document = store.FindById("user0001");

        // Print the OJAI Document
        Console.WriteLine(document);

        // Close the OJAI connection
        connection.Close();
    }
}

```

```
}
}
```

Go

This example retrieves a single document identified by the ID `user0001`.

Note: To query for a range of document IDs, you must specify an OJAI [Condition](#). See [Querying with Conditions](#) on page 2918 for examples of the syntax.

```
package main

import (
    "fmt"
    client "github.com/mapr/private-maprdb-go-client"
)

func main() {
    // Create connection string
    connectionString := "192.168.33.11:5678?" +
        "auth=basic;" +
        "user=mapr;" +
        "password=mapr;" +
        "ssl=true;" +
        "sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
        "sslTargetNameOverride=nodel.cluster.com"

    storeName := "/demo_table"

    // Create a connection to DAG
    connection, err := client.MakeConnection(connectionString)
    if err != nil {
        panic(err)
    }

    // Get a store and assign it as a DocumentStore struct
    store, err := connection.GetStore(storeName)
    if err != nil {
        panic(err)
    }

    // Fetch the OJAI Document by its '_id' field
    doc, err := store.FindByIdString("id0001")
    if err != nil {
        panic(err)
    }

    // Print the OJAI Document
    fmt.Println(doc.AsJsonString())

    // Close connection
    connection.Close()
}
```

Querying and Returning All Documents

The examples in this section show you two ways of retrieving all documents from a document store.

Java - Example 1

The following example queries a document store and returns all documents by using the [DocumentStore.find](#) method.

```

/**
 * Copyright (c) 2017 MapR, Inc.
 *
 * Licensed under the Apache License, Version 2.0 (the "License");
 * you may not use this file except in compliance with the License.
 * You may obtain a copy of the License at
 *
 * http://www.apache.org/licenses/LICENSE-2.0
 *
 * Unless required by applicable law or agreed to in writing, software
 * distributed under the License is distributed on an "AS IS" BASIS,
 * WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied.
 * See the License for the specific language governing permissions and
 * limitations under the License.
 */
package com.mapr.ojai.examples;

import org.ojai.Document;
import org.ojai.DocumentStream;
import org.ojai.store.Connection;
import org.ojai.store.DocumentStore;
import org.ojai.store.DriverManager;

public class OJAI_004_FindAll {

    public static void main(String[] args) {

        System.out.println("==== Start Application ===");

        // Create an OJAI connection to MapR cluster
        final Connection connection = DriverManager.getConnection("ojai:mapr:");

        // Get an instance of OJAI DocumentStore
        final DocumentStore store = connection.getStore("/demo_table");

        // fetch all OJAI Documents from this store
        final DocumentStream stream = store.find();

        for (final Document userDocument : stream) {
            // Print the OJAI Document
            System.out.println(userDocument.asJsonString());
        }

        // Close this instance of OJAI DocumentStore
        store.close();

        // close the OJAI connection and release any resources held by the
        connection
        connection.close();

        System.out.println("==== End Application ===");
    }
}

```

Java - Example 2

The following example queries a document store and returns all documents. It creates a [Query](#) object and passes that to the [DocumentStore.findQuery](#) method.

```

/**
 * Copyright (c) 2017 MapR, Inc.
 *
 * Licensed under the Apache License, Version 2.0 (the "License"); you may
not use this file except in compliance with
 * the License. You may obtain a copy of the License at
 *
 * http://www.apache.org/licenses/LICENSE-2.0
 *
 * Unless required by applicable law or agreed to in writing, software
distributed under the License is distributed on
 * an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either
express or implied. See the License for the
 * specific language governing permissions and limitations under the
License.
 */
package com.mapr.ojai.examples;

import org.ojai.Document;
import org.ojai.DocumentStream;
import org.ojai.store.Connection;
import org.ojai.store.DocumentStore;
import org.ojai.store.DriverManager;
import org.ojai.store.Query;

public class OJAI_005_FindAllQuery {

    public static void main(final String[] args) {

        System.out.println("==== Start Application ===");

        // Create an OJAI connection to MapR cluster
        final Connection connection = DriverManager.getConnection("ojai:mapr:");

        // Get an instance of OJAI DocumentStore
        final DocumentStore store = connection.getStore("/demo_table");

        // Build an OJAI query
        final Query query = connection.newQuery().build();

        // fetch all OJAI Documents from this store
        final DocumentStream stream = store.find(query);

        for (final Document userDocument : stream) {
            // Print the OJAI Document
            System.out.println(userDocument.asJsonString());
        }

        // Close this instance of OJAI DocumentStore
        store.close();

        // close the OJAI connection and release any resources held by the
connection
        connection.close();

        System.out.println("==== End Application ===");
    }
}

```

```
}

```

Node.js - Example 1

The following example queries a document store and returns all documents by using the [DocumentStore.find](#) method.

```
/*
 * Copyright (c) 2018 MapR, Inc.
 *
 * Licensed under the Apache License, Version 2.0 (the "License");
 * you may not use this file except in compliance with the License.
 * You may obtain a copy of the License at

 * distributed under the License is distributed on an "AS IS" BASIS,
 * WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied.
 * See the License for the specific language governing permissions and
 * limitations under the License.
 */

const { ConnectionManager } = require('node-maprdb');

const connectionString = 'localhost:5678?' +
  'auth=basic;' +
  'user=mapr;' +
  'password=mapr;' +
  'ssl=true;' +
  'sslCA=/opt/mapr/conf/ssl_truststore.pem;' +
  'sslTargetNameOverride=node1.mapr.com';

let connection;

// Create a connection to data access server
ConnectionManager.getConnection(connectionString)
  .then((conn) => {
    connection = conn;
    // Get a store
    return connection.getStore('/demo_table');
  })
  .then((store) => {
    // fetch all OJAI Documents from table
    return store.find({});
  })
  .then((queryResult) => {
    queryResult.on('data', (document) => console.log(document));
    queryResult.on('end', () => {
      // close the OJAI connection
      connection.close();
    });
  });
});
```

Node.js - Example 2

The following example queries a document store and returns all documents. It creates an empty query and passes that to the [DocumentStore.find](#) method.

```

/*
 * Copyright (c) 2018 MapR, Inc.
 *
 * Licensed under the Apache License, Version 2.0 (the "License");
 * you may not use this file except in compliance with the License.
 * You may obtain a copy of the License at

 */

const { ConnectionManager } = require('node-maprdb');

const connectionString = 'localhost:5678?' +
  'auth=basic;' +
  'user=mapr;' +
  'password=mapr;' +
  'ssl=true;' +
  'sslCA=/opt/mapr/conf/ssl_truststore.pem;' +
  'sslTargetNameOverride=nodel.mapr.com';

let connection;

// Create a connection to data access server
ConnectionManager.getConnection(connectionString)
  .then((conn) => {
    connection = conn;
    // Get a store
    return connection.getStore('/demo_table');
  })
  .then((store) => {
    // options for find request
    const options = {
      'ojai.mapr.query.include-query-plan': true,
      'ojai.mapr.query.timeout-milliseconds': 10000
    }
    // fetch all OJAI Documents from table
    return store.find({}, options)
  })
  .then((queryResult) => {
    // get query plan
    console.log(queryResult.queryPlan);

    queryResult.on('data', (document) => {
      // Print OJAI Documents from document stream
      console.log(document);
    });
    queryResult.on('end', () => {
      // close the OJAI connection
      connection.close();
    });
  });
}

```

Python - Example 1

The following example queries a document store and returns all documents by using the [DocumentStore.find](#) method.

```
from mapr.ojai.storage.ConnectionFactory import ConnectionFactory

# Create a connection to data access server
connection_str = "localhost:5678?auth=basic;user=mapr;password=mapr;" \
                "ssl=true;" \
                "sslCA=/opt/mapr/conf/ssl_truststore.pem;" \
                "sslTargetNameOverride=nodel.mapr.com"
connection = ConnectionFactory.get_connection(connection_str=connection_str)

# Get a store and assign it as a DocumentStore object
store = connection.get_store('/demo_table')

# fetch all OJAI Documents from table
query_result = store.find()

# Print OJAI Documents from document stream
for doc in query_result:
    print(doc)

# close the OJAI connection
connection.close()
```

Python - Example 2

The following example queries a document store and returns all documents. It creates a [Query](#) object and passes that to the [DocumentStore.find](#) method.

```
from mapr.ojai.storage.ConnectionFactory import ConnectionFactory

# Create a connection to data access server
connection_str = "localhost:5678?auth=basic;user=mapr;password=mapr;" \
                "ssl=true;" \
                "sslCA=/opt/mapr/conf/ssl_truststore.pem;" \
                "sslTargetNameOverride=nodel.mapr.com"
connection = ConnectionFactory.get_connection(connection_str=connection_str)

# Get a store and assign it as a DocumentStore object
store = connection.get_store('/demo_table')

# Build an OJAI query
query = connection.new_query().build()

# options for find request
options = {
    'ojai.mapr.query.include-query-plan': True,
    'ojai.mapr.query.result-as-document': True,
    'ojai.mapr.query.timeout-milliseconds': 10000
}

# fetch all OJAI Documents from table
query_result = store.find(query, options=options)

# get query plan
print(query_result.get_query_plan())

doc_stream = query_result
# Print OJAI Documents from document stream
```

```

for doc in doc_stream:
    print(doc.as_dictionary())

# close the OJAI connection
connection.close()

```

dbshell

The following is the equivalent of the code examples using dbshell. See [dbshell find or findbyid](#) on page 5492 for more details about the syntax dbshell provides.

```

# mapr dbshell
maprdb root:> find /demo_table

```

C# - Example 1

The following example queries a document store and returns all documents by using the [GetAllDocuments](#) method.

```

using System;
using MapRDB.Driver;
using MapRDB.Driver.Ojai;

public class FindAllDocuments
{
    public async void FindAllDocuments()
    {
        // Create a connection to data access server
        var connectionStr = $"localhost:5678?auth=basic;" +
            $"user=mapr;" +
            $"password=mapr;" +
            $"ssl=true;" +
            $"sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
            $"sslTargetNameOverride=nodel.mapr.com";
        var connection = ConnectionFactory.CreateConnection(connectionStr);

        // Get a store and assign it as a DocumentStore object
        var store = connection.GetStore("/demo_table");

        // Fetch all OJAI Documents from table
        var queryResult = store.Find();
        var documentStream = await queryResult.GetAllDocuments();

        // Print OJAI Documents from document stream
        foreach (var document in documentStream)
        {
            Console.WriteLine(document.ToJsonString());
        }

        // Close the OJAI connection
        connection.Close();
    }
}

```

C# - Example 2

The following example queries a document store and returns all documents. It creates a [Query](#) object and passes that to the [DocumentStore.Find](#) method.

```
using System;
using MapRDB.Driver;
using MapRDB.Driver.Ojai;

public class FindAllQuery
{
    public async void FindAllQuery()
    {
        // Create a connection to data access server
        var connectionStr = $"localhost:5678?auth=basic;" +
            $"user=mapr;" +
            $"password=mapr;" +
            $"ssl=true;" +
            $"sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
            $"sslTargetNameOverride=node1.mapr.com";
        var connection = ConnectionFactory.CreateConnection(connectionStr);

        // Get a store and assign it as a DocumentStore object
        var store = connection.GetStore("/demo_table");

        // Build an OJAI query
        var query = connection.NewQuery().Build();

        // Options for find request
        var options = new QueryOptions()
        {
            IncludeQueryPlan = true,
            Timeout = 1000
        };

        // Fetch all OJAI Documents from table
        var queryResult = store.Find(query, options);

        // Get query plan
        Console.WriteLine(queryResult.GetQueryPlan());

        var documentStream = await
        queryResult.GetDocumentAsyncStream().GetAllDocuments();
        // Print OJAI Documents from document stream
        foreach (var document in documentStream)
        {
            Console.WriteLine(document.ToDictionary());
        }

        // Close the OJAI connection
        connection.Close();
    }
}
```

Go - Example 1

The following example queries a document store and returns all documents by using the [DocumentStore.FindAll](#) function.

```
package main

import (
```

```

    "fmt"
    client "github.com/mapr/private-maprdb-go-client"
)

func main() {
    // Create connection string
    connectionString := "192.168.33.11:5678?" +
        "auth=basic;" +
        "user=mapr;" +
        "password=mapr;" +
        "ssl=true;" +
        "sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
        "sslTargetNameOverride=node1.cluster.com"

    storeName := "/demo_table"

    // Create a connection to DAG
    connection, err := client.MakeConnection(connectionString)
    if err != nil {
        panic(err)
    }

    // Get a store and assign it as a DocumentStore struct
    store, err := connection.GetStore(storeName)
    if err != nil {
        panic(err)
    }

    // Fetch all OJAI Documents from table
    findResult, err := store.FindAll(&client.FindOptions{IncludeQueryPlan:
false, ResultAsDocument: true})

    // Print OJAI Documents from document stream
    for _, doc := range findResult.DocumentList() {
        fmt.Println(doc)
    }

    // Close connection
    connection.Close()
}

```

Go - Example 2

The following example queries a document store and returns all documents. It creates a [Query](#) object and passes that to the [DocumentStore.FindQuery](#) function.

```

package main

import (
    "fmt"
    client "github.com/mapr/private-maprdb-go-client"
)

func main() {
    // Create connection string
    connectionString := "192.168.33.11:5678?" +
        "auth=basic;" +
        "user=mapr;" +
        "password=mapr;" +
        "ssl=true;" +
        "sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
        "sslTargetNameOverride=node1.cluster.com"

```

```

storeName := "/demo_table"

// Create a connection to DAG
connection, err := client.MakeConnection(connectionString)
if err != nil {
    panic(err)
}

// Get a store and assign it as a DocumentStore struct
store, err := connection.GetStore(storeName)
if err != nil {
    panic(err)
}

// Options for find request
options := &client.FindOptions{IncludeQueryPlan: true,
ResultAsDocument: true}

// Build an OJAI query
query, err := client.MakeQuery()
if err != nil {
    panic(err)
}

// Fetch all OJAI Documents from table
findResult, err := store.FindQuery(query, options)

// Get query plan
fmt.Println(findResult.QueryPlan())

// Print OJAI Documents from document stream
for _, doc := range findResult.DocumentList() {
    fmt.Println(doc)
}

// Close connection
connection.Close()
}

```

Paginating Your Result

An alternative to returning all documents from a store is to specify a limit in the query. Another alternative is to paginate the result using offset and limit. [Querying with Order By](#) on page 2931 contains an example that shows you how to use offset and limit. Although the example also uses order by, you can use offset and limit independent of order by.

Querying with Select

The examples in this section query a document store and retrieve specific fields from the documents.

Note: Selecting a specific field is also known as a *projection*. You can improve the performance of projection queries by using secondary indexes. See [Using Indexes to Optimize Projections in Queries](#) on page 543 for more details.

Java

The following example shows how to retrieve the `_id` and `address.zipCode` fields from all documents in a store using the [Query.select](#) method.

```

    });
    queryResult.on('end', () => {
      // close the OJAI connection
      connection.close();
    });
  });
}

```

Python

The following example shows how to retrieve the `_id` and `address.zipCode` fields from all documents in a store using an OJAI query.

```
from mapr.ojai.storage.ConnectionFactory import ConnectionFactory

# Create a connection to data access server
connection_str = "localhost:5678?auth=basic;user=mapr;password=mapr;" \
    "ssl=true;" \
    "sslCA=/opt/mapr/conf/ssl_truststore.pem;" \
    "sslTargetNameOverride=nodel.mapr.com"
connection = ConnectionFactory.get_connection(connection_str=connection_str)

# Get a store and assign it as a DocumentStore object
store = connection.get_store('/demo_table')

# Create an OJAI query
query = {"$select": ["_id", "address.zipCode"]}

# options for find request
options = {
    'ojai.mapr.query.result-as-document': True
}

# fetch OJAI Documents by query
query_result = store.find(query, options=options)

# Print OJAI Documents from document stream
for doc in query_result:
    print(doc.as_dictionary())

# close the OJAI connection
connection.close()
```

dbshell

The following two dbshell commands are equivalent to the code examples. See [dbshell find or findbyid](#) on page 5492 for more details about the syntax dbshell provides.

```
# mapr dbshell
maprdb root:> find /demo_table --query {"$select":["_id","address.zipcode"]}

maprdb root:> find /demo_table --fields _id,address.zipcode
```

C#

The following example shows how to retrieve the `_id` and `address.zipCode` fields from all documents in a store using an OJAI query.

```
using System;
using MapRDB.Driver;
using MapRDB.Driver.Ojai;

public class FindQueryWithSelect
{
    public async void FindQueryWithSelect()
    {
        // Create a connection to data access server
        var connectionStr = $"localhost:5678?auth=basic;" +
            $"user=mapr;" +
```

```

        $"password=mapr;" +
        $"ssl=true;" +
        $"sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
        $"sslTargetNameOverride=nodel.mapr.com";
var connection = ConnectionFactory.CreateConnection(connectionStr);

// Get a store and assign it as a DocumentStore object
var store = connection.GetStore("/demo_table");

//Create an OJAI query
var query = connection.NewQuery().Select("_id",
"address.zipCode").Build();

// Options for find request
var options = new QueryOptions(1000, true);

// Fetch OJAI Documents by query
var queryResult = store.Find(query, options);

var documentStream = await
queryResult.GetDocumentAsyncStream().GetAllDocuments();
// Print OJAI Documents from document stream
foreach (var document in documentStream)
{
    Console.WriteLine(document.ToDictionary());
}

// Close the OJAI connection
connection.Close();
    }
}

```

Go

The following example shows how to retrieve the `_id` and `address.zipCode` fields from all documents in a store using an OJAI query.

```

package main

import (
    "fmt"
    client "github.com/mapr/private-maprdb-go-client"
)

func main() {
    // Create connection string
    connectionString := "192.168.33.11:5678?" +
        "auth=basic;" +
        "user=mapr;" +
        "password=mapr;" +
        "ssl=true;" +
        "sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
        "sslTargetNameOverride=nodel.cluster.com"

    storeName := "/demo_table"

    // Create a connection to DAG
    connection, err := client.MakeConnection(connectionString)
    if err != nil {
        panic(err)
    }
}

```

```

// Get a store and assign it as a DocumentStore struct
store, err := connection.GetStore(storeName)
if err != nil {
    panic(err)
}

// Options for find request
options := &client.FindOptions{ResultAsDocument: true}

// Create an OJAI query
query := map[string]interface{}{"$select": []interface{}{"_id",
"address.zipCode"}}

// Fetch all OJAI Documents from table
findResult, err := store.FindQueryMap(query, options)

// Print OJAI Documents from document stream
for _, doc := range findResult.DocumentList() {
    fmt.Println(doc)
}

// Close connection
connection.Close()
}

```

Querying with Conditions

The examples in this section query a document store and return documents that have specific conditions.

For more information about how to specify query conditions in OJAI, see [Query Conditions in OJAI Applications](#) on page 2866.

Note: You can improve the performance of queries with conditions by using secondary indexes. See [Queries that Benefit from Secondary Indexes](#) on page 532 for more details.

Java - OJAI QueryCondition Object

The following example shows how to return all documents from a store where `address.zipCode` equals 95196, using the [Query.where](#) method. It uses an OJAI [QueryCondition](#) to specify the condition.

```

/**
 * Copyright (c) 2017 MapR, Inc.
 *
 * Licensed under the Apache License, Version 2.0 (the "License"); you may
 * not use this file except in compliance with
 * the License. You may obtain a copy of the License at

 */
package com.mapr.ojai.examples;

import org.ojai.Document;
import org.ojai.DocumentStream;
import org.ojai.store.Connection;
import org.ojai.store.DocumentStore;
import org.ojai.store.DriverManager;

```

```

import org.ojai.store.Query;
import org.ojai.store.QueryCondition.Op;

public class OJAI_007_FindQueryWithCondition {

    public static void main(final String[] args) {

        System.out.println("==== Start Application ===");

        // Create an OJAI connection to MapR cluster
        final Connection connection = DriverManager.getConnection("ojai:mapr:");

        // Get an instance of OJAI DocumentStore
        final DocumentStore store = connection.getStore("/demo_table");

        // Build an OJAI query with QueryCondition
        final Query query = connection.newQuery()
            .where(
                connection.newCondition()
                    .is("address.zipCode", Op.EQUAL, 95196) // Build an OJAI
QueryCondition
                    .build() //
                .build());

        // fetch all OJAI Documents from this store
        final DocumentStream stream = store.find(query);

        for (final Document userDocument : stream) {
            // Print the OJAI Document
            System.out.println(userDocument.asJsonString());
        }

        // Close this instance of OJAI DocumentStore
        store.close();

        // close the OJAI connection and release any resources held by the
connection
        connection.close();

        System.out.println("==== End Application ===");
    }
}

```

Java - OJAI Query Condition in JSON Format

The following example shows how to return all documents from a store where `address.zipCode` equals 95196, using the [Query.where](#) method. It specifies the query condition using a JSON string.

```

/**
 * Copyright (c) 2017 MapR, Inc.
 *

*/

const { ConnectionManager } = require('node-maprdb');

const connectionString = 'localhost:5678?' +
  'auth=basic;' +
  'user=mapr;' +
  'password=mapr;' +
  'ssl=true;' +
  'sslCA=/opt/mapr/conf/ssl_truststore.pem;' +
  'sslTargetNameOverride=nodel.mapr.com';

let connection;

// Create a connection to data access server
ConnectionManager.getConnection(connectionString)
  .then((conn) => {
    connection = conn;
    // Get a store
    return connection.getStore('/demo_table');
  })
  .then((store) => {
    // Create an OJAI query
    const query = {"$where": {"$eq": { 'address.zipCode': 95196 }}};
    // fetch OJAI Documents by query
    return store.find(query);
  })
  .then((queryResult) => {
    queryResult.on('data', (document) => {
      // Print OJAI Documents from document stream
      console.log(document);
    });
    queryResult.on('end', () => {
      // close the OJAI connection
      connection.close();
    });
  });
});

```

Python - OJAI QueryCondition Object

The following example shows how to return all documents from a store where `address.zipCode` equals 95196, using the [Query.where](#) method. It uses an OJAI [QueryCondition](#) to specify the condition.

```

from mapr.ojai.ojai_query.QueryOp import QueryOp
from mapr.ojai.storage.ConnectionFactory import ConnectionFactory

# Create a connection to data access server
connection_str = "localhost:5678?auth=basic;user=mapr;password=mapr;" \
  "ssl=true;" \
  "sslCA=/opt/mapr/conf/ssl_truststore.pem;" \
  "sslTargetNameOverride=nodel.mapr.com"
connection = ConnectionFactory.get_connection(connection_str=connection_str)

# Get a store and assign it as a DocumentStore object
store = connection.get_store('/demo_table')

```

```

# Create an OJAI query
query = connection.new_query()\
    .where(connection.new_condition()\
        .is_('address.zipCode', QueryOp.EQUAL, 95196)\
        .close()\
        .build())\
    .build()

# fetch the OJAI Documents by query
query_result = store.find(query)

# Print OJAI Documents from document stream
for doc in query_result:
    print(doc)

# close the OJAI connection
connection.close()

```

Python - OJAI Query Condition in JSON Format

The following example uses an OJAI query condition specified in JSON format to return all documents from a store where `address.zipCode` equals 95196.

```

from mapr.ojai.storage.ConnectionFactory import ConnectionFactory

# Create a connection to data access server
connection_str = "localhost:5678?auth=basic;user=mapr;password=mapr;" \
    "ssl=true;" \
    "sslCA=/opt/mapr/conf/ssl_truststore.pem;" \
    "sslTargetNameOverride=node1.mapr.com"
connection = ConnectionFactory.get_connection(connection_str=connection_str)

# Get a store and assign it as a DocumentStore object
store = connection.get_store('/demo_table')

# Create an OJAI query
query = {"$where": {"$eq": {"address.zipCode": 95196}}}

# options for find request
options = {
    'ojai.mapr.query.result-as-document': True
}

# fetch OJAI Documents by query
query_result = store.find(query, options=options)

# Print OJAI Documents from document stream
for doc in query_result:
    print(doc.as_dictionary())

# close the OJAI connection
connection.close()

```

dbshell

The following two dbshell commands are equivalent to the code examples. See [dbshell find or findbyid](#) on page 5492 for more details about the syntax dbshell provides.

```

# mapr dbshell
maprdb root:> find /demo_table --q {"$where":{"$eq":{"address.zipCode":95196}}}

```

```
maprdb root:> find /demo_table --where {"$eq":
{"address.zipCode":95196}}
```

C# - OJAI QueryCondition Object

The following example shows how to return all documents from a store where `address.zipCode` equals 95196, using the `Query.Where` method. It uses an OJAI `QueryCondition` to specify the condition.

```
using System;
using MapRDB.Driver;
using MapRDB.Driver.Ojai;

public class FindQueryWithCondition
{
    public async void FindQueryWithCondition()
    {
        // Create a connection to data access server
        var connectionStr = $"localhost:5678?auth=basic;" +
            $"user=mapr;" +
            $"password=mapr;" +
            $"ssl=true;" +
            $"sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
            $"sslTargetNameOverride=node1.mapr.com";
        var connection = ConnectionFactory.CreateConnection(connectionStr);

        // Get a store and assign it as a DocumentStore object
        var store = connection.GetStore("/demo_table");

        //Create an OJAI query
        var query = connection
            .NewQuery()
            .Where(connection
                .NewQueryCondition()
                .Is("address.zipCode", QueryOp.EQUAL, 95196)
                .Close()
                .Build())
            .Build();

        // Fetch the OJAI Documents by query
        var queryResult = store.Find(query);

        var documentStream = await
        queryResult.GetDocumentAsyncStream().GetAllDocuments();
        // Print OJAI Documents from document stream
        foreach (var document in documentStream)
        {
            Console.WriteLine(document);
        }

        // Close the OJAI connection
        connection.Close();
    }
}
```

C# - OJAI Query Condition in JSON Format

The following example uses an OJAI query condition specified in JSON format to return all documents from a store where `address.zipCode` equals 95196.

```
using System;
using MapRDB.Driver;
using MapRDB.Driver.Ojai;

public class FindQueryWithConditionJson
{
    public async void FindQueryWithConditionJson()
    {
        // Create a connection to data access server
        var connectionStr = $"localhost:5678?auth=basic;" +
            $"user=mapr;" +
            $"password=mapr;" +
            $"ssl=true;" +
            $"sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
            $"sslTargetNameOverride=nodel.mapr.com";
        var connection = ConnectionFactory.CreateConnection(connectionStr);

        // Get a store and assign it as a DocumentStore object
        var store = connection.GetStore("/demo_table");

        // Create an OJAI query
        var query =
            @"{" +
                @"{"$where": " +
                    @"{" +
                        @"{"$eq": {"address.zipCode":
{"$numberLong": "95196"}}}"}" +
                    @"}" +
                @"}";

        // Fetch OJAI Documents by query
        var queryResult = store.FindQuery(query);

        var documentStream = await queryResult.GetAllDocuments();
        // Print OJAI Documents from document stream
        foreach (var document in documentStream)
        {
            Console.WriteLine(document.ToDictionary());
        }

        // Close the OJAI connection
        connection.Close();
    }
}
```

Go - OJAI QueryCondition Object

The following example shows how to return all documents from a store where `address.zipCode` equals 95196, using the [Query.WhereCondition](#) function. It uses an OJAI [Condition](#) to specify the condition.

```
package main

import (
    "fmt"
    client "github.com/mapr/private-maprdb-go-client"
)
```

```

func main() {
    // Create connection string
    connectionString := "192.168.33.11:5678?" +
        "auth=basic;" +
        "user=mapr;" +
        "password=mapr;" +
        "ssl=true;" +
        "sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
        "sslTargetNameOverride=node1.cluster.com"

    storeName := "/demo_table"

    // Create a connection to DAG
    connection, err := client.MakeConnection(connectionString)
    if err != nil {
        panic(err)
    }

    // Get a store and assign it as a DocumentStore struct
    store, err := connection.GetStore(storeName)
    if err != nil {
        panic(err)
    }

    // Options for find request
    options := &client.FindOptions{ResultAsDocument: true}

    // Create a condition
    condition, err := client.MakeCondition(client.Is("address.zipCode",
client.EQUAL, 95196), client.Close())
    if err != nil {
        panic(err)
    }
    condition.Build()

    // Create an OJAI query
    query, err := client.MakeQuery(client.WhereCondition(condition))
    if err != nil {
        panic(err)
    }
    query.Build()

    // Fetch all OJAI Documents from table
    findResult, err := store.FindQuery(query, options)

    // Print OJAI Documents from document stream
    for _, doc := range findResult.DocumentList() {
        fmt.Println(doc)
    }

    // Close connection
    connection.Close()
}

```

Go - OJAI Query Condition in JSON Format

The following example uses an OJAI query condition specified in JSON format to return all documents from a store where `address.zipCode` equals 95196.

```

package main

import (

```

```

    "fmt"
    client "github.com/mapr/private-maprdb-go-client"
)

func main() {
    // Create connection string
    connectionString := "192.168.33.11:5678?" +
        "auth=basic;" +
        "user=mapr;" +
        "password=mapr;" +
        "ssl=true;" +
        "sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
        "sslTargetNameOverride=node1.cluster.com"

    storeName := "/demo_table"

    // Create a connection to DAG
    connection, err := client.MakeConnection(connectionString)
    if err != nil {
        panic(err)
    }

    // Get a store and assign it as a DocumentStore struct
    store, err := connection.GetStore(storeName)
    if err != nil {
        panic(err)
    }

    // Options for find request
    options := &client.FindOptions{ResultAsDocument: true}

    // Create an OJAI query
    query := map[string]interface{}{
        "$where": map[string]interface{}{
            "$eq": map[string]interface{}{
                "address.zipCode": 95196
            }
        }
    }

    // Fetch all OJAI Documents from table
    findResult, err := store.FindQueryMap(query, options)

    // Print OJAI Documents from document stream
    for _, doc := range findResult.DocumentList() {
        fmt.Println(doc)
    }

    // Close connection
    connection.Close()
}

```

Querying with Select and Conditions

The examples in this section query a document store and return specific fields from documents that have specific conditions.

For more information about how to specify query conditions in OJAI, see [Query Conditions in OJAI Applications](#) on page 2866.

Note: You can improve the performance of queries with conditions by using secondary indexes. See [Queries that Benefit from Secondary Indexes](#) on page 532 for more details.

Java

The following example shows how to return the name, address.zipCode, age, and phoneNumber fields from documents that have address.zipCode equal to 95196. It uses the [Query.select](#) and [Query.where](#) methods, specifying the query condition as a JSON string.

```

 */

const { ConnectionManager } = require('node-maprdb');

const connectionString = 'localhost:5678?' +
  'auth=basic;' +
  'user=mapr;' +
  'password=mapr;' +
  'ssl=true;' +
  'sslCA=/opt/mapr/conf/ssl_truststore.pem;' +
  'sslTargetNameOverride=nodel.mapr.com';

let connection;

// Create a connection to data access server
ConnectionManager.getConnection(connectionString)
  .then((conn) => {
    connection = conn;
    // Get a store
    return connection.getStore('/demo_table');
  })
  .then((store) => {
    // Create an OJAI query
    const query = {"$select": ["name",
      "adress.zipCode",
      "age",
      "phoneNumbers[0]"],
      "$where": {"$eq": {"address.zipCode": 95196}}};
    // fetch OJAI Documents by query
    return store.find(query);
  })
  .then((queryResult) => {
    queryResult.on('data', (document) => {
      // Print OJAI Documents from document stream
      console.log(document);
    });
  });

```

```

    queryResult.on('end', () => {
      // close the OJAI connection
      connection.close();
    });
  });
};

```

Python

The following example shows how to return the name, address.zipCode, age, and phoneNumber fields from documents that have address.zipCode equal to 95196. It uses an OJAI query and condition.

```

from mapr.ojai.storage.ConnectionFactory import ConnectionFactory

# Create a connection to data access server
connection_str = "localhost:5678?auth=basic;user=mapr;password=mapr;" \
    "ssl=true;" \
    "sslCA=/opt/mapr/conf/ssl_truststore.pem;" \
    "sslTargetNameOverride=nodel.mapr.com"
connection = ConnectionFactory.get_connection(connection_str=connection_str)

# Get a store and assign it as a DocumentStore object
store = connection.get_store('/demo_table')

# Create an OJAI query
query = {"$select": ["name",
                    "adress.zipCode",
                    "age",
                    "phoneNumbers[0]"],
        "$where": {"$eq": {"address.zipCode": 95196}}}

# options for find request
options = {
    'ojai.mapr.query.result-as-document': True
}

# fetch OJAI Documents by query
query_result = store.find(query,
                          options=options)

# Print OJAI Documents from document stream
for doc in query_result:
    print(doc.as_dictionary())

# close the OJAI connection
connection.close()

```

dbshell

The following two dbshell commands are equivalent to the code examples. See [dbshell find or findbyid](#) on page 5492 for more details about the syntax dbshell provides.

```

find /demo_table --query {
  "$select":["name","address.zipCode","age","phoneNumber[0]"],
  "$where":{"$eq":{"address.zipCode":95196}}
}

find /demo_table
--fields name,address.zipCode,age,phoneNumber[0]
--where {"$eq":{"address.zipCode":95196}}

```

Note: The commands are shown split across multiple lines for readability. When using dbshell, you must enter them in a single line.

C#

The following example shows how to return the name, address.zipCode, age, and phoneNumber fields from documents that have address.zipCode equal to 95196. It uses an OJAI query and condition.

```
using System;
using MapRDB.Driver;
using MapRDB.Driver.Ojai;

public class FindQueryWithSelectAndCondition
{
    public async void FindQueryWithSelectAndCondition()
    {
        // Create a connection to data access server
        var connectionStr = $"localhost:5678?auth=basic;" +
            $"user=mapr;" +
            $"password=mapr;" +
            $"ssl=true;" +
            $"sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
            $"sslTargetNameOverride=nodel.mapr.com";
        var connection = ConnectionFactory.CreateConnection(connectionStr);

        // Get a store and assign it as a DocumentStore object
        var store = connection.GetStore("/demo_table");

        // Create an OJAI condition
        var condition = connection
            .NewQueryCondition()
            .Is("address.zipCode", QueryOp.EQUAL, 95196)
            .Close()
            .Build();

        // Create an OJAI query
        var query = connection
            .NewQuery()
            .Select("name", "adress.zipCode", "age", "phoneNumbers[0]")
            .Where(condition)
            .Build();

        // Fetch OJAI Documents by query
        var queryResult = store.Find(query);

        var documentStream = await
queryResult.GetDocumentAsyncStream().GetAllDocuments();
        // Print OJAI Documents from document stream
        foreach (var document in documentStream)
        {
            Console.WriteLine(document.ToJsonString());
        }

        // Close the OJAI connection
        connection.Close();
    }
}
```

Go

The following example shows how to return the name, address.zipCode, age, and phoneNumber fields from documents that have address.zipCode equal to 95196. It uses an OJAI query and condition.

```
package main

import (
    "fmt"
    client "github.com/mapr/private-maprdb-go-client"
)

func main() {
    // Create connection string
    connectionString := "192.168.33.11:5678?" +
        "auth=basic;" +
        "user=mapr;" +
        "password=mapr;" +
        "ssl=true;" +
        "sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
        "sslTargetNameOverride=nodel.cluster.com"

    storeName := "/demo_table"

    // Create a connection to DAG
    connection, err := client.MakeConnection(connectionString)
    if err != nil {
        panic(err)
    }

    // Get a store and assign it as a DocumentStore struct
    store, err := connection.GetStore(storeName)
    if err != nil {
        panic(err)
    }

    // Options for find request
    options := &client.FindOptions{ResultAsDocument: true}

    // Create an OJAI query
    query := map[string]interface{}{"$select": []interface{}{"firstName",
"address.zipCode", "age", "phoneNumbers[0]"},
"$where": map[string]interface{}{
"$eq": map[string]interface{}{"address.zipCode": 95196}}}

    // Fetch all OJAI Documents from table
    findResult, err := store.FindQueryMap(query, options)

    // Print OJAI Documents from document stream
    for _, doc := range findResult.DocumentList() {
        fmt.Println(doc)
    }

    // Close connection
    connection.Close()
}
```

Querying with Order By

The examples in this section query a document store and return specific fields from the documents, sorted in a specific order. One of the examples also uses offset and limit.

 **Note:** You can improve the performance of order by queries by using secondary indexes. See [Using Indexes to Optimize ORDER BY Queries](#) on page 540 for more information.

Java - Order By

The following example shows how to return the `_id`, `firstName`, `lastName`, and `address.zipCode` fields from documents in a store, sorting the documents by `_id`. It uses the [Query.select](#) and [Query.orderBy](#) methods.

 **Note:** The example sorts in the default ascending order. To sort in descending order, modify the `orderBy` method call as follows:

```
orderBy("_id", SortOrder.DESC)
```

```

connection
connection.close();

System.out.println("==== End Application ===");
}
}

```

Node.js - Order By

The following example uses an OJAI query to return the `_id` and `name` fields from documents in a store and to sort the documents by `_id`.

Note: The example sorts in the default ascending order. To sort in descending order, modify the `orderby` specification as follows:

```
order_by('_id', desc)
```

```

 */

const { ConnectionManager } = require('node-maprdb');

```

```

const connectionString = 'localhost:5678?' +
  'auth=basic;' +
  'user=mapr;' +
  'password=mapr;' +
  'ssl=true;' +
  'sslCA=/opt/mapr/conf/ssl_truststore.pem;' +
  'sslTargetNameOverride=node1.mapr.com';

let connection;

// Create a connection to data access server
ConnectionManager.getConnection(connectionString)
  .then((conn) => {
    connection = conn;
    // Get a store
    return connection.getStore('/demo_table');
  })
  .then((store) => {
    // Create an OJAI query
    const query = {"$select": ["_id", "name"], "$orderby": {"_id": "asc"}};
    // fetch OJAI Documents by query
    return store.find(query);
  })
  .then((queryResult) => {
    queryResult.on('data', (document) => {
      // Print OJAI Documents from document stream
      console.log(document);
    });
    queryResult.on('end', () => {
      // close the OJAI connection
      connection.close();
    });
  });
});

```

Node.js - Order By with Offset and Limit

The following example uses an OJAI query to return the `_id`, `firstName`, `lastName`, and `address.zipCode` fields from documents in a store, sort the documents by `_id`, offset the result by two documents, and limit the result to a single document.

Note: The example sorts in the default ascending order. To sort in descending order, modify the `orderby` specification as follows:

```
"$orderby": {"_id": "desc"}
```

```

/*
 * Copyright (c) 2018 MapR, Inc.
 *
 * Licensed under the Apache License, Version 2.0 (the "License");
 * you may not use this file except in compliance with the License.

 * See the License for the specific language governing permissions and
 * limitations under the License.
 */

```

```

const { ConnectionManager } = require('node-maprdb');

const connectionString = 'localhost:5678?' +
  'auth=basic;' +
  'user=mapr;' +
  'password=mapr;' +
  'ssl=true;' +
  'sslCA=/opt/mapr/conf/ssl_truststore.pem;' +
  'sslTargetNameOverride=nodel.mapr.com';

let connection;

// Create a connection to data access server
ConnectionManager.getConnection(connectionString)
  .then((conn) => {
    connection = conn;
    // Get a store
    return connection.getStore('/demo_table');
  })
  .then((store) => {
    // Create an OJAI query
    const query = { "$offset": 2,
      "$select": [ "_id",
        "firstName",
        "lastName",
        "address.zipCode" ],
      "$limit": 1,
      "$orderby": { "_id": "asc" } };
    // fetch OJAI Documents by query
    return store.find(query);
  })
  .then((queryResult) => {
    queryResult.on('data', (document) => {
      // Print OJAI Documents from document stream
      console.log(document);
    });
    queryResult.on('end', () => {
      // close the OJAI connection
      connection.close();
    });
  });
}

```

Python - Order By

The following example uses an OJAI query to return the `_id` and name fields from documents in a store and to sort the documents by `_id`.

Note: The example sorts in the default ascending order. To sort in descending order, modify the `orderby` specification as follows:

```
"$orderby": { "_id": "desc" }
```

```

from mapr.ojai.storage.ConnectionFactory import ConnectionFactory

# Create a connection to data access server
connection_str = "localhost:5678?auth=basic;user=mapr;password=mapr;" \
  "ssl=true;" \
  "sslCA=/opt/mapr/conf/ssl_truststore.pem;" \
  "sslTargetNameOverride=nodel.mapr.com"
connection = ConnectionFactory.get_connection(connection_str=connection_str)

```

```
# Get a store and assign it as a DocumentStore object
store = connection.get_store('/demo_table')

# Create an OJAI query
query = {"$select": ["_id", "name"], "$orderby": {"_id": "asc"}}

# fetch OJAI Documents by query
query_result = store.find(query)

# Print OJAI Documents from document stream
for doc in query_result:
    print(doc)

# close the OJAI connection
connection.close()
```

Python - Order By with Offset and Limit

The following example uses an OJAI query to return the `_id`, `firstName`, `lastName`, and `address.zipCode` fields from documents in a store, sort the documents by `_id`, offset the result by two documents, and limit the result to a single document.

Note: The example sorts in the default ascending order. To sort in descending order, modify the `orderby` method call as follows:

```
order_by('_id', desc)
```

```
from mapr.ojai.storage.ConnectionFactory import ConnectionFactory

# Create a connection to data access server
connection_str = "localhost:5678?auth=basic;user=mapr;password=mapr;" \
    "\ssl=true;" \
    "\sslCA=/opt/mapr/conf/ssl_truststore.pem;" \
    "\sslTargetNameOverride=nodel.mapr.com"
connection = ConnectionFactory.get_connection(connection_str=connection_str)

# Get a store and assign it as a DocumentStore object
store = connection.get_store('/demo_table')

# Create an OJAI query
query = {"$offset": 2,
        "$select": ["_id",
                    "firstName",
                    "lastName",
                    "address.zipCode"],
        "$limit": 1,
        "$orderby": {"_id": "asc"}}

# options for find request
options = {
    'ojai.mapr.query.result-as-document': True
}

# fetch OJAI Documents by query
query_result = store.find(query, options=options)

# Print OJAI Documents from document stream
for doc in query_result:
    print(doc.as_dictionary())
```

```
# close the OJAI connection
connection.close()
```

dbshell

The following dbshell commands are equivalent to the code examples. See [dbshell find or findbyid](#) on page 5492 for more details about the syntax dbshell provides.

```
find /demo_table --query {
  "$select":["_id","firstName","lastName","address.zipCode"],
  "$orderby":"_id"
}

find /demo_table
  --fields _id,firstName,lastName,address.zipCode
  --orderby _id

find /demo_table --query {
  "$select":["_id","firstName","lastName","address.zipCode"],
  "$orderby":"_id",
  "$offset":2,
  "$limit":1
}

find /demo_table
  --fields _id,firstName,lastName,address.zipCode
  --orderby _id
  --offset 2
  --limit 1
```

Note: The commands are shown split across multiple lines for readability. When using dbshell, you must enter them in a single line.

C# - Order By

The following example uses an OJAI query to return the `_id` and `name` fields from documents in a store and to sort the documents by `_id`.

Note: The example sorts in the default ascending order. To sort in descending order, modify the `OrderBy` specification as follows:

```
.OrderBy("_id", SortOrder.DESC)
```

```
using System;
using MapRDB.Driver;
using MapRDB.Driver.Ojai;

public class FindQueryWithOrderBy
{
    public async void FindQueryWithOrderBy()
    {
        // Create a connection to data access server
        var connectionStr = $"localhost:5678?auth=basic;" +
            $"user=mapr;" +
            $"password=mapr;" +
            $"ssl=true;" +
            $"sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
            $"sslTargetNameOverride=nodel.mapr.com";
        var connection = ConnectionFactory.CreateConnection(connectionStr);
```

```

// Get a store and assign it as a DocumentStore object
var store = connection.GetStore("/demo_table");

// Create an OJAI query
var query = connection
    .NewQuery()
    .Select("_id", "name")
    .OrderBy("_id", SortOrder.ASC)
    .Build();

// Fetch OJAI Documents by query
var queryResult = store.Find(query);

var documentStream = await
queryResult.GetDocumentAsyncStream().GetAllDocuments();
// Print OJAI Documents from document stream
foreach (var document in documentStream)
{
    Console.WriteLine(document);
}

// Close the OJAI connection
connection.Close();
}
}

```

C# - Order By with Offset and Limit

The following example uses an OJAI query to return the `_id`, `firstName`, `lastName`, and `address.zipCode` fields from documents in a store, sort the documents by `_id`, offset the result by two documents, and limit the result to a single document.

Note: The example sorts in the default ascending order. To sort in descending order, modify the `OrderBy` method call as follows:

```
.OrderBy("_id", SortOrder.DESC)
```

```

using System;
using MapRDB.Driver;
using MapRDB.Driver.Ojai;

public class FindQueryWithOrderByLimitOffset
{
    public async void FindQueryWithOrderByLimitOffset()
    {
        // Create a connection to data access server
        var connectionStr = $"localhost:5678?auth=basic;" +
            $"user=mapr;" +
            $"password=mapr;" +
            $"ssl=true;" +
            $"sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
            $"sslTargetNameOverride=nodel.mapr.com";
        var connection = ConnectionFactory.CreateConnection(connectionStr);

        // Get a store and assign it as a DocumentStore object
        var store = connection.GetStore("/demo_table");

        // Create an OJAI query
        var query = connection
            .NewQuery()

```

```

        .Select("_id", "firstName", "lastName", "address.zipCode")
        .Offset(2)
        .Limit(1)
        .OrderBy("_id", SortOrder.ASC)
        .Build();

    // Fetch OJAI Documents by query
    var queryResult = store.Find(query);

    var documentStream = await
queryResult.GetDocumentAsyncStream().GetAllDocuments();
    // Print OJAI Documents from document stream
    foreach (var document in documentStream)
    {
        Console.WriteLine(document.ToJsonString());
    }

    // Close the OJAI connection
    connection.Close();
}
}

```

Go - Order By

The following example uses an OJAI query to return the `_id` and `firstName` fields from documents in a store and to sort the documents by `_id`.

The example sorts in the default ascending order. To sort in descending order, modify the `orderby` specification as follows:

```
"$orderby": map[string]interface{}{"_id": "desc"}}
```

```

package main

import (
    "fmt"
    client "github.com/mapr/private-maprdb-go-client"
)

func main() {
    // Create connection string
    connectionString := "192.168.33.11:5678?" +
        "auth=basic;" +
        "user=mapr;" +
        "password=mapr;" +
        "ssl=true;" +
        "sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
        "sslTargetNameOverride=node1.cluster.com"

    storeName := "/demo_table"

    // Create a connection to DAG
    connection, err := client.MakeConnection(connectionString)
    if err != nil {
        panic(err)
    }

    // Get a store and assign it as a DocumentStore struct
    store, err := connection.GetStore(storeName)
    if err != nil {
        panic(err)
    }
}

```

```

// Options for find request
options := &client.FindOptions{ResultAsDocument: true}

// Create an OJAI query
query := map[string]interface{}{"$select": []interface{}{"_id",
"firstName"},
"$orderby": map[string]interface{}{"_id": "asc"}}

// Fetch all OJAI Documents from table
findResult, err := store.FindQueryMap(query, options)

// Print OJAI Documents from document stream
for _, doc := range findResult.DocumentList() {
    fmt.Println(doc)
}

// Close connection
connection.Close()
}

```

Go - Order By with Offset and Limit

The following example uses an OJAI query to return the `_id`, `firstName`, `lastName`, and `address.zipCode` fields from documents in a store, sort the documents by `_id`, offset the result by two documents, and limit the result to a single document.

The example sorts in the default ascending order. To sort in descending order, modify the `orderby` function call as follows:

```
"$orderby": map[string]interface{}{"_id": "desc"}}
```

```

package main

import (
    "fmt"
    client "github.com/mapr/private-maprdb-go-client"
)

func main() {
    // Create connection string
    connectionString := "192.168.33.11:5678?" +
        "auth=basic;" +
        "user=mapr;" +
        "password=mapr;" +
        "ssl=true;" +
        "sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
        "sslTargetNameOverride=node1.cluster.com"

    storeName := "/demo_table"

    // Create a connection to DAG
    connection, err := client.MakeConnection(connectionString)
    if err != nil {
        panic(err)
    }

    // Get a store and assign it as a DocumentStore struct
    store, err := connection.GetStore(storeName)
    if err != nil {
        panic(err)
    }
}

```

```

// Options for find request
options := &client.FindOptions{ResultAsDocument: true}

// Create an OJAI query
query := map[string]interface{}{"$select": []interface{}{"_id",
"firstName", "lastName", "address.zipCode"},
"$offset": 2,
"$limit": 1,
"$orderby": map[string]interface{}{"_id": "asc"}}

// Fetch all OJAI Documents from table
findResult, err := store.FindQueryMap(query, options)

// Print OJAI Documents from document stream
for _, doc := range findResult.DocumentList() {
    fmt.Println(doc)
}

// Close connection
connection.Close()
}

```

Using the Java OJAI Client

This topic describes HPE Ezmeral Data Fabric Database functionality that is applicable to only the Java OJAI client. This includes instructions on how to compile your Java OJAI application, enable buffered writes, use the read your own writes feature, and enable available query options.

Additional Resources

Examples: <https://github.com/mapr-demos/ojai-examples/tree/master/java/src/main/java/com/mapr/ojai/examples>

Compiling and Running Java OJAI Applications

For applications that use the Java OJAI API, use Maven to compile and determine the application's dependencies. Then, when you run the application, specify those dependencies in the application's classpath.

Compile and Determine Dependencies

Use Maven to compile and determine the application dependencies.

1. Add MapR's Maven repository to your `pom.xml` file, if it is not already added:

```

<repositories>
  <repository>
    <id>mapr-releases</id>
    <url>https://repository.mapr.com/nexus/content/repositories/
releases</url>
    <snapshots><enabled>true</enabled></snapshots>
    <releases><enabled>true</enabled></releases>
  </repository>
</repositories>

```

2. Add a dependency to the MapR OJAI driver project:

```
<dependencies>
  <dependency>
    <groupId>com.mapr.ojai</groupId>
    <artifactId>mapr-ojai-driver</artifactId>
    <version>6.0.0-mapr</version>
  </dependency>
</dependencies>
```

Note: Replace the `<version>` property with the HPE Ezmeral Data Fabric Database version that you are using.

3. Use Maven to compile the application and resolve dependencies.

Run the Application

When you develop a Java application, you can use a dependency management tool such as Maven to compile your application. However, it is recommended that do the following instead:

1. Compile the Java application without including dependencies
2. Specify the required classpath when you submit the application to the cluster

If you choose to bundle the JAR file, and there is a mismatch between the bundled JAR file and the version that your MapR cluster expects, this can result in failures. The failures differ depending on the version of MapR you are using. For more information, see [Using the File System JAR to Connect to the Cluster](#) on page 2649.

When the cluster is secure, the node must also have a MapR ticket configured for the user that runs the application.

You can use the following command to launch HPE Ezmeral Data Fabric Database JSON applications:

```
java -cp <classpath>:. -Djava.library.path=/opt/mapr/lib <main class JAR>
<command line arguments>
```

Enable OJAI Tracing

To help debug your Java OJAI application, you can enable OJAI tracing. MapR uses the `log4j` API to log tracing messages. To enable writing these messages to standard output, follow these steps:

1. Set the following property in your `/opt/mapr/conf/log4j.properties` file:

```
log4j.logger.com.mapr.ojai.store.impl=TRACE, stdout
```

2. Add the following to your `java` launch command:

- In your `java` classpath, add the library that includes custom MapR `log4j` classes:

```
-cp /opt/mapr/lib/central-logging-6.2.0-mapr.jar:<other classpaths>:.
```

- Define the location of the `log4j.properties` file:

```
-Dlog4j.configuration=file:/opt/mapr/conf/log4j.properties
```

Reading Your Own Writes in Java OJAI

The Java OJAI `DocumentStore` and `Query` APIs provide the ability to track writes to JSON tables. Use these APIs to ensure your application reads recent writes on JSON tables with secondary indexes.

Description

You should use this feature if it is important for your query results to reflect synchronized data between a JSON table and its secondary indexes. Because HPE Ezmeral Data Fabric Database updates secondary indexes asynchronously, it is possible for a JSON table and its secondary indexes to become out-of-sync while the index update is in progress.

For example, consider the following scenario:

- Your application updates a JSON table.
- The JSON table includes an `address` field that is a nested document with a `zipCode` subfield.
- You have a secondary index on `zipCode`.
- Later in your application, you query the JSON table filtering on `zipCode`.

You want your query result to reflect the updates from earlier in your application. To achieve this, use the `DocumentStore` and `Query` APIs that enable you to retrieve up-to-date information from the index. The APIs synchronize write operations on the JSON table with read operations on a secondary index.

See [Asynchronous Secondary Index Updates](#) on page 550 for more information about index updates.

Note: The Python and Node.js OJAI APIs do not support this feature.

API Details

The OJAI `DocumentStore` and `Query` interfaces provide the following methods to support this functionality.

| | |
|--|---|
| <code>DocumentStore.beginTrackingWrites</code> | Begins tracking the write operations performed through this instance of <code>DocumentStore</code> . The method takes an optional <code>previousWritesContext</code> parameter. If you specify this parameter, the tracking uses that context as the base state. |
| <code>DocumentStore.endTrackingWrites</code> | Flushes any buffered writes operations for this <code>DocumentStore</code> and returns a <code>writesContext</code> . Use this context to ensure that writes are visible to later queries. You can use the context across <code>DocumentStore</code> objects in the same, as well as different, client processes, when the stores refer to the same JSON table. For example, you can pass the <code>writesContext</code> returned by one <code>DocumentStore</code> to a second <code>DocumentStore</code> , to begin write tracking on the second store. |
| <code>DocumentStore.clearTrackedWrites</code> | Stops the write tracking and clears any state on this <code>DocumentStore</code> instance. |
| <code>Query.waitForTrackedWrites</code> | Sets the <code>writesContext</code> parameter for this query. A <code>writesContext</code> allows this query to "see" all the writes that happened inside the <code>writesContext</code> of a <code>DocumentStore</code> . |

For the complete API, see [Java OJAI Client API](#).

Read Your Own Writes Example

A complete code example is available on github at [OJAI_013_ReadYourOwnWrite.java](#). The following are code snippets from that example. Each step contains links to corresponding lines of code in the github example:

1. Call [beginWriteTracking](#) to set the starting point for the commit context on the JSON table /demo_table:

```
// Create an OJAI connection to MapR cluster
final Connection connectionNode1 =
DriverManager.getConnection("ojai:mapr:");

// Get an instance of OJAI DocumentStore
final DocumentStore storeNode1 = connectionNode1.getStore("/demo_table");

// initiate tracking of commit-context
storeNode1.beginTrackingWrites();
```

2. [Update](#) the zipCode of an existing user and [insert](#) a new user in /demo_table:

```
// issue a set of mutations/insert/delete/etc
storeNode1.update("user0000",
connectionNode1.newMutation().set("address.zipCode", 95110L));
storeNode1.insertOrReplace(connectionNode1.newDocument(
    "{ \"_id\": \"user0004\", \"firstName\": \"Joel\",
    \"lastName\": \"Smith\", \"age\": 56, \"address\": { \"zipCode\":
    { \"$numberLong\": 95110 } } }" ));
```

3. Call [endWriteTracking](#) to flush the write operations after step 1, including updates to the secondary index:

```
final String commitContext = storeNode1.endTrackingWrites();
```

The call also returns a `commitContext`.

4. Issue a query that calls [waitForTrackedWrites](#) with the `commitContext` from step 3:

```

/*
 * Next section of the code can run on the same or on a different node,
 * the `commitContext` obtained earlier needs to be propagated to that
 * node.
 */

// Create an OJAI connection to MapR cluster
final Connection connectionNode2 =
  DriverManager.getConnection("ojai:mapr:");

// Get an instance of OJAI DocumentStore
final DocumentStore storeNode2 = connectionNode2.getStore("/demo_table");

// Build an OJAI query and set its commit context with timeout of 2
seconds
final Query query = connectionNode2.newQuery()
  .select("_id", "firstName", "lastName", "address.zipCode")
  .where("{\"$gt\": {\"address.zipCode\": 95110}}")
  .waitForTrackedWrites(commitContext)
  .build();

```

The query filters on the indexed subfield `address.zipCode`. The `commitContext` ensures that the query result includes the changes made in step 2.

Setting Query Options in Java OJAI

This topic describes how to set query options in your Java OJAI application.

See [OJAI Query Options](#) on page 2864 for a list of available query options.

To set an option, pass the option name as the first parameter to the [Query.setOption](#) method:

```
query.setOption("ojai.mapr.query.hint-using-index", indexName);
```

Enabling Buffered Writes in Java OJAI

By default, HPE Ezmeral Data Fabric Database JSON does not buffer writes. You can improve performance by enabling buffered writes in your Java OJAI application.

Description

The buffered writes option can be set in the [Connection.getStore](#) method. You pass the option setting through a `Document` object in the second parameter to the method. The `Document` object sets `ojai.mapr.documentstore.buffer-writes` to either `true` or `false`. The default value is `false`, which means that writes are not buffered.

Example Code Snippet

The following code sample enables buffered writes:

```

final DocumentStore store =
  connection.getStore(
    "/demo_table",

    connection.newDocument().set("ojai.mapr.documentstore.buffer-writes",
    true));

```

Using the Java OJAI Thin Client

Starting with EEP 6.3.0, you can use the Java OJAI Thin Client to write HPE Ezmeral Data Fabric Database JSON applications. The Java OJAI Thin Client provides a lightweight library that supports the

OJAI API. You can connect to HPE Ezmeral Data Fabric Database JSON, and add, update, and query documents in a HPE Ezmeral Data Fabric Database JSON table.

Java OJAI Thin Client Benefits

The client provides you with the following benefits:

- Easy installation and use
- Access to HPE Ezmeral Data Fabric Database JSON through the OJAI interface
- An OJAI interface that is tailored to Java developers
- Support for L3/L4 (transport level) and L7 (application level) proxy load balancing

Comparing the Java OJAI Client and the Java OJAI Thin Client

Note these considerations when deciding whether to use the Java OJAI Client or the Java OJAI Thin Client:

- Both the Java OJAI client and Java OJAI Thin Client use the same API ([Java OJAI Client API](#)).
- The Java OJAI client is more scalable, more performant, and more fault tolerant, but also more complicated to deploy. See [Using the Java OJAI Client](#) on page 2942.
- The Java OJAI Thin Client requires you to specify the service ([MapR Data Access Gateway](#)) to which you will connect.
- The Java OJAI Thin Client is a pure Java client, while the Java OJAI client requires a JNI library.

Installing the MapR Data Access Gateway

To use the Java OJAI Thin Client, you must install the [MapR Data Access Gateway](#) on your HPE Ezmeral Data Fabric cluster. The gateway serves as a proxy for translating requests between the Java OJAI Thin Client and the HPE Ezmeral Data Fabric cluster. To administer the gateway and configure load balancing, see [Administering the Data Access Gateway](#) on page 1669.

Java OJAI Thin Client Security

The client supports username/password authentication. The initial connection (and token renewal) use these credentials. Subsequent communication uses JWT.

When connecting to a secure cluster, the client uses:

- X.509 certificates to authenticate with the Data Access Gateway
- TLS v1.2 to encrypt communication between the client and the Data Access Gateway

Java OJAI Thin Client Connection String

The string you use to connect your OJAI client to a HPE Ezmeral Data Fabric cluster must have the following format:

```
"ojai:mapr:thin:@<hostname>[:<port>][?<option_name>=<option_value>;...]"
```

<hostname>

Name of the HPE Ezmeral Data Fabric Data Access Gateway host

<port>

Port number (see [Ports Used by HPE Ezmeral Data Fabric Software](#) on page 2579) that gRPC clients use to connect to the HPE Ezmeral Data Fabric Data Access Gateway

| | |
|---|---|
| | Default: 5678 |
| <code>auth=<scheme_name></code> | The authentication scheme for the current connection; currently, only <code>basic</code> |
| <code>user=<username></code> | The user name for <code>basic</code> authentication |
| <code>password=<password></code> | The password for <code>basic</code> authentication |
| <code>ssl=true false</code> | Whether to establish a secure connection using SSL/TLS An error is returned if there is a mismatch between your client and cluster security settings. The default for this option is <code>true</code> , which is the required setting if connecting to a secure HPE Ezmeral Data Fabric cluster. If connecting to a nonsecure HPE Ezmeral Data Fabric cluster, set it to <code>false</code> . If set to <code>false</code> , the other SSL parameters are ignored. |
| <code>sslCA=<path to PEM file containing CA certificate></code> | Path to a local file containing Certificate Authority (CA) signed certificates in PEM format. Must be set if the <code>ssl</code> option is <code>true</code> . |

Here is an example of a connection string:

```
"ojai:mapr:thin:@localhost:5678?
auth=basic;user=fred;password=george;sslCA=/opt/app/conf/rootca.pem"
```

Advanced Parameters

Advanced parameters such as `maxmsgsize` are optional for the Java OJAI Thin Client connection string:

| | |
|-------------------------|--|
| <code>maxmsgsize</code> | If you use thin-client version 1.0.2-mapr and later, <code>maxmsgsize</code> sets the maximum message size that the gRPC client accepts. The default is set to 32 MB, as this is the default maximum document size for HPE Ezmeral Data Fabric Database JSON tables. The value specified in the connection string should be less than or equal to the value set in the Data Access Gateway configuration on the server side (see Administering the Data Access Gateway on page 1669). |
|-------------------------|--|

Maven Coordinates

The Maven coordinates are:

```
<dependency>
  <groupId>com.mapr.ojai</groupId>
  <artifactId>mapr-ojai-driver-thin</artifactId>
  <version>1.0.2-mapr</version>
</dependency>
```

Additional Resources

The Java OJAI Client examples at the following location also apply to the Java OJAI Thin Client. Only the connection string and the Maven artifact name will be different for the thin client: <https://github.com/mapr-demos/ojai-examples/tree/master/java/src/main/java/com/mapr/ojai/examples>

Using the Node.js OJAI Client

Starting with EEP 6.0, you can use the Node.js OJAI client to write HPE Ezmeral Data Fabric Database JSON applications. The client provides you with a lightweight library that supports the OJAI API. You can connect to HPE Ezmeral Data Fabric Database JSON from middleware components, and add, update, and query documents in a HPE Ezmeral Data Fabric Database JSON table.

The client provides you with the following benefits:

- Easy installation and use
- Access to HPE Ezmeral Data Fabric Database JSON through the OJAI interface in Node.js
- An OJAI interface that is tailored to Node.js developers
- Support for Callback and Promise/Async Node.js asynchronous programming models
- Support for L3/L4 (transport level) and L7 (application level) proxy load balancing
- Use of JavaScript to manipulate HPE Ezmeral Data Fabric Database JSON documents

To use the Node.js OJAI client, you must install the [MapR Data Access Gateway](#) on your HPE Ezmeral Data Fabric cluster. The gateway serves as a proxy for translating requests between the Node.js client and the HPE Ezmeral Data Fabric cluster. The gateway also performs data processing to keep the client lightweight. See [Administering the Data Access Gateway](#) on page 1669 for information about how to administer the gateway and configure load balancing.

Important: HPE Ezmeral Data Fabric does not support running the Node.js OJAI client in a web browser.

Examples: <https://github.com/mapr-demos/ojai-examples/tree/master/nodejs>

Source Code: <https://github.com/mapr/maprdb-node-client>

Getting Started with the Node.js OJAI Client

This section describes the software required to run the Node.js OJAI client, client/server security, and how to specify your connection string. It also provides links to documentation that shows you how to write Node.js OJAI applications.

The Node.js OJAI client is available starting in the EEP 6.0 release.

Software Requirements

You must have the following software installed to run the client:

| Client Software | Installation Notes |
|---------------------|---|
| Node.js | Supported versions: <ul style="list-style-type: none"> • 6.x • 8.x • 9.x • 10.x |
| Node.js OJAI client | Install the client by using the following command: <pre>npm install node-maprdb</pre> |

You also must have access to the following software:

- MapR cluster 6.1 or later
- [MapR Data Access Gateway 2.0](#) or later

To run a Node.js OJAI application, you simply need to install and configure the MapR Data Access Gateway:

- [Installing the Data Access Gateway Service](#) on page 1669
- [Modifying Configuration Settings for the Data Access Gateway Service](#) on page 1669

Node.js OJAI Client Security

The client supports username/password authentication. The initial connection (and token renewal) use these credentials. Subsequent communication uses JWT.

When connecting to a secure cluster, the client uses:

- X.509 certificates to authenticate with the Data Access Gateway
- TLS v1.2 to encrypt communication between the client and the Data Access Gateway

Node.js OJAI Client Connection String

The string you use to connect your OJAI client to the cluster must have the following format:

```
"[ojai:mapr:thin:v1@]<hostname>[:<port>][?<option_name>=<option_value>;...]"
```

The prefix `ojai:mapr:thin:v1@` is optional.

| | |
|--|--|
| <code><hostname></code> | Name of the Data Access Gateway host |
| <code><port></code> | Port number (see Ports Used by HPE Ezmeral Data Fabric Software on page 2579) that gRPC clients use to connect to the Data Access Gateway Default: 5678 |
| <code>auth=<scheme_name></code> | The authentication scheme for the current connection; currently, only <code>basic</code> |
| <code>user=<username></code> | The user name for <code>basic</code> authentication |
| <code>password=<password></code> | The password for <code>basic</code> authentication |

ssl=true|false

Whether to establish a secure connection using SSL/TLS

An error is returned if there is a mismatch between your client and Data Access Gateway security settings. The default for this option is `true`, which is the required setting if connecting to a secure Data Access Gateway. If connecting to a nonsecure Data Access Gateway, set it to `false`.

If set to `false`, the other SSL parameters are ignored.

Note that the `grpc.service.ssl.enabled` property controls the SSL setting for the Data Access Gateway. For more information, see [Administering the Data Access Gateway](#) on page 1669.

sslCA=<path to PEM file containing CA certificate>

Path to a local file containing Certificate Authority (CA) signed certificates in PEM format.

Must be set if the `ssl` option is `true`.

sslTargetNameOverride=<CA certificate common name>

Fully qualified domain name specified in the CA certificate, which is different from the `<hostname>` in the connection string.

For example, imagine that you are using the following:

- Public network host name is `ec2-203-0-113-25.compute-1.amazonaws.com`.
- Internal DNS is `node1.mydomain.com`.
- CA signed certificate is issued to `node1.mydomain.com`.

Using these names, you must specify the following connection string:

```
"ec2-203-0-113-25.compute-1.amazonaws.com:5678?ssl=true;sslCA=/opt/app/conf/rootca.pem;sslTargetNameOverride=node1.mydomain.com"
```

Other examples of connection strings are the following:

```
"ojai:mapr:thin:v1@localhost:5678?auth=basic;user=fred;password=george;sslCA=/opt/app/conf/rootca.pem"
"localhost:5678?ssl=false;auth=basic;user=fred;password=george"
```

Node.js OJAI Connection Retry Options

If your OJAI client cannot connect to your cluster, it waits 10 ms. After 10 ms, it makes a second connection attempt. If that fails, it continues the attempts up to a configurable number of retries. The following parameters control the number of retries and the wait time between attempts:

| Connection Option Parameter | Description | Default Value |
|---|--|---------------|
| <code>ojai.mapr.rpc.wait-multiplier</code> | Multiplier that determines the wait time for subsequent attempts after the initial 10 ms wait. The previous wait time is multiplied by this parameter. | 1000 |
| <code>ojai.mapr.rpc.wait-max-attempt</code> | Maximum wait time between attempts regardless of the multiplier parameter | 18000 ms |

| Connection Option Parameter | Description | Default Value |
|-----------------------------|----------------------------------|---------------|
| ojai.mapr.rpc.max-retries | Maximum number of retry attempts | 7 |

The following examples demonstrate how these parameters work, including the default case:

| Attempt # | Wait Time (in ms) for each Retry Attempt | |
|-----------|---|---|
| | Default Parameters: | |
| | <pre>{ 'ojai.mapr.rpc.wait-multiplier': 1000, 'ojai.mapr.rpc.wait-max-attempt': 18000, 'ojai.mapr.rpc.max-retries': 7 }</pre> | <pre>{ 'ojai.mapr.rpc.wait-multiplier': 2, 'ojai.mapr.rpc.wait-max-attempt': 90, 'ojai.mapr.rpc.max-retries': 5 }</pre> |
| 1 | 10 | 10 |
| 2 | $10 \times 1000 = 10000$ | $10 \times 2 = 20$ |
| 3 | 18000 $10000 \times 1000 = 10,000,000$, which exceeds 18000 | $20 \times 2 = 40$ |
| 4 | 18000 | $40 \times 2 = 80$ |
| 5 | 18000 | 90 $80 \times 2 = 160$, which exceeds 90 |
| 6 | 18000 | Error |
| 7 | 18000 | N/A |
| 8 | Error | N/A |

To set these retry options, you must pass them in the `ConnectionManager.getConnection` call:

```
const connectionString = 'localhost:5678?' +
  'auth=basic;' +
  'user=mapr;' +
  'password=mapr;' +
  'ssl=true;' +
  'sslCA=/opt/mapr/conf/ssl_truststore.pem;' +
  'sslTargetNameOverride=nodel.mapr.com';
const options = {
  'ojai.mapr.rpc.wait-multiplier': 5,
  'ojai.mapr.rpc.wait-max-attempt': 50,
  'ojai.mapr.rpc.max-retries': 3
}

let connection;

ConnectionManager.getConnection(connectionString, options)
  .then((conn) => {
    connection = conn;
    // Get a store
    return connection.getStore('/demo_table');
  })
```

Writing Node.js OJAI Applications

For information about writing a Node.js OJAI application, see the Node.js sections in the following topics:

[Querying in OJAI Applications](#) on page 2855

Provides an introduction to the basic flow of an OJAI application that queries a HPE Ezmeral Data Fabric Database JSON table

[Examples: Querying JSON Documents](#) on page 2900

Contains code samples of OJAI applications that query HPE Ezmeral Data Fabric Database JSON tables

[Managing JSON Documents](#) on page 2818

Describes how to perform CRUD (create, query, update, and delete) operations on JSON documents in HPE Ezmeral Data Fabric Database JSON tables

Node.js OJAI Client Classes and Methods

This topic lists and describes the classes supported by the Node.js OJAI client and provides a link to document pages that describe the methods in each class.

| Class Name | Description |
|-------------------|---|
| ConnectionManager | Manages connections to HPE Ezmeral Data Fabric Database JSON. |
| Connection | Provides a logical connection to an OJAI data source: for example, HPE Ezmeral Data Fabric Database JSON. |
| DocumentStore | Encapsulates a store, typically persistent, of OJAI documents: for example, HPE Ezmeral Data Fabric Database JSON tables. |
| QueryResult | Encapsulates the stream of result sets for an OJAI query. |
| OTime | Encapsulates the OJAI TIME type. |
| OTimestamp | Encapsulates the OJAI TIMESTAMP type. |
| ODate | Encapsulates the OJAI DATE type. |

See [Node.js OJAI Client API](#) for details about each class, including the methods available in each class.

Setting Query Options in Node.js OJAI

There are two categories of options you can set in your Node.js OJAI application. This topic describes both and shows you how to set each.

Setting Query Options Using a Node.js OJAI Method Call

| Option Name | Description |
|---|---|
| <code>ojai.mapr.query.include-query-plan</code> | Enables or disables availability of the query plan for retrieval Value: <code>true false</code> Default: <code>false</code> |
| <code>ojai.mapr.query.timeout-milliseconds</code> | Query timeout in milliseconds Maximum allowed value is 2147483647. Default: None; no timeout |

To set any of these query options, you must pass the option as the second parameter in the `DocumentStore.find` method.

The following code snippet sets the query timeout to 3000 milliseconds:

```
const docStream = store.find(
  query,
  { 'ojai.mapr.query.timeout-milliseconds': 3000 }
);
```

Setting Query Options in Node.js Using OJAI Query Syntax

[OJAI Query Options](#) on page 2864 describes query options that are available in all OJAI clients. To use these options in Node.js OJAI, you must construct your query in JSON format and use the `$options` keyword. See [OJAI Query Syntax](#) for details about the syntax, including an example.

Using the Python OJAI Client

Starting with EEP 6.0, you can use the Python OJAI client to write HPE Ezmeral Data Fabric Database JSON applications. The client provides you with a lightweight library that supports the OJAI API. You can connect to HPE Ezmeral Data Fabric Database JSON, and add, update, and query documents in a HPE Ezmeral Data Fabric Database JSON table.

The client provides you with the following benefits:

- Easy installation and use
- Access to HPE Ezmeral Data Fabric Database JSON through the OJAI interface in Python
- An OJAI interface that is tailored to Python developers
- Use of Python types to manipulate HPE Ezmeral Data Fabric Database JSON documents
- Support for Python multiprocessing and multithreading modules
- Support for L3/L4 (transport level) and L7 (application level) proxy load balancing

To use the Python OJAI client, you must install the [MapR Data Access Gateway](#) on your HPE Ezmeral Data Fabric cluster. The gateway serves as a proxy for translating requests between the Python client and the HPE Ezmeral Data Fabric cluster. The gateway also performs data processing to keep the client lightweight. See [Administering the Data Access Gateway](#) on page 1669 for information about how to administer the gateway and configure load balancing.

Getting Started with the Python OJAI Client

This section describes the software required to run the Python OJAI client, client/server security, and how to specify your connection string. It also provides links to documentation that shows you how to write Python OJAI applications.

The Python OJAI client is available starting with the EEP 6.0 release.

Software Requirements

You must have the following software installed to run the client:

| Client Software | Installation Notes |
|-----------------|--|
| Python | Use Python 2.7 or later |
| pip | See https://pip.pypa.io/en/stable/installing/ for instructions specific to your environment. |

| Client Software | Installation Notes |
|--------------------|---|
| Python OJAI client | Install the client by using the following command: <pre>pip install maprdb-python-client</pre> |

You also must have access to the following software:

- MapR cluster 6.1 or later
- [MapR Data Access Gateway 2.0](#) or later

To run a Python OJAI application, you simply need to install and configure the MapR Data Access Gateway:

- [Installing the Data Access Gateway Service](#) on page 1669
- [Modifying Configuration Settings for the Data Access Gateway Service](#) on page 1669

Python OJAI Client Security

The client supports username/password authentication. The initial connection (and token renewal) use these credentials. Subsequent communication uses JWT.

When connecting to a secure cluster, the client uses:

- X.509 certificates to authenticate with the Data Access Gateway
- TLS v1.2 to encrypt communication between the client and the Data Access Gateway

Python OJAI Client Connection String

The string you use to connect your OJAI client to the cluster must have the following format:

```
"[ojai:mapr:thin:v1@]<hostname>[:<port>][?<option_name>=<option_value>;...]"
```

The prefix `ojai:mapr:thin:v1@` is optional.

| | |
|--|---|
| <code><hostname></code> | Name of the Data Access Gateway host |
| <code><port></code> | Port number (see Ports Used by HPE Ezmeral Data Fabric Software on page 2579) that gRPC clients use to connect to the Data Access Gateway Default: 5678 |
| <code>auth=<scheme_name></code> | The authentication scheme for the current connection; currently, only <code>basic</code> |
| <code>user=<username></code> | The user name for <code>basic</code> authentication |
| <code>password=<password></code> | The password for <code>basic</code> authentication |
| <code>ssl=true false</code> | Whether to establish a secure connection using SSL/TLS An error is returned if there is a mismatch between your client and Data Access Gateway security settings. The default for this option is <code>true</code> , which is the required setting if connecting to a secure Data Access Gateway. If connecting to a nonsecure Data Access Gateway, set it to <code>false</code> . |

If set to `false`, the other SSL parameters are ignored.

Note that the `grpc.service.ssl.enabled` property controls the SSL setting for the Data Access Gateway. For more information, see [Administering the Data Access Gateway](#) on page 1669.

sslCA=<path to PEM file containing CA certificate>

Path to a local file containing Certificate Authority (CA) signed certificates in PEM format.

Must be set if the `ssl` option is `true`.

sslTargetNameOverride=<CA certificate common name>

Fully qualified domain name specified in the CA certificate, which is different from the `<hostname>` in the connection string.

For example, imagine that you are using the following:

- Public network host name is `ec2-203-0-113-25.compute-1.amazonaws.com`.
- Internal DNS is `node1.mydomain.com`.
- CA signed certificate is issued to `node1.mydomain.com`.

Using these names, you must specify the following connection string:

```
"ec2-203-0-113-25.compute-1.amazonaws.com:5678?ssl=true;sslCA=/opt/app/conf/rootca.pem;sslTargetNameOverride=node1.mydomain.com"
```

Other examples of connection strings are the following:

```
"ojai:mapr:thin:v1@localhost:5678?auth=basic;user=fred;password=george;sslCA=/opt/app/conf/rootca.pem"
"localhost:5678?ssl=false;auth=basic;user=fred;password=george"
```

Python OJAI Connection Retry Options

If your OJAI client cannot connect to your cluster, it waits 10 ms. After 10 ms, it makes a second connection attempt. If that fails, it continues the attempts up to a configurable number of retries. The following parameters control the number of retries and the wait time between attempts:

| Connection Option Parameter | Description | Default Value |
|---|--|---------------|
| <code>ojai.mapr.rpc.wait-multiplier</code> | Multiplier that determines the wait time for subsequent attempts after the initial 10 ms wait. The previous wait time is multiplied by this parameter. | 1000 |
| <code>ojai.mapr.rpc.wait-max-attempt</code> | Maximum wait time between attempts regardless of the multiplier parameter | 18000 ms |
| <code>ojai.mapr.rpc.max-retries</code> | Maximum number of retry attempts | 7 |

The following examples demonstrate how these parameters work, including the default case:

| Wait Time (in ms) for each Retry Attempt | | |
|--|---|---|
| Attempt # | Default Parameters: | |
| | <pre>{ 'ojai.mapr.rpc.wait-multiplier': 1000, 'ojai.mapr.rpc.wait-max-attempt': 18000, 'ojai.mapr.rpc.max-retries': 7 }</pre> | <pre>{ 'ojai.mapr.rpc.wait-multiplier': 2, 'ojai.mapr.rpc.wait-max-attempt': 90, 'ojai.mapr.rpc.max-retries': 5 }</pre> |
| 1 | 10 | 10 |
| 2 | 10*1000 = 10000 | 10*2 = 20 |
| 3 | 18000 10000*1000 = 10,000,000, which exceeds 18000 | 20*2 = 40 |
| 4 | 18000 | 40*2 = 80 |
| 5 | 18000 | 90 80*2 = 160, which exceeds 90 |
| 6 | 18000 | Error |
| 7 | 18000 | N/A |
| 8 | Error | N/A |

To set these retry options, you must pass them in the `ConnectionFactory.get_connection` call:

```
connection_str = 'localhost:5678?auth=basic;user=mapr;password=mapr;' \
  'ssl=true;' \
  'sslCA=/opt/mapr/conf/ssl_truststore.pem;' \
  'sslTargetNameOverride=nodel.mapr.com'
options = {
  'ojai.mapr.rpc.wait-multiplier': 5,
  'ojai.mapr.rpc.wait-max-attempt': 50,
  'ojai.mapr.rpc.max-retries': 3
}
connection =
ConnectionFactory.get_connection(connection_str=connection_str,options=options)
```

Writing a Python OJAI Application

For information about writing a Python OJAI application, see the Python sections in the following topics:

[Querying in OJAI Applications on page 2855](#)

Provides an introduction to the basic flow of an OJAI application that queries a HPE Ezmeral Data Fabric Database JSON table

[Examples: Querying JSON Documents on page 2900](#)

Contains code samples of OJAI applications that query HPE Ezmeral Data Fabric Database JSON tables

[Managing JSON Documents on page 2818](#)

Describes how to perform CRUD (create, query, update, and delete) operations on JSON documents in HPE Ezmeral Data Fabric Database JSON tables

Python OJAI Client Classes and Methods

This topic lists and describes the classes supported by the Python OJAI client and provides a link to document pages that describe the methods in each class.

| Class Name | Description |
|-------------------|---|
| Connection | Provides a logical connection to an OJAI data source: for example, HPE Ezmeral Data Fabric Database JSON. |
| ConnectionDriver | Provides a connection handler, which enables you to get and check connections |
| ConnectionManager | Manages connections to HPE Ezmeral Data Fabric Database JSON. |
| Document | Provides the primary, DOM-based interface for inspecting OJAI documents. |
| DocumentMutation | Encapsulates a mutation to an existing OJAI document in a store. |
| DocumentStore | Encapsulates a store, typically persistent, of OJAI documents: for example, HPE Ezmeral Data Fabric Database JSON tables. |
| DocumentStream | Encapsulates the result set of an OJAI query. |
| QueryResult | Encapsulates the result set of an OJAI query. |
| Query | Encapsulates an OJAI query. |
| QueryCondition | Encapsulates a query condition; similar to a SQL <code>where</code> clause. |
| Value | Encapsulates the value of a field, scalar, or complex type in an OJAI document. |
| OTime | Encapsulates the OJAI <code>TIME</code> type. |
| OTimestamp | Encapsulates the OJAI <code>TIMESTAMP</code> type. |
| ODate | Encapsulates the OJAI <code>DATE</code> type. |
| OInterval | Encapsulates the OJAI <code>INTERVAL</code> type. |

See [Python OJAI Client API](#) for details about each class, including the methods available in each class.

Multiprocessing and Multithreading in Python OJAI Applications

Python supports multiprocessing and multithreading modules that enable you to spawn either multiple processes or multiple threads in a Python program. This section contains examples that show you how to use these modules in your Python OJAI application.

Multiprocessing in Python OJAI Applications

The following code example spawns multiple processes using the Python `multiprocessing` module. When you use the module, you must create a separate OJAI connection for each process.

The code example is available at [014_multiprocessing_example.py](#).

```

"""Following example works with Python Client"""

import multiprocessing
from mapr.ojai.storage.ConnectionFactory import ConnectionFactory

"""Create a connection, get store, insert_or_replace/update document in
store via multiprocessing"""

# Create a connection string using path:user@password
connection_str = "localhost:5678?auth=basic;user=mapr;password=mapr;" \

```

```

        "ssl=true;" \
        "sslCA=/opt/mapr/conf/ssl_truststore.pem;" \
        "sslTargetNameOverride=node1.mapr.com"

# Create method which will be used for multiprocessing
def sample():
    # Create connection from connection_url
    # Cannot share connection for processes,
    # so need to create connection for each process.
    connection =
ConnectionFactory().get_connection(connection_str=connection_str)

    # Get a store and assign it as a DocumentStore object
    store = connection.get_or_create_store('/tmp/store_name')

    # Insert 15 documents, represented as Python dictionaries,
    # into DocumentStore
    for i in range(15):
        store.insert_or_replace(doc={'_id': str(i), 'name': 'Greg'})

    # Create DocumentMutation object using the OJAICConnection object
    mutation = connection.new_mutation()

    # Set mutation value
    mutation.set_or_replace(field_path='name', value='T')

    # Update 15 Document in store
    for i in range(15):
        store.update(_id=str(i), mutation=mutation)

# Create simple method for run process from Pool
def run(unused_var):
    pass

# Create data for multiprocessing
proces_count = 7
map_iterable = [1] # simple iterator

# Create Pool object using the function and process_count value
p = multiprocessing.Pool(proces_count, initializer=sample)

# Run processes from the Pool
p.map(run, map_iterable)

```

Multithreading in Python OJAI Applications

You can use either the Python `thread` or `threading` module to spawn multiple threads in your Python application. When you use these modules, you can share an OJAI connection across threads.

Thread Module

The following code example uses the `thread` module. It is available at [015_thread_example.py](#).

```

"""Following example works with
Python Client"""
import thread
import time
from
mapr.ojai.storage.ConnectionFactory
import ConnectionFactory

```

```

"""Create a connection, get store,
insert_or_replace/update document in
store via thread using same
connection"""

# Create method which will be used
for threads
def run_thread(name, conn):
    # Print that thread started with
threadName
    print('\n Start thread ', name)

    # Get a store and assign it as a
DocumentStore object
    store =
conn.get_or_create_store('/tmp/
store_name')

    # Insert 15 documents,
represented as Python dictionaries,
# into DocumentStore
    for index in range(15):

store.insert_or_replace(doc={'_id':
str(index), 'name': 'Greg'})

    # Create DocumentMutation object
using the OJAIConnection object
    mutation = conn.new_mutation()

    # Set mutation value

mutation.set_or_replace(field_path='na
me', value='T')

    # Update 15 Document in store
for index in range(15):
        store.update(_id=str(index),
mutation=mutation)

    # Print that thread done with
threadName
    print('\n Done thread ', name)

# Create a connection string using
path:user@password
connection_str = "localhost:5678?
auth=basic;user=mapr;password=mapr;" \
        "ssl=true;" \
        "sslCA=/opt/mapr/conf/
ssl_truststore.pem;" \

"sslTargetNameOverride=node1.mapr.com"

# Create connection from
connection_url
# Can share connection for processes,
# so need to only one connection
instance for all threads

```

```

connection =
ConnectionFactory.get_connection(connection_str)

# Create 10 threads using the same
connection instance
for i in range(10):
    thread_name =
    'Thread-{}'.format(str(i))

thread.start_new_thread(run_thread,
(thread_name, connection,))

# This thread implementation doesn't
return thread object
# so thread status cannot be checked
# Wait 10 seconds
time.sleep(10)

# Close connection
connection.close()

```

Threading Module

The following code example uses the threading module. It is available at [016_threading_example.py](#).

```

"""Following example works with
Python Client"""
import threading
import time

from
mapr.ojai.storage.ConnectionFactory
import ConnectionFactory

"""Create a connection, get store,
insert_or_replace/update document in
store via thread using same
connection"""

# Create a connection string using

    # Create thread instance using
MyThread and OJAIConnection object
    thread =
MyThread(name='Thread-{0}'.format(str(
i)),
        connection=connection)

        # Start current thread
thread.start()

        # Append thread object into
thread_list
        thread_list.append(thread)

# Wait until all threads will finished
waiter(thread_list)

# Close connection
connection.close()

```

Setting Query Options in Python OJAI

There are two categories of options you can set in your Python OJAI application. This topic describes both and shows you how to set each.

Setting Query Options Using a Python OJAI Method Call

| Option Name | Description |
|---|--|
| <code>ojai.mapr.query.include-query-plan</code> | Enables or disables availability of the query plan for retrieval Value: True False Default: False |
| <code>ojai.mapr.query.result-as-document</code> | Enables or disables returning the query result as an OJAI Document class object versus a Python dictionary Value: True False Default: False; returns query result as a Python dictionary |

| Option Name | Description |
|---|--|
| <code>ojai.mapr.query.timeout-milliseconds</code> | Query timeout in milliseconds Maximum allowed value is 2147483647. Default: None; no timeout |

To set any of these query options, you must pass the option as the second parameter in the [DocumentStore.find](#) method.

The following code snippet sets the option to return the query result as a [Document](#) object:

```
options = {'ojai.mapr.query.result-as-document': True}
query_result = store.find(query, options=options)
```

Setting Query Options in Python Using OJAI Query Syntax

[OJAI Query Options](#) on page 2864 describes query options that are available in all OJAI clients. To use these options in Python OJAI, you must construct your query in JSON format and use the `$options` keyword. See [OJAI Query Syntax](#) for details about the syntax, including an example.

Using the C# OJAI Client

Starting with EEP 6.1.0, you can use the C# OJAI client to write HPE Ezmeral Data Fabric Database JSON applications. The client provides you with a lightweight library that supports the OJAI API. You can connect to HPE Ezmeral Data Fabric Database JSON, and add, update, and query documents in a HPE Ezmeral Data Fabric Database JSON table.

The client provides you with the following benefits:

- Easy installation and use
- Access to HPE Ezmeral Data Fabric Database JSON through the OJAI interface in C#
- An OJAI interface that is tailored to C# developers
- Use of C# types to manipulate HPE Ezmeral Data Fabric Database JSON documents
- Support for C# asynchronous programming and threading mechanism
- Support for L3/L4 (transport level) and L7 (application level) proxy load balancing

To use the C# OJAI client, you must install the [MapR Data Access Gateway](#) on your HPE Ezmeral Data Fabric cluster. The gateway serves as a proxy for translating requests between the C# client and the HPE Ezmeral Data Fabric cluster. The gateway also performs data processing to keep the client lightweight. See [Administering the Data Access Gateway](#) on page 1669 for information about how to administer the gateway and configure load balancing.

Additional Resources

Examples: <https://github.com/mapr-demos/ojai-examples/tree/master/csharp>

Getting Started with the C# OJAI Client

This section describes the software required to run the C# OJAI client, client/server security, and how to specify your connection string. It also provides links to documentation that shows you how to write C# OJAI applications.

The C# OJAI client is available starting in the EEP 6.0.0 release.

Software Requirements

You must have the following software installed to run the client:

| Client Software | Installation Notes |
|--------------------|--|
| Visual Studio 2017 | https://visualstudio.microsoft.com/vs/ |
| C# OJAI client | <ul style="list-style-type: none"> Install the client by using the NuGet Command Line Interface (CLI). Install the <code>MapRDB.Driver</code> using the NuGet Package Manager Console: <pre>Install-Package MapRDB.Driver -Version 1.0.0</pre> Use the <code>dotnet</code> command line interface: <pre>dotnet add package MapRDB.Driver</pre> Use the NuGet Package Manager UI. For instructions, follow this link. |

You also must have access to the following software:

- MapR cluster 6.1 or later
- [MapR Data Access Gateway 2.0](#) or later

To run a C# OJAI application, you simply need to install and configure the MapR Data Access Gateway:

- [Installing the Data Access Gateway Service](#) on page 1669
- [Modifying Configuration Settings for the Data Access Gateway Service](#) on page 1669

C# OJAI Client Security

The client supports username/password authentication. The initial connection (and token renewal) use these credentials. Subsequent communication uses JWT.

When connecting to a secure cluster, the client uses:

- X.509 certificates to authenticate with the Data Access Gateway
- TLS v1.2 to encrypt communication between the client and the Data Access Gateway

C# OJAI Client Connection String

The string you use to connect your OJAI client to the cluster must have the following format:

```
"[ojai:mapr:thin:v1@]<hostname>[:<port>][?<option_name>=<option_value>;...]"
```

The prefix `ojai:mapr:thin:v1@` is optional.

`<hostname>`

Name of the Data Access Gateway host

`<port>`

Port number (see [Ports Used by HPE Ezmeral Data Fabric Software](#) on page 2579) that gRPC clients use to connect to the Data Access Gateway

Default: 5678

| | |
|---|---|
| <code>auth=<scheme_name></code> | The authentication scheme for the current connection; currently, only <code>basic</code> |
| <code>user=<username></code> | The user name for <code>basic</code> authentication |
| <code>password=<password></code> | The password for <code>basic</code> authentication |
| <code>ssl=true false</code> | Whether to establish a secure connection using SSL/TLS An error is returned if there is a mismatch between your client and Data Access Gateway security settings. The default for this option is <code>true</code> , which is the required setting if connecting to a secure Data Access Gateway. If connecting to a nonsecure Data Access Gateway, set it to <code>false</code> . If set to <code>false</code> , the other SSL parameters are ignored. Note that the <code>grpc.service.ssl.enabled</code> property controls the SSL setting for the Data Access Gateway. For more information, see Administering the Data Access Gateway on page 1669. |
| <code>sslCA=<path to PEM file containing CA certificate></code> | Path to a local file containing Certificate Authority (CA) signed certificates in PEM format. Must be set if the <code>ssl</code> option is <code>true</code> . |
| <code>sslTargetNameOverride=<CA certificate common name></code> | Fully qualified domain name specified in the CA certificate, which is different from the <code><hostname></code> in the connection string. For example, imagine that you are using the following: <ul style="list-style-type: none"> • Public network host name is <code>ec2-203-0-113-25.compute-1.amazonaws.com</code>. • Internal DNS is <code>node1.mydomain.com</code>. • CA signed certificate is issued to <code>node1.mydomain.com</code>. Using these names, you must specify the following connection string: |

```
"ec2-203-0-113-25.compute-1.amazonaws.com:5678?ssl=true;sslCA=/opt/app/conf/rootca.pem;sslTargetNameOverride=node1.mydomain.com"
```

Other examples of connection strings are the following:

```
"ojai:mapr:thin:vl@localhost:5678?auth=basic;user=fred;password=george;sslCA=/opt/app/conf/rootca.pem"
"localhost:5678?ssl=false;auth=basic;user=fred;password=george"
```

C# OJAI Connection Retry Options

If your OJAI client cannot connect to your MapR cluster, it waits 10 ms. After 10 ms, it makes a second connection attempt. If that fails, it continues the attempts up to a configurable number of retries. The following parameters control the number of retries and the wait time between attempts:

| Connection Option Parameter | Description | Default Value |
|-----------------------------|--|---------------|
| retryExponentialMultiplier | Multiplier that determines the wait time for subsequent attempts after the initial 10 ms wait. The previous wait time is multiplied by this parameter. | 1000 |
| retryCount | Maximum number of retry attempts | 7 |

To set these retry options, you must pass them in the `ConnectionFactory.CreateConnection` call:

```
var connectionStr = $"localhost:5678?auth=basic;" +
    $"user=mapr;" +
    $"password=mapr;" +
    $"ssl=true;" +
    $"sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
    $"sslTargetNameOverride=node1.mapr.com";
var connection = ConnectionFactory.CreateConnection(connectionStr, 3, 5);
```

Writing a C# OJAI Application

For information about writing a C# OJAI application, see the C# sections in the following topics:

[Querying in OJAI Applications on page 2855](#)

Provides an introduction to the basic flow of an OJAI application that queries a HPE Ezmeral Data Fabric Database JSON table

[Examples: Querying JSON Documents on page 2900](#)

Contains code samples of OJAI applications that query HPE Ezmeral Data Fabric Database JSON tables

[Managing JSON Documents on page 2818](#)

Describes how to perform CRUD (create, query, update, and delete) operations on JSON documents in HPE Ezmeral Data Fabric Database JSON tables

C# OJAI Client Classes and Methods

This topic lists and describes the classes supported by the C# OJAI client and provides a link to document pages that describe the methods in each class.

| Class Name | Description |
|--|---|
| Value | Encapsulates the value of a field, scalar, or complex in an OJAI document. |
| OjaiDocument | Provides the primary, DOM-based interface for inspecting OJAI documents |
| OjaiDocumentStream/QueryResult | Encapsulates the result set of an OJAI query. |
| OjaiDocumentMutation | Encapsulates a mutation to an existing OJAI document in a store. |
| Query | Encapsulates an OJAI query. |
| QueryCondition | Encapsulates a query condition; similar to a SQL <code>where</code> clause. |
| ConnectionFactory | Provides a logical connection to an OJAI data source: for example, HPE Ezmeral Data Fabric Database JSON. |
| MapRDBConnection | Provides a connection handler, which enables you to get and check connections. |
| OjaiDocumentStore | Encapsulates a store, typically persistent, of OJAI documents: for example, HPE Ezmeral Data Fabric Database JSON tables. |
| OTime | Encapsulates the OJAI <code>TIME</code> type. |

| Class Name | Description |
|----------------------------|--|
| OTimestamp | Encapsulates the OJAI <code>TIMESTAMP</code> type. |
| ODate | Encapsulates the OJAI <code>DATE</code> type. |
| OInterval | Encapsulates the OJAI <code>INTERVAL</code> type. |

See the [C# OJAI Client API](#) for details about each class, including the methods available in each class.

Setting Query Options in C# OJAI

There are two categories of options you can set in your C# OJAI application. This topic describes both and shows you how to set each.

Setting Query Options Using a C# OJAI Method Call

| Option Name | Description |
|-------------------------------|---|
| <code>IncludeQueryPlan</code> | Enables or disables availability of the query plan for retrieval Value: <code>true false</code> Default: <code>false</code> |
| <code>Timeout</code> | Query timeout in milliseconds Maximum allowed value is 2147483647. Default: None; no timeout |

To set any of these query options, you must pass the option as the second parameter in the `DocumentStore.Find` method.

The following code snippet sets the query timeout to 3000 milliseconds:

```
var queryResult = store.Find(query, new QueryOptions() { Timeout = 3000 });
var queryResult = store.Find(query, new QueryOptions(3000));
```

Setting Query Options in C# Using OJAI Query Syntax

[OJAI Query Options](#) on page 2864 describes query options that are available in all OJAI clients. To use these options in C# OJAI, you must construct your query in JSON format and use the `$options` keyword. See [OJAI Query Syntax](#) for details about the syntax, including an example.

Using the Go OJAI Client

Starting with EEP 6.0.0, you can use the Go OJAI client to write HPE Ezmeral Data Fabric Database JSON applications. The client provides you with a lightweight library that supports the OJAI API. You can connect to HPE Ezmeral Data Fabric Database JSON, and add, update, and query documents in a HPE Ezmeral Data Fabric Database JSON table.

The client provides you with the following benefits:

- Easy installation and use
- Access to HPE Ezmeral Data Fabric Database JSON through the OJAI interface in Go
- An OJAI interface that is tailored to Go developers
- Use of Go types to manipulate HPE Ezmeral Data Fabric Database JSON documents
- Support for Go multithreading using Goroutines

- Support for L3/L4 (transport level) and L7 (application level) proxy load balancing

To use the Go OJAI client, you must install the [MapR Data Access Gateway](#) on your HPE Ezmeral Data Fabric cluster. The gateway serves as a proxy for translating requests between the Go client and the HPE Ezmeral Data Fabric cluster. The gateway also performs data processing to keep the client lightweight. To administer the gateway and configure load balancing, see [Administering the Data Access Gateway](#) on page 1669.

Additional Resources

Blog: [CRUD with the New Golang Client for MapR Database](#)

Examples: <https://github.com/mapr-demos/ojai-examples/tree/master/golang>

Source Code: <https://github.com/mapr/maprdb-go-client>

Getting Started with the Go OJAI Client

This section describes the software required to run the Go OJAI client, client/server security, and how to specify your connection string. It also provides links to documentation that shows you how to write Go OJAI applications.

The Go OJAI client is available starting in the EEP 6.0.0 release.

Software Requirements

You must have the following software installed to run the client:

| Client Software | Installation Notes |
|------------------------|---|
| Golang 1.10 (or later) | |
| Go OJAI client | Install the client using the following command: <pre>go get github.com/mapr/maprdb-go-client</pre> |

You also must have access to the following software:

- MapR cluster 6.1 or later
- [MapR Data Access Gateway](#) 2.0 or later

To run a Go OJAI application, you simply need to install and configure the MapR Data Access Gateway:

- [Installing the Data Access Gateway Service](#) on page 1669
- [Modifying Configuration Settings for the Data Access Gateway Service](#) on page 1669

For some sample code, see https://github.com/magpierre/mapr_go_client_mqtt. `main.go` shows a simple Go client that reads from an MQTT messaging protocol and writes to a MapR JSON database.

Go OJAI Client Security

The client supports username/password authentication. The initial connection (and token renewal) use these credentials. Subsequent communication uses JWT.

When connecting to a secure cluster, the client uses:

- X.509 certificates to authenticate with the Data Access Gateway
- TLS v1.2 to encrypt communication between the client and the Data Access Gateway

Go OJAI Client Connection String

The string you use to connect your OJAI client to the cluster must have the following format:

```
"[ojai:mapr:thin:v1@]<hostname>[:<port>][?<option_name>=<option_value>;...]"
```

The prefix `ojai:mapr:thin:v1@` is optional.

| | |
|---|---|
| <code><hostname></code> | Name of the Data Access Gateway host |
| <code><port></code> | Port number (see Ports Used by HPE Ezmeral Data Fabric Software on page 2579) that gRPC clients use to connect to the Data Access Gateway Default: 5678 |
| <code>auth=<scheme_name></code> | The authentication scheme for the current connection; currently, only <code>basic</code> |
| <code>user=<username></code> | The user name for <code>basic</code> authentication |
| <code>password=<password></code> | The password for <code>basic</code> authentication |
| <code>ssl=true false</code> | Whether to establish a secure connection using SSL/TLS An error is returned if there is a mismatch between your client and Data Access Gateway security settings. The default for this option is <code>true</code> , which is the required setting if connecting to a secure Data Access Gateway. If connecting to a nonsecure Data Access Gateway, set it to <code>false</code> . If set to <code>false</code> , the other SSL parameters are ignored. Note that the <code>grpc.service.ssl.enabled</code> property controls the SSL setting for the Data Access Gateway. For more information, see Administering the Data Access Gateway on page 1669. |
| <code>sslCA=<path to PEM file containing CA certificate></code> | Path to a local file containing Certificate Authority (CA) signed certificates in PEM format. Must be set if the <code>ssl</code> option is <code>true</code> . |
| <code>sslTargetNameOverride=<CA certificate common name></code> | Fully qualified domain name specified in the CA certificate, which is different from the <code><hostname></code> in the connection string. For example, imagine that you are using the following: <ul style="list-style-type: none"> Public network host name is <code>ec2-203-0-113-25.compute-1.amazonaws.com</code>. Internal DNS is <code>node1.mydomain.com</code>. CA signed certificate is issued to <code>node1.mydomain.com</code>. Using these names, you must specify the following connection string: |

```
"ec2-203-0-113-25.compute-1.amazonaws.com:5678?ssl=true;sslCA=/opt/app/conf/"
```

```
rootca.pem;sslTargetNameOverride=node1
.mydomain.com"
```

Other examples of connection strings are the following:

```
"ojai:mapr:thin:vl@localhost:5678?
auth=basic;user=fred;password=george;sslCA=/opt/app/conf/rootca.pem"
"localhost:5678?ssl=false;auth=basic;user=fred;password=george"
```

Go OJAI Connection Retry Options

If your OJAI client cannot connect to your MapR cluster, it waits 10 ms. After 10 ms, it makes a second connection attempt. If that fails, it continues the attempts up to a configurable number of retries. The following parameters control the number of retries and the wait time between attempts:

| Connection Option Parameter | Description | Default Value |
|-----------------------------|------------------------------------|---------------|
| MaxAttempt | Maximum number of retry attempts | 9 |
| WaitBetweenSeconds | Maximum wait time between attempts | 12 s |
| CallTimeoutSeconds | Maximum call timeout | 60 s |

To set these retry options, you must pass them in the `client.MakeConnectionWithRetryOptions` call:

```
connectionString := "localhost:5678?" +
    "auth=basic;" +
    "user=mapr;" +
    "password=mapr;" +
    "ssl=true;" +
    "sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
    "sslTargetNameOverride=node1.cluster.com"
options := &client.ConnectionOptions{MaxAttempt:3,
WaitBetweenSeconds:10, CallTimeoutSeconds:60}
connection, _ :=
client.MakeConnectionWithRetryOptions(connectionString, options)
```

Writing a Go OJAI Application

For information about writing a Go OJAI application, see the Go sections in the following topics:

[Querying in OJAI Applications on page 2855](#)

Provides an introduction to the basic flow of an OJAI application that queries a HPE Ezmeral Data Fabric Database JSON table

[Examples: Querying JSON Documents on page 2900](#)

Contains code samples of OJAI applications that query HPE Ezmeral Data Fabric Database JSON tables

[Managing JSON Documents on page 2818](#)

Describes how to perform CRUD (create, query, update, and delete) operations on JSON documents in HPE Ezmeral Data Fabric Database JSON tables

Go OJAI Client Structures and Functions

This topic lists and describes the structures supported by the Go OJAI client and provides a link to document pages that describe the functions in each structure.

| Structure Name | Description |
|----------------------------------|---|
| Document | Provides the primary, DOM-based interface for inspecting OJAI documents. |
| QueryResult | Encapsulates the result set of an OJAI query. |
| DocumentMutation | Encapsulates a mutation to an existing OJAI document in a store. |
| Query | Encapsulates an OJAI query. |
| Condition | Encapsulates a query condition; similar to a SQL <code>where</code> clause. |
| Connection | Provides a logical connection to an OJAI data source: for example, HPE Ezmeral Data Fabric Database JSON. |
| DocumentStore | Encapsulates a store, typically persistent, of OJAI documents: for example, HPE Ezmeral Data Fabric Database JSON tables. |
| OTime | Encapsulates the OJAI <code>TIME</code> type. |
| OTimestamp | Encapsulates the OJAI <code>TIMESTAMP</code> type. |
| ODate | Encapsulates the OJAI <code>DATE</code> type. |

For details about each structure, including the functions available in each structure, see the [Go OJAI Client API](#).

Setting Query Options in Go OJAI

There are two categories of options you can set in your Go OJAI application. This topic describes both and shows you how to set each.

Setting Query Options Using a Go OJAI Function Call

| Option Name | Description |
|-------------------------------|--|
| <code>IncludeQueryPlan</code> | Enables or disables availability of the query plan for retrieval. Value: <code>true false</code> Default: <code>false</code> |
| <code>ResultAsDocument</code> | Enables or disables returning the query result as an OJAI <code>Document</code> object list versus a Go map list. Value: <code>True False</code> Default: <code>False</code> : returns query result as a Go map list |
| <code>Timeout</code> | Query timeout in milliseconds. Maximum allowed value is 2147483647 Default: <code>None</code> ; no timeout |

To set any of these query options, you must pass the option as the second parameter in the `DocumentStore.FindQueryWithContext` function.

The following code snippet sets the query timeout to 3000 milliseconds:

```
timeoutCtx, cancel := context.WithTimeout(context.Background(),
time.Duration(3*time.Second))
result, err := suite.store.FindQueryWithContext(query, findOptions,
timeoutCtx)
cancel()
```

Setting Query Options in Go Using OJAI Query Syntax

[OJAI Query Options](#) on page 2864 describes query options that are available in all OJAI clients. To use these options in Go OJAI, you must construct your query in JSON format and use the `$options` keyword. See [OJAI Query Syntax](#) for details about the syntax, including an example.

Using the HPE Ezmeral Data Fabric Database JSON REST API

Starting in the EEP 5.0 release, you can use a REST API to access HPE Ezmeral Data Fabric Database JSON tables. The REST API allows you to use HTTP calls to perform basic operations on HPE Ezmeral Data Fabric Database JSON tables.

The API supports the following operations:

- Create and delete HPE Ezmeral Data Fabric Database JSON tables
- Insert, update, and delete documents from a table
- Retrieve documents while specifying filter conditions and projections

The REST API has the following characteristics:

- Operations are stateless
- Operations are synchronous
- Request responses are not buffered
- Web connections are secure when connecting to secure MapR clusters
- Supports the following methods of authentication:
 - Basic authentication
 - Token-based authentication using [JSON Web Tokens \(JWT\)](#)
- [Supports user impersonation](#) - All data access calls are run on behalf of the authenticated user
- Returns HTTP error codes and detailed error responses in the response message body

When connecting to a MapR cluster, you must use HTTPS in your requests.

With basic authentication, you pass a username and password in your Web client. With token based authentication, you generate a token and then pass the token in the header of subsequent API requests.

The [MapR Data Access Gateway](#) is the service that supports this web API. You should configure multiple instances of this service across your MapR cluster to distribute request processing. To achieve load balancing, you must install an external load balancer. Using token based authentication and an external load balancer, you can achieve high availability and failover. Because the REST API is stateless, you do not have to regenerate your authentication token when different service instances process your API request. This applies even in the event of failovers and service restart. You must regenerate your token when it expires.

The API does not support the following features:

- HPE Ezmeral Data Fabric Database JSON administrative commands, except the commands noted earlier
- [Read Your Own Writes](#)

To modify properties that the HPE Ezmeral Data Fabric Database JSON REST API uses, see [Application Properties](#).

Related concepts

[Understanding the HPE Ezmeral Data Fabric Data Access Gateway](#) on page 826

The HPE Ezmeral Data Fabric Data Access Gateway is a service that acts as a proxy and gateway for translating requests between lightweight client applications and the HPE Ezmeral Data Fabric cluster.

[Administering the Data Access Gateway](#) on page 1669

The HPE Ezmeral Data Fabric Data Access Gateway is a service that acts as a proxy and gateway for translating requests between lightweight client applications and the HPE Ezmeral Data Fabric cluster. This section describes considerations when upgrading the service, how to modify configuration settings, and how to administer and manage the service.

Getting Started with the HPE Ezmeral Data Fabric Database JSON REST API

A simple way to invoke the HPE Ezmeral Data Fabric Database JSON REST API is to use `cURL` commands. This section contains a sequence `cURL` commands that demonstrate the basic functionality of the API.

Note: The HPE Ezmeral Data Fabric Database JSON REST API is available starting in the EEP 5.0 release.

The operations shown are the following:

- Create a HPE Ezmeral Data Fabric Database JSON table
- Insert documents into the table
- Retrieve documents from the table, including retrievals that contain field projections and conditions
- Update individual documents and fields within a document

To learn about the complete API, see the reference material at [Understanding the HPE Ezmeral Data Fabric Database JSON REST API](#) on page 2979.

The examples in this section assume that you installed the MapR Data Access Gateway on the host `10.10.100.42`. The examples use HTTPS with the default HTTPS port of 8243. For information about installing the Data Access Gateway, see [Installing the Data Access Gateway Service](#) on page 1669.

Note: The examples URL encode the slashes in the table path (`%2F`) to differentiate them from the slashes in the command API.

Using Basic Authentication

The commands in this section use basic authentication. To use this form of authentication, you must pass the username and password in all commands, using the `-u` option.

1. Create a HPE Ezmeral Data Fabric Database JSON table in the path `/apps/employees`:

```
curl -X PUT \
  'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees' \
  -u root:mapr
```

2. Insert 3 documents into the table:

```
curl -X POST \
  'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees' \
  -u root:mapr \
  -H 'Content-Type: application/json' \
  -d '[{"_id": "user001", "first_name": "John", "last_name": "Doe"},
{"_id": "user002", "first_name": "Jane", "last_name": "Doe"},
{"_id": "user003", "first_name": "Simon", "last_name": "Davis"}]'
```

3. Retrieve all of the documents:

```
curl -X GET \
  'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees%2F' \
  -u root:mapr
```

The command returns the following:

```
{
  "DocumentStream": [
    {
      "_id": "user001",
      "first_name": "John",
      "last_name": "Doe"
    },
    {
      "_id": "user002",
      "first_name": "Jane",
      "last_name": "Doe"
    },
    {
      "_id": "user003",
      "first_name": "Simon",
      "last_name": "Davis"
    }
  ]
}
```

4. Limit the GET request to 2 documents starting at offset 1:

```
curl -X GET \
  'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees%2F?
  offset=1&limit=2' \
  -u root:mapr
```

The command returns the following:

```
{
  "DocumentStream": [
    {
      "_id": "user002",
      "first_name": "Jane",
      "last_name": "Doe"
    },
    {
      "_id": "user003",
      "first_name": "Simon",
      "last_name": "Davis"
    }
  ]
}
```

5. Retrieve only the first names in the documents:

```
curl -X GET \
'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees?
fields=first_name' \
-u root:mapr
```

The command returns the following:

```
{
  "DocumentStream": [
    {
      "first_name": "John"
    },
    {
      "first_name": "Jane"
    },
    {
      "first_name": "Simon"
    }
  ]
}
```

6. Retrieve all documents with a last name of 'Doe':

```
curl -g -X GET \
'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees?
condition={"$eq":{"last_name":"Doe"}}' \
-u root:mapr
```

Note: You must pass '-g' in the cURL command due to the nested braces in the condition.

The command returns 2 documents:

```
{
  "DocumentStream": [
    {
      "_id": "user001",
      "first_name": "John",
      "last_name": "Doe"
    },
    {
      "_id": "user002",
      "first_name": "Jane",
      "last_name": "Doe"
    }
  ]
}
```

7. Retrieve the id and first name of documents with a last name of 'Doe':

```
curl -g -X GET \
'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees?
condition={"$eq":{"last_name":"Doe"}}&fields=_id,first_name' \
-u root:mapr
```

Note: You must pass '-g' in the cURL command due to the nested braces in the condition.

The command returns the following:

```
{
  "DocumentStream": [
    {
      "_id": "user001",
      "first_name": "John"
    },
    {
      "_id": "user002",
      "first_name": "Jane"
    }
  ]
}
```

8. Run the same command, also retrieving the query plan:

```
curl -g -X GET \
'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees?
condition={"$eq":
{"last_name":"Doe"}}&fields=_id,first_name&getPlan=true' \
-u root:mapr
```

The output includes the query plan:

```
{
  "DocumentStream": [
    {
      "_id": "user001",
      "first_name": "John"
    },
    {
      "_id": "user002",
      "first_name": "Jane"
    }
  ],
  "QueryPlan": [
    {
      "streamName": "DBDocumentStream",
      "parameters": {
        "queryConditionPath": true,
        "projectionPath": [
          "_id",
          "first_name"
        ],
        "primaryTable": "/apps/employees"
      }
    }
  ]
}
```

9. Update the first name in one of the documents, specifying the `id` in the command:
