```
curl -X POST \
'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees/document/
user001' \
-H 'Content-Type: application/json' \
-u root:mapr \
-d '{"$set":{"first_name":"Jay"}}'
```

10. Retrieve the updated document, specifying the `id` in the command:

```
curl -X GET \
'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees/document/
user001' \
-u root:mapr
```

The document contains an updated first name:

```
{
  "_id": "user001",
  "first_name": "Jay",
  "last_name": "Doe"
}
```

11. Replace the same document, but this time with a user who has only a first name:

```
curl -X PUT \
'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees/document/
user001' \
-H 'Content-Type: application/json' \
-u root:mapr \
-d '{"_id":"user001","first_name":"Jonathan"}'
```

12. Retrieve the new document by passing the `id` in the request:

```
curl -X GET \
'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees/document/
user001' \
-u root:mapr
```

The document contains only a first name:

```
{
  "_id": "user001",
  "first_name": "Jonathan"
}
```

Using Token-Based Authentication

To use token-based authentication, you first create a token, authenticating with a username and password. You then pass the generated token in all subsequent commands.

1. Generate a token using the following command:

```
curl -X POST \
  'https://10.10.100.42:8243/auth/v2/token' \
  -u root:mapr
```

The command returns the following token:

```
{
  "token":
  "eyJhbGciOiJIUzUxMiJ9.eyJzdWIiOiJyb290IiwiaXVkiJoid2ViIiwiaXhwIjoxNTIwMjY5MTQwLCJpYXQiOiJlMjY5NTc5NDB9.NT8L2deiA6v55bfbU_opiG1XXGPP0IwfSex3jW5A1ZsoI1ar09it7-XwNtRqfL_I29IHLyfmuhcT5eSIpwq6ng"
```

2. Pass the token in your cURL command, as shown in the following GET:

```
curl -X GET \
  https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees \
  -H 'Authorization:
  Bearer
  eyJhbGciOiJIUzUxMiJ9.eyJzdWIiOiJyb290IiwiaXVkiJoid2ViIiwiaXhwIjoxNTIwMjY5MTQwLCJpYXQiOiJlMjY5NTc5NDB9.NT8L2deiA6v55bfbU_opiG1XXGPP0IwfSex3jW5A1ZsoI1ar09it7-XwNtRqfL_I29IHLyfmuhcT5eSIpwq6ng'
```

Understanding the HPE Ezmeral Data Fabric Database JSON REST API

The section describes the details of the HPE Ezmeral Data Fabric Database JSON REST API.

The following table summarizes the commands the API supports. Click on the command for details about the command parameters and examples.

| Category | REST API Command | Description |
|---------------------------|--|---|
| Authentication | POST /auth/v2/token on page 2980 | Creates an authentication token |
| Table Operations | PUT /api/v2/table/{path} on page 2980 | Creates a HPE Ezmeral Data Fabric Database JSON table |
| | DELETE /api/v2/table/{path} on page 2980 | Drops a HPE Ezmeral Data Fabric Database JSON table |
| Table Document Operations | POST /api/v2/table/{path} on page 2981 | Adds one or more documents to a HPE Ezmeral Data Fabric Database JSON table |
| | PUT /api/v2/table/{path}/document/{id} on page 2982 | Updates a document by id in a HPE Ezmeral Data Fabric Database JSON table |
| | POST /api/v2/table/{path}/document/{id} on page 2983 | Updates a partial document by id in a HPE Ezmeral Data Fabric Database JSON table using mutations |
| | DELETE /api/v2/table/{path}/document/{id} on page 2984 | Deletes a single document by id in a HPE Ezmeral Data Fabric Database JSON table |
| | GET /api/v2/table/{path} on page 2984 | Retrieves one or more documents from a HPE Ezmeral Data Fabric Database JSON table |
| | GET /api/v2/table/{path}/document/{id} on page 2987 | Retrieves a single document by id from a HPE Ezmeral Data Fabric Database JSON table |

POST /auth/v2/token

Authenticates a user. If successful, creates an authentication token that you use in subsequent API requests. By default, the token expires in 30 minutes. After a token expires, you must rerun this command to generate a new token.

Request Example

The following creates an authentication token for user `root`:

```
curl -X POST \
  'https://10.10.100.42:8243/auth/v2/token' \
  -u root:mapr
```

Response Example

```
200 OK

{
  "token":
  "eyJhbGciOiJIUzUxMiJ9.eyJzdWIiOiJtYXByIiwiaXVkiOiJoid2ViIiwiaXNjaXkiOiJ0eXNTE2NzQ2MDc4LkUyYXQyOjE1MTY3NDQyNzh9.6YXWX72UP9_U9DPmT8c-_DQRDwY_TL0DEdsBaBqoaLf8iK0qHNctyBTbFO5ktUJMTubVOj6D7pFOEyEuV8lhjA"
}
```

For an example that shows how to use the token returned by this API call in a subsequent `GET` command, see [Using Token-Based Authentication](#) on page 2978.

PUT /api/v2/table/{path}

Creates a HPE Ezmeral Data Fabric Database JSON table

Parameters

| Name | Description |
|--------------------------|--|
| path string (path) | Required: Path to the new HPE Ezmeral Data Fabric Database JSON table |

Request Example

The following creates a table with the path `/apps/employees`:

```
curl -X PUT \
  'https://10.10.100.42:8243/api/v2/table/%2Fapps/employees' \
  -u root:mapr
```

Response Example

```
201 Created
```

DELETE /api/v2/table/{path}

Drops a HPE Ezmeral Data Fabric Database JSON table

Parameters

| Name | Description |
|--------------------------|--|
| path string (path) | Required: Path to the HPE Ezmeral Data Fabric Database JSON table |

Request Example

The following drops a table with the path `/apps/employees`:

```
curl -X DELETE \
  'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees' \
  -u root:mapr
```

Response Example

```
200 OK
```

POST /api/v2/table/{path}

Adds or replaces one or more documents in a HPE Ezmeral Data Fabric Database JSON table

Parameters

| Name | Description |
|---------------------------------|--|
| path string (path) | Required: Path to the HPE Ezmeral Data Fabric Database JSON table |
| fieldAsKey string (query) | The name of the field that serves as the key in the JSON document |
| mode string (query) | <p>Defines the behavior of the operation.</p> <p>The following are the possible values:</p> <ul style="list-style-type: none"> <code>insertOrReplace</code> - Inserts new document if specified document ID does not exist; otherwise, replaces existing document specified by the ID. <code>insert</code> - Inserts new document; if the specified document ID already exists, returns an error. <code>replace</code> - Replaces document with specified ID; returns an error if document does not exist. <p>Default: <code>insertOrReplace</code></p> |
| body (body) | The body of the documents to add or replace |

Request Example

The following inserts 3 documents into `/apps/employees`:

```
curl -X POST \
  'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees' \
  -u root:mapr \
  -H 'Content-Type: application/json' \
  -d '[{"_id": "user001", "first_name": "John", "last_name": "Doe"},
{"_id": "user002", "first_name": "Jane", "last_name": "Doe"},
{"_id": "user003", "first_name": "Simon", "last_name": "Davis"}]'
```

Response Example

```
200 OK
```

PUT /api/v2/table/{path}/document/{id}

Updates a single document by id in a HPE Ezmeral Data Fabric Database JSON table

Parameters

| Name | Description |
|--------------------------------|---|
| path string (path) | Required: Path to the HPE Ezmeral Data Fabric Database JSON table |
| id string (path) | Required: Id of the document to update. If the document with the specified id does not exist, the mode parameter determines the behavior. |
| condition string (query) | Query condition (in JSON format) used to perform OJAI <code>DocumentStore.checkAndReplace</code> evaluation. See OJAI Query Condition Syntax on page 2882 for a description of the syntax. |
| mode string (query) | Defines the behavior of the operation. The following are the possible values: <ul style="list-style-type: none"> <code>insertOrReplace</code> - Inserts new document if specified document ID does not exist; otherwise, replaces existing document specified by the ID. <code>insert</code> - Inserts new document; if the specified document ID already exists, returns an error. <code>replace</code> - Replaces document with specified ID if it exists Default: <code>insertOrReplace</code> |
| body (body) | Required: The body of the new document |

Request Example

The following replaces the document with id `user001` in `/apps/employees` with an employee who has only a first name:

```
curl -X PUT \
'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees/document/
user001' \
-H 'Content-Type: application/json' \
-u root:mapr \
-d '{"_id":"user001","first_name":"Jonathan"}'
```

Response Example

```
200 OK
```

POST /api/v2/table/{path}/document/{id}

Updates a partial document by id in a HPE Ezmeral Data Fabric Database JSON table using mutations

Parameters

| Name | Description |
|--------------------------------|---|
| path string (path) | Required: Path to the HPE Ezmeral Data Fabric Database JSON table |
| id string (path) | Required: Id of the document to update. If the document does not exist, inserts a new document. |
| condition string (query) | Query condition (in JSON format) used to perform <code>OJAI DocumentStore.checkAndUpdate</code> evaluation. See OJAI Query Condition Syntax on page 2882 for a description of the syntax. |
| body (body) | Required: The mutation specifying updates to the document. See Using OJAI Mutation Syntax on page 2837 for a description of the syntax. |

Request Example

The following updates the `first_name` field the document in `/apps/employees` with id `user001`, replacing the field with the value `Jay`:

```
curl -X POST \
'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees/document/
user001' \
-H 'Content-Type: application/json' \
-u root:mapr \
-d '{"$set":{"first_name":"Jay"}}'
```

Response Example

```
200 OK
```

DELETE /api/v2/table/{path}/document/{id}

Deletes a single document by id in a HPE Ezmeral Data Fabric Database JSON table

Parameters

| Name | Description |
|--------------------------------|---|
| path string (path) | Required: Path to the HPE Ezmeral Data Fabric Database JSON table |
| id string (path) | Required: Id of the document to delete |
| condition string (query) | Query condition (in JSON format) used to perform OJAI <code>DocumentStore.checkAndDelete</code> evaluation. See OJAI Query Condition Syntax on page 2882 for a description of the syntax. |

Request Example

The following deletes the document with id `user003` in `/apps/employees`:

```
curl -X DELETE \
  'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees/document/
  user003' \
  -u root:mapr
```

Response Example

```
200 OK
```

GET /api/v2/table/{path}

Retrieves one or more documents from a HPE Ezmeral Data Fabric Database JSON table

Parameters

| Name | Description |
|--------------------------------|--|
| path string (path) | Required: Path to the HPE Ezmeral Data Fabric Database JSON table |
| condition string (query) | Query condition (in JSON format) to evaluate on documents retrieved. See OJAI Query Condition Syntax on page 2882 for a description of the syntax. |
| fields string (query) | The fields from the document to retrieve. See JSON Document Field Paths on page 478 for details about how to specify field paths. |

| Name | Description |
|-------------------------------|--|
| fromId string (query) | Starting id of the range of documents to retrieve (inclusive) |
| told string (query) | Ending id of the range of documents to retrieve (exclusive) |
| getPlan string (query) | If set to <code>true</code> , returns the query plan used to retrieve the documents Value: True False Default: False |
| limit integer (query) | The maximum number of documents to retrieve |
| offset integer (query) | The number of documents to skip past before returning results |
| orderBy string (query) | The fields on which to sort the result. Specify the fields in a comma separated list, in the format <code><field name>:<sort order></code> where <code><sort order></code> is either <code>asc</code> or <code>desc</code> . <code><sort order></code> is optional and defaults to <code>asc</code> . |
| query string (query) | Query string with predefined keywords that define the behavior of the query. See Query with --query on page 5495 for syntax details. |
| withTags string (query) | Enables or disables output with extended type tags Value: True False Default: True |

Request Examples

1. The following retrieves all documents from `/apps/employees`:

```
curl -X GET \
  'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees' \
  -u root:mapr
```

2. The following specifies an offset and limit in the GET request:

```
curl -X GET \
  'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees%2F?offset=1&limit=2' \
  -u root:mapr
```

3. The following retrieves only the first names in the documents:

```
curl -X GET \
'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees?
fields=first_name' \
-u root:mapr
```

4. The following retrieves all documents with a last name of 'Doe':

```
curl -g -X GET \
'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees?
condition={"$eq":{"last_name":"Doe"}}' \
-u root:mapr
```

Note: You must pass '-g' in the cURL command due to the nested braces in the condition.

5. The following retrieves the id and first name of documents with a last name of 'Doe':

```
curl -g -X GET \
'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees?
condition={"$eq":{"last_name":"Doe"}}&fields=_id,first_name' \
-u root:mapr
```

6. The following runs the same command and includes a request for the query plan:

```
curl -g -X GET \
'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees?
condition={"$eq":{"last_name":"Doe"}}&fields=_id,first_name&getPlan=true' \
-u root:mapr
```

Response Examples

```
200 OK

{
  "DocumentStream": [
    {
      "_id": "user001",
      "first_name": "John",
      "last_name": "Doe"
    },
    {
      "_id": "user002",
      "first_name": "Jane",
      "last_name": "Doe"
    },
    {
      "_id": "user003",
      "first_name": "Simon",
      "last_name": "Davis"
    }
  ]
}
```

If you have configured the MapR Data Access Gateway to limit the number of documents in retrieval requests, and your result set exceeds the limit, the API response includes a warning. In the following example, the limit is set to 2:

```
{
  "DocumentStream": [
    {
      "_id": "user001",
      "first_name": "John",
      "last_name": "Doe"
    },
    {
      "_id": "user002",
      "first_name": "Jane",
      "last_name": "Doe"
    }
  ],
  "WARNING": "result truncated due to limit set to 2."
}
```

The following shows an example of output that includes a query plan. It corresponds to the output from example #6 in the previous section:

```
{
  "DocumentStream": [
    {
      "_id": "user001",
      "first_name": "John"
    },
    {
      "_id": "user002",
      "first_name": "Jane"
    }
  ],
  "QueryPlan": [
    [
      {
        "streamName": "DBDocumentStream",
        "parameters": {
          "queryConditionPath": true,
          "projectionPath": [
            "_id",
            "first_name"
          ],
          "primaryTable": "/apps/employees"
        }
      }
    ]
  ]
}
```

GET /api/v2/table/{path}/document/{id}

Retrieves a single document by id from a HPE Ezmeral Data Fabric Database JSON table

Parameters

| Name | Description |
|--------------------------------|---|
| path string (path) | Required: Path to the HPE Ezmeral Data Fabric Database JSON table |
| id string (path) | Required: Id of the document to retrieve |
| condition string (query) | Query condition (in JSON format) to evaluate on document retrieved. See OJAI Query Condition Syntax on page 2882 for a description of the syntax. |
| fields string (query) | The fields from the document to retrieve. See JSON Document Field Paths on page 478 for details about how to specify field paths. |
| withTags string (query) | Enables or disables output with extended type tags Value: True False Default: True |

Request Example

The following retrieves the document with id `user003` from `/apps/employees`:

```
curl -X GET \
'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees/document/
user003' \
-u root:mapr
```

Response Example

```
200 OK

{
  "_id": "user003",
  "first_name": "Simon",
  "last_name": "Davis"
}
```

HPE Ezmeral Data Fabric Database JSON MapReduce API

This API library extends the Apache Hadoop MapReduce framework, so that you can write your own MapReduce applications to write data from one JSON table to another.

Prerequisites to using this API Library

- Ensure that you have a firm grasp of MapReduce concepts and experience writing MapReduce applications.
- Before running a MapReduce application that uses this API, ensure that the destination JSON table or tables already exist and that any column families other than the default are already created on the destination tables.

Classes

The following table summarizes the information that is in the [HPE Ezmeral Data Fabric Database JSON MapReduce API](#), which you can refer to for complete details of the classes.

| Category | Class | Description |
|-------------------|----------------------------|--|
| Utility | MapRDBMapReduceUtil | Simplifies the use of the API for most use cases. |
| Input formatters | TableInputFormat | Describes how to read documents from HPE Ezmeral Data Fabric Database JSON tables. |
| Record reader | TableRecordReader | Reads documents (records) from HPE Ezmeral Data Fabric Database JSON tables. |
| | TableRecordReaderImpl | Iterates over HPE Ezmeral Data Fabric Database JSON table data. Returns key-value pair as <code>ByteBufWritableComparable</code> and <code>Document</code> respectively. |
| Record writers | BulkLoadRecordWriter | Bulk loads documents into HPE Ezmeral Data Fabric Database JSON tables. |
| | TableMutationRecordWriter | Modifies documents that are in HPE Ezmeral Data Fabric Database JSON tables. |
| | TableRecordWriter | Writes documents to HPE Ezmeral Data Fabric Database JSON tables. |
| Output formatters | BulkLoadOutputFormat | Describes how to bulk load documents into HPE Ezmeral Data Fabric Database JSON tables. |
| | TableOutputFormat | Describes how to write documents to HPE Ezmeral Data Fabric Database JSON tables. |
| | TableMutationOutputFormat | Writes <code>DocumentMutation</code> from the MapReduce phase to JSON tables . The key is of type <code>Value</code> and the value is a <code>DocumentMutation</code> . |
| Serializers | DocumentSerialization | Defines the serializer and deserializer for passing data from <code>Document</code> objects between map and reduce phases. |
| | DBDocumentSerialization | Converts a JSON document from HPE Ezmeral Data Fabric Database format to binary <code>SequenceFile</code> format. |
| | ValueSerialization | Serializes a JSON key and passes it between MapReduce phases. |
| Partitioner | TablePartitioner | Specifies how to partition data from the source JSON table. |
| | TotalOrderPartitioner<K,V> | Globally sorts data according to row key and then partitions the sorted data. This class is useful when the destination table has been pre-split into two or more tablets. |

Using MapRDBMapReduceUtil to Set Default Values in Configurations and Jobs

The centerpiece of this API is the `MapRDBMapReduceUtil` class, which you can use in the `createSubmittableJob()` method of your applications to perform these actions:

- Set default values in the configuration for a MapReduce application and set the input and output format classes.
- Set default types for output keys and values.
- Configure a `TotalOrderPartitioner` and return the number of reduce tasks to use for a job.

To set default values in the configuration for a MapReduce application and set the input and output format classes, use the following methods:

```
configureTableInputFormat(org.apache.hadoop.mapreduce.Job job, String
srcTable)
```

The `configureTableInputFormat` method performs the following actions:

- Set the serialization class for `Document` and `Value` objects. These interfaces are part of the OJAI (Open JSON Application Interface) API.
- Set the field `INPUT_TABLE` in `TableInputFormat` to the path and name of the source table, and pass this value to the configuration for the MapReduce application.
- Set the input format class for the job to `TableInputFormat`.

```
configureTableOutputFormat(org.apache.hadoop.mapreduce.Job job, String
destTable)
```

The `configureTableOutputFormat` method performs the following actions:

- Set the field `OUTPUT_TABLE` in `TableOutputFormat` to the path and name of the destination table, and pass this value to the configuration for the MapReduce applications.
- Set the output format class for the job to `TableOutputFormat`.

If you want to set values for other fields in `TableInputFormat` or `TableOutputFormat`, or write your own logic for them, you can pass field values to configurations and specify these classes for jobs as you would in common MapReduce applications.

To set default types for output keys and values, use the following methods:

```
setMapOutputKeyValueClass(org.apache.hadoop.mapreduce.Job job)
setOutputKeyValueClass(org.apache.hadoop.mapreduce.Job job)
```

Note: You can also set types for output keys and values from the map phase, if those types will differ from the final output types.

To configure `TotalOrderPartitioner` and return the number of reduce tasks to use for a job, you can use a code line similar to the following in your application's method for creating a job:

```
int numReduceTasks =
MapRDBMapReduceUtil.setPartitioner(org.apache.hadoop.mapreduce.Job job,
String destPath);
```

The `setPartitioner()` method finds out whether a table has been pre-split into two or more tablets, counts the number of tablets, writes the number to a partitioner file, and sends that file to an instance of

`TotalOrderPartitioner`. This line also returns the number of tablets to `numReduceTasks`. Your code can then use that variable to set the number of reducers, like the following:

```
job.setNumReduceTasks(numReduceTasks);
```

Note: The sample application gives an example of how to use `MapRDBMapReduceUtil`.

Mutating Rows in Destination Tables

Use the `TableMutationRecordWriter` class when you need to mutate rows.

For example, suppose that you are tracking the number of users who are performing various actions on your retail website. To do this, at intervals you run your MapReduce application and save the results in JSON documents in HPE Ezmeral Data Fabric Database. Suppose that you count the number of users who went through the order process but abandoned their orders. After every run of the application, you want to update a JSON document by adding the current count to the total count and by updating a field that tracks the date and time that the MapReduce application was last run.

You could do that by setting values in a `DocumentMutation` object (see the [OJAI \(Open JSON Application Interface\) Javadoc](#)). You would then serialize that and write it to the table with `TableMutationRecordWriter`.

Compiling and Running Applications

You can compile applications that use the HPE Ezmeral Data Fabric Database Java API by using the required JAR file from the MapR installation. Run applications with the `mapr` command.

To compile an application, use the following command:

```
javac -cp 'mapr_classpath' <Application jars>
```

To launch an application, use the following command

```
mapr <Main class jar> <commandline arguments>
```

Note: If you want to add JAR files to the classpath that the `mapr` command uses, add them with the environment variable `MAPR_CLASSPATH`. For example:

```
export MAPR_CLASSPATH=/home/apps/awesome-1.0.jar
mapr com.company.MyAwesomeApp
```

**Important:** Turn off speculative execution

Speculative execution of MapReduce tasks is on by default. For custom applications that load HPE Ezmeral Data Fabric Database tables, it is recommended to turn speculative execution off. When it is on, the tasks that import data might run multiple times. Multiple tasks for an incremental bulkload could insert one or more versions of a record into a table. Multiple tasks for a full bulkload could cause loss of data if the source data continues to be updated during the load.

If your custom MapReduce application uses

`MapRDBMapReduceUtil.configureTableOutputFormat()`, you do not have to turn off speculative execution manually. This method turns it off automatically.

Turn off speculative execution by using either of these methods:

- Set the following MapReduce version 2 parameter to false: `mapreduce.map.speculative`
- Include the following line in the method in your application that sets parameters for jobs:

```
job.setSpeculativeExecution(false);
```

HPE Ezmeral Data Fabric Database JSON MapReduce: Sample App

This sample application reads records (JSON documents) from a JSON table and inserts new documents into another JSON table.

After reading records from a JSON table, the application aggregates data within those records, creates new JSON documents that contain the aggregated records, and then inserts the new documents into another JSON table. Each record contains the name of an author and the name of a book that the author has written.

The JSON documents have this structure:

```
{
  "_id" : <string or binary>,
  "authorid" : "<string>",
  "name" : "<string>",
  "book" : {
    "id" : <int>,
    "title" : "<string>"
  }
}
```

The structure of each aggregate record will look like this:

```
{
  "_id" : <string or binary>,
  "authorid" : "<string>",
  "book" : {
    [
      "title" : "<string>",
      "title" : "<string>",
      ...
    ]
  }
}
```

Prerequisites

- Ensure that your user ID has the `-readAce` and `-writeAce` privileges on the volumes where you plan to create the source and destination tables.

- Create the source JSON table. You can create the source table and populate it with sample records by running [sample_dataset.txt](#) from the `mapr dbshell` utility.

```
$ mapr dbshell < sample_dataset.txt
```

- Create the destination JSON table. A simple way to create this table is to use the `create` command in the [HPE Ezmeral Data Fabric Database Shell \(JSON Tables\)](#) on page 5488 utility.

Compiling and Running

To compile an application, use the following command:

```
javac -cp <classpath> <java source file(s)>
```

To launch an application, use the following command:

```
java -cp <classpath>:. -Djava.library.path=/opt/mapr/lib <main class>  
<command line arguments>
```

To run the application, supply the paths and names of the source and destination tables as arguments:

```
CombineBookList <source_table> <destination_table>
```

Code Walkthrough

```
private static Job createSubmittableJob(Configuration conf, String[]  
otherArgs)  
    throws IOException {  
  
    srcTable = otherArgs[0];  
    destTable = otherArgs[1];  
  
    Job job = new Job(conf, NAME + "_" + destTable);  
    job.setJarByClass(CombineBookList.class);  
    MapRDBMapReduceUtil.configureTableInputFormat(job, srcTable);  
    job.setMapperClass(CombineBookListMapper.class);  
    MapRDBMapReduceUtil.setMapOutputKeyValueClass(job);  
    MapRDBMapReduceUtil.configureTableOutputFormat(job, destTable);  
    job.setReducerClass(CombineBookListReducer.class);  
    MapRDBMapReduceUtil.setOutputKeyValueClass(job);  
    job.setNumReduceTasks(1);  
    return job;  
}
```

The `createSubmittableJob()` method uses methods that are in the [MapRDBMapReduceUtil](#) class to perform the following tasks:

Set the input format to the default table input format

You can call the `configureTableInputFormat()` method, passing in the job and also passing in the path and name of the source table:

```
MapRDBMapReduceUtil.configureTableInputFormat(job, srcTable);
```

The default behavior is to do the following:

- Set the serialization class for [Document](#) and [Value](#) objects. These interfaces are part of the OJAI (Open JSON Application Interface) API.
- Set the field `INPUT_TABLE` in [TableInputFormat](#) to the path and name of the source table, and pass this value to the configuration for the MapReduce application.
- Set the input format class for the job to [TableInputFormat](#).

If you want to customize [TableInputFormat](#), you can call it as you would normally set the input format for a job:

```
job.setInputFormatClass(TableInputFormat.class);
```

Set the type for keys and values that are output from the mapper

You can call the `setMapOutputKeyValueClass()` method to use the default type for keys and values:

```
MapRDBMapReduceUtil.setMapOutputKeyValueClass(job);
```

If you want to customize the output keys and values, you can call `Job.setMapOutputKeyClass()` and `Job.setMapOutputValueClass()` as you would normally for MapReduce applications.

Set the output format to the default table output format

You can call the `configureTableOutputFormat()` method, passing in the job and also passing in the path and name of the destination table, which must already exist at runtime:

```
MapRDBMapReduceUtil.configureTableOutputFormat(job, destTable);
```

The default behavior is to do the following:

- Set the field `OUTPUT_TABLE` in [TableOutputFormat](#) to the path and name of the destination table, and pass this value to the configuration for the MapReduce applications.
- Set the output format class for the job to [TableOutputFormat](#).

If you want to customize [TableOutputFormat](#), you can call it as you would normally set the output format for a job:

```
job.setOutputFormatClass(TableOutputFormat.class);
```

You also have the option of using the [BulkLoadOutputFormat](#) class for bulk loading.

Set the type of the keys and values that are output from the reducer

You can call the `setOutputKeyValueClass()` method to use the default type for keys and values:

```
MapRDBMapReduceUtil.setOutputKeyValueClass(job);
```

If you want to customize the output keys and values, you can call `Job.setOutputKeyClass()` and `Job.setOutputValueClass()` as you would normally for MapReduce applications.

The `map()` method in the mapper class `CombineBookListMapper` takes the value of the `_id` field in a document as a key and the JSON document with that `_id` field value as a `Document`. The mapper does nothing with the `Value` object. For each `record`, the mapper writes the value of the `authorid` field and the full JSON document itself to the context.

```
public static class CombineBookListMapper extends Mapper<Value, Document, Value, Document> {
    @Override
    public void map(Value key, Document record, Context context) throws IOException, InterruptedException {
        context.write(record.getValue("authorid"), record);
    }
}
```

Both the `Value` and `Document` interfaces are part of the OJAI (Open JSON Application Interface) API. The javadoc for the OJAI API is [here](#).

The `reduce()` method in the reducer class `CombineBookListReducer` takes the map output key, which is the value of the `authorid` field, and the map output value, which is an iterator of `Document` objects that each contain a full record. For each author ID, the reducer creates a document. For each document in the iterator, the reducer extracts the value of the `book` field and adds that value to the list `books` within a new JSON document.

```
public static class CombineBookListReducer extends Reducer<Value, Document, Value, Document> {

    @Override
    public void reduce(Value key, Iterable<Document> values, Context context) throws IOException, InterruptedException {
        Document d = MapRDB.newDocument();
        List<Document> books = new ArrayList<Document>();

        for (Document b : values) {
            books.add((Document)b.getValue("book"));
        }

        d.setId(key);
        d.set("books", books);
        context.write(key, d);
    }
}
```

The [MapRDB](#) class is part of the HPE Ezmeral Data Fabric Database JSON API, not the HPE Ezmeral Data Fabric Database JSON MapReduce API.

HPE Ezmeral Data Fabric Event Streams and Apps

HPE Ezmeral Data Fabric Event Streams brings integrated publish and subscribe messaging to HPE Ezmeral Data Fabric.

HPE Ezmeral Data Fabric Event Streams is built into the HPE Ezmeral Data Fabric. It requires no additional process to manage, leverages the same architecture as the rest of the platform, and requires minimal additional management.

1. [The Getting Started with HPE Ezmeral Data Fabric Event Streams section](#) provides overall instructions for setting up, producing, and consuming streams.
2. [The HPE Ezmeral Data Fabric Event Streams section](#) provides conceptual information.
3. [The Administering Streams section](#) provides information about creating and managing streams, topics, and stream replication.

! **Attention:** As of core version 6.1, the HPE Ezmeral Data Fabric Event Streams API enforces a maximum of 4096 partitions for a topic. If you create an application with the HPE Ezmeral Data Fabric Event Streams 6.1 API, the maximum number of partitions is 4096. If you previously created an application with HPE Ezmeral Data Fabric Event Streams 6.0.1 API (or older) and you have upgraded, the original number of partitions can be used. For example, if you were using more than 4096 partitions in core version 6.0.1 or earlier, you can continue with the same number of partitions after upgrading.

Getting Started with HPE Ezmeral Data Fabric Event Streams

If you have a basic understanding of HPE Ezmeral Data Fabric Event Streams components and the typical flow of messages from producers to consumers, you can get started.

- Ensure that your Linux, Windows, or OS X system has Java SDK 7 or later installed.

- Install the latest version of HPE Ezmeral Data Fabric on a cluster.
- Install the core client (mapr-client) package, if you want to run the producer and consumer from a machine outside the cluster. See [Installing the Data Fabric Client](#) on page 340 for more information.

1. On a node in the HPE Ezmeral Data Fabric cluster, follow these steps:

a) Create a stream.

- Run this command if you plan to run the producer and consumer with the same user ID that you are using to create the stream:

```
maprcli stream create -path /<path to and name of the stream>
```

- Run this command if you plan to run the producer and consumer with user IDs that are different from the user ID that you are using to create the stream:

```
maprcli stream create -path /<path to and name of the stream> -consumeperm u:<user ID> -produceperm u:<user ID>
```

The two additional parameters grant security permissions. By default, these permissions are granted to the user ID that ran the `maprcli stream create` command.

| | |
|---------------------|---|
| -consumeperm | Grants permission to read messages from topics that are in the stream. |
| -produceperm | Grants permission to publish messages to topics that are in the stream. |

b) Create a topic.

Run this command to create the topic:

```
maprcli stream topic create -path <path and name of the stream> -topic <name of the topic>
```

2. On the system where the mapr-client is installed, compile and launch the Java consumer first and then launch the Java producer.

In both the consumer and producer, change this text to the path and name of your stream and to the name of the first of the topics:

```
/<path to and name of the stream>:<name of topic>
```

For the steps of compiling and launching, see [Compiling and Running HPE Ezmeral Data Fabric Event Streams Java Apps](#) on page 3051.

Launch the consumer first, and then launch the producer. If you launch the producer first and then the consumer, the producer publishes 50 messages, but the consumer (as consumers do by default) starts reading from the head of the partition, which is after the 50 messages.

Note: As of MapR 6.0, the message offset in a partition starts from zero (0). If you are upgrading and do not enable the HPE Ezmeral Data Fabric Database/HPE Ezmeral Data Fabric Event Streams feature, **mfs.feature.db.streams.v6.support**, the message offset in a partition starts from one (1).

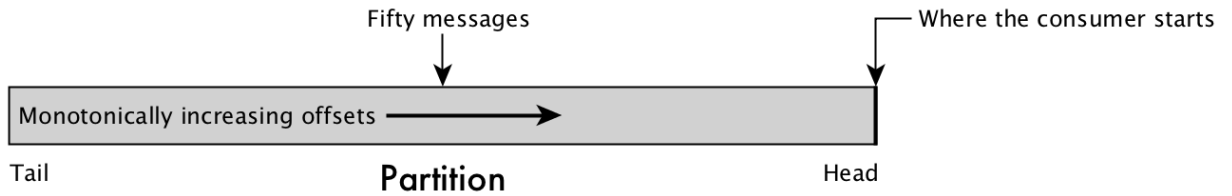

Figure 31: Result of starting the producer before starting the consumer for this step

If you launch the consumer first, the partition is empty and the consumer continuously polls for new messages.

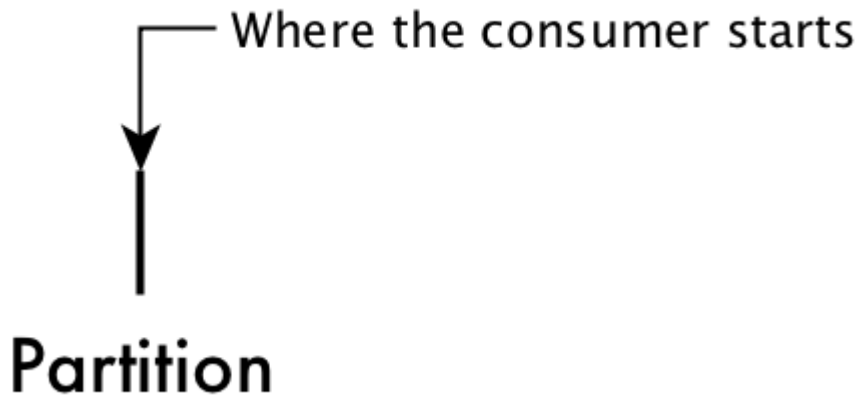

Figure 32: The position of a consumer on an empty partition

After you launch the producer, the fifty messages are published to the partition, and the consumer can move forward in the partition, reading the messages.

Figure 33: Result of starting the consumer first and then starting the producer for this step

Sample Java Consumer

You need to first add the following dependency to the POM file:

```
<dependency>
  <groupId>commons-logging</groupId>
  <artifactId>commons-logging</artifactId>
  <version>1.1.1</version>
</dependency>

/* This code is successfully tested for common-logging version 1.11 and
1.2. */
```

```

import org.apache.kafka.clients.consumer.ConsumerConfig;
import org.apache.kafka.clients.consumer.ConsumerRecords;
import org.apache.kafka.clients.consumer.KafkaConsumer;

import java.time.Duration;
import java.util.Collections;
import java.util.Properties;

public class SampleConsumer {
    // Set the stream and topic to read from
    public static String topic = "<path to and name of the stream>:<name
of topic>";

    // Declare a new consumer.
    public static KafkaConsumer<Integer, String> consumer;

    public static void main(String[] args) {
        configureConsumer();

        // Subscribe to the topic.
        consumer.subscribe(Collections.singletonList(topic));

        // Set the timeout interval for requests for unread messages.
        Duration pollTimeout = Duration.ofMillis(1000);

        try {
            while (true) {
                ConsumerRecords<Integer, String> records =
consumer.poll(pollTimeout);
                records.forEach(record -> {
                    System.out.printf("%s %d %d %s %s \n", record.topic(),
record.partition(), record.offset(),
record.key(), record.value());
                });
            } finally {
                consumer.close();
            }
        }

        /* Set the value for a configuration parameter.
        This configuration parameter specifies which
        class to use to deserialize the value of each message. */
        public static void configureConsumer() {
            Properties props = new Properties();
            props.put(ConsumerConfig.GROUP_ID_CONFIG, "consumer-group");
            props.put(ConsumerConfig.AUTO_OFFSET_RESET_CONFIG, "earliest");
            props.put(ConsumerConfig.KEY_DESERIALIZER_CLASS_CONFIG,

"org.apache.kafka.common.serialization.IntegerDeserializer");
            props.put(ConsumerConfig.VALUE_DESERIALIZER_CLASS_CONFIG,
                "org.apache.kafka.common.serialization.StringDeserializer");
            consumer = new KafkaConsumer(props);
        }
    }
}

```

Sample Java Producer

```

import org.apache.kafka.clients.producer.KafkaProducer;
import org.apache.kafka.clients.producer.ProducerConfig;
import org.apache.kafka.clients.producer.ProducerRecord;

```

```

import java.util.Properties;

public class SampleProducer {
    // Set the stream and topic to publish to.
    public static String topic = "/<path to and name of the stream>:<name
of topic>";
    // Set the number of messages to send.
    public static int numMessages = 50;

    // Declare a new producer.
    public static KafkaProducer<Integer, String> producer;

    public static void main(String[] args) {
        configureProducer();

        for(int i = 0; i < numMessages; i++) {
            // Set content of each message.
            String messageText = "Msg " + i;

            /* Add each message to a record. A ProducerRecord object
            identifies the topic or specific partition to publish
            a message to. */
            ProducerRecord<Integer, String> rec = new ProducerRecord(topic,
i, messageText);

            // Send the record to the producer client library.
            producer.send(rec);
            System.out.println("Sent message number " + i);
        }
        producer.close();
        System.out.println("All done.");
    }

    /* Set the value for a configuration parameter.
    This configuration parameter specifies which class
    to use to serialize the value of each message. */
    public static void configureProducer() {
        Properties props = new Properties();
        props.put(ProducerConfig.KEY_SERIALIZER_CLASS_CONFIG,
            "org.apache.kafka.common.serialization.IntegerSerializer");
        props.put(ProducerConfig.VALUE_SERIALIZER_CLASS_CONFIG,
            "org.apache.kafka.common.serialization.StringSerializer");
        producer = new KafkaProducer(props);
    }
}

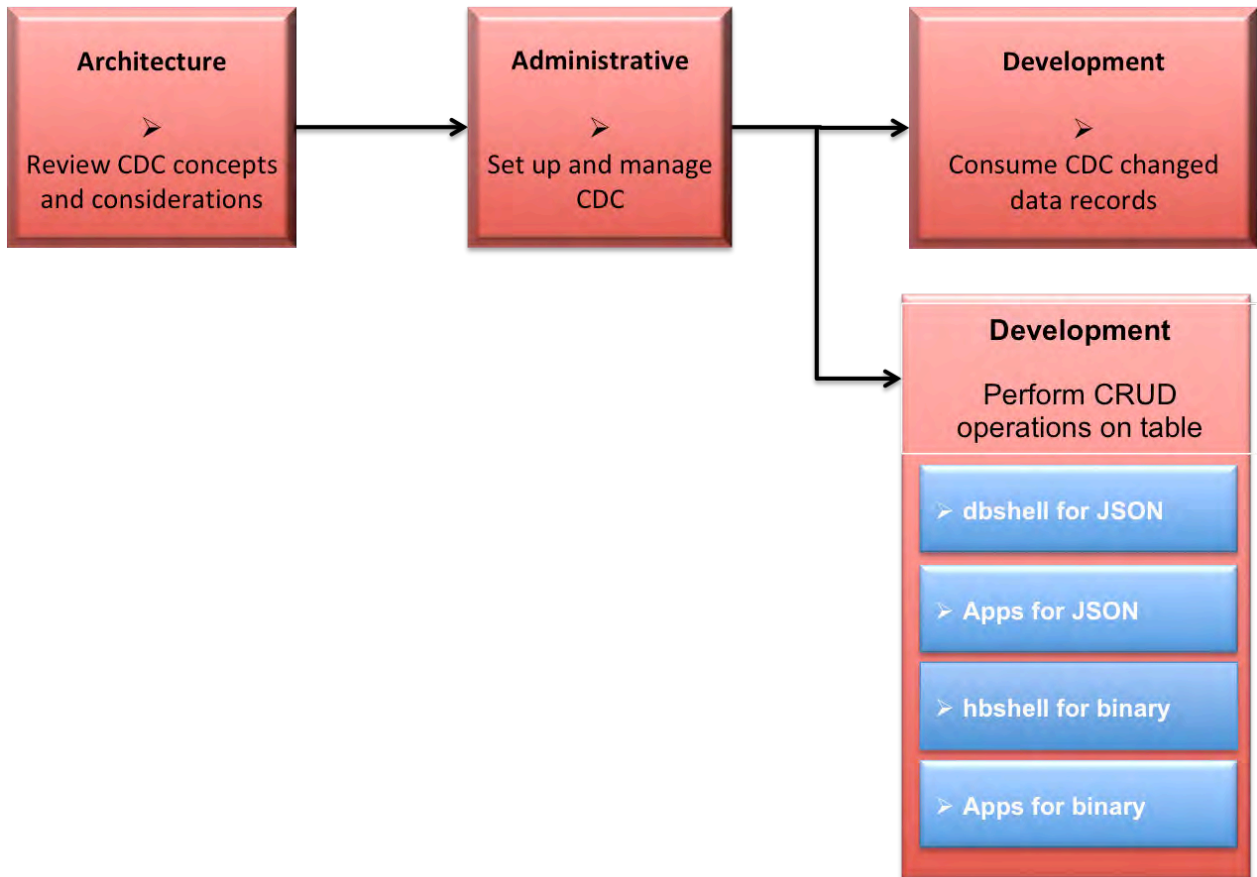

```

For additional information, see <https://github.com/mapr-demos/mapr-streams-sample-programs>.

Consuming CDC Records

The OJAI changelog interfaces are used to consume changed data records (propagated by the Change Data Capture feature).

The general CDC flow of understanding architectural concepts, performing administrative tasks to set up and use CDC, performing CRUD operations on a database table, and developing applications for consuming CDC changed data records. This diagram provides hotspot links to help you navigate to the applicable documentation.

1. [Learning about CDC](#)
2. [Administering Change Data Capture](#)
3. [Building a consumer app for CDC](#)
4. [Using dbshell to perform CRUD operations on HPE Ezmeral Data Fabric Database JSON tables](#)
5. [Developing client applications for HPE Ezmeral Data Fabric Database JSON tables.](#)
6. [Using hbshell to perform CRUD operations on HPE Ezmeral Data Fabric Database binary tables.](#)
7. [Developing client applications for HPE Ezmeral Data Fabric Database binary tables.](#)

Javadoc

See the following Java documentation for detailed information about CDC APIs.

[Java OJAI CDC API](#)

Deserializer for consuming CDC records

The deserializer converts stream messages into individual change data records.

When your application creates a CDC consumer, you must also register the ChangeData deserializer by setting the `value.deserializer` configuration parameter to `com.mapr.db.cdc.ChangeDataRecordDeserializer`.

Note: When applications consume from a CDC change topic, the record key retrieved from `poll()` is not deserialized. The record key is not equal to the `_id` field of the document. If you want to retrieve the exact `_id` of the document, you must call the `ChangeDataRecord.getId()` method.

Interfaces for working with CDC records

The following OJAI interfaces and enumerations create consumers for CDC changed data.

ChangeNode

Contains the change to a single field in a document.

ChangeEvent

Identifies the change event associated with the current change node. The value of `ChangeEvent` can be one of the following:

- NULL (no event)
- NODE (a change with real value)
- START_MAP (a node representing the beginning of a map)
- END_MAP (a node representing the end of a map)
- START_ARRAY (a node representing the beginning of an array)
- END_ARRAY (a node representing the end of an array)

ChangeOp

Identifies the type of the operation performed on the current field. The values of `ChangeOp` can be one of the following:

- NULL (no operation)
- SET (replace the current field with the given value)
- PUT (add an extra version of the value)
- MERGE (combine the given value with the existing values in the table)
- DELETE (delete all values older than or equal to the delete operation timestamp)
- DELETE_EXACT (delete the version of the value with the given timestamp)

ChangeDataRecord

Contains all the changes made on a single document/row in the source table.

ChangeDataRecordType

Specifies the mode of change for the change data record. The following values are specified:

- RECORD_INSERT
- RECORD_UPDATE
- RECORD_DELETE

ChangeDataReader

Is a parser that traverses over the individual change tree nodes on a change data record. It provides cursor-like semantics that can be moved, one tree node at a time, by invoking the `next` method. The APIs retrieve the properties of individual change nodes

(for example: data type, field name, field value, and so on).

Open Data Format

The CDC Open Format feature allows you to create applications in languages other than Java that consume CDC (Change Data Capture) changed data records. For example, C/C++, Python, and C#/.NET are supported.

This functionality is provided with an open format decoder/serializer in the HPE Ezmeral Data Fabric Event Streams C library. The decoder translates the internal format to the open data format, decodes/deserializes the data, and returns the value of the changed data record as a human readable JSON string.

All languages that are binding through the HPE Ezmeral Data Fabric Event Streams C library can retrieve the open data format and, with a simple JSON parser, consume changed data records.

Building Consumers for CDC

HPE Ezmeral Data Fabric Event Streams consumers read and process CDC changed data records. The consumer is built with the OJAI API library.

Description

When building a consumer, the general steps are to:

- Set the consumer properties using Apache Kafka and HPE Ezmeral Data Fabric configuration parameters.
- Subscribe to the stream topic.
- Consume the events and determine record type.
- Process the change data records.

The following examples refer to the [MapR CDC Sample](#). See the [Java OJAI CDC API](#) for specific API information.

Set Configuration

This code snippet configures the consumer properties using the Apache Kafka configuration parameters. See [HPE Ezmeral Data Fabric Event Streams Configuration Parameters](#) for Consumers. This could be externalized in a file or hard coded in the application code. The following code examples show both methods.

Note: CDC uses a optimized serialization format for all the events, so `value.deserializer` must be set to `com.mapr.db.cdc.ChangeDataRecordDeserializer`.

```
// Consumer configuration parameters specified in application

Properties consumerProperties = new Properties();
consumerProperties.setProperty("group.id",
"cdc.consumer.demo_table.fts_geo");
consumerProperties.setProperty("enable.auto.commit", "true");
consumerProperties.setProperty("auto.offset.reset", "latest");
consumerProperties.setProperty("key.deserializer",
"org.apache.kafka.common.serialization.ByteArrayDeserializer");
consumerProperties.setProperty("value.deserializer",
```

```
"com.mapr.db.cdc.ChangeDataRecordDeserializer");

// Consumer configuration parameters specified in an external file

key.deserializer=org.apache.kafka.common.serialization.ByteArrayDeserializer
value.deserializer=com.mapr.db.cdc.ChangeDataRecordDeserializer
enable.auto.commit=true
auto.offset.reset=latest
group.id=cdc.consumer.demo_table.fts_geo
```

Subscribe to topic

This code snippet creates the consumer and subscribes to the HPE Ezmeral Data Fabric Event Streams topic that contains the change data records. The consumer is created using a key (bytes[]) and a ChangeDataRecord object for the value.

```
// Consumer used to consume MapR-DB CDC events

KafkaConsumer<byte[], ChangeDataRecord> consumer = new
KafkaConsumer<byte[], ChangeDataRecord>(consumerProperties);
consumer.subscribe(Arrays.asList("/demo_changelog:demo_table"));
```

Consume the events and determine record type

This code snippet polls the topic to determine whether there are any changes and, if so, iterates through the change data records to retrieve the change data record IDs based on the change data record type. The ChangeDataRecordType interface is used to determine the type of record and the ChangeDataRecord interface is used to retrieve the record type and record ID.

```
while (true) {
    ConsumerRecords<byte[], ChangeDataRecord> changeRecords =
consumer.poll(500);
    Iterator<ConsumerRecord<byte[], ChangeDataRecord>> iter =
changeRecords.iterator();

    while (iter.hasNext()) {
        ConsumerRecord<byte[], ChangeDataRecord> crec = iter.next();
        // The ChangeDataRecord contains all the changes made to a document
        ChangeDataRecord changeDataRecord = crec.value();
        String documentId = changeDataRecord.getId().getString();

        if (changeDataRecord.getType() ==
ChangeDataRecordType.RECORD_INSERT) {
            System.out.println("\n\t Document Inserted " + documentId);
            insertAndUpdateDocument(changeDataRecord, producer);
        } else if (changeDataRecord.getType() ==
ChangeDataRecordType.RECORD_UPDATE) {
            System.out.println("\n\t Document Updated " + documentId);
            insertAndUpdateDocument(changeDataRecord, producer);
        } else if (changeDataRecord.getType() ==
ChangeDataRecordType.RECORD_DELETE) {
            System.out.println("\n\t Document Deleted " + documentId);
            deleteDocument(changeDataRecord, producer);
        }
    }
}
```

```
}
```

Process the records

This code snippet processes the change data records and based on the type of event (insert, update, delete), using the `ChangeDataRecordType` class and the `changeDataRecord.getType()` method, checks and retrieves the record type.

```
// Use the ChangeNode Iterator to capture all the individual changes

Iterator<KeyValue<FieldPath, ChangeNode>> cdrItr =
changeDataRecord.iterator();

while (cdrItr.hasNext()) {
    Map.Entry<FieldPath, ChangeNode> changeNodeEntry = cdrItr.next();
    String fieldPathAsString = changeNodeEntry.getKey().asPathString();
    ChangeNode changeNode = changeNodeEntry.getValue();
    ...
    ...
}
```

To process and retrieve an inserted new document, you can check to see if the field path is NULL or empty. When *a new document is inserted*, all the changes are made in a single object represented as a Map. You then retrieve the map value by using the `changeNode.getMap()` or `changeNode.getString()` methods depending on the field value.

```
if (fieldPathAsString == null || fieldPathAsString.equals("")) { // Insert
    Map<String, Object> documentInserted = changeNode.getMap();

    if (documentInserted.containsKey("firstName")) {
        fieldToIndex.put("firstName", (String)
documentInserted.get("firstName"));
        sendIndexingMessage = true;
    }

    if (documentInserted.containsKey("lastName")) {
        fieldToIndex.put("lastName", (String)
documentInserted.get("lastName"));
        sendIndexingMessage = true;
    }

    if (documentInserted.containsKey("address")) {
        addressMessage.set("address",
jsonMapper.convertValue((Map)documentInserted.get("address"),
JsonNode.class));
        sendAddressMessage = true;
    }
}
```

To process and retrieve updated documents, you can check the field path and retrieve the value depending on the expected value type. When *a document is updated*, the iterator contains one `ChangeNode` by updated field. You can then access the field path and value directly. You then retrieve the map value by using the `changeNode.getMap()` or `changeNode.getString()` methods depending on the field value.

```
if (fieldPathAsString.equalsIgnoreCase("firstName")) {
    fieldToIndex.put("firstName", changeNode.getString());
    sendIndexingMessage = true;
}
```

```

    }
    else if (fieldPathAsString.equalsIgnoreCase("lastName")) {
        fieldToIndex.put("lastName", changeNode.getString());
        sendIndexingMessage = true;
    }
    else if (fieldPathAsString.equalsIgnoreCase("address")) {
        addressMessage.set("address",
            jsonMapper.convertValue( changeNode.getMap(), JsonNode.class) );
        sendAddressMessage = true;
    }
}

```

To process delete operations, you can directly retrieve the document ID using the `changeDataRecord.getId()` method and process the document deletion with the `deleteDocument` method. The delete operation is a single change data record.

Consumer Application for CDC JSON Data

This example consumes changed data records from HPE Ezmeral Data Fabric Database JSON tables.

Example of Consuming JSON Changed Data Records

In this example, the following occurs:

- Initialize the consumer properties using Apache Kafka and MapR configuration parameters.
- Display the change data record properties.
- Iterate through the change nodes, determine the type of operation, and retrieve the operation value.
- Retrieve the properties of individual change node (for example: data type, field name, field value, and so on) by using various methods of the `ChangeDataReader` interface.
- Display the change data record values by using the `ChangeNode` interface.
- Subscribe to the stream topic, consume the events, and determine record type.

For changed data records from HPE Ezmeral Data Fabric Database JSON table data, the following are unique:

- There are multiple property values that can be retrieved through the `ChangeDataReader` interface. For example, `getDouble` or `getFloat`.
- There are multiple values for single fields in documents that can be retrieved through `ChangeNode` interface. See the code line: `Value value = changeNode.getValue();`

```

Consumer Application for CDC Binary Data

This example consumes changed data records from HPE Ezmeral Data Fabric Database Binary tables.

Example of Consuming Binary Changed Data Records

In this example, the following occurs:

- Initialize the consumer properties using Apache Kafka and HPE Ezmeral Data Fabric configuration parameters.
- Display the change data record properties.
- Iterate through the change nodes, determine the type of operation, and retrieve the operation value.
- Display the change data record values by using the `ChangeNode` interface.
- Subscribe to the stream topic, consume the events, and determine record type.

For changed data records from HPE Ezmeral Data Fabric Database Binary table data, the following are unique:

- An additional package must be imported: `java.nio.ByteBuffer`

- There is single value for single fields in documents that can be retrieved through ChangeNode interface. See the code line: `ByteBuffer value = changeNode.getBinary();`

```

package com.mapr.qa.cdc.tests.binary;

import org.apache.kafka.clients.consumer.ConsumerRecord;
import org.apache.kafka.clients.consumer.ConsumerRecords;
import org.apache.kafka.clients.consumer.KafkaConsumer;
import org.ojai.*;
import org.ojai.store.Connection;
import org.ojai.store.Driver;
import org.ojai.store.DriverManager;
import org.ojai.store.cdc.*;

import java.nio.ByteBuffer;
import java.util.*;

```

```
}
}
```

Open Format

Describes the CDC open format.

Open Format Mapping

The following shows the mapping between the HPE Ezmeral Data Fabric CDC data types and the JSON open format data types.

```
{
  "map": {
    "null": null,
    "boolean": true,
    "string": "eureka",
    "byte": {"$numberByte": 127},
    "short": {"$numberShort": 32767},
    "int": {"$numberInt": 2147483647},
    "long": {"$numberLong": 9223372036854775807},
    "float": {"$numberFloat": 3.4028235E38},
    "double": 1.7976931348623157e308,
    "decimal": {"$decimal":
"12345678901234567890189012345678901.23456789"},
    "date": {"$dateDay": "yyyy-mm-dd"},
    "time": {"$time": "HH:mm:ss[.sss]"},
    "timestamp": {"$date": "yyyy-MM-ddTHH:mm:ss.SSSXXX"},
    "interval": {"$interval": number_of_millisecods},
    "binary": {"$binary": "base64_encoded_binary_value"},
    "array": [42, "open sesame", 3.14, {"$dateDay": "2015-01-21"}]
  }
}
```

JSON Record Format

When the consumer retrieves the changed data record (by the key-value pair), the record is returned as a string in JSON format (a readable open format). The information about the mutation is returned as an array where each array element is one (1) change.

Note: If you use the default print, the string returns float values of up to six (6) digits of precision and double values of up to fifteen (15) digits. If the data exceeds this default and you want the exact number returned, use the CDC API that returns a float or double value.

The following example changed data record shows two (2) mutations.

```
{
  "_id": "row1"
  "$opType": "$RECORD_UPDATE",
  "$opTime": 1518654391801,

  "$mutations": [
    { "$fieldPath": "arrayB",
      "$fieldOp": "$SET",
      "$fieldValue": [{"$numberInt": 100}, false, "set a map"]
    },
    { "$fieldPath": "arrayC",
      "$fieldOp": "$SET",
      "$fieldValue": [{"$numberInt": 200}, false, "set a map"]
    }
  ]
}
```

```
    ]
}
```

Example

The following sample code initialized consumer properties for open format and consumes the changelog data from the topic.

```
/*
 * Initialize Basic Consumer Properties for Open Format
 * @return
 */

private Properties getOpenFormatListenerProperties() {

```

Consuming Audit Logs

Audit Streaming (available from v6.0.1) provides a way to process the audit data in real-time.

When audit streaming is enabled, the HPE Ezmeral Data Fabric generates audit logs that are sent as an audit stream, opening the possibility of real-time processing of the audit data. See [Streaming Audit Logs](#) on page 669 for more information.

Use the sample consumer application, or build your custom consumer application, to consume the audit logs that are available as a stream topic, when audit streaming is enabled.

The sample application uses filesystem APIs to get the file path and name from the FID, and the volume name from the volume ID.

Determine When to use Cached or Uncached Version of the Filesystem API

Caching the file path and file name, along with the volume name at the initial API call, reduces the load on CLDB for subsequent API calls.

However, there could be cases when the uncached version of the application is more suitable for use. Consider the following example:

For the initial API call, File1 is returned as the file name for FID 1. The result is cached.

The file is then renamed to File2. For subsequent API calls, to get the file name for FID 1, the result from the cache is used. The cache, unaware of the rename operation, returns the name as File1, which is incorrect, as the file is already renamed to File2. For such a case, use the uncached version.

Evaluate your use case, and then use the cached, or the uncached version, as appropriate.

Sample Cached Consumer Application for Audit Stream

The Consumer.java application demonstrates how to connect to the filesystem, and consume the messages in a stream topic.

Sample Application

Before running this application, ensure that you have access to a cluster running filesystem. To build and run this application:

1. Set the classpath as shown below:

```
export CLASSPATH=`hadoop classpath`
```

2. Compile the Java file as shown below:

```
javac -cp .:`mapr classpath` Consumer.java
```

3. Run the final Consumer.class file. For example:

```
java -cp .:`mapr classpath` Consumer
```

This application requires the following imports:

- org.apache.kafka.clients.consumer.ConsumerRecord
- org.apache.kafka.clients.consumer.ConsumerRecords
- org.apache.kafka.clients.consumer.KafkaConsumer
- org.apache.hadoop.conf.Configuration
- com.mapr.fs.MapRFileSystem
- com.google.common.io.Resources
- java.net.URI
- java.io.IOException
- java.io.InputStream
- java.util.Iterator
- java.util.Properties
- java.util.Random

- `java.util.StringTokenizer`
- `java.util.regex.Pattern`

The application performs the actions described in the following sections.

Initializes the consumer properties

The [configuration parameters](#) for the consumer are stored in `consumer.props` file. This file should be present in the current directory or `mapr` classpath. For example, your `consumer.props` file could look similar to the following:

```
#bootstrap.servers=localhost:9092
group.id=test
enable.auto.commit=true
key.deserializer=org.apache.kafka.common.serialization.StringDeserializer
value.deserializer=org.apache.kafka.common.serialization.StringDeserializer
# fast session timeout makes it more fun to play with failover
## apps specific ?
session.timeout.ms=10000

# These buffer sizes are needed to avoid consumer switching to
# a mode where it processes one bufferful every 5 seconds with
multiple
# timeouts along the way.
fetch.min.bytes=50000
# receive.buffer.bytes=262144 // fixed size buffer
max.partition.fetch.bytes=2097152

auto.offset.reset=earliest
```

The application initializes the consumer properties stored in the `consumer.props` file.

```
public static void main(String[] args) throws
IOException, InterruptedException {
    KafkaConsumer<String, String>
    consumer;
    try (InputStream props =
Resources.getResource("consumer.props")
).openStream()) {
        Properties properties = new
Properties();
        properties.load(props);
        if
(properties.getProperty("group.id")
== null) {
            properties.setProperty("group.id",
"group-" + new
Random().nextInt(100000));
        }
        consumer = new
KafkaConsumer<>(properties);
```

```
}
}
```

Subscribes to the topic to read from

The application initializes the filesystem object, with the last parameter as `true` so that the audit logs generated by the operations for converting fid to file path and valid to volume name are sent to the `ExpandAudit.json.log` file used by the [expandaudit](#) on page 2376 utility and not to the stream. It then selects the stream and subscribes to the topic to read at path `/var/mapr/auditstream/auditlogstream:<clustername>`.

```
Configuration conf = new
Configuration();
String uri = MAPRFS_URI;
uri = uri + "mapr/";
conf.set("fs.default.name", uri);
MapRFileSystem fs = new
MapRFileSystem();
fs.initialize(URI.create(uri), conf,
true);
Pattern pattern
= Pattern.compile("/var/
mapr/auditstream/
auditlogstream:<clustername>.+");
consumer.subscribe(pattern);
```

Requests unread messages from the topic

The application requests to read unread messages in the subscribed topic. It then iterates through the returned records, extracts the value of each message, and prints the value to the standard output.

```
boolean stop = false;
int pollTimeout = 1000;
while (!stop) {
    ConsumerRecords<String,
String> consumerRecords =
consumer.poll(pollTimeout);
    Iterator<ConsumerRecord<String,
String>> iterator =
consumerRecords.iterator();
    if (iterator.hasNext()) {
        while (iterator.hasNext()) {
            ConsumerRecord<String,
String> record = iterator.next();
            String value = record.value();
            String rvalue =
value.replace("\\", "");
            String recordValue
= processRecord(fs, rvalue,
value);
            System.out.println(("
Consumed Record: " + recordValue));
        }
    } else {
        Thread.sleep(1000);
        //stop = true;
    }
}
```

Gets the record and expands individual fields

The application then takes the record and expands fid in the message to path to file using the `getMountPathFidCached()` API and `valid` in the message to volume name using the `getVolumeNameCached()` API.

```

while (st.hasMoreTokens()) {
    String field = st.nextToken();
    StringTokenizer st1 = new
StringTokenizer(field, ":");
    while (st1.hasMoreTokens()) {
        String token =
st1.nextToken();
        if (token.endsWith("Fid")) {
            String lfidStr =
st1.nextToken();
            String path= null;
            try {
                path =
fs.getMountPathFidCached(lfidStr); //
Expand FID to path
            } catch (IOException e){
            }
            lfidPath =
"\FidPath\":" + path + "\", ";
            // System.out.println("\nPath
for fid " + lfidStr + " is " + path);
        }
        if (token.endsWith("volumeId")) {
            String valid =
st1.nextToken();
            String name= null;
            try {
                int volumeId =
Integer.parseInt(valid);
                name =
fs.getVolumeNameCached(volumeId); //
Cached API to convert volume Id to
volume Name
            } catch (IOException e){
            }
            lvolName =
"\VolumeName\":" + name + "\", ";
            //
System.out.println("\nVolume Name for
valid " + valid + " is " + name);
        }
    }
}

```

Returns the record

The application finally returns the record after expanding the fid and valid to file path and volume name respectively.

```

String result = "";
StringTokenizer st2 = new
StringTokenizer(value, ",");
while (st2.hasMoreTokens()) {
    String tokens = st2.nextToken();
    result = result + tokens + ",";
    if (tokens.contains("Fid")) {
        result = result + lfidPath;
    }
}

```

```

        if (tokens.contains("volumeId"))
        {
            result = result + lvolName;
        }
    }
    return result.substring(0,
        result.length() - 1);

```

Sample Uncached Consumer Application for Audit Stream

The ConsumerUncached.java application demonstrates how to connect to the HPE Ezmeral Data Fabric file system, and consume the messages in a stream topic.

Sample Application

Before running this application, ensure that you have access to a cluster running filesystem. To build and run this application:

1. Set the classpath as shown below:

```
export CLASSPATH=`hadoop classpath`
```

2. Compile the Java file as shown below:

```
javac -cp `mapr classpath` ConsumerUncached.java
```

3. Run the final `ConsumerUncached.class` file. For example:

```
java -cp .:`mapr classpath` ConsumerUncached
```

This application requires the following:

- `org.apache.kafka.clients.consumer.ConsumerRecord`
- `org.apache.kafka.clients.consumer.ConsumerRecords`
- `org.apache.kafka.clients.consumer.KafkaConsumer`
- `org.apache.hadoop.conf.Configuration`
- `com.mapr.fs.MapRFileSystem`
- `com.google.common.io.Resources`
- `java.net.URI`
- `java.io.IOException`
- `java.io.InputStream`
- `java.util.Iterator`
- `java.util.Properties`
- `java.util.Random`
- `java.util.StringTokenizer`
- `java.util.regex.Pattern`

The application performs the actions described in the following sections.

Initializes the consumer properties

The [configuration parameters](#) for the consumer are stored in `consumer.props` file. This file should be present in the current directory or `mapr classpath`. For example, your `consumer.props` file could look similar to the following:

```
#bootstrap.servers=localhost:9092
group.id=test
enable.auto.commit=true
key.deserializer=org.apache.kafka.common.serialization.StringDeserializer
value.deserializer=org.apache.kafka.common.serialization.StringDeserializer

# fast session timeout makes it more fun to play with failover
## apps specific ?
session.timeout.ms=10000

# These buffer sizes are needed to avoid consumer switching to
# a mode where it processes one bufferful every 5 seconds with
multiple
```

```
# timeouts along the way.
fetch.min.bytes=50000
# receive.buffer.bytes=262144 //
fixed size buffer
max.partition.fetch.bytes=2097152

auto.offset.reset=earliest
```

The application initializes the consumer properties stored in the `consumer.props` file.

```
public static void main(String[]
args) throws
IOException, InterruptedException {
    KafkaConsumer<String, String>
consumer;
    try (InputStream props =
Resources.getResource("consumer.props"
).openStream()) {
        Properties properties = new
Properties();
        properties.load(props);
        if
(properties.getProperty("group.id")
== null) {

properties.setProperty("group.id",
"group-" + new
Random().nextInt(100000));
        }
        consumer = new
KafkaConsumer<>(properties);
    }
}
```

Subscribes to the topic to read from

The application initializes the filesystem object, with the last parameter as `true` so that the audit logs generated by the operations for converting fid to file path and valid to volume name are sent to the `ExpandAudit.json.log` file used by the [expandaudit](#) on page 2376 utility and not to the stream. It then selects the stream and subscribes to the topic to read at path `/var/mapr/auditstream/auditlogstream:<clustername>`.

```
Configuration conf = new
Configuration();
String uri = MAPRFS_URI;
uri = uri + "mapr/";
conf.set("fs.default.name", uri);
MapRFileSystem fs = new
MapRFileSystem();
fs.initialize(URI.create(uri), conf,
true);

Pattern pattern =
Pattern.compile("/var/mapr/
auditstream/
auditlogstream:<clustername>.+");
consumer.subscribe(pattern);
```

Requests unread messages from the topic

The application requests to read unread messages in the subscribed topic. It then iterates through the returned records, extracts the value of each message, and prints the value to the standard output.

```
boolean stop = false;
int pollTimeout = 1000;
while (!stop) {
    ConsumerRecords<String,
String> consumerRecords =
consumer.poll(pollTimeout);
    Iterator<ConsumerRecord<String,
String>> iterator =
consumerRecords.iterator();
    if (iterator.hasNext()) {
        while (iterator.hasNext()) {
            ConsumerRecord<String,
String> record = iterator.next();
            String value =
record.value();
            String rvalue =
value.replace("\\", "");
            String recordValue =
processRecord(fs, rvalue, value);
            System.out.println(("
Consumed Record: " + recordValue));
        }
    } else {
        //stop = true;
    }
}
```

Gets the record and expands individual fields

The application then takes the record and expands fid in the message to path to file using the `getMountPathFid()` API and `valid` in the message to volume name using the `getVolumeName()` API.

```
public static String
processRecord(MapRFileSystem fs,
String rvalue, String value)
{
    StringTokenizer st = new
StringTokenizer(rvalue, ",");
    String lfidPath = "";
    String lvolName = "";

    while (st.hasMoreTokens()) {
        String field =
st.nextToken();
        StringTokenizer st1 = new
StringTokenizer(field, ":");
        while (st1.hasMoreTokens())
        {
            String token =
st1.nextToken();
            if
(token.endsWith("Fid")) {
                String lfidStr =
st1.nextToken();
                String path= null;
                try {
                    path =
```

```

fs.getMountPathFid(lfidStr);
        } catch (IOException e)
    { }
        lfidPath =
        "\"FidPath\\":\\"+path+"\", ";
        if
        (token.endsWith("volumeId")) {
            String volid =
            st1.nextToken();
            String name= null;
            try {
                int volumeId =
                Integer.parseInt(volid);
                name =
                fs.getVolumeName(volumeId);
            }
            catch (IOException e){ }
            lvolName =
            "\"VolumeName\\":\\"+name+"\", ";
        }
    }
}

```

Returns the record

The application finally returns the record after expanding the fid and volid to file path and volume name respectively.

```

String result = "";
StringTokenizer st2 = new
StringTokenizer(value, ",");
while (st2.hasMoreTokens()) {
    String tokens = st2.nextToken();
    result = result + tokens + ",";
    if (tokens.contains("Fid")) {
        result = result + lfidPath;
    }
    if (tokens.contains("volumeId")) {
        result = result + lvolName;
    }
    return result.substring(0,
result.length() - 1);
}

```

    conf.set("fs.default.name", uri);
    MapRFileSystem fs = new MapRFileSystem();
    fs.initialize(URI.create(uri), conf, true);
    //final String topic = "/var/mapr/auditstream/
auditlogstream:<clustername>_atsqa4-130.qa.lab";
    //Replace <clustername> by the name of cluster
    Pattern pattern = Pattern.compile("/var/mapr/auditstream/
auditlogstream:<clustername>.+");
    // Subscribe to the topic.
    consumer.subscribe(pattern);

    boolean stop = false;
    int pollTimeout = 1000;
    while (!stop) {
        // Request unread messages from the topic.
        ConsumerRecords<String, String> consumerRecords =
consumer.poll(pollTimeout);
        Iterator<ConsumerRecord<String, String>> iterator =
consumerRecords.iterator();
        if (iterator.hasNext()) {
            while (iterator.hasNext()) {
                ConsumerRecord<String, String> record = iterator.next();
                // Iterate through returned records, extract the value
                // of each message, and print the value to standard
                output.
                //System.out.println((" Consumed Record: " +
record.toString()));
                String value = record.value();
                String rvalue = value.replace("\\", "");
                String recordValue = processRecord(fs, rvalue, value);

                System.out.println((" Consumed Record: " +
recordValue));
                //System.out.println((" Consumed Record: " + value));
            }
        } else {
            Thread.sleep(1000);
            //stop = true;
        }
    }
    consumer.close();
    System.out.println("All done.");
}

```

```

    }
    public static String processRecord(MapRFileSystem fs, String rvalue,
String value)
    {
        StringTokenizer st = new StringTokenizer(rvalue, ",");
        String lfidPath = "";
        String lvolName = "";

        while (st.hasMoreTokens())
        {

            StringTokenizer st1 = new StringTokenizer(field, ":");
            while (st1.hasMoreTokens())
            {
                String token = st1.nextToken();
                if (token.endsWith("Fid")) {
                    String lfidStr = st1.nextToken();
                    String path= null;
                    try {
                        path = fs.getMountPathFid(lfidStr);
                    } catch (IOException e){
                    }
                    lfidPath = "\"FidPath\":\","+path+"\"";
                    // System.out.println("\nPath for fid " + lfidStr +
"is " + path);
                }

                if (token.endsWith("volumeId")) {
                    String volid = st1.nextToken();
                    String name= null;
                    try {
                        int volumeId = Integer.parseInt(volid);
                        name = fs.getVolumeName(volumeId);
                    }
                    catch (IOException e){
                    }
                    lvolName = "\"VolumeName\":\","+name+"\"";
                    // System.out.println("\nVolume Name for volid " +
volid + "is " + name);
                }
            }
        }
        String result = "";
        StringTokenizer st2 = new StringTokenizer(value, ",");
        while (st2.hasMoreTokens()) {
            String tokens = st2.nextToken();
            result = result + tokens + ",";
            if (tokens.contains("Fid")) {
                result = result + lfidPath;
            }
            if (tokens.contains("volumeId")) {
                result = result + lvolName;
            }
        }
        return result.substring(0, result.length() - 1);
    }
}

```

HPE Ezmeral Data Fabric Event Streams Java Applications

This section contains information on developing client applications with Java including information about the HPE Ezmeral Data Fabric Event Streams and Apache Kafka Java APIs, configuration parameters, and compiling and running producers and consumers.

Apache Kafka Support

HPE Ezmeral Data Fabric supports the following Apache Kafka Java API versions:

Table

| Core version | Apache Kafka API |
|-------------------|------------------|
| As of 6.2 | 2.1 |
| As of 6.1 | 1.1 |
| As of 6.0.1 | 1.0 |
| 6.0.0 and earlier | 0.9.0 |

Log Compaction

As of HPE Ezmeral Data Fabric 6.1, log compaction is supported. Log compaction can be enabled for streams created with HPE Ezmeral Data Fabric core 6.1 and later. In addition, clients older than HPE Ezmeral Data Fabric 6.1 are prevented from consuming from streams that have had log compaction enabled on them at least once in their lifetime.

When a stream on a source cluster has both log compaction and replication enabled, the replica cluster does not automatically have log compaction enabled. You must explicitly enable log compaction on the replica cluster.

- If a replica cluster has been upgraded and the stream data for a source cluster is compacted (that is, one or more messages have been deleted), then the source cluster replicates the compacted data to the replica cluster.
- If a replica cluster has **not** been upgraded, then the source cluster fails the replication and an error is generated that requests a replica cluster upgrade.

In the context of a scan by a client that is **not** upgraded, the (upgraded) server inspects the row header to check if it is serving a compacted row. If it is serving a compacted row, then the server fails the consumer request. This behavior applies both to a stream that is explicitly configured for compaction and a replica that has received a compacted row.

Important: To perform log compaction on older streams, the `-force` option can be used.

The `-force` option should only be used when ALL clients have been upgraded to HPE Ezmeral Data Fabric 6.1.

Idempotent Producer

As of HPE Ezmeral Data Fabric 6.1, the idempotent producer (exactly once) feature is supported. You can implement the idempotent producer with HPE Ezmeral Data Fabric core 6.1 and later.

When creating a producer instance, use the following configuration:

```
props.put(ProducerConfig.ENABLE_IDEMPOTENCE_CONFIG, true)
```

The idempotent producer feature is supported by EEP HPE Ezmeral Data Fabric 6.0 clients and HPE Ezmeral Data Fabric 6.1.0 servers.

- You must upgrade all servers to v6.1.0 and enable all the v6.1.0 features, before you enable the idempotent producer.
- If you use a pre-HPE Ezmeral Data Fabric 6.1 client and a HPE Ezmeral Data Fabric 6.1 server, and if a group of messages are atomically persisted without a valid producer ID, the server treats the request as a non-idempotent producer.
- If you use a HPE Ezmeral Data Fabric 6.1 client and a pre-HPE Ezmeral Data Fabric 6.1 server, the idempotent producer is not supported. In this case, the idempotent producer fails to produce to the stream and the following exception is thrown:

```
Exception in thread "main" java.util.concurrent.ExecutionException:
org.apache.kafka.common.errors.UnknownTopicOrPartitionException:
Operation not permitted (1) null

Operation not permitted (1) null
```

TimestampType Permissions

The following discussion describes the [ACE](#) permissions that you need when using the timestamp type parameter. See [Stream Security](#) on page 627 for general information about HPE Ezmeral Data Fabric Event Streams streams security.

A HPE Ezmeral Data Fabric Event Streams stream topic inherits the default timestamp type value from its stream. To override the stream's default value, set the timestamp type for the topic to a different value.

- Setting the value at the stream-level requires `adminperm` permissions. The stream-level timestamp type parameter is `defaulttimestamptype`. See [stream create](#) on page 1999 and [stream edit](#) on page 2006 for more information on setting this parameter using the `maprcli` command.
- Setting the `timestamptype` at the topic-level requires `topicperm` permissions. The topic-level timestamp type parameter is `timestamptype`. See [stream topic create](#) on page 2022 and [stream topic edit](#) on page 2025 for more information on setting this parameter using the `maprcli` command.

User Impersonation

As of HPE Ezmeral Data Fabric 6.0, user impersonation is supported for HPE Ezmeral Data Fabric Event Streams.

You can set up user impersonation programmatically. To do so, use the `UserGroupInformation.doAs()` method in the Hadoop documentation. See [Class UserGroupInformation](#) for more information.

If you are setting up user impersonation in a secure cluster, you need to generate an impersonation ticket. See the [Generating and Printing Service with Impersonation Ticket](#) section in the [maprlogin Command Examples](#) on page 2416 topic.

After generating the ticket:

1. Ensure that user `mapruser1` has read permissions on the ticket.
2. If you moved the ticket file to a different location, set the `$MAPR_TICKETFILE_LOCATION` environment variable with the appropriate path.

For more information about impersonation, see:

- [How Impersonation Works](#) on page 1652
- [Generating a Service with Impersonation Ticket](#) on page 1545
- [Managing Impersonation](#) on page 1651

Backward Compatibility

As of HPE Ezmeral Data Fabric 6.0.1, along with the support of Apache Kafka, the `java.util.Collection` interface is being used. This impacts applications using certain APIs. See [HPE Ezmeral Data Fabric Event Streams Java API Library](#) on page 3033 for detailed information.

HPE Ezmeral Data Fabric Event Streams Java API Library

Use the HPE Ezmeral Data Fabric Event Streams Admin Java API library as an alternative to `maprcli` commands and the REST APIs for performing administrative tasks on streams and topics. This library can also be used for analysis of the contents of streams.

Javadoc

The following Apache Kafka Java API versions are supported:

Table

| Core version | Apache Kafka API |
|-------------------|------------------|
| As of 6.2 | 2.1.1 |
| As of 6.1 | 1.1 |
| As of 6.0.1 | 1.0 |
| 6.0.0 and earlier | 0.90 |

See the following APIs for detailed information:

HPE Ezmeral Data Fabric Event Streams Java APIs (as of 6.1 and 6.2)

The following HPE Ezmeral Data Fabric Event Streams Java APIs are available as of HPE Ezmeral Data Fabric 6.1 and HPE Ezmeral Data Fabric 6.2:

Table

| Interface | Method | Description |
|-------------------------------|---|----------------------------------|
| <code>StreamDescriptor</code> | <code>void setCompact(boolean compact)</code> | Sets log compaction on a stream. |

Table (Continued)

| Interface | Method | Description |
|------------------|-------------------------------------|--|
| StreamDescriptor | boolean getCompact() | Gets the log compaction on a stream. Returns true if the stream has log compaction on the stream. |
| StreamDescriptor | void setMinCompactionLagMS(long ts) | Sets the time in (milliseconds) that a message should remain uncompactd in the topic-partition. Applies only if log compaction is enabled on the stream. |
| StreamDescriptor | long getMinCompactionLagMS() | Returns the minimum time (in milliseconds) a message will remain uncompactd in the topic-partition. Applies only if log compaction is enabled on the stream. |
| StreamDescriptor | void setDeleteRetentionMS(long ts) | Sets the time (in milliseconds) for which deleted records are retained. Applies only if log compaction is enabled on the stream. |
| StreamDescriptor | long getDeleteRetentionMS() | Returns the time (in milliseconds) for which deleted records are retained. Applies only if log compaction is enabled on the stream. |
| Producer | ProducerConfig class | The idempotence producer option is set by setting the enable.idempotence value of true passed through the ProducerConfig class. |

HPE Ezmeral Data Fabric Event Streams Java APIs (as of 6.0.1)

The following table lists the new Interfaces and APIs for HPE Ezmeral Data Fabric 6.0.1. They are the delta between HPE Ezmeral Data Fabric 6.0.1 and 6.0.0, meaning, they are applicable to HPE Ezmeral Data Fabric6.0.1 but not HPE Ezmeral Data Fabric 6.0.0.

Table

| Interface and Methods | Description |
|--|---|
| Admin.close | Long duration for TimeUnit. |
| Admin.createTopic | TopicDescriptor array for topic attributes. |
| Admin.editTopic | TopicDescriptor array for topic attributes. |
| Admin.getTopicDescriptor | Method for retrieving topic attributes. |
| Admin.listTopic | Method for listing all the topics in a stream. |
| Admin.streamExists | Method for determining whether a stream exists. |
| StreamDescriptor.getDefaultTimestampType | Method for retrieving the timestamp type. |
| StreamDescriptor.setDefaultTimestampType | Method for setting the timestamp type. |
| TopicDescriptor | New HPE Ezmeral Data Fabric interface. |
| TopicDescriptor.getPartitions | Method associated with the new interface. |
| TopicDescriptor.setPartitions | Method associated with the new interface. |
| TopicDescriptor.getTimestampType | Method associated with the new interface. |

Table (Continued)

| Interface and Methods | Description |
|----------------------------------|---|
| TopicDescriptor.setTimestampType | Method associated with the new interface. |
| Enum TimestampType | New Enum class and associated methods. |

Backward Compatibility

As of HPE Ezmeral Data Fabric 6.0.1, Apache Kafka 1.0 is supported. The following `pause`, `resume`, `seekToBeginning`, and `seekToEnd` APIs support the Collection Interface. The deprecated APIs will continue to run unchanged, however, they may be removed in a future release.

Table

| Replacement Collection APIs | Deprecated APIs |
|---|--|
| <code>void pause(Collection<TopicPartition> partitions);</code> | <code>void pause(TopicPartition... partitions);</code> |
| <code>void resume(Collection<TopicPartition>partitions);</code> | <code>void resume(TopicPartition... partitions);</code> |
| <code>void seekToBeginning(Collection<TopicPartition>);</code> | <code>void seekToBeginning(TopicPartition... partitions);</code> |
| <code>void seekToEnd(Collection<TopicPartition>);</code> | <code>void seekToEnd(TopicPartition... partitions);</code> |

The following `subscribe` and `assign` APIs support the Collection Interface (which is more generalized) as well as the List Interface. Support for the List Interface has been retained for backward binary compatibility.

Table

| Replacement Collection APIs | Retained APIs |
|--|---|
| <code>void subscribe(Collection<String> topics);</code> | <code>void subscribe(java.util.List<java.lang.String> topics);</code> |
| <code>void subscribe(Collection<String> topics, ConsumerRebalanceListener);</code> | <code>void subscribe(java.util.List<java.lang.String> topics, ConsumerRebalanceListener listener);</code> |
| <code>void assign(Collection<TopicPartition> partitions);</code> | <code>void assign(java.util.List<TopicPartition> partitions);</code> |

Stream and Topic Operations Summary

Provides a summary of stream topic operations and the interface, class, or method used for the operation.

The following stream and topic operations is not an inclusive list, but a sampling. For detailed information, see the following libraries:

Table

| Operation | Interface/Method Used |
|---|--|
| Creating streams | <code>StreamDescriptor</code> is used to set the attributes for streams that you plan to create. <code>Admin.createStream(String streamPathAndName, StreamDescriptor desc)</code> - create the stream. |
| Editing stream attributes | <code>StreamDescriptor</code> is used to edit the stream's attribute values. <code>Admin.editStream(String streamPathAndName, StreamDescriptor desc)</code> - set or modify the stream's attribute values. |
| Retrieving the default timestamp type on a stream | <code>StreamDescriptor.getDefaultTimestampType()</code> - retrieves the default timestamp type on the stream.  Note: This method is new as of 6.0.1 |

Table (Continued)

| Operation | Interface/Method Used |
|---|--|
| Sets the default timestamp type on a stream | <pre>StreamDescriptor.setDefaultTimestampType(TimestampType logAppendTime)</pre> - sets the default timestamp type on the stream.  Note: TimestampType Enum is new as of 6.0.1 |
| Deleting streams | <pre>Admin.deleteStream(String streamPathAndName)</pre> |
| Determining stream existence | <pre>Admin.streamExists(String streamPathAndName)</pre> - determines whether a stream exists or not. Returns: true false  Note: This method is new as of 6.0.1 |
| Creating topics | <pre>Admin.createTopic(String streamPathAndName, String topicName, TopicDescriptor desc)</pre> is used when creating a topic with the defaults for partitions and timestamp type.  Note: TopicDescriptor is new as of 6.0.1 <pre>Admin.createTopic(String streamPathAndName, String topicName)</pre> is used when accepting the default number of partitions. <pre>Admin.createTopic(String streamPathAndName, String topicName, int npartitions)</pre> - creates a topic with a specific number of partitions.  Note: If you do not specify the number of partitions for a stream topic, the default number of partitions is inherited from the stream. |
| Editing topics | <pre>Admin.editTopic(String streamPathAndName, String topicName, TopicDescriptor desc)</pre> - sets the partitions and timestamp type attributes of a topic.  Note: TopicDescriptor is new as of 6.0.1 <pre>Admin.editTopic(String streamPathAndName, String topicName, int npartitions)</pre> |
| Retrieving topic attributes | <pre>Admin.getTopicDescriptor(String streamPathAndName, String topicName)</pre> - retrieves topic attributes.  Note: This method is new as of 6.0.1 |
| Deleting topics | <pre>Admin.deleteTopic(String streamPathAndName, String topicName)</pre> - deletes topics. |
| Listing topics | <pre>Admin.listTopics(String streamPathAndName)</pre> - lists all topics in a stream.  Note: This method is new as of 6.0.1 |
| Counting topics | <pre>Admin.countTopics(String streamPathAndName)</pre> - counts the number of topics in a stream. |
| Gets/Sets topic timestamp type | TopicDescriptor is used to retrieve the timestamp type attribute value of a topic.  Note: TopicDescriptor is new as of 6.0.1 <pre>TopicDescriptor.getTimestampType()</pre> - retrieves the default timestamp type of a topic. <pre>TopicDescriptor.setTimestampType(TimestampType timestampType)</pre> - sets the default timestamp type of a topic. |

Table (Continued)

| Operation | Interface/Method Used |
|------------------------------------|--|
| Gets/Sets topic partitions | <p><code>TopicDescriptor</code> is used to retrieve the partition attribute value of a topic.</p> <p> Note: <code>TopicDescriptor</code> is new as of 6.0.1</p> <p><code>TopicDescriptor.getPartitions()</code> - retrieves the partitions of a topic.</p> <p><code>TopicDescriptor.setPartitions(int numPartitions)</code> - sets the partitions of a topic.</p> |
| Enabling and tuning log compaction | <p><code>TopicDescriptor</code> is used to enable and tune log compaction at the stream-level.</p> <ul style="list-style-type: none"> <code>setCompact(boolean compact)</code> - sets log compaction. <code>getCompact()</code> - returns true if log compaction is set on the stream. <code>setMinCompactionLagMS(long ts)</code> - set the lag time (in milliseconds) that a message should remain uncompactd. <code>getMinCompactionLagMS()</code> - retrieves the value of the lag time. <code>setDeleteRetentionMS(long ts)</code> - sets the time (in milliseconds) for which deleted records are retained. <code>getDeleteRetentionMS()</code> - returns the time value of which deleted records are retained. <p>In addition, the <code>Admin</code> interface is used with the following method to set compaction at the topic-level:</p> <ul style="list-style-type: none"> <code>compactTopic(java.lang.String streamPath, java.lang.String topicName)</code> |
| Enabling an Idempotent Producer | The <code>Producer</code> interface along with the <code>ProducerConfig</code> class is used to enable idempotence (exact-once message delivery semantics) publishing. |

Managing Streams with Java

Provides Java code snippets for performing CRUD operations on HPE Ezmeral Data Fabric Event Streams streams.

Creating Streams

`StreamDescriptor` is used to set attributes for streams that you want to create.

```
public StreamDescriptor createStreamDescriptor(int numPartitions, String
adminUsers, String producerUsers, String consumerUsers, String copyUsers,
String topicUsers) {
    StreamDescriptor desc = Streams.newStreamDescriptor();
    desc.setDefaultPartitions(numPartitions);
    desc.setCompressionAlgo("zlib");
    desc.setAutoCreateTopics(false);
    desc.setAdminPerms(adminUsers);
    desc.setConsumePerms(consumerUsers);
    desc.setCopyPerms(copyUsers);
    desc.setTopicPerms(topicUsers);

    return desc;
}
```

Admin is used with the `createStream` method to create the stream with the pre-established attribute values.

```
public void createStreamUtilFunction(String streamPathAndName,
StreamDescriptor desc) throws IllegalArgumentException, IOException{
    Configuration conf = new Configuration();
    Admin streamAdmin = Streams.newAdmin(conf);
    streamAdmin.createStream(streamPathAndName, desc);
    streamAdmin.close();
}
```

Editing Stream Attributes

`StreamDescriptor` is used to retrieve the stream's attribute values. Admin with the `editStream` method is used to set or modify the stream's attribute values.

```
Admin.editStream(String streamPathAndName, StreamDescriptor desc)
```

```
Configuration conf = new Configuration();
Admin streamAdmin = Streams.newAdmin(conf);
StreamDescriptor desc =
streamAdmin.getStreamDescriptor(streamPathAndName);
```

```
public void editStreamUtilFunction(String streamPathAndName,
StreamDescriptor desc) throws IllegalArgumentException, IOException{
    Configuration conf = new Configuration();
    Admin streamAdmin = Streams.newAdmin(conf);
    streamAdmin.editStream(streamPathAndName, desc);
    streamAdmin.close();
}
```

Deleting Streams

```
public void deleteStreamUtilFunction(String streamPathAndName) throws
IllegalArgumentException, IOException{
    Configuration conf = new Configuration();
    Admin streamAdmin = Streams.newAdmin(conf);
    streamAdmin.deleteStream(streamPathAndName);
    streamAdmin.close();
}
```

Managing Topics with Java

Provides Java code snippets for performing CRUD operations on HPE Ezmeral Data Fabric Event Streams stream topics.

Creating Topics

The `createTopic` API is used to create a topic with the default number of partitions.

```
Admin.createTopic(String streamPathAndName, String topicName)
```

Note: If you do not specify the number of partitions for a stream topic, the default number of partitions is inherited from the stream.

```
public void createTopicUtilFunction(String streamPathAndName, String
topicName) throws IOException{
    Configuration conf = new Configuration();
```

```

Admin streamAdmin = Streams.newAdmin(conf);
streamAdmin.createTopic(streamPathAndName, topicName);
streamAdmin.close();
}

```

The `createTopic` API is used to create a topic with a specific number of partitions.

```

Admin.createTopic(String streamPathAndName, String topicName, int
npartitions)

```

```

public void createTopicWithPartitionsUtilFunction(String streamPathAndName,
String topicName, int npartitions) throws IOException{
    Configuration conf = new Configuration();
    Admin streamAdmin = Streams.newAdmin(conf);
    streamAdmin.createTopic(streamPathAndName, topicName, npartitions);
    streamAdmin.close();
}

```

Editing Topics

The `editTopic` API is used to change timestamp type and the number of partitions for a topic.

```

Admin.editTopic(String streamPathAndName, String topicName, int npartitions)

```

```

public void editTopicUtilFunction(String streamPathAndName, String
topicName, int npartitions) throws IOException{
    Configuration conf = new Configuration();
    Admin streamAdmin = Streams.newAdmin(conf);
    streamAdmin.editTopic(streamPathAndName, topicName, npartitions);
    streamAdmin.close();
}

```

Retrieving Topic Attributes

The `getTopicDescriptor` API is used to get or set the topic's attribute values. `TopicDescriptor` is passed into methods to set and retrieve topic partitions and timestamp type. The Enum `TimestampType` values are `CREATE_TIME` and `LOG_APPEND_TIME`.

Note: `TopicDescriptor` is available as of MapR 6.0.1.

Deleting Topics

The `deleteTopic` API is used to delete a topic from a stream.

```

Admin.deleteTopic(String streamPathAndName, String topicName)

```

```

public void deleteTopicUtilFunction(String streamPathAndName, String
topicName) throws IOException{
    Configuration conf = new Configuration();
    Admin streamAdmin = Streams.newAdmin(conf);
    streamAdmin.deleteTopic(streamPathAndName, topicName);
    streamAdmin.close();
}

```

Counting Topics

The `countTopics` API is used to count the number of topics in a stream. See the [mapr streamanalyzer](#) on page 5552 utility for a sample application that counts and queries topic messages.

```
Admin.countTopics(String streamPathAndName)

public int countTopicsUtilFunction(String streamPathAndName){
    Configuration conf = new Configuration();
    Admin streamAdmin = Streams.newAdmin(conf);
    int count = streamAdmin.countTopics(streamPathAndName);
    streamAdmin.close();

    return count;
}
```

Using Timestamps on Streams and Topics

Provides a code example for using timestamps on HPE Ezmeral Data Fabric Event Streams streams and topics.

Passing Timestamp Value

The timestamp value can be passed as part of the `ProducerRecord`, for example:

```
ProducerRecord<String, String> producerRecord =
    new ProducerRecord<String, String>(topicName, partition, timestamp,
    key, value);
```

Note: The timestamp value is retained if the timestamp type is `createtime`. If the timestamp type is `logappendtime`, then the timestamp value is ignored and instead the server timestamp is used.

Retrieving Timestamp Type

This example sets and retrieves the timestamp type. The following code example performs the following:

- Creates a stream with a default timestamp type of `LogAppendTime`.
- Creates a topic with a specific timestamp type of `CreateTime`.
- Retrieves the topics's timestamp type.

```
// Create stream with default timestamp type as "LogAppendTime"
// Create a topic with timestamp type as "CreateTime"
Configuration conf = new Configuration();
Admin streamAdmin = Streams.newAdmin(conf);

// Create a stream
StreamDescriptor sDesc = Streams.newStreamDescriptor();
sDesc.setDefaultTimestampType(TimestampType.LOG_APPEND_TIME);
streamAdmin.createStream(streamName, sDesc);

// Create a topic
TopicDescriptor tDesc = Streams.newTopicDescriptor();
tDesc.setTimestampType(TimestampType.CREATE_TIME);
streamAdmin.createTopic(streamName, topicName, tDesc);

// Get topic timestamp type
TopicDescriptor rDesc = streamAdmin.getTopicDescriptor(streamName,
```

```
topicName);
    System.out.println(rDesc.getTimestampType().name);
```

Enabling Log Compaction

Provides a code example for using timestamps on HPE Ezmeral Data Fabric Event Streams streams and topics.

Log compaction is enabled through the HPE Ezmeral Data Fabric Event Streams `StreamDescriptor` interface with the `setCompact` method where the compact value is set to **true**. Additionally, use the `setDeleteRetentionMS` and `setMinCompactionLagMS` methods to set the time delay before compacting records and the time that deleted records are retained.

Configuration values include:

- `compact` - used to set log compaction at the stream-level.
- `min.compaction.lag.ms` - used to set a **minimum** time delay (milliseconds) before starting to compact records after they are written. Records won't get compacted until after this period. The setting gives consumers time to retrieve every record.
- `delete.retention.ms` - used to set the **minimum** time (milliseconds) that deleted records are retained.

Note: You can set not set log compaction when creating the stream; only when editing the stream configuration. The configuration parameters, `min.compaction.lag.ms` and `delete.retention.ms` can be set when both creating and editing streams.

Enabling Log Compaction

The following code example performs the following:

- Enables log compaction at the stream-level.
- Sets the minimum time delay before log compaction starts
- Set the minimum time that deleted record are retained.

```
// Creates a stream
// Sets log compaction on the stream
// Sets the minimum time for a message to stay uncompactd
// Sets the time that deleted records are retained.

(Admin streamAdmin = Streams.newAdmin(conf))
    StreamDescriptor streamDescriptor = Streams.newStreamDescriptor();
    streamDescriptor.setCompact(true);
    streamDescriptor.setDeleteRetentionMS(deleteRetentionMs);
    streamDescriptor.setMinCompactionLagMS(minCompactionLagMs);
    streamAdmin.editStream(streamName, streamDesc);
}
```

For More Information

See the following topics for more information:

- [Log Compaction](#) on page 604
- `maprccli stream create` on page 1999 and `stream edit` on page 2006
- [Preparing Clusters for Log Compaction](#) on page 1257

Enabling an Idempotent Producer

Describes how to enable an idempotent producer. Idempotence refers to exactly-once message delivery semantics.

To enable idempotence, the `enable.idempotence` configuration must be set to **true**. When set, the retries configuration defaults to `Integer.MAX_VALUE` and the Acks configuration defaults to `all`.

The idempotence producer option is set by setting the `enable.idempotence` value of `true` passed through the `ProducerConfig` class.

| Constant Field Values | | |
|---|--|---------------------------------|
| <code>org.apache.kafka.clients.producer.ProducerConfig</code> | | |
| Modifier and Type | Constant Field | Value |
| <code>public static final java.lang.String</code> | <code>ENABLE_IDEMPOTENCE_CONFIG</code> | <code>enable.idempotence</code> |

Example Code Snippet:

```
props.put(ProducerConfig.ENABLE_IDEMPOTENCE_CONFIG, true);
```

Note: The default is `false`, which retains at-least-once message delivery semantics.

Tip: There are no API changes for the Idempotent Producer functionality, so existing applications do not need to be modified except to enable the producer configuration property.

Example: Subscribing and Querying with Timestamps

This sample Java consumer application uses the `subscribe` API to subscribe to the input topics and queries offsets upon partition-assignment.

In the query, the `offsetsForTimes` API returns the earliest offset in a topic-partition with a timestamp greater than or equal to the input timestamp. The consumer then seeks to that offset if it is greater than the consumer's current position. Following this, the consumer polls for messages. If there are messages following that offset with timestamps earlier than the input timestamp, then those messages are skipped by the consumer.

        }
    }
}

```

```

        // for each assigned partition, find the earliest offset in that
        partition with a timestamp
        // greater than or equal to the input timestamp
        Map<TopicPartition, OffsetAndTimestamp> outOffsets =
        consumer.offsetsForTimes(timestampsToSearch);
        for (TopicPartition partition : partitions) {
            Long seekOffset = outOffsets.get(partition).offset();
            Long currentPosition = consumer.position(partition);
            // seek to the offset returned by the offsetsForTimes API
            // if it is beyond the current position
            if (seekOffset.compareTo(currentPosition) > 0) {
                consumer.seek(partition, seekOffset);
            }
        }
    }
}

@Override
public void onPartitionsRevoked(Collection<TopicPartition> partitions) {
}
}
}
}

```

Querying Topic Messages

Describes how HPE Ezmeral Data Fabric Event Streams topic messages can be queried.

Time-based Querying

The `consumer.offsetsForTimes` API is used to get offsets in a topic-partition. This API takes in a `Map` of `TopicPartition` and timestamp. The offset is returned in an `OffsetAndTimestamp` object when `offsetsForTime` is called.

The following shows how the `Map` is constructed:

```

Long timestamp = 1522195205L;
TopicPartition topicPartition = new TopicPartition(topic,partition);

HashMap<TopicPartition, Long> offsetsForTimesMap = new
HashMap<TopicPartition, Long>();
offsetsForTimesMap.put(topicPartition, timestamp);

// Invocation to offsetsForTimes
Map<TopicPartition, OffsetAndTimestamp> offsetForTimesResultMap =
consumer.offsetsForTimes(offsetsForTimesMap);

```

Direct Querying

The `Streams` class is used to directly query topic messages. See the [mapr streamanalyzer](#) on page 5552 utility for a sample application that counts and queries topic messages.

- The `getMessageStore()` APIs are used to get the `DocumentStore` object which represents the underlying topic messages for a specified stream.
- The `DocumentStore.find()` APIs are used to query the messages that are in the `DocumentStore` object. While running `find()` on the returned `DocumentStore` object, message fields can be projected based on the specified field name.

Note: `DocumentStore` is a part of the open-source OJAI API.

The logical schema of each message is the same, where analytics applications can run queries on these fields. See [Logical Schema of Messages](#) on page 598 for more information.

```
{
  "_id": <STRING>,
  "topic": <STRING>,
  "partition": <SHORT>,
  "offset": <LONG>,
  "timestamp": <LONG>,
  "producer": <VARCHAR>,
  "key": <BINARY>,
  "value": <VARBINARY>
}
```

Apache Kafka Java APIs

HPE Ezmeral Data Fabric Event Streams supports these Apache Kafka Java APIs.

Javadoc

As of HPE Ezmeral Data Fabric 6.2.0, Apache Kafka 2.1 is supported.

EEP 8.0.0 supports Apache Kafka 2.6.1.

See the following APIs for detailed information:

- [HPE Ezmeral Data Fabric Event Streams Java API Library](#)
- [Apache Kafka 2.1 APIs used with HPE Ezmeral Data Fabric Event Streams](#)

Note: The Apache Kafka 2.1 APIs are also supported in Apache Kafka 2.6.1.

Admin APIs

The following Admin APIs, `org.apache.kafka.clients.admin` package, are applicable to HPE Ezmeral Data Fabric support of Apache Kafka.

Note: The AdminClient API options (CreateTopicsOptions, DeleteTopicsOptions, DescribeTopicsOptions, ListTopicsOptions, CreatePartitionsOptions, and DescribeTopicsOptions), are ignored. All of the methods assume that a topic belongs to the default stream unless a stream path is specified in the topic name.

If a default stream name is not specified and the topic path does not contain a stream name, the an exception is reported via the Result object. For example:

- If the topic name is specified as `topic1`, then the API assumes the full topic path as `/defaultStream:topic1`.
- If the topic name is specified as `/defaultStream:topic1`, then that will be the full topic path.

Note: The AdminClient default stream configuration parameter is `streams.admin.default.stream`. See [Configuration Parameters](#) on page 3048 for more information.

Note: For a complete list of supported APIs, see [Apache Kafka 2.1 APIs used with HPE Ezmeral Data Fabric Event Data Streams](#)

Consumer APIs

The following Consumer APIs, `org.apache.kafka.clients.consumer` package, are applicable to HPE Ezmeral Data Fabric support of Apache Kafka 2.1 and 2.6.1. .

Table

| Modifier and Type | Method |
|-------------------|-----------------|
| long | timestamp() |
| long | timestamptype() |

Table

| Modifier and Type | Method |
|---|---|
| void | pause(Collection<TopicPartition> partitions) |
| void | resume(Collection<TopicPartition> partitions) |
| void | seekToBeginning(Collection<TopicPartition>) |
| void | seekToEnd(Collection<TopicPartition>) |
| void | subscribe(Collection<String> topics); |
| void | subscribe(Collection<String> topics, ConsumerRebalanceListener) |
| void | assign(Collection<TopicPartition> partitions) |
| java.util.Map<TopicPartition, OffsetAndTimestamp> | offsetsForTimes(java.util.Map<TopicPartition, java.lang.Long> timestampsToSearch) |
| java.util.Map<TopicPartition, java.lang.Long> | beginningOffsets(Collection<TopicPartition>) |
| java.util.Map<TopicPartition, java.lang.Long> | endOffsets(Collection<TopicPartition> partitions) |
| ConsumerRecords<K, V> | poll(long timeout) |
| void | commitSync() |
| void | commitAsync() |

The following consumer interface and classes are applicable to HPE Ezmeral Data Fabric support of Apache Kafka.

- `org.apache.kafka.clients.consumer.ConsumerConfig`
- `org.apache.kafka.clients.consumer.ConsumerRebalanceCallback` (interface)
- `org.apache.kafka.clients.consumer.ConsumerRecord<K, V>`
- `org.apache.kafka.clients.consumer.ConsumerRecords<K, V>`
- `org.apache.kafka.clients.consumer.KafkaConsumer<K, V>` implements `Consumer<K, V>`

Note: For a complete list of supported APIs, see [Apache Kafka 2.1 APIs used with HPE Ezmeral Data Fabric Event Data Streams](#)

Producer APIs

The following producer interface and classes, `org.apache.kafka.clients.producer` package, are applicable to HPE Ezmeral Data Fabric support of Apache Kafka 2.1. .

Table

| Modifier and Type | Method |
|--|---|
| <code>java.util.concurrent.Future<RecordMetadata></code> | <code>send(ProducerRecord<K,V> record)</code> |
| <code>void</code> | <code>flush()</code> |
| <code>void</code> | <code>close()</code> |

The following producer interface and classes are applicable to HPE Ezmeral Data Fabric support of Apache Kafka.

- `org.apache.kafka.clients.producer.Callback` (Interface)
- `org.apache.kafka.clients.producer.KafkaProducer<K,V>`
- `org.apache.kafka.clients.producer.ProducerConfig`
- `org.apache.kafka.clients.producer.ProducerRecord<K,V>`
- `org.apache.kafka.clients.producer.RecordMetadata`

Note: For a complete list of supported APIs, see [Apache Kafka 2.1 APIs used with HPE Ezmeral Data Fabric Event Data Streams](#)

Common APIs

The following common APIs, `org.apache.kafka.clients.common` packages, are applicable to HPE Ezmeral Data Fabric support of Apache Kafka 2.1. .

Table

| Modifier and Type | Method |
|-------------------------------|----------------------|
| <code>java.lang.String</code> | <code>key()</code> |
| <code>byte[]</code> | <code>value()</code> |

The following APIs are applicable to HPE Ezmeral Data Fabric support for Apache Kafka.

- `org.apache.kafka.common.PartitionInfo`
Supported methods in `PartitionInfo`:
 - `int partition()`
 - `java.lang.String topic()`
 - `java.lang.String toString()`
- `org.apache.kafka.common.serialization.Serializer<T>` (Interface)
- `org.apache.kafka.common.serialization.Deserializer<T>` (interface)
- `org.apache.kafka.common.TopicPartition`

Note: For a complete list of supported APIs, see [Apache Kafka 2.1 APIs used with HPE Ezmeral Data Fabric Event Data Streams](#)

Configuration Parameters

This topic describes configuration parameters that are either specific to HPE Ezmeral Data Fabric Event Streams or supported from Apache Kafka.

AdminClient

Table

| Parameter | Description |
|---|--|
| <code>streams.admin.default.stream</code> | <p>This parameter, when set during creation of the AdminClient instance, ensures that the specified stream is using the the AdminClient instance for all administrative operations.</p> <p>Syntax:</p> <pre>/mapr/<cluster name>/<volume name>/<stream name></pre> |
| <code>streams.rpc.timeout.ms</code> | <p>Specifies the length of time in milliseconds to wait for a response from the HPE Ezmeral Data Fabric Event Streams server if soft mount is configured (<code>fs.mapr.hardmount</code> is set to false). Default: 120000 Minimum: 30000</p> <p> Note: Applicable as of MapR 6.0.1, is used instead of <code>fs.mapr.rpc.timeout</code></p> <p>For producer and consumer applications, make sure the <code>streams.rpc.timeout.ms</code> configuration value for both producers and consumers is set to greater than 50000 to avoid Message Fetch RPC overload.</p> |

Consumer

Table

| Parameter | Description |
|--|--|
| <code>streams.consumer.buffer.memory</code> | Specifies how much memory to use for caching pre-fetched messages. Messages that are in subscribed topics and partitions are pre-fetched and cached to improve performance. Default 64MB |
| <code>streams.consumer.default.stream</code> | Specifies the path and name of the stream that the consumer subscribes to if, when subscribing to a topic, the consumer does not specify a stream. |
| <code>streams.rpc.timeout.ms</code> | <p>Specifies the length of time in milliseconds to wait for a response from the HPE Ezmeral Data Fabric Event Streams server if a soft mount is configured (<code>fs.mapr.hardmount</code> is set to false). Default: 305000 Minimum: 300000</p> <p>For producer and consumer applications, make sure the <code>streams.rpc.timeout.ms</code> configuration value for both producers and consumers is set to greater than 50000 to avoid Message Fetch RPC overload.</p> |

Table

| Parameter | Description |
|--------------------------------------|---|
| <code>auto.commit.interval.ms</code> | The frequency in milliseconds that the offsets are committed. Default: 1000ms |
| <code>auto.offset.reset</code> | Specifies what HPE Ezmeral Data Fabric Event Streams should do when there is no initial offset, such as when a consumer starts reading from a partition. Default: latest <p>earliest Reset the offset to the offset of the earliest message in the partition.</p> <p>latest Reset the offset to the offset of the latest message in the partition.</p> |
| <code>enable.auto.commit</code> | If true, periodically commits the highest offsets of the messages fetched by the consumer in all of the partitions for the topics that the consumer is subscribed to. Default: true |
| <code>fetch.min.bytes</code> | The minimum amount of data the server should return for a fetch request. If insufficient data is available, the server will wait for this minimum amount of data to accumulate before answering the request. <p>This minimum applies to the totality of what a consumer has subscribed to.</p> <p>Works in conjunction with the timeout interval that is specified in the poll function. If the minimum number of bytes is not reached by the time that the interval expires, the poll returns with nothing.</p> <p>For example, suppose the value is set to 6 bytes and the timeout on a poll is set to 100ms. If there are 5 bytes available and no further bytes come in before the 100ms expire, the poll returns with nothing. Default: 1 byte</p> |
| <code>fetch.max.bytes</code> | The maximum amount of data the server should return for a fetch request. If the first record batch in the first non-empty partition of the fetch is larger than this configuration, the record batch is still returned to ensure that the consumer can make progress. <p> Note: This parameter is new as of MapR 6.0.1.</p> |
| <code>fetch.max.wait.ms</code> | The maximum amount of time the HPE Ezmeral Data Fabric Event Streams server will block before answering the fetch request if there isn't sufficient data to satisfy the requirement given by <code>fetch.min.bytes</code> . |
| <code>group.id</code> | A string 2457 up to bytes long that uniquely identifies the group of consumer processes to which this consumer belongs. By setting the same group ID, multiple consumer processes indicate that they are all part of the same consumer group. Putting consumers into groups provides benefits that are described in Consumer Groups . <p>It is possible for a single consumer to be in a group.</p> |

Table (Continued)

| Parameter | Description |
|--|---|
| <code>max.poll.records</code> | <p>Places an upper bound on the number of records returned from each call.</p> <p> Note: This parameter is new as of MapR 6.0.1.</p> |
| <code>max.partition.fetch.bytes</code> | <p>The number of bytes of message data to attempt to fetch for each partition in each poll request. These bytes will be read into memory for each partition, so this parameter helps control the memory that the consumer uses. Default: 64KB</p> <p>The size of the poll request must be at least as large as the maximum message size that the server allows or else it is possible for producers to send messages that are larger than the consumer can fetch.</p> <p>If the first record batch in the first non-empty partition of the fetch is larger than this configuration, the record batch is still returned to ensure that the consumer can make progress.</p> <p> Note: This is a behavior change as of MapR 6.0.1.</p> |

Producer

Table

| Parameter | Description |
|--|--|
| <code>streams.buffer.max.time.ms</code> | <p>Messages are buffered in the producer for at most the specified time. A thread will flush all the messages that have been buffered for more than the time specified. Default: 3 * 1000 msec create default stream</p> |
| <code>streams.parallel.flushers.per.partition</code> | <p>If enabled, producer may have multiple parallel send requests to the server for each topic partition. If this setting is set to true, it is possible for messages to be sent out of order. Default: true create default stream</p> |
| <code>streams.producer.default.stream</code> | <p>Specifies the stream that the producer will use by default if the producer does not provide the name of a stream when specifying a topic to write to.</p> <p>Syntax:</p> <pre>/mapr/<cluster name>/<volume name>/ <stream name></pre> <p>create default stream</p> |
| <code>fs.mapr.hardmount</code> | <p>Specifies whether to use a hard mount or a soft mount for connections to the MapR Streams server.</p> <p>The default is to use a hard mount and the value is <code>true</code>.</p> <p>If a value for this parameter is set in the <code>core-site.xml</code> file, the value in that file is ignored.</p> <p>create default stream</p> |

Table (Continued)

| Parameter | Description |
|-------------------------------------|---|
| <code>fs.mapr.rpc.timeout</code> | <p>Specifies the length of time in seconds to wait for a response from the HPE Ezmeral Data Fabric Event Streams server if the configuration parameter <code>fs.mapr.hardmount</code> is set to false. Default: 300. Minimum value: 30.</p> <p> Note: Applicable to MapR 6.0.0 and earlier. As of MapR 6.0.1, use <code>streams.mapr.timeout.ms</code>.</p> <p>If a soft mount is used, the time expires while a producer waits for a response from the HPE Ezmeral Data Fabric Event Streams server, and the producer used the <code>KafkaProducer.send(ProducerRecord<K,V> record, Callback callback)</code> method, the callback is invoked with the error <code>EAGAIN</code>, which means "Resource temporarily unavailable."</p> <p>create default stream</p> |
| <code>streams.rpc.timeout.ms</code> | <p>Specifies the length of time in milliseconds to wait for a response from the HPE Ezmeral Data Fabric Event Streams server if soft mount is configured (<code>fs.mapr.hardmount</code> is set to false). Default: 30000 Minimum: 30000</p> <p>For producer and consumer applications, make sure the <code>streams.rpc.timeout.ms</code> configuration value for both producers and consumers is set to greater than 50000 to avoid Message Fetch RPC overload.</p> |

Table

| Parameter | Description |
|----------------------------------|---|
| <code>buffer.memory</code> | The total bytes of memory the producer can use to buffer records waiting to be sent to the server. If records are generated faster than they can be delivered to the server the producer will block. Default: 33554432 |
| <code>client.id</code> | Producers can tag records with a client ID that identifies the producer. Consumers can then be aware of which producer sent a message or set of messages. Apache Drill or other analytic tools querying messages can include this ID in the filters for their queries. Default: No client ID. |
| <code>metadata.max.age.ms</code> | The producer generally refreshes the topic metadata from the server when there is a failure. It will also poll for this data regularly. Default: 300 * 1000 msec |

Compiling and Running HPE Ezmeral Data Fabric Event Streams Java Apps

For producer and consumer applications that use the HPE Ezmeral Data Fabric Event Streams Java API, use Maven to compile and determine the application's dependencies. Then, when you run the application, specify those dependencies in the application's classpath.

Compile and Determine Dependencies

See [HPE Ezmeral Data Fabric Event Streams Streams Sample Programs](#) on GitHub for an example pom.xml file.

1. Add MapR's Maven repository to your pom.xml file, if it is not already added:

```
<repositories>
  <repository>
    <id>mapr-releases</id>
    <url>https://repository.mapr.com/nexus/content/repositories/
releases</url>
    <snapshots><enabled>true</enabled></snapshots>
    <releases><enabled>true</enabled></releases>
  </repository>
</repositories>
```

2. Add a dependency to the MapR Streams Java client (kafka-clients) project:

```
<dependency>
  <groupId>org.apache.kafka</groupId>
  <artifactId>kafka-clients</artifactId>
  <version><version selected from the repository></version>
</dependency>
```

Note: The kafka-clients version mentioned above is an example. The actual version that your application requires is based on the current EEP and MapR version that you are running. The versions are listed in the following location: <https://repository.mapr.com/nexus/content/groups/mapr-public/org/apache/kafka/kafka-clients/>

3. Add a dependency to the MapR Streams project:

```
<dependency>
  <groupId>com.mapr.streams</groupId>
  <artifactId>mapr-streams</artifactId>
  <version><version selected from the repository></version>
</dependency>
```

Note: The MapR Streams project version mentioned above is an example. The actual version that your application requires is based on the current EEP and MapR version that you are running. The versions are listed in the following location: <https://repository.mapr.com/nexus/content/groups/mapr-public/com/mapr/streams/mapr-streams/>

4. Use Maven to compile the application and resolve dependencies. For example, you can run `mvn clean package`.

Run the Application

When you develop a Java application, you can use a dependency management tool such as Maven to compile your application. However, it is recommended that do the following instead:

1. Compile the Java application without including dependencies
2. Specify the required classpath when you submit the application to the cluster

If you choose to bundle the JAR file, and there is a mismatch between the bundled JAR file and the version that your MapR cluster expects, this can result in failures. The failures differ depending on the version of

MapR you are using. For more information, see [Using the File System JAR to Connect to the Cluster](#) on page 2649.

When the cluster is secure, the node must also have a mapr ticket configured for the user that runs the application.

You can use the following command to launch HPE Ezmeral Data Fabric Event Streams applications:

```
java -cp <classpath>:. -Djava.library.path=/opt/mapr/lib <main class JAR>
<command line arguments>
```

Migrating Apache Kafka Java Applications to HPE Ezmeral Data Fabric Event Streams

There are only two steps that you need to follow to migrate applications written with the Apache Kafka Java API to HPE Ezmeral Data Fabric Event Streams.

The following steps assume that migration is from either:

- Apache Kafka 2.6.1 to HPE Ezmeral Data Fabric Event Streams 6.2 or higher
- Apache Kafka 2.1.1 to HPE Ezmeral Data Fabric Event Streams 6.2 or higher
- Apache Kafka 1.1 to HPE Ezmeral Data Fabric Event Streams 6.1 or higher
- Apache Kafka 1.0 to HPE Ezmeral Data Fabric Event Streams 6.0.1 or higher
- Apache Kafka 0.9.0 to HPE Ezmeral Data Fabric Event Streams 6.0.0 or earlier

Important: For information on backward compatibility, see [HPE Ezmeral Data Fabric Event Streams Java API Library](#) on page 3033

1. Change the names of topics to include the path and name of the MapR Stream stream in which the topic is located.

Here is the syntax to use:

```
/<path and name of stream>:<name of topic>
```

For example, you might have a stream in a MapR cluster that is named `stream_A`, and the stream might be in a volume named `IoT` and in a directory named `automobile_sensors`. You want to redirect a producer application to a topic in that stream. The syntax of the path to the topic might look like this:

```
/mapr/IoT/automobile_sensors/stream_A:<name of topic>
```

2. If a producer application uses the Kafka interface `Partitioner` to compute which partitions to publish messages to, revise the application so that it uses the `Kafka StreamsPartitioner` interface instead.

Differences between HPE Ezmeral Data Fabric Event Streams and Apache Kafka Configuration

Describes the HPE Ezmeral Data Fabric Event Streams supportability of Apache Kafka configuration parameters for producers and consumers.

Kafka Producer

| Name | Description | Supported for producers in HPE Ezmeral Data Fabric Event Streams? |
|-------------------|---|--|
| bootstrap.servers | A list of host/port pairs to use for establishing the initial connection to the Kafka cluster. The client will make use of all servers irrespective of which servers are specified here for bootstrapping—this list only impacts the initial hosts used to discover the full set of servers. This list should be in the form <code>host1:port1,host2:port2,...</code> Since these servers are just used for the initial connection to discover the full cluster membership (which may change dynamically), this list need not contain the full set of servers (you may want more than one, though, in case a server is down). | No. Cluster details are discovered from the file <code>mapr-clusters.conf</code> . |
| key.serializer | Serializer class for key that implements the <code>Serializer</code> interface. | Yes |
| value.serializer | Serializer class for value that implements the <code>Serializer</code> interface. | Yes |

| Name | Description | Supported for producers in HPE Ezmeral Data Fabric Event Streams? |
|---------------|--|--|
| acks | <p>The number of acknowledgments the producer requires the leader to have received before considering a request complete. This controls the durability of records that are sent. The following settings are common:</p> <p><code>acks=0</code></p> <p>If set to zero then the producer will not wait for any acknowledgment from the server at all. The record will be immediately added to the socket buffer and considered sent. No guarantee can be made that the server has received the record in this case, and the retries configuration will not take effect (as the client won't generally know of any failures). The offset given back for each record will always be set to -1.</p> <p><code>acks=1</code></p> <p>This will mean the leader will write the record to its local log but will respond without awaiting full acknowledgement from all followers. In this case should the leader fail immediately after acknowledging the record but before the followers have replicated it then the record will be lost.</p> <p><code>acks=all</code></p> <p>This means the leader will wait for the full set of in-sync replicas to acknowledge the record. This guarantees that the record will not be lost as long as at least one in-sync replica remains alive. This is the strongest available guarantee.</p> | Ignored, all writes in HPE Ezmeral Data Fabric Event Streams are synchronous, and number of replicas is determined at the volume level, with a default of 3. |
| buffer.memory | <p>The total bytes of memory the producer can use to buffer records waiting to be sent to the server. If records are sent faster than they can be delivered to the server the producer will either block or throw an exception based on the preference specified by <code>block.on.buffer.full</code>.</p> <p>This setting should correspond roughly to the total memory the producer will use, but is not a hard bound since not all memory the producer uses is used for buffering. Some additional memory will be used for compression (if compression is enabled) as well as for maintaining in-flight requests.</p> | Yes |

| Name | Description | Supported for producers in HPE Ezmeral Data Fabric Event Streams? |
|-------------------------|--|--|
| compression.type | The compression type for all data generated by the producer. The default is none (i.e. no compression). Valid values are none, gzip, snappy, or lz4. Compression is of full batches of data, so the efficacy of batching will also impact the compression ratio (more batching means better compression). | Ignored. Compression is configured per stream. |
| retries | Setting a value greater than zero will cause the client to resend any record whose send fails with a potentially transient error. Note that this retry is no different than if the client resent the record upon receiving the error. Allowing retries will potentially change the ordering of records because if two records are sent to a single partition, and the first fails and is retried but the second succeeds, then the second record may appear first. | Ignored. HPE Ezmeral Data Fabric Event Streams always does automatic retries on transient errors. |
| ssl.key.password | The password of the private key in the key store file. This is optional for client. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| ssl.keystore.location | The location of the key store file. This is optional for client and can be used for two-way authentication for client. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| ssl.keystore.password | The store password for the key store file. This is optional for client and only needed if <code>ssl.keystore.location</code> is configured. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| ssl.truststore.location | The location of the trust store file. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| ssl.truststore.password | The password for the trust store file. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |

| Name | Description | Supported for producers in HPE Ezmeral Data Fabric Event Streams? |
|-------------------------|--|--|
| batch.size | The producer will attempt to batch records together into fewer requests whenever multiple records are being sent to the same partition. This helps performance on both the client and the server. This configuration controls the default batch size in bytes. | Ignored. HPE Ezmeral Data Fabric always batches records for optimal performance. |
| | No attempt will be made to batch records larger than this size. | |
| | Requests sent to brokers will contain multiple batches, one for each partition with data available to be sent. | |
| | A small batch size will make batching less common and may reduce throughput (a batch size of zero will disable batching entirely). A very large batch size may use memory a bit more wastefully as we will always allocate a buffer of the specified batch size in anticipation of additional records. | |
| client.id | An id string to pass to the server when making requests. The purpose of this is to be able to track the source of requests beyond just ip/port by allowing a logical application name to be included in server-side request logging. | Yes |
| connections.max.idle.ms | Close idle connections after the number of milliseconds specified by this config. | Ignored. |

| Name | Description | Supported for producers in HPE Ezmeral Data Fabric Event Streams? |
|------------------|---|--|
| linger.ms | <p>The producer groups together any records that arrive in between request transmissions into a single batched request. Normally this occurs only under load when records arrive faster than they can be sent out. However in some circumstances the client may want to reduce the number of requests even under moderate load. This setting accomplishes this by adding a small amount of artificial delay—that is, rather than immediately sending out a record the producer will wait for up to the given delay to allow other records to be sent so that the sends can be batched together. This can be thought of as analogous to Nagle's algorithm in TCP. This setting gives the upper bound on the delay for batching; once we get batch.size worth of records for a partition it will be sent immediately regardless of this setting, however if we have fewer than this many bytes accumulated for this partition we will 'linger' for the specified time waiting for more records to show up. This setting defaults to 0 (i.e. no delay). Setting linger.ms=5, for example, would have the effect of reducing the number of requests sent but would add up to 5ms of latency to records sent in the absence of load.</p> | Ignored. |
| max.block.ms | <p>The configuration controls how long {@link KafkaProducer#send()} and {@link KafkaProducer#partitionsFor} will block. These methods can be blocked for multiple reasons. For e.g: buffer full, metadata unavailable. This configuration imposes maximum limit on the total time spent in fetching metadata, serialization of key and value, partitioning and allocation of buffer memory when doing a send(). In case of partitionsFor(), this configuration imposes a maximum time threshold on waiting for metadata</p> | Ignored. HPE Ezmeral Data Fabric Event Streams has a similar parameter: streams.rpc.timeout.ms |
| max.request.size | <p>The maximum size of a request. This is also effectively a cap on the maximum record size. Note that the server has its own cap on record size which may be different from this. This setting will limit the number of record batches the producer will send in a single request to avoid sending huge requests.</p> | Ignored. |

| Name | Description | Supported for producers in HPE Ezmeral Data Fabric Event Streams? |
|---|--|--|
| <code>partitioner.class</code> | Partitioner class that implements the Partitioner interface. | Use the Kafka StreamsPartitioner interface. |
| <code>receive.buffer.bytes</code> | The size of the TCP receive buffer (SO_RCVBUF) to use when reading data. | Ignored. |
| <code>request.timeout.ms</code> | The configuration controls the maximum amount of time the client will wait for the response of a request. If the response is not received before the timeout elapses the client will resend the request if necessary or fail the request if retries are exhausted. | Ignored. HPE Ezmeral Data Fabric Event Streams has a similar parameter: <code>streams.rpc.timeout.ms</code> |
| <code>sasl.kerberos.service.name</code> | The Kerberos principal name that Kafka runs as. This can be defined either in Kafka's JAAS config or in Kafka's config. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| <code>security.protocol</code> | Protocol used to communicate with brokers. Currently only PLAINTEXT and SSL are supported. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| <code>send.buffer.bytes</code> | The size of the TCP send buffer (SO_SNDBUF) to use when sending data. | Ignored. |
| <code>ssl.enabled.protocols</code> | The list of protocols enabled for SSL connections. TLSv1.2, TLSv1.1 and TLSv1 are enabled by default. | Ignored. |
| <code>ssl.keystore.type</code> | The file format of the key store file. This is optional for client. Default value is JKS | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| <code>ssl.protocol</code> | The SSL protocol used to generate the SSLContext. Default setting is TLS, which is fine for most cases. Allowed values in recent JVMs are TLS, TLSv1.1 and TLSv1.2. SSL, SSLv2 and SSLv3 may be supported in older JVMs, but their usage is discouraged due to known security vulnerabilities. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| <code>ssl.provider</code> | The name of the security provider used for SSL connections. Default value is the default security provider of the JVM. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| <code>ssl.truststore.type</code> | The file format of the trust store file. Default value is JKS. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |

| Name | Description | Supported for producers in HPE Ezmeral Data Fabric Event Streams? |
|---------------------------------------|---|--|
| timeout.ms | The configuration controls the maximum amount of time the server will wait for acknowledgments from followers to meet the acknowledgment requirements the producer has specified with the acks configuration. If the requested number of acknowledgments are not met when the timeout elapses an error will be returned. This timeout is measured on the server side and does not include the network latency of the request. | Ignored. HPE Ezmeral Data Fabric Event Streams has a similar parameter: <code>streams.rpc.timeout.ms</code> |
| block.on.buffer.full | When our memory buffer is exhausted we must either stop accepting new records (block) or throw errors. By default this setting is true and we block, however in some scenarios blocking is not desirable and it is better to immediately give an error. Setting this to false will accomplish that: the producer will throw a <code>BufferExhaustedException</code> if a record is sent and the buffer space is full. | Ignored. |
| max.in.flight.requests.per.connection | The maximum number of unacknowledged requests the client will send on a single connection before blocking. Note that if this setting is set to be greater than 1 and there are failed sends, there is a risk of message re-ordering due to retries (i.e., if retries are enabled). | Ignored. HPE Ezmeral Data Fabric Event Streams has a similar parameter: <code>streams.parallel.flushers.per.partition</code> |
| metadata.fetch.timeout.ms | The first time data is sent to a topic we must fetch metadata about that topic to know which servers host the topic's partitions. This fetch to succeed before throwing an exception back to the client. | Ignored. |
| metadata.max.age.ms | The period of time in milliseconds after which we force a refresh of metadata even if we haven't seen any partition leadership changes to proactively discover any new brokers or partitions. | Yes |
| metric.reporters | A list of classes to use as metrics reporters. Implementing the <code>MetricReporter</code> interface allows plugging in classes that will be notified of new metric creation. The <code>JmxReporter</code> is always included to register JMX statistics. | No |
| metrics.num.samples | The number of samples maintained to compute metrics. | No. |
| metrics.sample.window.ms | The number of samples maintained to compute metrics. | No. |

| Name | Description | Supported for producers in HPE Ezmeral Data Fabric Event Streams? |
|--|--|--|
| reconnect.backoff.ms | The amount of time to wait before attempting to reconnect to a given host. This avoids repeatedly connecting to a host in a tight loop. This backoff applies to all requests sent by the consumer to the broker. | Ignored. HPE Ezmeral Data Fabric Event Streams has a similar parameter: <code>streams.rpc.timeout.ms</code> |
| retry.backoff.ms | The amount of time to wait before attempting to retry a failed fetch request to a given topic partition. This avoids repeated fetching-and-failing in a tight loop. | Ignored. HPE Ezmeral Data Fabric Event Streams has a similar parameter: <code>streams.rpc.timeout.ms</code> |
| sasl.kerberos.kinit.cmd | Kerberos kinit command path. Default is <code>/usr/bin/kinit</code> | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| sasl.kerberos.min.time.before.relogin | Login thread sleep time between refresh attempts. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| sasl.kerberos.ticket.renew.jitter | Percentage of random jitter added to the renewal time. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| sasl.kerberos.ticket.renew.window.factor | Login thread will sleep until the specified window factor of time from last refresh to ticket's expiry has been reached, at which time it will try to renew the ticket. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| ssl.cipher.suites | A list of cipher suites. This is a named combination of authentication, encryption, MAC and key exchange algorithm used to negotiate the security settings for a network connection using TLS or SSL network protocol. By default all the available cipher suites are supported. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| ssl.endpoint.identification.algorithm | The endpoint identification algorithm to validate server hostname using server certificate. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| ssl.keymanager.algorithm | The algorithm used by key manager factory for SSL connections. Default value is the key manager factory algorithm configured for the Java Virtual Machine. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| ssl.trustmanager.algorithm | The algorithm used by trust manager factory for SSL connections. Default value is the trust manager factory algorithm configured for the Java Virtual Machine. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |

Kafka Consumer

| Name | Description | Supported for consumers in HPE Ezmeral Data Fabric Event Streams? |
|--------------------|---|--|
| bootstrap.servers | A list of host/port pairs to use for establishing the initial connection to the Kafka cluster. The client will make use of all servers irrespective of which servers are specified here for bootstrapping—this list only impacts the initial hosts used to discover the full set of servers. This list should be in the form host1:port1,host2:port2,.... Since these servers are just used for the initial connection to discover the full cluster membership (which may change dynamically), this list need not contain the full set of servers (you may want more than one, though, in case a server is down). | No. Cluster details are discovered from the file <code>mapr-clusters.conf</code> . |
| key.deserializer | Deserializer class for key that implements the Deserializer interface. | Yes |
| value.deserializer | Deserializer class for value that implements the Deserializer interface. | Yes |
| fetch.min.bytes | The minimum amount of data the server should return for a fetch request. If insufficient data is available the request will wait for that much data to accumulate before answering the request. The default setting of 1 byte means that fetch requests are answered as soon as a single byte of data is available or the fetch request times out waiting for data to arrive. Setting this to something greater than 1 will cause the server to wait for larger amounts of data to accumulate which can improve server throughput a bit at the cost of some additional latency. | Yes |
| fetch.max.bytes | The maximum amount of data the server should return for a fetch request. If the first record batch in the first non-empty partition of the fetch is larger than this configuration, the record batch is still returned to ensure that the consumer can make progress.  Note: This is new as of MapR 6.0.1. | Yes, as of MapR 6.0.1. |
| group.id | A unique string that identifies the consumer group this consumer belongs to. This property is required if the consumer uses either the group management functionality by using <code>subscribe(topic)</code> or the Kafka-based offset management strategy. | Yes |

| Name | Description | Supported for consumers in HPE Ezmeral Data Fabric Event Streams? |
|---------------------------|--|--|
| heartbeat.interval.ms | The expected time between heartbeats to the consumer coordinator when using Kafka's group management facilities. Heartbeats are used to ensure that the consumer's session stays active and to facilitate rebalancing when new consumers join or leave the group. The value must be set lower than session.timeout.ms, but typically should be set no higher than 1/3 of that value. It can be adjusted even lower to control the expected time for normal rebalances. | No |
| max.poll.records | Places an upper bound on the number of records returned from each call.  Note: This parameter is new as of MapR 6.0.1. | Yes, as of MapR 6.0.1. |
| max.partition.fetch.bytes | The maximum amount of data per-partition the server will return. The maximum total memory used for a request will be #partitions * max.partition.fetch.bytes. This size must be at least as large as the maximum message size the server allows or else it is possible for the producer to send messages larger than the consumer can fetch. If that happens, the consumer can get stuck trying to fetch a large message on a certain partition. If the first record batch in the first non-empty partition of the fetch is larger than this configuration, the record batch is still returned to ensure that the consumer can make progress.  Note: This is a behavior change as of MapR 6.0.1. | Yes |
| session.timeout.ms | The timeout used to detect failures when using Kafka's group management facilities. | Ignored |
| ssl.key.password | The password of the private key in the key store file. This is optional for client. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| ssl.keystore.location | The location of the key store file. This is optional for client and can be used for two-way authentication for client. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |

| Name | Description | Supported for consumers in HPE Ezmeral Data Fabric Event Streams? |
|-------------------------------|--|--|
| ssl.keystore.password | The store password for the key store file. This is optional for client and only needed if ssl.keystore.location is configured. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| ssl.truststore.location | The location of the trust store file. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| ssl.truststore.password | The password for the trust store file. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| auto.offset.reset | <p>What to do when there is no initial offset in Kafka or if the current offset does not exist any more on the server (e.g. because that data has been deleted):</p> <p>earliest automatically reset the offset to the earliest offset</p> <p>latest automatically reset the offset to the latest offset</p> <p>none throw exception to the consumer if no previous offset is found for the consumer's group</p> <p>anything else throw exception to the consumer.</p> | Yes |
| connections.max.idle.ms | Close idle connections after the number of milliseconds specified by this config. | Ignored |
| enable.auto.commit | If true the consumer's offset will be periodically committed in the background. | Yes |
| partition.assignment.strategy | The class name of the partition assignment strategy that the client will use to distribute partition ownership amongst consumer instances when group management is used | Ignored. HPE Ezmeral Data Fabric Event Streams distributes partitions equally among the consumers in a group. |
| receive.buffer.bytes | The size of the TCP receive buffer (SO_RCVBUF) to use when reading data. | Ignored. |

| Name | Description | Supported for consumers in HPE Ezmeral Data Fabric Event Streams? |
|----------------------------|--|--|
| request.timeout.ms | The configuration controls the maximum amount of time the client will wait for the response of a request. If the response is not received before the timeout elapses the client will resend the request if necessary or fail the request if retries are exhausted. | Ignored. HPE Ezmeral Data Fabric Event Streams has a similar parameter: <code>streams.rpc.timeout.ms</code> |
| sasl.kerberos.service.name | The Kerberos principal name that Kafka runs as. This can be defined either in Kafka's JAAS config or in Kafka's config. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| security.protocol | Protocol used to communicate with brokers. Currently only PLAINTEXT and SSL are supported. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| send.buffer.bytes | The size of the TCP send buffer (SO_SNDBUF) to use when sending data. | Ignored. |
| ssl.enabled.protocols | The list of protocols enabled for SSL connections. TLSv1.2, TLSv1.1 and TLSv1 are enabled by default. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| ssl.keystore.type | The file format of the key store file. This is optional for client. Default value is JKS | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| ssl.protocol | The SSL protocol used to generate the SSLContext. Default setting is TLS, which is fine for most cases. Allowed values in recent JVMs are TLS, TLSv1.1 and TLSv1.2. SSL, SSLv2 and SSLv3 may be supported in older JVMs, but their usage is discouraged due to known security vulnerabilities. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| ssl.provider | The name of the security provider used for SSL connections. Default value is the default security provider of the JVM. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| ssl.truststore.type | The file format of the trust store file. Default value is JKS. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| auto.commit.interval.ms | The frequency in milliseconds that the consumer offsets are auto-committed to Kafka if <code>enable.auto.commit</code> is set to true. | Yes |

| Name | Description | Supported for consumers in HPE Ezmeral Data Fabric Event Streams? |
|--------------------------|--|--|
| check.crcs | Automatically check the CRC32 of the records consumed. This ensures no on-the-wire or on-disk corruption to the messages occurred. This check adds some overhead, so it may be disabled in cases seeking extreme performance. | Ignored. HPE Ezmeral Data Fabric Event Streams always does end-to-end crc computation and verification. |
| client.id | An id string to pass to the server when making requests. The purpose of this is to be able to track the source of requests beyond just ip/port by allowing a logical application name to be included in server-side request logging. | Yes |
| fetch.max.wait.ms | The maximum amount of time the server will block before answering the fetch request if there isn't sufficient data to immediately satisfy the requirement given by fetch.min.bytes. | No |
| metadata.max.age.ms | The period of time in milliseconds after which we force a refresh of metadata even if we haven't seen any partition leadership changes to proactively discover any new brokers or partitions. | Yes |
| metric.reporters | A list of classes to use as metrics reporters. Implementing the MetricReporter interface allows plugging in classes that will be notified of new metric creation. The JmxReporter is always included to register JMX statistics. | No |
| metrics.num.samples | The number of samples maintained to compute metrics. | No |
| metrics.sample.window.ms | The number of samples maintained to compute metrics. | No |
| reconnect.backoff.ms | The amount of time to wait before attempting to reconnect to a given host. This avoids repeatedly connecting to a host in a tight loop. This backoff applies to all requests sent by the consumer to the broker. | Ignored. HPE Ezmeral Data Fabric Event Streams has a similar parameter: <code>streams.rpc.timeout.ms</code> |
| retry.backoff.ms | The amount of time to wait before attempting to retry a failed fetch request to a given topic partition. This avoids repeated fetching-and-failing in a tight loop. | Ignored. HPE Ezmeral Data Fabric Event Streams has a similar parameter: <code>streams.rpc.timeout.ms</code> |
| sasl.kerberos.kinit.cmd | Kerberos kinit command path. Default is <code>/usr/bin/kinit</code> | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |

| Name | Description | Supported for consumers in HPE Ezmeral Data Fabric Event Streams? |
|--|--|--|
| sasl.kerberos.min.time.before.relogin | Login thread sleep time between refresh attempts. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| sasl.kerberos.ticket.renew.jitter | Percentage of random jitter added to the renewal time. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| sasl.kerberos.ticket.renew.window.factor | Login thread will sleep until the specified window factor of time from last refresh to ticket's expiry has been reached, at which time it will try to renew the ticket. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| ssl.cipher.suites | A list of cipher suites. This is a named combination of authentication, encryption, MAC and key exchange algorithm used to negotiate the security settings for a network connection using TLS or SSL network protocol. By default all the available cipher suites are supported. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| ssl.endpoint.identification.algorithm | The endpoint identification algorithm to validate server hostname using server certificate. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| ssl.keymanager.algorithm | The algorithm used by key manager factory for SSL connections. Default value is the key manager factory algorithm configured for the Java Virtual Machine. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |
| ssl.trustmanager.algorithm | The algorithm used by trust manager factory for SSL connections. Default value is the trust manager factory algorithm configured for the Java Virtual Machine. | Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See Security on page 650 for more information. |

HPE Ezmeral Data Fabric Event Streams Parameters

The following HPE Ezmeral Data Fabric Event Streams parameters are for the Admin API.

Table

| HPE Ezmeral Data Fabric Event Streams Parameter | Description | Kafka Parameter Replaced |
|---|--|--|
| <code>streams.rpc.timeout.ms</code> | <p>Specifies the length of time in milliseconds to wait for a response from the HPE Ezmeral Data Fabric Event Streams server if soft mount is configured (<code>fs.mapr.hardmount</code> is set to false). Default: 120000 Minimum: 30000</p> <p> Note: Applicable as of MapR 6.0.1, is used instead of <code>fs.mapr.rpc.timeout</code></p> | <p><code>request.timeout.ms</code> <code>reconnect.backoff.ms</code> <code>retry.backoff.ms</code></p> |

The following HPE Ezmeral Data Fabric Event Streams parameter are for the Producer API:

Table

| HPE Ezmeral Data Fabric Event Streams Parameter | Description | Kafka Parameter Replaced |
|--|---|--|
| <code>streams.buffer.max.time.ms</code> | <p>Messages are buffered in the producer for at most the specified time. A thread will flush all the messages that have been buffered for more than the time specified.</p> <p>Default: 3 * 1000 msec</p> | <code>linger.ms</code> |
| <code>streams.parallel.flushers.per.partition</code> | <p>If enabled, producer may have multiple parallel send requests to the server for each topic partition. If this setting is set to true, it is possible for messages to be sent out of order.</p> <p>Default: true</p> | <code>max.in.flight.requests.per.connection</code> |
| <code>streams.partition.class</code> | <p>The class that implements the <code>StreamsPartitioner</code> interface. This interface lets you write custom algorithms for determining which topic and partition to use for messages that match specific criteria. Use this configuration parameter only for producers that are written in Java.</p> | Not applicable. |

Table (Continued)

| HPE Ezmeral Data Fabric Event Streams Parameter | Description | Kafka Parameter Replaced |
|---|---|---|
| streams.producer.default.stream | <p>Specifies the stream that the producer will use by default if the producer does not provide the name of a stream when specifying a topic to write to.</p> <p>For example, the producer can specify the name of a stream together with the name of a topic to write to, like this:</p> <pre>/<stream>/<topic></pre> <p>However, if the stream is not specified, the value of this configuration parameter is assumed to be the stream in which the topic is located.</p> <p>If the producer specifies the name of a topic without also providing the path and name of the stream, and there is no value for this configuration parameter, HPE Ezmeral Data Fabric Event Streams assumes that the topic specified is in Apache Kafka and does nothing.</p> | Not applicable. |
| streams.rpc.timeout.ms | <p>Specifies the length of time in milliseconds to wait for a response from the HPE Ezmeral Data Fabric Event Streams server if soft mount is configured (fs.mapr.hardmount is set to false). Default: 30000 Minimum: 30000</p> <p>If the time expires while a producer waits for a response from the HPE Ezmeral Data Fabric Event Streams server, and the producer used the <code>KafkaProducer.send(ProducerRecord<K,V> record, Callback callback)</code> method, the callback is invoked with the error <code>EAGAIN</code>, which means "Resource temporarily unavailable."</p> <p> Note: Applicable as of MapR 6.0.1, is used instead of <code>fs.mapr.rpc.timeout</code></p> | <pre>max.block.ms request.timeout.ms timeout.ms reconnect.backoff.ms retry.backoff.ms</pre> |

The following HPE Ezmeral Data Fabric Event Streams parameters are for the Consumer API:

Table

| HPE Ezmeral Data Fabric Event Streams Parameter | Description | Kafka Parameter Replaced |
|---|--|---|
| <code>streams.consumer.default.stream</code> | Specifies the path and name of the stream that the consumer subscribes to if, when subscribing to a topic, the consumer does not specify a stream. This default value is also used for the <code>KafkaConsumer.listTopics()</code> method. | Not applicable. |
| <code>streams.rpc.timeout.ms</code> | Specifies the length of time in milliseconds to wait for a response from the HPE Ezmeral Data Fabric Event Streams server if a soft mount is configured (<code>fs.mapr.hardmount</code> is set to false). Default: 305000 Minimum: 300000  Note: Applicable as of MapR 6.0.1, is used instead of <code>fs.mapr.rpc.timeout</code> | <code>request.timeout.ms</code> <code>reconnect.backoff.ms</code> <code>retry.backoff.ms</code> |

HPE Ezmeral Data Fabric Event Streams C Applications

C applications can be developed for HPE Ezmeral Data Fabric Event Streams (as of MapR 5.2.1). The HPE Ezmeral Data Fabric Event Streams C Client is a distribution of `librdkafka` that works with HPE Ezmeral Data Fabric Event Streams. The HPE Ezmeral Data Fabric Event Streams C Client is available in Ezmeral Ecosystem Pack (EEP) 3.0 or higher.

The following Apache Kafka `librdkafka` versions are supported:

Table

| Core release | EEP Release | Kafka <code>librdkafka</code> version |
|---------------------------|-------------|---------------------------------------|
| As of 6.0.1 | As of 5.0 | 0.11.3 |
| As of 5.2.1 through 6.0.0 | As of 3.0 | 0.9.0 |

The HPE Ezmeral Data Fabric Event Streams C Client supports a majority of the `librdkafka` C APIs plus additional [configuration properties](#) that are available only with HPE Ezmeral Data Fabric Event Streams. When developing applications for HPE Ezmeral Data Fabric Event Streams or migrating Kafka applications to HPE Ezmeral Data Fabric Event Streams, see the list of [librdkafka APIs Supported by HPE Ezmeral Data Fabric Event Streams C Client](#) on page 3086 which also describes API behavior. Reference [rdkafka.h](#) for API signatures.

When developing and running HPE Ezmeral Data Fabric Event Streams C applications, note the following:

- You can create producers and high-level consumers. Low-level consumers are not supported.
- Consuming or producing topics in a Kafka cluster is not supported.
- As of HPE Ezmeral Data Fabric 6.0, the HPE Ezmeral Data Fabric Event Streams offset values start at 0.
- HPE Ezmeral Data Fabric Security is supported. Kafka application-level security is not supported. See [Security](#) on page 650.
- User impersonation is not supported.

CAUTION: As of HPE Ezmeral Data Fabric 6.1, the `mapr-core` package has a dependency on `mapr-librdkafka`. If the `mapr-librdkafka` package is installed, do not remove it manually. Doing so could result in the removal of HPE Ezmeral Data Fabric core packages, rendering the node unusable.

Configuring the HPE Ezmeral Data Fabric Event Streams C Client

After installing the HPE Ezmeral Data Fabric Client and before developing applications, you must configure your client C library by setting the library path.

Linux

For Linux installations, add `/opt/mapr/lib` to the end of `LD_LIBRARY_PATH`.

```
export LD_LIBRARY_PATH=$LD_LIBRARY_PATH:/opt/mapr/lib
```

Important: For HPE Ezmeral Data Fabric 6.0.1, the `libjvm.so` configuration is *not* required.

For HPE Ezmeral Data Fabric 6.0.0 and earlier, add the `/opt/mapr/lib` and the path to the directory that contains `libjvm.so` to the end of `LD_LIBRARY_PATH`.

```
export LD_LIBRARY_PATH=$LD_LIBRARY_PATH:/opt/mapr/lib:  
lib:<path_to_libjvm.so_directory>
```

The location of the `libjvm.so` differs based on where you installed Java. You can use `find / -name libjvm*` to determine the file location. For example, if the `libjvm.so` file is in the following location:

```
/usr/lib/jvm/java-7-openjdk-amd64/jre/lib/amd64/server/libjvm.so
```

Then, you set the library path like this:

```
export LD_LIBRARY_PATH=$LD_LIBRARY_PATH:/opt/mapr/lib:/usr/lib/jvm/  
java-7-openjdk-amd64/jre/lib/amd64/server/
```

Mac

For Mac installations, add `/opt/mapr/lib` to the end of `DYLD_LIBRARY_PATH`.

```
export DYLD_LIBRARY_PATH=$DYLD_LIBRARY_PATH:/opt/mapr/lib
```

 **Important:** For HPE Ezmeral Data Fabric 6.0.1, the `libjvm.so` configuration is *not* required.

For HPE Ezmeral Data Fabric 6.0.0 and earlier, add `/opt/mapr/lib` and the path to the directory that contains `libjvm.dylib` to the end of `DYLD_LIBRARY_PATH`.

```
export DYLD_LIBRARY_PATH=$DYLD_LIBRARY_PATH:/opt/mapr/lib:  
lib:<path_to_libjvm.dylib_directory>
```

The location of the `libjvm.dylib` differs based on where you installed Java. You can use `find / -name libjvm*` to determine the file location. For example, if the `libjvm.dylib` file is in the following location:

```
/Library/Java/JavaVirtualMachines/jdk1.8.0_121.jdk/Contents/  
Home/jre/lib/server/libjvm.dylib
```

Then, you set the library path like this:

```
export DYLD_LIBRARY_PATH=$DYLD_LIBRARY_PATH:/opt/mapr/lib:/Library/Java/  
JavaVirtualMachines/jdk1.8.0_121.jdk/Contents/Home/jre/lib/server
```

Windows

Note: As of HPE Ezmeral Data Fabric 6.0.1, the HPE Ezmeral Data Fabric C client is available on Windows.

For Windows installations, no additional configuration is required. Link your application and run your programs against the HPE Ezmeral Data Fabric Client dynamic link libraries (dll) located at: `C:\opt\mapr\lib`. The corresponding `librdkafka` header is `C:\opt\mapr\include\librdkafka`.

Developing a HPE Ezmeral Data Fabric Event Streams C Application

This topic includes basic information about how to develop a HPE Ezmeral Data Fabric Event Streams C application. Sample applications are provided.

Before you Begin

Confirm that your environment meets the following requirements:

- The HPE Ezmeral Data Fabric cluster version is 5.2.1 or greater.
- HPE Ezmeral Data Fabric core client (`mapr-client`) package is installed on the node and it is configured to access the cluster. Or, it is a HPE Ezmeral Data Fabric cluster node. See [Installing the Data Fabric Client](#) on page 340 for more information.
- The HPE Ezmeral Data Fabric Event Streams C Client is installed and configured on the node. See [Configuring the HPE Ezmeral Data Fabric Event Streams C Client](#) on page 3071.
- GNU Compiler Collection (GCC) is installed on the node.

Creating, Compiling and Running C Apps

The following sections describes how to create a producer and consumer in C, compile the source code, generate executables, and run the applications.

Create Producer

This topic describes how to create a HPE Ezmeral Data Fabric Event Streams streams producer in C. While the code to generate a HPE Ezmeral Data Fabric Event Streams stream producer varies depending on the use case, in general, the producer code should contain the following:

1. Include the rdkafka.h header file (/opt/mapr/include/librdkafka/rdkafka.h)
2. Use rd_kafka_conf_new() to create the producer configuration.
3. Use rd_kafka_new () to create the producer handle.
4. Use rd_kafka_topic_conf_new() to create the topic configuration.
5. Use rd_kafka_topic_new () to create a topic handle for the producer.
6. Use rd_kafka_produce() to produce messages.
7. Optionally, use rd_kafka_poll() to poll for callbacks. This is useful to see if there are messages that have yet to be sent to the server.
8. Use rd_kafka_topic_destroy () to destroy the topic handle destroy
9. Use rd_kafka_destroy () to destroy the producer handle.

Note: For more details on the APIs, see [Supported APIs for HPE Ezmeral Data Fabric Event Streams C Client](#) and [rdkafka.h](#) on page 3167

For example, the following source code produces 5 messages to topic /MapR_Streams:MapR-Topic1:

```

/*
 * This file contains the producer function.
 *
 */

#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <rdkafka.h>
#include <errno.h>

/* msgDeliveryCB: Is the delivery callback.
 * The delivery report callback will be called once for each message
 * accepted by rd_kafka_produce() with err set to indicate
 * the result of the produce request. An application must call
rd_kafka_poll()
 * at regular intervals to serve queued delivery report callbacks.
 */
static void msgDeliveryCB (rd_kafka_t *rk,
                          const rd_kafka_message_t *rkmessage, void
*opaque) {
    if (rkmessage->err != RD_KAFKA_RESP_ERR_NO_ERROR) {
        printf("FAILURE: Message not delivered to partition.\n");
        printf("ERROR: %s", rd_kafka_err2str(rkmessage->err));
    } else {
        printf("Produced: %.*s\n", (int)rkmessage->len, (const
char*)rkmessage->payload);
    }
}

/*
 * Method      : int producer(int nummsgs_p, const char *fullTopicName)
 * Description : This is a simple producer method. In this method the
producer
 *              produces messages to a topic.
 */

```

```

int producer(int nummsgs_p, const char *fullTopicName) {
    printf("***** PRODUCER *****\n");
    rd_kafka_t *prodHandle;
    rd_kafka_conf_t *prodCfg;
    char errstr[1000];
    int totalMsgs = nummsgs_p;

    printf("Create producer configuration object\n");
    /*
     * rd_kafka_conf_new(): This API creates default rd_kafka_conf_t object
to
     * be passed at the time of producer object creation using rd_kafka_new
call.
     */
    prodCfg = rd_kafka_conf_new();
    if (prodCfg == NULL) {
        printf("Failed to create conf\n");
        return (EXIT_FAILURE);
    }
    /* rd_kafka_conf_set_dr_msg_cb(): This API sets the producer callback
     * 'msgDeliveryCB' in producer config 'prodCfg'
     * The delivery report callback will be called once for each message
     * accepted by rd_kafka_produce() with err set to indicate
     * the result of the produce request. An application must call
rd_kafka_poll()
     * at regular intervals to serve queued delivery report callbacks.
     */
    rd_kafka_conf_set_dr_msg_cb(prodCfg, msgDeliveryCB);

    printf("Create Producer Kafka handle\n");
    /*
     * rd_kafka_new():Creates a new Kafka handle and starts its operation
     * according to the specified type (RD_KAFKA_CONSUMER or
RD_KAFKA_PRODUCER).
     * prodCfg object passed here is freed by this function and must not be
used
     * or destroyed by the application subsequently. errstr must be a
pointer to
     * memory of at least size errstr_size where
     * `rd_kafka_new()` may write a human readable error message in case the
     * creation of a new handle fails. In which case the function returns
NULL.
     */
    prodHandle = rd_kafka_new(RD_KAFKA_PRODUCER, prodCfg, errstr,
sizeof(errstr));
    if (prodHandle == NULL) {
        printf("Failed to create producer: %s\n", errstr);
        return (EXIT_FAILURE);
    }

    /*
     * Following code does following:
     * 1. Create a topic handle for each producer-topic combination
     * 2. Produce 'totalMsgs' # of messages using topic handle created in
step 1
     * 3. Wait for all messages to be produced and callback to be delivered.
     * 4. Move on to next topic and repeat.
     */

    int totalTopics = 1;
    for (int nTopics = 0; nTopics < totalTopics ; nTopics++) {
        printf("Create topic handle\n");
        rd_kafka_topic_conf_t *prodTopicCfg;
        /*

```

```

* rd_kafka_topic_conf_new(): This API Creates topic conf object
* required to create topic handle which then will be used for each
* producer-topic combination
*/

prodTopicCfg = rd_kafka_topic_conf_new();
if (prodTopicCfg == NULL) {
    printf("Failed to create new topic conf\n");
    return (EXIT_FAILURE);
}

rd_kafka_topic_t *prodTopicHndl;
/*
* rd_kafka_topic_new(): This API Creates topic handle for a
given
* producer, topic name and topic config. Topic handles are
refcounted
* internally and calling rd_kafka_topic_new()
topic handle
* again with the same topic name will return the previous
for each
* without updating the original handle's configuration.
resources.
* Applications must eventually call rd_kafka_topic_destroy()
*/
prodTopicHndl = rd_kafka_topic_new(prodHndle, fullTopicName,
prodTopicCfg);
if (prodTopicHndl == NULL) {
    printf("Failed to create new topic handle\n");
    return (EXIT_FAILURE);
}
prodTopicCfg = NULL; /* Now owned by topic */

const char* key = "Key";

    printf("\nFAIL: producer failed\n");
} else {
    printf("\nPASS: %d messages produced and sent to topic partition %s
\n", nummsgs_p, fullTopicName);
}
}
}

```

Create Consumer

This topic describes how to create a HPE Ezmeral Data Fabric Event Streams streams consumer in C. While the code to generate a HPE Ezmeral Data Fabric Event Streams stream consumer varies depends on the use case, in general, the consumer code should contain the following:

1. Include the rdkafka.h header file (/opt/mapr/include/librdkafka/rdkafka.h).
2. Use rd_kafka_conf_new() to create the consumer configuration.
3. Use rd_kafka_conf_set() to set the configuration parameters. For this API, you must set the "group.id."
4. Use rd_kafka_new () to create the consumer handle.
5. Use rd_kafka_subscribe() or rd_kafka_assign() to specify which topics to consume.
6. Use rd_kafka_consumer_poll() to poll for messages that are ready to be consumed.
7. Use rd_kafka_consumer_close() to perform auto commits and prepare to destroy the consumer handle.
8. Use rd_kafka_destroy () to destroy the consumer handle.

For example, the following source code consumes 5 messages from topic /MapR_Streams:MapR-Topic1:

```

/*
 * This file contains the consumer function.
 */

#include <stdio.h>
#include <stdlib.h>
#include <rdkafka.h>
#include <string.h>

/*
 * Method      : int consumer(int expected_nummsgs, const char
 *fullTopicName)
 * Description : This is a simple consumer method. In this method the
consumer
 *              consumes messages from a topic.
 */

int consumer(int expected_nummsgs, const char *fullTopicName) {
    printf("***** CONSUMER START *****\n");
    rd_kafka_t *consHndle;
    rd_kafka_conf_t *consCfg;
    rd_kafka_topic_conf_t *consTopicCfg;
    char errstr[1000];

```

```

rd_kafka_resp_err_t errCode;

printf("Create new consumer configuration object\n");
/*
 * rd_kafka_conf_new(): This API creates default rd_kafka_conf_t object
to
 * be passed at the time of consumer object creation using rd_kafka_new
call.
 */
consCfg = rd_kafka_conf_new();
if(consCfg == NULL) {
    printf("Failed to create consumer conf\n");
    return(EXIT_FAILURE);
}
/*
 * rd_kafka_conf_set(): This API is used to set config parameters in the
 * rd_kafka_conf_t object. group.id Must be set for all the consumers.
 * All changes to the consCfg must be done before creating consumer
object.
 */
if(RD_KAFKA_CONF_OK != rd_kafka_conf_set(consCfg,
    "group.id", "consumerGroup",
    errstr, sizeof(errstr))) {
    printf("rd_kafka_conf_set() failed with error: %s\n", errstr);
    return (EXIT_FAILURE);
}
/*
 * rd_kafka_topic_conf_new(): This API Creates topic conf object
 * required to set the default topic configuration.
 */
printf("Set topic configurations\n");
consTopicCfg = rd_kafka_topic_conf_new();

/* rd_kafka_topic_conf_set(): This API sets the config property by name.
 * consTopicCfg should have been previously set up with
`rd_kafka_topic_conf_new()`
 * property set in this call is 'auto.offset.reset', when set to
 * earliest will return messages on rd_kafka_consumer_poll from
beginning of
 * time (for the very first time consumption) or from last committed
offset
 * for online consumer. If property is set to 'latest' it will return the
 * messages produced after consumer has started(for first time consumer)
or
 * from the last committed offset for online consumer
 */
if (RD_KAFKA_CONF_OK != rd_kafka_topic_conf_set(consTopicCfg,
"auto.offset.reset",
    "earliest", errstr, sizeof(errstr))) {
    printf("rd_kafka_topic_conf_set() failed with error: %s\n", errstr);
    return (EXIT_FAILURE);
}

/*
 * rd_kafka_conf_set_default_topic_conf(): This API sets the default
topic
 * configuration to use for automatically subscribed topics
 * The topic config object is not usable after this call.
 */
rd_kafka_conf_set_default_topic_conf(consCfg, consTopicCfg);

printf("Create consumer Kafka handle\n");
/*
 * rd_kafka_new():Creates a new Kafka handle and starts its operation

```

```

    * according to the specified type (RD_KAFKA_CONSUMER or
RD_KAFKA_PRODUCER).
    * consCfg object passed here is freed by this function and must not be
used
    * or destroyed by the application subsequently. errstr must be a
pointer to
    * memory of at least size errstr_size where
    * `rd_kafka_new()` may write a human readable error message in case the
    * creation of a new handle fails. In which case the function returns
NULL.
    */

    consHndle = rd_kafka_new(RD_KAFKA_CONSUMER, consCfg, errstr,
sizeof(errstr));
    if(consHndle == NULL) {
        printf("Failed to create consumer:%s", errstr);
        return (EXIT_FAILURE);
    }

    /* rd_kafka_poll_set_consumer() is used to redirect the main queue
which is
    * serviced using rd_kafka_poll() to the rd_kafka_consumer_poll(). With
one api
    * 'rd_kafka_consumer_poll()' both callbacks and message are serviced.
    * Once queue is forwarded using this API, it is not permitted to call
    * rd_kafka_poll to service non message delivery callbacks.
    */
    rd_kafka_poll_set_consumer(consHndle);

    /* Topic partition list (tp_list) is supplied as an input to the
consumer
    * subscribe(using rd_kafka_subscribe()). The api rd_kafka_subscribe()
expects
    * that the partition argument to be set to RD_KAFKA_PARTITION_UA and
internally
    * all partitions are assigned to the consumer.
    * Note: partition balancing/assignment is done if more consumers are
part
    * of the same consumer group.
    */

    printf("Create topic partition list for topic: %s\n", fullTopicName);
    rd_kafka_topic_partition_list_t *tp_list =
rd_kafka_topic_partition_list_new(0);
    rd_kafka_topic_partition_t* tpObj =
rd_kafka_topic_partition_list_add(tp_list,
                                   fullTopicName,
RD_KAFKA_PARTITION_UA);
    if (NULL == tpObj) {
        printf("Could not add the topic partition to the list.\n");
        return (EXIT_FAILURE);
    }

    printf("Subscribe consumer to the topic:\n");
    /*
    * rd_kafka_subscribe(): This API subscribes given consumer to the topic
list
    * provided in tp_list, depending upon number of consumers in a consumer
group
    * partitions will be balanced and assigned to each consumer.
    */
    errCode = rd_kafka_subscribe(consHndle, tp_list);
    if (errCode != RD_KAFKA_RESP_ERR_NO_ERROR) {
        printf("Topic partition subscription failed. ERROR: %d\n", errCode);
    }

```

```

        return(errCode);
    }
    printf("Destroy topic partition list:\n");
    /*
    * rd_kafka_topic_partition_list_destroy(): This API is used to free all
    * resources used by the list and the list itself.
    */

    rd_kafka_topic_partition_list_destroy(tp_list);

    printf("\nStart message consumption:\n");
    int msg_count = 0;
    while(1) {
        /*
        * rd_kafka_consumer_poll(): This API returns one message or
callback at
        * a time. An application should make sure to call consumer_poll()
at regular
        * intervals, even if no messages are expected, to serve any
        * queued callbacks waiting to be called. When the application is
finished
        * with a message it must call rd_kafka_message_destroy() to destroy
and
        * message.
        */
        rd_kafka_message_t *msg = rd_kafka_consumer_poll(consHndle, 1000);
        if (msg != NULL) {
            if (msg->err == RD_KAFKA_RESP_ERR_NO_ERROR) {
                msg_count++;
                printf("%d Consumed: %.*s\n", msg_count, (int) msg->len,
                    (const char*)msg->payload);
                if (msg_count == expected_nummsgs){
                    rd_kafka_message_destroy(msg);
                    break;
                }
            }
            rd_kafka_message_destroy(msg);
        }
    }

    printf("\nCommit the offsets before closing the consumer\n");
    /*
    * Commit offsets on broker for the provided list of topic partitions.
    * when input is NULL the current partition assignment will be used
instead.
    * If async is false this operation will block until the offset commit
    * is done, returning the resulting success or error code.
    * This call is made to be sure that offsets are committed before
closing
    * consumer.
    */
    int retVal = rd_kafka_commit(consHndle, NULL, false/**async*/);

    int ret_val;

    /* Consume Messages */
    ret_val = consumer(expected_nummsgs, fullTopicName);
    if (EXIT_SUCCESS != ret_val) {
        printf("\nFAIL: consumer failed\n");
    } else {
        printf("\nPASS: %d messages consumed from topic %s\n",
            expected_nummsgs, fullTopicName);
    }
}
}

```

Note: For more details on the APIs, see [Supported APIs for HPE Ezmeral Data Fabric Event Streams C Client](#) and [rdkafka.h](#) on page 3167

Compile the Apps

This topic describes how to compile HPE Ezmeral Data Fabric Event Streams streams producers and consumers in C. When you compile a HPE Ezmeral Data Fabric Event Streams C application, you must link it with the librdkafka library in the /opt/mapr/lib/ library path and include the header file directory to ensure that your application references the header file included with HPE Ezmeral Data Fabric Event Streams C Client.

Important: For MapR 6.0.0 and earlier, When you compile a HPE Ezmeral Data Fabric Event Streams C application, you must link it with the librdkafka library in the /opt/mapr/lib/ library path, *the libjvm library*, and include the header file directory to ensure that your application references the header file included with HPE Ezmeral Data Fabric Event Streams C Client.

The following steps compile the source code and generate executables in the same directory as the Makefile. For example, in the **librdkafka_example** directory, the `consumer` and `producer` executables are generated from the `producer.c` and `consumer.c` source files.

1. On your node, create a directory. For example: **librdkafka_example**.
2. In your directory (**librdkafka_example**), create a producer application. For example, if you are using the provided sample producer application:
 - a. Create a file named `producer.c`.
 - b. Copy the contents of the sample producer application into that file.

3. In your directory (**librdkafka_example**), create a consumer application. For example, if you are using the provided sample consumer application:
 - a. Create a file named `consumer.c`.
 - b. Copy the contents of the sample consumer application into that file.
4. In your directory (**librdkafka_example**), create a file named `Makefile` with the following content:

```
CC= g++
HEADERDIR=/opt/mapr/include/librdkafka/
CCFLAGS= -Wall -I$(HEADERDIR) -g -std=c99

export LD_LIBRARY_PATH=/opt/mapr/lib

LIBDIR= /opt/mapr/lib/
%.o: %.c
    gcc $(CCFLAGS) -c $<

consumer: consumer.o
    gcc -o $@ $@.o -lrdkafka -L$(LIBDIR) $(CCFLAGS)

producer: producer.o
    gcc -o $@ $@.o -lrdkafka -L$(LIBDIR) $(CCFLAGS)

all: consumer producer

clean:
    /bin/rm -f *.o consumer producer
```

Important: For MapR 6.0.0 and earlier, use the following `Makefile`:

```
CC= g++
HEADERDIR=/opt/mapr/include/librdkafka/
CCFLAGS= -Wall -I$(HEADERDIR) -g -std=c99

#Edit JAVA_HOME to be appropriate for your environment
JAVA_HOME=/usr/lib/jvm/java-7-openjdk-amd64/
export LD_LIBRARY_PATH=/opt/mapr/lib:$(JAVA_HOME)/jre/lib/amd64/
server

LIBDIR= /opt/mapr/lib/
%.o: %.c
    gcc $(CCFLAGS) -c $<

consumer: consumer.o
    gcc -o $@ $@.o -lrdkafka -L$(LIBDIR) $(CCFLAGS)

producer: producer.o
    gcc -o $@ $@.o -lrdkafka -L$(LIBDIR) $(CCFLAGS)

all: consumer producer

clean:
    /bin/rm -f *.o consumer producer
```

5. Complete the following edits to the `Makefile`:

For Mac users, locate the following line of code:

```
export LD_LIBRARY_PATH=/opt/mapr/lib
```

Then, replace this line with the following line of code:

```
export DYLD_LIBRARY_PATH=/opt/mapr/lib
```

Important: For MapR 6.0.0 and earlier, the following steps apply:

- a. For Mac users, locate the following line of code:

```
export LD_LIBRARY_PATH=/opt/mapr/lib:$(JAVA_HOME)/jre/lib/amd64/
server
```

Then, replace this line with the following line of code:

```
export DYLD_LIBRARY_PATH=/opt/mapr/lib:$(JAVA_HOME)/jre/lib/server
```

- b. Based on your environment, edit `JAVA_HOME`. This ensures that `LD_LIBRARY_PATH` or `DYLD_LIBRARY_PATH` will include the full path to the directory containing the `libjvm` library.

Note: You can use `find / -name libjvm*` to determine the `JAVA_HOME` directory on your machine. However, note that the results of this command include the full path to the `libjvm` file not just the `JAVA_HOME` directory.

For example, `JAVA_HOME` may be set to `Library/Java/JavaVirtualMachines/jdk1.8.0_121.jdk/Contents/Home/` on a Mac and `JAVA_HOME` may be set to `/usr/lib/jvm/java-1.7.0-openjdk-1.7.0.79.x86_64/` on Linux.

6. From your directory (**librdkafka_example**), run the following commands to compile the source code:

```
make clean
```

```
make all
```

Run the Apps

Once you have the application executables, complete the following steps to run the application:

1. On a cluster node, use the `maprcli` to create a stream. For example, **MapR_Streams**.

```
maprcli stream create -path /MapR_Streams
```

Note: As long as `autocreate` is enabled for the stream when you run `stream create`, the producer will create the topic. By default, `autocreate` is enabled. For more information, see [stream create](#) on page 1999.

2. At the command line, set the library path to include `/opt/mapr/lib` and the path to the directory that contains the `libjvm` library. For more information, see [Configuring the HPE Ezmeral Data Fabric Event Streams C Client](#) on page 3071.

Note: You must complete this step at the command line even though you already set the library path in the Makefile. If you do not complete the step, an error similar to the following displays when you run the application in the next step: `error while loading shared libraries: librdkafka.so.1: cannot open shared object file: No such file or directory`

- From your directory (**librdkafka_example**), run the producer application from the command line. For example, if the application is called producer:

```
./producer
```

The following appears on the console assuming that the stream name is MapR_Streams:

```
***** PRODUCER *****
Create producer configuration object
Create Producer Kafka handle
Create topic handle
Send/Produce message to topic: /MapR_Streams:MapR-Topic1
Wait for messages to be delivered
Produced: Welcome to MapR Streams CAPI
Produced: MapR Streams CAPI Message Payload 1
Produced: MapR Streams CAPI Message Payload 2
Produced: MapR Streams CAPI Message Payload 3
Produced: MapR Streams CAPI Message Payload 4

Destroy topic handle
Destroy producer handle

PASS: 5 messages produced and sent to topic partition /
MapR_Streams:MapR-Topic1
```

- From your directory (**librdkafka_example**), run the consumer application from the command line. For example, if the application is called consumer:

```
./consumer
```

The following appears on the console assuming that the stream name is MapR_Streams:

```
***** CONSUMER START *****
Create new consumer configuration object
Set topic configurations
Create consumer Kafka handle
Create topic partition list for topic: /MapR_Streams:MapR-Topic1
Subscribe consumer to the topic:
Destroy topic partition list:

Start message consumption:
1 Consumed: Welcome to MapR-ES CAPI
2 Consumed: MapR Streams CAPI Message Payload 1
3 Consumed: MapR Streams CAPI Message Payload 2
4 Consumed: MapR Streams CAPI Message Payload 3
5 Consumed: MapR Streams CAPI Message Payload 4

Commit the offsets before closing the consumer

Close and destroy consumer handle

PASS: 5 messages consumed from topic /MapR_Streams:MapR-Topic1
```

Migrating Kafka C Applications to HPE Ezmeral Data Fabric Event Streams

With some modification, you can use existing Kafka C applications to consume and produce topics in HPE Ezmeral Data Fabric Event Streams. The HPE Ezmeral Data Fabric Event Streams C Client is a distribution of librdkafka that is compatible with HPE Ezmeral Data Fabric Event Streams.

- Install and [configure the MapR Streams C Client](#).

- When you refer to a topic in the application code, include the path and name of the stream in which the topic is located:

```
/<path and name of stream>:<name of topic>
```

For example, you might have a stream in a HPE Ezmeral Data Fabric cluster that is named `stream_A`, and the stream might be in a volume named `IoT` and in a directory named `automobile_sensors`. You want to redirect a producer application to a topic in that stream. The syntax of the path to the topic might look like this: `/mapr/IoT/automobile_sensors/stream_A:<name of topic>`.

Note: Optionally, use the `streams.consumer.default.stream` and `streams.producer.default.stream` configuration parameters. When you configure these parameters, applications can specify just the topic name to write or read from the default stream. To use these HPE Ezmeral Data Fabric-specific parameters in your application, compile your application with the `rdkafka.h` file (`/opt/mapr/include/librdkafka/rdkafka.h`) that was installed with the HPE Ezmeral Data Fabric Event Streams C Client. See the [Compile the Apps](#) on page 3081 section of [Developing a HPE Ezmeral Data Fabric Event Streams C Application](#) on page 3072.

- See [Configuration Properties for HPE Ezmeral Data Fabric Event Streams C Client](#) on page 3157 for the list of supported configuration parameters, including a few parameters that are HPE Ezmeral Data Fabric-specific. Make changes to your application, as needed.

Note: SSL-related configuration parameters are ignored. When you set these parameters, the HPE Ezmeral Data Fabric Event Streams Client issues a warning indicating that the parameters are not supported.

- Review the list of `librdkafka` APIs that are **not** supported by the HPE Ezmeral Data Fabric Event Streams C Client and make changes to your application, as needed.

Simple/low level consumer APIs that are not supported

- `rd_kafka_queue_new`
- `rd_kafka_queue_destroy`
- `rd_kafka_consume_start`
- `rd_kafka_consume_start_queue`
- `rd_kafka_consume_stop`
- `rd_kafka_consume`
- `rd_kafka_consume_batch`
- `rd_kafka_consume_callback`
- `rd_kafka_consume_queue`
- `rd_kafka_consume_batch_queue`
- `rd_kafka_consume_callback_queue`
- `rd_kafka_offset_store`
- `rd_kafka_pause_partitions`
- `rd_kafka_resume_partitions`

Producer/Consumer common APIs that are not supported

- `rd_kafka_conf_set_dr_cb`

- rd_kafka_conf_set_throttle_cb
- rd_kafka_conf_set_stats_cb
- rd_kafka_conf_set_socket_cb
- rd_kafka_conf_set_open_cb
- rd_kafka_conf_dump
- rd_kafka_conf_dump_free
- rd_kafka_name
- rd_kafka_set_log_level
- rd_kafka_mem_free
- rd_kafka_set_log_level
- rd_kafka_mem_free

Topic APIs that are not supported

- rd_kafka_query_watermark_offsets
 **Note:** As of HPE Ezmeral Data Fabric 6.0.1, this API is supported.
- rd_kafka_get_watermark_offsets
 **Note:** As of HPE Ezmeral Data Fabric 6.0.1, this API is supported.

Cluster APIs that are not supported

- rd_kafka_memberid
- rd_kafka_metadata
- rd_kafka_metadata_destroy

Miscellaneous APIs that are not supported

- rd_kafka_version
- rd_kafka_version_str
- rd_kafka_get_debug_contexts
- rd_kafka_dump
- rd_kafka_thread_cnt
- rd_kafka_message_timestamp

librdkafka APIs Supported by HPE Ezmeral Data Fabric Event Streams C Client

This topic lists the librdkafka APIs supported by the HPE Ezmeral Data Fabric Event Streams C Client. It also describes behavior differences between librdkafka and the HPE Ezmeral Data Fabric Event Streams C Client.

Table

| Core release | EEP Release | Kafka librdkafka version |
|---|-------------|--------------------------|
| As of HPE Ezmeral Data Fabric 6.0.1 | As of 5.0 | 0.11.3 |
| As of HPE Ezmeral Data Fabric 5.2.1 through 6.0.0 | As of 3.0 | 0.9.0 |

This topic contains the following supported APIs:

- [Producer APIs](#) on page 3087
- [Consumer APIs](#) on page 3089
- [Producer/Consumer Common APIs](#) on page 3096
- [Topic APIs](#) on page 3103
- [Queue APIs](#) on page 3118
- [Event APIs](#) on page 3124
- [Timestamp APIs](#) on page 3129
- [Interceptors APIs](#) on page 3130
- [Cluster Configuration APIs](#) on page 3148
- [Miscellaneous API](#) on page 3149

Producer APIs

| API Behavior |
|--|
| <p>Same as librdkafka. Available as of librdkafka 0.11.3. Supported as of HPE Ezmeral Data Fabric 6.0.1.</p> |
| <p>Same as librdkafka.</p> |

| A P I Behavior |
|---|
| <p>When this API is called with NULL payload, an invalid argument error is sent to the callback. librdkafka creates a message with NULL payload and key value instead.</p> <p>librdkafka produces</p> |
| <p>Same as librdkafka. This API should be used with either RD_KAFKA_V_TOPIC or RD_KAFKA_V_RKT. Available as of librdkafka 0.11.3. Supported as of HPE Ezmeral Data Fabric 6.0.1.</p> <p>librdkafka produces</p> |
| <p>When this API is called with NULL payload, an invalid argument error is sent to the callback. librdkafka creates a message with NULL payload and key value instead.</p> <p>librdkafka produces</p> |

| A P I Behavior |
|---|
| <p>This API returns a positive number to indicate that messages are waiting to be produced to a streams topic but the value does not indicate the actual number of messages. librdkafka returns the actual number of messages that are waiting to be sent to or acknowledged by the broker.</p> |

Consumer APIs

| A P I Behavior |
|---|
| <p>If this API is called for a consumer that is already subscribed to topics, no operation is performed.</p> |
| <p>This API returns the number of topic partitions the consumer is assigned to. However, it returns 0 when topic partitions have yet to be created by the producer. librdkafka returns the number of partitions assigned to a consumer even when the partitions have not been created.</p> <p> Note: For this API to work, the argument partitions must be explicitly allocated or initialized with either <code>rd_kafka_topic_partition_list_t *parts = NULL</code> or <code>rd_kafka_topic_partition_list_new(0)</code>; For example:</p> <pre>RD_EXPORT rd_kafka_resp_err_t rd_kafka_assignment (rd_kafka_t *rk, rd_kafka_topic_partition_list_t **partitions);</pre> |

**Note:**

For librdkafka 0.9: If the consume callback was set and messages were polled using `rd_kafka_consumer_poll()`, then the consume callback gets called and the messages can be consumed in the callback.

For librdkafka 0.11.3: If the consume callback is set and messages are polled using `rd_kafka_consumer_poll()`, the consume callback is not called. The result is that you cannot consume messages in the consume callback when using `rd_kafka_consumer_poll()`.

This API can only be used by consumers that are subscribed to at least one stream on the cluster and have a default stream configured with the `streams.consumer.default.stream` parameter. It returns the group list of subscribed consumers associated with the default stream. `librdkafka` returns all consumer groups from the cluster instead.

Note: This API returns `RD_KAFKA_RESP_ERR__TIMED_OUT` when the querying consumer is not subscribed to any topic.

Additional Information

For more information and API signatures, see [rdkafka.h](#) on page 3167.

librdkafka APIs NOT Supported by HPE Ezmeral Data Fabric Event Streams C Client

This topic lists the librdkafka APIs that are *not* supported by the HPE Ezmeral Data Fabric Event Streams C Client.

These APIs are also documented in the [rdkafka.h](#) on page 3167 as not support by HPE Ezmeral Data Fabric Event Streams. If you want to see the list of supported librdkafka APIs, see [librdkafka APIs Supported by HPE Ezmeral Data Fabric Event Streams C Client](#) on page 3086.

Note: This list of librdkafka APIs *not* supported is applicable to HPE Ezmeral Data Fabric 6.0.1 and librdkafka 0.11.3.

Table

| Core release | EEP Release | Kafka librdkafka version |
|---|-------------|--------------------------|
| As of HPE Ezmeral Data Fabric 6.0.1 | As of 5.0 | 0.11.3 |
| As of HPE Ezmeral Data Fabric 5.2.1 through 6.0.0 | As of 3.0 | 0.9.0 |

| p r o p e r t y N a m e | Behavior |
| e v e r y e o o t o n y e o | Same as librdkafka. |
| t m s g t c b | Same as librdkafka. |

Topic Configuration

| | |
|--|---|
| P r o p e r t y N a m e | Behavior |
| a r r t e r b | Same as librdkafka. |
| a u t o m a t e d | Supports the following values: beginning, end, earliest, latest, none, smallest, and largest. As of HPE Ezmeral Data Fabric 6.0.1, beginning and end are supported.  Note: librdkafka additionally supports error. |

HPE Ezmeral Data Fabric-Specific Configurations

| Property Name | Behavior |
|---------------|--|
| eas | <p>Specifies the path and name of the stream that the consumer subscribes to if, when subscribing to a topic, the consumer does not specify a stream. For example, the consumer can specify the name of a stream together with the name of a topic to write to, like this: /<stream>:<topic>.</p> <p> Note: rd_kafka_list groups API uses this consumer configuration to obtain the consumer groups.</p> |

| | |
|---|---|
| P r o p e r t y N a m e | Behavior |
| e n a b l e s t h e p r o d u c e r t o h a v e m u l t i p l e p a r a l l e l s e n d r e q u e s t s t o t h e s e r v e r f o r e a c h t o p i c p a r t i t i o n . | Enables the producer to have multiple parallel send requests to the server for each topic partition. When this property is set to true, the default value, it is possible for messages to be sent out of order. |

| | |
|-------------------------------|---|
| Property Name Behavior | <p>Specifies the stream that the producer will use by default if the producer does not provide the name of a stream when specifying a topic to write to. For example, the producer can specify the name of a stream together with the name of a topic to write to, like this: <code>/<stream>:<topic></code>. However, if the stream is not specified, the value of this configuration parameter is assumed to be the stream in which the topic is located. If the producer specifies the name of a topic without also providing the path and name of the stream, and there is no value for this configuration parameter, HPE Ezmeral Data Fabric Event Streams assumes that the topic specified is in Apache Kafka and does nothing.</p> |
|-------------------------------|---|

Additional Information

For more information, see [rdkafka.h](#) on page 3167.

rdkafka.h

This rdkafka header file has been updated to be compatible with HPE Ezmeral Data Fabric Event Streams. After you install the HPE Ezmeral Data Fabric Event Streams C Client, this file is available in the following directory: `/opt/mapr/include/librdkafka/`

librdkafka 0.11.3

Apache librdkafka 0.11.3 is supported as of HPE Ezmeral Data Fabric 6.0.1/EEP5.0.

Important: With this release, the `RD_KAFKA_MSG_F_BLOCK` call provides *blocking* behavior, whereas, the `RD_KAFKA_MSG_F_COPY` and `RD_KAFKA_MSG_F_FREE` calls are *non-blocking* (this is a behavior change from previous releases).

/**
 * @brief \b Consumer: Set rebalance callback for use with
 *
 * coordinated consumer group balancing.
 *
 * The \p err field is set to either RD_KAFKA_RESP_ERR__ASSIGN_PARTITIONS
 * or RD_KAFKA_RESP_ERR__REVOKE_PARTITIONS and 'partitions'
 * contains the full partition set that was either assigned or revoked.
 *
 * Registering a \p rebalance_cb turns off librdkafka's automatic
 * partition assignment/revocation and instead delegates that responsibility
 * to the application's \p rebalance_cb.
 *
 * The rebalance callback is responsible for updating librdkafka's
 * assignment set based on the two events:
RD_KAFKA_RESP_ERR__ASSIGN_PARTITIONS
 * and RD_KAFKA_RESP_ERR__REVOKE_PARTITIONS but should also be able to
handle
 * arbitrary rebalancing failures where \p err is neither of those.
 * @remark In this latter case (arbitrary error), the application must
 * call rd_kafka_assign(rk, NULL) to synchronize state.
 *
 * Without a rebalance callback this is done automatically by librdkafka
 * but registering a rebalance callback gives the application flexibility
 * in performing other operations along with the assigning/revocation,
 * such as fetching offsets from an alternate location (on assign)
 * or manually committing offsets (on revoke).
 *
 * @remark The \p partitions list is destroyed by librdkafka on return
 * return from the rebalance_cb and must not be freed or
 * saved by the application.
 *
 * The following example shows the application's responsibilities:
 * @code
 * static void rebalance_cb (rd_kafka_t *rk, rd_kafka_resp_err_t err,
 *                          rd_kafka_topic_partition_list_t *partitions,
 *                          void *opaque) {
 *
 *     switch (err)
 *     {
 *     case RD_KAFKA_RESP_ERR__ASSIGN_PARTITIONS:

```

```

*          // application may load offsets from arbitrary external
*          // storage here and update \p partitions
*
*          rd_kafka_assign(rk, partitions);
*          break;
*
*          case RD_KAFKA_RESP_ERR__REVOKE_PARTITIONS:
*              if (manual_commits) // Optional explicit manual commit
*                  rd_kafka_commit(rk, partitions, 0); // sync commit
*
*              rd_kafka_assign(rk, NULL);
*              break;
*
*          default:
*              handle_unlikely_error(err);
*              rd_kafka_assign(rk, NULL); // sync state
*              break;

full.
*     WARNING: If a delivery report callback
*               is used the application MUST
*               call rd_kafka_poll() (or equiv.)
*               to make sure delivered messages
*               are drained from the internal
*               delivery report queue.
*               Failure to do so will result
*               in indefinitely blocking on
*               the produce() call when the
*               message queue is full.
*/

/**
 * @brief Produce and send a single message to broker.
 *
 * \p rkt is the target topic which must have been previously created with
 * `rd_kafka_topic_new()`.
 *
 * `rd_kafka_produce()` is an asynch non-blocking API.
 *
 * \p partition is the target partition, either:
 * - RD_KAFKA_PARTITION_UA (unassigned) for
 *   automatic partitioning using the topic's partitioner function, or
 * - a fixed partition (0..N)
 *
 * \p msgflags is zero or more of the following flags OR'ed together:
 * RD_KAFKA_MSG_F_BLOCK - block \p produce*() call if
 *                        \p queue.buffering.max.messages or
 *                        \p queue.buffering.max.kbytes are exceeded.
 * Messages are considered in-queue from the
point they
 *                        are accepted by produce() until their
corresponding
 *                        delivery report callback/event returns.
 * It is thus a requirement to call

```

```

*         rd_kafka_poll() (or equiv.) from a separate
*         thread when F_BLOCK is used.
*         See WARNING on \c RD_KAFKA_MSG_F_BLOCK above.
*
* RD_KAFKA_MSG_F_FREE - rdkafka will free(3) \p payload when it is done
* with it.
* RD_KAFKA_MSG_F_COPY - the \p payload data will be copied and the
* \p payload pointer will not be used by rdkafka
* after the call returns.
*
* .._F_FREE and .._F_COPY are mutually exclusive.
*
* If the function returns -1 and RD_KAFKA_MSG_F_FREE was specified, then
* the memory associated with the payload is still the caller's
* responsibility.
*
* \p payload is the message payload of size \p len bytes.
*
* \p key is an optional message key of size \p keylen bytes, if non-NULL it
* will be passed to the topic partitioner as well as be sent with the
* message to the broker and passed on to the consumer.
*
* \p msg_opaque is an optional application-provided per-message opaque
* pointer that will provided in the delivery report callback (`dr_cb`) for
* referencing this message.
*
* @remark on_send() and on_acknowledgement() interceptors may be called
* from this function. on_acknowledgement() will only be called if
the
* message fails partitioning.
*
* @returns 0 on success or -1 on error in which case errno is set
accordingly:
* - ENOBUFS - maximum number of outstanding messages has been reached:
*           "queue.buffering.max.messages"
*           (RD_KAFKA_RESP_ERR__QUEUE_FULL)
* - EMSGSIZE - message is larger than configured max size:
*           "messages.max.bytes".
*           (RD_KAFKA_RESP_ERR_MSG_SIZE_TOO_LARGE)
* - ESRCH - requested \p partition is unknown in the Kafka cluster.
*           (RD_KAFKA_RESP_ERR__UNKNOWN_PARTITION)
* - ENOENT - topic is unknown in the Kafka cluster.
*           (RD_KAFKA_RESP_ERR__UNKNOWN_TOPIC)
*
* @sa Use rd_kafka_errno2err() to convert `errno` to rdkafka error code.

 *
 */

/**
 * @brief Adds one or more brokers to the kafka handle's list of initial
 *        bootstrap brokers.
 *
 * Additional brokers will be discovered automatically as soon as rdkafka
 * connects to a broker by querying the broker metadata.
 *
 * If a broker name resolves to multiple addresses (and possibly
 * address families) all will be used for connection attempts in
 * round-robin fashion.
 *
 * \p brokerlist is a ,-separated list of brokers in the format:
 * \c \<broker1\>,\<broker2\>,...
 * Where each broker is in either the host or URL based format:
 * \c \<host\>[:\<port\>]
 * \c \<proto\>://\<host\>[:port]
 * \c \<proto\> is either \c PLAINTEXT, \c SSL, \c SASL, \c SASL_PLAINTEXT
 * The two formats can be mixed but ultimately the value of the
 * `security.protocol` config property decides what brokers are allowed.
 *
 * Example:
 * brokerlist = "broker1:10000,broker2"
 * brokerlist = "SSL://broker3:9000,ssl://broker2"
 *
 * @returns the number of brokers successfully added.
 *
 * @remark Brokers may also be defined with the \c metadata.broker.list or

/**@}*/

/**
* @name Interceptors
*
* @{
*
* @brief A callback interface that allows message interception for both
*       producer and consumer data pipelines.
*
* Except for the on_new(), on_conf_set(), on_conf_dup() and
on_conf_destroy()
* interceptors, interceptors are added to the
* newly created rd_kafka_t client instance. These interceptors MUST only
* be added from on_new() and MUST NOT be added after rd_kafka_new()
returns.
*
* The on_new(), on_conf_set(), on_conf_dup() and on_conf_destroy()
interceptors
* are added to the configuration object which is later passed to
* rd_kafka_new() where on_new() is called to allow addition of
* other interceptors.
*
* Each interceptor reference consists of a display name (ic_name),
* a callback function, and an application-specified opaque value that is
* passed as-is to the callback.
* The ic_name must be unique for the interceptor implementation and is used
* to reject duplicate interceptor methods.
*
* Any number of interceptors can be added and they are called in the order
* they were added, unless otherwise noted.
* The list of registered interceptor methods are referred to as
* interceptor chains.
*
* @remark Contrary to the Java client the librdkafka interceptor interface
*         does not support message modification. Message mutability is
*         discouraged in the Java client and the combination of
*         serializers and headers cover most use-cases.
*
* @remark Interceptors are NOT copied to the new configuration on
*         rd_kafka_conf_dup() since it would be hard for interceptors to
*         track usage of the interceptor's opaque value.
*         An interceptor should rely on the plugin, which will be copied
*         in rd_kafka_conf_dup(), to set up the initial interceptors.
*         An interceptor should implement the on_conf_dup() method
*         to manually set up its internal configuration on the newly
created

```

```

*         configuration object that is being copied-to based on the
*         interceptor-specific configuration properties.
*         conf_dup() should thus be treated the same as conf_init().
*
* @remark Interceptors are keyed by the interceptor type (on_..()), the
*         interceptor name (ic_name) and the interceptor method function.
*         Duplicates are not allowed and the .._add_on_..() method will
*         return RD_KAFKA_RESP_ERR__CONFLICT if attempting to add a
duplicate
*         method.
*         The only exception is on_conf_destroy() which may be added
multiple
*         times by the same interceptor to allow proper cleanup of
*         interceptor configuration state.
*/

/**
 * @brief \b Consumer: Set rebalance callback for use with
 *
 * coordinated consumer group balancing.
 *
 * The \p err field is set to either RD_KAFKA_RESP_ERR__ASSIGN_PARTITIONS
 * or RD_KAFKA_RESP_ERR__REVOKE_PARTITIONS and 'partitions'
 * contains the full partition set that was either assigned or revoked.
 *
 * Registering a \p rebalance_cb turns off librdkafka's automatic
 * partition assignment/revocation and instead delegates that responsibility
 * to the application's \p rebalance_cb.
 *
 * The rebalance callback is responsible for updating librdkafka's
 * assignment set based on the two events:
RD_KAFKA_RESP_ERR__ASSIGN_PARTITIONS

```

```

* and RD_KAFKA_RESP_ERR__REVOKE_PARTITIONS but should also be able to
handle
* arbitrary rebalancing failures where \p err is neither of those.
* @remark In this latter case (arbitrary error), the application must
*     call rd_kafka_assign(rk, NULL) to synchronize state.
*
* Without a rebalance callback this is done automatically by librdkafka
* but registering a rebalance callback gives the application flexibility
* in performing other operations along with the assigning/revocation,
* such as fetching offsets from an alternate location (on assign)
* or manually committing offsets (on revoke).
*
* @remark The \p partitions list is destroyed by librdkafka on return
*     return from the rebalance_cb and must not be freed or
*     saved by the application.
*
* The following example shows the application's responsibilities:
* @code
*     static void rebalance_cb (rd_kafka_t *rk, rd_kafka_resp_err_t err,
*                               rd_kafka_topic_partition_list_t *partitions,
*                               void *opaque) {
*
*         switch (err)
*         {
*             case RD_KAFKA_RESP_ERR__ASSIGN_PARTITIONS:
*                 // application may load offsets from arbitrary external
*                 // storage here and update \p partitions
*
*                 rd_kafka_assign(rk, partitions);
*                 break;
*
*             case RD_KAFKA_RESP_ERR__REVOKE_PARTITIONS:
*                 if (manual_commits) // Optional explicit manual commit
*                     rd_kafka_commit(rk, partitions, 0); // sync commit
*
*                 rd_kafka_assign(rk, NULL);
*                 break;
*
*             default:
*                 handle_unlikely_error(err);
*                 rd_kafka_assign(rk, NULL); // sync state
*                 break;

/**
* @brief Produce and send a single message to broker.
*
* \p rkt is the target topic which must have been previously created with
* `rd_kafka_topic_new()`.
*
* `rd_kafka_produce()` is an asynch non-blocking API.
*
* \p partition is the target partition, either:
* - RD_KAFKA_PARTITION_UA (unassigned) for

```

```

*      automatic partitioning using the topic's partitioner function, or
*      - a fixed partition (0..N)
*
* \p msgflags is zero or more of the following flags OR:ed together:
*   RD_KAFKA_MSG_F_FREE - rdkafka will free(3) \p payload when it is done
*                       with it.
*   RD_KAFKA_MSG_F_COPY - the \p payload data will be copied and the
*                       \p payload pointer will not be used by rdkafka
*                       after the call returns.
*
*   .._F_FREE and .._F_COPY are mutually exclusive.
*
*   If the function returns -1 and RD_KAFKA_MSG_F_FREE was specified, then
*   the memory associated with the payload is still the caller's
*   responsibility.
*
* \p payload is the message payload of size \p len bytes.
*
* \p key is an optional message key of size \p keylen bytes, if non-NULL it
* will be passed to the topic partitioner as well as be sent with the
* message to the broker and passed on to the consumer.
*
* \p msg_opaque is an optional application-provided per-message opaque
* pointer that will provided in the delivery report callback (`dr_cb`) for
* referencing this message.
*
* Returns 0 on success or -1 on error in which case errno is set
accordingly:
* - ENOBUFS - maximum number of outstanding messages has been reached:
*           "queue.buffering.max.messages"
*           (RD_KAFKA_RESP_ERR__QUEUE_FULL)
* - EMSGSIZE - message is larger than configured max size:
*           "messages.max.bytes".
*           (RD_KAFKA_RESP_ERR_MSG_SIZE_TOO_LARGE)
* - ESRCH - requested \p partition is unknown in the Kafka cluster.
*          (RD_KAFKA_RESP_ERR__UNKNOWN_PARTITION)
* - ENOENT - topic is unknown in the Kafka cluster.
*          (RD_KAFKA_RESP_ERR__UNKNOWN_TOPIC)
*
* @sa Use rd_kafka_errno2err() to convert `errno` to rdkafka error code.

/**
 * @brief Adds one or more brokers to the kafka handle's list of initial
 * bootstrap brokers.
 *
 * Additional brokers will be discovered automatically as soon as rdkafka
 * connects to a broker by querying the broker metadata.
 *
 * If a broker name resolves to multiple addresses (and possibly
 * address families) all will be used for connection attempts in
 * round-robin fashion.
 *
 * \p brokerlist is a ,-separated list of brokers in the format:
 * \c \<broker1\>,\<broker2\>,...
 * Where each broker is in either the host or URL based format:
 * \c \<host\>[:\<port\>]
 * \c \<proto\>://\<host\>[:port]
 * \c \<proto\> is either \c PLAINTEXT, \c SSL, \c SASL, \c SASL_PLAINTEXT
 * The two formats can be mixed but ultimately the value of the
 * `security.protocol` config property decides what brokers are allowed.
 *
 * Example:
 * brokerlist = "broker1:10000,broker2"
 * brokerlist = "SSL://broker3:9000,ssl://broker2"
 *
 * @returns the number of brokers successfully added.
 *

HPE Ezmeral Data Fabric Event Streams Python Applications

As of HPE Ezmeral Data Fabric 5.2.1, you can create python applications for HPE Ezmeral Data Fabric Event Streams using the HPE Ezmeral Data Fabric Event Streams Python client. The HPE Ezmeral Data Fabric Event Streams Python client is a binding for librdkafka and the HPE Ezmeral Data Fabric Event Streams C Client is a distribution of librdkafka that works with HPE Ezmeral Data Fabric Event Streams.

The HPE Ezmeral Data Fabric Event Streams Python client is available in a Ezmeral Ecosystem Pack (EEP) starting with EEP 3.0.

The following Apache Kafka librdkafka versions are supported:

Table

| Core release | EEP Release | Kafka librdkafka version |
|---|-------------|--------------------------|
| As of HPE Ezmeral Data Fabric 6.0.1 | As of 5.0 | 0.11.3 |
| As of HPE Ezmeral Data Fabric 5.2.1 through 6.0.0 | As of 3.0 | 0.9.0 |

Note: Because the HPE Ezmeral Data Fabric Event Streams Python Client is dependent on the HPE Ezmeral Data Fabric Event Streams C Client, the HPE Ezmeral Data Fabric Event Streams C Client must be configured before using the HPE Ezmeral Data Fabric Event Streams Python Client.

When developing and running HPE Ezmeral Data Fabric Event Streams Python applications, note the following points:

- You can create producers and high-level consumers. Low-level consumers are not supported.
- Consuming or producing topics in a Kafka cluster is not supported.
- HPE Ezmeral Data Fabric Event Streams offset values start at 1, not 0.
- HPE Ezmeral Data Fabric security is supported including ACLs and ACEs for authorization. The unique Kafka security features that are part of Apache Kafka are not supported. See [Security](#) on page 650 for more information about HPE Ezmeral Data Fabric security features.
- User impersonation is not supported.

Developing HPE Ezmeral Data Fabric Event Streams Python Applications

This topic includes basic information about how to develop a HPE Ezmeral Data Fabric Event Streams Python application and an example program that you can run.

Before you Begin

Confirm that your environment meets the following requirements:

- HPE Ezmeral Data Fabric cluster version 5.2.1 or greater.
- HPE Ezmeral Data Fabric core client (mapr-client) package. See [Installing the Data Fabric Client](#) on page 340 for more information.
- HPE Ezmeral Data Fabric Event Streams C Client (mapr-librdkafka) is installed and configured on the node. See [Configuring the HPE Ezmeral Data Fabric Event Streams C Client](#) on page 3071.
- HPE Ezmeral Data Fabric Event Streams Python Client (mapr-streams-python) is installed on the node. See [Installing HPE Ezmeral Data Fabric Event Streams Python Client](#) on page 190.
- Python installed on the node (Python version 2.7.x and above, up to version 3.6.x).

Create a HPE Ezmeral Data Fabric Event Streams Producer Application

In general, you want to create a producer that performs the following steps:

1. Import the producer class.
2. Define the producer and its configuration.
3. Produce data.
4. Wait for all messages to be sent to consumer.

As of EEP 5.0 HPE Ezmeral Data Fabric Event Streams Python Client: In the following example code, three messages are produced to a topic named `mytopic` in a stream named `my_stream`.

```
from confluent_kafka import Producer
p = Producer({'streams.producer.default.stream': '/my_stream'})
some_data_source= ["msg1", "msg2", "msg3"]
for data in some_data_source:
    p.produce('mytopic', data.encode('utf-8'))
    p.flush()
```

As of EEP 3.0 HPE Ezmeral Data Fabric Event Streams Python Client: In the following example code, three messages are produced to a topic named `mytopic` in a stream named `my_stream`.

```
from mapr_streams_python import Producer
p = Producer({'streams.producer.default.stream': '/my_stream'})
some_data_source= ["msg1", "msg2", "msg3"]
for data in some_data_source:
    p.produce('mytopic', data.encode('utf-8'))
    p.flush()
```

Create a HPE Ezmeral Data Fabric Event Streams Consumer Application

In general, you want to create a consumer that performs the following steps:

1. Import the consumer class.
2. Define the consumer and its configuration.
3. Consume data.
4. Wait for all messages to be consumed.

As of EEP 5.0 HPE Ezmeral Data Fabric Event Streams Python Client: In following example code, the HPE Ezmeral Data Fabric Event Streams consumer is subscribed to `my_stream/mytopic` and it prints the content of each message that it reads.

```
from confluent_kafka import Consumer, KafkaError
c = Consumer({'group.id': 'mygroup',
             'default.topic.config': {'auto.offset.reset': 'earliest'}})
c.subscribe(['/my_stream:mytopic'])
running = True
while running:
    msg = c.poll(timeout=1.0)
    if msg is None: continue
    if not msg.error():
        print('Received message: %s' % msg.value().decode('utf-8'))
    elif msg.error().code() != KafkaError._PARTITION_EOF:
        print(msg.error())
        running = False
c.close()
```

As of EEP 3.0 HPE Ezmeral Data Fabric Event Streams Python Client: In following example code, the HPE Ezmeral Data Fabric Event Streams consumer is subscribed to `my_stream/mytopic` and it prints the content of each message that it reads.

```
from mapr_streams_python import Consumer, KafkaError
c = Consumer({'group.id': 'mygroup',
             'default.topic.config': {'auto.offset.reset': 'earliest'}})
c.subscribe(['/my_stream:mytopic'])
running = True
```

```

while running:
    msg = c.poll(timeout=1.0)
    if msg is None: continue
    if not msg.error():
        print('Received message: %s' % msg.value().decode('utf-8'))
    elif msg.error().code() != KafkaError._PARTITION_EOF:
        print(msg.error())
        running = False
c.close()

```

Run the Example Applications

To run the sample producer and consumer applications:

1. Create a stream named `mystream`.
2. Create a file named `producer.py`.
3. Add the producer example code into the `producer.py` file.
4. Create a file named `consumer.py`.
5. Add the consumer example code into the `consumer.py` file.
6. Verify that you have completed the steps to configure the HPE Ezmeral Data Fabric Event Streams C client or complete the steps now. See [Configuring the HPE Ezmeral Data Fabric Event Streams C Client](#) on page 3071.

Note: The HPE Ezmeral Data Fabric Event Streams Python Client is dependent on the HPE Ezmeral Data Fabric Event Streams C Client. Therefore, the HPE Ezmeral Data Fabric Event Streams C Client must be configured before you can run the application.

7. Run `producer.py` from the command line to generate messages.

```
$ python producer.py
```

8. Run `consumer.py` from the command line:

```
$ python consumer.py
```

Migrating Kafka Python Applications to HPE Ezmeral Data Fabric Event Streams

With some modification, you can use existing confluent-kafka python applications to consume and produce topics in HPE Ezmeral Data Fabric Event Streams. The HPE Ezmeral Data Fabric Event Streams Python Client is a binding for Apache librdkafka that works with HPE Ezmeral Data Fabric Event Streams.

1. Install the HPE Ezmeral Data Fabric Event Streams Python Client.

Note: This required that you also install and configure the HPE Ezmeral Data Fabric Event Streams C Client. See [Configuring the HPE Ezmeral Data Fabric Event Streams C Client](#) on page 3071.

2. Do one of the following depending on whether you are using the EEP 5.0 (or higher) HPE Ezmeral Data Fabric Event Streams Python Client or the EEP 3.0 (or higher) HPE Ezmeral Data Fabric Event Streams Python Client.
 - If you are using HPE Ezmeral Data Fabric Event Streams Python EEP 5.0 (or higher), skip this step. The references to `confluent_kafka` should be retained.

- If you are using HPE Ezmeral Data Fabric Event Streams Python EEP 3.0 (or higher), update import statements to refer to the MapR Stream Python API. References to `confluent_kafka` should be updated to `mapr_streams_python`.

Note: For example, update `from confluent_kafka import Consumer` to `from mapr_streams_python import Consumer`.

3. When you refer to a topic in the application code, include the path and name of the stream in which the topic is located:

```
<path and name of stream>:<name of topic>
```

For example, you might have a stream in a HPE Ezmeral Data Fabric cluster that is named `stream_A`, and the stream might be in a volume named `IoT` and in a directory named `automobile_sensors`. You want to redirect a producer application to a topic in that stream. The syntax of the path to the topic might look like this: `/mapr/IoT/automobile_sensors/stream_A:<name of topic>`.

Note: Optionally, use the `streams.consumer.default.stream` and `streams.producer.default.stream` configuration parameters. When you configure these parameters, applications can specify just the topic name to write or read from the default stream.

4. Review the APIs that are supported and make changes to your application, as needed. See [API for HPE Ezmeral Data Fabric Event Streams Python Client](#) on page 3277.
5. See [Configuration Properties for HPE Ezmeral Data Fabric Event Streams Python Client](#) on page 3283 for the list of supported configuration parameters and make changes to your application, as needed.

Note: SSL-related configuration parameters are ignored. When you set these parameters, the HPE Ezmeral Data Fabric Event Streams Client issues a warning indicating that the parameters are not supported.

API for HPE Ezmeral Data Fabric Event Streams Python Client

HPE Ezmeral Data Fabric Event Streams Python Client is a binding for `librdkafka` and it supports the following APIs.

As of HPE Ezmeral Data Fabric 5.2.1, you can create python applications for HPE Ezmeral Data Fabric Event Streams using the HPE Ezmeral Data Fabric Event Streams Python client. The HPE Ezmeral Data Fabric Event Streams Python client is a binding for `librdkafka` and the HPE Ezmeral Data Fabric Event Streams C Client is a distribution of `librdkafka` that works with HPE Ezmeral Data Fabric Event Streams.

Table

| Core release | EEP Release | Kafka librdkafka version |
|---|-------------|--------------------------|
| As of HPE Ezmeral Data Fabric 6.0.1 | As of 5.0 | 0.11.3 |
| As of HPE Ezmeral Data Fabric 5.2.1 through 6.0.0 | As of 3.0 | 0.9.0 |

`class mapr_streams_python.Consumer`

A high-level Kafka Consumer.

| Method | Behavior |
|---------------------------------|---|
| <code>Consumer(**kwargs)</code> | Create new Consumer instance using provided configuration dictionary. |

| Method | Behavior |
|--|---|
| assign(partitions) | <p>Set consumer partition assignment to the provided list of TopicPartition and starts consuming.</p> <p>Parameters(s):</p> <ul style="list-style-type: none"> partitions (list(TopicPartition)) – List of topic+partitions and optionally initial offsets to start consuming |
| unassign() | <p>Unassign from all TopicPartitions that have been assigned with the .assign(*topic_partition_list) method.</p> <p> Note: This method is applicable as of HPE Ezmeral Data Fabric Event Streams Python Client EEP 5.0 which is associated with librdkafka 0.11.3.</p> |
| assignment() | <p>Return a list of assignments for a consumer object.</p> <p> Note: This method is applicable as of HPE Ezmeral Data Fabric Event Streams Python Client EEP 5.0 which is associated with librdkafka 0.11.3.</p> |
| close() | <p>Close down and terminate the Kafka Consumer.</p> <p>Actions(s):</p> <ul style="list-style-type: none"> Stops consuming Commits offsets Leave consumer group |
| commit([message=None][, offsets=None][, async=True]) | <p>Commit a message or a list of offsets.</p> <p>Message and offsets are mutually exclusive, if neither is set the current partition assignment's offsets are used instead.</p> <p>Parameters(s):</p> <ul style="list-style-type: none"> message (confluent_kafka.Message) – Commit message's offset+1. offsets (list(TopicPartition)) – List of topic+partitions+offsets to commit. async (bool) – Asynchronous commit, return immediately. |

| Method | Behavior |
|--|---|
| <p>committed(partitions[, timeout=None])</p> | <p>Retrieve committed offsets for the list of partitions.</p> <p>Parameters(s):</p> <ul style="list-style-type: none"> • partitions (list(TopicPartition)) - List of topic+partitions to query for stored offsets. • timeout (float) – Request timeout <p>Returns: List of topic+partitions with offset and possibly error set.</p> <p>Return type: list(TopicPartition)</p> <p>Raises: KafkaException</p> <p> Note: As of HPE Ezmeral Data Fabric 6.0, the message offset in a partition starts from zero (0). If you are upgrading and do not enable the HPE Ezmeral Data Fabric Database/HPE Ezmeral Data Fabric Event Streams feature, mfs.feature.db.streams.v6.support, the message offset in a partition starts from one (1).</p> |
| <p>on_commit(err, partitions)</p> | <p>A callback for Consumer.commit() that triggers custom actions when a commit request completes.</p> <p>Parameters(s):</p> <ul style="list-style-type: none"> • err (KafkaError) – Commit error object, or None on success. • Partitions (list(TopicPartition)) – List of partitions with their committed offsets or per-partition errors |
| <p>poll([timeout=None])</p> | <p>Consume messages, calls callbacks and returns events. The application must check the returned Message object's Message.error() method to distinguish between proper messages (error() returns None), or an event or error (see error().code() for specifics).</p> <p>Parameter(s): timeout (float) – Maximum time to block waiting for message, event or callback</p> <p>Returns: A Message object or None on timeout</p> <p>Return type: Message or None</p> |
| <p>position(partitions[, timeout=None])</p> | <p>Retrieve current positions (offsets) for the list of partitions.</p> <p>Parameter(s): partitions (list(TopicPartition)) – List of topic+partitions to return current offsets for. The current offset is the offset of the last consumed message + 1</p> <p>Returns: List of topic+partitions with offset and possibly error set.</p> <p>Return type: list(TopicPartition)</p> <p>Raises: KafkaException</p> <p>This function returns 0 when the messages have not yet been consumed from partitions. librdkafka returns -1001 instead.</p> |

| Method | Behavior |
|---|---|
| subscribe(topics[, listener=None]) | <p>Set subscription to supplied list of topics This replaces a previous subscription.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • topics (list(str)) – List of topics (strings) to subscribe to. • on_assign (callable) – callback to provide handling of customized offsets on completion of a successful partition re-assignment. • on_revoke (callable) – callback to provide handling of offset commits to a customized store on the start of a rebalance operation. <p>Raises: KafkaException</p> <p> Note: You cannot use the rd_kafka_subscribe API to subscribe a consumer to topics when that consumer is already assigned to topics. If you call this API for an assigned consumer, error RD_KAFKA_RESP_ERR__CONFLICT is returned.</p> |
| on_assign(consumer, partitions) | Same as librdkafka. |
| unsubscribe() | Same as librdkafka. |
| on_revoke(consumer, partitions) | <p>Parameter(s):</p> <ul style="list-style-type: none"> • consumer (Consumer) – Consumer instance. • partitions (list(TopicPartition)) – Absolute list of partitions being assigned or revoked. |
| get_watermark_offsets(confluent_kafka.TopicPartition) | <p>Get WatermarkOffsets for a given Topic Partition.</p> <p>Parameter(s): TopicPartition - Gets the watermark offset</p> <p> Note: This method is applicable as of HPE Ezmeral Data Fabric Event Streams Python Client EEP 5.0 which is associated with librdkafka 0.11.3.</p> |

lass mapr_streams_python.Producer

Asynchronous Kafka Producer.

| Method | Behavior |
|--------------------|---|
| Producer(**kwargs) | Create new Producer instance using provided configuration dict. |
| len() | <p>This API returns a positive number to indicate that messages are waiting to be produced to a streams topic but the value does not indicate the actual number of messages. librdkafka returns the actual number of messages that are waiting to be sent to or acknowledged by the broker.</p> <p>Return type: int</p> |

| Method | Behavior |
|---|---|
| flush() | Wait for all messages in the Producer queue to be delivered. This is a convenience method that calls poll() until len() is zero. |
| poll([timeout]) | <p>Polls the producer for events and calls the corresponding callbacks (if registered).</p> <p>Parameter(s):</p> <ul style="list-style-type: none"> • timeout (float) – Maximum time to block waiting for events <p>Returns: Number of events processed (callbacks served). Return type: int</p> |
| produce(topic[, value][, key][, partition][, callback]) | <p>Produce message to topic. This is an asynchronous operation, an application may use the callback (alias on_delivery) argument to pass a function (or lambda) that will be called from poll() when the message has been successfully delivered or permanently fails delivery.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • topic (str) – Topic to produce message to • value (str bytes) – Message payload • key (str bytes) – Message key • partition (int) – Partition to produce to, else uses the configured partitioner. • on_delivery(err,msg) (func) – Delivery report callback to call (from poll() or flush()) on successful or failed deliver <p>Raises:</p> <ul style="list-style-type: none"> • BufferError – if the internal producer message queue is full (queue.buffering.max.messages exceeded) • KafkaException – for other errors, see exception code <p> Note: When this function is called with NULL payload, an invalid argument error is sent to the callback. librdkafka creates a message with NULL payload and key value instead.</p> |

class mapr_streams_python.Message

The Message object represents either a single consumed or produced message, or an event . An application must check with error() to see if the object is a proper message (error() returns None) or an error/event. This class is not user-instantiable.

| Method | Behavior |
|--------|---|
| len() | <p>Returns: Message value (payload) size in bytes. Return type: int</p> |

| Method | Behavior |
|-------------|---|
| error() | The message object is also used to propagate errors and events. Applications must check error() to determine if the Message is a proper message (error() returns None) or an error or event (error() returns a KafkaError object) Return type: None or KafkaError |
| key() | Returns: message key or None if not available Return type: str bytes or None |
| offset() | Returns: message offset or None if not available Return type: int or None |
| partition() | Returns: partition number or None if not available Return type: int or None |
| topic() | Returns: topic name or None if not available Return type: str or None |
| value() | Returns: message value (payload) or None if not available Return type: str bytes or None |
| timestamp() | Returns: message timestamp  Note: This method is applicable as of HPE Ezmeral Data Fabric Event Streams Python Client EEP 5.0 which is associated with librdkafka 0.11.3. |

class `mapr_streams_python.TopicPartition`

TopicPartition is a generic type to hold a single partition and various information about it. It is typically used to provide a list of topics or partitions for various operations, such as Consumer.assign().

| Method | Behavior |
|--|--|
| TopicPartition(topic[, partition][, offset]) | Instantiate a TopicPartition object. Parameter(s) <ul style="list-style-type: none"> • topic (string) – Topic name • partition (int) – Partition id • offset (int) – Initial partition offset Return type: TopicPartition |
| error | Attribute that indicates an error (with KafkaError) unless None. |
| offset | Attribute for offset. |
| partition | Attribute for partition number. |
| topic | Attribute for topic name. |

class mapr_streams_python.KafkaError

Kafka error and event object.

The KafkaError class serves multiple purposes:

- Propagation of errors
- Propagation of events
- Exceptions

This class is not user-instantiable.

| Method | Behavior |
|--------|--|
| code() | Returns the error/event code for comparison toKafkaError.<ERR_CONSTANTS>. Returns: error/event code Return type: int |
| name() | Returns the enum name for error/event. Returns: error/event enum name string Return type: str |
| str() | Returns the human-readable error/event string. Returns: error/event enum message string Return type: str |

Configuration Properties for HPE Ezmeral Data Fabric Event Streams Python Client

In the instance constructor of a HPE Ezmeral Data Fabric Event Streams Python application, you can use a dictionary to set the following configuration properties. HPE Ezmeral Data Fabric Event Streams Python client supports a superset of the configuration properties supported by the HPE Ezmeral Data Fabric Event Streams C client.

Global Configuration Properties

| Property Name | Behavior |
|---------------------------|---|
| client.id | Same as librdkafka |
| default.topic.config | A dictionary of topic-level configuration properties that are applied to all used topics for the instance. |
| message.max.bytes | Supports a value less than or equal to 10MB (10000000). If this property is set to a value that is higher than 10MB, the client issues a warning and sets the configuration to 10MB. Produce calls fail when the message size is greater than 10MB. |
| receive.message.max.bytes | Same as librdkafka |
| topic.blacklist | Same as librdkafka |
| error_cb | A callback for generic/global error events. This callback is served by poll(). |
| opaque | Same as librdkafka. |

Consumer Configuration Properties

| Property Name | Behavior |
|----------------------------|--|
| group.id | Same as librdkafka. |
| enable.auto.commit | Same as librdkafka. |
| auto.commit.interval.ms | Same as librdkafka. |
| rebalance_cb | Same as librdkafka. |
| offset_commit_cb | Same as librdkafka. |
| delivery.report.only.error | Same as librdkafka. |
| dr_msg_cb | Same as librdkafka. |
| on_commit | A callback used to indicate success or failure of commit requests. |

Topic Configuration Properties

| Property Name | Behavior |
|-------------------|--|
| partitioner_cb | Same as librdkafka. |
| auto.offset.reset | Supports the following values: earliest, latest, none, smallest, and largest. librdkafka also supports biggest, end and error. |

Producer Configuration Properties

| Property Name | Behavior |
|--|--|
| on_delivery(kafka.KafkaError, kafka.Message) | A Python function reference that is called once for each produced message to indicate the final delivery result (success or failure). This property may also be set per-message by passing callback=callable (or on_delivery=callable) to the confluent_kafka.Producer.produce() function. |

HPE Ezmeral Data Fabric-Specific Configuration Properties

| Property Name | Behavior |
|---|--|
| streams.consumer.default.stream | Specifies the path and name of the stream that the consumer subscribes to if, when subscribing to a topic, the consumer does not specify a stream. For example, the consumer can specify the name of a stream together with the name of a topic to write to, like this: / <stream>:<topic>.  Note: rd_kafka_list groups API uses this consumer configuration to obtain the consumer groups. |
| streams.parallel.flushers.per.partition | Enables the producer may have multiple parallel send requests to the server for each topic partition. If this setting is set to true, it is possible for messages to be sent out of order. |

| Property Name | Behavior |
|---------------------------------|---|
| streams.producer.default.stream | Specifies the stream that the producer will use by default if the producer does not provide the name of a stream when specifying a topic to write to. For example, the producer can specify the name of a stream together with the name of a topic to write to, like this: /<stream>:<topic>. However, if the stream is not specified, the value of this configuration parameter is assumed to be the stream in which the topic is located. If the producer specifies the name of a topic without also providing the path and name of the stream, and there is no value for this configuration parameter, HPE Ezmeral Data Fabric Event Streams assumes that the topic specified is in Apache Kafka and does nothing. |

Additional Information

Here is a consumer configuration example:

```
conf = {'group.id': 'mygroup',
'session.timeout.ms': 6000,
'on_commit': my_commit_callback,
'default.topic.config': {'auto.offset.reset': 'smallest'}}
consumer = mapr_streams_python.Consumer(**conf)
```

HPE Ezmeral Data Fabric Event Streams C#.NET Applications

As of HPE Ezmeral Data Fabric 6.0.1/EEP5.0, you can create C#.NET applications for HPE Ezmeral Data Fabric Event Streams using the HPE Ezmeral Data Fabric Event Streams C#.NET client. The HPE Ezmeral Data Fabric Event Streams C#.NET client is a binding for librdkafka and the HPE Ezmeral Data Fabric Event Streams C Client is a distribution of librdkafka that works with HPE Ezmeral Data Fabric Event Streams.

Requirements

- HPE Ezmeral Data Fabric Client on Windows 7 (or higher) x64 operating systems
- HPE Ezmeral Data Fabric cluster version 6.0.1 or greater
- Java 8 SDK and set Java HOME
- HPE Ezmeral Data Fabric Event Streams C Client (mapr-librdkafka 0.11.3)
- HPE Ezmeral Data Fabric Event Streams C#.NET Client (mapr-streams-dotnet)
- .NET SDK 4.5.x or 4.6.x or .NET Core SDK 1.1
- nuget.exe

See [Installing HPE Ezmeral Data Fabric Event Streams C#.NET Client](#) on page 192 for installation information.

General Information

When developing and running HPE Ezmeral Data Fabric Event Streams C#.NET applications, note the following points:

- You can create producers and high-level consumers. Low-level consumers are not supported.
- Consuming or producing topics in a Kafka cluster is not supported.
- HPE Ezmeral Data Fabric Event Streams offset values start at 1, not 0.
- HPE Ezmeral Data Fabric security is supported including ACLs and ACEs for authorization. The unique Kafka security features that are part of Apache Kafka are not supported. See [Security](#) on page 650 for more information about HPE Ezmeral Data Fabric security features.
- User impersonation is not supported.

Developing HPE Ezmeral Data Fabric Event Streams C#.NET Applications

Describes general tasks for developing C#.NET applications.

Before Your Begin

Confirm that your environment meets the following requirements:

- HPE Ezmeral Data Fabric cluster version 6.0.1 or greater.
- HPE Ezmeral Data Fabric Event Streams C Client (mapr-librdkafka 0.11.3) is installed and configured on the node. See [Configuring the HPE Ezmeral Data Fabric Event Streams C Client](#) on page 3071.
- HPE Ezmeral Data Fabric Event Streams C#.NET Client (mapr-streams-dotnet) is installed on the node.
- .NET SKD 4.5.x or 4.6.x
- .NET Core SDK 1.1
- nuget.exe

Create a Producer Application

In general, you want to create a producer that performs the following steps:

1. Import the producer class.
2. Define the producer and its configuration.
3. Produce data.
4. Wait for all messages to be sent to consumer.

In the following example code, three messages are produced to a topic named mytopic in a stream named my_stream.

```
class Producer
{
    public static async void Produce()
    {
        string stream = "/my_stream";
```

```

        string topicName = "mytopic";

        var config = new Dictionary<string, object>
        { { "streams.producer.default.stream", stream } };
        var messages = new string[] { "Msg1", "Msg2", "Msg3" };

        using (var producer = new Producer<Null, string>(config, null,
new StringSerializer(Encoding.UTF8)))
        {
            foreach (var msg in messages)
            {
                var deliveryReport = await
producer.ProduceAsync(topicName, null, msg);
                Console.WriteLine($"Delivery report:
{deliveryReport.TopicPartitionOffset}");
            }

            producer.Flush(TimeSpan.FromSeconds(1));
        }
    }
}

```

Create a Consumer Application

In general, you want to create a consumer that performs the following steps:

1. Import the consumer class.
2. Define the consumer and its configuration.
3. Consume data.
4. Wait for all messages to be consumed.

In following example code, the HPE Ezmeral Data Fabric Event Streams consumer is subscribed to `my_stream/mytopic` and it prints the content of each message that it reads.

```

using Confluent.Kafka;
using Confluent.Kafka.Serialization

class Consumer
{
    public static void Consume()
    {
        var stream = "/mystream";
        var topic = "mytopic";

        var config = new Dictionary<string, object>
        {
            { "group.id", "simple-csharp-consumer" },
            { "streams.consumer.default.stream", stream }
        };

        bool running = true;

        using (var consumer = new Consumer<Ignore, string>(config,
null, new StringDeserializer(Encoding.UTF8)))
        {
            var l = new List<TopicPartitionOffset> { new
TopicPartitionOffset(topic, 0, 0) };
            consumer.Assign(l);

```

```

        // Raised on critical errors, e.g. connection failures.
        consumer.OnError += (_, error) =>
        {
            Console.WriteLine($"Error: {error}");
            running = false;
        };

        // Raised on deserialization errors or when a consumed
message has an error != NoError.
        consumer.OnConsumeError += (_, error) =>
        {
            Console.WriteLine($"Consume error: {error}");
            running = false;
        };

        while (running)
        {
            Message<Ignore, string> msg;
            if (consumer.Consume(out msg, TimeSpan.FromSeconds(10)))
            {
                Console.WriteLine($"Topic: {msg.Topic} Partition:
{msg.Partition} Offset: {msg.Offset} {msg.Value}");
            }
        }
    }
}
}
}
}

```

Run the Example Applications

To run the sample producer and consumer applications:

1. Create a stream named **mystream**.
2. Create a folder application.
3. Create a file named **example.cs**.
4. Add producer example code into the **example.cs** file.
5. Add consumer example code into the **example.cs** file.
6. Add an entry point for your application:

```

class Demo
{
    public static void Main(string[] args)
    {
        Producer.Produce();
        Consumer.Consume();
    }
}

```

7. Create a project file named **example.csproj**.

8. Add the following dependency properties into the **example.csproj** file:

```
<?xml version="1.0" encoding="utf-8"?>
<Project ToolsVersion="15.0" xmlns="http://schemas.microsoft.com/
developer/msbuild/2003">
  <Import Project="$(MSBuildExtensionsPath)\$(MSBuildToolsVersion)
\Microsoft.Common.props" Condition="Exists('$(MSBuildExtensionsPath)\$
(MSBuildToolsVersion)\Microsoft.Common.props')" />
  <PropertyGroup>
    <Configuration Condition=" '$(Configuration)' == '' ">Debug</
Configuration>
    <Platform Condition=" '$(Platform)' == '' ">AnyCPU</Platform>
    <ProjectGuid>{99EDBA4B-D7DA-48BB-8D0C-AF4B12387935}</ProjectGuid>
    <OutputType>Exe</OutputType>
    <RuntimeIdentifiers>win10-x64</RuntimeIdentifiers>
    <RootNamespace>app</RootNamespace>
    <AssemblyName>app</AssemblyName>
    <TargetFrameworkVersion>v4.6.1</TargetFrameworkVersion>
    <FileAlignment>512</FileAlignment>
    <AutoGenerateBindingRedirects>true</AutoGenerateBindingRedirects>
  </PropertyGroup>
  <PropertyGroup Condition=" '$(Configuration)|$(Platform)' == 'Debug|
AnyCPU' ">
    <PlatformTarget>AnyCPU</PlatformTarget>
    <DebugSymbols>true</DebugSymbols>
    <DebugType>full</DebugType>
    <Optimize>>false</Optimize>
    <OutputPath>bin\Debug\</OutputPath>
    <DefineConstants>DEBUG;TRACE</DefineConstants>
    <ErrorReport>prompt</ErrorReport>
    <WarningLevel>4</WarningLevel>
  </PropertyGroup>
  <ItemGroup>
    <Compile Include="app.cs" />
  </ItemGroup>
  <ItemGroup>
    <PackageReference Include="mapr-streams-dotnet" Version="0.11.3" />
  </ItemGroup>
  <Import Project="$(MSBuildToolsPath)\Microsoft.CSharp.targets" />
</Project>
```

9. Verify that you have completed the steps to configure the HPE Ezmeral Data Fabric Event Streams C client or complete the steps now. See [Configuring the HPE Ezmeral Data Fabric Event Streams C Client](#) on page 3071.

Note: The HPE Ezmeral Data Fabric Event Streams C#/.NET Client is dependent on the HPE Ezmeral Data Fabric Event Streams C Client. Therefore, the HPE Ezmeral Data Fabric Event Streams C Client must be configured before you can run the application.

10. Open your project folder on the command line and run:

```
dotnet run
```

Migrating Kafka C#/.NET Applications to HPE Ezmeral Data Fabric Event Streams

With some modification, you can use existing confluent-kafka C#/.NET applications to consume and produce topics in HPE Ezmeral Data Fabric Event Streams. The HPE Ezmeral Data Fabric Event Streams C#/.NET Client is a binding for Apache librdkafka that works with HPE Ezmeral Data Fabric Event Streams.

Migrating a .NET 4.5 or 4.6 Application

Note: This migration information is applicable for Windows (Win7-x64) platform *only*.

To migrate an existing .NET 4.5 or 4.6 application:

1. Install and configure the HPE Ezmeral Data Fabric Event Streams C Client. See [Configuring the HPE Ezmeral Data Fabric Event Streams C Client](#) on page 3071.
2. Replace the librdkafka.dll with the HPE Ezmeral Data Fabric librdkafka 0.11.3 from **/bin/.../runtimes/<win7-x64>/<native folder>**.
3. Add a symlink from the **MapRClient.dll** to the **librdkafka.dll**.
4. Restart the application.

Migrating a .NET Core Application1

Note: This migration information is applicable for Windows (Win7-x64) and Linux platforms.

To migrate an existing .NET Core application:

1. Install and configure the HPE Ezmeral Data Fabric Event Streams C Client. See [Configuring the HPE Ezmeral Data Fabric Event Streams C Client](#) on page 3071.
2. Replace the librdkafka.dll with the MapR librdkafka 0.11.3 from **USER_HOME/.NUGET/PACKAGES/LIBRDKAFKA.REDIST/0.11.3/runtimes/<platform>/<native folder>**.
3. Add a symlink from the **MapRClient.dll** to the **librdkafka.dll**.
4. Restart the application.

Migrating a .NET Core Application2

Note: This migration information is applicable for Linux platforms *only*.

To migrate an existing .NET Core application:

1. Remove all **.so** files from the **~/.NUGET/PACKAGES/LIBRDKAFKA.REDIST/0.11.3/runtimes/<platform>/<native folder>** directory.
2. Install and configure the HPE Ezmeral Data Fabric Event Streams C Client. See [Configuring the HPE Ezmeral Data Fabric Event Streams C Client](#) on page 3071.
3. Replace the librdkafka.dll with the MapR librdkafka 0.11.3 from **USER_HOME/.NUGET/PACKAGES/LIBRDKAFKA.REDIST/0.11.3/runtimes/** directory.
4. If the MapR Client doesn't install into the ID search path, add a symlink from the **MapRClient.dll** to the **/usr/local/lib**.
5. Restart the application.

General Migration Information

- When you refer to a topic in the application code, include the path and name of the stream in which the topic is located:

```
/<path and name of stream>:<name of topic>
```

For example, you might have a stream in a MapR cluster that is named stream_A, and the stream might be in a volume named IoT and in a directory named automobile_sensors. You want to redirect a producer application to a topic in that stream. The syntax of the path to the topic might look like this: /mapr/IoT/automobile_sensors/stream_A:<name of topic>.

Note: Optionally, use the `streams.consumer.default.stream` and `streams.producer.default.stream` configuration parameters. When you configure these parameters, applications can specify just the topic name to write or read from the default stream.

- Review the APIs that are supported and make changes to your application, as needed. See [API for HPE Ezmeral Data Fabric Event Streams C#/.NET](#) on page 3291.
- See [Configuration Properties for HPE Ezmeral Data Fabric Event Streams C#/.NET Client](#) on page 3293 for the list of supported configuration parameters and make changes to your application, as needed.

Note: SSL-related configuration parameters are ignored. When you set these parameters, the HPE Ezmeral Data Fabric Event Streams Client issues a warning indicating that the parameters are not supported.

API for HPE Ezmeral Data Fabric Event Streams C#/.NET

HPE Ezmeral Data Fabric Event Streams C#/.NET Client is a binding for librdkafka and the HPE Ezmeral Data Fabric Event Streams C Client is a distribution of librdkafka that works with HPE Ezmeral Data Fabric Event Streams.

Table

| Core release | EEP Release | Kafka librdkafka version |
|-------------------------------------|-------------|--------------------------|
| As of HPE Ezmeral Data Fabric 6.0.1 | As of 5.0 | 0.11.3 |

Classes

| Classes | Description |
|------------------------|---|
| CommittedOffsets | Encapsulates information provided to a Consumer's OnOffsetsCommitted event - per-partition offsets and success/error together with overall success/error of the commit operation. |
| Consumer | Implements a high-level Apache Kafka consumer (without deserialization). |
| Consumer<TKey, TValue> | Implements a high-level Apache Kafka consumer (with key and value deserialization). |
| Error | Represents an error that occurred when interacting with a Kafka broker or the librdkafka library. |
| ErrorCodeExtensions | Provides extension methods on the ErrorCode enumeration. |
| GroupInfo | Encapsulates information describing a particular Kafka group. |

| Classes | Description |
|---------------------------|---|
| GroupMemberInfo | Encapsulates information describing a particular member of a Kafka group. |
| Ignore | A type for use in conjunction with that enables message keys or values to be read as null, regardless of their value. |
| KafkaException | Represents an error that occurred during an interaction with Kafka. |
| Library | Methods that relate to the native librdkafka library itself (do not require a Producer or Consumer broker connection). |
| Loggers | OnLog callback event handler implementations. |
| LogMessage | Encapsulates information provided to the Producer/Consumer OnLog event. |
| Message | Represents a message stored in Kafka. |
| Message<TKey, TValue> | Represents a (deserialized) message stored in Kafka. |
| Metadata | Kafka cluster metadata. |
| Null | A type for use in conjunction with and that enables null key or values to be enforced when producing or consuming messages. |
| PartitionMetadata | Metadata pertaining to a single Kafka topic partition. |
| Producer | Implements a high-level Apache Kafka producer (without serialization). |
| Producer<TKey, TValue> | Implements a high-level Apache Kafka producer with key and value serialization. |
| TopicMetadata | Metadata pertaining to a single Kafka topic. |
| TopicPartition | Represents a Kafka (topic, partition) tuple. |
| TopicPartitionError | Represents a Kafka (topic, partition, error) tuple. |
| TopicPartitionOffset | Represents a Kafka (topic, partition, offset) tuple. |
| TopicPartitionOffsetError | Represents a Kafka (topic, partition, offset, error) tuple. |
| TopicPartitionTimestamp | Represents a Kafka (topic, partition, timestamp) tuple. |
| WatermarkOffsets | Represents the low and high watermark offsets of a Kafka topic/partition. |

Interfaces

| Interface | Description |
|--------------------------------|--|
| IDeliveryHandler | This interface is implemented by types that handle delivery report callbacks as a result of calls to <code>Producer.ProduceAsync()</code> . |
| IDeliveryHandler<TKey, TValue> | This interface is implemented by types that handle delivery report callbacks as a result of calls to <code>Producer<TKey,TValue>.ProduceAsync()</code> . |

| Interface | Description |
|------------------------------------|---|
| ISerializingProducer<TKey, TValue> | This interface describes the minimum functionality to be provided by a high level (serializing) Kafka producer. |

Structs

| Struct | Description |
|-----------|--|
| Offset | Represents a Kafka partition offset value. |
| Timestamp | Encapsulates a Kafka timestamp and its type. |

Enums

| Enum | Description |
|---------------|---|
| ErrorCode | Enumeration of local and broker generated error codes. |
| TimestampType | Enumerates the different meanings of a message timestamp value. |

Configuration Properties for HPE Ezmeral Data Fabric Event Streams C#.NET Client

Describes the C#.NET client configuration properties.

Global Configuration Properties

| | |
|---|---------------------|
| <p>P r o p e r t y N a m e Behavior</p> | |
| <p>c</p> | Same as librdkafka. |
| <p>e n t i t y</p> | |

| | |
|---|--|
| P r o p e r t y N a m e | |
| Behavior | <p>Supports a value less than or equal to 10MB (10000000). If this property is set to a value that is higher than 10MB, the client issues a warning and sets the configuration to 10MB. Produce calls fail when the message size is greater than 10MB.</p> |
| S a m e a s l i b r d k a f k a . | <p>Same as librdkafka.</p> |

| Parameter Name | Behavior |
|----------------|---|
| librdkafka | Same as librdkafka. |
| librdkafka | Same as librdkafka. |
| librdkafka | Same as librdkafka. |
| librdkafka | Same as librdkafka. Available as of librdkafka 0.11.3. Supported as of HPE Ezmeral Data Fabric 6.0.1. |

| | |
|---|---|
| P r o p e r t y N a m e | Behavior |
| u e e o u t e c o n t e n t s | Same as librdkafka. Available as of librdkafka 0.11.3. Supported as of HPE Ezmeral Data Fabric 6.0.1. |

Consumer Configuration Properties

| | |
|-------------------|---------------------|
| Property Name | |
| Property Behavior | Same as librdkafka. |
| Property | Same as librdkafka. |
| Property | Same as librdkafka. |

| |
|----------------------------|
| <p>Behavior</p> |
| <p>Same as librdkafka.</p> |
| <p>Same as librdkafka.</p> |
| <p>Same as librdkafka.</p> |

Topic Configuration

| | |
|--|---|
| P r o p e r t y N a m e | Behavior |
| a r r t e r b | Same as librdkafka. |
| a u t o m a t e d | Supports the following values: beginning, end, earliest, latest, none, smallest, and largest. As of HPE Ezmeral Data Fabric 6.0.1, beginning and end are supported.  Note: librdkafka additionally supports error. |

HPE Ezmeral Data Fabric-Specific Configurations

| | |
|----------------------|--|
| <p>Property Name</p> | |
| <p>Behavior</p> | <p>Specifies the path and name of the stream that the consumer subscribes to if, when subscribing to a topic, the consumer does not specify a stream. For example, the consumer can specify the name of a stream together with the name of a topic to write to, like this: /<stream>:<topic>.</p> <p> Note: rd_kafka_list groups API uses this consumer configuration to obtain the consumer groups.</p> |

| | |
|---|-----------------|
| P r o p e r t y N a m e | Behavior |
| e n a b l e s t h e p r o d u c e r t o h a v e m u l t i p l e p a r a l l e l s e n d r e q u e s t s t o t h e s e r v e r f o r e a c h t o p i c p a r t i t i o n .W h e n t h i s p r o p e r t y i s s e t t o t r u e t h e d e f a u l t v a l u e i s t r u e i t i s p o s s i b l e f o r m e s s a g e s t o b e s e n t o u t o f o r d e r. | |

| | |
|-------------------------------|---|
| Property Name Behavior | <p>Specifies the stream that the producer will use by default if the producer does not provide the name of a stream when specifying a topic to write to. For example, the producer can specify the name of a stream together with the name of a topic to write to, like this: <code>/<stream>:<topic></code>. However, if the stream is not specified, the value of this configuration parameter is assumed to be the stream in which the topic is located. If the producer specifies the name of a topic without also providing the path and name of the stream, and there is no value for this configuration parameter, HPE Ezmeral Data Fabric Event Streams assumes that the topic specified is in Apache Kafka and does nothing.</p> |

Utilities for HPE Ezmeral Data Fabric Event Streams

HPE Ezmeral Data Fabric Event Streams provides the utilities for operating on streams and topics.

Note: HPE Ezmeral Data Fabric Event Streams cannot use HPE Ezmeral Data Fabric Database Shell to perform operations on streams or topics.

`mapr costream`

This utility copies data from one Data Fabric Event Stream to another Data Fabric Event Stream. You can use it, for example, if you want to set up replication manually from one stream to another.

`mapr diffstreams`

This utility compares the message IDs, metadata, and data in two Data Fabric Event Streams. Then, generates two directories that contain sequence files

mapr diffstreamswithcrc

that you can use to merge the rows from the two Data Fabric Event Streams.

This utility uses a cyclic redundancy check to detect differences between sets of messages in the specified Data Fabric Event Streams. Then, for each set of non-identical messages, it performs a detailed comparison. Finally, it generates one or more directories of sequence files.

mapr exportstream and mapr importstream

Use these utilities together to export data from Data Fabric Event Streams into binary sequence files, and then import the data from the binary sequence files into other Data Fabric Event Streams. You can also use the `mapr importstream` utility to import changes that are specified in sequence files output by the `mapr diffstreams` utility.

mapr perfconsumer

This utility runs a consumer reading messages from topics in a Data Fabric Event Stream. Use this utility to run consumers when you want to estimate the performance of consumers for your Data Fabric Event Streams applications, given your network configuration.

mapr perfproducer

This utility runs a producer, generating messages and publishing them to a Data Fabric Event Stream. Use this utility to run producers when you want to estimate the performance of producers for your Data Fabric Event Streams applications, given your network configuration.

mapr streamanalyzer

This light-weight utility, which is a sample application for the `Streams` Java class for analytics on Data Fabric Event Streams, lets you count the messages in a stream or a subset of the topics in a stream. The utility also lets you print either whole retrieved messages or a subset of the fields in each message.

Configuring Properties for Message Size

Describes the `message.max.bytes` and `receive.message.max.bytes` properties for configuring message size.

message.max.bytes

For a C producer, the `message.max.bytes` value is 1000000 B by default.

The minimum value is 1000 B and maximum value is 32000000 B. The maximum message size produced by a C API is decided by the `message.max.bytes` value set on the C producer.

From C, Python, and C# APIs, the maximum message size that can be produced is 32000000 B. If a C consumer needs to consume a message that is greater than 32000000 B in size, which may be produced by a Java client, the consumer needs to update the `message.max.bytes` or `receive.message.max.bytes` properties to a higher value to consume it.

If the `message.max.bytes` property is set to greater than 32000000 B, it is by default capped at 32000000 B. Though a consumer can consume messages greater than 32000000 B (produced say by a Java client), only up to 32000000 B is produced from the MapR C client. The maximum message size

consumed by a C API is limited by the value that is higher among the `message.max.bytes` and `receive.message.max.bytes` values.

receive.message.max.bytes

For a C consumer, the `receive.message.max.bytes` is 1000000 B by default. The minimum value is 1000 B and maximum value is 1000000000 B.

Using a Java API, a larger message size can be produced if the cluster-side property is changed using the following `maprcli config save` command:

```
Cluster side:
maprcli config save -values
{"mfs.db.max.rowsize.kb":<value in KB>}
```

In this case, the row size is 32 MB by default and the maximum is a little less than 2 GB.

The `mfs.db.max.rowsize.kb` setting is a cluster-wide setting that applies to HPE Ezmeral Data Fabric Database (Binary+JSON) and MapR Event Store for Apache Kafka, and it is not configurable per stream or topic.

MapReduce and Apps

This section contains information associated with developing YARN applications.

External Applications and Classpath

Describes how to configure the class path for external applications.

MapReduce version 2 applications require the `hadoop 2.x` or the `yarn classpath`, and other applications that can run on YARN require the `yarn classpath`.

The method to specify the classpath differs based on how the job or application is submitted:

| Method used to Submit the Job | Method to Specify Classpath |
|---|---|
| The external application uses the <code>hadoop jar</code> or the <code>yarn jar</code> command. | <p>YARN applications (MapReduce or custom applications) that are submitted using the <code>yarn jar</code> command will automatically use the <code>yarn classpath</code>.</p> <p>If the external application has a service that submits the job, you can set the <code>CLASSPATH</code> environment variable to point to a different classpath prior to starting the service. In this case, the <code>hadoop classpath</code> that you set in the <code>CLASSPATH</code> environment variable takes priority over the <code>hadoop classpath</code> for the <code>hadoop jar</code> command.</p> |

| Method used to Submit the Job | Method to Specify Classpath |
|--|---|
| <p>The external application does not use the <code>hadoop jar</code> or the <code>yarn jar</code> command.</p> | <p>Set the classpath using one of the following options:</p> <ul style="list-style-type: none"> • If the external application has a service that submits the job or application, you can set the <code>CLASSPATH</code> environment variable to point to the hadoop or yarn classpath prior to starting the service. • Set the classpath within the application. <p>Use one of the following methods to get the classpath:</p> <ul style="list-style-type: none"> • <code>hadoop2 classpath</code> or <code>hadoop -yarn classpath</code>: Gets the classpath for MRv2 applications. • <code>yarn classpath</code>: Gets the classpath for YARN applications (MRv2 or other applications that can run on YARN). |

Important: When you launch a spring boot application, ensure that you prefix the classpath with `/opt/mapr/conf:/opt/mapr/hadoop/hadoop-2.7.0/etc/hadoop`. Alternatively, copy the `core-site.xml` file to the `/src/main/resources/` folder.

Classpath Construction

This section describes how the MapReduce classpath is constructed.

The classpath that is used to run a MapReduce program is constructed based on how the program is submitted.

When you submit an application from the command line, the classpath used to process the program is based on the following items in this order of priority:

1. JARs in the program's classpath, such as the hadoop 2.x or yarn classpath.
2. JARs specified with the `-libjar` parameter which can be appended to `hadoop jar` or `yarn jar` commands.

If an external application submits the application, the classpath that is used to process the jar file is based on the following items in this order of priority:

1. JARs in the classpath of the external application.
2. JARs in the program's classpath, such as the hadoop 2.x or yarn classpath.
3. JARs specified with `-libjar` parameter which can be appended to `hadoop jar` or `yarn jar` commands.

Managing Third-Party Libraries

Any third-party library that is required by a MapReduce program must be accessible to the data node that processes the application.

A data node is a node in the cluster that includes the NodeManager role. You can provide the third-party libraries when you submit the program, or you can install the third-party libraries on each node that processes the application.

Include the third-party libraries with each program

Including the third-party libraries with each program is the preferred method.

Perform one the following operations to include the third-party jars when you submit the program:

- Package the third-party libraries with the MapReduce jar file. The benefit of this method is that the node from which you submit the program and the node that runs the program are not required to have the libraries files.
- Use the `-libjars` parameter to specify the third-party libraries on the command line. With this option, the library files are submitted to the data node along with the program. The benefit of this method is that the node that runs the program does not need to have the library files installed. However, the node that submits the program must have the library files installed.

Install the third-party libraries on each node that runs the program

You can also install the third-party libraries on each data node. However, this may not be preferred as there could be conflicts between library versions or library files.

To install the third-party libraries on each data node, perform one of the following operations:

- Install the third-party libraries in the following directory on each Node Manager node: `/opt/mapr/hadoop/hadoop-2.x/share/hadoop/common`
- On each node with the NodeManager role, install the required third-party libraries and then specify the location(s) of the third-party libraries with the `HADOOP_CLASSPATH` env variable in the `env_override.sh` file. The `env_override.sh` file is located in the following directory: `/opt/mapr/conf`. For more information about the file, see [About env_override.sh](#) on page 2576.

Kubernetes Interfaces for Data Fabric

This section describes how to leverage the capabilities of the Kubernetes Interfaces for Data Fabric.

Container Storage Interface (CSI) Storage Plugin Configuration

This section describes how to use and troubleshoot the Container Storage Interface (CSI) Storage Plugin.

See [Container Storage Interface \(CSI\) Storage Plugin Overview](#) on page 629 for more information.

Using the Container Storage Interface (CSI) Storage Plugin

This section describes how to configure for static and dynamic provisioning and mounting using example configuration files.

For an overview of the Container Storage Interface (CSI) Storage Plugin, see [Container Storage Interface \(CSI\) Storage Plugin Overview](#) on page 629.

Before You Begin CSI Configuration

Before configuring the Container Storage Interface (CSI) Storage Plugin, be sure to review the following notes about supported and unsupported features and parameters. For an overview of the Container Storage Interface (CSI) Storage Plugin, see [Container Storage Interface \(CSI\) Storage Plugin Overview](#) on page 629.

Data Fabric Parameters for Static and Dynamic Provisioning

In dynamic provisioning, you can specify parameters for the data-fabric volume to be created. For a list of the parameters that you can use, see [volume create](#) on page 2190. Note these considerations for using the parameters:

- Volume attributes must be represented as a string (enclosed within quotations). Using an integer or boolean is not supported. In the following example, the `aetype` attribute will generate an error because the value (1) is not enclosed in quotations.

```
namePrefix: "pv"
mountPrefix: "/pv"
type: "rw"
advisoryquota: "100M"
aetype: 1
```

- The following parameters are ignored because they are redundant, and the CSI Driver configures these parameters automatically during volume creation:
 - `mount`
 - `quota*`
 - `createparent`
 - `path`
 - `name`

*Specifying `resources: requests: storage` in a PersistentVolumeClaim (PVC) makes it unnecessary to set the `quota` parameter. For an example, see [Example: Statically Provisioning a Volume Using the Container Storage Interface \(CSI\) Storage Plugin](#) on page 3314.

Kubernetes Access Modes

Kubernetes access modes control how a PersistentVolume (PV) is mounted on the host. [Access modes](#) can be specified on both PVs and PVCs. Only Volumes with a matching Access Mode will be bound to a PVC. Container Storage Interface (CSI) Storage Plugin supports ROX (ReadOnlyMany), RWO (ReadWriteOnce) and RWX (ReadWriteMany) access modes for the PV and PVC spec. See [Kubernetes CSI documentation](#) for more information.

Reclaim Policy

The Kubernetes `reclaimPolicy` parameter controls what happens to a PersistentVolume if the corresponding PersistentVolumeClaim is deleted. The `Recycle` Reclaim Policy is not supported by Kubernetes CSI Drivers, so it cannot be used with the Kubernetes Interfaces for Data Fabric. You can specify the reclaim policy normally when you configure a persistent volume.

The following table shows the supported values for the reclaim policy:

| Reclaim Policy Value | Description | Support |
|------------------------|--|-----------|
| Delete (default value) | The PersistentVolume and the data-fabric volume are deleted when the user deletes the corresponding PersistentVolumeClaim. | Supported |
| Retain | The PersistentVolume and the data-fabric volume are not deleted when the user deletes the corresponding PersistentVolumeClaim. | Supported |

For more information about the reclaim policy, see [Change the Reclaim Policy of a PersistentVolume](#).

Kubernetes Mount Options

The `Kubernetes mountOptions` parameter is not supported for use with the Container Storage Interface (CSI) Storage Plugin.

Configuring Static and Dynamic Provisioning Using Container Storage Interface (CSI) Storage Plugin

This page summarizes the high-level steps for configuring the Container Storage Interface (CSI) Storage Plugin after [installation](#) to provide static or dynamic provisioning. To learn more about static and dynamic provisioning, see [Static and Dynamic Volume Provisioning Using Container Storage Interface \(CSI\) Storage Plugin](#) on page 630.

Static Provisioning

1. Create the ticket secret and deploy the secret in the Pod only if the volume is on a secure MapR cluster.
See [Configuring a Secret](#) on page 3371 for more information.
2. Configure a `PersistentVolume` in your Pod spec or as part of a separate configuration file and provide information about the MapR volume.
See [Example: Statically Provisioning a Volume Using the Container Storage Interface \(CSI\) Storage Plugin](#) on page 3314, [Persistent Volumes](#), and [Example: Mounting a PersistentVolume for Static Provisioning](#) on page 3317.
3. Configure a `PersistentVolumeClaim` in your Pod spec or as part of a separate configuration file.
See [PersistentVolumeClaims](#).
4. Run the Pod spec using `kubectl` commands.
See [Overview of kubectl](#).

Dynamic Provisioning

1. Create the REST and ticket secrets and deploy the secrets in the Pod only if the volume is on a secure MapR cluster.
See [Configuring a Secret](#) on page 3371 for more information.
2. Create a storage class in your Pod spec or in a separate configuration file.
See [Storage Classes](#) and [Example: Mounting a PersistentVolume for Dynamic Provisioning Using Container Storage Interface \(CSI\) Storage Plugin](#) on page 3324.
3. Configure a `PersistentVolumeClaim` in your Pod spec or in a separate configuration file.
See [Example: Mounting a PersistentVolume for Dynamic Provisioning Using Container Storage Interface \(CSI\) Storage Plugin](#) on page 3324.
4. Run the Pod spec using `kubectl` commands.
See [Overview of kubectl](#).

Configuring Static and Dynamic Provisioning for a Raw Block Volume

[Raw block volumes](#) are supported for both static and dynamic provisioning. To request a raw-block `PersistentVolumeClaim`, set `volumeMode: Block`. If not specified, `volumeMode` defaults to `Filesystem` in the `PersistentVolumeClaimSpec`. `PersistentVolumes` also have a `volumeMode` field in the `PersistentVolumeSpec` that is used for static provisioning. `Block`-type PVCs can only bind to `Block`-type PVs.

All the features supported on `Filesystem`-persistent volumes are supported on `Block` volumes. For example:

- Create and Delete Volumes
- Expand Volumes
- Clone Volumes
- Create and Delete Snapshot
- Snapshot Restore

Block volumes are supported only in single-node-writer access modes. At any given time, they can only be published once as read/write on a single node. For `Block` volumes, the CSI driver does not format the block device; it just binds the block device to the target path. The application pod can choose to format the block device to any required Linux file system, such as `ext4`, `xfs`, `btrfs`, and others.

Each block volume is stored in an HPE Ezmeral Data Fabric file. Statically provisioned block files are located at the path designated in the `volumePath` specified in the persistent volume definition. Dynamically provisioned block files are located at the path designated by the `mountPrefix` in the storage class. For fast, random block-write performance, these files should not be erasure coded (warm tiering) or tiered off to an objectstore (cold tiering).

Static Provisioning Example

```
apiVersion: v1
kind: PersistentVolume
metadata:
  name: test-blockpv
  namespace: test-csi
spec:
  accessModes:
    - ReadWriteOnce
  volumeMode: Block
  persistentVolumeReclaimPolicy: Delete
  capacity:
    storage: 5G
  csi:
    driver: com.mapr.csi-kdf
    volumeHandle: test-simplepv
    volumeAttributes:
      volumePath: "/user/guest/myblockvolume"
      cluster: "clusterA"
      cldbHosts: "10.10.10.210"
      securityType: "secure"
      platinum: "true"
      capacityBytes: "5000000000"
```

Note: For the Loopback NFS CSI driver, change `driver` to `com.mapr.csi-nfskdf`.

Dynamic Provisioning Example

Note that no change in the `StorageClass` is required:

```
kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: test-secure-block-pvc
  namespace: test-csi
spec:
  storageClassName: test-secure-sc
  accessModes:
    - ReadWriteOnce
  volumeMode: Block
```

```
resources:
  requests:
    storage: 5G
```

Pod Specification

In the pod specification, you must specify `volumeDevices` and `devicePath` for the block volume instead of `volumeMounts` and `mountPath`.

```
apiVersion: v1
kind: Pod
metadata:
  name: test-secure-block-pod
spec:
  containers:
    - name: fc-container
      image: fedora:26
      command: ["/bin/sh", "-c"]
      args: [ "tail -f /dev/null" ]
      volumeDevices:
        - name: data
          devicePath: /dev/xvda
  volumes:
    - name: data
      persistentVolumeClaim:
        claimName: test-secure-block-pvc
```

Configuring a Secret

Kubernetes Secrets enable you to inject sensitive data into a pod. For more information about Secrets, see [Secrets](#).

The examples in this section show how Secrets can be used in static and dynamic provisioning. Secrets are not by themselves secure. For more information about security and Secrets, see [Security Properties](#). Specifically, it is important to turn on encryption at rest for Secrets. See [Encrypting Secret Data at Rest](#).

During installation of the Driver, the Kubernetes token that was moved into the pod is written to the host node so that the plugin can query a Secret to pull the ticket for mounting. This Kubernetes token is sensitive and should be protected. The token is placed in `/var/run/secrets/kubernetes.io/serviceaccount`.

Here is an example of a configuration file for a Kubernetes Secret:

```
apiVersion: v1
kind: Secret
metadata:
  name: mapr-provisioner-secrets
  namespace: test-driver
type: Opaque
data:
  ...
```

The following table describes the fields in the sample Secret file. For more information, see [Secrets](#) in the Kubernetes documentation.

| Parameter | Notes |
|-------------------------|-----------------------------------|
| <code>apiVersion</code> | The Kubernetes API version. |
| <code>kind</code> | The type of object being created. |
| <code>name</code> | A string to identify the Secret. |

| | |
|------|---|
| type | The type of Secret being created. For type <code>opaque</code> , clients must treat these values as opaque and pass them unmodified back to the server. |
|------|---|

REST Secrets

For dynamic provisioning, you must use a Secret to pass the user name and password of a data-fabric user to the provisioner. This user must have privileges to create and delete a data-fabric volume. The credentials allow the provisioner to make REST calls to the data-fabric webserver. Secrets are protected by the Kubernetes [RBAC](#).

The following example shows a REST secret in the Secret file:

```
apiVersion: v1
kind: Secret
metadata:
  name: mapr-provisioner-secrets
  namespace: test-driver
type: Opaque
data:
  MAPR_CLUSTER_USER: cm9vdA==
  MAPR_CLUSTER_PASSWORD: bWFwcmg==
```

The following table describes the REST secret fields in the REST Secret example.

| Parameter | Notes |
|-----------------------|--|
| MAPR_CLUSTER_USER | The base64 representation of a data-fabric user that has the ability to create and delete data-fabric volumes. See Converting a String to Base64 on page 3373. |
| MAPR_CLUSTER_PASSWORD | The base64 representation of the password for the user defined by the MAPR_CLUSTER_USER parameter. See Converting a String to Base64 on page 3373. |
| MAPR_CLUSTER_TICKET | The base64 representation of the ticket contents generated on the data-fabric cluster using the <code>maprlogin</code> utility. For dynamic provisioning, with the latest CSI drivers, you can configure a data-fabric ticket to authenticate to the data-fabric webserver to make REST calls. This parameter is provided as a Beta feature. |

Ticket Secrets

For static and dynamic provisioning, you must specify a Secret, which is the base64 representation of the ticket, to enable the POSIX client to communicate with a secure MapR cluster. The ticket for the POSIX client can be generated on the data-fabric cluster using the `maprlogin` on page 2412 utility.

The following example shows a ticket Secret:

```
apiVersion: v1
kind: Secret
metadata:
  name: mapr-ticket-secret
  namespace: mapr-examples
type: Opaque
data:
  CONTAINER_TICKET: CHANGETHIS!
```

The following table describes the CONTAINER_TICKET field in the ticket Secret example.

| Parameter | Notes |
|-----------|-------|
|-----------|-------|

CONTAINER_TICKET

Base64-encoded ticket value. See [Converting a String to Base64](#) on page 3373.

To create the secret:

1. Run the following command to create the Secret file:

```
kubectl create -f <secret-file-name>.yaml
```

2. Convert sensitive data, such as a user name and password, to a base64 representation.

See [Converting a String to Base64](#) on page 3373.

3. Add the base64 representation of sensitive data in the Secret file.

For more information about the format of the Secret files, see [REST Secrets](#) on page 3312 and [Ticket Secrets](#) on page 3312 earlier in this section.

4. Deploy the secret on the pod by running the following command:

```
kubectl apply -f <secret-file-name>.yaml
```

Converting a String to Base64

Sensitive data contained in a Secret must be represented in base64. Use these steps to convert such information to the base64 representation:

For example, in Linux:

```
echo -n 'mapr' | base64
```

The output shows the base64 representation of the user name `mapr` is `bWFwY290`.

MapR tickets include a cluster name followed by a base64-encoded string. It is not sufficient to insert the base64-encoded string into a Kubernetes Secret. You must convert *both* the cluster name and string into base64 representation and then insert the result into the Secret.

The following command shows how to convert a MapR ticket to base64 representation:

```
echo -n "cluster-name <base64-encoded ticket-value>" | base64
```

For example:

```
echo -n "cluster2 PuG0lpuPXuDxj9ERgKCTXOqsXYPTnqRJl6/
mlWJjdVKvE5r46QS2Bh9nC+I4Rcu0GtnWRUOtKBG9gp65bsZN9Kphnr/
Wp15z8D3O2go951CANes/
7QQ1lYVP7l2BOPGR6i1zIrC3XGwI8OQWT6lqpsjSVZv8z05oQ5GDYQTKPttI/yAk/
uJBES1ohCz38n9HgYALLvMALVsBPtUtG+cNGc1ktUDDMR2q1EgVzdJbuYsOuHnZX3LO3euKDG14C
4MCMrv9DWiWJxwiZ1yZu69GbZJLXxqLOQB1kdMoTXk=" | base64
```

```
Y2xlc3RlcjIgdUHVHMgxdVBYdUR4ajlFUmdLQ1RYT3FzWF1QVG5xUkpsNi9tbFdkamRWS3ZFNXI0
NlFtMkJoOW5DK0k0UmN1MED0bldSVU90S0JHOWdwNjVic1pOOUtwaG5yLldwMTV6OEQzTzJnbzk1
MUNBTmVzLzZdRUWxsWVZQN2wyQk9wR1I2STF6SXJDM1hHd0k4T1FXVDYxcXBza1NWWnY4ek81b1E1
R0RZUVRrUHR0SS95QWsvdUpCRVMxb2hDejM4bjlIZ1lBTEEx2TUFMvNncUHRVdEcrY05HYzFrdfVE
RElSMnExRWdWemRKYnVZc09lSG5aWDMNTzNldUtER2w0QzRNQ21ydj1lEV2lXSnh3aVoxeVp1Nj1H
Y1pKbFh4cUxPUUJsa2RNb1RYaz0K
```

Note: Another method for converting values to base64 is to use an Internet tool such as <https://www.base64encode.org> to encode or decode data.

Best Practices for Using Tickets

When using secure data-fabric clusters with the Kubernetes Interfaces for Data Fabric, you must generate tickets for your containers. Here are some best practices:

- Create a different user for each container.
- To avoid frequent renewals, use long-lived user tickets or servicewithimpersonation tickets. If you refresh or update a ticket, you must restart your containers.
- If you use an impersonation ticket, it is CRITICAL that you use security contexts in the pod definitions to avoid a misbehaving container impersonating all user IDs. For restrictions that apply to the use of impersonation tickets, see [How Impersonation Works](#) on page 1652 and [maprlogin](#) on page 2412.
- Match the security context `runAsUser`: ID and `fsGroup`: group to the ID or group used to create the ticket.

Here is an example of a pod spec that specifies a security context:

```
apiVersion: v1
kind: Pod
metadata:
  name: test-secure
  namespace: mapr-examples
spec:
  securityContext:
    runAsUser: 1000
    fsGroup: 2000
```

Example: Statically Provisioning a Volume Using the Container Storage Interface (CSI) Storage Plugin

You can designate a volume for use with Kubernetes by specifying the volume parameters directly inside the PersistentVolume spec.

Suppose you want to get an application container up and running quickly in the HPE Ezmeral Data Fabric. You already have a file-system path that you want to use for the application. You only need the data accessible to read. To make this work, you must do the following:

1. Generate a service ticket and set the `securityType` parameter in the PersistentVolume spec to `secure` if the volume to mount is on a secure cluster.

See [Generating a Service Ticket](#) on page 1545 for more information. For example:

```
kind: PersistentVolume
metadata:
  name: pv-securepv-test
  namespace: test-csi
spec:
  accessModes:
  ...
  csi:
  ...
  volumeAttributes:
  ...
  securityType: "secure"
```

2. If the volume to mount is on a secure cluster, configure a Ticket Secret, and include the base64-encoded contents of the ticket file in the Ticket Secret.

For more information, see [Configuring a Secret](#) on page 3371. The following table describes the properties of the Secret file:

| Property | Notes |
|----------|-------|
|----------|-------|

| | |
|------------------|---|
| apiVersion | The Kubernetes API version. |
| kind | The type of object being created. |
| name | A string to identify the Secret. |
| namespace | The namespace in which the Secret runs. |
| type | The type of Secret being created. For type <code>Opaque</code> , clients must treat these values as opaque and pass them unmodified back to the server. |
| CONTAINER_TICKET | The contents of the ticket encoded in base64. If you specified <code>secure</code> for the <code>securityType</code> , you must provide the ticket. To encode the ticket, see Converting a String to Base64 on page 3373. You may remove the ticket if the cluster is not secure. |

3. Set the `runAsUser` and the `fsGroup` parameters in the pod spec to the UID and GID of the user that created the ticket.

For example:

```
apiVersion: v1
kind: Pod
metadata:
  name: test-pv1
  namespace: test-csi
spec:
  ...
  securityContext:
    runAsUser: 1000
    fsGroup: 2000
  ...
```

The following table lists the properties specified in the sample pod spec:

| Parameter | Notes |
|----------------------------|--|
| apiVersion | The Kubernetes API version for the pod spec. |
| kind | The kind of object being created. For clarity, the example uses a naked pod. Generally, it is better to use a Deployment, DaemonSet, or StatefulSet for high availability (HA) and ease of upgrade. |
| metadata: name | The pod name. |
| metadata: namespace | The namespace in which the pod runs. |
| numrpcthreads | Sets the number of RPC threads for the data-fabric client. The default value is 1. The maximum value is 4. Use this option to increase throughput with FUSE basic or container licenses or with the Loopback NFS driver. |
| securityContext: runAsUser | The user ID to run the container under. This user ID must be the same as the user ID for which the ticket was generated. |
| securityContext: fsGroup | The group ID to run the container under. This group ID must be the same as the group ID of the user for which the ticket was generated. |

4. Point the `volumePath` in the CSI driver setting to the desired path, and fill in the `clbdbHosts` and `cluster` information.

For the complete list of volume attributes, see [volume create](#) on page 2190; however, note that volume attributes like `mount`, `quota`, `createparent`, `path`, and `name` are ignored when provisioning a volume. For more information, see [Data Fabric Parameters for Static and Dynamic Provisioning](#) on page 3307.

For example:

FUSE

```

apiVersion: v1
kind: PersistentVolume
metadata:
  name: test-simplepv
  namespace: test-csi
spec:
  accessModes:
  - ReadWriteOnce
  persistentVolumeReclaimPolicy: Delete
  capacity:
    storage: 5Gi
  csi:
    driver: com.mapr.csi-kdf
    volumeHandle: test-simplepv
    volumeAttributes:
      volumePath: "/"
      cluster: "clusterA"
      cldbHosts: "10.10.10.210"
      securityType: "secure"
      platinum: "true"

```

Loopback NFS

```

apiVersion: v1
kind: PersistentVolume
metadata:
  name: test-simplepv
  namespace: test-csi
spec:
  accessModes:
  - ReadWriteOnce
  persistentVolumeReclaimPolicy: Delete
  capacity:
    storage: 5Gi
  csi:
    driver: com.mapr.csi-nfskdf
    volumeHandle: test-simplepv
    volumeAttributes:
      volumePath: "/"
      cluster: "clusterA"
      cldbHosts: "10.10.10.210"
      securityType: "secure"

```

The following table lists the properties shown in the sample PersistentVolume spec:

| Parameter | Notes |
|---------------------|--|
| apiVersion | The Kubernetes API version for the Pod spec. |
| kind | The kind of object being created. |
| metadata: name | The Pod name. |
| metadata: namespace | The namespace in which the Pod runs. |
| accessModes | How the PersistentVolume is mounted on the host. All modes work the same.  Note: The PV and PVC modes must be the same so that they can bind. For more information, see Access Modes . |

| | |
|--------------------------------|---|
| <code>csi: driver</code> | The CSI Driver being used. Call it using one of these drivers: <ul style="list-style-type: none"> FUSE driver: <code>com.mapr.csi-kdf</code> Loopback NFS driver: <code>com.mapr.csi-nfskdf</code> |
| <code>csi: volumeHandle</code> | The existing volume name or unique volume name for static provisioning. |
| <code>volumePath</code> | The mount point within the filesystem. This parameter specifies an existing MapR path. |
| <code>cluster</code> | The cluster name. |
| <code>cldbHosts</code> | The DNS names or IP addresses of the CLDB hosts for the cluster. You must provide at least one CLDB host. For fault-tolerance, providing multiple CLDB hosts is recommended. To specify multiple hosts, separate each name or IP address by a space. |
| <code>securityType</code> | A parameter that indicates whether tickets are used or not used. If tickets are used, specify <code>secure</code> . Otherwise, specify <code>unsecure</code> . |

Example: Mounting a PersistentVolume for Static Provisioning

The information on this page is valid for both FUSE POSIX and Loopback NFS plugins. Examples or tables that mention the FUSE POSIX driver (`com.mapr.csi-kdf`) are equally valid for the Loopback NFS driver (`com.mapr.csi-nfskdf`).

For static provisioning, configuring a PersistentVolume has some advantages over annotating Kubernetes volume information in a pod spec:

- The configuration file can be shared for use by multiple pod specs.
- The configuration file enables the PersistentVolume to be mounted and available even when the pod spec that references it is removed.

For example, suppose a marketing volume exists in the secure filesystem under the path `/Departments/Marketing`. An administrator wants to statically provision this volume and make it available to multiple users. It is critical that data access is as fast as possible. To make this work, the administrator must do the following:

- Create a PersistentVolume (PV) (if you have already not statically provisioned a volume as described in this [example](#)) and set the following volumeAttributes:
 - `accessMode` of the PV to `ReadWriteOnce`
 - `securityType` parameter to `secure` because the volume is on a secure cluster
 - `volumePath` in the CSI driver setting to the desired path, and fill in the `cldbHosts` and `cluster` information
 - `platinum` parameter to use the POSIX platinum client or the `license` parameter to select from three POSIX clients

For example:

```
apiVersion: v1
kind: PersistentVolume
metadata:
  name: test-simplepv
  namespace: test-csi
  labels:
    name: pv-simplepv-test
spec:
```

```

accessModes:
- ReadWriteOnce
persistentVolumeReclaimPolicy: Delete
capacity:
  storage: 5Gi
csi:
  nodePublishSecretRef:
    name: "mapr-ticket-secret"
    namespace: "test-csi"
  driver: com.mapr.csi-kdf
  volumeHandle: test-simplepv
  volumeAttributes:
    volumePath: "/"
    cluster: "clusterA"
    cldbHosts: "10.10.102.96"
    securityType: "secure"
    platinum: "true"

```

The preceding example specifies the high-performance Platinum POSIX license by including `platinum: "true"` in the `volumeAttributes`.

If you have a Platinum FUSE POSIX license, Release 1.0.2 and later provide another way to control the POSIX client. Instead of specifying `platinum: "true"`, you can specify `license: "<license-name>"` and select one of three POSIX licenses (Basic, Container, or Platinum). Release 1.0.2 also adds support for a `startupConfig` line that lets you pass custom startup parameters to the FUSE process. The following example shows these options:

```

apiVersion: v1
kind: PersistentVolume
metadata:
  name: test-simplepv
  namespace: test-csi
  labels:
    name: pv-simplepv-test
spec:
  accessModes:
  - ReadWriteMany
  persistentVolumeReclaimPolicy: Delete
  capacity:
    storage: 5Gi
  csi:
    nodePublishSecretRef:
      name: "mapr-ticket-secret"
      namespace: "test-csi"
    driver: com.mapr.csi-kdf
    volumeHandle: test-simplepv
    volumeAttributes:
      volumePath: "/"
      cluster: "clusterB"
      cldbHosts: "10.10.10.210"
      securityType: "secure"
      license: "container"
      startupConfig: "-o allow_other -o big_writes -o auto_unmount -o
async_dio -o max_background=24 -o auto_inval_data --disable_writeback"

```

The following table shows the properties defined in the sample `PersistentVolume`:

| Parameter | Notes |
|-----------------------------|---|
| <code>metadata: name</code> | The <code>PersistentVolume</code> name. |

| | |
|---------------------------------|---|
| metadata: namespace | The namespace in which the PersistentVolume is stored. |
| accessModes | How the PersistentVolume is mounted on the host. All modes work the same. The example uses <code>ReadWriteOnce</code> . Note that <code>ReadOnlyMany</code> does not mount read-only.  Note: The accessMode is not used to set the access mode bit on the volume. The accessMode of the PV and PVC should be the same so that they can bind. For more information, see Access Modes . |
| persistentVolumeReclaimPolicy | Specifies what happens to the volume when it is released by its claim. The <code>Retain</code> value keeps the PVC around for manual cleanup. <code>Delete</code> deletes the PV from Kubernetes.  Note: If this volume was created using dynamic provisioning, <code>Delete</code> causes the underlying volume to be deleted. For more information, see Reclaiming . |
| capacity | Specifies how big the allocated storage should be. This value is not validated against the quota or advisory quota. It is up to the person creating the PV to specify this value accurately. |
| csi: nodePublishSecretRef | The Ticket Secret for the CSI driver. |
| nodePublishSecretRef: name | The name of the Ticket Secret that contains the ticket to use when mounting to the cluster. See Configuring a Secret on page 3371. |
| nodePublishSecretRef: namespace | The namespace that contains the Ticket Secret. Use the same namespace as the namespace used by the PersistentVolume. |
| csi: driver | The CSI driver being used. Call it by specifying <code>driver: mapr.com/maprfs</code> . |
| volumeHandle | The existing volume name or unique volume name for static provisioning. |
| volumePath | The mount point within the filesystem. This parameter specifies an existing path. For example, you can specify the root volume as <code>"/"</code> , providing access to the entire filesystem. |
| cluster | The data-fabric cluster name. |
| cldbHosts | The hostname or IP addresses of the CLDB hosts for the cluster. You must provide at least one CLDB host. For fault-tolerance, providing multiple CLDB hosts is recommended. To specify multiple hosts, separate each name or IP address by a space. |
| securityType | A parameter that indicates whether tickets are used or not used. If tickets are used, specify <code>secure</code> . Otherwise, specify <code>unsecure</code> . |
| platinum | If set to <code>platinum: "true"</code> , the POSIX client uses the platinum driver for better performance. Note that the platinum driver consumes more host resources and Platinum licenses. |

| | |
|------------------------------|--|
| license (FUSE POSIX) | <p>Release 1.0.2 and later support the <code>license: "<license-name>"</code> parameter in addition to the <code>platinum: "<true false>"</code> parameter for the FUSE POSIX plugin. The <code>license: "<license-name>"</code> parameter can have one of three values that control the number of host resources that are consumed:</p> <ul style="list-style-type: none"> • <code>"container"</code> for the Container driver (one binary, 8 threads) • <code>"basic"</code> for the Basic driver (one binary, 64 threads) • <code>"platinum"</code> for the Platinum driver (multiple binaries, each running 64 threads) <p>Note the following considerations for using the <code>license: "<license-name>"</code> parameter:</p> <ul style="list-style-type: none"> • To use the <code>license: "<license-name>"</code> parameter, you must have a Platinum license. • If you specify both the <code>platinum: "<true false>"</code> parameter and the <code>license: "<license-name>"</code> parameter, the <code>platinum: "<true false>"</code> parameter overrides the <code>license: "<license-name>"</code> parameter. • If neither the <code>platinum: "<true false>"</code> nor the <code>license: "</code>parameter is specified, the <code>container</code> driver is implemented. |
| startupConfig (FUSE POSIX) | <p>Release 1.0.2 and later support specifying the <code>startupConfig</code> line. The <code>startupConfig</code> line allows you to specify FUSE configuration parameters that are passed to the <code>fuse.conf</code> file. For the parameters that can be passed, see Configuring the HPE Ezmeral Data Fabric FUSE-Based POSIX Client on page 1358.</p> <p>If no <code>startupConfig</code> line is specified, these default startup settings are used:</p> <pre style="background-color: #f0f0f0; padding: 5px;">"-o allow_other -o big_writes -o auto_unmount"</pre> <p>The default settings allow other users to access the mount point, enable writes larger than 4 KB, and automatically unmount the filesystem when the process is terminated.</p> <p>The following example includes the three default settings and adds some additional settings (shown in bold):</p> <pre style="background-color: #f0f0f0; padding: 5px;">startupConfig: "-o allow_other -o big_writes -o auto_unmount -o async_dio -o max_background=24 -o auto_inval_data --disable_writeback"</pre> <p>The additional settings enable asynchronous direct I/O, set the maximum number of asynchronous requests to 24, automatically invalidate the kernel FUSE cache for any data change that causes a change in the files, and disable the writeback cache.</p> |
| startupConfig (Loopback NFS) | <p>The <code>startupConfig</code> line allows you to specify configuration parameters that are passed to the <code>nfsserver.conf</code> file. For the parameters that can be passed, see nfsserver.conf on page 2491. The <code>startupConfig</code> values supported for Loopback NFS are all the configs supported in the <code>nfsserver.conf</code> file. Values must be separated by a space. If no <code>startupConfig</code> line is specified, these default startup settings are used:</p> <pre style="background-color: #f0f0f0; padding: 5px;">startupConfig: "NFS_HEAPSIZE=1024 DrCacheSize=1024000"</pre> |
| trackMemory | <p>Enables memory profiling to debug memory leaks in the FUSE or Loopback NFS process. To be enabled after direction from the DF support team. The default value is <code>false</code>.</p> |
| logLevel | <p>Sets the log level to one of the following values: <code>error</code>, <code>warn</code>, <code>info</code>, or <code>debug</code>. For the FUSE POSIX driver (<code>com.mapr.csi-kdf</code>), the default value is <code>error</code>. For the Loopback NFS driver (<code>com.mapr.csi-nfskdf</code>), the default value is <code>info</code>.</p> |
| retainLogs | <p>Retains the logs for the pod on the host machine. The default value is <code>false</code>.</p> |

See [Example: Statically Provisioning a Volume Using the Container Storage Interface \(CSI\) Storage Plugin](#) on page 3314 for more information.

2. Create a PersistentVolumeClaim (PVC) spec and set the `accessMode` of the PVC to `ReadWriteOnce`.

For example:

```
kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: test-simplepvc
  namespace: test-csi
spec:
  accessModes:
    - ReadWriteOnce
  resources:
    requests:
      storage: 5G
```

The following table shows the properties used in the sample PersistentVolumeClaim:

| Parameter | Notes |
|----------------------------------|--|
| <code>metadata: name</code> | The PersistentVolumeClaim name. |
| <code>metadata: namespace</code> | The namespace in which the PersistentVolumeClaim is configured. |
| <code>accessMode</code> | How the requested PersistentVolume is mounted on the host. All modes work the same. The example uses <code>ReadWriteOnce</code> . Note that <code>ReadOnlyMany</code> does not mount read-only.  Note: The PV and PVC modes should be the same so that they can bind. For more information, see Access Modes . |

3. Generate a service ticket, and create and deploy a ticket secret on the pod (if you have already not done it as described in steps 1 and 2 of this [example](#)).
See [maprlogin](#) on page 2412 for information on generating a ticket and [Configuring a Secret](#) on page 3371 for information on creating and deploying a ticket secret.
4. Create the pod spec and set the `runAsUser` and the `fsGroup` parameters to the UID and GID of the user that created the ticket.

For example:

```
apiVersion: v1
kind: Pod
metadata:
  name: test-pv
  namespace: test-csi
spec:
  securityContext:
    runAsUser: 1000
    fsGroup: 2000
  containers:
    - name: busybox
      image: busybox
      args:
        - sleep
        - "1000000"
      resources:
        requests:
```

```

    memory: "2Gi"
    cpu: "500m"
  volumeMounts:
  - mountPath: /mapr
    name: maprflex
  volumes:
  - name: maprflex
    persistentVolumeClaim:
      claimName: test-simplepvc

```

The following table shows the properties defined in the sample pod spec:

| Parameter | Notes |
|----------------------------------|--|
| apiVersion | The Kubernetes API version for the pod spec. |
| kind | The kind of object being created. The example uses a naked pod for clarity. Generally, it is better to use a Deployment, DaemonSet, or StatefulSet for high availability and ease of upgrade. |
| metadata: name | The pod name. |
| metadata: namespace | The namespace in which the pod runs. |
| numrpcthreads | Sets the number of RPC threads for the data-fabric client. The default value is 1. The maximum value is 4. Use this option to increase throughput with FUSE basic or container licenses or with the Loopback NFS driver. |
| securityContext: runAsUser | The user ID to run the container under. This user ID must be the same as the user ID for which the ticket was generated. |
| securityContext: fsGroup | The group ID to run the container under. This group ID must be the same as the group ID of the user for which the ticket was generated. |
| volumeMounts: mountPath | A directory inside the container that is designated as the mount path. |
| volumeMounts: name | A name that you assign to the Kubernetes <code>volumeMounts</code> resource. Matches with <code>Volumes: name</code> . |
| Volumes: name | A string to identify the name of the Kubernetes <code>volumes</code> resource. The value should match <code>volumeMounts: name</code> . |
| persistentVolumeClaim: claimName | The name of the PersistentVolumeClaim (PVC). For more information, see PersistentVolumeClaims . |

5. Deploy the `.yaml` file on the pod by running the following command:

```
kubectl apply -f <filename>.yaml
```

For each Pod mount request, the POSIX client starts with the pod's hostname and new generated `hostid`, which is tracked on the data-fabric cluster. You can run the `node list` on page 1911 command on the data-fabric cluster to determine the number of POSIX clients. For example:

FUSE POSIX

```
# maprcli node list -clientonly true
clienttype      clienthealth hostname
ip              lasthb id
posixclientbasic Inactive      4f3d34fe-2007-11e9-8980-0cc47ab39644

  accessModes:
  - ReadWriteOnce
  resources:
    requests:
      storage: 5G

```

Example: Mounting a PersistentVolume for Dynamic Provisioning Using Container Storage Interface (CSI) Storage Plugin

This example also uses a PersistentVolume. However, unlike the previous example, when you use the dynamic provisioner, you do not need to create a PersistentVolume manually. The PersistentVolume is created automatically based on the parameters specified in the referenced StorageClass.

Dynamic provisioning is useful in cases where you do not want data-fabric and Kubernetes cluster administrators to create storage manually to store the pod storage state.

The following example uses a PersistentVolumeClaim that references a Storage Class. In this example, a Kubernetes administrator has created a storage class called `test-secure-sc` for pod creators to use when they want to create persistent storage for their pods. In this example, it is important for the created pod storage to survive the deletion of a pod.

The information on this page is valid for both FUSE POSIX and Loopback NFS plugins. Examples or tables that mention the FUSE POSIX provisioner (`com.mapr.csi-kdf`) are equally valid for the Loopback NFS provisioner (`com.mapr.csi-nfskdf`).

To dynamically provision a volume, you must do the following:

1. Generate a user ticket, and create and deploy a ticket secret on the pod. See:
 - [Best Practices for Using Tickets](#) on page 3374 to select the right ticket
 - [maplogin](#) on page 2412 for information about generating a ticket
 - [Configuring a Secret](#) on page 3371 for information about creating and deploying a ticket secret
2. Create the REST secret and deploy the secret on the pod.
See [Configuring a Secret](#) on page 3371 for information about creating and deploying a ticket secret.
3. Create a StorageClass similar to the following:

```
apiVersion: storage.k8s.io/v1
kind: StorageClass
metadata:
  name: test-secure-sc
  namespace: test-csi
provisioner: com.mapr.csi-kdf
allowVolumeExpansion: true
reclaimPolicy: Delete
parameters:
  csiProvisionerSecretName: "mapr-provisioner-secrets"
  csiProvisionerSecretNamespace: "test-csi"
  csiNodePublishSecretName: "mapr-ticket-secret"
  csiNodePublishSecretNamespace: "test-csi"
  restServers: "10.10.10.210:8443"
  cldbHosts: "10.10.10.210:7222"
  cluster: "clusterA"
  securityType: "secure"
  namePrefix: "csi-pv"
  mountPrefix: "/csi"
  advisoryquota: "100M"
  trackMemory: "false"
  logLevel: "error"
  retainLogs: "false"
```

For more information, see [Storage Classes](#). The following table shows the properties defined in the sample StorageClass:

| Property | Description |
|---------------------------|---|
| apiVersion | The Kubernetes API version for the StorageClass spec. |
| kind | The kind of object being created. This is a StorageClass. |
| metadata: name | The name of the StorageClass. Administrators should specify the name carefully because it will be used by pod authors to help select the right StorageClass for their needs. |
| metadata: namespace | The namespace in which the StorageClass runs. This namespace can be different from the namespace used by the PVC and pod, since the StorageClass namespace can be a cross-namespace resource. |
| provisioner | The provisioner being used. For the FUSE POSIX provisioner, specify <code>com.mapr.csi-kdf</code> . For the Loopback NFS provisioner, specify <code>com.mapr.csi-nfskdf</code> . |
| csiNodePublishSecret Name | The name of the Secret that contains the ticket to use when mounting to the HPE Ezmeral Data Fabric cluster. See Configuring a Secret on page 3371. |

| Property | Description |
|---|---|
| <code>csiNodePublishSecretNamespace</code> | The namespace that contains the Secret. Use the same namespace as the namespace used by the pod. |
| <code>csiProvisionerSecretName (deprecated)</code> <code>csi.storage.k8s.io/provisioner-secret-name</code> | The name of the Kubernetes Secret that is used to store data-fabric administrative credentials (user, password, and ticket information for the data-fabric webserver). To use the provisioner, you must configure a Secret. See Configuring a Secret on page 3371. |
| <code>csiProvisionerSecretNamespace (deprecated)</code> <code>csi.storage.k8s.io/provisioner-secret-namespace</code> | The namespace for the Secret containing the data-fabric administrative credentials (user name and password information for a data-fabric user that has the privileges to create volumes). This namespace can be different from the namespace used by the pod, since a pod author or namespace admin might not be trusted to create administration Secrets for the data-fabric cluster. |
| <code>restServers</code> | A space-separated list of data-fabric webserver. Specify the hostname or IP address and port number of each REST server for the cluster. For fault tolerance, providing multiple REST server hosts is recommended. |
| <code>cldbHosts</code> | The hostname or IP addresses of the CLDB hosts for the data-fabric cluster. You must provide at least one CLDB host. For fault-tolerance, providing multiple CLDB hosts is recommended. To specify multiple hosts, separate each name or IP address by a space. |
| <code>cluster</code> | The data-fabric cluster name. |
| <code>securityType</code> | A parameter that indicates whether data-fabric tickets are used or not used. If data-fabric tickets are used, specify <code>secure</code> . Otherwise, specify <code>unsecure</code> . |
| <code>namePrefix</code> | A prefix for the data-fabric volume to be created. For example, if you specify <code>PV</code> as the <code>namePrefix</code> , the first dynamically created volume might be named <code>PV.bevef5esscr</code> . The provisioner generates random names using lower-case letters. If you do not specify a prefix, the provisioner uses <code>maprprovisioner</code> as a prefix. |
| <code>mountPrefix</code> | The parent path of the mount in the data-fabric filesystem. If you do not specify a mount prefix, the provisioner mounts your volume under the data-fabric root.  Note: User provisioning a volume under this <code>mountPrefix</code> requires read-write permissions to mount the newly created volume; otherwise, the volume provision will fail. |
| <code>advisoryquota</code> | The advisory storage quota for the volume. The <code>advisoryquota</code> is one of the data-fabric parameters that you can specify for dynamic provisioning. For more information, see Before You Begin on page 3355. |
| <code>trackMemory</code> | Enables memory profiling to debug memory leaks in the FUSE or Loopback NFS process. To be enabled after direction from the DF support team. The default value is <code>false</code> . |
| <code>logLevel</code> | Sets the log level to one of the following values: <code>error</code> , <code>warn</code> , <code>info</code> , or <code>debug</code> . For the FUSE POSIX driver (<code>com.mapr.csi-kdf</code>), the default value is <code>error</code> . For the Loopback NFS driver (<code>com.mapr.csi-nfskdf</code>), the default value is <code>info</code> . |
| <code>retainLogs</code> | Retains the logs for the pod on the host machine. The default value is <code>false</code> . |

4. Configure a PersistentVolumeClaim similar to the following:

```
kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: test-secure-pvc
  namespace: test-csi
```

```
spec:
  storageClassName: test-secure-sc
  accessModes:
    - ReadWriteOnce
  resources:
    requests:
      storage: 5G
```

The following table shows the properties defined in the sample PersistentVolumeClaim:

| Property | Description |
|---------------------|--|
| apiVersion | The Kubernetes API version for the pod spec. |
| kind | The kind of object being created. This is a PersistentVolumeClaim (PVC). |
| metadata: name | The PVC name. |
| metadata: namespace | The namespace in which the PVC runs. This should be the same namespace used by the pod. |
| storageClassName | The name of the storage class requested by the PersistentVolumeClaim. For more information, see Dynamic Provisioning and Storage Classes . |
| accessModes | How the PersistentVolume is mounted on the host. For more information, see Access Modes . |
| requests: storage | The storage resources being requested, or that were requested and have been allocated. The pod author can use this parameter to specify how much quota is needed for the data-fabric volume. For the units, see Resource Model . |

5. Create the pod spec similar to the following:

```
apiVersion: v1
kind: Pod
metadata:
  name: test-secure-pod
  namespace: test-csi
spec:
  containers:
    - name: busybox
      image: busybox
      args:
        - sleep
        - "1000000"
      resources:
        requests:
          memory: "2Gi"
          cpu: "500m"
      volumeMounts:
        - mountPath: /mapr
          name: maprflex
  volumes:
    - name: maprflex
      persistentVolumeClaim:
        claimName: test-secure-pvc
```

The following table shows the properties defined in the sample pod spec:

| Property | Description |
|------------|--|
| apiVersion | The Kubernetes API version for the pod spec. |

| Property | Description |
|----------------------------------|--|
| kind | The kind of object being created. For clarity, this example uses a naked Pod. Generally, it is better to use a Deployment, DaemonSet, or StatefulSet for high availability and ease of upgrade. |
| metadata: name | The pod name. |
| metadata: namespace | The namespace in which the pod runs. It should be the same namespace in which the PVC runs. |
| numrpcthreads | Sets the number of RPC threads for the data-fabric client. The default value is 1. The maximum value is 4. Use this option to increase throughput with FUSE basic or container licenses or with the Loopback NFS driver. |
| volumeMounts: mountPath | A directory inside the container that is designated as the mount path. |
| volumeMounts: name | A name that you assign to the Kubernetes volumeMounts resource. The value should match Volumes: name. |
| Volumes: name | A string to identify the name of the Kubernetes volumes resource. The value should match volumeMounts: name. |
| persistentVolumeClaim: claimName | The name of the PersistentVolumeClaim (PVC). For more information, see PersistentVolumeClaims . |

6. Deploy the .yaml file on the pod by running the following command:

```
kubectl apply -f <filename>.yaml
```

For each pod mount request, the POSIX client starts with the pod's hostname and new generated hostid, which is tracked on the data-fabric cluster. You can run the [node list](#) on page 1911 command on the cluster to determine the number of POSIX clients. For example:

FUSE POSIX

```
# maprcli node list -clientonly true
clienttype clienthealth hostname ip lasthb id
posixclientbasic Inactive 4f3d34fe-2007-11e9-8980-0cc47ab39644

```

Full example, which includes PV, PVC, and Pod configuration

```

apiVersion: storage.k8s.io/v1
kind: StorageClass
metadata:
  name: test-secure-sc
  namespace: test-csi
provisioner: com.mapr.csi-kdf
parameters:
  csiProvisionerSecretName: "mapr-provisioner-secrets"
  csiProvisionerSecretNamespace: "test-csi"
  csiNodePublishSecretName: "mapr-ticket-secret"
  csiNodePublishSecretNamespace: "test-csi"
  restServers: "10.10.10.210"
  clldbHosts: "10.10.10.210"
  cluster: "clusterA"
  securityType: "secure"
  namePrefix: "csi-pv"
  mountPrefix: "/csi"
  advisoryquota: "100M"
--
kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: test-secure-pvc
  namespace: test-csi
spec:
  storageClassName: test-secure-sc
  accessModes:
    - ReadWriteOnce
  resources:
    requests:
      storage: 5G
--
apiVersion: v1
kind: Pod
metadata:
  name: test-secure-pod
  namespace: test-csi
spec:
  containers:
    - name: busybox
      image: busybox
      args:
        - sleep
        - "1000000"
      resources:
        requests:
          memory: "2Gi"
          cpu: "500m"
      volumeMounts:
        - mountPath: /mapr
          name: maprflex
  volumes:
    - name: maprflex
      persistentVolumeClaim:
        claimName: test-secure-pvc

```

Example: Volume Cloning for Dynamic Provisioning

You can clone a volume from an existing volume by configuring a PersistentVolumeClaim that specifies the volume PVC as the data source. In the following example, the PVC named `testcsi-secure-pvc` serves as the data source for creating a new volume named `testcsi-secure-pvc-clone`:

```
kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: testcsi-secure-pvc-clone
  namespace: test-csi
spec:
  storageClassName: testcsi-secure-sc
  accessModes:
    - ReadWriteOnce
  resources:
    requests:
      storage: 10G
  dataSource:
    kind: PersistentVolumeClaim
    name: testcsi-secure-pvc
```

When cloning extra large volumes (volumes measuring hundreds of GB), you might experience timeouts or a failure to clone the volume. To prevent timeouts with extra large volumes, increase the retry timeout setting for the `csi-provisioner` sidecar container. See the `--timeout` argument in the latest `csi-maprkd-<version>.yaml`.

For more information, see [CSI Volume Cloning](#).

Example: Volume Expansion for Dynamic Provisioning Using Container Storage Interface (CSI) Storage Plugin

The following versions of the Container Storage Interface (CSI) Storage Plugin support a volume expansion feature for dynamically provisioned volumes:

- FUSE POSIX plugin versions [1.1.0](#) and later
- Loopback NFS plugin versions [1.0.0](#) and later

Volume expansion means you can increase the storage quota of volumes created by the CSI driver. Note that the `StorageClass` must have `allowVolumeExpansion` set to `true` for volume expansion to succeed. For more information about volume expansion, see [Expanding Persistent Volume Claims](#).

To use volume expansion, increase the storage value and reapply the PersistentVolumeClaim configuration. For example, in the following PVC configuration, to increase the storage quota for the volume from 5G to 10G, change `storage: 5G` to `storage: 10G`, and run the `kubectl apply -f <path_to_pvc>.yaml` command:

```
kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: test-secure-pvc
  namespace: test-csi
spec:
  storageClassName: test-secure-sc
  accessModes:
    - ReadWriteOnce
  resources:
    requests:
      storage: 5G
```

Verifying Creation of a Kubernetes PersistentVolumeClaim and Persistent Volume

Once the pod spec is installed, you can verify the status of a PersistentVolumeClaim and/or a PersistentVolume by using the `kubectl` command. For example:

1. Run the Kubernetes `get` command to verify the status of the PersistentVolumeClaim:

Note: The information on this page is valid for both FUSE POSIX and Loopback NFS plugins. Examples or tables that mention the FUSE POSIX driver (`com.mapr.csi-kdf`) are equally valid for the Loopback NFS driver (`com.mapr.csi-nfskdf`).

Static Provisioning

```
# kubectl describe pvc -n test-csi
Name:          mapr-secure-claim
Namespace:    test-csi
StorageClass:
Status:      Bound
Volume:      pv-securepv-test
Labels:       <none>
Annotations:

```

3. Run the `node list` on page 1911 command on the cluster to determine the number of POSIX clients.

For each pod mount request, the POSIX client starts with the pod's hostname and new generated hostid, which is tracked on the cluster. For example:

```

# maprcli node list -clientonly true
clienttype      clienthealth  hostname
ip              lasthb      id
posixclientbasic Inactive      4f3d34fe-2007-11e9-8980-0cc47ab39644

```

Managing Snapshots Using the Container Storage Interface (CSI) Storage Plugin

This section describes how to create and delete one or more snapshots of volumes dynamically provisioned by the Container Storage Interface (CSI) Storage Plugin on the data-fabric cluster.

The Container Storage Interface (CSI) Storage Plugin v1.x.x uses the `csi-snapshotter` to support snapshot provisioning.

CSI now supports snapshot restore, which allows you to create a new volume from the snapshot data of another volume. See [Creating a Volume from a Snapshot](#) on page 3350. To manually restore a volume, see [Copying From a Snapshot Using the CLI](#) on page 1034.

Creating a Snapshot Using the Container Storage Interface (CSI) Storage Plugin

You can create one or more snapshots of a dynamically provisioned volume using the Container Storage Interface (CSI) Storage Plugin.

Creating a Snapshot of a Dynamically Provisioned Volume on the Cluster

1. Verify that the volume was successfully provisioned by checking the PersistentVolume (PV) and PersistentVolumeClaim (PVC) for the volume.

For example, run the describe `kubectl` command to verify the PV and then the PVC.

```
# kubectl describe pv -n test-csi
Name:                mapr-pv-e46a50cd-2012-11e9-84c0-0cc47ab39644
Labels:                <none>
Annotations:          pv.kubernetes.io/provisioned-by: com.mapr.csi-kdf
Finalizers:           [kubernetes.io/pv-protection]
StorageClass:         test-secure-sc
Status:             Bound
Claim:                test-csi/test-secure-pvc
Reclaim Policy:       Delete
Access Modes:         RWO
VolumeMode:           Filesystem
Capacity:             5Gi
Node Affinity:        <none>
Message:
Source:
  Type:                CSI (a Container Storage Interface (CSI) volume

3 Successfully provisioned volume
mapr-pv-e46a50cd-2012-11e9-84c0-0cc47ab39644
Mounted By: test-secure-pod

```

2. Deploy the REST secret .yaml file by running the following command:

```
kubectl apply -f <secret filename>.yaml
```

The Secret file should look similar to the following:

```

# Copyright (c) 2009 & onwards. MapR Tech, Inc., All rights reserved
apiVersion: v1
kind: Secret
metadata:
  name: mapr-snapshot-secrets
  namespace: test-csi
type: Opaque
data:
  MAPR_CLUSTER_USER: cm9vdA==
  MAPR_CLUSTER_PASSWORD: bWFwY2g==

```

For more information, see [Configuring a Secret](#) on page 3371.

3. Create a snapshot class for provisioning a snapshot of the volume. For example, the snapshot class file should look similar to the following:

FUSE

```

apiVersion: snapshot.storage.k8s.io/v1beta1
kind: VolumeSnapshotClass
metadata:
  name: testcsi-snapshotclass
  namespace: test-csi
driver: com.mapr.csi-kdf
deletionPolicy: Delete
parameters:
  restServers: "10.10.102.95:8443"
  cluster: "mycluster"
  csi.storage.k8s.io/snapshotter-secret-name: mapr-snapshot-secrets
  csi.storage.k8s.io/snapshotter-secret-namespace: test-csi

```

Loopback NFS

```

apiVersion: snapshot.storage.k8s.io/v1beta1
kind: VolumeSnapshotClass
metadata:
  name: testcsi-snapshotclass
  namespace: test-csi
driver: com.mapr.csi-nfskdf

```

```

deletionPolicy: Delete
parameters:
  restServers: "10.10.102.95:8443"
  cluster: "mycluster"
  csi.storage.k8s.io/snapshotter-secret-name: mapr-snapshot-secrets
  csi.storage.k8s.io/snapshotter-secret-namespace: test-csi

```

The sample snapshot class file shown above contains the following properties:

| Property | Description |
|--|--|
| apiVersion | The Kubernetes API version for the StorageClass spec. |
| kind | The kind of object being created. This is a StorageClass. |
| metadata: name | The name of the snapshot calss. Administrators should specify the name carefully because it will be used by Pod authors to help select the right snapshot class for their needs. |
| metadata: namespace | The namespace in which the snapshot class runs. |
| driver | The CSI volume plugin to use for provisioning the volume snapshots. For example: <code>com.mapr.csi-kdf</code> . |
| restServers | A space-separated list of webservers. Specify the hostname or IP address and port number of each REST server for the cluster. For fault tolerance, providing multiple REST server hosts is recommended. |
| cluster | The cluster name. |
| csiSnapshotterSecret Name (deprecated) csi.storage.k8s.io/ snapshotter-secret-n ame | The name of the Kubernetes Secret that is used to store administrative credentials (user, password, and ticket information for the webserver). To use the provisioner, you must configure a Secret. See Configuring a Secret on page 3371. |
| csiSnapshotterSecret Namespace (deprecated) csi.storage.k8s.io/ snapshotter-secret-n amespace | The namespace for the Secret containing the administrative credentials (user name and password information for a user that has the privileges to create volumes). This namespace can be different from the namespace used by the Pod, since a Pod author or namespace admin might not be trusted to create administration Secrets for the cluster. |

4. Deploy the snapshot class by running the following command:

```
kubectl apply -f <snapshot class>.yaml
```

5. Verify whether the snapshot class was successfully deployed by running one of the following commands:

```
# kubectl get volumesnapshotclass -n test-csi
NAME                AGE
test-snapshotclass  41s
root@qa102-92:~/csi-kdf-3/csi-kdf/examples/snapshot# kubectl describe
volumesnapshotclass -n test-csi
Name:                test-snapshotclass
Namespace:
Labels:              <none>
Annotations:         kubernetes.io/last-applied-configuration:
                    {"apiVersion":"snapshot.storage.k8s.io/v1alpha1",
                    "kind":"VolumeSnapshotClass",
                    "metadata":{"annotations":{"name":"test-snapshotclass"}},
                    "parameters":{"cluster":"clusterA",
                    "csiSnapshotterSecretName":"mapr-snapshot-secrets",
                    "csiSnapshotterSecretNamespace":"test-csi",
                    "namePrefix":"test-snapshot",
                    "restServers":"10.10.10.210:8443"}},
                    "snapshotter":"com.mapr.csi-kdf"}
API Version:         snapshot.storage.k8s.io/v1alpha1

Parameters:
  Cluster:            clusterA
  Csi Snapshotter Secret Name:  mapr-snapshot-secrets
  Csi Snapshotter Secret Namespace: test-csi
  Name Prefix:        test-snapshot
  Rest Servers:       10.10.10.210:8443
Snapshotter:         com.mapr.csi-kdf
Events:              <none>
```

```
# kubectl get volumesnapshotclass -n test-csi -o yaml
apiVersion: v1
items:
- apiVersion: snapshot.storage.k8s.io/v1alpha1
  kind: VolumeSnapshotClass
  metadata:
    annotations:
      kubernetes.io/last-applied-configuration: |
        {"apiVersion":"snapshot.storage.k8s.io/v1alpha1",
        "kind":"VolumeSnapshotClass",
        "metadata":{"annotations":{"name":"test-snapshotclass"}},
        "parameters":{"cluster":"clusterA",
        "csiSnapshotterSecretName":"mapr-snapshot-secrets",
        "csiSnapshotterSecretNamespace":"test-csi",
        "namePrefix":"test-snapshot",
        "restServers":"10.10.10.210:8443"}},
        "snapshotter":"com.mapr.csi-kdf"}
    creationTimestamp: "2019-01-24T21:13:35Z"
    generation: 1
    name: test-snapshotclass
    resourceVersion: "1039219"
    selfLink: /apis/snapshot.storage.k8s.io/v1alpha1/volumesnapshotclasses/test-snapshotclass
    uid: e94a1fc8-201c-11e9-84c0-0cc47ab39644
  parameters:
    cluster: clusterA
    csiSnapshotterSecretName: mapr-snapshot-secrets
    csiSnapshotterSecretNamespace: test-csi
    namePrefix: test-snapshot
    restServers: 10.10.10.210:8443
    snapshotter: com.mapr.csi-kdf
  kind: List
```

```

metadata:
  resourceVersion: ""
  selfLink: ""

```

- Associate the snapshot class with the PersistentVolumeClaim (for the volume to take a snapshot of) by creating a VolumeSnapshot. For example, the VolumeSnapshot file should look similar to the following:

```

apiVersion: snapshot.storage.k8s.io/v1beta1
kind: VolumeSnapshot
metadata:
  name: testcsi-secure-snapshot
  namespace: test-csi
spec:
  volumeSnapshotClassName: testcsi-snapshotclass
  source:
    persistentVolumeClaimName: testcsi-secure-pvc

```

The sample VolumeSnapshot file shown above contains the following properties:

| Property | Description |
|---------------------|---|
| metadata: name | The VolumeSnapshot name. |
| metadata: namespace | The namespace in which the VolumeSnapshot runs. |
| snapshotClassName | The volumeSnapshotClassName. |
| source: name | The persistentVolumeClaimName. |

- Deploy the VolumeSnapshot by running the following command:

```
kubectl apply -f <volume snapshot>.yaml
```

- Verify whether VolumeSnapshot was successfully deployed by doing the following:

- a) Run one of the following commands to retrieve the VolumeSnapshot:

```
# kubectl get volumesnapshot -n test-csi -o yaml
apiVersion: v1
items:
- apiVersion: snapshot.storage.k8s.io/v1alpha1
  kind: VolumeSnapshot
  metadata:
    annotations:
      kubectl.kubernetes.io/last-applied-configuration: |
        {"apiVersion":"snapshot.storage.k8s.io/
v1alpha1","kind":"VolumeSnapshot","metadata":{"annotations":
{},"name":"test-snapshot","namespace":"test-csi"},"spec":

  Events: <none>

```

9. Log in to the cluster and verify by running the `volume snapshot list` on page 2303 command. For example:

```

# maprcli volume snapshot list -path /csisc/
csisc-securesc-txiqvsdxwu -cluster clusterA -json
{
  "timestamp":1548365090744,
  "timeofday":"2019-01-24 01:24:50.744 GMT-0800 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "ownername":"root",
      "ownertype":"1",
      "volumeid":"234021649",
      "volumename":"csisc-securesc.txiqvsdxwu",
      "volumepath":"/csisc/csisc-securesc-txiqvsdxwu",
      "snapshotid":"256000051",

      "snapshotname":"mapr-snapshot-4c5293bc-201d-11e9-84c0-0cc47ab39644",
      "creationtime":"Thu Jan 24 13:16:22 PST 2019",
      "cumulativeReclaimSizeMB":"0",
      "ownedsize":"0",
      "sharedSize":"0",
      "volumeSnapshotAces":{
        "readAce":"p",
        "writeAce":"p"
      }
    }
  ]
}

```

Creating Multiple Snapshots of a Dynamically Provisioned Volume

1. Perform steps 1 - 5 described in the [Creating a Snapshot of a Dynamically Provisioned Volume on the Cluster](#) on page 3339 section.

2. Create a VolumeSnapshot similar to the one shown in step 6 of the [Creating a Snapshot of a Dynamically Provisioned Volume on the Cluster](#) on page 3339 section for each additional snapshot to create for the volume.

For example:

```
apiVersion: snapshot.storage.k8s.io/v1alpha1
kind: VolumeSnapshot
metadata:
  name: test-snapshot1
  namespace: test-csi
spec:
  snapshotClassName: test-snapshotclass
  source:
    name: test-secure-pvc
    kind: PersistentVolumeClaim
```

3. Repeat step 7 in [Creating a Snapshot of a Dynamically Provisioned Volume on the Cluster](#) on page 3339 for each additional volume snapshots you have created.

4. Log in to the cluster and verify by running the `volume snapshot list` on page 2303 command. For example:

```
# maprcli volume snapshot list -path /csisc/
csisc-securesc-txiqvsdxwu -cluster clusterA -json
{
  "timestamp":1548365359138,
  "timeofday":"2019-01-24 01:29:19.138 GMT-0800 PM",
  "status":"OK",
  "total":2,
  "data":[
    {
      "ownername":"root",
      "ownertype":"l",
      "volumeid":"234021649",
      "volumename":"csisc-securesc.txiqvsdxwu",
      "volumepath":"/csisc/csisc-securesc-txiqvsdxwu",
      "snapshotid":"256000051",

"snapshotname":"mapr-snapshot-4c5293bc-201d-11e9-84c0-0cc47ab39644",
      "creationtime":"Thu Jan 24 13:16:22 PST 2019",
      "cumulativeReclaimSizeMB":"0",
      "ownedsize":"0",
      "sharedSize":"0",
      "volumeSnapshotAces":{
        "readAce":"p",
        "writeAce":"p"
      }
    },
    {
      "ownername":"root",
      "ownertype":"l",
      "volumeid":"234021649",
      "volumename":"csisc-securesc.txiqvsdxwu",
      "volumepath":"/csisc/csisc-securesc-txiqvsdxwu",
      "snapshotid":"256000052",

"snapshotname":"mapr-snapshot-19282d27-201f-11e9-84c0-0cc47ab39644",
      "creationtime":"Thu Jan 24 13:29:15 PST 2019",
      "cumulativeReclaimSizeMB":"0",
      "ownedsize":"0",
      "sharedSize":"0",
      "volumeSnapshotAces":{
        "readAce":"p",
        "writeAce":"p"
      }
    }
  ]
}
```

Deleting a Snapshot of a Dynamically Provisioned Volume

You can delete snapshots you created using Container Storage Interface (CSI) Storage Plugin. To delete:

1. Run the following command:

```
kubectl delete -f <volume snapshot>.yaml
```

For example:

```
# kubectl delete -f test-snapshot1.yaml
volumesnapshot.snapshot.storage.k8s.io "test-snapshot1" deleted
```

2. Log in to the cluster and verify that the snapshot was deleted by running the [volume snapshot list](#) on page 2303 command.

For example:

```
# maprcli volume snapshot list -path /csisc/
csisc-secure-sc-txiqvdxwu -cluster clusterA -json
{
  "timestamp":1548365417772,
  "timeofday":"2019-01-24 01:30:17.772 GMT-0800 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "ownername":"root",
      "ownertype":"1",
      "volumeid":"234021649",
      "volumename":"csisc-secure-sc-txiqvdxwu",
      "volumepath":"/csisc/csisc-secure-sc-txiqvdxwu",
      "snapshotid":"256000051",

      "snapshotname":"mapr-snapshot-4c5293bc-201d-11e9-84c0-0cc47ab39644",
      "creationtime":"Thu Jan 24 13:16:22 PST 2019",
      "cumulativeReclaimSizeMB":"0",
      "ownedsize":"0",
      "sharedSize":"0",
      "volumeSnapshotAces":{
        "readAce":"p",
        "writeAce":"p"
      }
    }
  ]
}
```

Creating a Volume from a Snapshot

You can restore a volume from a volume snapshot by configuring a PersistentVolumeClaim that specifies the volume snapshot as the data source.

In the following example, the snapshot named `testcsi-secure-snapshot` serves as the data source for creating a new volume named `testcsi-secure-pvc-restore`:

```
kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: testcsi-secure-pvc-restore
  namespace: test-csi
spec:
  storageClassName: testcsi-secure-sc
  accessModes:
```

```

- ReadWriteOnce
resources:
  requests:
    storage: 10G
dataSource:
  kind: VolumeSnapshot
  apiGroup: snapshot.storage.k8s.io
  name: testcsi-secure-snapshot
    
```

When creating a volume from snapshots of extra large volumes (volumes measuring hundreds of GB), you might experience timeouts or a failure to create the volume. To prevent timeouts with extra large volumes, increase the retry timeout setting of the `csi-snapshotter` sidecar container. See the `--timeout` argument in the latest `csi-maprkd-<version>.yaml`.

For more information, see [Persistent Volumes](#).

Enabling the Platinum POSIX Client for Container Storage Interface (CSI) Storage Plugin

When you install the Container Storage Interface (CSI) Storage Plugin, the Container FUSE-based POSIX client package is installed on the CSI Driver container. The CSI Driver also supports the use of the Basic, Container, and Platinum FUSE-based POSIX client. For a comparison of the POSIX client packages, see [Preparing for Installation \(HPE Ezmeral Data Fabric POSIX Client\)](#) on page 354.

 **Note:** Enabling the Platinum POSIX client is not required for the Loopback NFS plug-in.

To install the Platinum POSIX client, include the `platinum` parameter in your pod spec. For example:

```

volumeAttributes:
  volumePath: "/"
  cluster: "clusterA"
  cldbHosts: "10.10.102.96"
  securityType: "secure"
  platinum: "true"
    
```

Release 1.0.2 and later support another method for specifying the POSIX client. You can use the `license` parameter and specify the Container, Basic, or Platinum driver. For example:

```

volumeAttributes:
  volumePath: "/"
  cluster: "clusterA"
  cldbHosts: "10.10.102.96"
  securityType: "secure"
  license: "platinum"
    
```

For more information, see [Example: Mounting a PersistentVolume for Static Provisioning](#) on page 3317.

Logging for the CSI Driver and Provisioner

Describes the event logs for the CSI driver and provisioner for both FUSE and Loopback NFS plugins.

Logs for the Container Storage Interface (CSI) Storage Plugin can be found in `/var/log/csi-maprkd/`. The following table shows the new log-file format. Before the FUSE 1.2.2 and Loopback NFS 1.0.2 drivers were introduced, the log files included a version in the file name.

| Log File Type | FUSE or Loopback NFS | Log File | Description | Which Nodes |
|-------------------|----------------------|--------------------------------|--|-----------------------|
| Driver events log | FUSE | <code>csi-plugin.log</code> | Captures CSI Driver events such as registering the driver and CSI Driver logs for node mount and unmount operations. | All Kubernetes nodes. |
| | Loopback NFS | <code>csi-nfsplugin.log</code> | | |

| Log File Type | FUSE or Loopback NFS | Log File | Description | Which Nodes |
|------------------------|----------------------|------------------------|---|---|
| Provisioner events log | FUSE | csi-provisioner.log | Captures provisioner events such as registering the CSI provisioner and CSI Controller events such as Create/Delete volumes, Create/Delete Snapshots etc. | The Kubernetes node where the provisioner StatefulSet pod is running. |
| | Loopback NFS | csi-nfsprovisioner.log | | |

Note: The directory must grant `rw` permissions for creating the logs and must grant write/append permissions to the plug-in and provisioner.

Troubleshooting the Container Storage Interface (CSI) Storage Plugin

This section describes how to resolve common problems you might encounter when installing and using the Container Storage Interface (CSI) Storage Plugin.

Troubleshooting CSI Driver installation

Run the following commands to get the pods that are deployed for the CSI plugin and provisioner:

FUSE

```
kubectl get pods -n mapr-csi
```

Loopback NFS

```
kubectl get pods -n mapr-nfscsi
```

The installation is considered successful if the `get pods` command shows the pods in the `Running` state. For example, your output should look similar to the following when CSI plugin is deployed on three worker nodes:

FUSE

```
mapr-csi          csi-controller-kdf-0          5/5      Running      0
4h25m
mapr-csi          csi-nodeplugin-kdf-2kfrf      3/3      Running      0
4h25m
mapr-csi          csi-nodeplugin-kdf-lq5nw      3/3      Running      0
4h25m
mapr-csi          csi-nodeplugin-kdf-pkrzt      3/3      Running      0
4h25m
```

Loopback NFS

```
csi-controller-nfskdf-0          7/7      Running      0          22h
csi-nodeplugin-nfskdf-5rjt2      3/3      Running      0          18h
csi-nodeplugin-nfskdf-7d9cs      3/3      Running      0          22h
csi-nodeplugin-nfskdf-qw7kg      3/3      Running      0          22h
```

The preceding output shows the following:

FUSE

- `csi-nodeplugin-kdf-*`: Daemonset pods deployed on all the Kubernetes worker nodes
- `csi-controller-kdf-0`: StatefulSet pod deployed on a single Kubernetes worker node

Loopback NFS

- `csi-nodeplugin-nfskdf-*`: Daemonset pods deployed on all the Kubernetes worker nodes
- `csi-controller-nfskdf-0`: StatefulSet pod deployed on a single Kubernetes worker node

Troubleshoot CSI Plugin Deployment Failures

If the pods show a failure in the deployment, run the following kubectl command to see the container logs:

FUSE

```
kubectl logs <csi-nodeplugin-*> -n mapr-csi -c <nodeplugin-pod-container>
```

Loopback NFS

```
kubectl logs <csi-nodeplugin-*> -n mapr-nfscsi -c <nodeplugin-pod-container>
```

If the pods show a failure in the deployment, run the following kubectl commands to see the container logs:

FUSE

```
kubectl logs <csi-nodeplugin-*> -n mapr-csi -c <nodeplugin-pod-container>
```

Loopback NFS

```
kubectl logs csi-controller-nfskdf-0 -n mapr-nfscsi -c  
<controller-pod-container>
```

Here, replace `<nodeplugin-pod-container>` with the container that is failing. You can also run the following kubectl command to see the controller logs:

```
kubectl logs csi-controller-kdf-0 -n mapr-csi -c <controller-pod-container>
```

Here, replace `<controller-pod-container>` with the container which is failing.

Troubleshooting Volume Provisioning

Check the provisioner log and check for any provisioner errors:

FUSE

```
tail -100f /var/log/csi-maprkdf/csi-provisioner.log
```

Loopback NFS

```
tail -100f /var/log/csi-maprkdf/csi-nfsprovisioner.log
```

Troubleshooting Mount Operation

Check the CSI Storage plug-in log for any mount/unmount errors:

FUSE

```
tail -100f /var/log/csi-maprkdf/csi-plugin.log
```

Loopback NFS

```
tail -100f /var/log/csi-maprkdf/csi-nfsplugin.log
```

If you don't see any errors, see the kubelet logs on the node where the pod is scheduled to run. Check the MapR CSI Storage plugin logs for specific errors.

Troubleshooting CSI Storage Plugin Discovery with kubelet

Check the kubelet path for kubernetes deployment from the kubelet process running with `--root-dir`. The `--root-dir` is a string that contains the directory path for managing kubelet files (such as volume mounts, etc.,) and defaults to `/var/lib/kubelet`. If the Kubernetes environment has a different kubelet path, modify the CSI driver deployment `.yaml` file with the new path, and redeploy the CSI Storage Plugin again.

Troubleshooting Snapshot Provisioning

See the provisioner log and check for any provisioner errors:

```
tail -100f /var/log/csi-maprkdf/csi-provisioner.log
```

If there are no errors, run the following kubectl command to check the snapshot:

```
kubectl describe volumesnapshot.snapshot.storage.k8s.io <snapshot-name> -n <namespace-name>
```

Here:

- `<snapshot-name>`: Name of the VolumeSnapshot Object defined in yaml
- `<namespace-name>`: Namespace where the VolumeSnapshot object is created

Troubleshooting No Space on Disk Error

The devicemapper storage driver used for Docker allows only 10 GB by default resulting in "no space left on device" errors when writing to new directories for a new volume mount request. If `--maxvolumespernode` is configured to be greater than 20 and underlying docker is using devicemapper storagedriver, do the following to increase the storage size:

1. Change storagedriver to be other than devicemapper, which restricts container storage to 10 GB by default.
2. Increase default container storage to more than the default of 10 GB for devicemapper storagedriver for the Docker container running on Kubernetes worker node.

For example, do the following to increase the storage size to 50 GB:

1. In `/etc/sysconfig/docker-storage` file, add `--storage-opt dm.basesize=50G` under `DOCKER_STORAGE_OPTIONS` section.
2. Restart Docker.
3. Confirm that the setting is correctly applied by running the following command:

```
docker info | grep "Base Device Size"
```

Kubernetes FlexVolume Driver Configuration

This section describes how to use and troubleshoot the HPE Ezmeral Data Fabric for Kubernetes FlexVolume Driver.

For more information about the HPE Ezmeral Data Fabric for Kubernetes, see [Kubernetes Interfaces for Data Fabric FlexVolume Driver Overview](#) on page 633.

Using the MapR Data Fabric for Kubernetes FlexVolume Driver

This section describes how to configure Kubernetes objects to enable persistent storage and includes example configuration files for static and dynamic provisioning.

Before You Begin

Before configuration, be sure to review the following notes about supported and unsupported features and parameters:

MapR Parameters for Dynamic Provisioning

In dynamic provisioning, you can specify MapR parameters for the MapR volume to be created. For a list of the MapR parameters that you can use, see [volume create](#) on page 2190. Note these considerations for using the MapR parameters:

- Volume attributes must be represented as a string (enclosed within quotations). Using an integer or boolean is not supported. In the following example, the `aetype` attribute will generate an error because the value (`1`) is not enclosed in quotations.

```
namePrefix: "pv"
mountPrefix: "/pv"
type: "rw"
advisoryquota: "100M"
aetype: 1
```

- The following MapR parameters are ignored because they are redundant or not supported in the Kubernetes implementation:

- `mount`
- `quota*`
- `createparent`
- `path`
- `name`

*Specifying `resources: requests: storage` in a PersistentVolumeClaim (PVC) (see [Example: Mounting a PersistentVolume for Static Provisioning Using the FlexVolume Driver](#) on page 3359) makes it unnecessary to set the MapR `quota` parameter.

Kubernetes Access Modes

Kubernetes access modes control how a PersistentVolume (PV) is mounted on the host. [Access modes](#) can be specified on both PVs and PVCs. Only Volumes with a matching Access Mode will be bound to a PVC. Unfortunately, beyond the PVC/PV binding behavior, PVs using FlexVolume drivers ignore these access modes in the current version of Kubernetes. All access modes will work with the MapR Data Fabric for Kubernetes. However, they will appear the same. This means the ROX mode will not make the volume read only. If you want read-only behavior, specify `readOnly:` in the FlexVolume driver flags.

PersistentVolumeClaim Protection

PVC protection is a Kubernetes 1.9 alpha feature that restricts the user from deleting a PVC while it is being used by an active Pod. Alpha features are not tested for use with the volume plug-in and provisioner. However, without PVC protection, you should not delete a PVC that is still attached to Pods. If you have not turned on PVC protection, ensure that you do not delete PVC's that are in use. In the current release of the MapR Data Fabric for Kubernetes, deleting a PVC causes undefined behavior.

Reclaim Policy

The Kubernetes `reclaimPolicy` parameter controls what happens to a PersistentVolume if the corresponding PersistentVolumeClaim is deleted. The `Recycle` Reclaim Policy is not supported by Kubernetes FlexVolume Drivers, so it cannot be used with KDF. The Retain Policy is currently broken in Kubernetes 1.9 StoragePolicies but not in static PersistentVolumes. The MapR Data Fabric for Kubernetes has a workaround that allows Retain policy on dynamically provisioned volumes by passing the `reclaimPolicy` in the parameters rather than in the standard place that FlexVolumes ignore. You can specify the reclaim policy normally when you configure a persistent volume.

The following table shows the supported values for the reclaim policy:

| Reclaim Policy Value | Description | Support |
|------------------------|---|---|
| Delete (default value) | The PersistentVolume and the MapR volume are deleted when the user deletes the corresponding PersistentVolumeClaim. | Supported |
| Retain | The PersistentVolume and the MapR volume are not deleted when the user deletes the corresponding PersistentVolumeClaim. | Supported* |
| Recycle | Performs a basic scrub on a PersistentVolume and makes it available for a new PersistentVolumeClaim. | Not Supported by Kubernetes Flexvolumes |

*Not supported for dynamic provision without a workaround.

For more information about the reclaim policy, see [Change the Reclaim Policy of a PersistentVolume](#).

Kubernetes Mount Options

The Kubernetes `mountOptions` parameter is not supported for use with the MapR Data Fabric for Kubernetes because it is not supported for use with the FlexVolume plug-in.

Steps for Configuring the MapR Data Fabric for Kubernetes FlexVolume Driver

This page summarizes the high-level steps for configuring the MapR Data Fabric for Kubernetes FlexVolume Driver to provide static or dynamic provisioning. To learn more about static and dynamic provisioning, see [Static and Dynamic Provisioning Using FlexVolume Driver](#) on page 635.

Static Provisioning

1. Install the MapR Data Fabric for Kubernetes.
 - See [Installing the MapR Data Fabric for Kubernetes FlexVolume Driver](#) on page 228.
2. In your Pod spec or as part of a separate configuration file, configure a PersistentVolume.
 - See [Example: Mounting a PersistentVolume for Static Provisioning Using the FlexVolume Driver](#) on page 3359 and [Persistent Volumes](#).
3. Do *one* of the following:
 - Annotate the Pod spec to provide information about the MapR volume.
 - See [Example: Statically Provisioning a MapR Volume Using the FlexVolume Plug-in](#) on page 3357.
 - In your Pod spec or as part of a separate configuration file, configure a PersistentVolumeClaim.
 - See [PersistentVolumeClaims](#).
4. Run the Pod spec by using `kubectl` commands. See [Overview of kubectl](#).

Dynamic Provisioning

1. Install the MapR Data Fabric for Kubernetes.
See [Installing the MapR Data Fabric for Kubernetes FlexVolume Driver](#) on page 228.
2. In your Pod spec or in a separate configuration file, create a storage class.
See [Example: Mounting a PersistentVolume for Dynamic Provisioning Using the FlexVolume Driver](#) on page 3363 and [Storage Classes](#).
3. In your Pod spec or in a separate configuration file, configure a PersistentVolumeClaim.
See [Example: Mounting a PersistentVolume for Dynamic Provisioning Using the FlexVolume Driver](#) on page 3363.
4. Run the Pod spec by using `kubectl` commands. See [Overview of kubectl](#).

Example: Statically Provisioning a MapR Volume Using the FlexVolume Plug-in

You can designate a MapR volume for use with Kubernetes by specifying the MapR FlexVolume parameters directly inside the Pod spec. In the Pod spec, you define a Kubernetes volume and add the MapR FlexVolume information to it. You can supply path information by using the `volumePath` parameter. The Kubernetes volume is only as persistent as the Pod. By defining the volume this way, when the Pod is removed, the Kubernetes volume is also immediately unmounted and removed. This approach to static provisioning is most appropriate when you want to get up and running quickly or when you want the Pod and Kubernetes volume lifecycle to be the same.

For example, a developer wants to get her application container up and running quickly with MapR. She already has a MapR path that she wants to use for the application. She only needs the data accessible to read. To make this work, she must:

1. Generate a MapR service ticket, and set the `securityType` parameter in the Pod spec to `secure`. See [Generating a Service Ticket](#) on page 1545.
2. Configure a Ticket Secret, and include the base64-encoded contents of the ticket file in the Ticket Secret. See [Configuring a Secret](#) on page 3371.
3. Set the `runAsUser` and the `fsGroup` parameters to the UID and GID of the user that created the ticket.
4. Point the `volumePath` in the `flexVolume` setting to the desired path, and fill in the `cldbHosts` and `cluster` information.

Note: The following example works for on-premise deployments. For GKE and AWS deployments, you must set a default StorageClass to the `maprfs` StorageClass. If a default StorageClass is not provided for GKE and AWS deployments, the volume is created using your default StorageClass, which might not be a good fit. For information about changing the default StorageClass, see [Change the default StorageClass](#).

```
apiVersion: v1
kind: Pod
metadata:
  name: test-secure
  namespace: mapr-examples

      ticketSecretNamespace: "mapr-examples"
---
apiVersion: v1
kind: Secret
metadata:
  name: mapr-ticket-secret
  namespace: mapr-examples
type: Opaque
data:
  CONTAINER_TICKET: <BASE64 ENCODED VERSION OF CONTENTS OF TICKET FILE>

```

The following tables describe the parameters in the example:

Pod

| Parameter | Notes |
|----------------------------|---|
| apiVersion | The Kubernetes API version for the Pod spec. |
| kind | The kind of object being created. For clarity, the example uses a naked Pod. Generally, it is better to use a Deployment, DaemonSet, or StatefulSet for high availability (HA) and ease of upgrade. |
| metadata: name | The Pod name. |
| metadata: namespace | The namespace in which the Pod runs. |
| securityContext: runAsUser | The user ID to run the container under. This user ID must be the same as the user ID for which the ticket was generated. |
| securityContext: fsGroup | The group ID to run the container under. This group ID must be the same as the group ID of the user for which the ticket was generated. |
| volumeMounts: mountPath | A directory inside the container that is designated as the mount path. |
| volumeMounts: name | A name that you assign to the Kubernetes volumeMounts resource. Matches with Volumes: name. |

| | |
|------------------------------------|---|
| <code>volumes: name</code> | A string to identify the name of the Kubernetes <code>volumes</code> resource. Matches with <code>volumeMounts: name</code> . |
| <code>flexVolume: driver</code> | The MapR FlexVolume driver being used. Call it using this driver: <code>mapr.com/maprfs</code> . |
| <code>flexVolume: readOnly</code> | Specifies that the FlexVolume driver should tell the MapR POSIX Client to mount the volume with the read-only flag. |
| <code>volumePath</code> | The mount point within the MapR filesystem. This parameter specifies an existing MapR path. For example, you can specify the root volume as <code>"/</code> ", providing access to the entire filesystem. |
| <code>cluster</code> | The MapR cluster name. |
| <code>cldbHosts</code> | The DNS names or IP addresses of the CLDB hosts for the MapR cluster. You must provide at least one CLDB host. For fault-tolerance, providing multiple CLDB hosts is recommended. To specify multiple hosts, separate each name or IP address by a space. |
| <code>securityType</code> | A parameter that indicates whether MapR tickets are used or not used. If MapR tickets are used, specify <code>secure</code> . Otherwise, specify <code>unsecure</code> . |
| <code>ticketSecretName</code> | The name of the Secret that contains the ticket to use when mounting to the MapR cluster. See Configuring a Secret on page 3371. |
| <code>ticketSecretNamespace</code> | The namespace that contains the Secret. See Configuring a Secret on page 3371 |

Secret

| Parameter | Notes |
|-------------------------------|---|
| <code>apiVersion</code> | The Kubernetes API version. |
| <code>kind</code> | The type of object being created. |
| <code>name</code> | A string to identify the Secret. |
| <code>namespace</code> | The namespace in which the Secret runs. |
| <code>type</code> | The type of Secret being created. For type <code>Opaque</code> , clients must treat these values as opaque and pass them unmodified back to the server. |
| <code>CONTAINER_TICKET</code> | The contents of the MapR ticket encoded in base64. If you specified <code>secure</code> for the <code>securityType</code> , you must provide the ticket. To encode the ticket, see Converting a String to Base64 on page 3373. You may remove the ticket if the MapR cluster is not secure. |

Example: Mounting a PersistentVolume for Static Provisioning Using the FlexVolume Driver

For static provisioning, configuring a PersistentVolume has some advantages over annotating Kubernetes volume information in a Pod spec:

- The configuration file can be shared for use by multiple Pod specs.
- The configuration file enables the PersistentVolume to be mounted and available even when the Pod spec that references it is removed.

For example: A marketing volume exists in the MapR filesystem under the path `/Departments/Marketing`. An administrator wants to statically provision this volume and make it available to multiple users. It is critical that data access is as fast as possible. To make this work, the administrator must:

1. Create a PersistentVolume (PV).
2. Set the `AccessMode` of the PV to `ReadWriteOnce`.
3. Create a PersistentVolumeClaim (PVC) spec.
4. Set the `AccessMode` of the PVC to `ReadWriteOnce`.
5. Create the Pod spec.
6. Generate a MapR service ticket, and set the `flexVolume securityType` parameter to `secure`. For information about generating a service ticket, see [Generating a Service Ticket](#) on page 1545.
7. Configure a Ticket Secret, and include the base64-encoded contents of the ticket file in the Ticket Secret. See [Configuring a Secret](#) on page 3371.
8. Set the `runAsUser` and the `fsGroup` parameters to the UID and GID of the user that created the ticket.
9. Set the `platinum` parameter in the Pod spec to `platinum: "true"`. See [Enabling the Platinum Posix Client for Kubernetes Interfaces for Data Fabric FlexVolume Driver](#) on page 3370.
10. Point the `volumePath` in the `flexVolume` setting to the desired MapR path.
11. Fill in the `cldbHosts` and `cluster` information.

```

```

PersistentVolume (PV)

| Parameter | Notes |
|-------------|--|
| Capacity | Specifies how big the allocated storage should be. This value is not validated against the MapR quota or advisory quota. It is up to the person creating the PV to specify this value accurately. |
| accessModes | How the PersistentVolume is mounted on the host. All modes work the same. The example uses ReadWriteOnce. Note that ReadOnlyMany does not mount read-only. (To implement a read-only mount, use the Flexvolume flag for readOnly, as shown in Example: Statically Provisioning a MapR Volume Using the FlexVolume Plug-in on page 3357.) It's important that the PV and PVC modes are the same so that they can bind. For more information, see Access Modes . |

| | |
|--|--|
| <code>persistentVolumeReclaimPolicy</code> | Specifies what happens to the volume when it is released by its claim. The <code>Retain</code> value keeps the PVC around for manual cleanup. <code>Delete</code> deletes the PV from Kubernetes.  Note: If this volume was created using dynamic provisioning, <code>Delete</code> causes the underlying volume to be deleted. <code>Recycle</code> is not supported by Kubernetes FlexVolumes. For more information, see Reclaiming . |
| <code>claimRef</code> | Specifies a default PVC to bind to. If unspecified, the PV selected for a PVC is randomly allocated based on the access mode and provides at least as much storage capacity as requested by the PVC. |
| <code>flexVolume: driver</code> | The MapR FlexVolume driver being used. Call it by specifying <code>driver: mapr.com/maprfs</code> . |
| <code>platinum</code> | If set to <code>platinum: "true"</code> , the POSIX client uses the platinum driver for better performance. Note that the platinum driver consumes more host resources and MapR Platinum licenses. |
| <code>cluster</code> | The MapR cluster name. |
| <code>cldbHosts</code> | The hostname or IP addresses of the CLDB hosts for the MapR cluster. You must provide at least one CLDB host. For fault-tolerance, providing multiple CLDB hosts is recommended. To specify multiple hosts, separate each name or IP address by a space. |
| <code>volumePath</code> | The mount point within the MapR filesystem. This parameter specifies an existing MapR path. For example, you can specify the root volume as <code>"/</code> , providing access to the entire filesystem. |
| <code>securityType</code> | A parameter that indicates whether MapR tickets are used or not used. If MapR tickets are used, specify <code>secure</code> . Otherwise, specify <code>unsecure</code> . |
| <code>ticketSecretName</code> | The name of the Ticket Secret that contains the ticket to use when mounting to the MapR cluster. See Configuring a Secret on page 3371. |
| <code>ticketSecretNamespace</code> | The namespace that contains the Ticket Secret. Use the same namespace as the namespace used by the Pod. |

Pod

| Parameter | Notes |
|--------------------------------------|---|
| <code>apiVersion</code> | The Kubernetes API version for the Pod spec. |
| <code>kind</code> | The kind of object being created. The example uses a naked Pod for clarity. Generally, it is better to use a Deployment, DaemonSet, or StatefulSet for high availability and ease of upgrade. |
| <code>metadata: name</code> | The Pod name. |
| <code>metadata: namespace</code> | The namespace in which the Pod runs. |
| <code>volumeMounts: mountPath</code> | A directory inside the container that is designated as the mount path. |

| | |
|--------------------|--|
| volumeMounts: name | A name that you assign to the Kubernetes <code>volumeMounts</code> resource. This value should match <code>Volumes: name</code> . |
| Volumes: name | A string to identify the name of the Kubernetes <code>volumes</code> resource. This value should match <code>volumeMounts: name</code> . |

PersistentVolumeClaim (PVC)

| Parameter | Notes |
|------------|---|
| AccessMode | How the requested PersistentVolume is mounted on the host. All modes work the same. The example uses <code>ReadWriteOnce</code> . Note that <code>ReadOnlyMany</code> does not mount read-only. (To implement a read-only mount, use the Flexvolume flag for <code>readOnly</code> , as shown in Example: Statically Provisioning a MapR Volume Using the FlexVolume Plug-in on page 3357.) It's important that the PV and PVC modes are the same so that they can bind. For more information, see Access Modes . |

Secret

| Parameter | Notes |
|---------------------|---|
| metadata: name | The name of the Ticket Secret. See Configuring a Secret on page 3371 |
| metadata: namespace | The namespace in which the Ticket Secret runs. |
| CONTAINER_TICKET | The contents of the MapR ticket encoded in base64. If you specified <code>secure</code> for the <code>securityType</code> , you must provide the ticket. To encode the ticket, see Converting a String to Base64 on page 3373. You may remove the ticket if the MapR cluster is not secure. |

Example: Mounting a PersistentVolume for Dynamic Provisioning Using the FlexVolume Driver

This example also uses a PersistentVolume. However, unlike the previous example, when you use the MapR dynamic provisioner, you do not need to create a PersistentVolume manually. The PersistentVolume is created automatically based on the parameters specified in the referenced StorageClass.

Dynamic provisioning is useful in cases where you do not want MapR and Kubernetes administrators to create storage manually to store the Pod storage state.

The following example uses a PersistentVolumeClaim that references a Storage Class. In this example, a Kubernetes Administrator has created a storage class called `secure-maprfs` for Pod creators to use when they want to create persistent storage for their Pods. In this example, it is important for the created Pod storage to survive the deletion of a Pod.

```
apiVersion: storage.k8s.io/v1
kind: StorageClass
metadata:
  name: secure-maprfs
  namespace: mapr-examples
provisioner: mapr.com/maprfs
parameters:
  restServers: "rest1:8443"
  cldbHosts: "cldb1 cldb2 cldb3"
  cluster: "mysecurecluster"
  securityType: "secure"
  ticketSecretName: "mapr-ticket-secret"
```

```

    ticketSecretNamespace: "mapr-examples"
    maprSecretName: "mapr-provisioner-secrets"
    maprSecretNamespace: "mapr-examples"
    namePrefix: "pv"
    mountPrefix: "/pv"
    readOnly: "true"
    reclaimPolicy: "Retain"
    advisoryquota: "100M"
    readonly: "1"

---

kind: Pod

```

The following tables describe the parameters in the example:

StorageClass

| Parameter | Notes |
|-----------------------|--|
| apiVersion | The Kubernetes APi version for the StorageClass spec. |
| kind | The kind of object being created. This is a StorageClass. |
| metadata: name | The name of the StorageClass. Administrators should specify the name carefully because it will be used by Pod authors to help select the right StorageClass for their needs. |
| metadata: namespace | The namespace in which the StorageClass runs. This namespace can be different from the namespace used by the PVC and Pod, since the StorageClass namespace can be a cross-namespace resource. |
| provisioner | The provisioner being used. for the MapR provisioner, specify <code>mapr.com/maprfs</code> . |
| restServers | A space-separated list of MapR webservers. Specify the hostname or IP address and port number of each REST server for the MapR cluster. For fault tolerance, providing multiple REST server hosts is recommended. |
| cldbHosts | The hostname or IP addresses of the CLDB hosts for the MapR cluster. You must provide at least one CLDB host. For fault-tolerance, providing multiple CLDB hosts is recommended. To specify multiple hosts, separate each name or IP address by a space. |
| cluster | The MapR cluster name. |
| securityType | A parameter that indicates whether MapR tickets are used or not used. If MapR tickets are used, specify <code>secure</code> . Otherwise, specify <code>unsecure</code> . |
| ticketSecretName | The name of the Secret that contains the ticket to use when mounting to the MapR cluster. See Configuring a Secret on page 3371. |
| ticketSecretNamespace | The namespace that contains the Secret. Use the same namespace as the namespace used by the Pod. |
| maprSecretName | The name of the Kubernetes Secret that is used to store MapR administrative credentials (user, password, and ticket information for the MapR webserver). To use the provisioner, you must configure a Secret. See Configuring a Secret on page 3371. |
| maprSecretNamespace | The namespace for the Secret containing the MapR administrative credentials (user name and password information for a MapR user that has the privileges to create MapR volumes). This namespace can be different from the namespace used by the Pod, since a |

| Parameter | Notes |
|----------------------------|---|
| | Pod author or namespace admin might not be trusted to create administration Secrets for the MapR cluster. |
| <code>namePrefix</code> | A prefix for the MapR volume to be created. For example, if you specify <code>PV</code> as the <code>namePrefix</code> , the first dynamically created volume might be named <code>PV.bevefseser</code> . The provisioner generates random names using lower-case letters. If you do not specify a prefix, the provisioner uses <code>maprprovisioner</code> as a prefix. |
| <code>mountPrefix</code> | The parent path of the mount in MapR filesystem. If you do not specify a mount prefix, the provisioner mounts your volume under the MapR root. |
| <code>readOnly</code> | This parameter specifies that the POSIX driver should mount the MapR path as read only. This is different from the <code>readOnly</code> parameter for volume creation that creates the volume as read only. |
| <code>reclaimPolicy</code> | Kubernetes does not currently support passing a non-delete reclaim policy to the StorageClass. This parameter allows you to specify <code>Retain</code> . This ensures that provisioned volumes are not automatically deleted when their calling Pods are deleted. If you specify <code>Retain</code> , you must clean up your provisioned volumes manually. |
| <code>advisoryquota</code> | The advisory storage quota for the MapR volume. <code>advisoryquota</code> is one of the MapR parameters that you can specify for dynamic provisioning. For more information, see Before You Begin on page 3355. |
| <code>readOnly</code> | When the value is 1, this parameter specifies that the MapR volume should be created as read-only. This is different from the <code>readOnly</code> parameter that mounts the MapR path as read only. |

Pod

| Parameter | Notes |
|--------------------------------------|---|
| <code>apiVersion</code> | The Kubernetes API version for the Pod spec. |
| <code>kind</code> | The kind of object being created. For clarity, this example uses a naked Pod. Generally, it is better to use a Deployment, DaemonSet, or StatefulSet for high availability and ease of upgrade. |
| <code>metadata: name</code> | The Pod name. |
| <code>metadata: namespace</code> | The namespace in which the Pod runs. It should be the same namespace in which the PVC runs. |
| <code>volumeMounts: mountPath</code> | A directory inside the container that is designated as the mount path. |
| <code>volumeMounts: name</code> | A name that you assign to the Kubernetes <code>volumeMounts</code> resource. The value should match <code>Volumes: name</code> . |
| <code>Volumes: name</code> | A string to identify the name of the Kubernetes <code>volumes</code> resource. The value should match <code>volumeMounts: name</code> . |

| Parameter | Notes |
|---|---|
| <code>persistentVolumeClaim: claimName</code> | The name of the PersistentVolumeClaim (PVC). For more information, see PersistentVolumeClaims . |

PVC

| Parameter | Notes |
|----------------------------------|---|
| <code>apiVersion</code> | The Kubernetes API version for the Pod spec. |
| <code>kind</code> | The kind of object being created. This is a PersistentVolumeClaim (PVC). |
| <code>metadata: name</code> | The PVC name. |
| <code>metadata: namespace</code> | The namespace in which the PVC runs. This should be the same namespace used by the Pod. |
| <code>accessModes</code> | How the PersistentVolume is mounted on the host. (This is a limitation of the FlexVolume driver.) For more information, see Access Modes . |
| <code>storageClassName</code> | The name of the storage class requested by the PersistentVolumeClaim. For more information, see Dynamic Provisioning and Storage Classes . |
| <code>requests: storage</code> | The storage resources being requested, or that were requested and have been allocated. The Pod author can use this parameter to tell MapR how much quota is needed for the MapR volume. For the units, see Resource Model . |

Provisioner Secret

In the `mapr-provisioner-secrets` Secret:

| Parameter | Notes |
|------------------------------------|---|
| <code>MAPR_CLUSTER_USER</code> | This is the base64-encoded user ID used to log in to the MapR REST server and create or delete volumes. See Converting a String to Base64 on page 3373. For more information about Secrets, see Secrets . |
| <code>MAPR_CLUSTER_PASSWORD</code> | This is the base64-encoded password for the <code>MAPR_CLUSTER_USER</code> . See Converting a String to Base64 on page 3373. For more information about Secrets, see Secrets . |

Ticket Secret

In the `mapr-ticket-secret` Secret:

| Parameter | Notes |
|-------------------------------|---|
| <code>CONTAINER_TICKET</code> | The contents of the MapR ticket encoded in base64. If you specified <code>secure</code> for the <code>securityType</code> , you must provide the ticket. To encode the ticket, see Converting a String to Base64 on page 3373. You may remove the ticket if the MapR cluster is not secure. For more information about Secrets, see Secrets . |

Identifying the MapR Volume Created During Dynamic Provisioning

Describes how to find the name of the MapR volume created during dynamic provisioning.

In dynamic provisioning, the provisioner creates a new MapR volume with a name that is randomly generated using lower-case letters. For example, if you specify `PV` as the `namePrefix` in the `StorageClass`, the first dynamically created volume might be named `PV.bevefseser`. If you do not specify a prefix, the provisioner uses `maprprovisioner` as a prefix.

To find the name of the new MapR volume and the path to the volume:

1. Use the `kubectl describe` command to get information about the PVC:

```
kubectl describe pvc -n <namespace> <pvc-name>
```

The command output shows the name of the PersistentVolume (PV) that was created: For example:

```
kubectl describe pvc -n mapr-examples maprfs-secure-pvc109
Name:          maprfs-secure-pvc109
Namespace:    mapr-examples
StorageClass: secure-maprfs
Status:       Bound
Volume:    pv-ikmqxfwtjh
Labels:       <none>
Annotations:  control-plane.alpha.kubernetes.io/
              leader={holderIdentity:"ed60e649-0c68-11e8-acd5-36117e0e7e02", "leaseDurationSeconds":15, "acquireTime":"2018-02-09T22:09:43Z"}
              pv.kubernetes.io/bind-competed=yes
              pv.kubernetes.io/bound-by-controller=yes
              volume.beta.kubernetes.io/storage-provisioner=mapr.com/
maprfs
Finalizers:   []
Capacity:    300M
Access Modes: RWO
Events:
```

2. Use the `kubectl get` command and the PersistentVolume (PV) name to obtain a description of the PersistentVolume:

```
kubectl get pv <pv-name> -o yaml
```

The command output shows the path to the MapR volume. For example:

```
kubectl get pv pv-ikmqxfwtjh -o yaml
apiVersion: v1
kind: PersistentVolume
metadata:
  annotations:
    mapr.com/description: 'Dynamically provisioned PV for MapR-FS:
pv.ikmqxfwtjh'
    mapr.com/maprProvisionerIdentity: mapr.com/maprfs
    mapr.com/provisionerVersion: v1.0.0
    mapr.com/restServers: 10.10.88.214:8443
    mapr.com/secretName: mapr-provisioner-secrets
    mapr.com/secretNamespace: mapr-examples
    mapr.com/volumeName: pv.ikmqxfwtjh
    pv.kubernetes.io/provisioned-by: mapr.com/maprfs
  creationTimestamp: 2018-02-09T22:21:22Z
  name: pv-ikmqxfwtjh
  resourceVersion: "2875820"
  selfLink: /api/v1/persistentvolumes/pv-ikmqxfwtjh
  uid: 8f11aall-0de7-11e8-bdd6-84a9c4fbf7cb
spec:
  accessModes:
    - ReadWriteOnce
  capacity:
    storage: 300M
  claimRef:
    apiVersion: v1
    kind: PersistentVolumeClaim
    name: maprfs-secure-pvc109
    namespace: mapr-examples
    resourceVersion: "2842548"
    uid: ce555e4-0de5-11e8-bdd6-84a9c4fbf7cb
  flexVolume:
    driver: mapr.com/maprfs
    options:
      cldbHosts: xx.xx.xx.xxx yy.yy.yy.yyy zz.zz.zz.zzz
      cluster: Test5
      mountOptions: ""
      platinum: "true"
      readOnly: "false"
      securityType: secure
      ticketSecretName: mapr-ticket-secret
      ticetSecretNamespace: mapr-examples
      volumePath: /pv/pv-ikmqxfwtjh
  persistentVolumeReclaimPolicy: Delete
  storageClassName: secure-maprfs
status:
  phase: Bound
```

Creating a Default StorageClass

As noted in [Example: Statically Provisioning a MapR Volume Using the FlexVolume Plug-in](#) on page 3357, some deployments can require a default StorageClass. A default StorageClass can reduce the effort it takes to create Pods. For example, you could use a default StorageClass to provision storage dynamically to a MapR location for any PersistentVolumeClaim that you create.

If you set the `DefaultStorageClass` admission controller (see [PodSecurityPolicy](#)), and you wish to enable a MapR StorageClass as the default, follow the instructions in [Change the default StorageClass](#).

Verifying Creation of a Kubernetes PersistentVolumeClaim and Persistent Volume

Once the Pod spec is installed, you can verify the status of a PersistentVolumeClaim or a PersistentVolume by using the Kubernetes `get` command. For example:

```
$ kubectl get pvc
NAME          STATUS    VOLUME          CAPACITY   ACCESS MODES   STORAGECLASS   AGE
maprfs-pvc    Bound    pv-rsojpoapxy   8Mi        RWO             simple-maprfs  3d
$ kubectl get pv
NAME          CAPACITY   ACCESS MODES   RECLAIM POLICY   STATUS
CLAIM
Pv-rsojpoapxy 8Mi        RWO             Delete            Bound    mapr-demo/
maprfs-pvc
```

For an example of creating a PersistentVolumeClaim and a PersistentVolume, see [Example: Mounting a PersistentVolume for Static Provisioning Using the FlexVolume Driver](#) on page 3359.

Enabling the Platinum Posix Client for Kubernetes Interfaces for Data Fabric FlexVolume Driver

When you install the Kubernetes Interfaces for Data Fabric FlexVolume Driver, the Basic FUSE-based POSIX client package is installed on all nodes by default. The FlexVolume Driver also supports the use of the Platinum FUSE-based POSIX client. For a comparison of the two POSIX client packages, see [Preparing for Installation \(HPE Ezmeral Data Fabric POSIX Client\)](#) on page 354.

To install the Platinum POSIX client, include the `platinum` parameter in your Pod spec. For example:

```
options:
cluster: "cluster2"
platinum: "true"
cldbHosts: "10.10.102.96"
```

Mounting a Read-Only Volume

This page describes how to specify a volume that should be mounted as read-only.

The following example specifies a volume that should be mounted as read-only in a MapR path or PersistentVolume during static provisioning:

```
flexVolume:
  driver: "mapr.com/maprfs"
  readOnly: true
  options:
    volumePath: "/path/to/data/in/mapr"
    cluster: "mycluster"
    cldbHosts: "cldb1 cldb2 cldb3"
    securityType: "secure"
    ticketSecretName: "mapr-ticket-secret"
    ticketSecretNamespace: "mapr-examples"
```

The following example shows how to specify that the volume should be mounted read-only in a StorageClass for dynamic provisioning. The example specifies that the POSIX driver should mount the MapR path as read only. This is different from the `readonly` parameter for volume creation that creates the volume as `readonly`.

```
apiVersion: storage.k8s.io/v1
kind: StorageClass
metadata:
  name: secure-maprfs
  namespace: mapr-examples
```

```

provisioner: mapr.com/maprfs
parameters:
  restServers: "rest1:8443"
  cldbHosts: "cldb1 cldb2 cldb3"
  cluster: "mysecurecluster"
  securityType: "secure"
  ticketSecretName: "mapr-ticket-secret"
  ticketSecretNamespace: "mapr-examples"
  maprSecretName: "mapr-provisioner-secrets"
  maprSecretNamespace: "mapr-examples"
  namePrefix: "pv"
  mountPrefix: "/pv"
  readOnly: "true"
  reclaimPolicy: "Retain"
  advisoryquota: "100M"

```

The following example specifies that the volume should be created as `readOnly` in a `StorageClass` for dynamic provisioning:

```

apiVersion: storage.k8s.io/v1
kind: StorageClass
metadata:
  name: secure-maprfs
  namespace: mapr-examples
provisioner: mapr.com/maprfs
parameters:
  restServers: "rest1:8443"
  cldbHosts: "cldb1 cldb2 cldb3"
  cluster: "mysecurecluster"
  securityType: "secure"
  ticketSecretName: "mapr-ticket-secret"
  ticketSecretNamespace: "mapr-examples"
  maprSecretName: "mapr-provisioner-secrets"
  maprSecretNamespace: "mapr-examples"
  namePrefix: "pv"
  mountPrefix: "/pv"
  reclaimPolicy: "Retain"
  advisoryquota: "100M"
  readOnly: "1"

```

Configuring a Secret

Kubernetes Secrets enable you to inject sensitive data into a pod. For more information about Secrets, see [Secrets](#).

The examples in this section show how Secrets can be used in static and dynamic provisioning. Secrets are not by themselves secure. For more information about security and Secrets, see [Security Properties](#). Specifically, it is important to turn on encryption at rest for Secrets. See [Encrypting Secret Data at Rest](#).

During installation of the Driver, the Kubernetes token that was moved into the pod is written to the host node so that the plugin can query a Secret to pull the ticket for mounting. This Kubernetes token is sensitive and should be protected. The token is placed in `/var/run/secrets/kubernetes.io/serviceaccount`.

Here is an example of a configuration file for a Kubernetes Secret:

```

apiVersion: v1
kind: Secret
metadata:
  name: mapr-provisioner-secrets
  namespace: test-driver
type: Opaque

```

```
data:
  ...
```

The following table describes the fields in the sample Secret file. For more information, see [Secrets](#) in the Kubernetes documentation.

| Parameter | Notes |
|------------|---|
| apiVersion | The Kubernetes API version. |
| kind | The type of object being created. |
| name | A string to identify the Secret. |
| type | The type of Secret being created. For type <code>Opaque</code> , clients must treat these values as opaque and pass them unmodified back to the server. |

REST Secrets

For dynamic provisioning, you must use a Secret to pass the user name and password of a data-fabric user to the provisioner. This user must have privileges to create and delete a data-fabric volume. The credentials allow the provisioner to make REST calls to the data-fabric webserver. Secrets are protected by the Kubernetes [RBAC](#).

The following example shows a REST secret in the Secret file:

```
apiVersion: v1
kind: Secret
metadata:
  name: mapr-provisioner-secrets
  namespace: test-driver
type: Opaque
data:
  MAPR_CLUSTER_USER: cm9vdA==
  MAPR_CLUSTER_PASSWORD: bWFwcm9vdA==
```

The following table describes the REST secret fields in the REST Secret example.

| Parameter | Notes |
|-----------------------|--|
| MAPR_CLUSTER_USER | The base64 representation of a data-fabric user that has the ability to create and delete data-fabric volumes. See Converting a String to Base64 on page 3373. |
| MAPR_CLUSTER_PASSWORD | The base64 representation of the password for the user defined by the <code>MAPR_CLUSTER_USER</code> parameter. See Converting a String to Base64 on page 3373. |
| MAPR_CLUSTER_TICKET | The base64 representation of the ticket contents generated on the data-fabric cluster using the <code>maprlogin</code> utility. For dynamic provisioning, with the latest CSI drivers, you can configure a data-fabric ticket to authenticate to the data-fabric webserver to make REST calls. This parameter is provided as a Beta feature. |

Ticket Secrets

For static and dynamic provisioning, you must specify a Secret, which is the base64 representation of the ticket, to enable the POSIX client to communicate with a secure MapR cluster. The ticket for the POSIX client can be generated on the data-fabric cluster using the `maprlogin` on page 2412 utility.

The following example shows a ticket Secret:

```
apiVersion: v1
kind: Secret
metadata:
  name: mapr-ticket-secret
  namespace: mapr-examples
type: Opaque
data:
  CONTAINER_TICKET: CHANGETHIS!
```

The following table describes the CONTAINER_TICKET field in the ticket Secret example.

| Parameter | Notes |
|------------------|--|
| CONTAINER_TICKET | Base64-encoded ticket value. See Converting a String to Base64 on page 3373. |

To create the secret:

1. Run the following command to create the Secret file:

```
kubectl create -f <secret-file-name>.yaml
```

2. Convert sensitive data, such as a user name and password, to a base64 representation. See [Converting a String to Base64](#) on page 3373.
3. Add the base64 representation of sensitive data in the Secret file. For more information about the format of the Secret files, see [REST Secrets](#) on page 3372 and [Ticket Secrets](#) on page 3372 earlier in this section.
4. Deploy the secret on the pod by running the following command:

```
kubectl apply -f <secret-file-name>.yaml
```

Converting a String to Base64

Sensitive data contained in a Secret must be represented in base64. Use these steps to convert such information to the base64 representation:

For example, in Linux:

```
echo -n 'mapr' | base64
```

The output shows the base64 representation of the user name `mapr` is `bWFwcg==`.

MapR tickets include a cluster name followed by a base64-encoded string. It is not sufficient to insert the base64-encoded string into a Kubernetes Secret. You must convert *both* the cluster name and string into base64 representation and then insert the result into the Secret.

The following command shows how to convert a MapR ticket to base64 representation:

```
echo -n "cluster-name <base64-encoded ticket-value>" | base64
```

For example:

```
echo -n "cluster2 PuG01puPXuDxj9ERgKCTXOqsXYPTnqRJl6/
m1WJjdVKvE5r46QS2Bh9nC+I4Rcu0GtnWRUOtKBG9gp65bsZN9Kphnr/
Wp15z8D3O2go951CANes/
7QQ11YVP712BOpGR6I1zIrC3XGwI8OQWT61qpsjSVZv8z05oQ5GDYQTkPttI/yAk/"
```

```
uJBES1ohCz38n9HgYALLvMALVsBPtUtG+cNGc1ktUDDMR2q1EgVzdJbuYsOuHnZX3LO3euKDGL4C
4Mcmrv9DWiWJxwiZ1yZu69GbZJlXxqLQQLkdMoTXk=" | base64
```

```
Y2xlc3RlcjIgaUHVHMGxwdVBYdUR4ajlFUmdLQ1RYT3FzWF1QVG5xUkpsNi9tbFdkamRWS3ZFNXI0
N1FTMkJoOW5DK0k0UmNlMED0bldSVU90S0JHOWdwNjvic1pOOUtwag5yLldwMTV6OEQzTzJnbzk1
MUNBTmVzLzdRUWxsWVZQN2wyQk9wRlI2STF6SXJDM1hhd0k4T1FXVDYxcXBzalNWWnY4ek81blE1
R0RZUVRrUHR0SS95QWsvdUpCRVMxb2hDejM4bjlIZl1lBTEEx2TUFMVnNCUHRVdEcrY05HYzFrdFVE
RElSMnExRwdWemRKYnVZc09lSG5aWDNMTzNldUtER2w0QzRNQ21ydj1EV2lXSnh3aVoxeVp1Nj1H
Y1pKbFh4cUxPUUJsa2RNb1RYaz0K
```

Note: Another method for converting values to base64 is to use an Internet tool such as <https://www.base64encode.org> to encode or decode data.

Best Practices for Using Tickets

When using secure data-fabric clusters with the Kubernetes Interfaces for Data Fabric, you must generate tickets for your containers. Here are some best practices:

- Create a different user for each container.
- To avoid frequent renewals, use long-lived user tickets or servicewithimpersonation tickets. If you refresh or update a ticket, you must restart your containers.
- If you use an impersonation ticket, it is CRITICAL that you use security contexts in the pod definitions to avoid a misbehaving container impersonating all user IDs. For restrictions that apply to the use of impersonation tickets, see [How Impersonation Works](#) on page 1652 and [maplogin](#) on page 2412.
- Match the security context `runAsUser`: ID and `fsGroup`: group to the ID or group used to create the ticket.

Here is an example of a pod spec that specifies a security context:

```
apiVersion: v1
kind: Pod
metadata:
  name: test-secure
  namespace: mapr-examples
spec:
  securityContext:
    runAsUser: 1000
    fsGroup: 2000
```

Troubleshooting the Kubernetes Interfaces for Data Fabric FlexVolume Driver

This section describes how to resolve common problems you might encounter when using the Kubernetes Interfaces for Data Fabric FlexVolume driver.

Shared Memory Lock Causes POSIX Failure

| | |
|-----------------------|--|
| Problem | On an upgrade from a previous version of the volume plug-in, POSIX can fail with the following error in the POSIX log file: Create/Attach to stats shared memory failed. |
| Possible Cause | A shared-memory segment lock can prevent the mount from becoming available to the requested pod. |
| Resolution | Follow the steps in Troubleshooting loopbacknfs POSIX Client Upgrades on page 279 to remove the lock. Then retry the operation. |

Unable to Access filesystem

| | |
|-----------------------|--|
| Problem | Storage is not mounted and no errors are generated in the plugin or provisioner logs . |
| Possible Cause | The fusermount symlink might be broken. |
| Resolution | If the symlink points to a location other than <code>/opt/mapr/k8s/bin/fusermount</code> , unlink it using the following command from the command line on the host: <pre>unlink /bin/fusermount</pre> Then re-create the Kubernetes Pod. |

Pod Container Stuck in Container Creation State During Installation

| | |
|-----------------------|--|
| Problem | During installation, the Pod container can become stuck in the container creation state on a node, and the <code>/opt/mapr/k8s</code> directory is not created. As a result, the plug-in does not get copied to the node. |
| Possible Cause | Unknown. |
| Resolution | Check the installation logs for an indication that the installation is not completed or the <code>/opt/mapr/k8s</code> directory is not created. Restart the kubelet service in the node: <pre>systemctl restart kubelet</pre> |

Logs for the MapR Data Fabric for Kubernetes FlexVolume Driver

Logs for the MapR Data Fabric for Kubernetes can be found in:

```
/opt/mapr/logs
```

| Log File | Description | Which Nodes |
|-------------------------------------|--|--|
| <code>install-k8s-plugin.log</code> | Captures events related to the copying of files from the plug-in container to each Kubernetes host node. | All Kubernetes nodes. |
| <code>plugin-k8s.log</code> | Captures events from the FlexVolume plug-in. | All Kubernetes nodes.  Note: In Azure deployments, this log is hidden in the container. See Azure AKS Considerations on page 232. |
| <code>provisioner-k8s.log</code> | Captures events from the provisioner. | The Kubernetes node where the provisioner Pod is running. |

Useful Troubleshooting Commands

The following Kubernetes commands can help you gather information about the resources used by the MapR Data Fabric for Kubernetes:

- `kubectl describe <resourcetype> <resource> -n <namespace>`
- `kubectl get <resourcetype> <resource> -n <namespace> -o yaml`
- `kubectl logs <pod-name> -n <namespace>`
- `journalctl -u kubelet -r` (on the relevant node)

kubectl describe command

In this example, the `kubectl describe` command displays information about the `mapr-kdfprovisioner-5dff68656-ln6vh` Pod. Note that the `kubectl describe` output includes an event section.

```
kubectl describe pod mapr-kdfprovisioner-5dff68656-ln6vh -n mapr-system
Name:          mapr-kdfprovisioner-5dff68656-ln6vh
Namespace:     mapr-system
Node:          qa101-139/10.10.101.139
Start Time:    Fri, 09 Feb 2018 12:58:36 -0800
Labels:        app=mapr-kdfprovisioner
               pod-template-hash=189924212
Annotations:   openshift.ix/scc-maprkdf-scc

  Normal   Started        8m     kubelet, qa101-139   Started container
```

kubectl get command

In this example, the `kubectl get` returns the `.yaml` parameters for the `test-secure-provisioner86` Pod:

```
kubectl get pods test-secure-provisioner86 -n mapr-examples -o yaml
apiVersion: v1
kind: Pod
metadata:
  creationTimestamp: 2018-02-09T00:42:06Z
  name: test-secure-provisioner86
  namespace: mapr-examples
  resourceVersion: "721689"
  selfLink: /api/v1/namespaces/mapr-examples/pods/test-secure-provisioner86
```

```

uid: 0dd21274-0d32-11e8-bdd6-84a9c4fbf7cb
spec:
  containers:
  - args:
    - sleep
    - "1000000"
    image: busybox
    imagePullPolicy: Always
    name: busybox
    resources: {}
    terminationMessagePath: /dev/termination-log
    terminationMessagePolicy: file
    volumeMounts:
    - mountPath: /dynvolume
      name: maprfs-pvc
    - mountPath: /var/run/secrets/kubernetes.io/serviceaccount
      name: default-token-zpv69
      readOnly: true
  dnsPolicy: ClusterFirst
  nodeName: qa108-165.qa.lab
  restartPolicy: Never
  schedulerName: default-scheduler
  securityContext: {}
  serviceAccount: default
  serviceAccountName: default
  terminationGracePeriodSeconds: 30
  tolerations:
  - effect: NoExecute
    key: node.kubernetes.io/not-ready
    operator: Exists
    tolerationSeconds: 300
  - effect: NoExecute
    key: node.kubernetes.io/unreachable
    operator: Exists
    tolerationSeconds: 300
  volumes:
  -name: maprfs-pvc

```

Running the `kubectl get` command without the `-o yaml` parameter generates less output:

```

kubectl get pods test-secure-provisioner86 -n mapr-examples
NAME                                READY   STATUS    RESTARTS   AGE
test-secure-provisioner86          1/1     Running   0           14m

```

kubectl logs command

In this example, the `kubectl logs` command returns logged output for the `mapr-kdfprovisioner-5dff68656-ln6vh` Pod:

```

kubectl logs mapr-kdfprovisioner-5dff68656-ln6vh -n mapr-system
I0209 12:58:39.956822    1 controller.go:407] Starting provisioner
controller 013d58b3-0ddc-11e8-b0dd-0242acl10003!

```

journalctl -u command

In this example, the `journalctl` command returns events for the kubelet service for the node:

```

journalctl -u kubelet -r
-- Logs begin at Thu 2017-12-28 06:24:47 PST, end at Thu 2018-02-08
17:01:49 PST. --
Feb 08 17:01:49 k8s-master kubelet[26521]: E0206 17:01:49,047595 26521

```

```

Ecosystem Components

The following sections provide information about each open-source project that is supported by the HPE Ezmeral Data Fabric.

This section contains documentation for each open-source project. You can learn how to configure, use, and integrate each project within the context of a data-fabric cluster.

Documentation Covers All Component Versions

Unless noted, the ecosystem-component information in this content hierarchy applies to all component versions included in EEPs that are supported on the core software. For a list of the supported EEPs, see [EEP Support and Lifecycle Status](#) on page 5734.

Ezmeral Ecosystem Packs

An Ezmeral Ecosystem Pack (EEP) provides a set of ecosystem components that work together on one or more data-fabric cluster versions. Each EEP contains only one version of an ecosystem component. For example, each EEP supports only one version of Hive and one version of Spark.

HPE creates a new EEP version when a new ecosystem component is available or a patch is applied to an ecosystem component that is already in a released EEP.

A single version of core can support multiple EEPs, but only one at a time. For detailed information about each EEP, see [Ezmeral Ecosystem Pack \(EEP\) Reference](#) on page 6701. For a list of currently supported EEPs, see [EEP Support and Lifecycle Status](#) on page 5734.

Hadoop Ecosystem and Monitoring Components

Hadoop ecosystem components within an EEP undergo extensive interoperability testing to validate that the components can work together. Examples of Hadoop ecosystem components include Hive, Pig, Spark, and Oozie.

The following open-source components are included in the EEP for monitoring and logging use cases, but NOT for third-party use cases:

- Collectd
- Elasticsearch
- Fluentd
- Grafana
- Kibana

- OpenTSDB

Note: Developer previews for fast-moving ecosystem components continue to be available in addition to EEPs. However, developer preview releases of ecosystem components are not tested for production environments, and they do not undergo the same interoperability testing.

For more information, see the [EEP Release Notes](#) on page 5854.

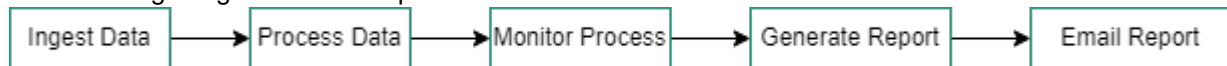

Apache Airflow

This topic provides an overview of Apache Airflow on HPE Ezmeral Data Fabric.

Starting from EEP 8.1.0, HPE Ezmeral Data Fabric supports Apache Airflow on core 6.2.x and core 7.0.0.

You can use Airflow to author, schedule, or monitor workflows or data pipelines.

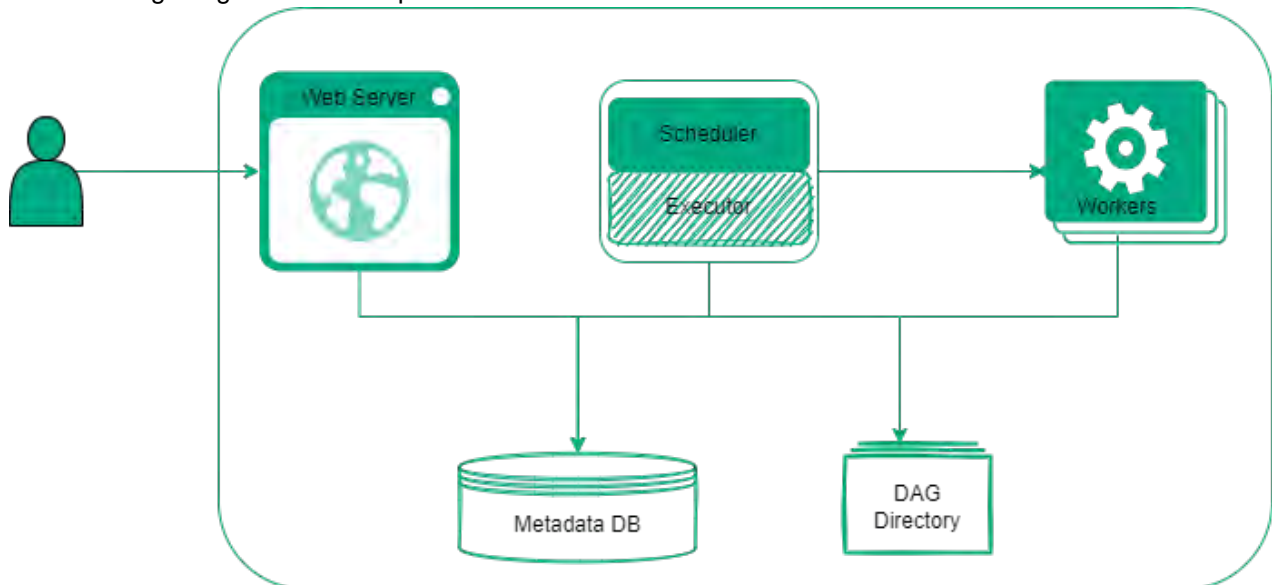

The following image shows the Apache Airflow workflow:

A workflow is a Directed Acyclic Graph (DAG) of tasks used to handle big data processing pipelines. The workflows are started on a schedule or triggered by an event. DAGs define the order to run the tasks or rerun in case of failures. The tasks define the actions to be performed, like ingest, monitor, report, and others.

Airflow Architecture

The following image shows the Apache Airflow Architecture:

Airflow Components

Airflow consists of the following components:

Scheduler

Triggers the scheduled workflows and submits the tasks to an executor to run.

Executor

Executes the tasks or delegates the tasks to workers for execution.

Worker

Executes the tasks.

Web Server

Provides a user interface to analyze, schedule, monitor, and visualize the tasks and DAG. The Web

| | |
|--------------------------|---|
| DAG Directory | Server enables you to manage users, roles, and set configuration options. |
| Metadata Database | Contains DAG files read by Scheduler, Executor, and Web Server. |
| | Stores the metadata about DAGs' state, runs, and Airflow configuration options. |

To learn more about Airflow, see [Airflow Concepts](#).

Starting, Stopping, and Restarting Airflow Services

This topic describes how to start, stop, and restart Airflow services on HPE Ezmeral Data Fabric.

The Warden daemon starts the Airflow server (airflow-webserver and airflow-scheduler) automatically at installation time.

You can start and stop Airflow from the command line or from the Control System. You can use the `maprcli node services` command to start Airflow on multiple nodes at one time.

Perform the following steps to start or stop or restart Airflow from the command line:

1. Make a list of nodes on which Airflow is configured.
2. Run the `maprcli node services` command with either `start`, `restart`, or `stop`, and specify the nodes on which Airflow is configured, separated by spaces.

```
maprcli node services -name airflow-webserver -action start|stop|
restart -nodes <nodes list>
```

```
maprcli node services -name airflow-scheduler -action start|stop|
restart -nodes <nodes list>
```

Configuring a Remote MySQL Database for Airflow

This topic describes how to configure a remote MySQL database for Airflow on HPE Ezmeral Data Fabric.

To connect to MySQL from Airflow, install **mysqlclient**. Perform the following steps:

1. Run `. <airflow_home>/build/env/bin/activate`
2. Run `pip install mysqlclient==2.0.3`
3. Run `deactivate`

Airflow uses SQLAlchemy to connect to the metadata database. The metadata database stores the information about Airflow configurations, user information, roles and policies, and statistics of each DAG's state, run, and task.

Airflow supports MySQL database engine of version 5.7 and 8.

To configure the remote MySQL Database for Airflow, see [Setting Up a MYSQL Database](#).

Configuring SSL Security for Airflow

This topic describes the security configurations for Airflow on HPE Ezmeral Data Fabric.

Airflow enables SSL by default on secure clusters and you can manually configure SSL for nonsecure clusters in HPE Ezmeral Data Fabric.

Enabling SSL on Secure Clusters

Airflow enables SSL by default on secure clusters and uses the standard Data-Fabric SSL configuration.

Enabling SSL on Nonsecure Clusters

To enable SSL on non-secure clusters, provide a certificate and a key to the webserver.

Add the following configuration options at `<airflow_home>/conf/airflow.cfg`.

```
[webserver]
web_server_ssl_cert = <path to certificate>
web_server_ssl_key = <path to private key>
```

Once you enable the SSL, you must use `https://` in the browser for secure connection.

Configuring Data-Fabric SASL and SSL for Hooks Connections

This topic describes configuration options for Data-Fabric SASL and SSL for hook connections in Airflow.

You can import and export data to multiple systems by using the Airflow. Airflow provides a high-level interface called Hooks to connect to these systems by integrating with Connections.

A connection is an object that stores the credentials like username, password and hostname, the type of system it connects to, and other configuration options.

HPE Ezmeral Data Fabric 7.0.0 supports Data-Fabric SASL authentication for Airflow.

To support Data-Fabric SASL authentication for HPE Ezmeral Data Fabric 6.2.x, see [Applying a Patch](#) on page 393.

Airflow authenticates with Data-Fabric SASL in the following ways:

Using the Ecosystem Component Client

To authenticate with Data-Fabric SASL, Airflow uses the clients of ecosystem component installed on the node. To submit the tasks, configure a Data-fabric User Ticket on a secure cluster. See [Generating a HPE Ezmeral Data Fabric User Ticket](#) on page 1543.

Using the REST API or Thrift protocol

To authenticate with Data-Fabric SASL, you can use REST API or Thrift protocol by setting the additional configuration options.

WebEZFSHook (webezfs_default connection id)

To connect with filesystem, set the following configuration options on `extra` section of connection configuration.

Data-Fabric SASL: Set `{"auth": "maprsasl"}`.

SSL: On secure clusters, set `{"use_ssl": "true"}` option. For nondefault SSL configuration, set `{"cert": "/path_to_truststore.pem"}`.

EzHiveCliHook (hive_cli_default connection id)

To connect with Hive, set the following configuration options on connection configuration.

Data-Fabric SASL: Set `{"use_beeline": true, "auth": "maprsasl", "ssl": "true"}`.

SSL: On secure clusters, set `{"use_beeline": true, "auth": "maprsasl", "ssl": "true"}`.

Add the following configuration options to `hive-site.xml` file:

```
<property>
```

```
<name>hive.security.authorization.sqls
td.confwhitelist.append</name>

    <value>mapred.job.name|
airflow.ctx.*</value>

</property>
```

EzHiveMetastoreHook (metastore_default connection id)

To connect with Hive Metastore, set the following configuration options on `extra` section of connection configuration.

Data-Fabric SASL: Set `{"authMechanism": "MAPRSASL"}`.

EzHiveServer2Hook (hiveserver2_default connection id)

To connect with HiveServer2, set the following configuration options on `extra` section of connection configuration.

Data-Fabric SASL: Set `{"authMechanism": "MAPRSASL"}`.

SSL: On secure clusters, set `{"ssl": "true"}` option. For nondefault SSL configuration, set `{"certificate": "/path_to_truststore.pem"}`.

EzLivyHook (livy_default connection id)

To connect with Livy, set the following configuration options on `extra` section of connection configuration.

Data-Fabric SASL: Set `{"auth": "maprsasl"}`.

SSL: On secure clusters, set `{"use_ssl": "true"}` option. For nondefault SSL configuration, set `{"cert": "/path_to_truststore.pem"}`.

EzS3Hook (aws_default connection id)

To connect with S3, set the following configuration options on `extra` section of connection configuration.

SSL: On secure clusters, set `{"cert": "/path_to_truststore.pem"}` option for nondefault SSL configuration.

Airflow Providers

This topic describes the Apache Airflow Provider packages available in HPE Ezmeral Data Fabric.

Providers contains operators, hooks, sensors, and transfer operators that enhances the core Airflow scheduling capabilities. To learn more about Providers, see [Airflow Providers](#).

Airflow provides an interface to Ezmeral Ecosystem Pack components, databases, and filesystem by using the providers.

The classes on Providers package in HPE Ezmeral Data Fabric are located inside `airflow.providers.ezmeral` Python package.

The following topics describes interfaces on Airflow Providers in HPE Ezmeral Data Fabric.

Interface to HPE Ezmeral Data Fabric Database

Airflow provides an interface to HPE Ezmeral Data Fabric Database by using the Providers.

See Provider examples of HPE Ezmeral Data Fabric Database at `<airflow_home>/build/env/lib/python3.9/site-packages/airflow/providers/ezmeral/database/example_dags/`.

Hooks**BinaryDbCliHook***Python path:*

airflow.providers.ezmeral.database.hooks.binary_shell

Description: This hook is a wrapper around the `hbase shell` command that must have `hbase` binary in the `PATH`.**JsonDbCliHook***Python path:*

airflow.providers.ezmeral.database.hooks.json_shell

Description: This hook is a wrapper around the `mapr dbshell` command.**EzTableHook***Python path:*

airflow.providers.ezmeral.database.hooks.table

Description: This hook is a wrapper around the `maprcli table` command.**Operators****BinaryDbCliOperator***Python path:*

airflow.providers.ezmeral.database.operators.binary_shell

Description: Executes HPE Ezmeral Data Fabric Database Binary `hbase shell` command.**JsonDbCliOperator***Python path:*

airflow.providers.ezmeral.database.operators.json_shell

Description: Executes HPE Ezmeral Data Fabric Database Binary `mapr dbshell` command.**CreateEzTableOperator***Python path:*

airflow.providers.ezmeral.database.operators.table

Description: Creates HPE Ezmeral Data Fabric Database table.**DropEzTableOperator***Python path:*

airflow.providers.ezmeral.database.operators.table

Description: Drops HPE Ezmeral Data Fabric Database table.**ImportJsonEzTableOperator***Python path:*

airflow.providers.ezmeral.database.operators.table

Description: Imports HPE Ezmeral Data Fabric Database JSON table.**ExportJsonEzTableOperator***Python path:*

airflow.providers.ezmeral.database.operators.table

Description: Exports HPE Ezmeral Data Fabric Database JSON table.**ImportBinaryEzTableOperator***Python path:*

airflow.providers.ezmeral.database.operators.table

Description: Imports HPE Ezmeral Data Fabric Database Binary table.**ExportBinaryEzTableOperator***Python path:*

airflow.providers.ezmeral.database.operators.table

Description: Exports HPE Ezmeral Data Fabric Database Binary table.

Sensors

EzTableSensor

Python path:
airflow.providers.ezmeral.database.sensors.table

Description: Waits for the table to show up in HPE Ezmeral Data Fabric Database.

Interface to the File System

Airflow provides an interface to the filesystem by using the Providers.

See Provider examples of the filesystem at `<airflow_home>/build/env/lib/python3.9/site-packages/airflow/providers/ezmeral/fs/example_dag/`.

Hooks

EZFSHook

Python path:
airflow.providers.ezmeral.fs.hooks.ezfs.EZFSHook

Description: Interacts with filesystem.

API::class
airflow.providers.ezmeral.fs.hooks.ezfs.EZFSHook(classpath: list = '/opt/mapr/lib/*')

The *classpath* parameter provides a path for Java and binaries libraries to access the filesystem Java client.

WebEZFSHook

Python path:
airflow.providers.ezmeral.fs.hooks.web_ezfs.WebEZFSHook

Description: Interacts with filesystem through HttpFS.

API: The same API as [Apache Web HDFS](#).

Sensors

EzfsSensor

Python path:
airflow.providers.ezmeral.fs.sensors.ezfs.EzfsSensor

Description: Waits for a file or folder to show up in the filesystem.

API: The same API as [Apache HDFS Sensor](#).

EzfsRegexSensor

Python path:
airflow.providers.ezmeral.fs.sensors.ezfs.EzfsRegexSensor

Description: Waits for matching files by matching on regex.

API: The same API as [Apache HDFS Regex sensor](#).

EzfsFolderSensor

Python path:
airflow.providers.ezmeral.fs.sensors.ezfs.EzfsFolderSensor

Description: Waits for a non-empty directory.

API: The same API as [Apache HDFS Folder sensor](#).

WebEzfsSensor

Python path:
airflow.providers.ezmeral.fs.sensors.web_ezfs.WebEzfsSensor

Description: Waits for a file or folder to show up in the filesystem.

API: The same API as [Apache WebHDFS sensor](#).

Interface to Hive

Airflow provides an interface to Hive by using the Providers.

See Provider examples of Hive at `<airflow_home>/build/env/lib/python3.9/site-packages/airflow/providers/ezmeral/hive/example_dags/`.

Hooks

All hooks have the same API as [Apache Hive Hooks](#).

EzHiveCliHook

Python path:
`airflow.providers.ezmeral.hive.hooks.ezhive.EzHiveCliHook`

Description: Provides access to Hive using Hive client.

EzHiveMetastoreHook

Python path:
`airflow.providers.ezmeral.hive.hooks.ezhive.EzHiveMetastoreHook`

Description: Provides access to Hive Metastore using HMSClient.

EzHiveServer2Hook

Python path:
`airflow.providers.ezmeral.hive.hooks.ezhive.EzHiveServer2Hook`

Description: Provides access to HiveServer using PyHive.

Operators

EzHiveOperator

Python path:
`airflow.providers.ezmeral.hive.operators.ezhive.EzHiveOperator`

Description: Executes HiveQL code or Hive script in a specific Hive database.

API: The same API as [Apache Hive Operator](#).

EzHiveStatsCollectionOperator

Python path:
`airflow.providers.ezmeral.hive.operators.ezhive_stats.EzHiveStatsCollectionOperator`

Description: Gathers partition statistics using a dynamically generated Presto query and inserts the statistics into a MySQL table.

API: The same API as [Apache Hive Stats Operator](#).

Sensors

EzHivePartitionSensor

Python path:
`airflow.providers.ezmeral.hive.sensors.ezhive_partition.EzHivePartitionSensor`

Description: Waits for a partition to show up in Hive.

API: The same API as [Apache Hive Partition Sensor](#).

EzMetastorePartitionSensor

Python path:
`airflow.providers.ezmeral.hive.sensors.ezmetastore_partition.EzMetastorePartitionSensor`

Description: An alternative to the HivePartitionSensor that talks directly to the MySQL database.

API: The same API as [Apache Hive Metastore Partition Sensor](#).

EzNamedHivePartitionSensor

Python path:
 airflow.providers.ezmeral.hive.sensors.eznamed_hive_partition.EzNamedHivePartitionSensor

Description: Waits for a set of partitions to show up in Hive.

API: The same API as [Apache Hive Named Partition Sensor](#).

Transfers**EzHiveToMySQLOperator**

Python path:
 airflow.providers.ezmeral.hive.transfers.ez_hive_to_mysql.EzHiveToMySQLOperator

Description: Moves data from Hive to MySQL. Use this operator to move small amount of data as data first loads into the memory and then into the MySQL.

API: The same API as [Apache HiveToMySQLOperator](#).

EzHiveToSambaOperator

Python path:
 airflow.providers.ezmeral.hive.transfers.ez_hive_to_samba.EzHiveToSambaOperator

Description: Moves data from Hive to Samba. Executes HiveQL code in a specific Hive database and loads the results of the query as a CSV to a Samba location.

API: The same API as [Apache HiveToSambaOperator](#).

EzMsSqlToHiveOperator

Python path:
 airflow.providers.ezmeral.hive.transfers.ez_mssql_to_hive.EzMsSqlToHiveOperator

Description: Moves data from Microsoft SQL Server to Hive.

API: The same API as [Apache MsSqlToHiveOperator](#).

EzMySQLToHiveOperator

Python path:
 airflow.providers.ezmeral.hive.transfers.ez_mysql_to_hive.EzMySQLToHiveOperator

Description: Moves data from MySQL to Hive.

API: The same API as [Apache MySQLToHiveOperator](#).

EzS3ToHiveOperator

Python path:
 airflow.providers.ezmeral.hive.transfers.ez_s3_to_hive.EzS3ToHiveOperator

Description: Moves data from Amazon S3 to Hive.

API: The same API as [Apache S3ToHiveOperator](#).

EzVerticaToHiveOperator

Python path:
 airflow.providers.ezmeral.hive.transfers.ez_vertica_to_hive.EzVerticaToHiveOperator

Description: Moves data from Vertica to Hive.

API: The same API as [Apache VerticaToHiveOperator](#).

Interface to Livy

Airflow provides an interface to Livy by using the Providers.

See Provider examples of Livy at `<airflow_home>/build/env/lib/python3.9/site-packages/airflow/providers/ezmeral/livy/example_dags/`.

Hooks

EzLivyHook

Python path:
 airflow.providers.ezmeral.livy.hooks.ezlivy.EzLivyHook
Description: Apache Livy hook on HPE Ezmeral Data Fabric through the REST API.
API: The same API as [Apache LivyHook](#).

Operators

EzLivyOperator

Python path:
 airflow.providers.ezmeral.livy.operators.ezlivy.EzLivyOperator
Description: Wraps the Livy batch REST API, enabling to submit a Spark application to the underlying cluster.
API: The same API as [Apache LivyOperator](#).

Sensors

EzLivySensor

Python path:
 airflow.providers.ezmeral.livy.sensors.ezlivy.EzLivySensor
Description: Monitors Livy sessions for termination.
API: The same API as [Apache LivySensor](#).

Interface to Amazon S3

Airflow provides an interface to Amazon S3 by using the Providers.

See Provider examples of Amazon S3 at `<airflow_home>/build/env/lib/python3.9/site-packages/airflow/providers/ezmeral/s3/example_dags/`.

Hooks

EzS3Hook

Python path: airflow.providers.ezmeral.s3.hooks.s3
Description: Interacts with Amazon S3 using Boto3 library.

Operators

EzS3CreateBucketOperator

Python path:
 airflow.providers.ezmeral.s3.operators.s3_bucket
Description: Creates an S3 bucket.

EzS3DeleteBucketOperator

Python path:
 airflow.providers.ezmeral.s3.operators.s3_bucket
Description: Deletes an S3 bucket.

EzS3GetBucketTaggingOperator

Python path:
 airflow.providers.ezmeral.s3.operators.s3_bucket_tagging
Description: Gets tagging from an S3 bucket.

EzS3PutBucketTaggingOperator

Python path:
 airflow.providers.ezmeral.s3.operators.s3_bucket_tagging
Description: Puts tagging for an S3 bucket.

EzS3DeleteBucketTaggingOperator

Python path:
airflow.providers.ezmeral.s3.operators.s3_bucket_tagging

Description: Deletes tagging from an S3 bucket.

EzS3CopyObjectOperator

Python path:
airflow.providers.ezmeral.s3.operators.s3_copy_object

Description: Creates a copy of the stored S3 object.

EzS3DeleteObjectsOperator

Python path:
airflow.providers.ezmeral.s3.operators.s3_delete_objects

Description: Deletes single or multiple objects from a bucket using a single HTTP request.

EzS3ListOperator

Python path:
airflow.providers.ezmeral.s3.operators.s3_list

Description: List all objects from the bucket with the given string prefix in name.

Sensors**EzS3KeySensor**

Python path:
airflow.providers.ezmeral.s3.sensors.s3_key

Description: Waits for a key to show up in a S3 bucket. S3 is a key-value store and key uniquely identifies the object in the bucket. S3 does not support folders and the path is just a key of resource.

EzS3KeySizeSensor

Python path:
airflow.providers.ezmeral.s3.sensors.s3_key

Description: Waits for a key whose size is larger than the defined size to show up in a S3 bucket. S3 is a key-value store and key uniquely identifies the object in the bucket. S3 does not support folders and the path is just a key of resource.

EzS3KeyUnchangedSensor

Python path:
airflow.providers.ezmeral.s3.sensors.s3_keys_unchanged

Description: Checks for changes in the number of objects at prefix in S3 bucket. This sensor returns `True` if the inactivity period has passed with no increase in the number of objects. This sensor might give an error when you use it in reschedule mode. Between rescheduled invocations, S3 bucket loses the state of the listed objects.

EzS3PrefixSensor

Python path:
airflow.providers.ezmeral.s3.sensors.s3_prefix

Description: Waits for a prefix to be available. A prefix is the first part of a key which enables checking of constructs similar to `glob airf1*` or `SQL LIKE 'airf1%'`. You can specify a delimiter to indicate the hierarchy or key which stops the match at that delimiter.

Transfers**EzGCSToS3Operator**

Python path:
airflow.providers.ezmeral.s3.transfers.gcs_to_s3

Description: Synchronizes a Google Cloud Storage bucket with an Amazon S3 bucket.

EzLocalFilesystemToS3Operator

Python path:
 airflow.providers.ezmeral.s3.transfers.local_to_s3

Description: Uploads a file from a local filesystem to S3.

EzMongoToS3Operator

Python path:
 airflow.providers.ezmeral.s3.transfers.mongo_to_s3

Description: Moves data from MongoDB using PyMongo to Amazon S3 using Boto.

EzMySQLToS3Operator

Python path:
 airflow.providers.ezmeral.s3.transfers.mysql_to_s3

Description: Saves data from a specific MySQL query into a file in S3.

EzS3ToFTPOperator

Python path:
 airflow.providers.ezmeral.s3.transfers.s3_to_ftp

Description: Enables the transfer of files from S3 to a FTP server.

EzS3ToSFTPOperator

Python path:
 airflow.providers.ezmeral.s3.transfers.s3_to_sftp

Description: Enables the transfer of files from S3 to a SFTP server.

EzSFTPToS3Operator

Python path:
 airflow.providers.ezmeral.s3.transfers.sftp_to_s3

Description: Enables the transfer of files from a SFTP server to S3.

Interface to Spark

Airflow provides an interface to Spark by using the Providers.

See Provider examples of Spark at `<airflow_home>/build/env/lib/python3.9/site-packages/airflow/providers/ezmeral/spark/example_dags/`.

Hooks**EzSparkSubmitHook**

Python path:
 airflow.providers.ezmeral.spark.hooks.ezspark_submit

Description: Launches Spark applications. This hook is a wrapper around the `spark-submit` binary to run a `spark-submit` job.

EzSparkSqlHook

Python path:
 airflow.providers.ezmeral.spark.hooks.ezspark_sql

Description: Enables interaction with binary tables through `spark-sql`. This hook is a wrapper around the `spark-sql` binary.

EzSparkJDBCHook

Python path:
 airflow.providers.ezmeral.spark.hooks.ezspark_jdbc

Description: Enables data transfers between JDBC databases and Apache Spark.

Operators**EzSparkSubmitOperator**

Python path:
 airflow.providers.ezmeral.spark.operators.ezspark_submit

EzSparkSqlOperator

Description: This operator is a wrapper around the `spark-submit` binary to run a `spark-submit` job.

Python path:
`airflow.providers.ezmeral.spark.operators.ezspark_sql`

Description: Executes Spark SQL query.

EzSparkJDBCOperator

Python path:
`airflow.providers.ezmeral.spark.operators.ezspark_jdbc`

Description: Extends the `SparkSubmitOperator` to enable data transfers between JDBC databases and Apache Spark.

AsyncHBase

MapR provides a version of AsyncHBase that is modified to work with HPE Ezmeral Data Fabric Database binary tables. The MapR version of AsyncHBase is based on the AsyncHBase library provides asynchronous Java APIs to access HPE Ezmeral Data Fabric Database binary tables. The HBase Client version is based on the current EEP and MapR version you are running. For more information, see the [Interoperability Matrices](#) on page 5722.

Configuring the Default Database for AsyncHBase

For AsyncHBase 1.7 and later, you can configure whether AsyncHBase accesses HBase tables or MapR-DB tables by default. If this value is not configured, AsyncHBase will determine the table type.

You can configure the default database in the `asynchbase.conf` file and the client application. A default database setting in the client application overrides the default database configuration in the `asynchbase.conf` file.

The process that AsyncHBase uses to access tables differs based on the default database configuration.

- When the default database is HBase, AsyncHBase accesses the table using the HBase port that was used to initialize the AsyncHBase client and the table name provided to the application.
- When the default database is MapR-DB, the table name provided to the application is translated to the MapR-DB table path, and then AsyncHBase accesses the table.
- When a default database is not configured, AsyncHBase first tries to access the table as a MapR-DB table. If that fails, it tries to access the table as an HBase table.

Set the Default Database using `asynchbase.conf`

To specify if AsyncHBase accesses HBase tables or MapR-DB tables:

1. Add the `mapr.hbase.default.db` parameter in the `asynchbase.conf` (`/opt/mapr/asynchbase/asynchbase-<version>/conf/asynchbase.conf`) file.
2. Set the value of `mapr.hbase.default.db` to one of the following values which will indicate the default database:
 - `hbase`
 - `maprddb`

Set the Default Database in the Client Application

Based on the database that you want as the default, add the following code in the client application:

- To access MapR-DB tables:

```
Config config = new Config();
String dbString = "maprdb";
config.overrideConfig(HBaseClient.CONFIG_PARAM_DEFAULT_DB,dbString);
HBaseClient client = new
HBaseClient(config);
```

- To access HBase tables:

```
Config config = new Config();
String dbString = "hbase";
config.overrideConfig(HBaseClient.CONFIG_PARAM_DEFAULT_DB,dbString);
HBaseClient client = new
HBaseClient(config);
```

Compiling and Running AsyncHBase Applications

When you compile or run AsyncHBase applications, you need to include the required AsyncHBase libraries.

To compile the application:

```
javac -cp `asynchbase
classpath`:$APP_CLASSPATH
<ProgramName>
```

To run the application, use one of the following commands:

- ```
java -cp `asynchbase
classpath`:$APP_CLASSPATH
<ProgramName>
```
- ```
asynchbase $APP_CLASSPATH
<ProgramName>
```

To include the AsyncHBase library in your maven project:

1. Add MapR's maven repository to the list of repositories in your project's pom.xml:

```
<repository>
<id>mapr-releases</id>
<url>https://repository.mapr.com/
maven/</url>
<snapshots><enabled>true</
enabled></snapshots>
<releases><enabled>true</enabled></
releases>
</repository>
```

2. Add the following dependency to the list of dependencies:

```
<dependency> <groupId>org.hbase</groupId>
<artifactId>asynchbase</artifactId>
<version><AsynchBaseVersion>-mapr-<MapREcoVersion></version> </dependency>
```

Note: For example, if you are using AsynchBase 1.7-1603, configure the following for the version dependency:
`<version>1.7.0-mapr-1603</version>`

AsynchBase Script

MapR provides an AsynchBase script that you can use to run applications and generate the AsynchBase classpath.

The asynchbase script has the following syntax:

```
asynchbase <command> [<args>]
Commands:
classpath Dump AsynchBase CLASSPATH
CLASSNAME Run the class named CLASSNAME
```

| Parameters | Description |
|------------|--|
| classpath | Dumps the AsynchBase classpath. For example, you can use <code>asynchbase classpath</code> when you compile an application: <pre>javac -cp `asynchbase classpath`:\$APP_CLASSPATH <ProgramName></pre> |
| CLASSNAME | Runs the named class. For example: <pre>asynchbase <path to application> CLASSNAME</pre> |

AsynchBase Behavior with HPE Ezmeral Data Fabric Database Binary Tables

After you install AsynchBase, you can use the AsynchBase libraries to provide asynchronous access to HPE Ezmeral Data Fabric Database binary tables. However, it is important to note the behavior that is specific to using AsynchBase with HPE Ezmeral Data Fabric Database.

The `Scanner.setMaxNumKeyValues` method, when run against HPE Ezmeral Data Fabric Database binary tables, does not behave as documented.

According to the AsynchBase documentation, this [method](#) sets “the maximum number of KeyValues the server is allowed to return in a single RPC response.”

When you use this method with HPE Ezmeral Data Fabric Database binary tables, the value for the maximum number of key values is ignored and the full set of KeyValues is always returned.

List<RegionClientStats> regionStats() is not supported

As of AsynchBase 1.7-1603, `List<RegionClientStats> regionStats()` is

not supported and when it is used the API does not return statistics.

HPE Ezmeral Data Fabric Database ignores HBase configurations in the `asynchbase.conf` file

As of AsyncHBase 1.7-1603, the `conf object` can be used to override Hbase properties that were previously only configured in the `asynchbase.conf` file. The `asynchbase.conf` file is located in the `asynchbase` installation directory. HPE Ezmeral Data Fabric Database does not use these Hbase configurations and therefore they are ignored by HPE Ezmeral Data Fabric Database

Using OpenTSDB with AsyncHBase

OpenTSDB can use MapR's AsyncHBase to perform time-series data-plots on HPE Ezmeral Data Fabric Database binary tables.

The [OpenTSDB](#) software package provides a time-series database that collects user-specified data.

To use OpenTSDB with AsyncHBase, install and configure OpenTSDB from source files or from a package.

Installing OpenTSDB from Source Files

The following steps describe how to install OpenTSDB from source files.

Be sure to install the OpenTSDB version that is required for your AsyncHBase version. AsyncHBase 1.6 requires OpenTSDB 2.0. AsyncHBase 1.7 requires OpenTSDB 2.2.

1. Clone the `opentsdb.git` project and check out the OpenTSDB branch that you require.

Note:

For example:

```
$ git clone https://github.com/OpenTSDB/opentsdb.git
Cloning into 'opentsdb'...
remote: Counting objects: 5625, done.
remote: Compressing objects: 100% (76/76), done.
remote: Total 5625 (delta 51), reused 64 (delta 30)
Receiving objects: 100% (5625/5625), 27.15 MiB | 2.67 MiB/s, done.
Resolving deltas: 100% (3755/3755), done.
Checking connectivity... done.
$ cd opentsdb
$ git tag -l
mapr-1.1.0-release+5
v1.0.0
v2.0.0
...
$ git checkout v2.0.0
Switched to a new branch 'v2.0.0'
```

2. Install dependencies for graph generation:

```
$ yum install autoconf automake gnuplot
```

3. Replace the `asynchbase.jar` file with the MapR version of that file:

```
$ yum install mapr-asynchbase
```

4. Run the build script:

```
./build.sh
```

5. If you want to use OpenTSDB with HPE Ezmeral Data Fabric Database tables, open the `create_table.sh` file (`<OPENTSDDB_ROOT_INSTALL_DIR>/src/create_table.sh`) and add `"/"` before the table names so that MapR recognizes them as HPE Ezmeral Data Fabric Database tables: See [Example: create_table.sh](#) on page 3394.

6. Create tables:

```
env COMPRESSION=NONE;HBASE_HOME=/opt/mapr/hbase/hbase-<version>
<OPENTSDDB_ROOT_INSTALL_DIR>/src/create_table.sh
```

7. Run the following command to verify that the tables are created successfully:

```
hadoop fs -ls /
```

8. Create a simple metric to store, such as `"sys.cpu.user"`:

```
./build/tsdb mkmetric sys.cpu.user --table=/tsdb --uidtable=/tsdb-uid
```

9. Run the OpenTSDB daemon (`tsd`).

```
./build/tsdb tsd --port=4242 --staticroot=build/staticroot
--cachedir=/tmp/opentsdb_tmp --zkquorum=10.10.101.50:5181 --table=/tsdb
--uidtable=/tsdb-uid
```

Note: Instead of providing these options on command line, you can configure the values in the `opentsdb.conf` file. This file must be in the root folder so the option settings are read when `tsd` is run. Also note that the `staticroot` argument points to the static UI files. You do not need to create `cachedir` because `opentsdb` creates it automatically. Specifying the destination `cachedir` argument is enough. You do need to explicitly specify `tsdb` tables (`tsdb`, `tsdb-uid`) and Zookeeper quorum nodes.

10. Log into the web UI: `http://<TSD_Installed_Node_IP>:<Port>`

For example: `http://10.10.10.230:4242/`

11. Run a simple test program that generates data and sends repeated puts for the metric over a socket connection: `<UI-IP>:<UI-Port>` . See [Data Generator Program](#) on page 3395.

12. Check the plot in the UI.

- a) Select **From date** and check **autoreload**.
- b) Fill in the metric (in this case, `sys.cpu.user`) and the Tag keys (`cpu`, `host`) values (`webserver 0`, `webserver 1`). You should see a graph with a random plot.

Example: create_table.sh

`create_table.sh` is used to set up HPE Ezmeral Data Fabric Database to accept `puts` from OpenTSDB. This example `create_table.sh` script was updated to work with HPE Ezmeral Data Fabric Database tables.

Note the changed sections for the *_TABLE variables.

```
#!/bin/sh
# Small script to setup the HBase tables used by OpenTSDB.

test -n "$HBASE_HOME" || {
    echo >&2 'The environment variable HBASE_HOME must be set'
    exit 1
}
test -d "$HBASE_HOME" || {
    echo >&2 "No such directory: HBASE_HOME=$HBASE_HOME"
    exit 1
}

TSDB_TABLE=${TSDB_TABLE-'/tsdb'}
UID_TABLE=${UID_TABLE-'/tsdb-uid'}
TREE_TABLE=${TREE_TABLE-'/tsdb-tree'}
META_TABLE=${META_TABLE-'/tsdb-meta'}
BLOOMFILTER=${BLOOMFILTER-'ROW'}
# LZO requires lzo2 64bit to be installed + the hadoop-gpl-compression jar.
COMPRESSION=${COMPRESSION-'LZO'}
# All compression codec names are upper case (NONE, LZO, SNAPPY, etc).
COMPRESSION=`echo "$COMPRESSION" | tr a-z A-Z`

case $COMPRESSION in
    (NONE|LZO|GZIP|SNAPPY) ;; # Known good.
    (*)
        echo >&2 "warning: compression codec '$COMPRESSION' might not be
supported."
        ;;
esac

# HBase scripts also use a variable named `HBASE_HOME', and having this
# variable in the environment with a value somewhat different from what
# they expect can confuse them in some cases. So rename the variable.
hbh=$HBASE_HOME
unset HBASE_HOME
exec "$hbh/bin/hbase" shell <<EOF
create '$UID_TABLE',
    {NAME => 'id', COMPRESSION => '$COMPRESSION', BLOOMFILTER =>
'$BLOOMFILTER'},
    {NAME => 'name', COMPRESSION => '$COMPRESSION', BLOOMFILTER =>
'$BLOOMFILTER'}

create '$TSDB_TABLE',
    {NAME => 't', VERSIONS => 1, COMPRESSION => '$COMPRESSION', BLOOMFILTER
=> '$BLOOMFILTER'}

create '$TREE_TABLE',
    {NAME => 't', VERSIONS => 1, COMPRESSION => '$COMPRESSION', BLOOMFILTER
=> '$BLOOMFILTER'}

create '$META_TABLE',
    {NAME => 'name', COMPRESSION => '$COMPRESSION', BLOOMFILTER =>
'$BLOOMFILTER'}
EOF
```

Data Generator Program

This simple test program generates data and sends repeated puts for the metric over a socket connection.

```
import java.io.PrintWriter;
import java.net.Socket;
import java.util.Date;
```

```

import java.util.Random;

public class TestOpenTsdBAPI {
    public static Random random = new Random();
    public static long timeStamp = new Date().getTime()/1000; //in secs
    public static void testTSDBConnection() throws Exception {
        Socket sock = null;
        PrintWriter pw = null;
        String hostname = "10.10.10.230";
        int port = 4242;
        int count=1;
        while(true) {
            if(null==sock) {
                sock = new Socket(hostname, port);
                pw = new PrintWriter(sock.getOutputStream(), true);
            }
            pw.println(dataGen(0, 0, count));
            pw.flush();
            pw.println(dataGen(0, 1, count));
            pw.flush();
            pw.println(dataGen(1, 0, count));
            pw.flush();
            pw.println(dataGen(1, 1, count));
            pw.flush();

            if(++count==Integer.MAX_VALUE) break;
            Thread.sleep(60000);
        }
    }
    public static void main(String [] args) {
        try {
            testTSDBConnection();
        } catch(Exception ex) {
            ex.printStackTrace();
        }
    }

    public static String dataGen(int web, int cpu, int count) {
        int Low = 1;
        int High = 99;
        int val = random.nextInt(High-Low) + Low;
        long timeStamp1 = new Date().getTime()/1000;
        String dat = "put sys.cpu.user "+(timeStamp1)+" "+val+"
host=webserver"+ web +" cpu="+cpu;//(timeStamp+count)
        System.out.println(dat);
        return dat;
    }
}

```

For example, this program tries to put metrics for 2 hosts (webserver 0 and webserver 1). Each host has 2 CPUs (cpu 0 and cpu 1). Sample puts look like this:

```

put sys.cpu.user 1415300810 87 host=webserver0 cpu=0
put sys.cpu.user 1415300810 66 host=webserver0 cpu=1
put sys.cpu.user 1415300810 18 host=webserver1 cpu=0
put sys.cpu.user 1415300810 26 host=webserver1 cpu=1

put <metric> <timestamp> <value> <tag1>=<> <tag2>=<>

```

When you run the program, you should see entries that indicate that the tags for the metric were created, and they should auto-complete on the UI.

```
UniqueId: Creating an ID for kind='tagv' name='webserver0'
```

You can also verify this from command line instead of the UI:

```
<OpenTSDB-Root>/build/tsdb query 1y-ago sum sys.cpu.user
```

Installing OpenTSDB with a Package

The following steps describe how to install OpenTSDB from a package.

Be sure to install the OpenTSDB version that is required for your AsyncHBase version. AsyncHBase 1.6 requires OpenTSDB 2.0. AsyncHBase 1.7 requires OpenTSDB 2.2.

1. Install the OpenTSDB RPM:

- a) `mkdir /root/opentsdbrpm`
- b) `cd /root/opentsdbrpm`
- c) Download the version of OpenTSDB that you required.
 For OpenTSDB 2.0: `wget https://github.com/OpenTSDB/opentsdb/releases/download/v2.0.0/opentsdb-2.0.0.noarch.rpm -O opentsdb-2.0.0.noarch.rpm`
 For OpenTSDB 2.2: `wget https://github.com/OpenTSDB/opentsdb/releases/download/v2.2.0/opentsdb-2.2.0.noarch.rpm -O opentsdb-2.2.0.noarch.rpm`
- d) `rpm -ivh opentsdb-<version>.noarch.rpm`

2. Configure OpenTSDB to work with MapR:

- a) Edit the following `tsdb` scripts to cover MapR-specific dependencies: `/usr/share/opentsdb/bin/tsdb` and `/usr/bin/tsdb`

```
# Base of MapR installation
BASEMAPR=${MAPR_HOME:-/opt/mapr}

# Add MapR hadoop jars to classpath
if test -d "$BASEMAPR/hadoop/hadoop-0.20.2/lib"; then
  # hadoop conf directory to beginning of classpath (for core-site.xml)
  CLASSPATH="$BASEMAPR/hadoop/hadoop-0.20.2/conf:$CLASSPATH"

  for jar in "$BASEMAPR"/hadoop/hadoop-0.20.2/lib/*.jar; do
    if [ "`echo $jar | grep slf4j`" != "" ]; then
      continue
    fi
    CLASSPATH="$CLASSPATH:$jar"
  done
fi
```

- b) Replace the `asynchbase` jar file (provide the current jar file name in the `cp` command):

```
cp
/opt/mapr/asynchbase/asynchbase-<version>/
asynchbase-<version>-mapr-*.jar
/usr/share/opentsdb/lib/
rm -f /usr/share/opentsdb/lib/asynchbase-<previous_version>.jar
```

- c) Configure the `opentsdb.conf` files: These files must have the following settings:

```
/usr/share/opentsdb/etc/opentsdb/opentsdb.conf
/etc/opentsdb/opentsdb.conf
```

```
tsd.network.port = 4242
tsd.http.staticroot = /usr/share/opentsdb/static/
tsd.core.auto_create_metrics = false (for testing purposes only)
tsd.storage.hbase.data_table = /tsdb
tsd.storage.hbase.uid_table = /tsdb-uid
tsd.storage.hbase.zk_quorum = <zookeeperNode>:<zookeeperP>
```

- d) Edit the `<OPENTSDB_ROOT_INSTALL_DIR>/src/create_table.sh` file and add `"/` before the table names so that MapR recognizes them as HPE Ezmeral Data Fabric Database tables. Then, create tables in HPE Ezmeral Data Fabric Database: .

```
export COMPRESSION=NONE; export HBASE_HOME=/opt/mapr/hbase/
hbase-<version>; /usr/share/opentsdb/tools/create_table.sh
```

See [Example: create_table.sh](#) on page 3394

- e) Confirm that the tables are created:

```
hadoop fs -ls /
tr-----   3 root root                2 2014-12-12 01:47 /tsdb
tr-----   3 root root                2 2014-12-12 01:47 /tsdb-meta
tr-----   3 root root                2 2014-12-12 01:47 /tsdb-tree
tr-----   3 root root                2 2014-12-12 01:47 /tsdb-uid
```

3. Start the `tsd` daemon. You can give executable permissions to the `tsdb` script in `/usr/share/opentsdb/bin`, or you can directly use `tsdb` (because of the dependencies you added earlier).

```
chmod +x /usr/share/opentsdb/bin/tsdb
/usr/share/opentsdb/bin/tsdb tsd --port=4242
--staticroot="/usr/share/opentsdb/static/"
--cachedir="/tmp/opentsdb" --auto-metric
```

4. Create a metric: `/usr/share/opentsdb/bin/tsdb mkmetric mymetric.stock`

5. Test the metric:

- a) Run a [Test Program for OpenTSDB](#) on page 3399 that reads from the `tmp_input` on page 3399 file and sends put requests to `opentsdb`, which saves the data to a HPE Ezmeral Data Fabric Database table (`tsdb/tsdb-uid`).
- b) Run aggregation queries (such as SUM) from the command line: `/usr/share/opentsdb/bin/tsdb query 1y-ago sum mymetric.stock` or `tsdb query 1y-ago sum mymetric.stock`

c) When you run the SUM command, the results should look like the following:

```
====
mymetric.stock 1407165399000 680.500015 {}
mymetric.stock 1407165401000 904.625000 {}
mymetric.stock 1407165402000 904.612495 {}
mymetric.stock 1407165403000 904.599991 {}
mymetric.stock 1407165404000 904.599991 {}
mymetric.stock 1407165405000 904.599991 {}
mymetric.stock 1407165406000 904.599991 {}
mymetric.stock 1407165407000 904.599991 {}
mymetric.stock 1407165408000 904.599991 {}
mymetric.stock 1407165409000 904.599991 {}
mymetric.stock 1407165410000 904.599991 {}
mymetric.stock 1407165411000 904.599991 {}
mymetric.stock 1407165412000 904.599991 {}
mymetric.stock 1407165413000 904.599991 {}
mymetric.stock 1407165414000 904.599991 {}
mymetric.stock 1407165415000 904.599991 {}
mymetric.stock 1407165416000 904.599991 {}
mymetric.stock 1407165417000 904.599991 {}
mymetric.stock 1407165418000 904.599991 {}
mymetric.stock 1407165419000 904.599991 {}
mymetric.stock 1407165422000 904.678749 {}
mymetric.stock 1407165423000 484.255005 {}

```

Test Program for OpenTSDB

```
public static void testTSDBConnection() throws Exception {
    Socket sock = null;
```

```

PrintWriter pw = null;
String hostname = "10.10.10.220"; //replace with the node where tsd
runs
    int port = 4242; //replace with your port
    sock = new Socket(hostname, port);
    pw = new PrintWriter(sock.getOutputStream(), true);
    File dir = new File(".");
    File fin = new File(dir.getCanonicalPath() + File.separator +
"tmp_input");
    BufferedReader br = new BufferedReader(new FileReader(fin));
String line = null;
while ((line = br.readLine()) != null) {
    System.out.println(line);
    pw.println(line);
    pw.flush();
}
br.close();
}

```

GetRequest API

MapR includes an additional constructor for the GetRequest class which takes an extra qualifier.

This additional constructor allows you to use one GetRequest to retrieve the key and value for tables that consist of multiple column families with different qualifiers:

```

public GetRequest(final byte[] table,
                  final byte[] key,
                  final byte[][] families,
                  final byte[][][] qualifiers) {
    super(table, key);
    this.families(families);
    this.qualifiers(qualifiers);
}

```

Cascading

Cascading™ is a Java application framework produced by Concurrent, Inc. that enables developers to quickly and easily build rich enterprise-grade Data Processing and Machine Learning applications that can be deployed and managed across private or cloud-based Hadoop clusters.

Note: Cascading is *not* part of the HPE Ezmeral Data Fabric distribution and not supported by HPE. However, like many other open source technologies, it can be used with HPE Ezmeral Data Fabric. The following information provides relevant details about using Cascading with HPE Ezmeral Data Fabric.

The `mt` command is the wrapper around Cascading. Multitool, a command line tool for processing large text files and datasets (like `sed` and `grep` on unix). The `mt` command is located in the `/opt/mapr/contrib/multitool/bin` directory.

Apache Drill

Drill is a low-latency distributed query engine for large-scale datasets, including structured and semi-structured/nested data. Inspired by Google's Dremel, Drill is designed to scale to several thousands of nodes and query petabytes of data at interactive speeds that BI/Analytics environments require.

Drill includes a distributed environment, purpose built for large-scale data processing. At the core of Drill is the "Drillbit" service which is responsible for accepting requests from the client, processing the queries, and returning results to the client.

Installing Drill

You can install Drill on one node or multiple nodes in a cluster. When Drill runs on each data node in a cluster, Drill can maximize data locality without moving data over the network or between nodes. Drill uses ZooKeeper to maintain cluster membership and health check information.

See [Installing Drill](#) on page 166 for instructions and additional information.

Configuring Data Source Connections

Drill connects to data sources through storage plugins. Drill can connect to several types of data sources including databases, local or distributed filesystems, and Hive metastores.

See [Connecting Drill to Data Sources](#) on page 3463 and [Connect a Data Source](#) for instructions and additional information.

Accessing Drill

After you install Drill and configure connections to your data sources, you can access Drill from any of the following user interfaces:

- [Drill shell \(SQLLine\)](#)
- [Drill Web Console](#)
- [ODBC](#)
- [JDBC](#)
- [C++ API](#)
- [REST API](#)

Additional Resources

Drill documentation is accessible from following the locations:

- [Drill Release Notes](#) on page 5942
- [Apache Drill](#)

Drill Tutorial

Drill is included as part of the Hadoop distribution. Refer to the [Drill web site](#) and [Drill documentation](#) for more details.

Hadoop is not a prerequisite for Drill and users can start learning Drill by running SQL queries directly on the local filesystem.

Getting to Know the Drill Setup

This section describes the configuration of the Drill system that you have installed and introduces the overall use case for the tutorial.

Storage Plugins Overview

The Hadoop cluster is set up with filesystem, HPE Ezmeral Data Fabric Database, and Hive, which all serve as data sources for Drill in this tutorial. Before you can run queries against these data sources, you need to connect to the data source through an interface called a storage plugin. A storage plugin defines interfaces to read/write and get metadata from the data source. Each storage plugin also exposes optimization rules for Drill to leverage for efficient query execution.

Jump directly to the queries in [Lesson 1: Learn About the Data Set](#), or first, get some important background information about pre-configured storage plugins by following these steps:

1. [Start the Drill Web Console](#).
2. Go to the Storage tab.
3. Open the configured storage plugins one at a time by clicking Update. You will see the following plugins configured.

dfs

This is a storage plugin configuration for the filesystem. The connection attribute indicates the type of distributed filesystem: in this case, filesystem. Drill can work with any distributed system, including HDFS, S3, and so on.

The configuration also includes a set of workspaces; each one represents a location in filesystem:

- root: access to the root filesystem location
- clicks: access to nested JSON log data
- logs: access to flat (non-nested) JSON log data in the logs directory and its subdirectories
- views: a workspace for creating views

A workspace in Drill is a location where users can easily access a specific set of data and collaborate with each other by sharing artifacts. Users can create as many workspaces as they need within Drill.

Each workspace can also be configured as “writable” or not, which indicates whether users can write data to this location and defines the storage format in which the data will be written (parquet, csv, json). These attributes become relevant when you explore Drill SQL commands, especially CREATE TABLE AS (CTAS) and CREATE VIEW.

Drill can query files and directories directly and can detect the file formats based on the file extension or the first few bits of data within the file. However, additional information around formats is required for Drill, such as delimiters for text files, which are specified in the “formats” section as follows.

```
{
  "type": "file",
  "enabled": true,
  "connection": "maprfs:///",
  "workspaces": {
    "root": {
      "location": "/mapr/demo.mapr.com/data",
      "writable": false,
      "storageformat": null
    },
    "clicks": {
      "location": "/mapr/demo.mapr.com/data/nested",
      "writable": true,
      "storageformat": "parquet"
    },
    "logs": {
      "location": "/mapr/demo.mapr.com/data/flat",
      "writable": true,
      "storageformat": "parquet"
    },
    "views": {
      "location": "/mapr/demo.mapr.com/data/views",
      "writable": true,
      "storageformat": "parquet"
    }
  },
  "formats": {
    "psv": {
      "type": "text",
      "extensions": [

        "tsv"
      ],
      "delimiter": "\t"
    },
    "parquet": {
      "type": "parquet"
    },
    "json": {
      "type": "json"
    }
  }
}
```

hive

A storage plugin configuration for a Hive data warehouse. Drill connects to the Hive metastore by using the configured metastore thrift URI. Metadata for Hive tables is automatically available for users to query.

```
{
  "type": "hive",
  "enabled": true,
  "configProps": {
    "hive.metastore.uris": "thrift://localhost:9083",
    "hive.metastore.sasl.enabled": "false"
  }
}
```

Client Application Interfaces

Drill also provides additional application interfaces for the client tools to connect and access from Drill. The interfaces include the following.

ODBC/JDBC drivers

Drill provides ODBC/JDBC drivers to connect from BI tools such as Tableau, MicroStrategy, SQUIrrel, and Jaspersoft; refer to [Drill Interfaces Introduction](#) to learn more.

SQLLine

SQLLine is a JDBC application that comes packaged with Drill. In order to start working with it, you can use the command line on the demo cluster to log in as root, then enter `sqlline`. Use `mapr` as the login password. For example:

```
$ ssh root@localhost -p 2222
Password:
Last login: Mon Sep 15 13:46:08 2014 from 10.250.0.28
Welcome to your Mapr Demo virtual machine.
[root@maprdemo ~]# sqlline
sqlline version 1.1.6
0: jdbc:drill:>
```

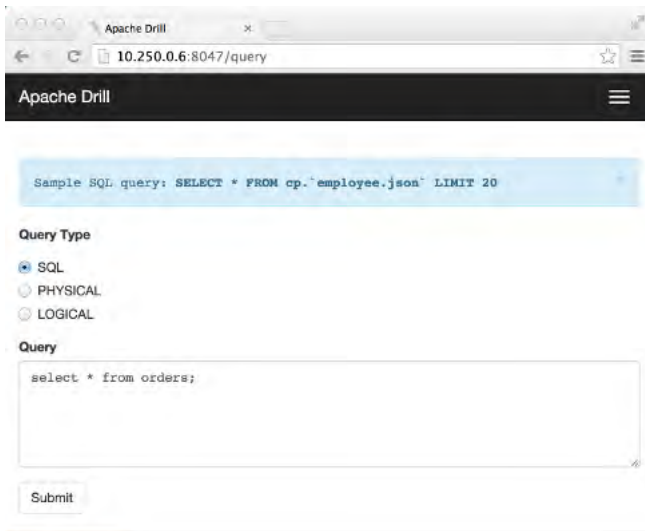

Drill Web UI

The Drill Web UI is a simple user interface for configuring and manage Drill. This UI can be launched from any of the nodes in the Drill cluster. The configuration for Drill includes setting up storage plugins that represent the data sources on which Drill performs queries. .

Users and developers can get the necessary information for tuning and performing diagnostics on queries, such as the list of queries executed in a session and detailed query plan profiles for each.

Detailed configuration and management of Drill is out of scope for this tutorial.

The following Web Console for Drill also provides a query UI where users can submit queries to Drill and observe results.

What's Next

Start running queries by going to [Lesson 1: Learn About the Data Set](#).

Lesson 1: Learn About the Data Set

Goal

This lesson is simply about discovering what data is available, in what format, using simple SQL SELECT statements. Drill is capable of analyzing data without prior knowledge or definition of its schema. This means that you can start querying data immediately (and even as it changes), regardless of its format.

The data set for the tutorial consists of:

- Transactional data: stored as a Hive table
- Product catalog and primary customer data: stored as HPE Ezmeral Data Fabric Database binary tables
- Clickstream and logs data: stored in the filesystem as JSON files

Queries in This Lesson

This lesson consists of select * queries on each data source.

Before You Begin

Start sqlline

If sqlline is not already started, use a Terminal or Command window to log into the demo VM as root, then enter sqlline:

```
$ ssh root@10.250.0.6
Password:
Last login: Mon Sep 15 13:46:08 2014 from 10.250.0.28
Welcome to your Mapr Demo virtual machine.
[root@maprdemo ~]# sqlline
sqlline version 1.1.6
0: jdbc:drill:>
```

You can run queries from this prompt to complete the tutorial. To exit from `sqlline`, type:

```
0: jdbc:drill:> !quit
```

Note that though this tutorial demonstrates the queries using `SQLLine`, you can also execute queries using the Drill Web UI.

Enable the DECIMAL Data Type

This tutorial uses the `DECIMAL` data type in some examples. The `DECIMAL` data type is disabled by default in this release, so enable the `DECIMAL` data type before proceeding:

```
alter session set `planner.enable_decimal_data_type`=true;
```

```
+-----+-----+
|  ok  |                summary                |
+-----+-----+
| true | planner.enable_decimal_data_type updated. |
+-----+-----+
1 row selected
```

List the available workspaces and databases:

```
0: jdbc:drill:> show databases;
```

```
+-----+
| SCHEMA_NAME |
+-----+
| hive.default |
| dfs.default  |
| dfs.logs     |
| dfs.root     |
| dfs.views    |
| dfs.clicks   |
| dfs.data     |
| dfs.tmp      |
| sys          |
| maprdb       |
| cp.default   |
| INFORMATION_SCHEMA |
+-----+
12 rows selected
```

Note that this command exposes all the metadata available from the storage plugins configured with Drill as a set of schemas. This includes the Hive and HPE Ezmeral Data Fabric Database databases as well as the workspaces configured in the filesystem. As you run queries in the tutorial, you will switch among these schemas by submitting the `USE` command. This behavior resembles the ability to use different database schemas (namespaces) in a relational database system.

Query Hive Tables

The `orders` table is a six-column Hive table defined in the Hive metastore. This is a Hive external table pointing to the data stored in flat files on the filesystem. The `orders` table contains 122,000 rows.

Set the schema to hive:

```
0: jdbc:drill:> use hive;
+-----+
| ok | summary |
+-----+
```

```
| true | Default schema changed to 'hive' |
+-----+
```

You will run the USE command throughout this tutorial. The USE command sets the schema for the current session.

Describe the table:

You can use the DESCRIBE command to show the columns and data types for a Hive table:

```
0: jdbc:drill:> describe orders;
+-----+-----+-----+
| COLUMN_NAME | DATA_TYPE | IS_NULLABLE |
+-----+-----+-----+
| order_id    | BIGINT     | YES         |
| month       | VARCHAR    | YES         |
| cust_id     | BIGINT     | YES         |
| state       | VARCHAR    | YES         |
| prod_id     | BIGINT     | YES         |
| order_total | INTEGER    | YES         |
+-----+-----+-----+
```

The DESCRIBE command returns complete schema information for Hive tables based on the metadata available in the Hive metastore.

Select 5 rows from the orders table:

```
0: jdbc:drill:> select * from orders limit 5;
+-----+-----+-----+-----+-----+-----+
| order_id | month | cust_id | state | prod_id | order_total |
+-----+-----+-----+-----+-----+-----+
| 67212    | June  | 10001   | ca    | 909     | 13          |
| 70302    | June  | 10004   | ga    | 420     | 11          |
| 69090    | June  | 10011   | fl    | 44      | 76          |
| 68834    | June  | 10012   | ar    | 0       | 81          |
| 71220    | June  | 10018   | az    | 411     | 24          |
+-----+-----+-----+-----+-----+-----+
```

Because orders is a Hive table, you can query the data in the same way that you would query the columns in a relational database table. Note the use of the standard LIMIT clause, which limits the result set to the specified number of rows. You can use LIMIT with or without an ORDER BY clause.

Drill provides seamless integration with Hive by allowing queries on Hive tables defined in the metastore with no extra configuration. Note that Hive is not a prerequisite for Drill, but simply serves as a storage plugin or data source for Drill. Drill also lets users query all Hive file formats (including custom serdes). Additionally, any UDFs defined in Hive can be leveraged as part of Drill queries.

Because Drill has its own low-latency SQL query execution engine, you can query Hive tables with high performance and support for interactive and ad-hoc data exploration.

Query HPE Ezmeral Data Fabric Database Binary Tables

The customers and products tables are HPE Ezmeral Data Fabric Database binary tables. HPE Ezmeral Data Fabric Database is an enterprise in-Hadoop NoSQL database. It exposes the HBase API to support application development. Every HPE Ezmeral Data Fabric Database binary table has a row_key, in addition to one or more column families. Each column family contains one or more specific columns. The row_key value is a primary key that uniquely identifies each row.

Drill allows direct queries on HPE Ezmeral Data Fabric Database binary tables. Unlike other SQL on Hadoop options, Drill requires no overlay schema definitions in Hive to work with this data. Think about a HPE Ezmeral Data Fabric Database table with thousands of columns, such as a time-series database, and the pain of having to management duplicate schemas for it in Hive!

Products Table

The products table has two column families.

| Column Family | Columns |
|---------------|------------------|
| details | name category |
| pricing | price |

The products table contains 965 rows.

Customers Table

The Customers table has three column families.

| Column Family | Columns |
|---------------|-----------------------|
| address | state |
| loyalty | agg_rev membership |
| personal | age gender |

The customers table contains 993 rows.

Set the workspace to maprdb:

```
0: jdbc:drill:> use maprdb;
+-----+
| ok | summary |
+-----+
| true | Default schema changed to 'maprdb' |
+-----+
```

Describe the tables:

```
0: jdbc:drill:> describe customers;
+-----+-----+-----+
| COLUMN_NAME | DATA_TYPE | IS_NULLABLE |
+-----+-----+-----+
| row_key     | ANY        | NO          |
| address     | (VARCHAR(1), ANY) MAP | NO          |
| loyalty     | (VARCHAR(1), ANY) MAP | NO          |
| personal    | (VARCHAR(1), ANY) MAP | NO          |
+-----+-----+-----+

0: jdbc:drill:> describe products;
+-----+
```

| COLUMN_NAME | DATA_TYPE | IS_NULLABLE |
|-------------|-----------------------|-------------|
| row_key | ANY | NO |
| details | (VARCHAR(1), ANY) MAP | NO |
| pricing | (VARCHAR(1), ANY) MAP | NO |

Unlike the Hive example, the DESCRIBE command does not return the full schema up to the column level. Column-oriented NoSQL databases such as HPE Ezmeral Data Fabric Database can be schema-less by design; every row has its own set of column name-value pairs in a given column family, and the column value can be of any data type, as determined by the application inserting the data.

A “MAP” complex type in Drill represents this variable column name-value structure, and “ANY” represents the fact that the column value can be of any data type. Observe the row_key, which is also simply bytes and has the type ANY.

Select 5 rows from the products table:

```
0: jdbc:drill:> select * from products limit 5;
+-----+-----+-----+
| row_key | details | pricing |
+-----+-----+-----+
| [B@a1a3e25 | {"category": "bGFwdG9w", "name": "I1Nvbnkgb... } |
{"price": "OTU5"} |
| [B@103a43af |
{"category": "RW52ZWxvcGVz", "name": "IzEwLTQgMS84IHggOSAxLzI... } |
{"price": "MT... } |
| [B@61319e7b |
{"category": "U3RvcnFnZSAmIE9yZ2FuaXphdGlvbg==", "name": "MjQgQ2FwYWNpdHkgTWF4a... } |
{"price": "... } |
| [B@9bcf17 | {"category": "TGFfZWxz", "name": "QXZlcnkgNDk4"} |
{"price": "Mw=="} |
| [B@7538ef50 | {"category": "TGFfZWxz", "name": "QXZlcnkgNDk="} |
{"price": "Mw=="} |
```

Given that Drill requires no up front schema definitions indicating data types, the query returns the raw byte arrays for column values, just as they are stored in HPE Ezmeral Data Fabric Database. Observe that the column families (details and pricing) have the map data type and appear as JSON strings.

In Lesson 2, you will use CAST functions to return typed data for each column.

Select 5 rows from the customers table:

```
0: jdbc:drill:> select * from customers limit 5;
+-----+-----+-----+-----+
| row_key | address | loyalty | personal |
+-----+-----+-----+-----+
| [B@284bae62 | {"state": "Imt5Ig==" } |
{"agg_rev": "IjEwMDEtMzAwMCI=", "membership": "ImJhc2ljIg==" } |
{"age": "IjI2LTMTlIg==" , "gender": "Ik1B |
| [B@7ffa4523 | {"state": "ImNhIg==" } |
{"agg_rev": "IjAtMTAwIg==" , "membership": "ImdvbGQi"} |
{"age": "IjI2LTMTlIg==" , "gender": "IkZFTUFMRSI= |
| [B@7d13e79 | {"state": "Im9rIg==" } |
{"agg_rev": "IjUwMS0xMDAwIg==" , "membership": "InNpbHZlciI=" } |
{"age": "IjI2LTMTlIg==" , "gender": "IkZFT |
| [B@3a5c7df1 | {"state": "ImtZlIg==" } |
{"agg_rev": "IjMwMDEtMTAwMDAwIg==" , "membership": "ImdvbGQi"} |
{"age": "IjUxLTUwMCI=" , "gender": "IkZFT |
| [B@e507726 | {"state": "Im5qIg==" } |
{"agg_rev": "IjAtMTAwIg==" , "membership": "ImJhc2ljIg==" } |
```

Select 2 rows from the clicks.json file:

```
0: jdbc:drill:> select * from `clicks/clicks.json` limit 2;
+-----+-----+-----+-----+-----+
| trans_id | date       | time       | user_info | trans_info |
+-----+-----+-----+-----+-----+
| 31920    | 2014-04-26 | 12:17:12  |           | {"cust_id":22526,"device":"IOS5","state":"il"} | {"prod_id":
[174,2],"purch_flag":"false"} |
| 31026    | 2014-04-20 | 13:50:29  |           | {"cust_id":16368,"device":"AOS4.2","state":"nc"} | {"prod_id":
[],"purch_flag":"false"} |
+-----+-----+-----+-----+-----+
2 rows selected
```

Note that the FROM clause reference points to a specific file. Drill expands the traditional concept of a “table reference” in a standard SQL FROM clause to refer to a file in a local or distributed filesystem.

The only special requirement is the use of back ticks to enclose the file path. This is necessary whenever the file path contains Drill reserved words or characters.

Select 2 rows from the campaign.json file:

```
0: jdbc:drill:> select * from `clicks/clicks.campaign.json` limit 2;
+-----+-----+-----+-----+-----+-----+
| trans_id | date       | time       | user_info | ad_info |
trans_info |
+-----+-----+-----+-----+-----+-----+
| 35232    | 2014-05-10 | 00:13:03  |           | {"camp_id":"null"} |
{"cust_id":18520,"device":"AOS4.3","state":"tx"} | {"prod_id":[7,7],"purch_flag":"true"} |
| 31995    | 2014-05-22 | 16:06:38  |           | {"camp_id":"null"} |
{"cust_id":17182,"device":"IOS6","state":"fl"} | {"prod_id":[],"purch_flag":"false"} |
+-----+-----+-----+-----+-----+-----+
2 rows selected
```

Notice that with a select * query, any complex data types such as maps and arrays return as JSON strings. You will see how to unpack this data using various SQL functions and operators in the next lesson.

Query Logs Data

Unlike the previous example where we performed queries against clicks data in one file, logs data is stored as partitioned directories on the filesystem. The logs directory has three subdirectories:

- 2012
- 2013
- 2014

Each of these year directories fans out to a set of numbered month directories, and each month directory contains a JSON file with log records for that month. The total number of records in all log files is 48000.

The files in the logs directory and its subdirectories are JSON files. There are many of these files, but you can use Drill to query them all as a single data source, or to query a subset of the files.

Set the workspace to dfs.logs:

```
0: jdbc:drill:> use dfs.logs;
+-----+
| ok | summary |
+-----+
| true | Default schema changed to 'dfs.logs' |
+-----+
```

Select 2 rows from the logs directory:

```
0: jdbc:drill:> select * from logs limit 2;
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| dir0 | dir1 | trans_id | date | time | cust_id | device | state | camp_id |
| keywords | prod_id | purch_fl |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| 2014 | 8 | 24181 | 08/02/2014 | 09:23:52 | 0 | IOS5 | il | 2 | wait | 128 |
| false |
| 2014 | 8 | 24195 | 08/02/2014 | 07:58:19 | 243 | IOS5 | mo | 6 | hmm |
107 | false |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
```

Note that this is flat JSON data. The `dfs.clicks` workspace location property points to a directory that contains the logs directory, making the FROM clause reference for this query very simple. You do not have to refer to the complete directory path on the file system.

The column names `dir0` and `dir1` are special Drill variables that identify subdirectories below the logs directory. In Lesson 3, you will do more complex queries that leverage these dynamic variables.

Find the total number of rows in the logs directory (all files):

```
0: jdbc:drill:> select count(*) from logs;
+-----+
| EXPR$0 |
+-----+
| 48000 |
+-----+
```

This query traverses all of the files in the logs directory and its subdirectories to return the total number of rows in those files.

What's Next

Go to Lesson 2: [Run Queries with ANSI SQL](#).

Lesson 2: Run Queries with ANSI SQL**Goal**

This lesson shows how to do some standard SQL analysis in Drill: for example, summarizing data by using simple aggregate functions and connecting data sources by using joins. Note that Drill provides ANSI SQL support, not a “SQL-like” interface.

Queries in This Lesson

Now that you know what the data sources look like in their raw form, using `select *` queries, try running some simple but more useful queries on each data source. These queries demonstrate how Drill supports

ANSI SQL constructs and also how you can combine data from different data sources in a single SELECT statement.

- Show an aggregate query on a single file or table. Use GROUP BY, WHERE, HAVING, and ORDER BY clauses.
- Perform joins between Hive, HPE Ezmeral Data Fabric Database, and filesystem data sources.
- Use table and column aliases.
- Create a Drill view.

Aggregation

Set the schema to hive:

```
0: jdbc:drill:> use hive;
+-----+-----+
|      ok      | summary |
+-----+-----+
| true         | Default schema changed to 'hive' |
+-----+-----+
1 row selected
```

Return sales totals by month:

```
0: jdbc:drill:> select `month`, sum(order_total)
from orders group by `month` order by 2 desc;
+-----+-----+
| month | EXPR$1 |
+-----+-----+
| June  | 950481 |
| May   | 947796 |
| March | 836809 |
| April | 807291 |
| July  | 757395 |
| October | 676236 |
| August | 572269 |
| February | 532901 |
| September | 373100 |
| January | 346536 |
+-----+-----+
```

Drill supports SQL aggregate functions such as SUM, MAX, AVG, and MIN. Standard SQL clauses work in the same way in Drill queries as in relational database queries.

Note that back ticks are required for the “month” column only because “month” is a reserved word in SQL.

Return the top 20 sales totals by month and state:

```
0: jdbc:drill:> select `month`, state, sum(order_total) as sales from
orders group by `month`, state
order by 3 desc limit 20;
+-----+-----+-----+
| month | state | sales |
+-----+-----+-----+
| May   | ca    | 119586 |
| June  | ca    | 116322 |
| April | ca    | 101363 |
| March | ca    | 99540  |
+-----+-----+-----+
```

| | | |
|----------|----|-------|
| July | ca | 90285 |
| October | ca | 80090 |
| June | tx | 78363 |
| May | tx | 77247 |
| March | tx | 73815 |
| August | ca | 71255 |
| April | tx | 68385 |
| July | tx | 63858 |
| February | ca | 63527 |
| June | fl | 62199 |
| June | ny | 62052 |
| May | fl | 61651 |
| May | ny | 59369 |
| October | tx | 55076 |
| March | fl | 54867 |
| March | ny | 52101 |

20 rows selected

Note the alias for the result of the SUM function. Drill supports column aliases and table aliases.

HAVING Clause

This query uses the HAVING clause to constrain an aggregate result.

Set the workspace to dfs.clicks

```
0: jdbc:drill:> use dfs.clicks;
-----+
|      ok      | summary |
-----+
| true         | Default schema changed to 'dfs.clicks' |
-----+
1 row selected
```

Return total number of clicks for devices that indicate high click-throughs:

```
0: jdbc:drill:> select t.user_info.device, count(*) from `clicks/
clicks.json` t
group by t.user_info.device
having count(*) > 1000;
-----+
|   EXPR$0   |   EXPR$1   |
-----+
| IOS5       | 11814      |
| AOS4.2     | 5986       |
| IOS6       | 4464       |
| IOS7       | 3135       |
| AOS4.4     | 1562       |
| AOS4.3     | 3039       |
-----+
```

The aggregate is a count of the records for each different mobile device in the clickstream data. Only the activity for the devices that registered more than 1000 transactions qualify for the result set.

UNION Operator

Use the same workspace as before (dfs.clicks).

Combine clicks activity from before and after the marketing campaign

```
0: jdbc:drill:> select t.trans_id transaction, t.user_info.cust_id customer
from `clicks/clicks.campaign.json` t
union all
select u.trans_id, u.user_info.cust_id from `clicks/clicks.json` u limit 5;
+-----+-----+
| transaction | customer |
+-----+-----+
| 35232       | 18520    |
| 31995       | 17182    |
| 35760       | 18228    |
| 37090       | 17015    |
| 37838       | 18737    |
+-----+-----+
```

This UNION ALL query returns rows that exist in two files (and includes any duplicate rows from those files): `clicks.campaign.json` and `clicks.json`.

Subqueries**Set the workspace to hive:**

```
0: jdbc:drill:> use hive;
+-----+-----+
|      ok      | summary |
+-----+-----+
| true         | Default schema changed to 'hive' |
+-----+-----+
```

Compare order totals across states:

```
0: jdbc:drill:> select ny_sales.cust_id, ny_sales.total_orders,
ca_sales.total_orders
from
(select o.cust_id, sum(o.order_total) as total_orders
from hive.orders o where state = 'ny' group by o.cust_id) ny_sales
left outer join
(select o.cust_id, sum(o.order_total) as total_orders
from
hive.orders o where state = 'ca' group by o.cust_id) ca_sales
on ny_sales.cust_id = ca_sales.cust_id
order by ny_sales.cust_id
limit 20;
+-----+-----+-----+
| cust_id | ny_sales | ca_sales |
+-----+-----+-----+
| 1001    | 72       | 47       |
| 1002    | 108      | 198      |
| 1003    | 83       | null     |
| 1004    | 86       | 210      |
| 1005    | 168      | 153      |
| 1006    | 29       | 326      |
| 1008    | 105      | 168      |
| 1009    | 443      | 127      |
| 1010    | 75       | 18       |
| 1012    | 110      | null     |
| 1013    | 19       | null     |
| 1014    | 106      | 162      |
| 1015    | 220      | 153      |
+-----+-----+-----+
```

| | | |
|------|-----|------|
| 1016 | 85 | 159 |
| 1017 | 82 | 56 |
| 1019 | 37 | 196 |
| 1020 | 193 | 165 |
| 1022 | 124 | null |
| 1023 | 166 | 149 |
| 1024 | 233 | null |

This example demonstrates Drill support for correlated subqueries. This query uses a subquery in the select list and correlates the result of the subquery with the outer query, using the `cust_id` column reference. The subquery returns the sum of order totals for California, and the outer query returns the equivalent sum, for the same `cust_id`, for New York.

The result set is sorted by the `cust_id` and presents the sales totals side by side for easy comparison. Null values indicate customer IDs that did not register any sales in that state.

CAST Function

Use the maprdb workspace:

```
0: jdbc:drill:> use maprdb;
+-----+-----+
|      ok      | summary |
+-----+-----+
| true         | Default schema changed to 'maprdb' |
+-----+-----+
1 row selected
```

Return customer data with appropriate data types

```
0: jdbc:drill:> select cast(row_key as int) as cust_id,
cast(t.personal.name as varchar(20)) as name,
cast(t.personal.gender as varchar(10)) as gender, cast(t.personal.age as
varchar(10)) as age,
cast(t.address.state as varchar(4)) as state, cast(t.loyalty.agg_rev as
dec(7,2)) as agg_rev,
cast(t.loyalty.membership as varchar(20)) as membership
from customers t limit 5;
```

| cust_id | name | gender | age | state | agg_rev | membership |
|---------|---------------------|----------|----------|-------|---------|------------|
| 10001 | "Corrine Mecham" | "FEMALE" | "15-20" | "va" | 197.00 | "silver" |
| 10005 | "Brittany Park" | "MALE" | "26-35" | "in" | 230.00 | "silver" |
| 10006 | "Rose Lokey" | "MALE" | "26-35" | "ca" | 250.00 | "silver" |
| 10007 | "James Fowler" | "FEMALE" | "51-100" | "me" | 263.00 | "silver" |
| 10010 | "Guillermo Koehler" | "OTHER" | "51-100" | "mn" | 202.00 | "silver" |

5 rows selected

Note the following features of this query:

- The CAST function is required for every column in the table. This function returns the HPE Ezmeral Data Fabric Database/HBase binary data as readable integers and strings. Depending on what encoding is used while populating the HPE Ezmeral Data Fabric Database binary tables/HBase tables, you might have to use CONVERT_TO/CONVERT_FROM functions to decode them.
- The row_key column functions as the primary key of the table (a customer ID in this case).
- The table alias t is required; otherwise the column family names would be parsed as table names and the query would return an error.

Remove the quotes from the strings:

You can use the regexp_replace function to remove the quotes around the strings in the query results. For example, to return a state name va instead of "va":

```
0: jdbc:drill:> select cast(row_key as int),
regexp_replace(cast(t.address.state as varchar(10)),'"', '')
from customers t limit 1;
+-----+-----+
|  EXPR$0  |  EXPR$1  |
+-----+-----+
| 10001    | va       |
+-----+-----+
1 row selected
```

CREATE VIEW Command

Use a mutable workspace:

```
0: jdbc:drill:> use dfs.views;
+-----+-----+
| ok | summary |
+-----+-----+
| true | Default schema changed to 'dfs.views' |
+-----+-----+
```

A mutable (or writable) workspace is a workspace that is enabled for “write” operations. This attribute is part of the storage plugin configuration. You can create Drill views and tables in mutable workspaces.

Create a view on a HPE Ezmeral Data Fabric Database binary table

```
0: jdbc:drill:> create or replace view custview as select cast(row_key as
int) as cust_id,
cast(t.personal.name as varchar(20)) as name,
cast(t.personal.gender as varchar(10)) as gender,
cast(t.personal.age as varchar(10)) as age,
cast(t.address.state as varchar(4)) as state,
cast(t.loyalty.agg_rev as dec(7,2)) as agg_rev,
cast(t.loyalty.membership as varchar(20)) as membership
from maprdb.customers t;
+-----+-----+
|  ok  |  summary  |
+-----+-----+
| true | View 'custview' replaced successfully in 'dfs.views' schema |
+-----+-----+
1 row selected
```

Drill provides CREATE OR REPLACE VIEW syntax similar to relational databases to create views. Use the OR REPLACE option to make it easier to update the view later without having to remove it first. Note

that the FROM clause in this example must refer to `maprdb.customers`. The HPE Ezmeral Data Fabric Database binary tables are not directly visible to the `dfs.views` workspace.

Unlike a traditional database where views typically are DBA/developer-driven operations, filesystem-based views in Drill are very lightweight. A view is simply a special file with a specific extension (`.drill`). You can store views even in your local filesystem or point to a specific workspace. You can specify any query against any Drill data source in the body of the CREATE VIEW statement.

Drill provides a decentralized metadata model. Drill is able to query metadata defined in data sources such as Hive, HBase, and the filesystem. Drill also supports the creation of metadata in the filesystem.

Query data from the view:

```
0: jdbc:drill:> select * from custview limit 1;
```

| cust_id | name | gender | age | state |
|---------|------------------|----------|---------|-------|
| 10001 | "Corrine Mecham" | "FEMALE" | "15-20" | "va" |

Once the users know what data is available by exploring it directly from the file system, views can be used as a way to read the data into downstream tools such as Tableau and MicroStrategy for analysis and visualization. For these tools, a view appears simply as a “table” with selectable “columns” in it.

Query Across Data Sources

Continue using `dfs.views` for this query.

Join the customers view and the orders table:

```
0: jdbc:drill:> select membership, sum(order_total) as sales from
hive.orders, custview
where orders.cust_id=custview.cust_id
group by membership order by 2;
```

| membership | sales |
|------------|---------|
| "basic" | 380665 |
| "silver" | 708438 |
| "gold" | 2787682 |

3 rows selected

In this query, we are reading data from a HPE Ezmeral Data Fabric Database binary table (represented by `custview`) and combining it with the order information in Hive. When doing cross data source queries such as this, you need to use fully qualified table/view names. For example, the orders table is prefixed by “hive,” which is the storage plugin name registered with Drill. We are not using any prefix for “`custview`” because we explicitly switched the `dfs.views` workspace where `custview` is stored.

Note: Note: If the results of any of your queries appear to be truncated because the rows are wide, set the maximum width of the display to 10000:

```
0: jdbc:drill:> !set maxwidth 10000
```

Do not use a semicolon for this SET command.

Join the customers, orders, and clickstream data:

```
0: jdbc:drill:> select custview.membership, sum(orders.order_total) as
sales from hive.orders, custview,
dfs.`/mapr/demo.mapr.com/data/nested/clicks/clicks.json` c
where orders.cust_id=custview.cust_id and
orders.cust_id=c.user_info.cust_id
group by custview.membership order by 2;
+-----+-----+
| membership | sales |
+-----+-----+
| "basic"    | 372866 |
| "silver"   | 728424 |
| "gold"     | 7050198 |
+-----+-----+
3 rows selected
```

This three-way join selects from three different data sources in one query:

- hive.orders table
- custview (a view of the HBase customers table)
- clicks.json file

The join column for both sets of join conditions is the cust_id column. The views workspace is used for this query so that custview can be accessed. The hive.orders table is also visible to the query.

However, note that the JSON file is not directly visible from the views workspace, so the query specifies the full path to the file:

```
dfs.`/mapr/demo.mapr.com/data/nested/clicks/clicks.json`
```

What's Next

Go to Lesson 3: [Run Queries on Complex Data Types](#)

Lesson 3: Run Queries on Complex Data Types**Goal**

This lesson focuses on queries that exercise functions and operators on self-describing data and complex data types. Drill offers intuitive SQL extensions to work with such data and offers high query performance with an architecture built from the ground up for complex data.

Queries in This Lesson

Now that you have run ANSI SQL queries against different tables and files with relational data, you can try some examples including complex types.

- Access directories and subdirectories of files in a single SELECT statement.
- Demonstrate simple ways to access complex data in JSON files.
- Demonstrate the repeated_count function to aggregate values in an array.

Query Partitioned Directories

You can use special variables in Drill to refer to subdirectories in your workspace path:

- dir0

- dir1
- ...

Note that these variables are dynamically determined based on the partitioning of the file system. No up-front definitions are required on what partitions exist.

Set workspace to dfs.logs

```
0: jdbc:drill:> use dfs.logs;
+-----+
| ok | summary |
+-----+
| true | Default schema changed to 'dfs.logs' |
+-----+
```

Query logs data for a specific year

```
0: jdbc:drill:> select * from logs where dir0='2013' limit 10;
+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| dir0 | dir1 | trans_id | date | time | cust_id | device | state | camp_id |
| keywords | prod_id | purch_flag |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| 2013 | 11 | 12119 | 11/09/2013 | 02:24:51 | 262 | IOS5 | ny | 0 | chamber |
| 198 | false |
| 2013 | 11 | 12120 | 11/19/2013 | 09:37:43 | 0 | AOS4.4 | il | 2 | outside |
| 511 | false |
| 2013 | 11 | 12134 | 11/10/2013 | 23:42:47 | 60343 | IOS5 | ma | 4 | and |
| 421 | false |
| 2013 | 11 | 12135 | 11/16/2013 | 01:42:13 | 46762 | AOS4.3 | ca | 4 |
| here's | 349 | false |
| 2013 | 11 | 12165 | 11/26/2013 | 21:58:09 | 41987 | AOS4.2 | mn | 4 | he |
| 271 | false |
| 2013 | 11 | 12168 | 11/09/2013 | 23:41:48 | 8600 | IOS5 | in | 6 | i |
| 459 | false |
| 2013 | 11 | 12196 | 11/20/2013 | 02:23:06 | 15603 | IOS5 | tn | 1 | like |
| 324 | false |
| 2013 | 11 | 12203 | 11/25/2013 | 23:50:29 | 221 | IOS6 | tx | 10 | if |
| 323 | false |
| 2013 | 11 | 12206 | 11/09/2013 | 23:53:01 | 2488 | AOS4.2 | tx | 14 |
| unlike | 296 | false |
| 2013 | 11 | 12217 | 11/06/2013 | 23:51:56 | 0 | AOS4.2 | tx | 9 | can't |
| 54 | false |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+
```

This query constrains files inside the subdirectory named 2013. The variable dir0 refers to the first level down from logs, dir1 to the next level, and so on. So this query returned 10 of the rows for February 2013.

Further constrain the results using multiple predicates in the query

```
0: jdbc:drill:> select dir0 as yr, dir1 as mth, cust_id from logs
where dir0='2013' and dir1='8' and device='IOS5' and purch_flag='true'
order by `date`;
+-----+-----+-----+
| yr | mth | cust_id |
+-----+-----+-----+
| 2013 | 8 | 4 |
| 2013 | 8 | 521 |
+-----+-----+-----+
```

```

| 2013 | 8 | 1 |
| 2013 | 8 | 2 |
| 2013 | 8 | 4 |
| 2013 | 8 | 549 |
| 2013 | 8 | 72827 |
| 2013 | 8 | 38127 |
...

```

This query returns a list of customer IDs for people who made a purchase via an IOS5 device in August 2013.

Return monthly counts per customer for a given year

```

0: jdbc:drill:> select cust_id, dir1 month_no, count(*) month_count from
logs
where dir0=2014 group by cust_id, dir1 order by cust_id, month_no limit 10;
+-----+-----+-----+
| cust_id | month_no | month_count |
+-----+-----+-----+
| 0       | 1       | 143       |
| 0       | 2       | 118       |
| 0       | 3       | 117       |
| 0       | 4       | 115       |
| 0       | 5       | 137       |
| 0       | 6       | 117       |
| 0       | 7       | 142       |
| 0       | 8       | 19        |
| 1       | 1       | 66        |
| 1       | 2       | 59        |
+-----+-----+-----+
10 rows selected

```

This query groups the aggregate function by customer ID and month for one year: 2014.

Query Complex Data

Drill provides some specialized operators and functions that you can use to analyze nested data natively without transformation. If you are familiar with JavaScript notation, you will already know how some of these extensions work.

Set the workspace to dfs.clicks

```

0: jdbc:drill:> use dfs.clicks;
+-----+-----+
| ok | summary |
+-----+-----+
| true | Default schema changed to 'dfs.clicks' |
+-----+-----+

```

Explore clickstream data

```

0: jdbc:drill:> select * from `clicks/clicks.json` limit 5;
+-----+-----+-----+-----+-----+
| trans_id | date | time | user_info | trans_info |
+-----+-----+-----+-----+-----+
| 31920 | 2014-04-26 | 12:17:12 | {"cust_id":22526,"device":"IOS5","state":"il"} | {"prod_id":
[174,2],"purch_flag":"false"} |
| 31026 | 2014-04-20 | 13:50:29 | {"cust_id":16368,"device":"AOS4.2","state":"nc"} | {"prod_id":

```

```
[ ],"purch_flag":"false"} |
| 33848 | 2014-04-10 | 04:44:42
| {"cust_id":21449,"device":"IOS6","state":"oh"} | {"prod_id":
[582],"purch_flag":"false"} |
| 32383 | 2014-04-18 | 06:27:47
| {"cust_id":20323,"device":"IOS5","state":"oh"} | {"prod_id":
[710,47],"purch_flag":"false"} |
| 32359 | 2014-04-19 | 23:13:25 |
{"cust_id":15360,"device":"IOS5","state":"ca"} | {"prod_id":
[0,8,170,173,1,124,46,764,30,711,0,3,25],"purch_flag":"true"} |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
```

Note that the `user_info` and `trans_info` columns contain nested data: arrays and arrays within arrays. The following queries show how to access this complex data.

Unpack the `user_info` column

```
0: jdbc:drill:> select t.user_info.cust_id as custid, t.user_info.device as
device,
t.user_info.state as state
from `clicks/clicks.json` t limit 5;
+-----+-----+-----+
| custid | device | state |
+-----+-----+-----+
| 22526  | IOS5   | il    |
| 16368  | AOS4.2 | nc    |
| 21449  | IOS6   | oh    |
| 20323  | IOS5   | oh    |
| 15360  | IOS5   | ca    |
+-----+-----+-----+
```

This query uses a simple `table.column.column` notation to extract nested column data. For example:

```
t.user_info.cust_id
```

where `t` is the table alias provided in the query, `user_info` is a top-level column name, and `cust_id` is a nested column name.

The table alias is required; otherwise column names such as `user_info` are parsed as table names by the SQL parser.

Unpack the `trans_info` column

```
0: jdbc:drill:> select t.trans_info.prod_id as prodid,
t.trans_info.purch_flag as
purchased
from `clicks/clicks.json` t limit 5;
+-----+-----+
| prodid | purchased |
+-----+-----+
| [174,2] | false    |
| []      | false    |
| [582]   | false    |
| [710,47] | false    |
| [0,8,170,173,1,124,46,764,30,711,0,3,25] | true    |
+-----+-----+
5 rows selected
```

Note that this result reveals that the `prod_id` column contains an array of IDs (one or more product ID values per row, separated by commas). The next step shows how you to access this kind of data.

Query Arrays

Now use the [n] notation, where n is the position of the value in an array, starting from position 0 (not 1) for the first value. You can use this notation to write interesting queries against nested array data.

For example:

```
trans_info.prod_id[0]
```

refers to the first value in the nested prod_id column and

```
trans_info.prod_id[20]
```

refers to the 21st value, assuming one exists.

Find the first product that is searched for in each transaction:

```
0: jdbc:drill:> select t.trans_id, t.trans_info.prod_id[0] from `clicks/
clicks.json` t limit 5;
+-----+-----+
| trans_id |  EXPR$1  |
+-----+-----+
| 31920    | 174      |
| 31026    | null     |
| 33848    | 582      |
| 32383    | 710      |
| 32359    | 0        |
+-----+-----+
5 rows selected
```

For which transactions did customers search on at least 21 products?

```
0: jdbc:drill:> select t.trans_id, t.trans_info.prod_id[20]
from `clicks/clicks.json` t
where t.trans_info.prod_id[20] is not null
order by trans_id limit 5;
+-----+-----+
| trans_id |  EXPR$1  |
+-----+-----+
| 10328    | 0        |
| 10380    | 23       |
| 10701    | 1        |
| 11100    | 0        |
| 11219    | 46       |
+-----+-----+
5 rows selected
```

This query returns transaction IDs and product IDs for records that contain a non-null product ID at the 21st position in the array.

Return clicks for a specific product range:

```
0: jdbc:drill:> select * from (select t.trans_id, t.trans_info.prod_id[0]
as prodid,
t.trans_info.purch_flag as purchased
from `clicks/clicks.json` t) sq
where sq.prodid between 700 and 750 and sq.purchased='true' order by
sq.prodid;
+-----+-----+-----+
| trans_id | prodid | purchased |
+-----+-----+-----+
| 21886   | 704   | true     |
```

```

| 20674 | 708 | true |
| 22158 | 709 | true |
| 34089 | 714 | true |
| 22545 | 714 | true |
| 37500 | 717 | true |
| 36595 | 718 | true |
...

```

This query assumes that there is some meaning to the array (that it is an ordered list of products purchased rather than a random list).

Perform Operations on Arrays

Rank successful click conversions and count product searches for each session:

```

0: jdbc:drill:> select t.trans_id, t.`date` as session_date,
t.user_info.cust_id as
cust_id, t.user_info.device as device, repeated_count(t.trans_info.prod_id)
as
prod_count, t.trans_info.purch_flag as purch_flag
from `clicks/clicks.json` t
where t.trans_info.purch_flag = 'true' order by prod_count desc;

```

```

+-----+-----+-----+-----+-----+-----+
| trans_id | session_date | cust_id | device | prod_count | purch_flag |
+-----+-----+-----+-----+-----+-----+
| 37426 | 2014-04-06 | 18709 | IOS5 | 34 | true |
| 31589 | 2014-04-16 | 18576 | IOS6 | 31 | true |
| 11600 | 2014-04-07 | 4260 | AOS4.2 | 28 | true |
| 35074 | 2014-04-03 | 16697 | AOS4.3 | 27 | true |
| 17192 | 2014-04-22 | 2501 | AOS4.2 | 26 | true |
...

```

This query uses a Drill SQL extension, the `repeated_count` function, to get an aggregated count of the array values. The query returns the number of products searched for each session that converted into a purchase and ranks the counts in descending order. Only clicks that have resulted in a purchase are counted.

Store a Result Set in a Table for Reuse and Analysis

To facilitate additional analysis on this result set, you can easily and quickly create a Drill table from the results of the query.

Continue to use the `dfs.clicks` workspace

```

0: jdbc:drill:> use dfs.clicks;
+-----+-----+
| ok | summary |
+-----+-----+
| true | Default schema changed to 'dfs.clicks' |
+-----+-----+

```

Return product searches for high-value customers:

```

0: jdbc:drill:> 0: jdbc:drill:> select o.cust_id, o.order_total,
t.trans_info.prod_id[0] as prod_id
from
hive.orders as o

```

```

join `clicks/clicks.json` t
on o.cust_id=t.user_info.cust_id
where o.order_total > (select avg(inord.order_total)
                       from hive.orders inord
                       where inord.state = o.state);
+-----+-----+-----+
| cust_id | order_total | prod_id |
+-----+-----+-----+
| 1328    | 73          | 26      |
| 1328    | 146         | 26      |
| 1328    | 56          | 26      |
| 1328    | 91          | 26      |
| 1328    | 74          | 26      |
...
+-----+-----+-----+
107,482 rows selected (14.863 seconds)

```

This query returns a list of products that are being searched for by customers who have made transactions that are above the average in their states.

Materialize the result of the previous query:

```

0: jdbc:drill:> 0: jdbc:drill:> create table product_search as select
o.cust_id, o.order_total, t.trans_info.prod_id[0] as prod_id
from
hive.orders as o
join `clicks/clicks.json` t
on o.cust_id=t.user_info.cust_id
where o.order_total > (select avg(inord.order_total)
                       from hive.orders inord
                       where inord.state = o.state);
+-----+-----+-----+
| Fragment | Number of records written |
+-----+-----+-----+
| 0_0      | 107482                    |
+-----+-----+-----+
1 row selected

```

This example uses a CTAS statement to create a table based on a correlated subquery that you ran previously. This table contains all of the rows that the query returns (107,482) and stores them in the format specified by the storage plugin (Parquet format in this example). You can create tables that store data in csv, parquet, and json formats.

Query the new table to verify the row count

```

0: jdbc:drill:> select count(*) from product_search;
+-----+
|  EXPR$0  |
+-----+
| 107482   |
+-----+
1 row selected

```

This example simply checks that the CTAS statement worked by verifying the number of rows in the table.

Find the storage file for the table

```

[root@maprdemo product_search]# cd /mapr/demo.mapr.com/data/nested/
product_search
[root@maprdemo product_search]# ls -la

```

```
total 451
drwxr-xr-x. 2 mapr mapr      1 Sep 15 13:41 .
drwxr-xr-x. 4 root root      2 Sep 15 13:41 ..
-rwxr-xr-x. 1 mapr mapr 460715 Sep 15 13:41 0_0_0.parquet
```

Note that the table is stored in a file called `0_0_0.parquet`. This file is stored in the location defined by the `dfs.clicks` workspace:

```
"location": "/mapr/demo.mapr.com/data/nested"
```

with a subdirectory that has the same name as the table you created.

Summary

This tutorial introduced Drill and its ability to run ANSI SQL queries against various data sources, including Hive tables, HPE Ezmeral Data Fabric Database binary tables, and filesystem directories. The tutorial also showed how to work with and manipulate complex and multi-structured data commonly found in Hadoop/NoSQL systems.

Now that you are familiar with different ways to access the sample data with Drill, you can try writing your own queries against your own data sources. Refer to the [Apache Drill documentation](#) for more information.

Drill-on-YARN

You can install and run Drill under Warden or you can install and run Drill under YARN. [YARN \(Yet Another Resource Negotiator\)](#) is a cluster management tool that automates the resource sharing process in a cluster.

Note: The [MapR default security feature](#) introduced in 6.0 is not supported with Drill-on-YARN.

The following sections provide information about Drill-on-YARN, including overview material, installation and configuration instructions, and additional information related to Drill-on-YARN:

Drill-on-YARN Overview

Running Drill as a YARN application (Drill-on-YARN) enables Drill to work alongside other applications, such as Hadoop and Spark, in a YARN-managed cluster. If you are currently running Drill under Warden, you can upgrade Drill and continue to run Drill under Warden, or you can migrate Drill to run under YARN. See [Migrate Drill to Run Under YARN](#) for instructions.

YARN assigns resources, such as memory and CPU, to applications in the cluster and eliminates the manual steps associated with installation and resource allocation for stand-alone applications in a multi-tenant environment. YARN automatically deploys (localizes) the Drill software onto each Drill node and manages the Drill cluster. Drill becomes a long-running application with YARN. You can monitor the Drill-on-YARN cluster using the Application Master web UI.

Resource Usage

By design, Drill aggressively uses all of the resources available to run queries at optimal speed. When Drill runs under YARN, you must inform YARN of the resources that Drill needs. The resource settings are descriptive, not proscriptive. Drill does not limit itself to the YARN settings, instead the YARN settings inform YARN of the resources that Drill will consume so that YARN does not over-allocate those resources to other tasks.

YARN manages CPU, memory, and disks. YARN calls settings for memory and CPU “vcores.” You configure Drill’s memory and then inform YARN of the Drill configuration. Drill uses all available disk I/O and CPU.

Components

Several software components work together to run Drill as a YARN application. Drill, YARN, and the Drill-on-YARN application collectively provide the components required to run Drill under YARN.

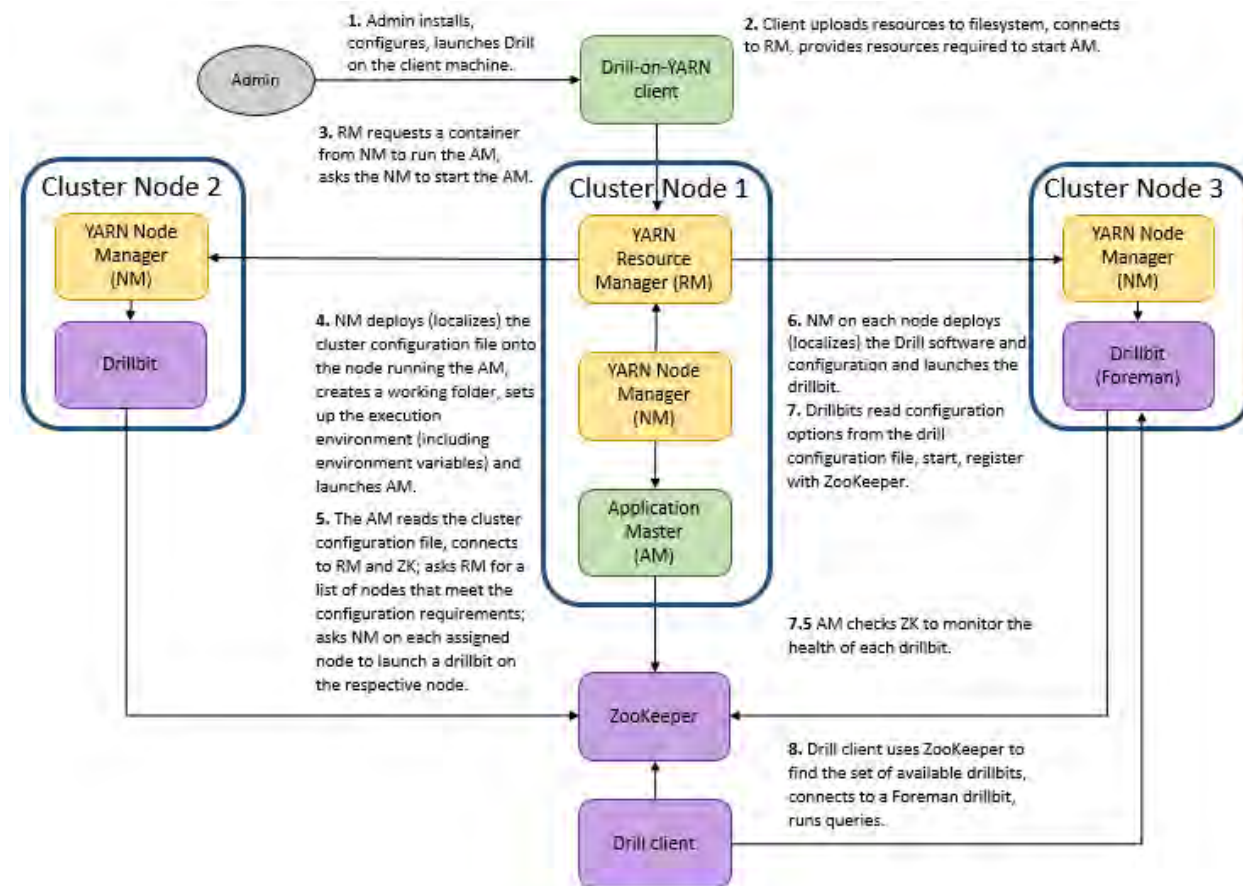

The following table lists the software components with their descriptions:

| Software | Component | Description |
|---------------------------|----------------------------|--|
| YARN | Resource Manager | The Resource Manager manages the set of applications running on the cluster. Each cluster must have one Resource Manager. |
| | Node Manager | The Node Manager manages the application tasks running on a particular node. Each node in a cluster must have one Node Manager. |
| Drill | Drillbit | A Drillbit is the Drill daemon software that YARN runs on each node in the cluster. See Drill Query Execution . The Drillbit process on the node acts as the application task. |
| | Client | A client, such as JDBC, ODBC, or SQLLine sends queries to a Drillbit. The client uses ZooKeeper to discover a Drillbit that the client treats as the Foreman. See Drill Clients . |
| | Drill distribution archive | The Drill distribution archive is a Drill distribution .tar.gz file included with the Drill installation. Drill-on-YARN uploads this archive to the distributed filesystem (DFS). YARN downloads (localizes) the file to each worker node. |
| ZooKeeper | ZooKeeper | ZooKeeper is the service that tracks the available set of Drillbit processes. The Foreman for a query uses ZooKeeper to identify the set of available drill nodes that can run the query. See Drill Query Execution . |
| Drill-on-YARN Application | Application Master (AM) | The Application Manager requests containers from the Resource Manager and launches Drillbits using those containers. The AM monitors Drillbits, detects failures, and restarts failed Drillbits. The AM also provides a web UI to manage the Drill cluster. |
| | Drill-on-YARN client | The Drill-on-YARN client is a command-line program that starts, stops, and monitors the Drill cluster. The client provides the information that YARN needs to start the Application Master. The client can run on any machine that has both the Drill and YARN client software. The client does not have to be part of the YARN cluster. |
| | drill-on-yarn.conf | The drill-on-yarn.conf configuration file provides the information that Drill-on-YARN needs to manage the Drill cluster. This file is separate from the configuration files for Drill itself. |

Component Workflow

Running Drill as a YARN application is mostly an automated process carried out by the Drill and YARN components. After an administrator installs, configures, and launches Drill from the Drill-on-YARN client, YARN deploys (localizes) Drill on to designated nodes and starts the Drill process on each node.

The following diagram shows the workflow between the components in a cluster with the steps that Drill and YARN complete to deploy and run Drill as a YARN application:

Configuring Drill to Run Under YARN

To run Drill under YARN, you must have the YARN version of Drill installed on the node designated as the Drill-on-YARN client. If you have not already planned your cluster and installed the YARN-ready version of Drill, see [Install Drill to Run Under YARN](#) and then return to this topic to configure Drill to run as a YARN application.

Configuring Drill to run under YARN requires modifications to Drill, Drill-on-YARN, and YARN configuration files. The following sections provide the information needed to make the changes to the configuration files, as well as information about how to launch Drill under YARN and validate the cluster configuration and status of the Drill nodes.

Complete the following steps to configure Drill to run under YARN, launch Drill as a YARN application, and validate the cluster:

Step 1: Configure Drill

Drill configuration under Drill-on-YARN differs from Drill configuration under Warden. You must create a site directory to contain the site-specific files for Drill. Drill-on-YARN copies the site directory to every node so that each node has the configuration settings. Having a site directory also simplifies upgrades because you can just delete the old Drill distribution and install the new one while the site-specific files remain unchanged in the site directory.

The `drill-env.sh` file contains only custom configurations. Data Fabric-specific configuration settings reside in `distrib-env.sh`, a file separate from the site-specific settings. When you migrate an existing Drill installation to run under YARN, you must modify the `drill-env.sh` to remove the Drill and Data Fabric settings, leaving only your site-specific settings.

When you finish configuring Drill, use the site directory to test Drill, including starting, checking status, and stopping Drill.

Note: If you installed the `mapr-drill-yarn` package on nodes other than the Drill-on-YARN client in order to make SQLLine accessible to users, the site directory must be accessible from all nodes. You can copy the configurations across all the nodes, as you did when you ran Drill under the Warden service. Alternatively, you can put the site directory in a shared filesystem `nfs` mount to extend the configuration. When users launch SQLLine, they should provide the ZooKeeper connection string to launch Drill.

Create the Site Directory

To create the `site` directory, complete the following steps as the user that installed Drill and will run the Drill-on-YARN client application:

1. Create the site directory and an environment variable for the directory:

```
export DRILL_SITE=/opt/mapr/drill/site
mkdir $DRILL_SITE
```

Note: The variable is not required. It is used for convenience in the documentation.

2. Copy the `drill-env.sh`, `drill-override.conf`, `drill-on-yarn.conf`, and `distrib-env.sh` files from `$DRILL_HOME/conf/` into the `site` directory. In the following example, `$DRILL_HOME` is the location of the new Drill installation (usually `/opt/mapr/drill/drill-<version>`).

```
cp $DRILL_HOME/conf/drill-override.conf $DRILL_SITE
cp $DRILL_HOME/conf/drill-env.sh $DRILL_SITE
cp $DRILL_HOME/conf/drill-on-yarn.conf $DRILL_SITE
cp $DRILL_HOME/conf/distrib-env.sh $DRILL_SITE
```

Note: Copy any configuration changes from `drill-env.sh` file in the previous Drill installation over to the `drill-env.sh` file in the `site` directory. Do not include the memory settings when you copy over your previous configurations. These changes must be made in the `drill-on-yarn.conf` file described in Step 3: Configure YARN to Run Drill.

Note: Never modify `distrib-env.sh`. The `distrib-env.sh` script contains Data Fabric settings that you should not change. You copy this file to the `site` directory because it often contains values set during Drill installation. When you upgrade Drill, replace the file with the latest version from `$DRILL_HOME/conf`.

3. If you developed custom code (data sources or user-defined functions), place the Java JAR files in `$DRILL_SITE/jars`. If you have code from your prior Drill installation, copy the JAR files from `$PREV_DRILL/jars/3rdparty` to `$DRILL_SITE/jars`.

```
cp $PREV_DRILL/jars/3rdparty/yourJarName.jar $DRILL_SITE/jars
```

Note: Only copy the JAR files that you added. Do not copy JAR files that shipped with the prior Drill version.

4. Add native libraries to the `site` directory. If you used a native library, such as the JPAM library in prior versions of Drill, place the native libraries in `$DRILL_SITE/lib` to enable YARN to automatically copy (localize) them to each node that runs Drill.

```
cp native_libraries $DRILL_SITE/lib
```

Modify the `drill-env.sh` File

Copy any configuration changes from the `drill-env.sh` file in the previous Drill installation over to the `drill-env.sh` file in the `site` directory. Memory settings under Drill-on-YARN are now part of the `drill-on-yarn.conf` file. Modify the memory settings in `$DRILL_SITE/drill-env.sh`, as shown below, to ensure that the Drill memory settings match the amount of memory that Drill-on-YARN requires.

To modify `drill-env.sh`, complete the following steps:

1. Review each line in `$PREV_DRILL/conf/drill-env.sh` for settings you added, and copy them into the new `$DRILL_SITE/drill-env.sh` file.

Note: If you do not recall whether you customized settings, you can compare your file with the original version of `drill-env.sh` that shipped with the prior Drill version.

2. Locate the following lines in `drill-env.sh` and note the values:

```
DRILL_MAX_DIRECT_MEMORY="<value>"
DRILL_HEAP="<value>"
```

Replace those lines with the following lines, substituting the values in the new lines with the values from the old lines:

```
export DRILL_MAX_DIRECT_MEMORY=${DRILL_MAX_DIRECT_MEMORY:-"<value>"}
export DRILL_HEAP=${DRILL_HEAP:-"<value>"}
```

Note: If you do not intend to run Drill outside of YARN, you can remove the two lines shown above from `drill-env.sh`.

Note: If you do not make this change, Drill ignores the memory settings in the `drill-on-yarn.conf` file. If you are installing Drill fresh, and do not have an existing file, you can skip this step. Files in Drill 1.8 and later have the correct format.

Note: When you install Drill, the Installer automatically adds the `HADOOP_HOME` variable, which points the current Data Fabric-provided Hadoop to your `drill-env.sh`. If `HADOOP_HOME` is located elsewhere, change this location in `drill-env.sh`

Use the Site Directory to Test Drill

You will use the `site` directory each time you start Drill using the `--site` or `--config` option. Use the option to verify that the configuration works by starting Drill as a stand-alone service on a single node.

```
drillbit.sh --site $DRILL_SITE start
```

Wait a few seconds and then verify that Drill continues to run:

```
drillbit.sh --site $DRILL_SITE status
```

You can also use the Drill Web Console for the Drillbit to verify that Drill has the proper settings. Once satisfied that the configuration is connect, stop Drill:

```
drillbit.sh --site $DRILL_SITE stop
```

Note: If you run a Drillbit with the `--site` (`--config`) option and you want to use SQLLine, you must add the option to SQLLine:

```
sqlline --site $DRILL_SITE
```

Tip: If you find that specifying the `--site` option becomes tedious, you can set the `DRILL_CONF_DIR` variable in your environment:

```
export DRILL_CONF_DIR="$DRILL_SITE"
drillbit.sh start
```

Step 2: Configure Drill-on-YARN

To configure Drill to run as a YARN application, modify the `$DRILL_SITE/drill-on-yarn.conf` cluster configuration file to suit the needs of your cluster. This file is a “starter” configuration file that corresponds to the simplest Drill cluster. The `drill-on-yarn.conf` file is in the same [HOCON](#) format as `drill-override.conf`.

Consult the `$DRILL_HOME/conf/drill-on-yarn-example.conf` file as an example. However, do not just copy the example file. Instead, copy only the specific configuration settings that you need; the others will automatically take the Drill-defined default values.

Note: Make sure that resources can accommodate the Drill memory, CPU, and disk requirements.

The following sections list the configuration settings required to run Drill under YARN:

Drill Memory Settings

The following configuration sets the Java heap size and amount of direct memory the node can allocate to Drill:

```
drillbit: { heap: "<value>" max-direct-memory: "<value>" }
```

When you add the configuration, use the same values set in the following parameters of the `drill-env.sh` file, if you did not remove these lines when you modified `drill-env.sh`:

```
export DRILL_MAX_DIRECT_MEMORY=${DRILL_MAX_DIRECT_MEMORY:-"<value>"}
export DRILL_HEAP=${DRILL_HEAP:-"<value>"}
```

Drill-on-YARN copies these values into the environment variables when launching each Drillbit. Drill also uses additional JVM memory. For example, Drill uses a code cache to hold classes generated at runtime. The default size of the cache is 1 GB:

```
drillbit: { code-cache: "1G" }
```

Typically, you do not need to change the code cache size, but you must account for it when computing the YARN container size.

YARN Container Size

The following configuration sets the YARN container size required to run Drill as a YARN application.

```
drillbit: {
  memory-mb: 14336
}
```

The default value is 14GB. Typically, this size is the sum of the heap and direct memory. However, if you use custom libraries that perform their own memory allocation, or launch sub-processes, you must account for that memory usage as well. Note that YARN memory is expressed in MB. To compute the container size, start with the values used for the heap, direct memory, and code cache settings, as shown in the following example:

```
drillbit: {
  heap: "4G"
  max-direct-memory: "8G"
  code-cache: "1G"
  memory-mb: 14336
}
```

The values shown above are the Drill defaults. You may use larger values. Although the three values account for the bulk of Drill memory, the JVM itself also has a certain overhead. Assume that the overhead is about 1 GB, though the amount varies depending on the workload.

Add the four values together to get a memory requirement in GB.

```
Total memory = 8G + 4G + 1G + 1G = 14G
```

YARN sizes containers in megabytes. Convert GB to MB:

```
Container size = 14G * 1024 = 14336 MB
```

Set this size in drill-on-yarn.conf:

```
drillbit: { memory-mb: 14336 }
```

CPU

The following configuration sets the CPU to allocate to Drill:

```
drillbit: { vcores: <value> }
```

Drill is a CPU-intensive operation and greatly benefits from each additional core. YARN does not limit the number of cores used by an application. Rather, this number reports to YARN the average CPU usage of Drill so that YARN can use the number when deciding how many other applications to run on the same node.

Drillbit Cluster Configuration

The following configuration sets the cluster group:

```
cluster: [ { name: "drillbits" type: "basic" count: 1 } ]
```

Drill-on-YARN uses the concept of a “cluster group” of Drillbits to describe the set of drillbits to launch. Currently, only the “basic” type of group is supported. A basic group launches drillbits anywhere in the YARN cluster where a container is available. For a basic group, specify the group type and the number of drillbits to launch.

Note: The syntax says that cluster is a list that contains cluster group objects contained in braces. Drill currently supports just one group.

The name is optional. It appears in the Application Master web UI. Type must be set to “basic.” Set the count to the number of hosts on which Drill is to run at launch time. You can resize the Drill cluster after the cluster is launched.

YARN Queue Labels

The following configuration sets the YARN queue labels that identify the cluster nodes that run Drill:

```
yarn: { queue: "<queue_name>" }
```

The distribution of YARN provides queue labels for assigning YARN applications to specific queues. See [Label-Based Scheduling for YARN Applications](#). You can use queue labels with Drill to identify the YARN queue that should run Drill.

To use queue labels, complete the following steps:

1. Create a node label.
2. Assign the label to the nodes that are to run Drill.
3. Create a Drill-specific queue that uses the node label.
4. Configure Drill-on-YARN to use the queue.

Suppose you create a queue called “drill.” Setting the following configuration causes Drill-on-YARN to launch through the drill queue:

```
yarn: { queue: "drill" }
```

Set queue to the name a name of your choice. When Drill-on-YARN launches, both the Application Master and drillbits run only on nodes with the same node label as the queue.

DFS Location

The following configuration sets the dfs location:

```
dfs: { app-dir: "/user/drill" }
```

Drill copies the archive in to the filesystem in a location you provide. The default is /user/drill, however you can specify a different location. You do not have to specify the filesystem connection information; this information is automatically defined.

Step 3: Configure YARN to Run Drill

YARN default settings are optimized for MapReduce applications. MapReduce applications use a limited amount of memory; however, Drill is long-running and consumes a significant amount of resources. Adjust the YARN memory configuration to allow YARN to allocate containers large enough to run Drill. Exclude the YARN container directory from `systemd-tmpfiles` to prevent `systemd-tmpfiles` from removing Drill's container files while Drill runs.

Increase Maximum Container Size

YARN provides a number of parameters to control the amount of resources available to applications. The data-fabric distribution of YARN sets most of these parameters automatically, except for the maximum container size, which is left at the Apache YARN default of 8 GB. Typical Drill configurations use significantly more memory. Therefore, you must increase the YARN maximum container size on each

node to suit the needs of Drill. You can use the YARN Resource Manager web UI to determine the amount of memory available on each node.

 **Note:** YARN resource requirements match the Drill resource requirements.

To increase the maximum container size, determine the required container size from the Drill setting in `drill-on-yarn.conf`, which you previously set in step 2:

```
drillbit: {
  memory-mb: 14336
}
```

Use this number to set the `yarn.scheduler.maximum-allocation-mb` parameter in `/opt/mapr/hadoop/hadoop-<version>/etc/hadoop.<version>`, substituting the number of the version you have installed.

Edit `yarn-site.xml` to add the following:

```
<property>
  <name>yarn.scheduler.maximum-allocation-mb</name>
  <value>14336</value>
  <description>Set to allow Drill containers 14G.</description>
</property>
```

 **Note:** You must update this configuration on every YARN node.

Restart the YARN Resource Manager to pick up change, and use the YARN Resource Manager UI to verify that the maximum container size shows the new value.

Exclude the YARN Container Directory from `systemd-tmpfiles`

The system puts the YARN Node Manager container files in the `/tmp` directory. Most system administrators configure `systemd-tmpfiles` to periodically remove files in `/tmp`. Since Drill-on-YARN is a long-running YARN application, `systemd-tmpfiles` can remove Drill's container files while Drill runs. If this occurs, you must manually shut down the Drill cluster because `systemd-tmpfiles` will have removed the `pid` file that YARN needs to manage Drill.

You can prevent `systemd-tmpfiles` from cleaning up Drill's container files by adding a new configuration file to `/etc/tmpfiles.d/`, for example `/etc/tmpfiles.d/exclude-nm-local-dir.conf`, with the following configuration:

```
x /tmp/hadoop-mapr/nm-local-dir/*
```

 **Note:** This configuration prevents `systemd-tmpfiles` from cleaning the `/nm-local-dir` directory when cleaning `/tmp`.

Example

```
$ cat /etc/tmpfiles.d/exclude-nm-local-dir.conf
x /tmp/hadoop-mapr/nm-local-dir/*
```

Step 4: Launch Drill Under YARN

Now that the Drill and YARN configuration is complete, you can issue the `start` command from the Drill-on-YARN client to launch Drill under YARN. Launching Drill-on-YARN from the client starts Drill and brings Drill up on other nodes.

Issuing the `start` command starts the YARN Application Master, which then works with YARN to start the Drillbits. The Application Master provides a web UI to monitor the cluster.

 **Note:** To simplify debugging, you can set the cluster size to a single node. Once you confirm that a single node works, increase the node count.

Launch Drill under YARN as the `mapr` user. For example, if you installed Drill as `mapr` launch Drill as the `mapr` user.

 **Note:** If you launch Drill as `root` and the system returns an error failing the launch attempt, launch Drill as a user with permissions, such as `mapr`.

Issue the following command to start Drill under YARN:

```
$DRILL_HOME/bin/drill-on-yarn.sh --site $DRILL_SITE start
```

 **Note:** To run SQLLine, you must also add the `--site` option:

```
$DRILL_HOME/bin/sqlline --site $DRILL_SITE
```

Tip: To avoid typing the `site` argument each time you launch Drill under YARN, set an environment variable:

```
export DRILL_CONF_DIR=$DRILL_SITE
$DRILL_HOME/bin/drill-on-yarn.sh start
```

After you issue the start command, a number of lines describing the start-up process print. The tool automatically archives and uploads the site directory, which YARN copies (along with the Drill software) onto each node. A URL that includes both the host and the port number displays. Enter the URL in a web browser to access the Application Master web UI.

 **Note:** When you launch Drill from the Drill-on-YARN client, the Application Master can come up on any node. Save the provided URL to share with other users so they can also access the Application Master. Alternatively, you can run the `status` command to see the URL or go to the YARN Resource Manager UI to get the link.

See [Drill-on-YARN Command Line Tool](#) for additional commands, including `stop`, `status`, and `resize`. See [Application Master Web UI](#) for cluster monitoring information.

Step 5: Validate Cluster Configuration and Status

The Drill-on-YARN command line tool prints a URL, for the Drill Application Master process, that you can use to monitor the cluster. The Drillbits should be up and running, unless the upload or launch failed.

Failed upload

If the upload fails, the most likely reason is that the `HADOOP_HOME` variable is not set, or the user launching Drill-on-YARN does not have permission to create or write to the DFS location set in the Drill-on-YARN configuration file.

Failed launch

If the launch fails, verify that the YARN maximum container size was set to be at least as large as the Drill container size and that YARN can provide the number of vcores and disks you have requested for Drill.

Monitor Cluster Activity

When the cluster launches successfully, you can verify the status of the components in the Drill cluster from the command line or you can copy the Application Master URL into your browser to use the Application Master web UI.

To check the status from the command line, issue the following command:

```
$DRILL_HOME/bin/drill-on-yarn.sh --site $DRILL_SITE status
```

- Verify that the Drillbits are in the Running state (or transition to that state after a few moments.) If the Drillbits remain in the Requesting state, the likely cause is that YARN cannot provide a container of the requested size. You can access this information on the Drillbits page in the Application Master web UI.
- Verify that the Application Master has correctly picked up the YARN-related configuration from `drill-override.conf` and `drill-on-yarn.conf`. You can access this information on the Configuration page in the Application Master web UI.
- Verify that the Application Master is running. The Drill Application Master uses ZooKeeper to verify that only one Application Master runs per Drill cluster. The Application Master fails if ZooKeeper is down, is configured incorrectly in `drill-override.conf`, or if another Application Master is running for the same cluster.
- Verify that the configurations in are correct in `drill-override.conf` if there are Drillbit failures. Drill-on-YARN detects Drillbit failures and retries each Drillbit a few times. If the Drillbit continues to fail, the node is black-listed for that run of Drill-on-YARN. You can see failures in the History page of the web UI. If your Drillbits fail, the most likely reason is misconfiguration within `drill-override.conf`. Use YARN to locate and view the Drill logs for the failed container.

Resize the Cluster

If the cluster works well for a single node, you can increase the number of nodes.

Note: In the Drill 1.8 release, adding nodes can be done while users run queries. However, removing nodes from the cluster causes queries to fail, and so should only be done when the cluster is idle.

To make a permanent change, modify the cluster size in `drill-on-yarn.conf`:

```
cluster: [
  {
    ...
    count: 5
  }
]
```

You can also resize the cluster dynamically. To add two nodes from the command line:

```
$DRILL_HOME/bin/drill-on-yarn.sh --site $DRILL_SITE resize +2
```

To set the cluster size to a total of five nodes:

```
$DRILL_HOME/bin/drill-on-yarn.sh --site $DRILL_SITE resize 5
```

To remove one of the nodes:

```
$DRILL_HOME/bin/drill-on-yarn.sh --site $DRILL_SITE resize -1
```

You can also resize your cluster using the Manage page of the Application Master web UI, by entering the number of desired nodes and clicking **Go**.

Stop the Cluster

You can stop the cluster from the command line or from the Manage page in the Application Master web UI.

To stop the cluster from the command line, issue the following command:

```
$DRILL_HOME/bin/drill-on-yarn.sh --site $DRILL_SITE stop
```

Migrate Drill to Run Under YARN

Explains how to migrate Drill to run under YARN instead of the Warden service.

When you migrate Drill to run under YARN, you must back up configurations, including files and storage plugins, shutdown the Drill cluster running under Warden, and uninstall Drill on all Drill nodes in the cluster. You may also want to determine which system settings have been changed from the Drill defaults.

Note: Drill-on-YARN is an advanced feature used to manage a production Drill cluster. Only skilled administrators, familiar with YARN, should configure Drill to run under YARN. If you are new to Drill, consider running Drill under the Warden service until you are familiar with Drill and Drill cluster management.

The sections below provide the tasks required to migrate Drill under YARN:

Tasks

Complete the following tasks when you want to migrate Drill to run under YARN:

Backup configurations and UDFs

Back up configuration files, storage plugin configurations, and UDFs (user-defined functions) or custom JAR files. Back up the configuration files located in `/opt/mapr/drill/drill-<version>/conf`, including `drill-override.conf` and `drill-env.sh`, to preserve your ZooKeeper configuration and any options or custom configurations specified in the files. Also back up `logback.xml` if you configured the file for the Lilith software.

- To back up configuration files, go to `/opt/mapr/drill/drill-<version>/conf`, and copy the files to a location outside of the Drill installation directory.

```
cp <file_name> drill-env.sh /
path/to/directory
```

- To back up custom JARs or UDFs, go to `/opt/mapr/drill/drill-<version>/jars/3rdparty` and copy the JARs or UDFs to a location outside of the Drill installation directory.
- To back up storage plugin configurations, complete the following steps:
 1. [Start the Web Console](#). The Drill node that you use to access the Web Console must be a node that is currently running the Drillbit process.
 2. Click **Storage**.
 3. Click **Update** next to a storage plugin.
 4. Copy the configuration to a text file, and save the file.
 5. Repeat steps 3 and 4 for each storage plugin configuration that you want to save.

Verify system option settings

Drill should save set system options when you migrate Drill. However, you may want to verify which system options were changed from the default settings beforehand. You can run the following query to see which system options were changed from the defaults:

```
select * from sys.options where
status = 'CHANGED';
```

Example:

```
select * from sys.options where
status = 'CHANGED';
```

```
+-----+
|      kind      |      name      |      status      |
| num_val      | string_val     | bool_val        |
| float_val    |                |                 |
+-----+-----+-----+
| exec.errors.verbose |
| BOOLEAN      | SYSTEM        | CHANGED        |
| null         | null          | true           |
| null         |                |                 |
| new_view_default_permissions |
| STRING       | SYSTEM        | CHANGED        |

+-----+-----+-----+
```

4 rows selected (0.541 seconds)

After you migrate, run the query again to verify that the system options are still set. If not, set the options.

Shutdown the Drill cluster

Issue the following command to shutdown the existing Warden-managed Drill cluster:

```
maprcli node services -name
drill-bits -action stop -nodes <node
host names separated by a space>
```

Note: Do not shutdown nodes when queries are in progress.

Verify that Drillbits stopped

Run the following command to verify that the Drillbit service is no longer running on each node:

```
ps -ef | grep -i drill
```

No Drill processes should print to screen when you run this command.

You can also log in to the Control System at `https://<host name>:8443` to verify the status of the Drillbit service. You should not see Drillbit as a listed service.

Uninstall Drill

Uninstall Drill and then run `configure.sh -R` to refresh the configuration.

Issue the command appropriate for your system as root or using `sudo` to uninstall the `mapr-drill` package:

| Operating System | Command |
|------------------|--|
| RedHat/CentOS | <code>yum remove mapr-drill</code> |
| Ubuntu | <code>apt-get remove mapr-drill</code> |

 **Note:** Verify that Drillbit processes stopped.

Additional Drill-on-YARN Configuration Options

You can include additional configuration options in the `DRILL_SITE/drill-on-yarn.conf` file for specialized cases. For example, you can customize the Application Master web UI port or Application Master settings.

Refer to the `drill-on-yarn-example.conf` file in `DRILL_HOME/conf` to see examples of the additional options. Do not use the example file.

The following list describes the changes that you can make for several of the Drill-on-YARN components:

Application Name

You can customize the application name that appears when starting or stopping the Drill cluster and in the Drill-on-YARN web UI. Change the value of the following option to a name you prefer:

```
app-name: "My Drill Cluster"
```

Application Master Web UI Port

If you run multiple Drill clusters in a YARN cluster, YARN may assign two Drill Application Master processes on the same node. To avoid port conflicts, change the HTTP port for one or both of the Drill clusters. Change the value of the following option to a different port number:

```
drill.yarn:
  http: {
    port: 12345
  }
}
```

Application Master Settings

You can customize certain Application Master properties. All of the Application Master properties are prefixed with `drill.yarn.am`, for example `drill.yarn.am.heap`.

The following table lists the Application Master properties with their default settings:

| Name | Description | Default |
|------|-------------|---------|
|------|-------------|---------|

| | | |
|-----------|---|-------|
| memory-mb | Memory, in MB, to allocate to the Application Master. | 14336 |
| vcores | Number of CPUS to allocate to the Application Master. | 1 |
| heap | Java heap for the Application Master. | 450M |

Drillbit

You can customize certain properties that control the Drillbit processes. All of the Drillbit properties are prefixed with `drill.yarn.drillbit`, for example `drill.yarn.drillbit.disks`.

Note: You can specify Drill disk usage to YARN, however Drill uses all disks regardless of the setting.

The following table lists the Drillbit properties with their default settings:

| Name | Description | Default |
|-------------------|---|---------|
| code-cache | Code cache that holds classes generated at runtime. | 1G |
| memory-mb | Memory, in MB, to allocate to the Drillbit. | 13000 |
| vcores | Number of CPUS to allocate to the AM. | 4 |
| disks | Number of disk equivalents consumed by Drill (on versions of YARN that support disk resources.) | 1 |
| heap | Java heap memory. | 4G |
| max-direct-memory | Direct (off-heap) memory for the Drillbit. | 4G |
| log-gc | Enables Java garbage collector logging. | false |
| class-path | Additional class-path entries. | blank |

Mapping of drill-env.sh to drill-on-yarn.conf Options

When you run Drill as a standalone application, you set startup options, such as Drillbit memory, in the \$DRILL_HOME/conf/drill-env.sh start up script. Under YARN, Drill still reads \$DRILL_SITE/drill-env.sh for configuration options, however Drill-on-YARN provides the \$DRILL_SITE/drill-on-yarn.conf file to configure options that were formerly set in drill-env.sh.

The following table maps the drill-env.sh environment variables to their equivalent configuration parameters in drill-on-yarn.conf:

| drill-env.sh Environment Variable | drill-on-yarn.conf Configuration Parameter |
|--|---|
| DRILL_MAX_DIRECT_MEMORY * | drill.yarn.drillbit.max-direct-memory |
| DRILL_HEAP * | drill.yarn.drillbit.heap |
| DRILL_JAVA_OPTS | drill.yarn.drillbit.vm-args (Added to those in drill-env.sh.) |
| SERVER_GC_OPTS (to add GC logging) | Drill.yarn.drillbit.log-gc (To enable GC logging) |
| DRILL_HOME | Set automatically when files are localized (drill.yarn.drill-install. localize is true), else drill.yarn.drill-install. drill-home. |
| DRILL_CONF_DIR | Set automatically when files are localized, else uses the normal defaults. |
| DRILL_LOG_DIR | Set automatically to point to YARN's log directory unless disabled by setting drill.yarn.drillbit. disable-yarn-logs to false. If disabled, uses the normal Drill defaults. |
| DRILL_CLASSPATH_PREFIX * | Drill.yarn.drillbit. prefix-class-path |
| HADOOP_CLASSPATH * | drill.yarn.hadoop.class-path (or, better drill.yarn.drillbit. extn-class-path.) |
| HBASE_CLASSPATH * | Drill.yarn.hadoop. hbase-class-path (or, better drill.yarn.drillbit. extn-class-path.) |
| EXTN_CLASSPATH * (New in Drill 1.8.) | Drill.yarn.drillbit. extn-class-path |
| DRILL_CLASSPATH * | drill.yarn.drillbit.class-path |

Multiple Drill Clusters within YARN

You can define multiple Drill clusters within a single YARN cluster. Each Drill cluster is a collection of Drillbits that work as an independent unit. For example, you might define one test Drill cluster that consists of a few machines on the same physical cluster that runs larger Drill clusters for development and marketing.

You must assign each Drill cluster a distinct ZooKeeper entry. Drill uses ZooKeeper to coordinate activities. Each Drill cluster also needs a distinct set of ports because YARN may launch Drillbits from different clusters on the same physical node.

The following steps summarize the process for defining multiple Drill clusters on a single YARN cluster:

1. Create a new site directory.
2. Configure Drill.
3. Configure Drill-on-YARN.
4. Start the cluster.

The following task provides instructions for each of the steps required to configure and run multiple Drill clusters under YARN:

Defining Multiple Drill Clusters within YARN

Complete the following steps to define multiple Drill clusters under YARN:

1. Create a new "site" directory under \$DRILL_HOME, and create an environment variable for the directory.

```
mkdir $DRILL_HOME/<site_name>
export $<SITE_NAME>_SITE=$DRILL_HOME/<site_name>
```

2. Copy the following configuration files from the existing "site" directory into the new "site" directory:

- drill-override.conf
- drill-env.sh
- drill-on-yarn.conf
- distrib-env.sh

3. Modify the settings in the `drill.exec` section of `$DRILL_SITE/drill-override.conf` to configure the new Drill cluster to act independently of the other Drill cluster(s), or share settings, such as storage plugin configurations. For the new Drill cluster to act independently, give `zk.root` a distinct name from the existing clusters. In the more advanced scenario where the clusters share configurations, give `zk.root` the same name as the existing Drill clusters. When the clusters share the same root, they must have distinct cluster-id values. The user, bit, and http ports must have values distinct from all the other Drill clusters.

The following example shows a number 1 added to the first digit of the default port numbers, however you can choose any available ports.

```
drill.exec: {
  cluster-id: "drillbits",
  zk: {
    root: "<site_name>"
    connect: "zk-host:5181"
  }

  rpc {
    user.server.port: 41010
    bit.server.port: 41011
  }
  http.port: 9047
}
```

4. Modify the `drill-on-yarn.conf` configuration file for the new cluster. The new cluster must have a distinct name, a distinct upload directory in the filesystem, and a distinct port number.

The following settings in the `drill.yarn` section must have distinct values for the new cluster:

```
drill.yarn: {
  app-name: "Distinct Cluster Name"

  dfs: {
    app-dir: "/upload/directory"
  }

  http: {
    port: <distinct port number>
  }
}
```

5. Start the new cluster from the "site" directory that correlates with the new cluster.

```
$DRILL_HOME/bin/drill-on-yarn.sh --site $NEW_SITE start
```

Drill-on-YARN Command Line Tool

Run the Drill-on-YARN command line tool from the Drill-on-YARN client and use it to start, stop, resize, and check the status of the Drill cluster. When you launch Drill from the command line, the tool automatically archives and uploads the "site" directory, which YARN deploys (along with Drill) onto each node.

You can access the Drill-on-YARN command line tool in the following directory:

```
$DRILL_HOME/bin/drill-on-yarn.sh --site $DRILL_SITE command
```

where *command* is the operation you want to perform, such as *start*.

To avoid having to type the site argument for each command, set an environment variable:

```
export DRILL_CONF_DIR=$DRILL_SITE
```

The following example shows the start command after setting the environment variable:

```
$DRILL_HOME/bin/drill-on-yarn.sh start
```

Command Summary

The following table lists the commands and provides a brief summary for each:

| Command | Description |
|--|--|
| start | Starts the Drill cluster. Prints the startup status followed by a summary of the application. |
| status | Retrieves basic information about the Drill cluster. |
| stop | Stops the Drill cluster. |
| resize <value> resize + <increase_node_count_by> resize - <decrease_node_count_by> | Adds or removes nodes in the Drill cluster while the cluster runs. You can specify the exact number of nodes you want to run, or you can use +/- to increase or decrease the current node count by a certain amount. |
| clean | Removes the cached Drill archive from the designated DFS directory. |

Commands

The following sections provide detailed information and examples for each of the commands listed in the command summary:

start

The start command launches Drill and provides a startup status followed by a summary of the application.

The first line in the summary displays the cluster name from the configuration file to confirm which cluster is starting.

```
Launching Drill-on-YARN...
```

The next line shows the YARN application ID and tracks the job status from Accepted to Running.

```
Application ID:
application_1462842354064_0001
Application State: ACCEPTED
Starting.....
Application State: RUNNING
```

Once the job starts, you see the YARN job tracking URL with the Drill-on-YARN web UI URL.

```
Application Master URL: http://
<YARN_Job_Tracking_URL>:8048/
```

Once the application starts, the Drill-on-YARN writes an “appid” file into the Drill installation directory:

```
ls /opt/mapr/drill/drill-<version>
...
drillbits1.appid
```

The file name is the same as the Drill cluster ID. The file contains the ID of the Drill-on-YARN application. The other commands use this ID. You can run only one Drill application at a time. If you attempt to start a second from the same client machine on which you started the first, the client command complains that the appid file already exists. If you attempt to start the cluster from a different node, the second application detects a conflict and shuts down again.

Example

```
$DRILL_HOME/bin/drill-on-yarn.sh start

Launching Drill-on-YARN...
Application ID:
application_1462842354064_0001
Application State: ACCEPTED
Starting.....
Application State: RUNNING
Tracking
URL: http://10.250.50.31:8088/proxy/
application_1462842354064_0001/
Application Master URL: http://
10.250.50.31:8048/
```

status

The status command retrieves basic information about the Drill cluster and provides a status summary.

The first several lines of the status summary provide information about the state of YARN, which includes the application ID, the application state, and YARN’s tracking URL for the application.

```
Application ID:
application_1462842354064_0001
Application State: RUNNING
Host: yosemite/10.250.50.31
Tracking URL:
```

Following the state of YARN information is the host on which the Drill application is running, the queue on which the application was placed, and the user who submitted the application. The start time tells you when YARN started the application.

```
http://10.250.50.31:8088/proxy/
application_1462842354064_0001/
Queue: default
User: drilluser
Start Time: 2016-05-09 16:56:40
```

The next few lines are specific to Drill, including the name of the application (which you configured in the drill-on-yarn.conf configuration file), the Drill Application Master URL, the number of Drillbits you requested to run, and the number actually running.

```
Application Name: Drill-on-YARN
AM State: LIVE
Target Drillbit Count: 1
Live Drillbit Count: 1
```

Finally, the last line provides the URL for the Drill-on-YARN web UI.

```
For more information, visit: http://
10.250.50.31:8048/
```

Example

```
$DRILL_HOME/bin/drill-on-yarn.sh
status

Application ID:
application_1462842354064_0001
Application State: RUNNING
Host: yosemite/10.250.50.31
Tracking
URL: http://10.250.50.31:8088/proxy/
application_1462842354064_0001/
Queue: default
User: drilluser
Start Time: 2016-05-09 16:56:40
Application Name: Drill-on-YARN
AM State: LIVE
Target Drillbit Count: 1
Live Drillbit Count: 1
For more information, visit: http://
10.250.50.31:8048/
```

stop

The stop command stops the Drill cluster. This command is forceful and kills any in-flight queries. The output tracks the shutdown and displays the final YARN application status.

Example

```
$DRILL_HOME/bin/drill-on-yarn.sh stop

Stopping Application ID:
```

```
application_1462842354064_0001
Stopping...
Stopped.
Final status: SUCCEEDED
```

resize

The `resize` command changes the number of nodes in the cluster. You can use this command to add or remove nodes in the Drill cluster as it runs. You can specify the change either by giving the number of nodes you want to run, or by using the `+` or `-` to specify the change in node count.

Drill adds nodes only if additional nodes are available from YARN. If you request to stop more nodes than are running, Drill stops all of the running nodes.

Example

```
$DRILL_HOME/bin/drill-on-yarn.sh
resize 10
$DRILL_HOME/bin/drill-on-yarn.sh
resize +2
$DRILL_HOME/bin/drill-on-yarn.sh
resize -3
```

clean

The `clean` command removes the cached Drill archive from the designated DFS directory. If you run Drill-on-YARN for a temporary cluster, Drill leaves the Drill software archive in your designated DFS directory. Specifically, the first start uploads the Drill archive to DFS. Stop leaves the archive in DFS. Subsequent start commands reuse the cached archive if it is the same size as the version on the local disk. Clean removes the cached file, forcing Drill to upload a fresh copy if you again restart the Drill cluster.

Example

```
$DRILL_HOME/bin/drill-on-yarn.sh clean
```

Application Master Web UI

Drill, running as a YARN application, provides the Drill-on-YARN Application Master (AM) process to manage the Drill cluster. The Drill AM provides a web UI where you can monitor cluster status and perform simple operations, such as increasing or decreasing cluster size, or stopping the cluster.

When you launch Drill using the Drill-on-YARN command line tool, the tool signals YARN to launch the AM, which in turn launches the Drillbits in the cluster. When Drill starts, you can access the web UI using the URL provided at startup.

The following sections describe the information that the Application Master web UI provides:

Main

The main page provides the following information about the Drill cluster:

Drill Cluster Status

The Drill cluster status show the state of the Drill cluster, which is one of the following:

- **LIVE:** This is the normal state and shows that the Drill cluster is running.

- **ENDING:** The cluster is in the process of shutting down

There is no “ENDED.” state. When the cluster shuts down, the web UI is no longer available.

Target Drillbit Count

The target Drillbit count is the number of Drillbits to run in the cluster. The actual number may be less if Drillbits have not yet started, or if YARN cannot allocate enough containers.

Live Drillbit Count

The live Drillbit count is the number of Drillbits that are ready for use. These have successfully started, have registered with ZooKeeper, and are ready for use. You can see the detail of all Drillbits (including those in the process of starting or stopping) using the Drillbits page. Each Drillbit must run on a separate node, so this is also the number of nodes in the cluster running Drill.

Total Drillbit Memory and Virtual Cores

The total number of YARN resources currently allocated to running Drillbits.

YARN Node Count, Memory, and Virtual Cores

Reports general information about YARN itself including the number of nodes, the total cluster memory, and total number of virtual cores.

Groups

Lists the cluster groups defined in the configuration file (only one is currently supported), along with the target and actual number of Drillbits in that group.

Configuration

The configuration page shows the complete set of configuration values used for the current run. The values come from the configurations you set and the Drill-provided defaults. Use this page to diagnose configuration-related issues. Names are shown in fully-expanded form. That is the name “drill.yarn.http.port” refers to the parameter defined, as follows, in your configuration file:

```
drill.yarn:
  http: {
    port: 8048
  }
}
```

Drillbits

The Drillbits page provides the following information about each of the Drillbits:

| | |
|--------------|---|
| ID | A sequential number assigned to each new Drillbit. Numbers may not start with 1 if you have previously shut down some Drillbits. |
| Group | The cluster group that started the Drillbit. Cluster groups configured in drill-on-yarn.conf. |
| Host | The host name or IP address on which the Drillbit runs. If the Drillbit is in a normal operating state, this field is also a hyperlink to the Web UI for the Drillbit. |
| State | The operating state of the Drillbit. The normal state is “Running.” The Drillbit passes through a number of states as YARN allocates a container and launches a process, as the AM waits for the Drillbit to become registered in ZooKeeper, and so on. Similarly, the Drillbit passes through a different set of states during |

| | |
|--|---|
| | shutdown. Use this value to diagnose problems. If the Drillbit is in a live state, this field shows an “[X]” link that you can use to kill this particular Drillbit. Use this if the Drillbit has startup problems or seems unresponsive. During the shut-down process, the kill link disappears and is replaced with a “Cancelled” note. |
| ZK State | The ZooKeeper handshake state. Normal state is “START_ACK”, meaning that the Drillbit has registered with ZooKeeper. This state is useful when diagnosing problems. |
| Container ID | The YARN-assigned container ID for the Drillbit task. The ID is a link that takes you to the YARN Node Manager UI for the Drillbit task. |
| Memory and Virtual Cores (vcores) | The amount of resources actually allocated to the Drillbit by YARN. |
| Start Time | The date and time (in your local time-zone, displayed in ISO format) when the Drillbit launch started. This page also displays unmanaged Drillbits, if present. An unmanage Drillbit is one that is running, has registered with ZooKeeper, but was not started by the Application Master. Likely, the Drillbit was launched using the Drillbit.sh script directly. Use the host name to locate the machine running the Drillbit if you want to convert the Drillbit to run under YARN. |

Manage

The Manage page provides options to resize or stop the Drill cluster. You can resize the cluster by adding or removing Drillbits or setting the cluster to a specific size.

Drill is a long-running application. Typically, Drill runs indefinitely, and you would only shut down the Drill cluster to perform an upgrade of the Drill software or to change configuration options. When you terminate the Drill cluster, any in-progress queries fail. Therefore, best practice is to perform the shutdown with users so that Drill is not processing any queries at the time of the shut-down.

When removing or shutting-down the cluster, you receive a confirmation page asking if you really do want to stop Drillbit processes. Click **Confirm** to continue.

History

The History page lists all failed, killed, and restarted Drillbits. You can detect failures and diagnose problems using the information on this page. Use the YARN container ID listed on this page to locate the log files for the Drillbit.

Enabling Application Master Web UI Security

By default, the Application Master Web UI is not secure and open to everyone. You can configure user authentication or implement a simple, predefined user name and password to secure the UI. Modify the drill-on-yarn.conf configuration file to enable Drill-on-YARN security.

The following sections describe how to enable security for the Application Master web UI.

User Authentication

You must enable [user authentication](#) in Drill if you want Drill-on-YARN to use this feature for security purposes. When user authentication is enabled, the user name and password must match that of the user that started the Drill-on-YARN application.

To secure the Application Master web UI by way of user authentication, modify `drill-on-yarn.conf` to include the following section with the `auth-type` set to `drill`:

```
drill.yarn.http: {
  auth-type: "drill"
}
```

Simple Security

Define a username and password in `drill-on-yarn.conf` and then restart the Drill-on-YARN Application Master to implement simple security for the Application Master web UI.

Modify the `drill-on-yarn.conf` configuration file to include the following section, replacing the `user-name` and `password` settings with yours, and then restart the Drill-on-YARN Application Master:

```
drill.yarn.http: {
  auth-type: "simple"
  user-name: "tsmith"
  password: "secret"
}
```

When you visit the web UI, a login page prompts you for the username and password that you configured. These are the only valid credentials.

Drill-on-YARN Limitations

Drill-on-YARN has the following limitations:

Hanging requests

Drill-on-YARN and YARN “hang” if YARN cannot fulfill a container request. YARN provides no information about why a request “hangs.”

/tmp directory

The default YARN settings cause Drillbits to become unmanaged within a short amount of time due to a `/tmp` directory issue. See the Exclude the YARN Container Directory from `tmpwatch` section in [Step 3: Configure YARN to Run Drill](#) for information on how to resolve the issue.

Container size

The default YARN settings do not allow a default Drill cluster to run due to the default YARN container size. See the Increase Maximum Container Size section in [Step 3: Configure YARN to Run Drill](#) for information on how to resolve the issue.

Drill disk usage

You can specify Drill disk usage to YARN, but Drill will use all disks regardless of the setting. There is no effective way to manage a Drill cluster that:

- resizes based on load.
- is rack-aware in its smaller state.

YARN chooses arbitrary nodes perhaps resulting in large network reads. (MD-1028, MD-1089)

Node Labels

Although the Apache YARN documentation states that you can associate node labels with YARN container requests, some people have noticed that the feature does not work in practice. While Drill-on-YARN configuration has settings to associate Drillbit container requests with node labels, doing so is not supported. To use node labels, associate node labels with YARN queues as described in the YARN

configuration step in the [Migrate Drill to Run Under YARN](#) documentation.

Configuring Drill

Lists the data-fabric-specific configuration for Drill.

Drill is highly configurable. This document focuses on data-fabric-related configurations and refers to the open source [Apache Drill documentation](#) for generic information. Key things to configure are:

| | |
|--|--|
| Drill memory | Determine the amount of heap and direct memory allocated to a Drillbit for query processing in a Drill cluster. See Configuring Drill Memory on page 3451. |
| Parquet block size | Change the Parquet block size to match the filesystem chunk size. See Configuring the Parquet Block Size on page 3453. |
| Resources for a shared Drillbit | Configure queues and parallelization for supporting multiple users sharing a Drillbit. Support separate Drillbits running on different nodes in the cluster. See Configuring Resources for a Shared Drillbit . |
| Multitenancy | Configure a multitenant cluster to account for resources required for Drill. See Configuring a Multitenant Cluster on page 3458. |
| User Impersonation | Configure impersonation to allow a service to act on behalf of a client while performing the action requested by the client. See User Impersonation on page 3492. |
| User authentication and encryption | Configure user authentication when you want the identity of a user, before permitting the user access to a process running on a system. See Default Security (Tickets) on page 3504 . |
| SSL/TLS for Encryption | Enable and configure SSL/TLS for encryption when you need to use Plain authentication. See SSL/TLS for Encryption on page 3524. |
| Drill impersonation with Hive authorization | Configure Drill impersonation to work with Hive impersonation to authorize access to metadata in the Hive metastore repository and data in the Hive warehouse. See User Impersonation with Hive on page 3498. |
| Volumes to use for spooling | Use the drill.exec.spill.directories option to set MapReduce volumes or local volumes for spooling to improve performance and stripe data across as many disks as possible. |
| Persistent configuration storage | See Persistent Configuration Storage and Configuring the ZooKeeper PStore Location on page 3460. |
| Access rights | Configure access rights if you have 777 file-level permissions to a table, and a query returns no results. See Configuring Access Rights . |

Drill typically runs along side other workloads, including the following:

- MapReduce
- Yarn
- Hive and Pig
- Spark

You need to plan and configure these resources for use with Drill and other workloads:

- Memory
- CPU
- Disk

Configuring Access Rights

If the security in your organization limits access to HPE Ezmeral Data Fabric Database tables, you might experience a problem querying the tables. If you have 777 file-level permissions to a table, yet a query returns no results, you might need to add your user name to the maprccli [ACL](#).

Adding a Drill Node to a Cluster

To add a new node to a cluster that provides the Drillbit service, add the node to the cluster first, and then install Drill on the new node. If you install Drill first, and then add the node to the cluster, the cluster cannot detect ZooKeeper information and the cluster is misnamed. These problems require some work to resolve. You need to edit the `drill-override.conf` file in the `mapr/drill` directory and modify the name of the cluster. Avoid this extra work, and install Drill only after adding the node to the cluster by performing steps in the following order:

1. Follow instructions for [adding a node to a cluster](#).
2. Reconfigure the cluster as described in the same instructions.
3. Verify that the new node is up and running.
4. Stop Warden, as shown:

```
$ service mapr-warden stop
```

5. Stop ZooKeeper service, as shown:

```
$ service mapr-zookeeper stop
```

6. [Configure the repository](#) to add the ecosystem repository.
7. [Install Drill](#) on the new node.
8. Reconfigure the node.

```
$ /opt/mapr/server/configure.sh -R
```

9. Start ZooKeeper if the node is a ZooKeeper node.
10. Start warden to make configuration changes effective.

Verify that the Drillbit service is running on the node. It might take a minute or so for the Drillbit to start after starting warden.

Configuring Drill Memory

A system administrator can modify the amount of system memory that Warden allocates to the Drill service on each node in the `warden.drill-bits.conf` file. Drill users, with file permissions, can modify the amount of heap and direct memory allocated to the Drill service on each node in the `drill-env.sh` file.

Note: The cumulative memory allocation in `drill-env.sh` cannot exceed the memory allocation in `warden.drill-bits.conf`.

After modifying `drill-env.sh`, restart Drill:

```
$ maprcli node services -name drill-bits -action restart -nodes
<space-separated-list-of-drill-hostnames>
```

After modifying `warden.drill-bits.conf`, run the configuration script, [configure.sh](#), to update the node configuration and then restart Drill:

```
/opt/mapr/server/configure.sh -R
$ maprcli node services -name drill-bits -action restart -nodes
<space-separated-list-of-drill-hostnames>
```

The following sections describe the `warden.drill-bits.conf` and `drill-env.sh` files in detail.

Drill Memory Allocation in a Warden-Managed Cluster

If you install and run Drill under the Warden service, Warden manages the amount of system memory that Drill can use. By default, Warden allocates 20% of the system memory on a node to the Drill service. For example, if a node has 50GB of memory, Warden allocates 10GB (20% of 50GB) to the Drill service.

A system administrator can define the amount of memory that Warden allocates to Drill by changing the value of the `DRILLBIT_MAX_PROC_MEM` variable in `/opt/mapr/drill/drill-<version>/conf/warden.drill-bits.conf`.

When starting, Drill verifies that the amount of memory configured in `drill-env.sh` does not exceed the limit set by the `service.env=DRILLBIT_MAX_PROC_MEM` variable in `warden.drill-bits.conf`. If the settings in `drill-env.sh` exceed the setting in Warden, the system prints a message stating the issue; Warden does not start the Drill service on the node.

The `warden.drill-bits.conf` file contains the following settings:

Note: Drill automatically configures the `service.heapsize` parameters. Do not modify them.

```
#Default Drill Mem Distrib: 20% of System memory
service.env=DRILLBIT_MAX_PROC_MEM=20%
//Specifies the maximum amount of memory that Warden will allocate to the
Drill service on the node. You can set this value as a percentage of system
memory or as an absolute value in GB. Memory configured in drill-env.sh
cannot exceed this memory setting.

service.heapsize.min=5120
//Minimum heap size. Do not change this value. The value is auto-populated
and represents the minimum memory that the Drillbit process will take.

service.heapsize.max=13312
//Maximum heap size. Do not change this value. The value is auto-populated
and represents the maximum memory that the Drillbit process will take.

#Warden will allocate 20% of memory for Drill
service.heapsize.percent=20
//Do not change this value. Total heap size available based on the value
set for the DRILLBIT_MAX_PROC_MEM variable. If the variable is defined in
absolute values, it is represented as a percent of the system memory.
```

Drill Memory Allocation in `drill-env.sh`

You can configure the amount of heap and direct memory allocated to Drill on each node in the `/opt/mapr/conf/conf.d/drill-env.sh` file. If you do not manually configure the heap and direct memory, Drill calculates these values based on the amount of system memory that Warden allocates to Drill and auto-populates the settings for the variables.

The cumulative amount of memory allocated to Drill in `drill-env.sh` cannot exceed the amount of memory that Warden allocates to Drill, which is set by the `DRILLBIT_MAX_PROC_MEM` variable in `warden.drill-bits.conf`.

Note: The values in `drill-env.sh`, such as 13G, are examples and do not indicate the default memory limits for Drill. By default, Warden allocates 20% of the system memory on a node to Drill.

The `drill-env.sh` file contains the following memory variables that you can uncomment and modify:

```
#export DRILLBIT_MAX_PROC_MEM=${DRILLBIT_MAX_PROC_MEM:-"13G"}
//Specifies the maximum amount of system memory that the Drill service
can use on a node. Must be equal to or less than the value set for
DRILLBIT_MAX_PROC_MEM in warden.drill-bits.conf. You can set this value as
a percentage of system memory or as an absolute value in GB. If you define
this variable, without defining the heap and direct memory variables, Drill
automatically calculates the heap and direct memory values.

#export DRILL_HEAP=${DRILL_HEAP:-"4G"}
//Maximum theoretical heap limit for the JVM per node.

#export DRILL_MAX_DIRECT_MEMORY=${DRILL_MAX_DIRECT_MEMORY:-"8G"}
//Java direct memory limit per node.

#export DRILLBIT_CODE_CACHE_SIZE=${DRILLBIT_CODE_CACHE_SIZE:-"1G"}
//The memory limit for the compiled code generated by the JVM JIT compiler.
Do not modify. The value for this parameter is auto-computed based on the
heap size and cannot exceed 1GB.
```

Note: If performance is an issue, add `-Dbounds=false`, as shown:

```
export DRILL_JAVA_OPTS="$DRILL_JAVA_OPTS -Dbounds=false"
```

Configuring the Parquet Block Size

The default value for the `store.parquet.block-size` parameter is 268435456 (256 MB), the same size as filesystem chunk sizes. In previous versions of Drill, the default value was 536870912 (512 MB).

If you change the filesystem chunk size, change the Parquet block size to match using the [ALTER SYSTEM](#) or [SET](#) commands, as shown:

```
ALTER SYSTEM SET `store.parquet.block-size` = <value>;
[ALTER SESSION] SET `store.parquet.block-size` = <value>
```

Alternatively, you can override the default setting in the `<DRILL_HOME>/conf/drill-override.conf` file, as shown:

```
drill.exec: {
  ...
  options.store.parquet.block-size = 268435456
}
```

For information about setting the filesystem chunk size, see [Setting Chunk Size](#).

Configuring Multiple Drill Clusters and Designating One Cluster as an OJAI Distributed Query Service

As of Core 6.0 and Drill 1.11, you can run operational queries through the OJAI Distributed Query Service, as well as analytical queries through Drill. If you want to run operational and analytical workloads in your cluster, you must configure multiple Drill clusters within the cluster and then configure a Drill cluster as the OJAI Distributed Query Service. Restricting each workload to its own cluster improves query performance.

Note: Installing Drill and the OJAI Distributed Query Service together through the Installer is not currently supported. Only one of these services running in the cluster is supported unless you manually install and configure multiple Drill clusters, as instructed here.

Data Distribution

If you install both Drill and the OJAI Distributed Query Service through the Installer, both workloads get processed across the entire cluster. When both services run together in the cluster, the system replicates data across the entire cluster, causing remote reads and impairing performance, which can lead to missed SLAs and memory issues.

Memory Allocation

The amount of memory allocated to Drill and the OJAI Distributed Query Service differ. By default, when you install Drill, 13 GB of memory is allocated to the Drillbit service running on a node:

- 8 GB direct
- 4 GB heap
- 1 GB core cache

The OJAI Distributed Query Service less memory than Drill. By default, the OJAI Distributed Query Service is allocated ~ 5 GB of memory:

- 1 GB direct
- 3 GB heap
- 512 MB core cache

If you use the Installer and select both Drill and the OJAI Distributed Query Service, memory is configured for Drill. If you only run operational queries, which do not use as much memory as analytical queries, you unnecessarily lose an additional 8 GB of memory.

How to Run Drill and the OJAI Distributed Query Service Together in a Cluster

You can manually install Drill on several nodes and divide the nodes into multiple topologies (Drill clusters). For each of the topologies, create and mount a volume. Then, create directories within each volume to store your data. Configure these directories as workspaces in the Drill dsf storage plugin. Finally, configure a Drill cluster to run as an OJAI Distributed Query Service.

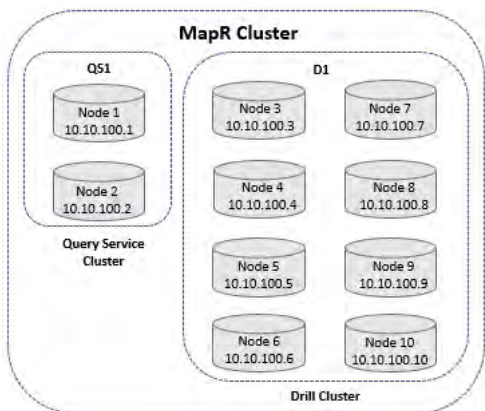

The following topics provide instructions for each of the required steps:

Step 1: Plan the Clusters

Decide which nodes in the cluster you want to run Drill and which nodes you want to run the OJAI Distributed Query Service.

The nodes you select to run Drill can form one or more Drill clusters, while the nodes you select to run the OJAI Distributed Query Service can form another Drill cluster. You can configure multiple Drill clusters.

For example, if you have a ten node cluster, you can configure one Drill cluster to run analytical queries and one OJAI Distributed Query Service cluster to run OJAI operational queries, as shown:

Track the nodes that you want to group into a cluster, as this information is needed to configure node topology and volumes. Also note the memory requirements of each service. Only non-overlapping Drill clusters are supported. You cannot install more than one Drillbit on a server node.

Step 2: Manually Install Drill on All Nodes

Manually install Drill on all nodes, including the nodes designated to run the OJAI Distributed Query Service.

For Drill installation instructions, see [Installing Drill](#). You can install Drill to run under Warden or YARN, as described in the following following topics:

- [Install Drill to Run Under Warden](#)
- [Install Drill to Run Under YARN](#)

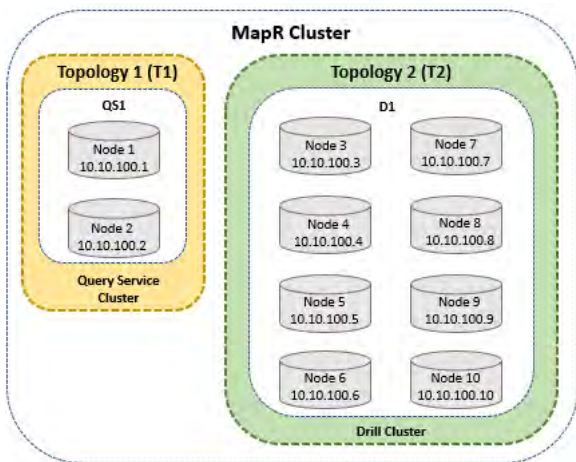

Step 3: Define Node Topologies

Node topologies restrict data to a designated set of nodes.

When you define a topology, data is only replicated on the nodes within the topology. Node topologies improve query performance because data is localized to the nodes specified in the topology instead of being distributed across the entire cluster.

You can create node topologies for the Drill clusters in the UI or from the CLI. See [Changing Topology for One or More Nodes](#) for instructions.

When you create a topology, you define the nodes that form a Drill cluster, as shown in the following image:

The image shows two node topologies, T1 and T2. T1 is the Drill cluster to be configured as the OJAI Distributed Query Service. T2 is the Drill cluster that will remain a Drill service cluster.

Step 4: Create Volumes

Volumes organize data and manage cluster performance. Create and mount a volume to each of the topologies (Drill clusters) you created.

For example, you can create a volume named "operational" and mount it to the T1 topology and then create a volume named "analytical" and mount it to the T2 topology.

See [Administering Volumes](#) for volume information and [Creating a Volume](#) on page 941 for instructions.

Once you create the volumes, you have a place where you can create directories and store data. For example, you can create and store operational data in the `/operational/data/here` directory and analytical data in the `/analytical/data/here` directory.

Use these directories to configure the workspaces in the Drill dfs storage plugin configuration.

Step 5: Configure Multiple Drill Clusters

Update the `/opt/mapr/drill/drill-<version>/conf/drill-override.conf` file on each Drill node that is part of a cluster with the cluster ID and a ZooKeeper entry to define the Drill cluster. Each Drill cluster should have a unique cluster ID and ZooKeeper entry to separate the clusters.

Note: Each Drill node in a cluster must have the same configuration.

The Drillbit process reads the configuration file and communicates with ZooKeeper to see if the cluster it belongs to exists. If the cluster exists, ZooKeeper says to join the cluster. If the cluster does not exist, the Drillbit initiates a new Drill cluster based on the cluster ID.

The following table provides an example of unique cluster IDs and ZooKeeper entries based on the topologies in the image shown in step 3, Define Node Topologies:

| Cluster | Nodes | Cluster ID | ZooKeeper Entry |
|---------|---|--------------------------|-------------------|
| QS1 | 10.10.100.1 10.10.100.2 | cluster-id: "drillbits" | zk.root: "drill" |
| D1 | 10.10.100.3 10.10.100.4 10.10.100.5 10.10.100.6 10.10.100.7 10.10.100.8 10.10.100.9 10.10.100.10 | cluster-id: "drillbits2" | zk.root: "drill2" |

For QS1, `drill-override.conf` must include the following configuration:

```
drill.exec: {
  zk.root: "drill",
  cluster-id: "drillbits",
  zk.connect: "<zk-node-ip-address>:5181",
}
```

For D1, `drill-override.conf` must include the following configuration:

```
drill.exec: {
  zk.root: "drill2",
  cluster-id: "drillbits2",
  zk.connect: "<zk-node-ip-address>:5181",
}
```

Note: If you installed Drill to run under YARN, follow the steps in [Defining Multiple Drill Clusters Under YARN](#) for each Drill node. Drill running under YARN requires some additional steps, such as changing ZooKeeper ports.

Step 6: Configure Workspaces

You must configure a workspace on one Drill node in each Drill cluster that points to the volume directory where data is stored. When you create a workspace, you must include the volume mount point.

For example, if you created a volume with the mount point `/operational` for the OJAI Distributed Query Service cluster and stored your data in `/data/here/` within that volume, you would configure the workspace, as shown:

```
{
  "type": "file",
  "enabled": true,
  "connection": "file:///",
  "workspaces": {
    "root": {
      "location": "/",
      "writable": false,
      "defaultInputFormat": null
    },
    "tmp": {
      "location": "/tmp",
      "writable": true,
      "defaultInputFormat": null
    },
    "operational": {
      "location": "/operational/data/here",
      "writable": true,
      "defaultInputFormat": null
    }
  }
}
```

Likewise, if you also created a volume with a mount point `/analytical` for the other Drill cluster that runs analytical queries and stored your data in `/data/here/` within that volume, you would configure the workspace, as shown:

```
{
  "type": "file",
  "enabled": true,
  "connection": "file:///",
  "workspaces": {
    "root": {
      "location": "/",
      "writable": false,
      "defaultInputFormat": null
    },
    "tmp": {
      "location": "/tmp",
      "writable": true,
      "defaultInputFormat": null
    },
    "analytical": {
      "location": "/analytical/data/here",
      "writable": true,
      "defaultInputFormat": null
    }
  }
}
```

You can define a workspace in the Drill dfs storage plugin configuration on the Storage page in the Drill Web UI at `https://<drill-node-ip-address>:8047`. You only need to configure the workspace on one Drill node in each Drill cluster.

See [Plugin Configuration Basics](#) and [Workspaces](#) for more information.

Step 7: Register a Drill Cluster as an OJAI Distributed Query Service

You can select any of the configured Drill clusters to act as the OJAI Distributed Query Service provider for operational queries, by running the `queryservice setconfig` command.

When you register the Drill cluster as the OJAI Distributed Query Service, adjust the memory setting on each node. The default Drill memory setting of 13 GB is unnecessarily high for the OJAI Distributed Query Service, which only requires ~ 5 GB. You must restart the Drillbits after you update the memory settings.

Registering a Drill Cluster as the OJAI Distributed Query Service

To register a Drill Cluster as an OJAI Distributed Query Service, run the following command:

```
maprcli cluster queryservice setconfig -enabled true -clusterid
<name_of_cluster> -storageplugin dfs -znode <zk_setting>
```

For example, `drillbits2` and `drill2` are the cluster ID and ZooKeeper settings used in examples in previous steps. For these configurations, the command is:

```
maprcli cluster queryservice setconfig -enabled true -clusterid
drillbits2 -storageplugin dfs -znode drill2
```

See [queryservice setconfig](#) for more information about the command.

Configuring Memory for the OJAI Distributed Query Service

Modify the memory settings on each node in the OJAI Distributed Query Service cluster and then restart Drill. See [Configuring Drill Memory](#) on page 3451 for instructions.

Configuring a Multitenant Cluster

Drill operations are memory and CPU-intensive. Currently, Drill resources are managed outside of any cluster management service, such as the Warden service. In a multi-tenant or any other type of cluster, YARN-enabled or not, you configure memory and memory usage limits for Drill by modifying `drill-env.sh` as described in the section, "[Configuring Drill Memory](#)" in Apache Drill documentation.

Configure a multitenant cluster to account for resources required for Drill. For example, on a cluster, ensure warden accounts for resources required for Drill. Configuring `drill-env.sh` allocates resources for Drill to use during query execution, while configuring the following properties in `warden-drill-bits.conf` prevents warden from committing the resources to other processes.

```
service.heapsize.min=<some value in MB>
service.heapsize.max=<some value in MB>
service.heapsize.percent=<a whole number>
```

Set the `service.heapsize` properties in `warden.drill-bits.conf` regardless of whether you changed defaults in `drill-env.sh` or not.

"[Configuring Drill in a YARN-enabled MapR Cluster](#)" shows an example of setting the `service.heapsize` properties. The `service.heapsize.percent` is the percentage of memory for the service bounded by minimum and maximum values. Typically, users change `service.heapsize.percent` because using a percentage setting increases or decreases resources according to different node configurations. For more information about the `service.heapsize` properties, see the section, "[warden.<servicename>.conf](#)."

You need to statically partition the cluster to designate which partition handles which workload. To configure resources for Drill in a cluster, modify one or more of the files created by the installation process in `/opt/mapr/conf/conf.d`:

```
warden.drill-bits.conf
warden.nodemanager.conf
warden.resourcemanager.conf
```

Configure Drill memory by modifying `warden.drill-bits.conf` in YARN and non-YARN clusters. Configure other resources by modifying `warden.nodemanager.conf` and `warden.resourcemanager.conf` in a YARN-enabled cluster.

Configuring Drill in a YARN-enabled Cluster

To add Drill to a YARN-enabled cluster, change memory resources to suit your application. For example, you have 120G of available memory that you allocate to following workloads in a Yarn-enabled cluster:

File system = 20G Yarn = 20G OS = 8G

If Yarn does most of the work, give Drill 20G, for example, and give Yarn 60G. If you expect a heavy query load, give Drill 60G and Yarn 20G.

YARN consists of two main services:

- **ResourceManager:** There is at least one instance in a cluster, more if you configure high availability.
- **NodeManager:** There is one instance per node.

The `warden.resourcemanager.conf` and `warden.nodemanager.conf` files set **ResourceManager** and **NodeManager** memory to the following defaults:

```
service.heapsize.min=64
service.heapsize.max=325
service.heapsize.percent=2
```

Change these settings for **NodeManager** and **ResourceManager** to reconfigure the total memory required for YARN services to run. If you want to place an upper limit on memory, set the `YARN_NODEMANAGER_HEAPSIZE` or `YARN_RESOURCEMANAGER_HEAPSIZE` environment variable in

```
/opt/mapr/hadoop/hadoop-2.5.1/etc/hadoop/yarn-env.sh
```

You do not set the `-Xmx` option, allowing memory to grow as needed.

MapReduce Version 2 and other Resources

You configure memory for each service by setting three values in `warden.conf`.

```
service.command.<servicename>.heapsize.percent
service.command.<servicename>.heapsize.max
service.command.<servicename>.heapsize.min
```

[Configure memory](#) for other services in the same manner. For more information about managing memory in a cluster, see the following sections:

- [Memory Allocation for Nodes](#)
- [Cluster Resource Allocation](#)

How to Manage Drill CPU Resources

Currently, you do not manage CPU resources within Drill. Use Linux [cgroups](#) to manage the CPU resources.

Configuring the ZooKeeper PStore Location

By default, the ZooKeeper PStore offloads query profile data to `maprfs:///apps/drill/profiles`. You can override the default location in the `drill-override.conf` file.

When query profile data is stored on a distributed system, like the data-fabric filesystem, you can see a [global query list](#) (view of query profiles coordinated by all Drill nodes in one Web UI).

To change the [ZooKeeper PStore](#) location, update the `drill.exec` block in `/opt/mapr/drill/drill-<version>/conf/drill-override.conf` with the following configuration, as shown:

```
drill.exec: {
  cluster-id: "my_cluster_com-drillbits",
  zk.connect: "<zkhostname>:5181",
  sys.store.provider.zk.blobroot: "maprfs:///new/storage/location/"
}
```

Note: By default, the filesystem replicates the data three times. If you are concerned about storage consumption, you can create a new volume specifically for query profile data, and set the replication value to 1 for that volume. After you create the volume, update `sys.store.provider.zk.blobroot` to point to the volume. See [Creating a Volume](#) on page 941 for additional information.

After you modify `drill-override.conf`, restart Drill:

```
maprcli node services -name drill-bits -action restart -nodes
<drill-hostnames-separated-by-a-space>
```

Configuring cgroups to Control CPU Usage

Starting in Drill 1.13, you can configure a Linux cgroup (control group) to enforce CPU limits on the Drillbit service running on a node. Linux cgroups enable you to limit system resources to defined user groups or processes. You can use the `cgconfig` service to configure a Drill cgroup to control CPU usage and then set the CPU limits for the Drill cgroup on each Drill node in the `/etc/cgconfig.conf` file.

Note: Cgroups V2 is recommended.

Before You Begin

Each Drill node must have the `libcgroup` package installed to configure CPU limits for a Drill cgroup. The `libcgroup` package installs the `cgconfig` service required to configure and manage the Drill cgroup.

Install the `libcgroup` package using the `yum install` command, as shown:

```
yum install libcgroup
```

Enable Drill to Directly Manage CPU Resources

Starting in Drill 1.14, Drill can directly manage CPU resources through the start-up script, `drill-env.sh`, which means that you no longer have to manually add the PID (Drill process ID) to the `cgroup.procs` file each time a Drillbit restarts. This step occurs automatically upon restart. The start-up script checks for the specified cgroup, such as `drillcpu`, and then applies the cgroup to the launched Drillbit JVM. The Drillbit CPU resource usage is then managed under the cgroup, `drillcpu`.

For Drill to directly manage CPU resources, you must enable (uncomment) the following variables in the `drill-env.sh` script:

| Variable | Description |
|--|---|
| <code>export DRILLBIT_CGROUP=\$ {DRILLBIT_CGROUP:-"drillcpu"}</code> | Sets the cgroup to which the Drillbit belongs when running as a daemon using <code>drillbit.sh</code> start. Drill uses the cgroup for CPU enforcement only. |
| <code>export SYS_CGROUP_DIR=\$ {SYS_CGROUP_DIR:-"/sys/fs/cgroup"}</code> | Drill assumes the default cgroup mount location set by systemd (the system and service manager for Linux operating systems). If your cgroup mount location is in a different location, change the setting to match your location. |
| <code>export DRILL_PID_DIR=\$ {DRILL_PID_DIR:-\$DRILL_HOME}</code> | The location of the Drillbit PID file when Drill is running as a daemon using <code>drillbit.sh</code> start. By default, this location is set to <code>\$DRILL_HOME</code> . |

Important: If you have Drill 1.13 running on the node, or you have Drill 1.14 running on the node and you do not want to enable Drill to directly manage the CPU resources through `drill-env.sh`, you must manually update the `/cgroup/cpu/drillcpu/cgroup.procs` file with the PID (Drill process ID), as shown, each time a Drillbit restarts to enforce the CPU limit for the Drillbit service:

```
echo 25809 > /cgroup/cpu/drillcpu/cgroup.procs
```

Set the CPU Limit for the Drillbit Service

You can set the CPU limit as a soft or hard limit, or both. You set the limits with parameters in the `/etc/cgconfig.conf` file. The hard limit takes precedence over the soft limit. When Drill hits the hard limit, in-progress queries may not complete. Review the following sections that describe the soft and hard limit parameters and then configure CPU limits.

Soft Limit Parameter

You set the soft limit with the `cpu.shares` parameter. This parameter takes an integer value, which specifies a relative share of CPU time available to the tasks in a cgroup. For example, if there are two tasks and `cpu.shares` is set to 100, each task receives half of the CPU time. The value must be 2 or greater. When you set a soft limit, Drill can exceed the CPU allocated if extra CPU is available for use on the system. Drill can continue to use CPU until there is contention with other processes over the CPU or Drill hits the hard limit.

Hard Limit Parameters

You set the hard limit on the amount of CPU time that the Drill process can use through the `cpu.cfs_period_us` and `cpu.cfs_quota_us` parameters.

- `cpu.cfs_period_us`

Specifies a period in microseconds (represented by `us` for μs) to indicate how often a cgroup's access to CPU resources should be reallocated. For example, if you want tasks in a cgroup to have access to a single CPU for 0.2 seconds in a 1 second window, set `cpu.cfs_quota_us` to 200000 and `cpu.cfs_period_us` to 1000000. The upper limit of the `cpu.cfs_quota_us` parameter is 1 second and the lower limit is 1000 microseconds.

- `cpu.cfs_quota_us`

Specifies the total amount of runtime in microseconds (represented by `us` for μs), for which all tasks in the Drill cgroup can run during one period (as defined by `cpu.cfs_period_us`). When tasks in the Drill cgroup use up all the time specified by the quota, the tasks are throttled for the remainder of the time specified by the period and they cannot run until the next period. For example, if tasks in the Drill cgroup can access a single CPU for 0.2 seconds out of every 1 second, set `cpu.cfs_quota_us` to 200000 and `cpu.cfs_period_us` to 1000000. Setting the `cpu.cfs_quota_us` value to -1 indicates that the group does not have any restrictions on CPU. This is the default value for every cgroup, except for the root cgroup.

Configuring CPU Limits

Complete the following steps to set a hard and/or soft CPU limit for the Drill process running on the node:

1. Start the cgconfig service:

```
service cgconfig start
```

2. Add a cgroup for Drill in the `/etc/cgconfig.conf` file:

```
group drillcpu {
    cpu {
        cpu.shares = 320;
        cpu.cfs_quota_us = 400000;
        cpu.cfs_period_us = 100000;
    }
}
```

In the configuration example above, the `cpu.shares` parameter sets the soft limit. The other two parameters, `cpu.cfs_quota_us` and `cpu.cfs_period_us`, set the hard limit. If you prefer to set only one type of limit, remove the parameters that do not apply. When setting a soft limit, allocate a specific number of CPU shares to the Drill cgroup in the configuration. Calculate the CPU shares as:

```
1024 (CPU allocated to Drill/Total available CPU)
```

In the example, CPU shares is calculated as:

```
1024 (10/32) = 320
```

When setting a hard limit, add limits to the `cpu.cfs_quota_us` and `cpu.cfs_period_us` parameters. In the example, the Drill process can fully utilize 4 CPU.

Tip:

The hard limit parameter settings persist after each cgroup service restart. Alternatively, you can set the parameters at the session level using the following commands:

```
echo 400000 > /cgroup/cpu/drillcpu/cpu.cfs_quota_us
echo 100000 > /cgroup/cpu/drillcpu/cpu.cfs_period_us
```

- (Optional) If you want the `cgconfig` service to automatically restart upon system reboots, run the following command:

```
chkconfig cgconfig on
```

Working with Drill

For general information about working with Drill, refer to the following key topics:

Connecting Drill to Data Sources

Choose and configure storage plugins to enable Drill to connect to a data source.

Drill serves as a query layer that connects to data sources through storage plugins. A storage plugin is a software module for connecting Drill to data sources. A storage plugin typically optimizes execution of Drill queries, provides the location of the data, and configures the workspace and file formats for reading data.

What you can do with Storage Plugins

Several storage plugins are installed with Drill that you can configure to suit your environment. Through a storage plugin, Drill connects to a data source, such as a database, a file on a local or distributed filesystem, or a Hive metastore. See the [Drill Storage and Format Plugin Support Matrix](#).

You can modify the default configuration of a storage plugin and give the new configuration a unique name. This document refers to `Y` as a different storage plugin, although it is actually just a reconfiguration of original interface.

On the Storage tab of the Web Console, you can view and reconfigure a storage plugin if you have permission. You can access each node running a Drillbit by starting the Drill Web Console. The way you [start the Drill Web Console](#) depends on your security setup.

When you install Drill using the `mapr-drill` package, storage plugin configurations are available for the following data sources:

- filesystem
- [HPE Ezmeral Data Fabric Database](#)

Note: To access HPE Ezmeral Data Fabric Database tables, use the `dfs` storage plugin with the [maprdb format plugin](#).

- [Hive](#)
- [Kafka](#)

Connecting Drill to HBase

As of the Core 6.0 and Drill 1.11, HBase is no longer supported, therefore the communication path between Drill and HBase is also not supported. If you have an `hbase` storage plugin configured in Drill, you should disable it.

Default Storage Plugin Configurations

The Drill documentation describes the [attributes and definitions](#) that you can configure for storage plugins, except for the HPE Ezmeral Data Fabric Database format. See [HPE Ezmeral Data Fabric Database Format Plugin for Drill](#).

The Drill Web Console includes some default storage plugin configurations. The following table lists the default configurations and their descriptions:

| Instance | Description |
|----------|--|
| cp | Points to a JAR file in the Drill classpath that contains the Transaction Processing Performance Council (TPC) benchmark schema TPC-H that you can query. |
| dfs | Points to filesystem by default. Drill automatically configures this instance when you install Drill in a the cluster. Includes a maprdb format plugin for HPE Ezmeral Data Fabric Database. |
| hive | Integrates Drill with the Hive metadata abstraction of files, HPE Ezmeral Data Fabric Database, and libraries to read data and operate on SerDes and UDFs. |

When you add or update a storage plugin configuration on one Drill node in a Drill cluster, Drill broadcasts the information to all of the other Drill nodes. All nodes have identical storage plugin configurations. You do not need to restart any Drillbits when you add or update a storage plugin configuration.h

Configuring Storage Plugin Instances

You can add, remove, or update Drill storage plugin configurations using the Web Console. The following image shows the default storage plugin configurations in the Drill Web UI:

The screenshot shows the Apache Drill web interface with three sections for managing storage plugins:

- Enabled Storage Plugins:** Lists 'cp' and 'dfs'. Each has 'Update' and 'Disable' buttons.
- Disabled Storage Plugins:** Lists 'hbase', 'hive', and 'mongo'. Each has 'Update' and 'Enable' buttons.
- New Storage Plugin:** A form with a 'Storage Name' input field and a 'Create' button.

If you click **Update** next to `dfs`, the following default configuration appears :

```
{
  "type": "file",
  "enabled": true,
  "connection": "maprfs:///",
  "workspaces": {
    "root": {
      "location": "/",
      "writable": false,
      "defaultInputFormat": null
    },
    "tmp": {
      "location": "/tmp",
      "writable": true,
      "defaultInputFormat": null
    }
  }
},
```

```

"formats": {
  "psv": {
    "type": "text",
    "extensions": [
      "tbl"
    ],
    "delimiter": "|"
  },
  "csv": {
    "type": "text",
    "extensions": [
      "csv"
    ],
    "delimiter": ","
  },
  "tsv": {
    "type": "text",
    "extensions": [
      "tsv"
    ],
    "delimiter": "\t"
  },
  "parquet": {
    "type": "parquet"
  },
  "json": {
    "type": "json"
  },
  "maprdb": {
    "type": "maprdb"
  }
}
}

```

The `dfs` configuration includes the storage plugin type, connection information, default workspaces, and file formats that the data source supports. You can add and remove workspaces and file formats.

Changing the Connection Attribute

You can also change the connection if you want the configuration to point to a different cluster.

By default, Drill connects to the cluster that the Drill node belongs to. You do not need to modify the connection unless you want to connect Drill to a different cluster. To connect to a different cluster, edit the connection to include the name of the cluster that you want to connect to.

Example:

```
"connection": "maprfs://<cluster_name>/"
```

Drill Storage and Format Plugin Support Matrix

You can deploy Drill without Hadoop in a standalone configuration on a single node, however multi-node standalone cluster deployments of Drill are not supported. Note that Drill itself does not require Hadoop.

The following table lists the supported and unsupported data sources and formats in Drill:

| Data Source | Storage Plugin Type | Formats | Supported |
|-------------|---------------------|----------------------|-----------|
| filesystem | dfs | Text (CSV, TSV, PSV) | Yes |
| | | Parquet | Yes |
| | | JSON | Yes |

| | | | |
|----------------------------------|----------|--|--|
| | | Avro | No |
| HPE Ezmeral Data Fabric Database | dfs | Binary | Yes |
| | | JSON | Yes |
| HBase | hbase | Binary | No (as of Drill 1.11 and Core 6.0) |
| Hive | hive | Text (CSV, TSV, PSV) | Yes |
| | | Parquet | Yes |
| | | JSON | Yes |
| | | Avro | Yes |
| | | Other Hive built-in SerDes | Yes (Not recommended due to the memory overhead and performance implications.) |
| S3 | s3 | Supports the same formats as the dfs storage plugin. | Yes |
| MongoDB | mongodb | N/A | No |
| RDBMS | jdbc | N/A | No |
| Kudu | kudu | N/A | No |
| Kafka | kafka | JSON | No  Note: The kafka storage plugin on the Streams is in the Alpha testing phase and not officially supported. See Configuring the Kafka Storage Plugin for more information. |
| OpenTSDB | openTSDB | N/A |  Note: The openTSDB storage plugin is not officially supported. See OpenTSDB Storage Plugin for more information. |

 **Note:** As of the Core 6.0 and Drill 1.11, HBase is no longer supported, therefore the communication path between Drill and HBase is also not supported. If you have an hbase storage plugin configured in Drill, you should disable it.

maprdb Format Plugin for Drill

Drill supports access to HPE Ezmeral Data Fabric Database JSON and binary tables through the maprdb format plugin.

When you install Drill, the maprdb format is automatically defined within the default dfs storage plugin configuration to make HPE Ezmeral Data Fabric Database a consumable data source for Drill. You can access the dfs storage plugin configuration from the Storage page in the [Drill Web UI](#).

When you install Drill, you will see some options specific to the maprdb format plugin that you can change or configure. You can modify these options in the following places:

- [dfs storage plugin configuration](#)
- [drill-override.conf file](#)
- [SET command](#)

For additional information about storage plugins, see [Plugin Configuration Basics](#).

Modifying the maprdb Format Settings within the dfs Storage Plugin Configuration

You can add or modify certain maprdb format plugin settings within the dfs storage plugin configuration on the Storage page in the Drill Web UI.

The following table lists the maprdb format options that you can set within the dfs storage plugin configuration:

| Option | Description | Value |
|------------------------------|---|------------|
| allTextMode | When enabled, Drill reads all values as type varchar. Useful when the underlying data set has type values of mixed scalar types, such as integers, floating point, varchars, date, time, and timestamp. Disabled by default. | true false |
| disableCountOptimization | When enabled, this option disables optimization for queries with the COUNT (*) aggregate function. Disabled by default. | true false |
| enablePushdown | When enabled, Drill pushes down filters to HPE Ezmeral Data Fabric Database. Disabling this option is not recommended unless you intend to use it for troubleshooting purposes. Enabled by default. | true false |
| ignoreSchemaChange | When enabled, Drill ignores schema changes. Disabled by default. | true false |
| nonExistentColumnsProjection | When enabled, Drill can distinguish between null and non-existent fields. Disabled by default. | true false |
| readNumbersAsDouble | When enabled, Drill reads all numeric values as type double. Useful when the underlying data set has type values of mixed numeric types, such as integers and floating point. Disabled by default. | true false |
| readTimestampWithZoneOffset | When enabled (set to 'true'), Drill converts timestamp values from UTC to local time zone when reading the values from MapR Database. Disabled (set to 'false') by default. Does not impact the <code>store.hive.maprdb_json.read_timestamp_with_timezone_of_fset</code> setting. | true false |

The following example configuration shows you how to include the options in the maprdb format configuration within the dfs storage plugin configuration:

```
{
  "type": "file",
  "enabled": true,
```

```

"connection": "maprfs:///",
"config": null,
"workspaces": {
  "root": {
    "location": "/",
    "writable": false,
    "defaultInputFormat": "maprdb",
    "allowAccessOutsideWorkspace": false
  },
  "formats": {
    "maprdb": {
      "type": "maprdb",
      "allTextMode": true,
      "disableCountOptimization": true,
      "enablePushdown": false
    },
    "parquet": {
      "type": "parquet"
    },
    "json": {
      "type": "json",
      "extensions": [
        "json"
      ]
    }
  }
}

```

See [Plugin Configuration Basics](#) and [File System Storage Plugin](#) for more information.

Overriding Default maprdb Format Plugin Settings in drill-override.conf

You can override the default maprdb format plugin settings that control the level of parallelism in Drill and the media type in the `drill-override.conf` file.

To override the default maprdb format plugin settings, add the options to the `format-maprdb.json` configuration in the `/opt/mapr/drill/drill-<version>/conf/drill-override.conf` file, as shown:

```

format-maprdb: {
  json: {
    scanSizeMB: 512,
    restrictedScanSizeMB: 4096
    mediaType: HDD
  }
}

```

The following sections describe how to modify the options in the configuration shown above:

Configuring the Level of Parallelism in Drill

The size of data chunks and number of minor fragments affect the level of parallelism in Drill. When querying JSON tables, Drill creates minor fragments that scan the chunks of data that HPE Ezmeral Data Fabric Database passes to Drill. Minor fragments are logical units of work that determine the level of parallelism in Drill. The level of parallelism increases with the number of minor fragments. See [Drill Query Execution](#) for more information about how Drill executes a query.

Modifying the Size of Data Chunks

The `format-maprdb.json.scanSizeMB` option changes the size of data chunks that HPE Ezmeral Data Fabric Database passes to Drill when querying JSON tables. Drill creates approximately one minor fragment per data chunk when querying JSON tables. For example, if a table has 4 GB of data and the chunk size is set to 128 MB, Drill creates approximately 32 minor fragments to scan the data chunks.

The default setting for data chunks is 128 MB, however you can override this default in the `drill-override.conf` file. The value of the `format-maprdb.json.scanSizeMB` option can range from 32 MB to 8192 MB (8 GB). Adjust the setting based on the size of your tables. Use a higher setting for larger tables and a lower setting for smaller tables. The right setting can reduce latency and increase throughput.

Modifying the Number of Minor Fragments Created

The `format-maprdb.json.restrictedScanSizeMB` option determines the number of minor fragments that Drill creates to scan the data and do the join-back to a JSON table when executing a non-covering index plan.

The default setting for this option is 4096 MB, however you can override this setting in the `drill-override.conf` file. The value of this option can range from 32 MB to 8192 MB (8 GB). Adjust the setting based on the size of your tables, keeping in mind that due to the random I/O nature of the join-back, a smaller setting (increased parallelism) may not necessarily increase throughput.

Note: The `planner.slice_target` option in Drill determines the number of minor fragments that can run in parallel. See [Modifying Query Planning Options](#) for more information.

Configuring the Media Type

Drill is optimized for SSDs, however HPE Ezmeral Data Fabric Database and Drill can run on HDDs. If you run Drill and HPE Ezmeral Data Fabric Database on HDDs, use the `mediaType` option in the `drill-override.conf` file to override the default setting. The `mediaType` option accepts HDD or SSD (default) as the value. Specify SSD or HDD in upper case as the value in the `drill-override.conf` file.

Drill Options for the maprdb Format Plugin

You can enable certain Drill options for the maprdb format plugin from the Options page in the Drill Web UI or from the command line using the SET and ALTER SYSTEM commands.

To enable the options from the Drill Web UI, go to `http(s)://<drill-hostname-or-ip-address>:8047`, and select **Options** in the menu bar. Alternatively, enable options from the command line using the [SET](#) or [ALTER SYSTEM](#) commands, as shown:

```
SET `store.hive.maprdb_json.optimize_scan_with_native_reader` = true;
```

You can enable the following Drill options for the maprdb format plugin:

| | |
|---|--|
| <code>store.hive.maprdb_json.optimize_scan_with_native_reader</code> | Starting in Drill 1.14 (EEP 6.0), enable the <code>store.hive.maprdb_json.optimize_scan_with_native_reader</code> option if you want Drill to use the native Drill reader to read Hive MapR-DB JSON tables . When you enable the native Drill reader, Drill typically performs faster reads of data and applies filter pushdown optimizations. |
| <code>store.hive.maprdb_json.read_timestamp_with_timezone_offset</code> | Starting in Drill 1.16, you can enable Drill to read timestamp values with a timezone offset when the hive plugin is used and the Drill native MapRDB JSON reader is enabled through the <code>store.hive.maprdb_json.optimize_scan_with_native_reader</code> option. |

Important: Internally, Drill stores timestamp values in UTC format, for example 2018-01-01T20:12:12.123Z. When you enable the timezone offset option, select on a table returns different timestamp values. If you filter on timestamp values when this option is enabled, you must include the new timestamp value in the filter condition. For example, look at the timestamp values when the `store.hive.maprdb_json.read_timestamp_with_timezone_offset` option is disabled (set to 'false'):

```
select * from dfs.`/tmp/timestamp`;
-----
_id          datestring          datetimestamp
-----
1           2018-01-01 12:12:12.123    2018-01-01 20:12:12.123
2           9999-12-31 23:59:59.999    10000-01-01 07:59:59.999
-----
```

When the option is enabled (set to 'true'), you can see the difference in the timestamp values returned:

```
select * from dfs.`/tmp/timestamp`;
-----
_id          datestring          datetimestamp
-----
1           2018-01-01 12:12:12.123    2018-01-01 12:12:12.123
2           9999-12-31 23:59:59.999    9999-12-31 23:59:59.999
-----
```

When the option is enabled, queries that filter on timestamp values must include the new timestamp value in the filter condition, as shown:

```
select * from dfs.`/tmp/timestamp` where datetimestamp=timestamp
'2018-01-01 12:12:12.123';
-----
_id          datestring          datetimestamp
-----
1           2018-01-01 12:12:12.123    2018-01-01 12:12:12.123
-----
```

Notice that the WHERE clause uses the ``2018-01-01 12:12:12.123`` format versus the ``2018-01-01 20:12:12.123`` format.

HPE Ezmeral Data Fabric Database Tables

The `maprdb` format plugin enables you to query binary and JSON tables like you would query files in a file system because HPE Ezmeral Data Fabric Database and the filesystem share the same namespace.

Binary tables differ from JSON tables in that they store a multi-dimensional map in which both keys and values are a sequence of bytes. JSON tables store [OJAI documents](#). JSON tables support rich data types, including complex and repeated types, that enable database servers to evaluate filter conditions for optimized query execution. Binary tables can pose performance limitations because the table columns do not contain the necessary type information.

You can query tables stored in any directory in HPE Ezmeral Data Fabric Database using the same syntax that you use to select from files in the filesystem. Instead of including the path of a file in a query, you include the table path. The user running the query must have [read permission](#) to access the table.

Note: HPE Ezmeral Data Fabric Database is a case sensitive data source. To ensure that your queries return results, use the case that corresponds to the column names in the JSON tables and views that you query. For example, if you query the “age” column in a JSON table, the query must reference the column as “age” and cannot reference the column as “AGE” or the query will not return results. If you have a dataset where a column name has mixed cases, such as “age” and “AGE,” cleanse the data set so column names consist of one case and then reimport the data into the table to ensure a complete result set when you query the column.

The following sections describe the types of tables that HPE Ezmeral Data Fabric Database supports, provide examples of Drill queries on each type of table, and show you how to load data into a JSON table from JSON files.

JSON Tables

A JSON table is a collection of JSON documents stored in an optimized format in HPE Ezmeral Data Fabric Database. JSON tables support complex schema, like JSON files including nested and repeated types, but with additional support for more [data types](#).

JSON tables leverage the [OJAI API](#) to natively support [Drill data types](#) making it possible for HPE Ezmeral Data Fabric Database to recognize, store, and interpret each of the Drill data types. This alleviates the need to encode data when an application writes to tables or use conversion functions when running queries against tables. For example, if a number or date is stored in a JSON table, you do not need to use the `CAST` or `CONVERT` functions for the query to return the actual values.

HPE Ezmeral Data Fabric Database's native support for Drill data types enables Drill to push down filters and projections to HPE Ezmeral Data Fabric Database which optimizes performance.

Querying a JSON Table

Querying JSON tables is simpler than querying binary tables because you do not have to include conversion functions in the queries to change the byte sequences into specific data types, and you do not have to include column families.

The following query examples show query results on a JSON table named “students” in HPE Ezmeral Data Fabric Database. Note that Drill returns human readable values without having to include the `CAST` or `CONVERT` functions in the queries.

Example 1

```
SELECT * FROM dfs.`/user/root/json/students`;
```

| _id | date | name | state | street | zipcode |
|----------|------------|-------|-------|------------------|---------|
| student1 | 2016-01-15 | Alice | CA | 123 Ballmer Av | 12345 |
| student2 | 2016-03-08 | Bob | CA | 1 Infinite Loop | 12345 |
| student3 | 2015-12-22 | Frank | CA | 435 Walker Ct | 12345 |
| student4 | 2015-09-15 | Mary | CA | 56 Southern Pkwy | 12345 |

4 rows selected (0.233 seconds)

Example 2

```
SELECT _id, `date`, name, state, street, zipcode FROM dfs.`/user/root/json/students`;
```

| _id | date | name | state | street | zipcode |
|----------|------------|-------|-------|------------------|---------|
| student1 | 2016-01-15 | Alice | CA | 123 Ballmer Av | 12345.0 |
| student2 | 2016-03-08 | Bob | CA | 1 Infinite Loop | 12345.0 |
| student3 | 2015-12-22 | Frank | CA | 435 Walker Ct | 12345.0 |
| student4 | 2015-09-15 | Mary | CA | 56 Southern Pkwy | 12345.0 |

```
+-----+-----+-----+-----+-----+
4 rows selected (1.033 seconds)
```

Loading JSON Documents into a HPE Ezmeral Data Fabric Database Table with dbshell Commands

You can use the INSERT command in the `mapr dbshell` to load JSON documents into a HPE Ezmeral Data Fabric Database table.

The INSERT command is useful when inserting a small number of JSON documents into a JSON table.

Note: Alternatively, you can put JSON documents in a flat text file and use the `mapr importJSON` command to import the JSON documents into a table. The `mapr importJSON` command is useful when you need to insert many documents into a table. Refer to [HPE Ezmeral Data Fabric Database JSON ImportJSON](#) on page 5525 for instruction.

Note: The examples in this document use the student data in the [Querying HBase Tutorial](#) to recreate the binary “students” table as a JSON table in HPE Ezmeral Data Fabric Database.

To load JSON documents into a HPE Ezmeral Data Fabric Database table through the `mapr dbshell`, complete the following steps:

1. Run the following command to start the `mapr dbshell`:

```
mapr dbshell
```

2. Run the following command to create a table:

```
create <table-name>
```

Example:

```
create students
```

Note: By default, the table is stored in the default directory. The default directory is the current directory on the MapR Filesystem, which is set to the user’s home directory when the `mapr dbshell` starts. Include a file path, as shown, if you do not want the table stored in the default directory:

```
create /file/path/table-name
```

3. Load the JSON documents into the table using the INSERT command, as shown:

```
insert <table-name> --value '{JSON-document}'
```

Example:

```
insert students --value '{"_id":"student1", "name":"Alice",
"street":"123 Ballmer Av", "zipcode":12345, "state":"CA"}'
insert students --value '{"_id":"student2", "name":"Bob", "street":"1
Infinite Loop", "zipcode":12345, "state":"CA"}'
insert students --value '{"_id":"student3", "name":"Frank",
"street":"435 Walker Ct", "zipcode":12345, "state":"CA"}'
insert students --value '{"_id":"student4", "name":"Mary", "street":"56
Southern Pkwy", "zipcode":12345, "state":"CA"}'
```

4. Run the following command to verify that the table was created:

```
find <table-name>
```

Example:

```
find students
```

5. Run the following command to close the `mapr dbshell`:

```
exit
```

6. If you need to start or restart Drill, run the following command:

```
maprcli node services -name drill-bits -action start|restart -nodes  
<space-separated-list-of-drill-hostnames>
```

7. Run the following command to start the Drill shell (SQLLine):

```
sqlline
```

You can query the HPE Ezmeral Data Fabric Database JSON table from the Drill shell. If you did not include a file path when you created the table, the table was created in the current directory on the MapR Filesystem, which is set to the user's home directory. For example, the following query specifies the default directory if the root user created the table without indicating a file path:

```
SELECT * FROM dfs.`/user/root/table-name`;
```

Example:

```
SELECT * FROM dfs.`/user/root/students`;
```

If the user created the table in a specific directory, the query must include the directory in which the table was created, as shown:

```
SELECT * FROM dfs.`/file/path/table-name`;
```

Binary Tables

Binary tables store data in a flat table structure where the table consists of columns and column values. Every field in a binary table is stored as a sequence of bytes.

Binary tables do not store data type information. You manage the encoding for binary tables when storing data and then convert the sequence of bytes into a specific data type using the `CAST` or `CONVERT` functions when you run queries against the tables.

For example, if a string is stored in binary format, such as a UTF-8 encoded string, you must use the `CAST` function for the query to return a string type. If an integer is stored in binary format, such as 4-byte little endian encoding, you must use the `CONVERT` function for the query to return the integer value instead of the 4-byte sequence.

Querying a Binary Table

The following examples, from the [Querying HBase Tutorial](#), display query results when the binary table `/user/root/binary/students` with two column families, `account` and `address`, is queried without using a conversion function to convert the binary table data into specific data types.

Example 1

```
SELECT * FROM `/user/root/binary/students` students;
```

```

+-----+-----+-----+-----+-----+-----+
| row_key | account |
| address |
+-----+-----+-----+-----+
| [B@78dfaled | {"date": "MjAxNi0wMS0xNQ==", "name": "QWxpY2U="} |
| {"state": "Q0E=", "street": "MTIzIEJhbGxtZXIgcXV=", "zipcode": "MTIzNDU="} |
| [B@22000c9a | {"date": "MjAxNi0wMy0wOA==", "name": "Qm9i"} |
| {"state": "Q0E=", "street": "MSBJbmZpbml0ZSBMb29w", "zipcode": "MTIzNDU="} |
| [B@313b63e6 | {"date": "MjAxNS0xMi0yMg==", "name": "RnJhbms="} |
| {"state": "Q0E=", "street": "NDMlIFdhdG91ciBDdA==", "zipcode": "MTIzNDU="} |
| [B@321baa4a | {"date": "MjAxNS0wOS0xNQ==", "name": "TWYyeQ=="} |
| {"state": "Q0E=", "street": "NTYgU291dGhlcm4gUGt3eQ==", "zipcode": "MTIzNDU="} |
+-----+-----+-----+-----+-----+
4 rows selected (0.612 seconds)

```

In example 2, using the CONVERT_FROM and CAST functions in a query on the same table converts the binary table data to typed data.

Example 2

```

SELECT CONVERT_FROM(row_key, 'UTF8') AS studentid,
CONVERT_FROM(students.account.name, 'UTF8') AS name,
CONVERT_FROM(students.address.state, 'UTF8') AS state,
CONVERT_FROM(students.address.street, 'UTF8') AS street,
CONVERT_FROM(students.address.zipcode, 'UTF8') AS zipcode,
CAST(students.account.`date` as date) AS `date` FROM dfs.`/user/root/binary/
students` students;

```

```

+-----+-----+-----+-----+-----+-----+
| studentid | name | state | street | zipcode | date |
+-----+-----+-----+-----+-----+-----+
| student1 | Alice | CA | 123 Ballmer Av | 12345 | 2016-01-15 |
| student2 | Bob | CA | 1 Infinite Loop | 12345 | 2016-03-08 |
| student3 | Frank | CA | 435 Walker Ct | 12345 | 2015-12-22 |
| student4 | Mary | CA | 56 Southern Pkwy | 12345 | 2015-09-15 |
+-----+-----+-----+-----+-----+-----+
4 rows selected (0.702 seconds)

```

Configuring the Hive Storage Plugin

You can connect Drill to a Hive data source through the hive storage plugin configuration in the Drill Web UI. Once configured, you can use Drill to query data stored in Hive.

Drill can work with only one version of Hive in a given cluster. To access Hive tables using custom SerDes or InputFormat/OutputFormat, all nodes running Drill must have the SerDes or InputFormat/OutputFormat JAR files in the following location: <drill_installation_directory>/jars/3rdparty.

To query across multiple versions of Hive, install each version of Hive on a separate Drill cluster. You must define separate storage plugins, each corresponding to the specific Hive version of the metastore.

Note: In [EEP 6.0](#), Drill requires Hive version 2.3.3-mapr or later to successfully query Hive data sources.

Note: You can update the hive storage plugin configuration through the configuration script, `configure.sh`. If the hive storage plugin is disabled, and the configuration in the Drill Web UI displays “null,” you must rerun `configure.sh` with the `-hiveMetastoreHost` argument. See [configure.sh](#) for details.

Configuring a Hive Remote Metastore

A remote Hive metastore configuration runs as a separate service outside of Hive. The metastore service communicates with the Hive database over JDBC. Point Drill to the Hive metastore service address, and provide the connection parameters in the hive storage plugin configuration to configure a connection to Drill. The hive storage plugin (located on the Storage tab in the Drill Web UI) has the following default configuration when you install Drill:

```
{
  "type": "hive",
  "enabled": true,
  "configProps": {
    "hive.metastore.uris": "",
    "javax.jdo.option.ConnectionURL": "jdbc:derby:;databaseName=../
sample-data/drill_hive_db;create=true",
    "hive.metastore.warehouse.dir": "/tmp/drill_hive_wh",
    "fs.default.name": "file:///",
    "hive.metastore.sasl.enabled": "false",
    "datanucleus.schema.autoCreateAll": "true"
  }
}
```

Complete the following steps to modify the default hive storage plugin configuration for your filesystem environment:

1. Verify that Hive is running.
2. Issue the following command to start the Hive metastore service on the system specified in the `hive.metastore.uris:hive --service metastore`
3. [Start the Drill Web UI](#).
4. Select the **Storage** tab. If [Web UI security](#) is enabled, you must have administrator privileges to perform this step.
5. In the list of disabled storage plugins in the Drill Web UI, click **Update** next to hive.
6. Update the following hive storage plugin parameters to match the system environment:
 - `"hive.metastore.uris"`
 - `"jdbc:<database>://<host:port>/<metastore database>"`
 - Change the default location of files to suit your environment. For example, change `"fs.default.name": "file:///"` to the filesystem location: `maprfs:///`
 - To run Drill and Hive in a secure cluster, change the `"hive.metastore.sasl.enabled"` parameter to `"true"`.
 - Change the `"datanucleus.schema.autoCreateAll"` property setting for your system environment. When enabled, `"datanucleus.schema.autoCreateAll"` initializes the Hive metastore schema.

- In a production environment, remove the "datanucleus.schema.autoCreateAll" property from the hive storage plugin configuration; the property is not required because the preferred schema information is already created for the Hive metastore service.
- In a test environment with an embedded Hive metastore, you can disable (set to false) this property after the first query on the Hive data source that you submit from Drill. Alternatively, use the [Hive schema tool](#) to initialize or upgrade the Hive metastore schema. Using the Hive schema tool is recommended for queries on transactional tables. Run the `schematool` command as an initialization step, as shown:

```
/opt/mapr/hive/hive-<version>/bin/schematool -dbType
<databaseType> -initSchema
```

7. Click **Enable** in the Web UI to enable the Hive storage plugin configuration.

Configuring the Kafka Storage Plugin

The Kafka storage plugin is not officially supported for Drill; however, if you choose to configure Kafka as a data source in Drill, you must update the `<drill_home>/jars/3rdParty` directory such that it contains the required JAR files and then restart Drill before you configure the `kafka` storage plugin in the Drill Web UI.

Verify that the nodes in your cluster meet the requirements and then complete the steps listed.

Requirements

The Kafka storage plugin requires:

- HPE Ezmeral Data Fabric 6.2 cluster
- Drill 1.16.1 installed on nodes
- The HPE Ezmeral Data Fabric Kafka client package (kafka-2.1.1 or 2.6.1) installed on at least one node. The Kafka client installation provides the following kafka JAR files that you copy into the `<drill_home>/jars/3rdParty` directory (step 4):
 - Kafka-2.1.1
 - kafka_2.11-2.1.1.200-mapr-710.jar
 - kafka-clients-2.1.1.200-mapr-710.jar
 - Kafka-2.6.1 (if you have eep-800 installed)
 - kafka_2.13-2.6.1.0-eep-800.jar
 - kafka-clients-2.6.1.0-eep-800.jar
 - kafka-eventstreams-0.1.0.0-eep-800.jar

Steps

Complete the following steps to query Kafka Streams from Drill:

Note: Do not perform step 2 if you installed Drill using the RPM or Debian packages. Step 2 is only required if you installed Drill using a TAR file.

1. Remove the specified JAR files from the `<drill_home>/jars/3rdParty` directory based on the Drill installation method:

- If you installed Drill using RPM or Debian packages, only remove JAR files that start with kafka, such as `kafka-clients-<version>.jar` and `kafka-<version>.jar`, from the `<drill_home>/jars/3rdParty` directory.
 - If you installed Drill using a TAR file, remove all the JAR files that start with `mapr` and `kafka`, such as `maprdb-<version>-mapr.jar`, `maprfs-<version>-mapr.jar`, `kafka-<version>-mapr.jar`, and `kafka-clients-<version>.jar`, from the `<drill_home>/jars/3rdParty` directory.
2. (Only perform this step if you installed Drill using a TAR file.) Copy the following JAR files from the `/opt/mapr/lib` directory into `<drill_home>/jars/3rdParty` directory:
 - `maprdb-6.2.0.0-mapr.jar`
 - `maprdb-6.2.0.0-mapr-tests.jar`
 - `maprfs-6.2.0.0-mapr.jar`
 - `maprfs-6.2.0.0-mapr-tests.jar`
 - `mapr-hbase-6.2.0.0-mapr.jar`
 - `mapr-hbase-6.2.0.0-mapr-tests.jar`
 - `mapr-streams-6.2.0.0-mapr.jar`
 3. Copy the `mapr-streams-6.2.0.0-mapr.jar` file from the `/opt/mapr/lib` directory into the `<drill_home>/jars/3rdParty` directory.
 4. Copy the following kafka JAR files from the `/opt/mapr/kafka/kafka-*/libs` directory into the `<drill_home>/jars/3rdParty` directory:
 - Kafka-2.1.1
 - `kafka_2.11-2.1.1.200-mapr-710.jar`
 - `kafka-clients-2.1.1.200-mapr-710.jar`
 - Kafka-2.6.1 (if you have `eep-800` installed)
 - `kafka_2.13-2.6.1.0-eep-800.jar`
 - `kafka-clients-2.6.1.0-eep-800.jar`
 - `kafka-eventstreams-0.1.0.0-eep-800.jar`
 5. Issue the following command to restart Drill:

```
$ maprcli node services -name drill-bits -action restart -nodes <node hostnames separated by a space>
```

6. Log in to the [Drill Web UI](#), and configure the kafka storage plugin. See [Kafka Storage Plugin](#) for instructions.

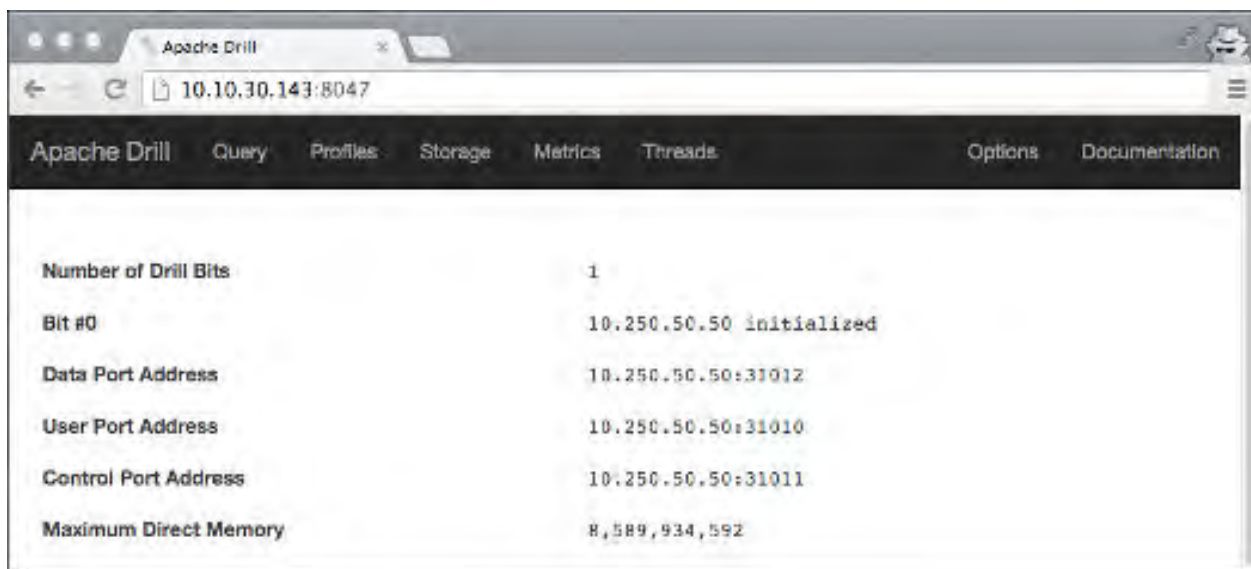

Note: When configuring the kafka storage plugin, you must also include the following parameter in the storage plugin configuration:

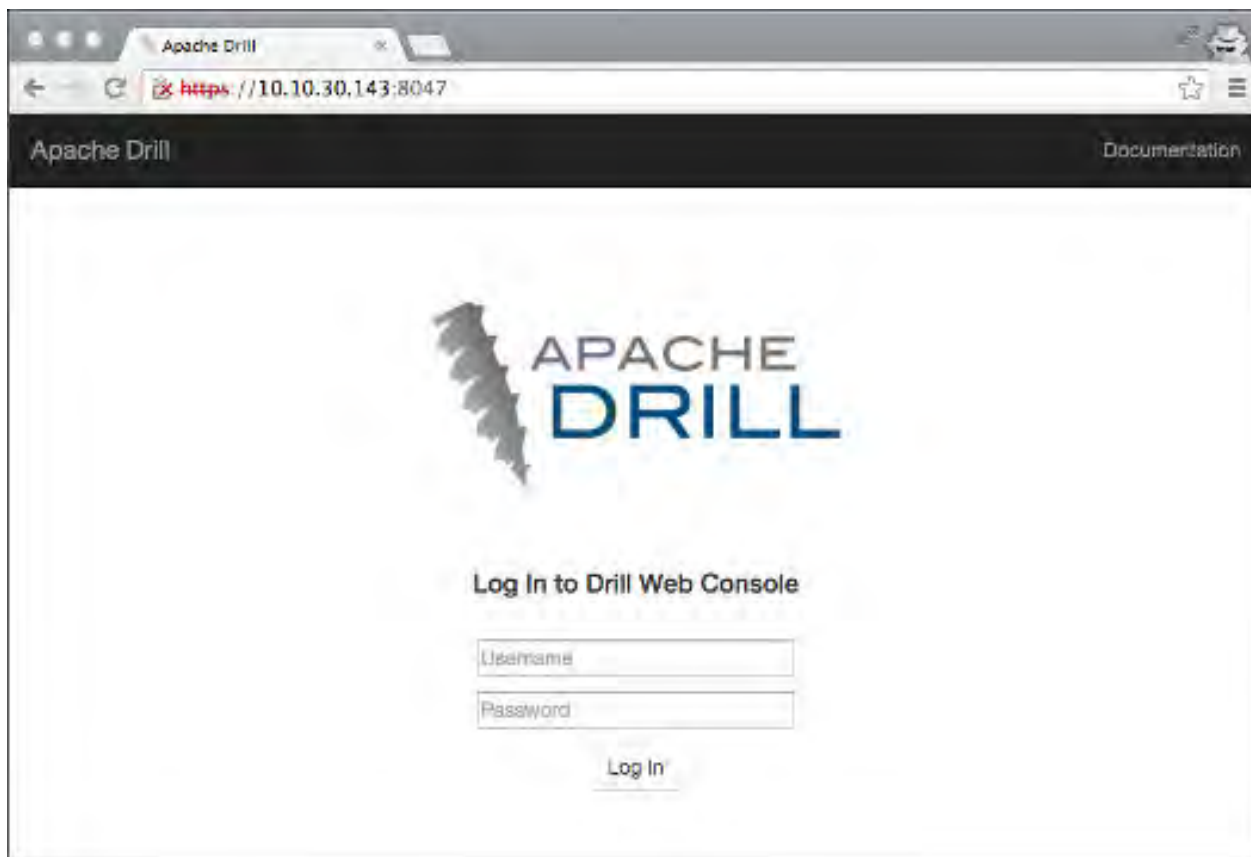

```
"streams.consumer.default.stream": "<path-to-stream>"
```

- If HTTPS support is enabled, use this URL: `https://<IP address or host name>:8047`

If user authentication is *not* enabled, all the Drill Web UI controls appear to users and administrators, including Query, Profiles, Storage, Metrics, and Threads:

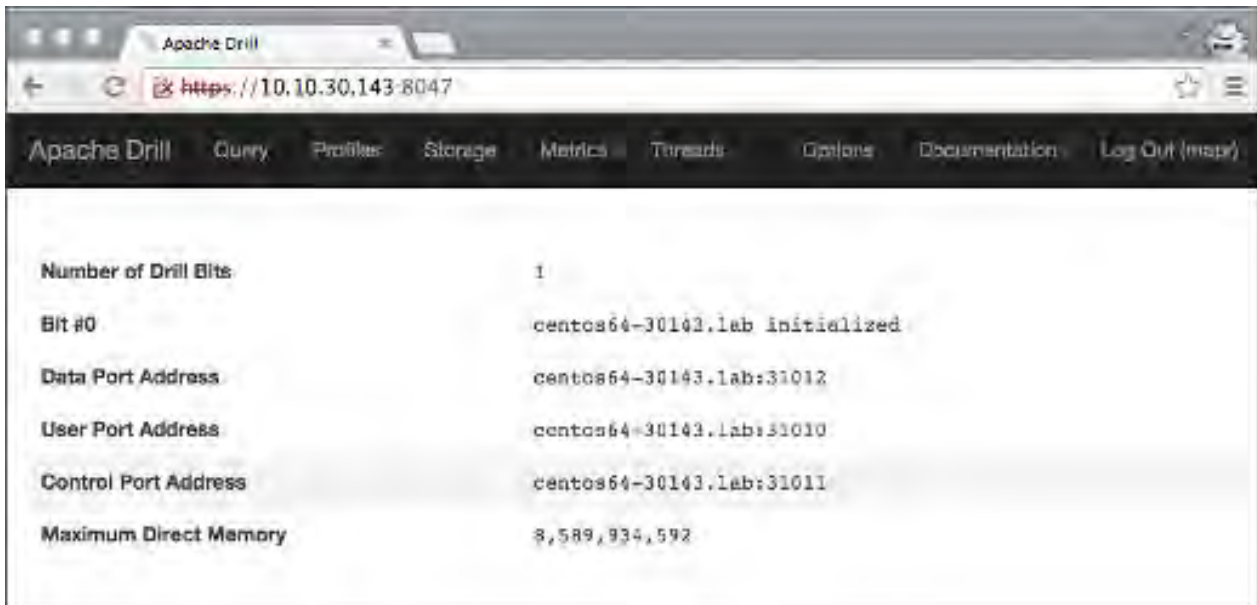

If user authentication is enabled, Drill prompts you for a user name and password:

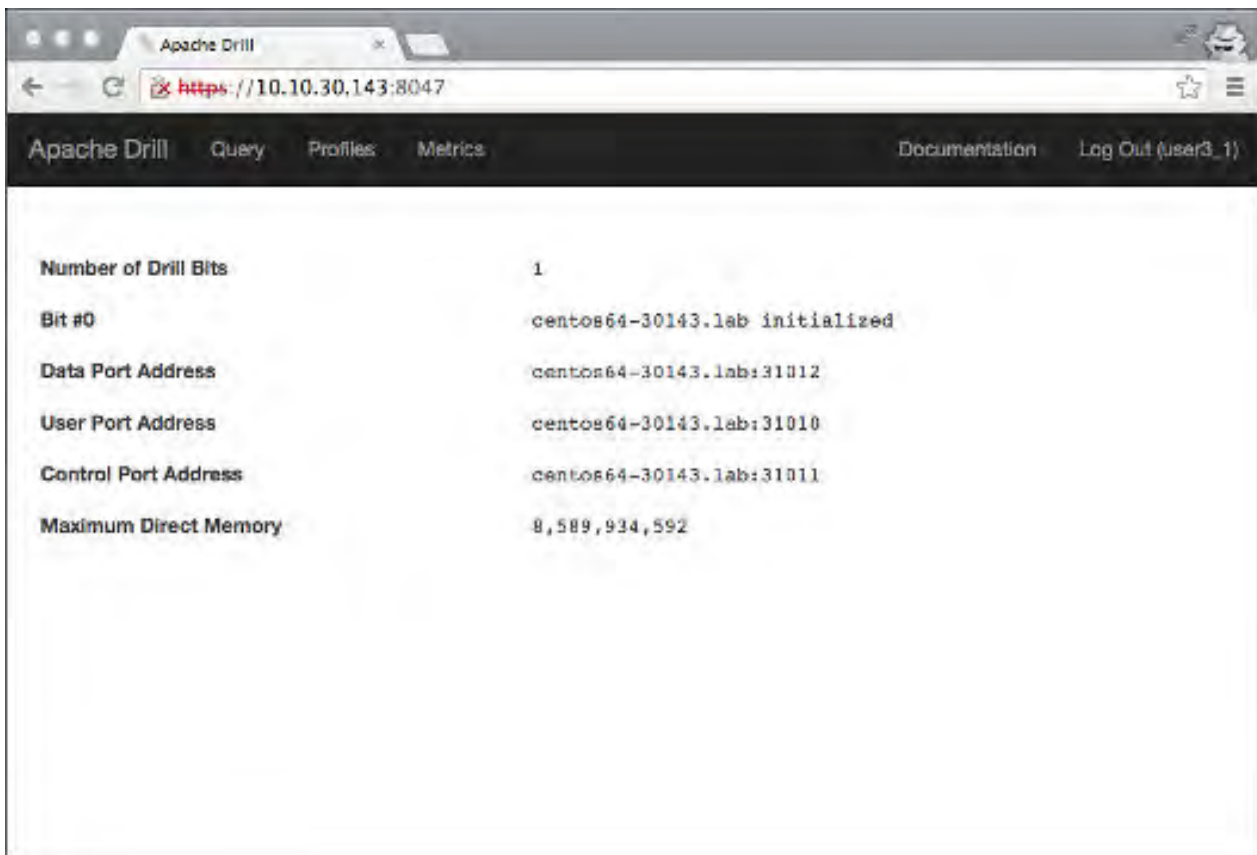

If an administrator logs in, all the Drill Web UI controls appear, including Query, Profiles, Storage, Metrics, Threads, and Options. For administrators, the Profiles page contains the profiles of all queries executed on a cluster. Only administrators can see and use the Storage tab to view, update, or add a new storage

plugin configuration. Only administrators can see and use the Threads tab, which provides information about threads running in Drill.

If a non-administrative user logs in, the Drill Web UI controls are limited to Query, Metrics, and Profiles. The Profiles tab for a non-administrative user contains the profiles of all queries the user issued either through ODBC, JDBC, or the Drill Web UI.

<https://drill.apache.org/docs/securing-drill/>

Start the Drill Shell (SQLLine)

SQLLine is a JDBC application packaged with Drill that serves as the Drill shell. When you issue queries from the SQLLine, the SQLLine client sends the queries to the connected Drillbit (Drill node).

You can connect to Drill through SQLLine directly or through a connection-property file. If want to avoid exposing credentials, connecting through the connection-property file is recommended.

A JDBC connection string supplies the connection information to a Drill node or ZooKeeper cluster. When connecting to a ZooKeeper cluster, ZooKeeper selects the Drillbit that SQLLine connects to.

JDBC Connection String

This is an example of a JDBC connection string that connects SQLLine to drillnode1:

```
jdbc:drill:drillbit=drillnode1:31010
```

The default port on any Drill node is 31010.

Starting SQLLine

You start SQLLine from the Drill installation directory, as shown in the following example where SQLLine connects directly to a Drill node named drillnode1:

```
/opt/mapr/drill/drill-<version>/bin/sqlline -u
jdbc:drill:drillbit=drillnode1:31010
```

Connection Parameters

You can include SQLLine connection parameters in the connection string and run various shell commands, as described in [Configuring the Drill Shell](#).

In the following example, -u is the connection parameter for the JDBC connection string, -n is the parameter for the username, and -p is the parameter for the password:

```
/opt/mapr/drill/drill-<version>/bin/sqlline -u
"jdbc:drill:drillbit=drillnode1:31010" -n mapr -p mapr
```

In the following example, the !connect shell command is used to hide the password when making an authenticated connection:

```
//From /opt/mapr/drill/drill-<version>/, run:
bin/sqlline

//The sqlline prompt appears. At the prompt, provide the connection string
with the !connect property:

sqlline> !connect jdbc:drill:drillbit=drillnode1:31010
//The system prompts you for the username and password.
Enter username for jdbc:drill:drillbit=drillnode1:31010: mapr
Enter password for jdbc:drill:drillbit=drillnode1:31010: *****
```

Notice: In Drill 1.15, the SQLLine `!connect` command incorrectly requests a username and password when connecting to a secure cluster via MAPRSASL or KERBEROS authentication:

```
sqlline> !connect jdbc:drill:drillbit=drillnode1:31010;auth=MAPRSASL

//!connect usage: connect <url> <username> <password> [driver]
//Driver is optional. Driver is the Apache Drill driver class,
org.apache.drill.jdbc.Driver.
```

To workaroud this issue, provide your username when you connect and press Enter when prompted for the password:

```
sqlline> !connect jdbc:drill:drillbit=drillnode1:31010;auth=MAPRSASL
mapr
Enter password for jdbc:drill:drillbit=drillnode1:31010;auth=MAPRSASL:
```

Alternatively, you can use an empty quote in place of a username:

```
sqlline> !connect jdbc:drill:drillbit=drillnode1:31010;auth=MAPRSASL ""
```

Configuration Options

You can also include configuration options, such as `schema` and `auth` (if authentication is enabled):

```
/opt/mapr/drill/drill-<version>/bin/sqlline -u "jdbc:drill:drillbit
drillnode1:31010;schema=dfs;auth=MAPRSASL"
```

Schema

The `schema` is the name of a [storage plugin](#) configuration to use as the default for queries. If you indicate the `schema` in the connection string, you do not have to run the `USE <schema>;` query to switch to the `schema` you want to use. All queries run against the `schema` indicated in the JDBC connection string.

Authentication

If authentication is enabled (Plain, MAPRSASL, Kerberos), include the `auth` option in the connection string. If Drill is installed on a cluster secured by the default security, set `auth=MAPRSASL`. If using Plain authentication, include the username and password, as shown:

```
/opt/mapr/drill/drill-<version>/bin/
sqlline -u "jdbc:drill:drillbit
drillnode1:31010;schema=dfs;auth=MAPRS
ASL"
```

Connecting to a Specific Drill Node

Indicate which Drill node you want SQLLine to connect to in the JDBC connection string, using the following JDBC connection string format:

```
jdbc:drill:drillbit=<host>:<port>
```

Note that properties are case-sensitive. The `host` is the DNS or IP address of the server (Drill node). The default connection port is 31010.

Example

The following example shows you how to start SQLLine with a JDBC connection string that includes the username, password, and auth parameters to authenticate to the server with Plain authentication:

```
/opt/mapr/drill/drill-<version>/bin/sqlline -u
"jdbc:drill:drillbit=<ip-address>:<port>;auth=PLAIN" -n <username> -p
<password>
```

If you installed Drill on a cluster secured by default security, set the auth type to `maprsasl`:

```
/opt/mapr/drill/drill-<version>/bin/sqlline -u
"jdbc:drill:drillbit=<ip-address>:<port>;auth=MAPRSASL"
```

Connecting to ZooKeeper

When you include the ZooKeeper nodes in the JDBC connection string, ZooKeeper selects an available Drill node for SQLLine to connect to.

Indicate the ZooKeeper cluster you want SQLLine to connect to in the JDBC connection string, using the following JDBC connection string format:

```
jdbc:drill:zk=<zk-server-list>/drill/<clustername>
```

The `zk-server-list` is a comma-separated list of the ZooKeeper nodes in the cluster. The `clustername` is the unique name of the Drillbit cluster that you want to connect to.

You can locate the name of the Drillbit cluster in `/opt/mapr/drill/drill-<version>/conf/drill-distrib.conf`. The default name of the Drillbit cluster is `drillbits1`. The name is set by the `cluster-id` property. If you have multiple Drill clusters, you may want to override the Drillbit cluster name in `drill-override.conf`. However, first [back-up your storage plugin configurations](#), as they may reset to the defaults when you change the cluster name. Restart Drill after you edit `drill-override.conf`.

Example

The following example shows you how to configure the JDBC connection string to connect SQLLine to the ZooKeeper cluster:

```
/opt/mapr/drill/drill-<version>/bin/sqlline
jdbc:drill:zk=<node-ip>:<port>,<node-ip>:<port>,<node-ip>:<port>/drill/
drillbits1;auth=PLAIN -n <username> -p <password>
```

The default port for ZooKeeper nodes is 5181.

If you installed Drill on a secure cluster, set the auth type to `MAPRSASL`:

```
/opt/mapr/drill/drill-<version>/bin/sqlline
jdbc:drill:zk=<node-ip>:<port>,<node-ip>:<port>,<node-ip>:<port>/drill/
drillbits1;auth=MAPRSASL
```

Using a Connection-Property File with SQLLine

Make sure you restrict access to the connection-property file to specific users.

Create a connection-property file named `login.properties`, as shown:

```
url:<jdbc-connection-url>
user:<username>
password:<password>

//Example
cat login.properties
```

```
url:jdbc:drill:schema=dfs;drillbit=drill-lab-node01
user:drilluser
password:letsdrill
```

To connect to Drill, run SQLLine as shown:

```
sqlline <sqlline args> <path/to/login.properties file>
```

The following examples show you how you can use the connection-property file to connect to Drill:

Example 1: Connecting to Drill via the connection-property file

Run SQLLine from /opt/mapr/drill/
drill-<version>/bin:

```
sqlline login.properties

//List the active connection:
0: jdbc:drill:schema=dfs> !list
1 active connection:
  #0 open
  jdbc:drill:schema=dfs;drillbit=drill-l
  ab-node01

//Exit SQLLine:
0: jdbc:drill:schema=dfs>!q
```

Example 2: Submitting a query when connecting to Drill via the connection-property file

Run SQLLine from /opt/mapr/drill/
drill-<version>/bin:

```
sqlline -q "SELECT version FROM
sys.version" login.properties

//Run query:
0: jdbc:drill:schema=dfs> select
version from sys.version;
+-----+
| version |
+-----+
| 1.16.0  |
+-----+
1 row selected (0.295 seconds)
```

Example 3: Use the properties command to connect to Drill via the connection-property

Run SQLLine from /opt/mapr/drill/
drill-<version>/bin:

```
sqlline

//At sqlline the prompt, run:
sqlline> !properties /home/drilluser/
login.properties
0: jdbc:drill:schema=dfs>
0: jdbc:drill:schema=dfs> !list
1 active connection:
  #0 open
  jdbc:drill:schema=dfs;drillbit=drill-l
  ab-node01
0: jdbc:drill:schema=dfs>
```

Verify that Login Details are Secure

Run the following command to verify that login details are not exposed to other users:

```
ps -ef | grep sqlline

drilluser      18938 21924 99 14:14
pts/0          00:00:03 /opt/
jdk1.8.0_141/bin/
java -XX:MaxPermSize=512M -Djava.secur
ity.auth.login.config=/opt/mapr/conf/
mapr.login.conf \
-Dzookeeper.sasl.client=false -Dhadoop
.login=simple -Dlog.path=/opt/mapr/
drill/drill-1.10.0/logs/
sqlline.log -Dlog.query.path=/opt/
mapr/drill/drill-1.16.0/logs/
sqlline_queries.json \
-cp /opt/mapr/drill/drill-1.10.0/
conf:/opt/mapr/drill/drill-1.16.0/
jars/*:/opt/mapr/drill/drill-1.16.0/
jars/ext/*:/opt/mapr/drill/
drill-1.16.0/jars/3rdparty/*:/opt/
mapr/drill/drill-1.16.0/jars/classb/*
sqlline.SqlLine -d
org.apache.drill.jdbc.Driver --maxWidt
h=10000 --color=true login.properties
drilluser      20119 1691 0 14:14
pts/1          00:00:00 grep sqlline
```

Exit SQLLine

To exit SQLLine, run `!quit`.

Start|Stop the Drill Process

You can start|stop|restart the Drill process on one or more nodes using the Control System or the following command:

```
maprcli node services -name drill-bits -action start|restart|stop -nodes
<node host names separated by a space>
```

Use the host name if possible. Using host names instead of IP addresses is a best practice.

Related concepts

[Drill Drivers](#) on page 3545

HPE Ezmeral Data Fabric provides Drill ODBC and JDBC drivers that you can download and use to connect Drill to BI tools. The drivers are updated periodically to include support for new functionality in Drill.

[Drill JDBC Drivers](#) on page 3545

Download the Drill JDBC driver and use it on all platforms to connect BI tools, such as SquirrelL and Spotfire, to Drill. Drill also includes an embedded, open-source JDBC driver.

Hive to Drill Type Mapping

Using Drill you can read tables created in Hive that use data types in the [Hive-to-Drill type mapping table](#). Currently, the Apache Hive version used by Drill does not support the timestamp in Unix Epoch format. The workaround is to use the JDBC format for the timestamp, which Hive accepts and Drill uses, as shown in the [type mapping example](#).

For more information about connecting Drill to data sources, refer to [Connect to Data Sources](#) on the [Apache Drill documentation web site](#). For information about workspaces, refer to [Workspaces](#).

Securing Drill

An administrator can install Drill with the default security configuration or manually configure custom security for Drill.

Drill supports several security features that secure the communication paths between Drill clients (such as [ODBC/JDBC](#)) and Drillbits and also between Drillbits. The following sections briefly describe the security configuration options for Drill and provide links to additional information and instructions.

Default Security Configuration

Starting in Core 6.0 and Drill 1.11 (EEP 4.0), Drill is automatically secured when you install Drill on a cluster that was installed with the default security configuration. The default security configuration provides authentication, authorization, and encryption through the data-fabric-SASL mechanism, except for HTTPS, which uses [SSL/TLS](#) with form-based authentication. See [Drill Default Security](#) and [SSL/TLS for Encryption](#) for more information. You may also want to reference the following topics:

- [Installing Drill](#), which describes some Drill installation security scenarios.
- [Drill Drivers](#) on page 3545, where you can access the JDBC and ODBC driver information and downloads required to connect to Drill when using the default security configuration.

Note: The default security configuration does not include Kerberos or Plain authentication; however, you can manually configure these security mechanisms in addition to the default security configuration.

Security Features Supported in a Custom Configuration

Drill supports several security features that an [administrator](#) can manually configure to secure the communication paths between the Drill client and Drillbit and also between Drillbits.

The following table lists the security features and mechanisms supported by Drill, as well as the communication paths secured by each mechanism:

Note: In the following table, Drill client refers to the Drill ODBC and JDBC clients. See [Drill Drivers](#) for ODBC and JDBC driver information.

| Security Features | Supported Mechanisms | Communication Paths Secured |
|-------------------|---|---|
| Authentication | MapR Security (data-fabric-SASL/Tickets) | <ul style="list-style-type: none"> • Drill client to Drillbit • Drillbit to Drillbit • Drillbit to ZooKeeper <p> Note: The Drillbit creates znodes, for which ZooKeeper ACLs provide security. See Security Between ZooKeeper and Drillbits for more information.</p> |
| | Kerberos | <ul style="list-style-type: none"> • Drill client to Drillbit • Drillbit to Drillbit |
| | Plain (username and password) | <ul style="list-style-type: none"> • Drill client to Drillbit |

| Security Features | Supported Mechanisms | Communication Paths Secured |
|-------------------|---|--|
| | Form-based | <ul style="list-style-type: none"> Web client/REST API to Drillbit  Note: You can configure SSL/TLS for encryption. |
| | SPNEGO for HTTP | <ul style="list-style-type: none"> Web client/REST API to Drillbit  Note: You can configure SSL/TLS for encryption. |
| Encryption | MapR Security (data-fabric/Tickets) | <ul style="list-style-type: none"> Drill client to Drillbit Drillbit to Drillbit |
| | Kerberos | <ul style="list-style-type: none"> Drill client to Drillbit Drillbit to Drillbit |
| | SSL/TLS | <ul style="list-style-type: none"> Drill client to Drillbit Web client/REST API to Drillbit |
| Authorization | Based on filesystem permissions. | <ul style="list-style-type: none"> Drill client to Drillbit |
| Impersonation | User Impersonation | <ul style="list-style-type: none"> Drill client to Drillbit  Note: Drill supports user impersonation, inbound impersonation, and user impersonation with Hive authorization. |
| | Inbound impersonation | <ul style="list-style-type: none"> Drill client to Drillbit  Note: Supports setting inbound impersonation policies, which are used to verify whether the user (set as the DelegationUID parameter passed in the client connection URL) can be impersonated by the connection user or not. |

Views and File ACEs

In addition to the listed security features, you can [create views](#) on data to limit access to the data. You can also create [file ACEs](#) on the view definition files to protect the views.

Related concepts

[Drill Drivers](#) on page 3545

HPE Ezmeral Data Fabric provides Drill ODBC and JDBC drivers that you can download and use to connect Drill to BI tools. The drivers are updated periodically to include support for new functionality in Drill.

[Start the Drill Shell \(SQLLine\)](#) on page 3482

SQLLine is a JDBC application packaged with Drill that serves as the Drill shell. When you issue queries from the SQLLine, the SQLLine client sends the queries to the connected Drillbit (Drill node).

[Connection URLs for Kerberos using JDBC Drivers to connect via SQLLine](#) on page 3516

You can use client-side connection URL parameters for Kerberos authentication in multiple combinations to authenticate a client with Drill.

[Connection URL for Plain Authentication using the Apache JDBC Driver to connect via SQLLine](#) on page 3523

When Plain authentication is enabled, each user that accesses the Drillbit process through a client, must provide username and password credentials for access.

[SSL/TLS for Encryption](#) on page 3524

You can enable SSL for Drill in a secure or unsecure cluster. SSL (Secure Sockets Layer), more recently called TLS, is a security mechanism that encrypts data passed between the Drill client and Drillbit (server). SSL also provides one-way authentication through which the Drill client verifies the identity of the Drillbit.

[Configuring Drill Web UI and Web API Security](#) on page 3535

The Drill web client and web API communicate with web browsers or web tools, like curl, through the HTTP or HTTPS. Drill uses HTTP by default.

[SPNEGO for HTTP Authentication](#) on page 3540

Drill 1.13 and later supports the Simple and Protected GSS-API Negotiation mechanism (SPNEGO) to extend the Kerberos-based single sign-on authentication mechanism to HTTP. An administrator configures the web server (Drillbit) to use SPNEGO for authentication. Depending on the system, either the administrator or the user configures the client (web browser or web client tool) to use SPNEGO for authentication.

Roles and Privileges

Drill has USER and ADMIN roles. Each role can perform different functions in Drill.

Access in the Drill Web UI differs between users and administrators. Certain pages are exposed based on privilege. For example, only administrators can see the Storage tab and edit a storage plugin configuration.

The following sections describe a few additional differences between a user and an administrator in Drill.

USER Role

The following list notes the functions that a user can perform in Drill:

- Users can run queries on data to which they have access.
- Users can view and cancel their own queries in the Profiles tab of the Drill Web UI.
- Users can create views on data to provide granular access to that data.

Note: Each data source manages the read/write permissions.

ADMIN Role

When authentication is enabled, only Drill users assigned the administrator (ADMIN) role can perform the following tasks:

- Change system-level options by issuing the ALTER SYSTEM command or through the options tab in the Drill Web UI.
- Update a storage plugin configuration through the REST API or Drill Web UI.
- View the profiles of all queries run by all users.
- Cancel running queries that were launched by any user in the cluster.
- Shut down the Drillbit in the Drill Web UI.

Configuring USER and ADMIN Roles

You can define administrative users through the `security.admin.user_groups` and `security.admin.users` options.

The default value for `admin.users` is the `drill_process_user`. The default value for `admin.user_groups` is `drill_process_user_groups`. These options accept a comma-separated list of users or user groups.

To edit these options, use the SET command, as shown in the following examples:

```
ALTER SYSTEM SET `security.admin.user_groups` = 'drill,
%drill_process_user_groups%';
ALTER SYSTEM SET `security.admin.users` = 'user1, %drill_process_user%';
ALTER SYSTEM SET `security.admin.users` = 'user1, user2';
```

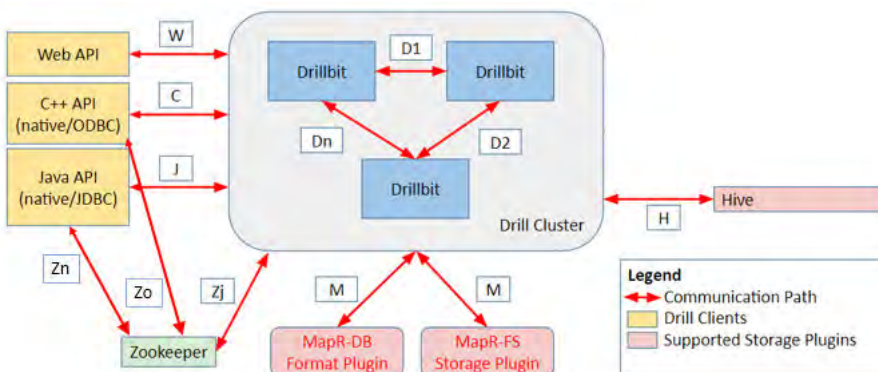

Drill Default Security

The default security configuration uses data-fabric-SASL (tickets) for authentication, authorization, and encryption to automatically secure the cluster and ecosystem components when you install them manually or using the Installer.

The default security configuration automatically secures all Drill communication paths with the following exceptions:

- The path between the web client and web server (W) uses [SSL/TLS](#) with form-based authentication.
- The path between the ODBC/JDBC client and ZooKeeper (Zn, Zo) is unsecure.

The following diagram shows the secured communication paths:

The following table describes the security support for each communication path in the diagram, along with the components involved in the communication:

| Type of Security Supported | Communication Path | Component Communication |
|--|--------------------|---|
| Authentication and encryption using data-fabric-SASL (tickets) | C | ODBC client/C++ API to Drillbits |
| | J | JDBC client/Java API to Drillbits |
| | D1, D2, Dn | Drillbit to Drillbit |
| | M | Drillbit to HPE Ezmeral Data Fabric Database/filesystem |

| | | |
|--|--------|--|
| | H | Drillbit to Hive  Note: The Hive storage plugin is not secured by default and requires that you manually modify the configuration to enable security. See Configuring the Hive Storage Plugin on page 3475. |
| Plain authentication with SSL encryption (HTTPS enabled) | W | Web client/Web API to Web server  Note: The HTTPS channel (Web client) uses Plain authentication to authenticate a Web client with SSL/TLS for encryption. This is configured by default in a secure 6.x cluster with Drill 1.11 or later installed. Plain authentication does not support encryption. You must enable SSL to encrypt the communication channels when using Plain authentication. See Configuring Drill Web UI and Web API Security on page 3535. |
| Authentication with security (no encryption) | Zj | Drillbit to ZooKeeper  Note: The Drillbit creates znodes, for which ZooKeeper <i>ACLs</i> provide security. See Security Between ZooKeeper and Drillbits on page 3534 for more information. |
| No security support | Zo, Zn | ODBC/JDBC client to ZooKeeper  Note: Only znodes created for Drillbit endpoints in Zookeeper are readable by the client. All other znodes (not required by the client) are secured using ZooKeeper <i>ACLs</i> , and are only readable by Drillbits. |

Note the following information:

- [Kerberos](#) and [Plain authentication](#) are not enabled or configured as part of the default security configuration. However, you can manually configure these security mechanisms in addition to the defaults. If you enable Plain authentication, you must use [SSL/TLS](#) for encryption.
- Drill clients running Drill 1.10 and earlier do not support encryption and cannot connect to Drillbits installed with the default security configuration.

Connecting Drill

See [Drill Drivers](#) on page 3545. Alternatively, you can use [SQLLine](#), [the Drill shell](#), as shown:

Disabling Security

You can turn off the default security configuration across the entire cluster.

Note: If you unsecure a cluster, you must backup the Drill znodes. After the switch to unsecured, update the ACL on the Drill znodes so that Drill in an unsecured cluster can access all Drill znodes. See [Security Between ZooKeeper and Drillbits](#) on page 3534 for more information.

To disable the default security configuration across an entire cluster, run `configure.sh` with the `-unsecure` parameter, as shown:

```
/opt/mapr/server/configure.sh -forceSecurityDefaults [ -unsecure | -secure ]
-C <CLDB_node> -Z <ZK_node>
```

Alternatively, you can enable security across an entire cluster with the `-secure` parameter.

See [Installing Drill](#) on page 166 and [configure.sh](#) on page 2331 for more information.

Additional Notes

Performance

The default security configuration enables encryption for all network channels, which can affect Drill performance. If performance is your highest priority, install the data-fabric and Drill without security enabled and have your security expert manually configure cluster security. Alternatively, you can install the data-fabric and Drill with security enabled, and then disable individual Drill security settings. For example, you can edit the `drill-override.conf` file and disable encryption, leaving authentication enabled.

Note: Manually configuring security settings when default security is enabled is not recommended.

Drill Configuration Files

The default security configuration introduces new Drill configuration files. In addition to `drill-override.conf`, `distrib-env.sh`, and `drill-env.sh`, Drill includes a `drill-distrib.conf` file. See [Drill Configuration Files](#) on page 3558 for more information. Note that modifying drill distribution-specific files is highly discouraged. To customize any Drill configuration, use `drill-override.conf` and `drill-env.sh`.

HBase

As of Core 6.0 and Drill 1.11, HBase is no longer supported; therefore, the communication path between Drill and HBase is also not supported.

User Impersonation

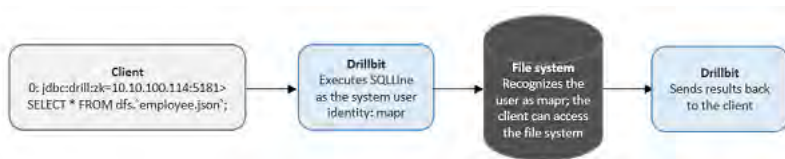

Impersonation allows a service to act on behalf of a client while performing the action requested by the client. By default, user impersonation is disabled in Drill. You can configure user impersonation in the `/opt/mapr/drill/drill-<version>/drill-override.conf` file.

When you enable impersonation, Drill executes all the client requests as the user logged in to the client. Drill passes the user credentials to the filesystem, and the filesystem checks to see if the user has permission to access the data. When you enable authentication, Drill uses the pluggable authentication module (PAM) to authenticate a user's identity before the user can access the Drillbit process.

If impersonation is disabled, Drill executes all of the client requests against the file system as the user that started the Drillbit service on the node. This is typically a privileged user. The filesystem verifies that the system user has permission to access the data.

User Impersonation Example

When impersonation is disabled and user Bob issues a query through the SQLLine client, SQLLine passes the query to the connecting Drillbit. The Drillbit executes the query as the system user that started the Drill process on the node. For the purpose of this example, we will assume that the system user has full access to the filesystem. Drill executes the query and returns the results back to the client.

When impersonation is enabled and user Bob issues a query through the SQLLine client, the Drillbit uses Bob's credentials to access data in the filesystem. The filesystem checks to see if Bob has permission to access the data. If Bob has permission, Drill returns the query results to the client. If Bob does not have permission, Drill returns an error.

Impersonation Support

Drill supports impersonation with the following clients, storage plugins, and types of queries:

- **Clients**

- ODBC
- JDBC
- REST API
- Drill Web UI

- **Storage plugins**

- filesystem
- HPE Ezmeral Data Fabric Database
- Hive

- **Types of queries**

Note: When you enable impersonation, the setting applies to queries on data and metadata. For example, if you issue the SHOW SCHEMAS command, Drill impersonates the user logged into the client to access the requested metadata. If you issue a SELECT query on a workspace, Drill impersonates the user logged in to the client to access the requested data.

Drill applies impersonation to queries issued using the following commands:

- SHOW SCHEMAS
- SHOW DATABASES
- SHOW TABLES
- CTAS
- SELECT
- CREATE VIEW
- DROP VIEW

- SHOW FILES.

Note: To successfully run the CTAS and CREATE VIEW commands, a user must have write permissions on the directory where the table or view will exist. Running these commands creates artifacts on the filesystem.

Impersonation and Views

You can use views with impersonation to provide granular access to data and protect sensitive information.

When you create a view, Drill stores the view definition in a file and suffixes the file with `view.drill`. For example, if you create a view named `myview`, Drill creates a view file named `myview.view.drill` and saves it in the current workspace or the workspace specified, such as `dfs.views.myview`. See [CREATE VIEW](#).

You can create a view and grant read permissions on the view to give other users access to the data that the view references. When a user queries a view on which s/he has read access, Drill impersonates the view owner to access the underlying data. If the user tries to query the data directly (instead of using the view), Drill returns a permission denied error. A user with read access to a view can create new views from the originating view to further restrict access on data.

View Permissions

A user must have write permission on a directory or workspace to create a view, as well as read access on the table(s) and/or view(s) that the view references. When a user creates a view, permission on the view is set to owner by default. Users can query an existing view or create new views from the view if they have read permissions on the view file and the directory or workspace where the view file is stored.

When users query a view, Drill accesses the underlying data as the user that created the view. If a user does not have permission to access a view, the query fails and Drill returns an error. Only the view owner or a superuser can modify view permissions to change them from owner to group or world.

The view owner or a superuser can modify permissions on the view file directly or they can set view permissions at the system or session level prior to creating any views. Any user that alters view permissions must have write access on the directory or workspace in which they are working.

Modifying Permissions on a View File

Only a view owner or a super user can modify permissions on a view file to change them from owner to group or world readable. Before you grant permission to users to access a view, verify that they have access to the directory or workspace in which the view file is stored.

Use the `chmod` and `chown` commands with the appropriate octal code to change permissions on a view file:

```
hadoop fs -chmod <octal code> <file_name>
hadoop fs -chown <user>:<group> <file_name>
//hadoop fs -chmod 750 employees.view.drill
```

Modifying SYSTEM|SESSION Level View Permissions

Use the `ALTER SESSION|SYSTEM` command with the `new_view_default_permissions` parameter and the appropriate octal code to set view permissions at the system or session level prior to creating a view.

```
ALTER SESSION SET `new_view_default_permissions` = '<octal_code>';
ALTER SYSTEM SET `new_view_default_permissions` = '<octal_code>';
//ALTER SESSION SET `new_view_default_permissions` = '777';
```

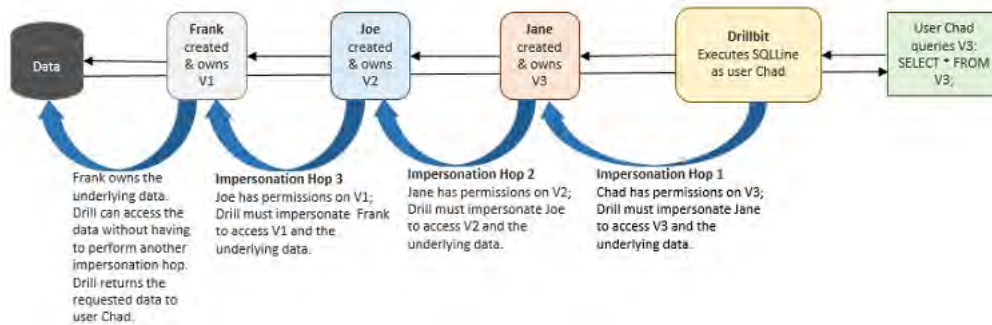

After you set this parameter, Drill applies the same permissions on each view created during the session or across all sessions if set at the system level.

Chained Impersonation

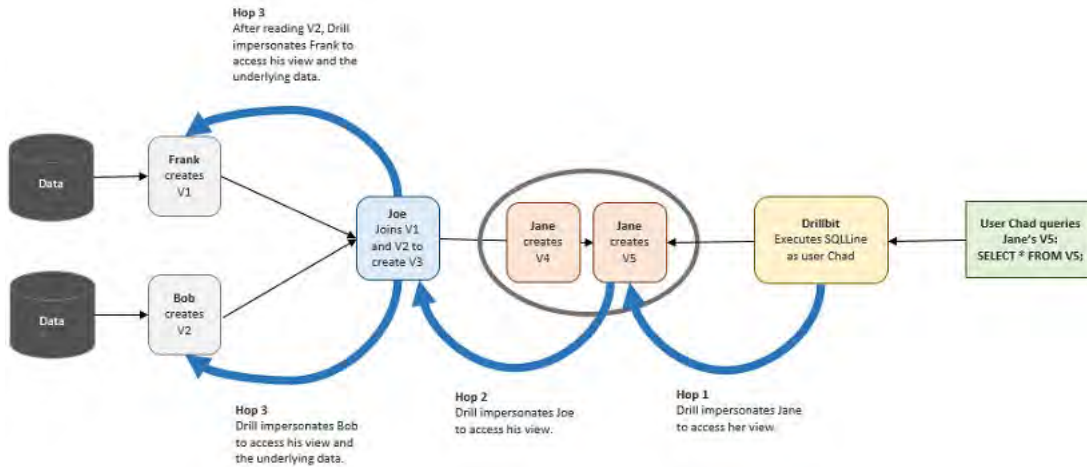

You can configure Drill to allow chained impersonation on views when you enable impersonation in the `drill-override.conf` file. Chained impersonation controls the number of identity transitions that Drill can make when a user queries a view. Each identity transition is equal to one hop.

An administrator can set the maximum number of hops for impersonation to limit the number of times that Drill can impersonate a different user when other users query a view. The default maximum number of hops is set at 3. When the maximum number of hops is set to 0, Drill does not allow impersonation chaining, and a user can only read data for which they have direct permission to access. An administrator may set the chain length to 0 to protect highly sensitive data.

The following diagram depicts a scenario where the maximum hop number is set to 3, and Drill must impersonate three users to access data when Chad queries a view that Jane created:

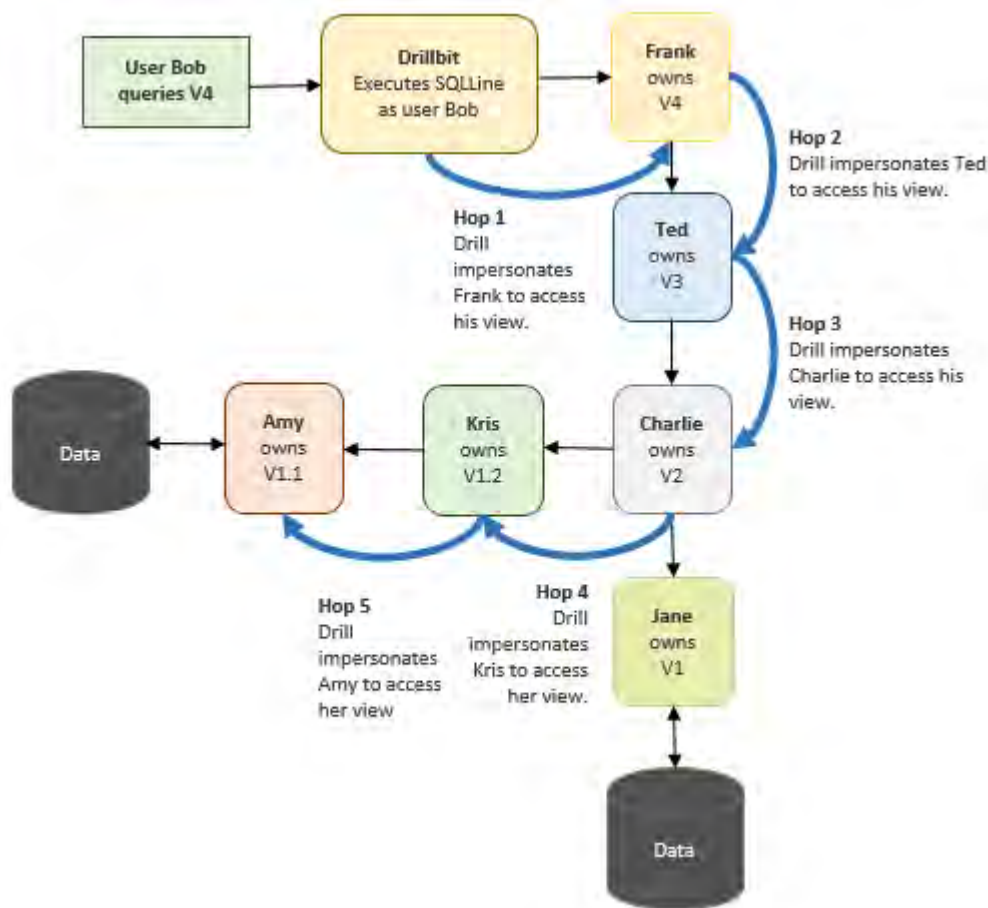

In the previous example, Joe created V2 from the view that user Frank created. In the following example, Joe created V3 by joining a view that Frank created with a view that Bob created.

Although V3 was created by joining two different views, the number of hops remains at 3 because Drill does not read the views at the same time. Drill reads V2 first and then reads V1.

In the next example, Bob queries V4 which was created by Frank. Frank's view was created from several underlying views. Charlie created V2 by joining Jane's V1 with Kris's V1.2. Kris's V1.2 was created from Amy's V1.1, increasing the complexity of the chaining. Assuming that the hop limit is set at 4, this scenario exceeds the limit.

When Bob queries Franks's view, Drill returns an error stating that the query cannot complete because the number of hops required to access the data exceeds the maximum hop setting of 4.

If users encounter this error, the administrator can increase the maximum hop setting to accommodate users running queries on views.

Configuring Impersonation and Chaining

Impersonation allows a service to act on behalf of a client while performing the action requested by the client. Chaining is a system-wide setting that applies to all views. Currently, Drill does not provide an option to allow different chain lengths for different views.

Complete the following steps on each Drillbit node to enable user impersonation, and set the maximum number of chained user hops that Drill allows:

1. Navigate to `<drill_installation_directory>/conf/` and edit `drill-override.conf`.

2. Under `drill.exec`, add the following:

```
drill.exec.impersonation: {
    enabled: true,
    max_chained_user_hops: 3
}
```

Alternatively, you can nest `impersonation` within the `drill.exec` block, as shown in the following example:

```
drill.exec: {
    cluster-id: "cluster_name",
    zk.connect:
"<hostname>:<port>,<hostname>:<port>,<hostname>:<port>",
    sys.store.provider.zk.blobroot: "hdfs://",
    impersonation: {
        enabled: true,
        max_chained_user_hops: 3
    }
}
```

3. Set the maximum number of chained user hops.

4. In `<drill_installation_directory>/conf/drill-env.sh`, add one of the following lines:

- If the underlying filesystem has security enabled, add the following line: `export MAPR_TICKETFILE_LOCATION=/opt/mapr/conf/mapruserticket`
- If the underlying filesystem is not secure, add the following line: `export MAPR_IMPERSONATION_ENABLED=true`

5. Restart the Drillbit process on each Drill node.

```
maprcli node services -name drill-bits -action restart -nodes
<node-hostnames-separated-by-a-space> -f
```

Example: Impersonation and Chaining

This example demonstrates how to use impersonation and chaining to limit access to data. Impersonation allows a service to act on behalf of a client while performing the action requested by the client. Chaining controls the number of identity transitions that Drill can make when a user queries a view.

Note: The number of identity transitions is controlled by the `max_chained_user_hops` option in the `drill-override.conf` file. See [Chained Impersonation](#) and [Configuring Impersonation and Chaining](#) for more information.

Frank is a senior HR manager at a company. Frank has access to all of the employee data because he is a member of the hr group. Frank created a table named “employees” in his home directory to store the employee data he uses. Only Frank has access to this table.

```
drwx----- frank:hr /user/frank/employees
```

Each record in the `employees` table consists of the following information: `emp_id`, `emp_name`, `emp_ssn`, `emp_salary`, `emp_addr`, `emp_phone`, `emp_mgr`

Frank needs to share a subset of this information with Joe who is an HR manager reporting to Frank. To share the employee data, Frank creates a view called `emp_mgr_view` that accesses a subset of the data. The `emp_mgr_view` filters out sensitive employee information, such as the employee social security

numbers, and only shows data for the employees that report directly to Joe. Frank and Joe both belong to the mgr group. Managers have read permission on Frank's directory.

```
rwxr----- frank:mgr /user/frank/emp_mgr_view.view.drill
```

The emp_mgr_view.view.drill file contains the following view definition:

```
(view definition: SELECT emp_id, emp_name, emp_salary, emp_addr, emp_phone
FROM `/user/frank/employee` WHERE emp_mgr = 'Joe')
```

When Joe issues `SELECT * FROM emp_mgr_view`, Drill impersonates Frank when accessing the employee data, and the query returns the data that Joe has permission to see based on the view definition. The query results do not include any sensitive data because the view protects that information. If Joe tries to query the employees table directly, Drill returns an error or null values.

Because Joe has read permissions on the emp_mgr_view, he can create new views from it to give other users access to the employee data even though he does not own the employees table and cannot access the employees table directly.

Joe needs to share employee contact data with his direct reports, so he creates a special view called emp_team_view to share the employee contact information with his team. Joe creates the view and writes it to his home directory. Joe and his reports belong to a group named joeteam. The joeteam group has read permissions on Joe's home directory so they can query the view and create new views from it.

```
rwxr----- joe:joeteam /user/joe/emp_team_view.view.drill
```

The emp_team_view.view.drill file contains the following view definition:

```
(view definition: SELECT emp_id, emp_name, emp_phone FROM `/user/frank/
emp_mgr_view.drill`);
```

When anyone on Joe's team issues `SELECT * FROM emp_team_view`, Drill impersonates Joe to access the emp_team_view and then impersonates Frank to access the emp_mgr_view and the employee data. Drill returns the data that Joe's team has can see based on the view definition. If anyone on Joe's team tries to query the emp_mgr_view or employees table directly, Drill returns an error or null values.

Because Joe's team has read permissions on the emp_team_view, they can create new views from it and write the views to any directory for which they have write access. Creating views can continue until Drill reaches the maximum number of impersonation hops (chained impersonation).

User Impersonation with Hive

You can configure Drill impersonation with Hive impersonation to authorize access to metadata in the Hive metastore repository and data in the Hive warehouse. [Drill impersonation](#) works with Hive when Hive has impersonation enabled and optionally, storage based or SQL standard based authorization enabled. Drill impersonation can also work with Hive when the Hive metastore has Kerberos enabled on a secure cluster. Currently, Drill does not support Hive configured with Sentry authorization.

Storage Based Authorization

Hive storage based authorization is a remote metastore server security feature that uses the underlying filesystem permissions to determine permissions on databases, tables, and partitions. The permissions a user or group has on directories in the filesystem determines access to data. Because the filesystem controls access at the directory and file level, storage based authorization cannot control access to data at the column or view level.

You manage user and group privileges through permissions and access controls in the distributed filesystem. DDL statements that manage permissions, such as GRANT and REVOKE, do not have any effect on permissions in the storage based authorization model.

For more information, see [Storage Based Authorization in the Metastore Server](#).

SQL Standard Based Authorization

The SQL standard based authorization model can control which users have access to columns, rows, and views. SQL standard based authorization is configured in HiverServer2 and enforced during query processing. Users with the appropriate permissions can issue the GRANT and REVOKE statements to manage privileges from Hive.

For more information, see [SQL Standard Based Hive Authorization](#).

Prerequisites

To configure user impersonation with Hive, the system must meet the following requirements:

- Core version 4.1 or later
- Drill installed with Drillbits running as the `mapr` user
- Supported version of Hive installed with the following:
 - [User impersonation](#) enabled
 - Configured Hive remote metastore repository
 - (Optional) [SQL standard based authorization](#) or [storage based authorization](#) configured

Note: See [EEP Components and OS Support](#) on page 5739 for supported versions of Hive.

Configuration

Complete the steps listed in [Configuring User Impersonation with Hive](#).

Configuring User Impersonation with Hive

Complete the following steps on a secure or insecure cluster to configure user impersonation with Hive:

Step 1: Modify `drill-env.sh`

Modify `<DRILL_HOME>/conf/drill-env.sh` to include the required environment variables on each Drill node.

Insecure Cluster

On an insecure cluster, include the following environment variable:

```
export MAPR_IMPERSONATION_ENABLED=true
```

Secure Cluster

On a secure cluster, include the following environment variables:

```
export
DRILL_JAVA_OPTS="$DRILL_JAVA_OPTS -Djava.security.auth.login.config=/opt/mapr/conf/mapr.login.conf -Dzookeeper.sasl.client=true"
export
DRILL_JAVA_OPTS="$DRILL_JAVA_OPTS -Dmapr_sec_enabled=true -Dhadoop.login=maprsasl_keytab -Dzookeeper.saslprovider=com.mapr.security.maprsasl.MaprSaslProvider -Dmapr.library.flatclass"
export MAPR_TICKETFILE_LOCATION=/opt/mapr/conf/mapruserticket
```

Step 2: Modify drill-override.conf

For secure and insecure clusters, modify `<DRILL_HOME>/conf/drill-override.conf` on each Drill node to enable impersonation in Drill, and set the [maximum number of chained user hops](#) that Drill allows.

Add the following configuration properties to the `drill.exec` block in `drill-override.conf`:

```
drill.exec: {
  cluster-id: "<drill_cluster_name>",
  zk.connect: "<hostname>:5181,<hostname>:5181,<hostname>:5181"
  impersonation: {
    enabled: true,
    max_chained_user_hops: 3
  }
}
```

Step 3: Modify the Hive Storage Plugin in Drill

Modify the Hive storage plugin configuration in the Drill Web UI based on the authorization and security scenario for the cluster. You can only access the Drill Web UI for a running Drillbit.

Complete the following steps to modify the Hive storage plugin configuration:

1. Navigate to `http://<drillbit_hostname>:8047`, and select the **Storage** tab.
2. Click **Update** next to the hive option.
3. In the configuration window, add the required properties based on the authorization type and security scenario:

Storage Based Authorization or No Authorization Enabled

For a *insecure cluster*, add the following properties to the configuration:

```
{
  type:"hive",
  enabled: true,
  configProps : {

    "hive.metastore.uris" : "thrift://
<metastore_hostname>:9083",
    "fs.default.name" : "maprfs:///",
    "hive.metastore.sasl.enabled" :
    "false",
    "hive.server2.enable.doAs" :
    "true",

    "hive.metastore.execute.setugi" :
    "true"
  }
}
```

For a *secure cluster*, add the following properties to the configuration:

```
{
  "type": "hive",
  "enabled": true,
  "configProps": {
    "hive.metastore.uris": "thrift://
<metastore_hostname>:9083",
    "fs.default.name": "maprfs:///",
    "hive.server2.enable.doAs": "true"
  }
}
```

```
}
}
```

Add the following additional properties if the Hive metastore is configured with Kerberos in a secure cluster; include a comma after each line except for the last:

```
"hive.metastore.kerberos.principal":
  "hive/<metastore_thrift_server>"
"hive.metastore.sasl.enabled":
  "true"
```

SQL Standard Based Authorization

For an *insecure cluster*, add the following properties to the configuration:

```
{
  type:"hive",
  enabled: true,
  configProps : {
    "hive.metastore.uris" :
    "thrift://
    <metastore_hostname>:9083",
    "fs.default.name" : "maprfs:///",

    "hive.security.authorization.enabled
    " : "true",

    "hive.security.authenticator.manager
    " :
    "org.apache.hadoop.hive.ql.security.
    SessionStateUserAuthenticator",

    "hive.security.authorization.manager
    " :
    "org.apache.hadoop.hive.ql.security.
    authorization.plugin.sqlstd.SQLStdHi
    veAuthorizerFactory",
    "hive.metastore.sasl.enabled" :
    "false",
    "hive.server2.enable.doAs" :
    "false",

    "hive.metastore.execute.setugi" :
    "false"
  }
}
```

For a *secure cluster*, add the following properties to the configuration:

```
{
  "type": "hive",
  "enabled": true,
  "configProps": {
    "hive.metastore.uris": " thrift://
    <metastore_hostname>:9083",
    "fs.default.name": "maprfs:///",

    "hive.security.authorization.enabled
```

```

": "true" ,

"hive.security.authenticator.manager
":
"org.apache.hadoop.hive.ql.security.
SessionStateUserAuthenticator" ,

"hive.security.authorization.manager
":
"org.apache.hadoop.hive.ql.security.
authorization.plugin.sqlstd.SQLStdHi
veAuthorizerFactory" ,
  "hive.server2.enable.doAs" :
  "false" ,
  "hive.metastore.execute.setugi" :
  "true"
}
}
}

```

Add the following additional properties if the Hive metastore is configured with Kerberos in a secure cluster; include a comma after each line except for the last:

```

"hive.metastore.kerberos.principal" :
  "hive/<metastore_thrift_server>"
"hive.metastore.sasl.enabled" :
  "true"

```

Step 4: Restart Warden

Run the following command on all nodes to restart the Warden service:

```
service mapr-warden restart
```

If you have `clush` installed, you can run the following command to restart Warden on all nodes at once:

```
clush -a "service mapr-warden restart"
```

Inbound Impersonation

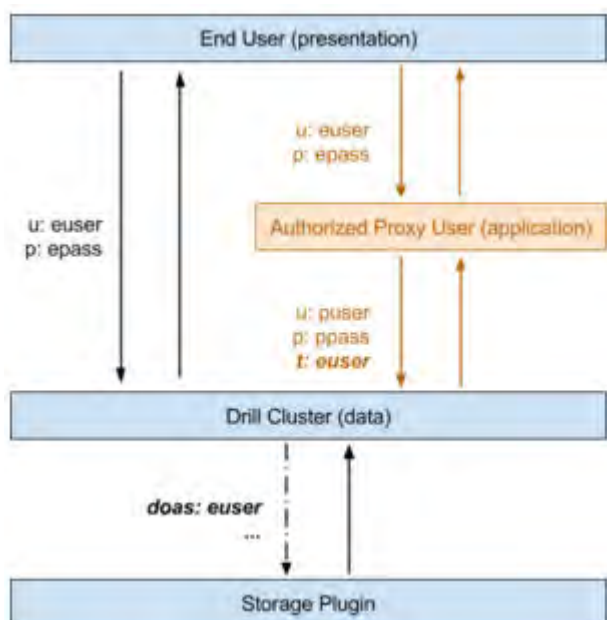

An administrator can define inbound impersonation policies to impersonate the end user.

Drill supports user impersonation where queries run as the user that created a connection. However, this user is not necessarily the end user who submits the queries. For example, in a classic three-tier architecture, the end user interacts with Tableau Desktop, which communicates with a Tableau Server, which in turn communicates with a Drill cluster. In this scenario, a proxy user creates a connection, and the queries are submitted to Drill by the proxy user on behalf of the end user, and not by the end user directly. In this particular case, the query needs run run as the end user.

The proxy user must be authorized to submit queries on behalf of the specified end user. Otherwise, any user can impersonate another user. The query runs as the end user, and data authorization is based on this user's access permissions. Note that without authentication enabled in both communication channels, a user can impersonate any other user.

Drill trusts proxy users to provide the correct end user identity information. Drill does not authenticate the end user. The proxy user (application) is responsible for end user authentication, which is usually enabled.

The following diagram shows how identity is propagated through various layers (with authentication enabled). The flow on the left is Drill with user impersonation enabled. The flow on the right is Drill with user impersonation and inbound impersonation enabled. `t:ouser` is a property on the connection (`u` is `username`, `pis` `password`, `t` is `impersonation_target`).

The following topic provides instructions for configuring inbound impersonation:

Configuring Inbound Impersonation

Administrators can configure inbound impersonation in the `drill-override.conf` file.

Complete the following steps to enable inbound impersonation:

1. If user impersonation is not enabled, you must enable it before configuring inbound impersonation. To enable user impersonation, edit `/opt/mapr/drill/drill-<version>/drill-override.conf` and set the option to `true`, as shown:

```
{
  drill.exec.impersonation.enabled: true,
  ...
}
```

2. Define inbound impersonation policies. For example, the following `ALTER SYSTEM` statement authorizes:

- `puser1` to impersonate any user (use `*` as a wildcard character)
- `puser2` to impersonate `euser1` and all users in `egroup2`
- all users in `pgroup3` to impersonate all users in `egroup3`

```
ALTER SYSTEM SET `exec.impersonation.inbound_policies`='[
  { proxy_principals : { users: ["puser1"] },
    target_principals: { users: ["*"] } },
  { proxy_principals : { users: ["puser2"] },
    target_principals: { users: ["euser1"], groups : ["egroup2"] } },
  { proxy_principals : { groups: ["pgroup3"] },
    target_principals: { groups: ["egroup3"] } } ]';
```

Policy format:

```
{ proxy_principals : { users : ["...", "..."], groups : ["...", "..."] },
  target_principals: { users : ["...", "..."], groups : ["...",
  "..."] } }
```

- Ensure that the proxy user (application) passes the username of the impersonation target user to Drill when creating a connection through the `impersonation_target` connection property. For example, through `sqlline`:

```
bin/sqlline -u
"jdbc:drill:schema=dfs;zk=myclusterzk;impersonation_target=euser1" -n
puser1 -p ppass1
```

Note: In this example, `puser1` is the user submitting the queries. This user is authenticated. Since this user is authorized to impersonate any user, queries through the established connection are run as `euser1`.

Related information

<https://drill.apache.org/docs/configuration-options-introduction/#system-options>

Default Security (Tickets)

Drill supports authentication and encryption through the Default (tickets) security mechanism. Authentication is the process of establishing confidence of authenticity. Encryption is the process of converting information or data from plain text into ciphertext to prevent unauthorized access. An administrator can manually configure Drill to use Default Security. When Default Security is enabled, all Drill clients, such as JDBC and ODBC, must connect to Drillbits through Default Security.

The Default Security mechanism secures the communication path between the Drill client, such as JDBC/ODBC and Drillbit, Drillbit and ZooKeeper, and also between Drillbits.

Note: The Drill web communication path (web client to web server) does not support Default Security-based authentication and encryption.

Note: The Apache JDBC driver packaged with Drill does not support Default Security.

Configuration parameters in the Drill startup configuration file, `/opt/mapr/drill/drill-<version>/conf/drill-override.conf`, enable or disable authentication and encryption.

Prerequisites

- Ensure that your cluster is secure. To manually configure secure clusters with Default Security, see [Enable Wire-Level Security](#).
- When you configure Drill to use encryption, authentication must also be configured and enabled with the encryption-specific configurations.
- For encryption and authentication to work together, the Drill client and Drillbits must all run Drill 1.11 or later. Drill clients running earlier versions of Drill cannot connect to Drillbits when encryption is enabled.
- The client-side should have created a user `mapr` ticket for the authenticating user. See [maprlogin](#) for more information.

Post-requisite

You must restart the Drillbit process on each node after you enable security and/or modify the configuration options, as shown:

```
$ maprcli node services -name drill-bits -action restart -nodes <node host
names separated by a space>
```

Download and configure the JDBC or ODBC Drill drivers. See [Drill Drivers](#) for more information.

The following topics provide configuration information to enable authentication and encryption in Drill:

Configuring Authentication

An administrator can enable Default Security as the only authentication mechanism, or in addition to other mechanisms, such as Kerberos and Plain authentication in `drill-override.conf`.

Note: When Drill is installed on the MapR Data Platform, Drill distribution defaults are stored in the `drill-distrib.conf` file. To override the defaults, you must explicitly disable them in the `drill-override.conf` file.

The following sections provide configuration examples for several configuration scenarios:

Note: For client-side configuration, see [Drill Drivers](#).

Example 1: Drill Client to Drillbit Authentication using Default Security Only

```
drill.exec:{
    security: {
        user.auth.enabled: true,
        auth.mechanisms : ["MAPRSASL"]
    }
}
```

Note: Drill executes all queries as a service or process user when impersonation is disabled.

Example 2: Drill Client to Drillbit Authentication with User Impersonation using Default

```
drill.exec:{
    security: {
        user.auth.enabled: true,
        auth.mechanisms : ["MAPRSASL"],
    }
    impersonation: {
        enabled: true,
        max_chained_user_hops: 3
    }
}
```

Note: Drill executes all queries as the authenticated (ticket) user when impersonation is enabled. The client to Drillbit communication path will not be encrypted.

Example 3: Drill Client to Drillbit using Multiple Authentication Mechanisms

```
drill.exec:{
    security: {
        user.auth.enabled: true,
        user.auth.impl: "pam4j",
        security.user.auth.packages +=
"org.apache.drill.exec.rpc.user.security",
        user.auth.pam_profiles: ["sudo", "login",
"mapr-admin"],
        auth.mechanisms : ["MAPRSASL", "KERBEROS", "PLAIN"],
        auth.principal : "mapr/_host@REALM.COM",
        auth.keytab : "/opt/mapr/conf/mapr.keytab"
    },
    impersonation: {
        enabled: true,
        max_chained_user_hops: 3
    }
}
```

```
}
```

Example 4: Drillbit to Drillbit Authentication using Default Security

```
drill.exec:{
  security: {
    auth.mechanisms : ["MAPRSASL"],
    bit.auth.enabled : true
    bit.auth.mechanism : "MAPRSASL"
  }
}
```

Example 5: Drill Client to Drillbit and Drillbit to Drillbit Authentication using Default Security

```
drill.exec {
  security: {
    user.auth.enabled: true,
    auth.mechanisms : ["MAPRSASL"],
    bit.auth.enabled : true,
    bit.auth.mechanism : "MAPRSASL"
  },
  impersonation: {
    enabled: true,
    max_chained_user_hops: 3
  }
}
```

Configuring Encryption

An administrator can enable encryption with Default Security (tickets).

 **Note:** When the `sasl_encrypt` (for JDBC) or `EnforceSaslEncrypt` (for ODBC) connection parameter is set to "true" or 1, the Drill client only accepts encrypted connections. If the client tries connecting to a Drillbit with encryption disabled, the connection fails.

 **Note:** For client-side configuration, see [Drill Drivers](#).

Set the encryption options to "true" in `/opt/mapr/drill/drill-<version>/conf/drill-override.conf`.

The following table lists the encryption configuration options with their descriptions and default values:

 **Note:** If you installed Drill on a cluster that was installed with the default security configuration, the following options are set to "true" by default.

| Option | Description | Default |
|---|--|---------|
| <code>drill.exec.security.user.encryption.sasl.enabled</code> | Determines if encryption on the server is enabled for negotiating privacy with the Drill client. | false |
| <code>drill.exec.security.bit.encryption.sasl.enabled</code> | Determines if the server is enabled for negotiating privacy with another Drillbit. | false |

The following sections provide configuration examples for Drill client to Drillbit encryption and Drillbit to Drillbit encryption.

Example 1: Drill Client to Drillbit Connection with Default Security Authentication and Encryption

In the following server configuration, the Drill client connection to the Drillbit is encrypted using the Default Security mechanism when the client is running with encryption support.

 **Note:** Drill clients running Drill 1.10 and earlier cannot connect to the Drillbit through Default Security with encryption enabled.

```
drill.exec {
  security: {
    user.auth.enabled: true,
    auth.mechanisms : ["MAPRSASL"]
    user.encryption.sasl.enabled : true
  }
}
```

 **Note:** Drill executes all queries as a service or process user when impersonation is disabled.

Example 2: Drillbit to Drillbit Connection with Default Security Authentication and Encryption

The following configuration authenticates and encrypts the path between Drillbits using the Default Security mechanism.

```
drill.exec {
  security: {
    auth.mechanisms : ["MAPRSASL"],
    bit.auth.enabled : true
    bit.auth.mechanisms : "MAPRSASL"
    bit.encryption.sasl.enabled : true
  }
}
```

Example 3: Drill Client to Drillbit and Drillbit to Drillbit Connection with Default Security Authentication and Encryption

The following configuration authenticates and encrypts the path between the Drill client and Drillbit, and between Drillbits using the Default Security mechanism.

```
drill.exec {
  security: {
    user.auth.enabled: true,
    auth.mechanisms : ["MAPRSASL"],
    user.encryption.sasl.enabled : true

    bit.auth.enabled : true
    bit.auth.mechanism : "MAPRSASL"
    bit.encryption.sasl.enabled : true
  }
}
```

 **Note:** Drill executes all queries as a service or process user when impersonation is disabled.

Example 4: Drill Client to Drillbit and Drillbit to Drillbit Connection with Default Security Authentication and Encryption and Impersonation Enabled

The following configuration authenticates and encrypts the path between the Drill client and Drillbit, and between Drillbits using the Default Security mechanism.

```
drill.exec {
  security: {
    user.auth.enabled: true,
```

```

        auth.mechanisms : ["MAPRSASL"],
        user.encryption.sasl.enabled : true

        bit.auth.enabled : true
        bit.auth.mechanism : "MAPRSASL"
        bit.encryption.sasl.enabled : true
    },
    impersonation: {
        enabled: true,
        max_chained_user_hops: 3
    }
}

```

 **Note:** Drill executes all queries as the authenticated (ticket) user when impersonation is enabled.

Example 5: Drill Client to Drillbit Authentication and Encryption Enabled using Multiple Mechanisms and Drillbit to Drillbit Authentication using Default Security

The following configuration authenticates and encrypts the connection between the Drill client and Drillbit using multiple authentication mechanisms, and also authenticates and encrypts the connection between Drillbits using the Default security mechanism.

 **Note:** Plain authentication not supported in this configuration.

```

drill.exec {
  security: {
    user.auth.enabled: true,
    auth.mechanisms : ["MAPRSASL", "KERBEROS"],
    auth.principal : "mapr/_host@REALM.COM",
    auth.keytab : "/opt/mapr/conf/mapr.keytab",
    user.encryption.sasl.enabled : true,
    bit.auth.enabled : true,
    bit.auth.mechanism : "MAPRSASL",
    bit.encryption.sasl.enabled : true
  }
  impersonation: {
    enabled: true,
    max_chained_user_hops: 3
  }
}

```

 **Note:** Drill executes all queries as a service or process user when impersonation is disabled.

Kerberos

Drill supports Kerberos v5 network security authentication and encryption. Kerberos is a network authentication protocol built on symmetric-key cryptography. Kerberos eliminates the need to store passwords locally or send them over the network and reduces the risk of impersonation.

Kerberos provides a security infrastructure called a Kerberos Realm. A Kerberos Realm is comprised of clients, services or hosts, and a KDC (key-distribution center). The KDC is a trusted third-party service that generates tickets to coordinate authentication between a client and server or host. Tickets are cached on the client machine, which allows for single sign-on.

Clients use a password or a special file called a “keytab” to get tickets from the KDC. Clients exchange the tickets and secret keys with the KDC and service or host to prove their identity for access to the requested service. This authentication process of exchanging tickets and secret keys runs in the background, unseen by the user trying to access the service. When a client request to access a service is granted, a unique session key is established between the client and service. The unique session key proves the authenticity of the user. The session key is used for all communication between the client and service. Kerberos also

supports encryption between the client and server to prevent data theft from a man-in-the-middle attack during communication.

A KDC administrator must create the password or keytab for the clients and servers, as well as a principal (a name for the user or server identity) to securely authenticate using the Kerberos infrastructure.

Note: Proper setup, configuration, administration, and usage of a Kerberos environment is beyond the scope of this documentation. See the [MIT Kerberos](#) documentation for more detailed information about Kerberos.

The following sections list the prerequisites for using Kerberos with Drill and describe the authentication process.

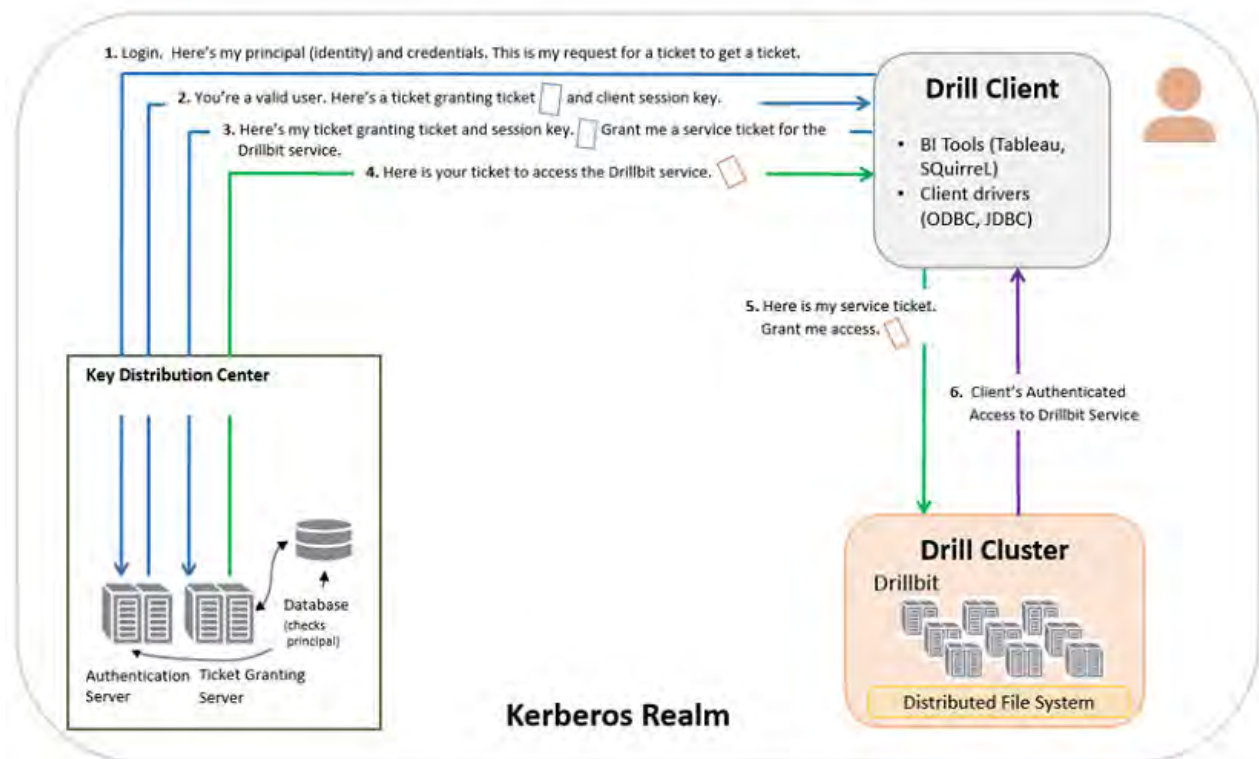

Prerequisites

- The [MapR Drill driver](#) includes the required Kerberos plugin to authenticate to secure Kerberos Drill clusters. To use Kerberos with Drill, you must have a working Kerberos infrastructure, which Drill does not provide.
- Either a ticket granting ticket (TGT) is pre-generated on the client node, or a keytab file and the client principal is available to provide in the connection URL for Kerberos authentication between the Drill client and Drill server. Drill does not generate the TGT.
- You must be working in a Linux-based or Windows Active Directory (AD) Kerberos environment with secure clusters and have a Drill server configured for Kerberos.

Client Authentication Process

This section provides a high-level overview of the Kerberos client authentication process. For this overview, assume that Kerberos credentials are present in the client.

The following diagram shows the process of authenticating a client:

1. The client sends a request for a ticket granting ticket that contains the user principal to the Kerberos KDC, a network service that supplies tickets and temporary session keys.
2. The authentication server validates the principal's identity and sends the client a ticket granting ticket and session key encrypted with a secret key. A session key is a temporary encryption key used for one login session.
3. Using the ticket granting ticket, the principal requests access to a Drillbit service from the ticket granting server.
4. The ticket granting server checks for a valid ticket granting ticket and the principal identity. If the request is valid, the ticket granting server returns a ticket granting service ticket.
5. The client uses the service ticket to request access to the Drillbit.
6. The Drillbit service has access to the keytab, a file that contains a list of keys for principals. The key allows the service to decrypt the client's ticket granting service ticket, identify the principal, and grant access.

Server Authentication Process

For Kerberos server authentication information, see the [MIT Kerberos](#) administration documentation.

Configuring Drill with Kerberos

The topics listed below provide configuration and connection information.

Configuring Authentication and Encryption

To enable authentication and encryption, you must create a Kerberos principal identity and a keytab file. You add the principal and keytab file to `<DRILLINSTALL_HOME>/conf/drill-override.conf` with the specified configuration parameters. In addition, you can configure a mapping from a Kerberos principal to a Drill user account. This mapping is used by a Drillbit to convert an authenticated client principal to a corresponding Kerberos short name, which is used to determine administrator privileges for the client principal. After you complete the configuration steps, restart the Drillbit.

To enable authentication and encryption using the Kerberos mechanism, configure the following Kerberos-specific parameters in `drill-override.conf`:

 **Note:** Only Drill 1.11 and later supports encryption.

 **Note:** For client-side configuration, see [Drill Drivers](#).

| Parameters | Communication Path | Description | Default |
|---|--------------------------------------|---|---------|
| <code>drill.exec.security.auth.principal</code> | Drill client (ODBC/JDBC) to Drillbit | String representation of the Kerberos principal used by the Drillbit service. | N/A |
| <code>drill.exec.security.auth.keytab</code> | Drill client (ODBC/JDBC) to Drillbit | Location of the keytab file for the configured Drillbit service principal.  Note: The Kerberos keytab file that contains the encrypted key for the Drillbit service principal. The file should be readable by the Drillbit process user. | N/A |

| Parameters | Communication Path | Description | Default |
|--|--------------------------------------|--|--|
| drill.exec.security.auth.auth_to_local | Drill client (ODBC/JDBC) to Drillbit | <p>Custom rules to convert the Kerberos principal to the Kerberos short name.</p> <p> Note: Drill uses a Hadoop Kerberos name and rules to transform the Kerberos principal provided by client to the one it will use internally as the client's identity. This client identity is used to determine administrator privileges. See Mapping from Kerberos Principal to OS user account in the Hadoop in Secure Mode documentation for details about how the rule works.</p> | The primary name of the Kerberos principal. By default, this mapping rule extracts the first part from the provided principal. For example, if the principal format is <Name1>/<Name2>@realm, the default rule extracts only Name1 from the principal and Name1 as the client's identity on server side. |
| drill.exec.security.user.encryption.sasl.enabled | Drill client (ODBC/JDBC) to Drillbit | Enables/disables encryption for the communication path between the Drill client and Drillbit. | false |
| drill.exec.security.bit.auth.use_login_principal | Drillbit to Drillbit | When set to true, the Drillbit uses the same logged in service principal configured with drill.exec.security.auth.principal for the Drillbit to Drillbit communication paths. When this parameter is set to false, a principal is constructed using the hostname from ZooKeeper for the remote Drillbit and keeping the primary and realm information the same as the logged in principal set by drill.exec.security.auth.principal . | false |
| drill.exec.security.bit.encryption.sasl.enabled | Drillbit to Drillbit | Enables/disables encryption for the communication path between the Drillbits. | false |

Steps to Enable Kerberos Authentication and Encryption

Complete the following steps to enable Drill to use Kerberos for authentication and encryption:

1. Create a Kerberos principal identity and a keytab file. You can create one principal for each Drillbit or one principal for all Drillbits in a cluster.

Note: The administrator must own the `drill.keytab` file and have the ability to read the file.

- For a single principal per node in cluster:

```
# kadmin
: addprinc -randkey <username>/<FQDN>@<REALM>.COM
: ktadd -k /opt/mapr/conf/drill.keytab <username>/
<FQDN>@<REALM>.COM
```

- For a single principal per cluster, use <clustername> instead of <FQDN>:

```
# kadmin
: addprinc -randkey <username>/<clustername>@<REALM>.COM
: ktadd -k /opt/mapr/conf/drill.keytab <username>/
<clustername>@<REALM>.COM
```

Note: The instance name must be lowercase. If `_HOST` is set as the instance name in the principal, it is replaced with the fully qualified domain name of that host for the instance name. For example, if a Drillbit running on `host01.aws.lab` uses `drill/_HOST@<EXAMPLE>.COM` as the principal, the canonicalized principal is `drill/host01.aws.lab@<EXAMPLE>.COM`.

2. Add the Kerberos principal identity, keytab file, and parameters specific to Kerberos to the `drill-override.conf` file. You can use the following configuration examples for enabling authentication, encryption, or both between the Drill client and Drillbit and between Drillbits.

Example 1: Enabling Kerberos Authentication Between the Drill Client and Drillbit

```
drill.exec: {
  cluster-id: "drillbits1",
  zk.connect:
    "qa102-81.qa.lab:5181,qa102-82.qa.la
    b:5181,qa102-83.qa.lab:5181",
  impersonation: {
    enabled: true,
    max_chained_user_hops: 3
  },
  security: {

user.auth.enabled:true,
      auth.mechanisms:
    ["KERBEROS"],

auth.principal:"drill/
<clustername>@<REALM>.COM",
      auth.keytab:"/etc/
drill/conf/drill.keytab"
    }
  }
}
```

Example 2: Enabling Kerberos Authentication and Encryption Between the Drill Client and Drillbit

```
drill.exec: {
  cluster-id: "drillbits1",
  zk.connect:
    "qa102-81.qa.lab:5181,qa102-82.qa.la
    b:5181,qa102-83.qa.lab:5181",
  impersonation: {
    enabled: true,
    max_chained_user_hops: 3
  },
  security: {

user.auth.enabled:true,
      auth.mechanisms:
    ["KERBEROS"],

auth.principal:"drill/
<clustername>@<REALM>.COM",
      auth.keytab:"/etc/
drill/conf/drill.keytab",
    }
  }
}
```

Example 3: Enabling Kerberos Authentication Between Drill Client and Drillbits and Between Drillbits

```
user.encryption.sasl.enabled: true
    }
  }
}
```

```
drill.exec: {
  cluster-id: "drillbits1",
  zk.connect:
    "qa102-81.qa.lab:5181,qa102-82.qa.la
b:5181,qa102-83.qa.lab:5181",
  impersonation: {
    enabled: true,
    max_chained_user_hops: 3
  },
  security: {

user.auth.enabled:true,
      auth.mechanisms:
["KERBEROS"],

auth.principal:"drill/
<clustername>@<REALM>.COM",
      auth.keytab:"/etc/
drill/conf/drill.keytab"
    }
    security.bit: {
      auth.enabled: true,
      auth.mechanism:
"Kerberos",

auth.use_login_principal: true
    }
  }
}
```

Example 4: Enabling Kerberos Authentication and Encryption Between Drill Client and Drillbits and Between Drillbits

```
drill.exec: {
  cluster-id: "drillbits1",
  zk.connect:
    "qa102-81.qa.lab:5181,qa102-82.qa.la
b:5181,qa102-83.qa.lab:5181",
  impersonation: {
    enabled: true,
    max_chained_user_hops: 3
  },
  security: {

user.auth.enabled:true,
      auth.mechanisms:
["KERBEROS"],

auth.principal:"drill/
<clustername>@<REALM>.COM",
      auth.keytab:"/etc/
drill/conf/drill.keytab",

user.encryption.sasl.enabled: true
    }
    security.bit: {
      auth.enabled: true,
      auth.mechanism:
"Kerberos",
```

```
auth.use_login_principal: true,
encryption.sasl.enabled: true
    }
}
```

Note: In examples 3 and 4 above, the Drillbit will use the same logged in service principal as configured in `drill.exec.security.auth.principal`.

Example 5: Enabling Kerberos Authentication and Encryption Between Drill Client and Drillbits and Between Drillbits. For Drillbit to Drillbit authentication, where the service principal is created using the hostname from ZooKeeper for a remote Drillbit as an instance name. The primary and the realm component of the service principal is used from the `drill.exec.security.auth.principal` parameter.

```
drill.exec: {
  cluster-id: "drillbits1",
  zk.connect:
    "qa102-81.qa.lab:5181,qa102-82.qa.la
    b:5181,qa102-83.qa.lab:5181",
  impersonation: {
    enabled: true,
    max_chained_user_hops: 3
  },
  security: {
    user.auth.enabled: true,
      auth.mechanisms:
    ["KERBEROS"],
    auth.principal: "drill/
    <clustername>@<REALM>.COM",
      auth.keytab: "/etc/
    drill/conf/drill.keytab",
    user.encryption.sasl.enabled: true
  }
  security.bit: {
    auth.enabled: true,
    auth.mechanism:
    "Kerberos",
    encryption.sasl.enabled: true
  }
}
```

Note: For the configuration in example 5, if the hostname of the remote Drillbit known to ZooKeeper is `host01.aws.lab`, then the service principal used by a Drillbit to authenticate with the remote Drillbit will be `drill/host01.aws.lab@<REALM>.COM`.

- Restart the Drillbit process on each Drill node.

```
$ maprccli node services -name drill-bits -action restart -nodes <node
host names separated by a space>
```

Related concepts

[Plain Authentication](#) on page 3521

An administrator can configure Drill to use the Linux pluggable authentication module (PAM) for Plain (username and password) authentication. PAM provides an authentication module that interfaces with any installed PAM authentication entity, such as the local operating system password file (/etc/passwd) or LDAP.

Configuring Drill to Use Kerberos with Hive Metastore

To configure Drill to use Kerberos with the Hive metastore, modify the hive storage plugin in the Drill Web UI and then restart the Warden service.

Note: When you configure Drill to use Kerberos with the Hive metastore, Drill submits requests to the Hive metastore as the `mapr` superuser. If you want Drill to submit requests to the Hive metastore as any other user, configure [Drill impersonation with Hive](#) instead of performing this task. Drill impersonation works with or without Kerberos configured for the Hive metastore.

Prerequisites

The configurations described in this document have the following dependencies:

- Data Fabric cluster.
- Drill installed with Drillbits running as the `mapr` user.
- Supported version of Hive installed with the following:
 - Hive Metastore configured to use Kerberos authentication
 - Configured Hive remote metastore repository

Note: See the [Drill Support Matrix](#) on page 5825 for supported versions of Hive.

Modify the Hive Storage Plugin in Drill

Modify the Hive storage plugin configuration in the Drill Web UI based on the authorization and security scenario for the cluster. You can only access the Drill Web UI for a running Drillbit.

Complete the following steps to configure Drill to use Kerberos with Hive Metastore:

1. Navigate to `http://<drillbit_hostname>:8047`, and select the **Storage** tab.

Note: You can only access the Drill Web UI for a running Drillbit.

2. Click **Update** next to the hive option.

3. In the configuration window, add the `hive.metastore.sasl.enabled`, `hive.metastore.kerberos.principal`, and `hive.security.authorization.enabled` properties, as shown below, if configuration does not contain them already. Note that other properties shown may or may not be required in your environment:

```
{
  "type": "hive",
  "enabled": true,
  "configProps": {
    "hive.metastore.uris": "thrift://<metastore_hostname>:9083",
    "fs.default.name": "maprfs:///",
    "hive.server2.enable.doAs": "false",
    "hive.metastore.sasl.enabled": "true",
    "hive.metastore.kerberos.principal":
    "<metastore_server_principal_name>",
    "hive.security.authorization.enabled": "true"
  }
}
```

Restart Warden

Issue the following command on all nodes to restart the Warden service:

```
service mapr-warden restart
```

If you have `clush` installed, you can run the following command to restart Warden on all nodes at once:

```
clush -a "service mapr-warden restart"
```

Connection URLs for Kerberos using JDBC Drivers to connect via SQLLine

You can use client-side connection URL parameters for Kerberos authentication in multiple combinations to authenticate a client with Drill.

Client Credentials

A client can provide its credentials in two ways:

- With a ticket granting ticket (TGT) generated on client side. The TGT must be present on client node; Drill does not generate the TGT.
- With a keytab file and the client principal provided in the user property of the connection URL.

Configuration Options

The following table lists configuration options for connection URLs. See the Connection URL Examples section for sample URLs.

| Connection Parameter (Apache Drill JDBC Driver) | Description | Mandatory/Optional | Default Value |
|---|--|--------------------|---|
| auth | <p>Authentication mechanism. The value is deduced if not specified. Kerberos if principal is provided. Plain if a user and password is provided. A Drill client can also explicitly specify a particular authentication mechanism to use using this parameter. For example, for Kerberos along with service_name, service_host or principal and for the Plain authentication with username and password.</p> | Optional | The preference order is Kerberos and Plain. |
| principal | <p>Drillbit service principal. The format of the principal is primary/instance@realm. For Kerberos, the Drill service principal is derived if the value is not provided using this configuration. service_name (primary) and service_host (instance) are used to generate a valid principal. Since the ticket or keytab contains the realm information, the realm is optional.</p> | Optional | |

| | | | |
|------------------------|--|----------|--|
| keytab | For Kerberos authentication, if the client chooses to use a keytab rather than a ticket, set the keytab parameter to the location of the keytab file. The client principal must be provided through the user parameter. A Kerberos ticket is used as the default credential (It is assumed to be present on client-side. The Drill client does not generate the required credentials.) | Optional | |
| sas_encryption | When set to true, ensures that a client connects to a server with encryption capabilities. For example, Drill 1.11 Drillbits, which support client-to-drillbit encryption. | Optional | FALSE |
| service_principal_name | Key name of the Drillbit service principal. | Optional | drill |
| service_instance_name | Key of the Drillbit service principal. | Optional | Since this value is usually the hostname of the node where a Drillbit is running, the default value is the Drillbit hostname is provided either through ZooKeeper or through a direct connection string. |
| realm | Kerberos realm name for the Drillbit service principal. The ticket or keytab contains the realm information. | Optional | |

Client Encryption

A client can specify that it requires a server with encryption capabilities only by setting the

`sasl_encrypt` connection parameter to "true." If the cluster to which client is connecting has encryption disabled, the client will fail to connect to that server.

```
drill.exec {
  security: {
    user.auth.enabled: true,
    auth.mechanisms: [ "KERBEROS" ],
    auth.principal: "drill/serverhostname@REALM.COM",
    auth.keytab: "/etc/drill/conf/drill.keytab",
    user.encryption.sasl.enabled: true
  }
}
```

Connection URL Examples

The following five examples show the JDBC connection URL that the embedded JDBC client uses for Kerberos authentication. The first section, Example of a Simple Connection URL, includes a simple connection string and the second section, Examples of Connection URLs Used with Previously Generated TGTs, includes examples to use with previously generated TGTs.

Example of a Simple Connection URL

Example 1: TGT for Client Credentials

The simplest way to connect using Kerberos is to generate a TGT on the client side. Only specify the service principal in the JDBC connection string for the Drillbit the user wants to connect to.

```
jdbc:drill:drillbit=10.10.10.10;principal=<principal for host 10.10.10.10>
```

In this example, the Drill client uses the:

- Default `service_name`, which is `drill`.
- `service_host` from the Drillbit name provided in the connection URL, which is `10.10.10.10`.

The service principal format is `<primary>/<instance>@<realm from TGT>`. The service principal is `principal for host 10.10.10.10`.

Examples of Connection URLs Used with Previously Generated TGTs

If you do not provide a service principal in the connection string when using Kerberos authentication, then use the `service_name` or `service_host` parameters. Since these parameters are optional, their default values will be used internally (if not provided) to create a valid principal.

Examples 2 through 4 show a valid connection string for Kerberos authentication if a client has previously generated a TGT. Realm information will be extracted from the TGT if it is not provided.

Note: For end-to-end authentication to function, it is assumed that the proper principal for the Drillbit service is configured in the KDC.

Example 2: Drillbit Provided by Direct Connection String and Configured with a Unique Service Principal

This type of connection string is used when:

- Each Drillbit in the cluster is configured with its own service principal.
- The instance component is the host address of the Drillbit.

```
jdbc:drill:drillbit=host1;auth=kerberos
```

In this example, the Drill client uses the:

- Default `service_name`, which is `drill`.

- `service_host`, which is the Drillbit name provided in the connection URL (`host1`).

The internally created service principal will be `drill/host1@<realm from TGT>`.

Example 3: Drillbit Selected by ZooKeeper and Configured with Unique Service Principal

This type of connection string is used when the Drillbit is chosen by ZooKeeper instead of directly from the connection string.

```
jdbc:drill:zk=host01.aws.lab:5181;auth=kerberos;service_name=myDrill
```

In this example, the Drill client uses the:

- Provided `service_name`, which is `myDrill` as the primary name of the principal.
- `service_host` as the address of the Drillbit, which is chosen from the list of active drillbits that ZooKeeper provides (`host01.aws.lab:5181`).

The internally created service principal will be `myDrill/<host address from zk>@<realm from TGT>`.

Example 4: Drillbit Selected by Zookeeper and Configured with a Common Service Principal

This type of connection string is used when all Drillbits in a cluster use the same principal.

```
jdbc:drill:zk=host01.aws.lab:5181;auth=kerberos;service_name=myDrill;service_host=myDrillCluster
```

In this example, the Drill client uses the:

- Provided `service_name`, which is `myDrill`.
- `service_host`, which is `myDrillCluster`.

The internally created service principal, which will be `myDrill/myDrillCluster@<realm from TGT>`.

Example 5: Keytab for Client Credentials

If a client chooses to provide its credentials in a keytab instead of a TGT, it must also provide a principal in the user parameter. In this case, realm information will be extracted from the `/etc/krb5.conf` file on the node if it is not provided in the connection URL. All other parameters can be used as shown in the preceding examples (1-4). This connection string is for the case when all Drillbits in a cluster use the same principal.

```
jdbc:drill:zk=host01.aws.lab:5181;auth=kerberos;service_name=myDrill;service_host=myDrillCluster;keytab=<path to keytab file>;user=<client principal>
```

In this example, the Drill client:

- Will authenticate itself with the:
 - Keytab (`path to keytab file`) and
 - Principal provided in the user parameter (`client principal`)
- Uses the:
 - Provided `service_name`, which is `myDrill`.
 - `service_host`, which is `myDrillCluster`.

The internally created service principal will be `myDrill/myDrillCluster@<realm from krb5.conf>`.

Plain Authentication

An administrator can configure Drill to use the Linux pluggable authentication module (PAM) for Plain (username and password) authentication. PAM provides an authentication module that interfaces with any installed PAM authentication entity, such as the local operating system password file (`/etc/passwd`) or LDAP.

Note: Starting in EEP 5.0, Drill supports form-based authentication between the web client and Drillbit. Form-based authentication is like Plain authentication in that a user is presented with a web form where s/he enters a username and password to access restricted web pages. [Configuring Drill to Use libpam4j](#) includes configuration details. When using form-based authentication, you can also configure Drill to use SPNEGO. See [SPNEGO for HTTP Authentication](#).

When using PAM for authentication, each user with permission to run Drill queries must exist in the list of users that resides on each Drill node in the cluster. The username (including uid) and password for each user must be identical across all Drill nodes.

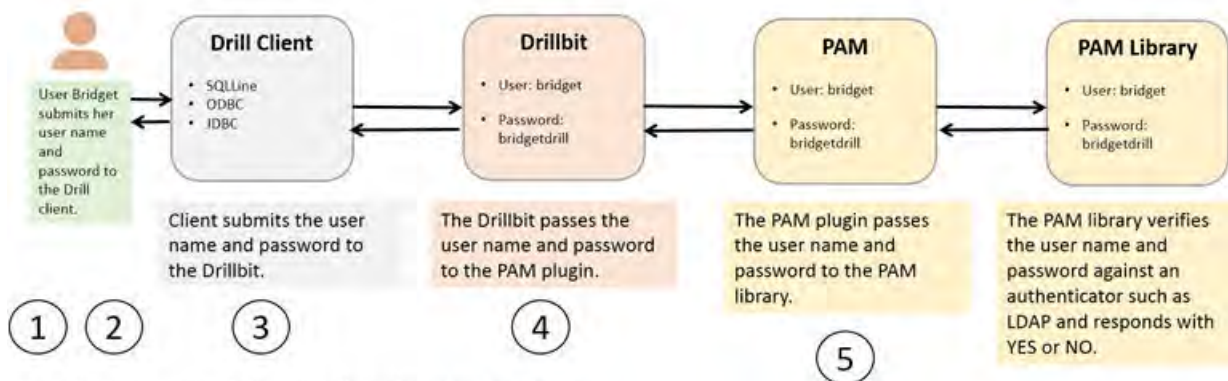

If you use PAM with `/etc/passwd` for authentication, verify that the users permitted to start the Drill process are part of the shadow user group on all nodes in the cluster. This enables Drill to read the `/etc/shadow` file for authentication.

Note: Plain authentication does not support SASL encryption. You can use [SSL/TLS for encryption](#) when Plain authentication is enabled. You can also enable [user impersonation](#) and create views to limit user access to data.

Authentication Process Overview

During the authentication process, the client passes a username and password to the Drillbit as part of the connection request, which then passes the credentials to PAM. If PAM authenticates the user, the connection request passes the authentication phase, and the connection is established. The user will be authorized to access Drill and issue queries against the filesystem or other storage plugins, such as Hive.

The following image illustrates the PAM user authentication process in Drill:

Plain (Username and Password) Authentication Process

If PAM cannot authenticate the user, the connection request does not pass the authentication phase and the user will not be authorized to access Drill. The connection is terminated as `AUTH_FAILED`.

For more PAM information (including a JPAM User Guide), see [JPAM](#).

Configuring Plain Authentication in Drill

Drill supports the `libpam` and `libpam4j` libraries. In Drill 1.12 and later, the `libpam4j` library is packaged with Drill. There is no download or external dependency required to use `libpam4j`. Using `libpam4j` is recommended for Drill 1.12 and later.

Note: You can configure Drill to use multiple types of authentication mechanisms. For example, you can configure Drill to use Plain, Kerberos, and data-fabric-SASL; however, only [SSL/TLS](#) is supported for encryption when Plain authentication is configured with other authentication mechanisms.

The following sections provide information for configuring Drill to use libpam4j or libpam, as well as instructions for connecting to Drill from SQLLine and BI tools when Plain authentication is enabled:

Configuring Drill to Use libpam4j

You can configure Drill to use libpam4j for Plain authentication between a client, such as ODBC, and the Drillbit.

Starting in EEP 5.0, you can configure Drill to use libpam4j for form-based authentication between a web client and Drillbit (web server). Form-based authentication is like Plain authentication in that a user is presented with a web form where s/he enters a username and password to access restricted web pages. When using form-based authentication, you can also configure Drill to use SPNEGO. See [SPNEGO for HTTP Authentication](#).

Complete the following steps to configure Plain authentication (for JDBC/ODBC clients) and form-based authentication (for the web client) in Drill:

1. Add the following configurations to the `/opt/mapr/drill/drill-<version>/conf/drill-override.conf` file:

```
drill.exec:{
  cluster-id:"drillbits1",

  zk.connect:"<zk-node-hostname>:5181,<zk-node-hostname>:5181,<zk-node-hostname>:5181",
  security:{
    auth.mechanisms:[ "PLAIN" ],
  },
  security.user.auth:{
    enabled:true,
    packages += "org.apache.drill.exec.rpc.user.security",
    impl:"pam4j",
    pam_profiles:[ "sudo", "login" ]
  },
  http.auth.mechanisms:[ "FORM" ]
}
```

2. (Optional) To add or remove different PAM profiles, add or delete the profile names in the `pam_profiles` array portion of the configuration:

```
pam_profiles: [ "sudo", "login" ]
```

3. Restart the Drillbit process on each Drill node, as shown:

```
/opt/mapr/drill/drill-<version>/bin/drillbit.sh restart
```

Configuring Drill to Use libpam

You can configure Drill to use libpam for Plain authentication between a client, such as ODBC, and the Drillbit.

To configure Drill to use libpam, complete the following steps:

1. Copy the `libpam.so` file from `/opt/mapr/lib` to a directory that does not contain other Hadoop components, for example `/opt/pam/`.

2. Add the following line to `/opt/mapr/drill/drill-<version>/conf/drill-env.sh`, including the directory where the `libpam.so` file is located, as shown:

```
export
DRILLBIT_JAVA_OPTS="$DRILLBIT_JAVA_OPTS -Djava.library.path=<directory>"
Example: export
DRILLBIT_JAVA_OPTS="$DRILLBIT_JAVA_OPTS -Djava.library.path=/opt/pam/"
```

3. Add the following configuration to the `drill.exec` block in `/opt/mapr/drill/drill-<version>/conf/drill-override.conf`:

```
drill.exec: {
    cluster-id: "drillbits1",
    zk.connect:
"qa102-81.qa.lab:5181,qa102-82.qa.lab:5181,qa102-83.qa.lab:5181",
    impersonation: {
        enabled: true,
        max_chained_user_hops: 3
    },
    security: {
        auth.mechanisms : ["PLAIN"],
    },
    security.user.auth: {
        enabled: true,
        packages += "org.apache.drill.exec.rpc.user.security",
        impl: "pam",
        pam_profiles: [ "sudo", "login", "mapr-admin" ]
    }
}
```

4. (Optional) To add or remove different PAM profiles, add or delete the profile names in the `pam_profiles` array portion of the configuration:

```
pam_profiles: [ "sudo", "login" ]
```

5. Restart the Drillbit process on each Drill node, as shown:

```
/opt/mapr/drill/drill-<version>/bin/drillbit.sh restart
```

Connection URL for Plain Authentication using the Apache JDBC Driver to connect via SQLLine

When Plain authentication is enabled, each user that accesses the Drillbit process through a client, must provide username and password credentials for access.

Connecting to Drill from SQLLine

Include the `-n` and `-p` parameters with your username and password when launching SQLLine, as shown in the following example:

```
sqlline -u jdbc:drill:zk=10.10.11.112:5181 -n <username> -p <password>
```

Alternatively, you can launch SQLLine and then issue the `!connect` command to hide the password.

Complete the following steps to hide the password:

1. Run the `sqlline` script, as shown:

```
$ /etc/drill/bin/sqlline
```

- At the prompt, enter the `!connect` command followed by

```
jdbc:drill:zk=zk=<zk name>[:<port>][,<zk name2>[:<port>]...]
```

, as shown:

```
`sqlline> !connect jdbc:drill:zk=localhost:5181 scan complete in 1385m`s
```

- When prompted, enter a username and password; the password is hidden as it is typed, as shown:

```
Enter username for jdbc:drill:zk=localhost:5181: yourusername
Enter password for jdbc:drill:zk=localhost:5181: *****
```

Connecting to Drill from BI Tools

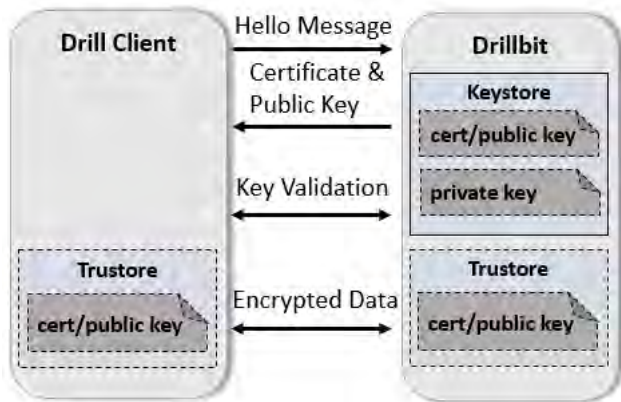

When you connect to Drill from a BI tool, such as Tableau, the ODBC driver prompts you for the authentication type, username, and password. For PAM, select **Basic Authentication** in the Authentication Type drop-down menu.

SSL/TLS for Encryption

You can enable SSL for Drill in a secure or unsecure cluster. SSL (Secure Sockets Layer), more recently called TLS, is a security mechanism that encrypts data passed between the Drill client and Drillbit (server). SSL also provides one-way authentication through which the Drill client verifies the identity of the Drillbit.

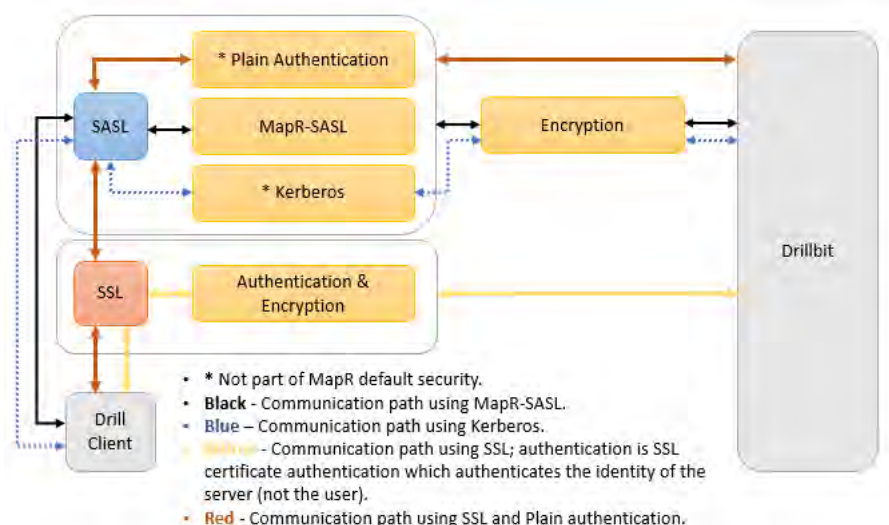

Authentication occurs during the SSL handshake when the Drillbit (server) presents its certificate to the client, and the client checks if the certificate exists in its truststore or if the certificate is signed by a trusted CA (Certificate Authority) that exists in its truststore.

The following diagram depicts the communication between the Drill client and the Drillbit (server):

The SASL feature in Drill provides authentication and an option to encrypt data, however the encryption feature is not available when using Plain authentication. If you need to use Plain authentication (certain BI tools only use Plain authentication), you can enable SSL to encrypt data. Using SSL and SASL encryption together is strongly discouraged.

The following diagram depicts the SSL communication paths between the Drill client and Drillbit (server), including the scenario where Plain authentication is used:

Note: The REST API supports HTTPS. SSL is not supported for communication between Drillbits.

The following sections provide information about how to use certificates in secure and insecure clusters, enabling and configuring SSL, connection parameters, and common SSL issues.

Related concepts

[SSL Certificates](#) on page 657

Describes how certificates are used to perform authentication and encryption for websites that use the HTTPS protocol.

SSL Certificates in Secure and Insecure Clusters

The Drill server requires an SSL certificate. The certificate can be self-signed or signed by a CA (Certificate Authority).

The sections below describe how to use SSL certificates in secure and insecure Data Fabric clusters.

SSL in a Secure Cluster

By default, SSL is configured in a secure MapR cluster, but not enabled. In a secure cluster the keystore is configured for you. The security in a MapR cluster uses a self-signed certificate. If you have a certificate signed by a certificate authority, follow the instructions for [Importing a Certificate Authority Signed \(CA Signed\) SSL Certificate Into a MapR Cluster](#) and then enable and configure SSL.

To use SSL, enable the SSL option and then modify any of the available configuration options as needed.

- To enable SSL for the ODBC/JDBC client to Drillbit communication path, you must enable SSL on the client side and Drillbit. See [Drill Drivers](#) for client instructions. See [Configuring SSL/TLS](#) for the Drillbit.
- To enable SSL for the Drill Web UI, see [Configuring the Drill Web UI and Web API Security](#).

After you modify the configuration options, restart Drill, as shown:

```
$ maprcli node services -name drill-bits -action restart -nodes <node host names separated by a space>
```

SSL in an Insecure Cluster

Before you can enable SSL in an insecure cluster, you must either get or generate a certificate and then import the certificate into the Java keystore. You can do this using the Java keytool utility. See [To Use keytool to Create a Server Certificate](#) for instructions.

If you have a custom certificate, you can import it using the method described in [Importing a Certificate Authority Signed \(CA Signed\) SSL Certificate Into a MapR Cluster](#). You may also want to reference [this document](#).

After you generate or import a server certificate, add the path (and password) to the keystore in the SSL configuration for Drill. See [Configuring SSL](#) for information on how to update the SSL configuration.

Restart Drill after you modify the configuration options, as shown:

```
$ maprcli node services -name drill-bits -action restart -nodes <node host
names separated by a space>
```

Configuring SSL/TLS

Enable SSL in `<DRILL_INSTALL_HOME>/conf/drill-override.conf`. You can use several configuration options to customize SSL/TLS.

You must restart the Drillbit process on each node after you modify the configuration options, as shown:

```
$ maprcli node services -name drill-bits -action restart -nodes <node host
names separated by a space>
```

The following sections provide information and instructions for enabling and configuring SSL:

Enabling SSL

When SSL is enabled, all Drill clients, such as JDBC and ODBC, must connect to Drill servers using SSL. Enable SSL in the Drill startup configuration file, `drill-override.conf`, located in `/opt/mapr/drill/drill-<version>/conf`.

To enable SSL for Drill, set the `drill.exec.security.user.encryption.ssl.enabled` option in `drill-override.conf` to `"true."`

Configuring SSL

You can customize SSL on a Drillbit through the SSL configuration options. You can set the options from the command-line (using Java system properties), in the `drill-override.conf` file, or in the property file to which the Hadoop parameter `hadoop.ssl.server.conf` points (recommended).

 **Note:** Specifying values in `drill-override.conf` can expose the security parameters to end users. Administrators should set these values in the Hadoop security file and restrict permissions on that file.

If a parameter is specified in multiple places, the value in the Hadoop configuration takes precedence over the Drill configuration, which takes precedence over the system property.

The Hadoop configuration is specified in the file pointed to by the `hadoop.ssl.server.conf` parameter in the Hadoop `core-site.xml` file. Typically, this parameter points to `$HADOOP_CONF/ssl-server.xml`, which contains the property names to configure SSL. Both the `core-site.xml` file and the `ssl-server.xml` file must exist in Drill's classpath. Drill's SSL configuration picks up the Hadoop SSL configuration.

 **Note:** Since the Drillbit implementation is based on JSSE, several standard parameters that apply to JSSE will also apply to the Drillbit. However, you typically do not need to configure JSSE parameters.

The following are the SSL configuration options with their descriptions and default values:

| | |
|--|----------------------------------|
| <code>drill.exec.security.user.encryption.ssl.enabled</code> | <i>Hadoop Property Name: N/A</i> |
| | <i>System Property Name: N/A</i> |

| | |
|--|---|
| | <p><i>Description:</i> Enable or disable TLS for Drill client - Drill Server communication. You must set this option in <code>drill-override.conf</code>.</p> <p><i>Allowed Values:</i> true or false</p> <p><i>Drill Default:</i> false</p> |
| drill.exec.ssl.protocol | <p><i>Hadoop Property Name:</i> N/A</p> <p><i>System Property Name:</i> N/A</p> <p><i>Description:</i> The version of the TLS protocol to use.</p> <p><i>Allowed Values:</i> TLS, TLSV1, TLSv1.1, TLSv1.2</p> <p><i>Drill Default:</i> TLSv1.2 (recommended)</p> |
| drill.exec.ssl.keyStoreType | <p><i>Hadoop Property Name:</i> ssl.server.keystore.type</p> <p><i>System Property Name:</i> javax.net.ssl.keyStoreType</p> <p><i>Description:</i> Format of the keystore file</p> <p><i>Allowed Values:</i> jks, jceks, pkcs12</p> <p><i>Drill Default:</i> jks</p> |
| drill.exec.ssl.keyStorePath | <p><i>Hadoop Property Name:</i> ssl.server.keystore.location</p> <p><i>System Property Name:</i> javax.net.ssl.keyStore</p> <p><i>Description:</i> Location of the Java keystore file containing the Drillbit's own certificate and private key. On Windows, the specified pathname must use forward slashes, /, in place of backslashes.</p> <p><i>Allowed Values:</i> Not Applicable</p> <p><i>Drill Default:</i> Not Applicable</p> |
| drill.exec.ssl.keyStorePassword | <p><i>Hadoop Property Name:</i> ssl.server.keystore.password</p> <p><i>System Property Name:</i> javax.net.ssl.keyStorePassword</p> <p><i>Description:</i> Password to access the private key from the keystore file. This password is used twice: To unlock the keystore file (store password), and to decrypt the private key stored in the keystore (key password) unless a key password is specified separately.</p> <p><i>Allowed Values:</i> Not Applicable</p> <p><i>Drill Default:</i> Not Applicable</p> |
| drill.exec.ssl.keyPassword | <p><i>Hadoop Property Name:</i> ssl.server.keystore.keypassword</p> <p><i>System Property Name:</i> Not Applicable</p> <p><i>Description:</i> Password to access the private key from the keystore file. May be different from the keystore password.</p> <p><i>Allowed Values:</i> Not Applicable</p> <p><i>Drill Default:</i> Not Applicable</p> |
| drill.exec.ssl.trustStoreType | <p><i>Hadoop Property Name:</i> ssl.server.truststore.type</p> <p><i>System Property Name:</i> javax.net.ssl.trustStoreType</p> <p><i>Description:</i> Format of the truststore file</p> <p><i>Allowed Values:</i> jks, jceks, pkcs12</p> <p><i>Drill Default:</i> jks</p> |
| drill.exec.ssl.trustStorePath | <p><i>Hadoop Property Name:</i> ssl.server.truststore.location</p> |

System Property Name: javax.net.ssl.trustStore

Description: Location of the Java keystore file containing the collection of CA certificates trusted by the Drill client. On Windows, the specified pathname must use forward slashes, /, in place of backslashes.

Note: If the `trustStorePath` is not provided, Drill ignores the `trustStorePassword` parameter and gets the default Java truststore instead, which causes issues if the Java truststore has a non-default password. The Java APIs to load the default keystore assume the default password. The only way to use the default keystore with a non-default password is to specify both the path and the password to the keystore. To work around this issue, pass the default Java truststore to the `trustStorePath` parameter.

Allowed Values: Not Applicable

Drill Default: Not Applicable

drill.exec.ssl.trustStorePassword

Hadoop Property Name: ssl.server.truststore.password

System Property Name:
javax.net.ssl.trustStorePassword

Description: Password to access the private key from the keystore file specified as the truststore.

Allowed Values: Not Applicable

Drill Default: Not Applicable

drill.exec.ssl.provider

Hadoop Property Name: Not Applicable

System Property Name: Not Applicable

Description: Changes the underlying implementation to the chosen value.

Allowed Values: OpenSSL or JDK

Drill Default: JDK

drill.exec.ssl.useHadoopConfig

Hadoop Property Name: Not Applicable

System Property Name: Not Applicable

Description: Use the setting in the Hadoop configuration file.

The Hadoop configuration is specified in the file pointed to by the `hadoop.ssl.server.conf` parameter in the `core-site.xml` file.

Typically, this parameter points to `$HADOOP_CONF/ssl-server.xml`, which contains the property names to configure TLS.

Allowed Values: true or false

Drill Default: true

JDBC Connection Parameters

Use the SSL JDBC connection parameters and fully qualified host name to configure the jdbc connection string in SQLLine and connect to Drill.

The following table lists the parameters that you can include in the `jdbc` connection string using SQLLine:

Note: Examples are provided after the table. For additional instructions, see the [Drill JDBC Driver](#) documentation.

| Parameter | Value | Required |
|--------------------------------|------------------------------|--|
| enableTLS | true/false | [Optional] If true, TLS is enabled. If not set or set to false, TLS is not enabled. |
| trustStoreType | string | [Optional] Default: JKS The trustStore type. Allowed values are : JKS PKCS12 If the useSystemTrustStore option is set to true (on Windows only), the allowed values are: Windows-MY Windows-ROOT Import the certificate into the "Trusted Root Certificate Authorities" and set trustStoreType=Windows-ROOT. Also import the certificate into "Trusted Root Certificate Authorities" or "Personal" and set trustStoreType=Windows-MY. |
| trustStorePath | string | [Optional] Path to the truststore. If not provided the default Java truststore will be used. If this is not provided the trustStorePassword parameter will be ignored. Note that the order for looking for the default trustStore java-home/lib/security/jssecacerts then java-home/lib/security/cacerts |
| trustStorePassword | string | [Optional] Password to the truststore. |
| disableHostVerification | true/false | [Optional] If true, we will not verify that the host in the certificate is the host we are connecting to. False by default (Hostname verification follows the specification in RFC2818). |
| disableCertificateVerification | true/false | [Optional] If true we will not validate the certificate against the truststore. False by default. |
| TLSProtocol | TLS, TLSV1, TLSv1.1, TLSv1.2 | [Optional] Default: TLSv1.2 (recommended) |

| | | |
|---------------------|----------------------|--|
| TLShandshakeTimeout | Time in milliseconds | [Optional] Default: 10 seconds In some cases, the TLS handshake may fail and leave the client hanging. This option sets the time for the client to timeout. |
| TLSPROvider | JDK/OPENSSL | [Optional] Default: JDK Changes the underlying implementation to the chosen value. |
| useSystemTrustStore | true/false | [Optional, Windows only] Default: false If provided, the client will read certificates from the Windows truststore. In this case, trustStorePath and trustStorePassword, if specified, will be ignored. The user should set the default provider in \$JRE_HOME/lib/security/java.security to SunMSCAPI. The trustStoreType should be set to either Windows-MY or Windows-ROOT. |

Examples

The following examples show you how to connect to Drill through SQLLine with the `jdbc` connection string when SSL is not enabled and when SSL is enabled with and without a truststore.

No SSL/TLS

```
./sqlline -u
"jdbc:drill:schema=dfs.work;drillbit=1
ocalhost:31010;enableTLS=false"
```

SSL/TLS Enabled - No truststore

The default JSSE truststore will be tried with default password; the provided password will be ignored. If the default truststore password has been changed, this gives an error. To use the default truststore with a different password, pass the path to the default truststore with the password.

```
./sqlline -u
"jdbc:drill:schema=dfs.work;drillbit=1
ocalhost:31010;enableTLS=true;trustSto
rePassword=drill123"
```

SSL/TLS enabled - With truststore

```
./sqlline -u
"jdbc:drill:schema=dfs.work;drillbit=1
ocalhost:31010;enableTLS=true;trustSto
rePath=~/.ssl/
truststore.ks;trustStorePassword=drill
123"
```

ODBC Connection Parameters

Use the SSL ODBC connection parameters to configure a connection to Drill through an ODBC tool.

The following table lists the ODBC connection parameters:

Note: The Drill ODBC driver does not support password protected PEM/CRT files or multiple CRT certificates in a single PEM/CRT file. For additional instructions, see the [Drill ODBC Driver](#) documentation.

| Name | Value | Required | Description |
|--------------|--|----------|---|
| SSL | Clear (0) | No. | <p>This option specifies whether the client uses an SSL encrypted connection to communicate with Drill.</p> <ul style="list-style-type: none"> Enabled(1):The client communicates with Drill using SSL. Disabled(0):SSL is disabled. <p>SSL is configured independently of authentication.</p> <p>When authentication and SSL are both enabled, the driver performs the specified authentication method over an SSL connection.</p> |
| TLSProtocol | Empty, which defaults to tlsv12. | No | <p>This property specifies the TLS protocol version used.</p> <p>Accepted values are:</p> <ul style="list-style-type: none"> tlsv1 tlsv11 tlsv12 |
| TrustedCerts | <p>The cacerts.pem file in the \lib subfolder within the Driver's installation directory. The exact file path varies depending on the version of the driver that is installed.</p> <p>For example, the path for the Windows driver is different from the path for the Mac OS driver.</p> | No | <p>The full path of the PEM file containing Trusted CA certificates, for verifying the server. If this option is not set, then the driver defaults to using the trusted CA certificates PEM file installed by the driver.</p> |

| | | | |
|--------------------------------|-----------|----|---|
| UseSystemTrustStore | Clear (0) | No | <p>This option specifies whether to use a CA certificate from the system truststore, or from a specified PEM file.</p> <ul style="list-style-type: none"> • Enabled (1): The driver verifies the connection using a certificate in the system truststore • Disabled (0): The driver verifies the connection using a specified PEM file. <p>Note: This option is only available on Windows. If using this option, import the certificate into the "Trusted Root Certificate Authorities" certificate store.</p> |
| DisableCertificateVerification | 0 | No | <p>This property specifies that the driver verifies the host certificate against the truststore. Accepted values are:</p> <ul style="list-style-type: none"> • 0: The driver verifies the certificate against the truststore. • 1: The driver does not verify the certificate against the truststore. |
| DisableHostVerification | 0 | No | <p>This property specifies if the driver verifies that the host in the certificate is the host being connected to. Accepted values are:</p> <ul style="list-style-type: none"> • 0: The driver verifies the certificate against the host being connected to. • 1: The driver does not verify the certificate against the host. |

Avoiding Common SSL Issues

The following sections provide insight to some common error messages that you may encounter with SSL.

ERROR: No Cipher suites in common.

This is a general purpose error message that may have many reasons. The most common reason is that in order to use certain cipher suites, JSSE needs to use the private key stored in the Keystore. If this key is not accessible, JSSE filters out all cipher suites that need a private key. This effectively prunes out all available cipher suites so that no cipher suites match between the client and the server.

The private key from the keystore may be inaccessible for the following reasons:

- Missing Keystore file

- Invalid Keystore password
- Empty key password or a key password that is different from the keystore password

JSSE does not allow a key password that is null or an empty string even though it is possible to create a keystore with such a key password. Also, JSSE does not provide a system property to specify the key password. Drill provides a way to set the key password, but if you are using only system properties to configure JSSE, Drill will use the `*keystore*` password. If the keystore password is not the same as the key password, the key will again be inaccessible.

- Corrupt keystore

You can validate the keystore using `keytool`.

ERROR: SSL is enabled, but cannot be initialized due to the ‘Cannot recover key’ exception.

The key is protected with a password and the provided password is not correct.

ERROR: Client connection timeout.

A client connection can timeout because of networking issues or if there is a mismatch between the TLS/SSL configuration on the client and server.

Before trying to debug the TLS/SSL configuration, check if the server is reachable from the client.

If there is a mismatch between the TLS/SSL configuration, the TLS/SSL handshake between the client and server will fail. The server will silently drop the connection and the client will eventually time out. The handshake may fail due to many reasons, including:

1. The server is configured to enable TLS and the client is not (and vice versa).
 - a. If the client is not configured to use TLS and the server is, the error message will be similar to the following:

```
Error: Failure in connecting to Drill:
org.apache.drill.exec.rpc.RpcException: HANDSHAKE_COMMUNICATION :
Channel closed /10.10.10.11:49907 <--> hostname/10.10.10.11:31010.
(state=,code=0)
java.sql.SQLNonTransientConnectionException: Failure in
connecting to Drill: org.apache.drill.exec.rpc.RpcException:
HANDSHAKE_COMMUNICATION : Channel closed /10.10.10.11:49907
<-->hostname/10.10.10.11:31010.
```

- b. If the server is not configured to use TLS and the client tries to connect using TLS, the error message will be similar to the following:

```
Error: Failure in connecting to Drill:
org.apache.drill.exec.rpc.NonTransientRpcException: Connecting to the
server timed out. This is sometimes due to a mismatch in the SSL
configuration between client and server. [ Exception: Timeout waiting
for task. ] (state=,code=0)
```

2. The server presents a certificate to the client containing a hostname that is not valid. When the client connects to a server, the hostname the client used to connect to the server must match the name of the host the certificate was assigned to. Certificates can contain wildcards for the hostname, so if you're connecting to a Drill cluster via ZooKeeper, it would be best to have a certificate that contains wildcards that cover all the hosts on which Drill might be running. It is also important to ensure that the DNS and the hostnames of the machines in the cluster are set up consistently so that the Drillbits are registered with ZooKeeper using the same name as the name assigned in the certificate. The error message in this case is the same as the previous case:

```
Error: Failure in connecting to Drill:
org.apache.drill.exec.rpc.NonTransientRpcException: Connecting to the
server timed out. This is sometimes due to a mismatch in the SSL
configuration between client and server. [ Exception: Timeout waiting
for task.] (state=,code=0)
```

Hostname verification can be turned off if there is no way to change the host configuration or the certificate. This is generally not recommended.

Security Between ZooKeeper and Drillbits

When Drill is installed on clusters with the default security enabled, authentication is enabled between the Drillbits and ZooKeeper. The ZooKeeper znode information is secured automatically through authentication and znode ACLs. Communication between the Drillbits and Zookeeper is not encrypted.

Note: If you installed Drill on a cluster that does not have the default security configuration, and you are configuring custom security, you must enable authentication and manually set ACLs on the znodes.

Drill uses ZooKeeper to store certain cluster-level configuration and query profile information in znodes. A znode is an internal data tree in ZooKeeper that stores coordination and execution related information. If information in the znodes is not properly secured, cluster privacy and/or security is compromised.

ZooKeeper uses ACLs to control access to znodes and secure the information they store. Starting in Drill 1.15, you can create a custom ACL (Access Control List) on the znodes to secure data. ACLs specify sets of ids and permissions that are associated with the ids.

Prior to Drill 1.15, ZooKeeper ACLs in secure and insecure clusters were set to `[world:all]`, meaning that all users had create, delete, read, write, and administrator access to the zknodes. Starting in Drill 1.15, ACLs in insecure clusters are set to `[world:all]`. ACLs in secure clusters are set to `[authid: all]`, which provides full access to the authenticated user that created the znode only. Discovery znodes (znodes with the list of Drillbits) have an additional ACL set to `[world:read]` making the list of Drillbits readable by any user.

Note: View the [drill-override-example.conf](#) file to see example ACL configurations.

Securing znodes

Complete the following steps to create a custom ACL and secure znodes:

1. Write a class that implements the `ZKACLProvider` interface. This class will contain the ACLs that need to be set on the znodes. You can use the [ZKSecureACLProvider class](#) as a sample reference.
2. Add the following dependency to the `pom` file of the project module created:

```
<groupId>org.apache.drill.exec</groupId>
<artifactId>drill-java-exec</artifactId>
```

3. Refer to the steps listed at <https://drill.apache.org/docs/manually-adding-custom-functions-to-drill/> to create a JAR and then add the JAR to Drill's classpath.

4. In `/opt/mapr/drill/drill-<version>/conf/drill-override.conf`, set `zk.acl_provider` to the `ZKACLProviderTemplate` type.
5. Restart Drill. When you restart Drill, the ACL, as mentioned in your custom class, is applied to the znode created when Drill starts.

Note: Existing ACLs for persistent znodes will not be affected if a Drillbit is restarted with a different ACL setting. ACLs are applied only at znode creation time. Drill does not recreate any znode that is already present. If you want to change an ACL for existing znodes, connect to the ZooKeeper server using `zkCli` and then use option a or b, as described:

- a) Shutdown Drillbits, delete the persistent znodes, change the ACL settings, and restart the Drillbit.
- b) Manually change the ACLs on the existing znodes to reflect the new ACL settings, using the `setAcl` command in the `zkCli`.

For either option to work, an authenticated connection between the `zkCli` and ZooKeeper Server must be established.

For additional information, refer to:

- [ZooKeeper access control using ACLs](#)
- [ZooKeeper and SASL](#)

Configuring Drill Web UI and Web API Security

The Drill web client and web API communicate with web browsers or web tools, like `curl`, through the HTTP or HTTPS. Drill uses HTTP by default.

Drill supports [form-based \(similar to Plain authentication\)](#) and [SPNEGO](#) authentication mechanisms to authenticate the communication between the web client and web browser or web tools. Drill supports SSL/TLS for encryption with form-based and SPNEGO authentication.

An administrator can configure security mechanisms and [set up Drill Web UI administrators and administrator-user groups](#) to control access to the Drill Web UI and Web API client applications. For example, limiting user access to Drill Web UI functionality, such as viewing or canceling queries submitted by other users.

Note:

- The Drill web server does not support data-fabric-SASL (tickets).
- With Drill Web UI security in place, users without administrator privileges must execute the `SHOW SCHEMAS` command in the Drill Web UI Query page to see storage plugin configuration information.

Form-Based Authentication

In EEP 5.0 and later, Drill supports form-based authentication between the web client and Drillbit. Form-based authentication is like [Plain Authentication](#) in that a user is presented with a web form where s/he enters a username and password to access restricted web pages. Form-based authentication also uses the Linux PAM (Pluggable Authentication Module).

[Configuring Drill to Use libpam4j](#) provides configuration details. When using form-based authentication, you can also configure Drill to use [SPNEGO for HTTP Authentication](#) and SSL/TLS for encryption.

HTTPS Support

The Drill Web UI supports the HTTPS protocol for encryption. With the default security configuration, HTTPS is enabled for Drill and it uses SSL trust- and keystore, which comes with cluster installation.

To use custom certificates, see [SSL Certificates in Secure and Unsecure MapR Clusters](#).

The following example shows the default HTTPS configuration in `<DRILL_INSTALL_HOME>/conf/drill-distrib.conf` for a secure cluster installation:

```
drill.exec: {
  http.ssl_enabled: true,
  ssl.useHadoopConfig: true
}
```

You can configure additional parameters:

| Drill Property Name | Hadoop Property Name | System Property Name | Description |
|-----------------------------------|---------------------------------|----------------------------------|---|
| drill.exec.http.ssl_enabled: | | | Enable or disable communication. Y |
| drill.exec.ssl.keyStorePath | ssl.server.keystore.location | javax.net.ssl.keyStore | Location of the Java own certificate and pathname must u |
| drill.exec.ssl.keyStorePassword | ssl.server.keystore.password | javax.net.ssl.keyStorePassword | Password to access password), and to (key password) u |
| drill.exec.ssl.keyPassword | ssl.server.keystore.keypassword | | Password to access be different from |
| drill.exec.ssl.trustStorePath | ssl.server.truststore.location | javax.net.ssl.trustStore | Location of the Java certificates trustee pathname must u |
| drill.exec.ssl.trustStorePassword | ssl.server.truststore.password | javax.net.ssl.trustStorePassword | Password to access specified as the t |
| drill.exec.ssl.useHadoopConfig | | | Use the setting in hadoop configura the hadoop.ssl.se file. Typically, this ssl-server.xml wh TLS.  Note: Verifi is located in symbolic lin for example <code><DRILL_</code> |

Setting up Web UI Administrators and Administrator-User Groups

The `security.admin.user_groups` and `security.admin.users` options set the administrative users when authentication is enabled.

Users listed in `security.admin.users` and the users belonging to the groups listed in `security.admin.user_groups` get administrative privileges. By default, these options are set to the username and groups of the user who started the Drill process. You can modify these options from the Drill Web UI or using the [ALTER SYSTEM](#) command.

An administrative user that authenticates to a Drillbit through data-fabric-SASL, Kerberos, Plain mechanism or through the HTTPS web interface can modify the `security.admin.user_groups` and `security.admin.users` options. The administrator can add or remove user names or user groups.

The `security.admin.user_groups` and `security.admin.users` options allow a single user/group name or a comma separated list of user/group names. When you view these options in the Drill Web UI, dummy default strings appear until the user explicitly changes the values.

Authenticated administrative users can view the current administrative user and administrative user groups on the Drill Web UI landing page (<https://<node-ip-address>:8047>) in the *Encryption Info* section.

Drill REST API and Web UI

This topic provides information about the Drill REST API and Web UI, including permission requirements.

If Drill has authentication enabled, you must supply credentials when using the Drill REST API.

Although Drill (in HPE Ezmeral Data Fabric) does not support HTTP basic authentication, you can work around this if your HTTP client saves cookies between requests. As a workaround, save the authenticated cookie to a file and then use the cookie in subsequent requests, as shown in the following example:

```
//Log in and save the authenticated cookie to a file:

curl -X POST \
  -H "Content-Type: application/x-www-form-urlencoded" \
  -k -c cookies.txt -s \
  -d "j_username=DRILL_USER" \
  -d "j_password=DRILL_PASSWORD" \
  https://HOSTNAME:8047/j_security_check

//In subsequent requests, use the cookie from that request:

curl -kv \
  -b cookies.txt \
  -X POST \
  -H "Content-Type: application/json" \
  -d @/tmp/hive-storage-plugin.json
  https://HOSTNAME:8047/storage/hive.json
```

Note: The session remains active for one hour. You can increase the session time through the `drill.exec.http.session_max_idle_secs` option in `drill-override.conf`:

```
drill.exec: {
  http: {
    session_max_idle_secs: 86400, # 24hr
  }
}
```

REST API Methods and Web UI Functions

The following table and subsections describe requests and privilege levels for accessing the REST API methods and corresponding Drill Web UI functions. Privileges in the table are listed as AMDIN, USER, and ALL. ALL indicates privileges given to both the user and administrator.

| Path | Request Type | Output Type | Functionality | Privileges |
|------|--------------|-------------|---------------|------------|
|------|--------------|-------------|---------------|------------|

| | | | | |
|------------------------------|--------|------------------|---|-------|
| / | GET | text/html | Returns Drillbit stats in a table in HTML format. | ALL |
| /stats.json | GET | application/json | Returns Drillbit stats such as ports and max direct memory in json format. | ALL |
| /status | GET | text/html | Returns Running! | ALL |
| /options.json | GET | application/json | Returns a list of options. Each option consists of name-value-type-kind (for example: (boot system datatype). | ALL |
| /options | GET | text/html | Returns an HTML table where each row is a form containing the option details and ability to modify the option values. | ALL |
| /option/{optionName} | POST | text/html | Updates the options and calls getSystemOptions to display list of options. | ADMIN |
| /storage.json | GET | application/json | Returns a list of storage plugin wrappers each containing name-config (instance of StoragePluginConfig) and enables the storage plugin configuration. | ADMIN |
| /storage | GET | text/html | Returns an HTML page with sections that contain: <ul style="list-style-type: none"> a table where each row is a form containing the plugin button for update page link and a button to disable the plugin. a table where each row is a form containing the plugin button for update page and a button to enable the plugin. | ADMIN |
| /storage/{name}.json | GET | application/json | Returns a plugin config wrapper for the requested web page. | ADMIN |
| /storage/{name} | GET | text/html | Returns an HTML page that has an editable text box for configuration editing, followed by buttons for creating, updating, and deleting. Each of the buttons make calls that generate the new page again. | ADMIN |
| /storage/{name}/enable/{val} | GET | application/json | Updates the storage plugin status. Returns success or failure. | ADMIN |
| /storage/{name}.json | DELETE | application/json | Deletes the storage plugin. Returns success or failure. | ADMIN |
| /storage/{name}/delete | GET | application/json | Same as deletePluginJSON but a GET instead of a DELETE request. | ADMIN |
| /storage/{name}.json | POST | application/json | Creates or updates the storage plugin. Returns success or failure. Expects JSON input. | ADMIN |

| | | | | |
|----------------------------|------|------------------|--|-------------|
| /storage/{name} | POST | application/json | Same as createOrUpdatePluginJSON expects JSON or FORM input. | ADMIN |
| /profiles.json | GET | application/json | Returns currently running and completed profiles from PStore. For each profile a queryId, startTime, foremanAddress, query, user, and state is returned. Each list (running and completed) is organized in reverse chronological order. | ADMIN, USER |
| /profiles | GET | text/html | Generates an HTML page from the data returned by getProfilesJSON with a hyperlink to a detailed query page. | ADMIN, USER |
| /profiles/{queryid}.json | GET | application/json | Returns the entire profile in JSON. | ADMIN, USER |
| /profiles/{queryid} | GET | text/html | Returns a complex profile page. | ADMIN, USER |
| /profiles/cancel/{queryid} | GET | text/html | Cancels the given query and sends a message. | ADMIN, USER |
| /query | GET | text/html | Gets the query input page. | ALL |
| /query.json | POST | application/json | Submits a query and waits until it is completed and then returns the results as one big JSON object. | ALL |
| /query | POST | text/html | Returns the results of submitQueryJSON in an HTML table. | ALL |
| /status/metrics | GET | application/json | Returns a page that fetches metric info from resource, status, and metrics. | ALL |
| /status/threads | GET | text/html | Returns a page that fetches metric information from resource, status, and threads. | ALL |
| /login | GET | text/html | Returns an HTML log in page. If the user is already logged in, returns the home page. If the URL contains a redirect, sets the redirect URI for the session and forwards the user to the redirect page after the user is successfully logged in. | ALL |
| /login | POST | text/html | Returns a validation error for incorrect credentials. | ALL |
| /logout | GET | text/html | Ends a session. | ALL |

GET /profiles.json

- ADMIN - gets all profiles on the system.
- USER - only the profiles of the queries the user has launched.

GET /profiles

- ADMIN - gets all profiles on the system.

- USER - only the profiles of the queries the user has launched.

GET /profiles/{queryid}.json

- ADMIN - return the profile.
- USER - if the query is launched the by the requesting user return it. Otherwise, return an error saying no such profile exists.

GET /profiles/{queryid}

- ADMIN - return the profile.
- USER - if the query is launched the by the requesting user return it. Otherwise, return an error saying no such profile exists

GET /profiles/cancel/{queryid}

- ADMIN - can cancel the query.
- USER - cancel the query only if the query is launched by the user requesting the cancellation.

SPNEGO for HTTP Authentication

Drill 1.13 and later supports the Simple and Protected GSS-API Negotiation mechanism (SPNEGO) to extend the Kerberos-based single sign-on authentication mechanism to HTTP. An administrator configures the web server (Drillbit) to use SPNEGO for authentication. Depending on the system, either the administrator or the user configures the client (web browser or web client tool) to use SPNEGO for authentication.

An administrator can configure both FORM (username and password) and SPNEGO authentication together, which provides the ability for clients with different security preferences to connect to the same Drill cluster. When a client (a web browser or a web client tool, such as curl) requests access to a secured page from the web server (Drillbit), the SPNEGO mechanism uses tokens to perform a handshake that authenticates the client browser and the web server.

The Drill Web UI provides two possible log in options for a user depending on the configuration. If a user selects FORM, s/he must enter their username and password to access restricted pages in the Drill Web UI. The user is authenticated through PAM. If the user selects SPNEGO, the user is automatically logged in if they are an authenticated Kerberos user. If accessing a protected page directly, the user is redirected to the authentication log in page. If the client fails to authenticate using SPNEGO, an error page displays with an option to use FORM authentication, assuming FORM authentication is configured on the server side.

Browser Support

The following browsers were tested with Drill configured to use SPNEGO authentication:

- Firefox
- Chrome
- Safari
- Internet Explorer

- Web client tool, such as curl

Prerequisites

SPNEGO authentication for Drill requires the following:

- Drill 1.13 or later installed on each node.
- A working Kerberos infrastructure, which Drill does not provide.
- A Linux-based or Windows Active Directory (AD) Kerberos environment with secure clusters and a Drill server configured for Kerberos.
- Kerberos principal and keytab on each web server (Drillbit) that will use SPNEGO for authentication.
- Kerberos Ticket Granting Ticket on the client machine for the user accessing the Drillbit (web server).
- Drill web server configured for SPNEGO.

Configuring SPNEGO on the Web Server and Web Client

The following sections provide the steps that an administrator can follow to configure SPNEGO on the web server (Drillbit). An administrator or a user can follow the steps for configuring the web browser or client tool.

Configuring SPNEGO on the Drillbit (Web Server)

To configure SPNEGO on the web server, complete the following steps:

1. Generate a Kerberos principal on each web server that will receive inbound SPNEGO traffic. Each principal must have a corresponding keytab. The principal must have the following form:

```
"HTTP/<client-known-server-hostname@realm>"
```

Example: "HTTP/example.QA.LAB@QA.LAB"

//In this example, the client known server hostname is example.QA.LAB.

Note: If HTTPS is enabled on the Drillbit (web server), the SPNEGO principal should also start with "HTTP/", not "HTTPS/" even though the URL includes HTTPS.

2. Update the `/opt/mapr/drill/drill-<version>/conf/drill-override.conf` file on each Drillbit with the following server-side SPNEGO configurations:

- To enable SPNEGO, add the following configuration to `drill-override.conf`:

```
impersonation: {
    enabled: true,
    max_chained_user_hops: 3
},
drill.exec.http: {
    spnego.auth.principal: "HTTP/hostname@realm",
    spnego.auth.keytab: "path/to/keytab",
    auth.mechanisms: ["SPNEGO"]
}
//The default authentication mechanism is "FORM".
```

- To enable SPNEGO and FORM authentication, add the following configuration to `drill-override.conf`:

```
impersonation: {
  enabled: true,
  max_chained_user_hops: 3
},
security.user.auth: {
  enabled: true,
  packages +=
"org.apache.drill.exec.rpc.user.security",
  impl: "pam4j",
  pam_profiles: [ "sudo", "login" ]
}
drill.exec.http: {
  spnego.auth.principal: "HTTP/hostname@realm",
  spnego.auth.keytab: "path/to/keytab",
  auth.mechanisms: [ "SPNEGO", "FORM" ]
}
}
```

- (Optional) To configure the mapping from a Kerberos principal to a user account used by Drill, update the `drill.exec.security.auth.auth_to_local` property in the `drill-override.conf` file with custom rules, as described in [Mapping from Kerberos Principal to OS user account](#).

Note: Drill uses a Hadoop Kerberos name and rules to transform the client Kerberos principal to the principal Drill uses internally as the client's identity. By default, this mapping rule extracts the first portion from the provided principal. For example, if the principal format is Name1/Name2@realm, the default rule extracts only Name1 from the principal and stores Name1 as the client's identity on server side. Drill uses the short name, for example Name1, as the user account known to Drill. This user account name is used to determine if the authenticated user has administrative privileges.

Configuring SPNEGO on the Client

An administrator or user can configure SPNEGO on the client (web browser or client tools, such as curl). To configure SPNEGO on the client, a Kerberos Ticket Granting Ticket must exist for the user accessing the web server. The Kerberos Ticket Granting Ticket generated on the client side is used by the web client to get a service ticket from the KDC. This service ticket is used to generate a SPNEGO token, which is presented to the web server for authentication.

The client should use the same web server hostname (as configured in the server-side principal) to access the Drill Web Console. If the server hostname differs, SPNEGO authentication will fail. For example, if the server principal is "HTTP/example.QA.LAB@QA.LAB", the client should use `http://example.QA.LAB:8047` as the Drill Web Console URL.

The following sections provide instructions for configuring the supported client-side browsers:

Firefox

To configure Firefox to use a negotiation dialog, such as SPNEGO to authenticate, complete the following steps:

- Go to **About > Config**, and accept the warnings.
- Navigate to the network settings.
- Set `network.negotiate-auth.delegation-uris` to "http://,https://".
- Set `network.negotiate-auth.trusted-uris` to "http://,https://".

Chrome

For MacOS or Linux, add the `--auth-server-whitelist` parameter to the `google-chrome` command. For example, to run Chrome from a Linux prompt, run the `google-chrome` command, as shown:

```
google-chrome --auth-server-whitelist = "hostname/domain"
Example: google-chrome --auth-server-whitelist = "example.QA.LAB"
```

Safari

No configuration is required for Safari. Safari automatically authenticates using SPNEGO when requested by the server.

Internet Explorer

To configure Internet Explorer to use a negotiation dialog, such as SPNEGO to authenticate, complete the following steps:

1. Go to **Tools > Options > Security > Local Intranet > Sites**, and select all options.
2. Select **Advanced**, and add one or both of the following URLs to server:
 - `http://`
 - `https://`

Note: Make sure you use the hostname of the Drillbit in the URL.

3. Close the **Advanced** tab, and click **OK**.
4. Go to **Tools > Options > Advanced > Security** (in the checkbox list), and enable the **Integrated Windows Authentication** option.
5. Click **OK**.
6. Close and reopen IE. You can browse to your Spengo protected resource.

REST API

You can use CURL commands to authenticate using SPNEGO and access secure web resources over REST.

Issue the following `curl` command to log in using SPNEGO, and save the authenticated session cookie to a file, such as `cookie.txt`, as shown:

```
curl -v --negotiate -c cookie.txt -u : http://<hostname>:8047/spnegoLogin
```

Use the authenticated session cookie stored in the file, for example `cookie.txt`, to access the Drill Web Console pages, as shown in the following example:

```
curl -v --negotiate -b cookie.txt -u : http://<hostname>:8047/query
Example: curl -v --negotiate -b cookie.txt -u : http://
example.QA.LAB:8047/query
```

Using ACEs on Views to Limit Data Access

Describes how to use access control expressions to limit data access for Views.

[Apache Drill](#) on page 3401 is a distributed SQL query layer that runs on the data platform. You can enable [user impersonation](#) and [create views](#) in Drill to control user access to data stored in the data platform at the

row and column levels. Access to data is based on file permissions set on the data (source files) and on the view definition files.

In addition to standard POSIX permissions, [ACEs \(access control expressions\)](#) are supported to secure data in the distributed filesystem. ACEs are a flexible access control mechanism that applies to files, tables, and streams. [Setting an ACE \(access control expression\)](#) on a file modifies the file permission to honor the [ACE](#) setting. Drill honors [ACE](#) set on Drill view files and on the source files that views access.

Each [Drill view](#) created has an associated view definition file, with a `.view.drill` extension, on which you can set ACEs to secure the view.

Example

Frank creates a [workspace](#) in the [dfs storage plugin configuration](#) in Drill that points to his home directory in the distributed filesystem. He then uses Drill to create a table named “employees” that he and the HR group can access:

```
-rwxr----- frank:hr /user/frank/employees
```

Joe, a member of the HR and MGR groups, creates a view named `emp_mgr_view` in his home directory to share a subset of the employees data with managers that belong to the MGR group:

```
-rwxr----- joe:mgr /user/joe/emp_mgr_view.drill.view
```

Managers in the MGR group have read permission on the `emp_mgr_view.drill.view` file so they can query the `emp_mgr_view` that Joe created and they can create new views from his view.

Setting [ACE](#) on the underlying data source (the “employees” table) or on the view file (`emp_mgr_view.drill.view`) that accesses the underlying data source resets the POSIX mode bits to match the permissions granted through [ACE](#) settings.

For example, if Frank issues the following command to apply an [ACE](#) to the “employees” table, a user must be a member of the EXEC group to read data in the “employees” table:

```
hadoop mfs -setace -R -readfile 'g:exec' employees
```

Anyone in the HR group that previously had access to the table can no longer access the table data unless they also belong to the EXEC group.

Running the `-getace` command on the table lists the [ACE](#) settings on the table:

```
hadoop mfs -getace /user/frank/employees
```

```
Path: /user/frank/employees
readfile: g:exec
writefile:
executefile:
readdir:
addchild:
deletechild:
lookupdir:
inherit: true
mode: -----
```

Similarly, if Joe issues the following command on the `emp_mgr_view.drill.view` file, only members of the HR group can read the file. Users that belong to the MGR group can no longer access the data through the view, unless they also belong to the HR group.

```
hadoop mfs -setace -R -readfile 'g:hr' emp_mgr_view.drill.view
```

Running the `-getace` command on view file shows the [ACE](#) settings on the file:

```
hadoop mfs -getace /user/joe/emp_mgr_view.drill.view

Path: /user/joe/emp_mgr_view.drill.view
readfile: g:hr
writefile:
executefile:
readdir:
addchild:
deletechild:
lookupdir:
inherit: true
mode: -----
```

You may also want to view another [File ACE Example](#) on page 1572.

Drill Drivers

HPE Ezmeral Data Fabric provides Drill ODBC and JDBC drivers that you can download and use to connect Drill to BI tools. The drivers are updated periodically to include support for new functionality in Drill.

The following table provides links to driver download sites and documentation:

| Driver | Driver Download Site | Driver Documentation |
|-------------------|--|---|
| Drill ODBC Driver | All versions of the Drill ODBC driver are located at https://package.mapr.hpe.com/tools/MapR-ODBC/MapR_Drill/ . | <ul style="list-style-type: none"> Information about the driver, including Drill driver version compatibility and important messages, is located at Drill ODBC Driver on page 3557. Driver documentation, including installation and configuration instructions, is located in the Drill ODBC Driver PDF file. |
| Drill JDBC Driver | All versions of the Drill JDBC driver are located at https://package.mapr.hpe.com/tools/MapR-JDBC/MapR_Drill/ . | <ul style="list-style-type: none"> Information about the driver, including Drill driver version compatibility and important messages, is located at Drill JDBC Drivers on page 3545. Driver documentation, including installation and configuration instructions, is located in the Drill JDBC Driver PDF file. |

Drill JDBC Drivers

Download the Drill JDBC driver and use it on all platforms to connect BI tools, such as SquirrelL and Spotfire, to Drill. Drill also includes an embedded, open-source JDBC driver.

The downloadable Drill JDBC driver provides read-only access to Drill data sources and supports the security features described in [Securing Drill](#).

Alternatively, you can use the [open-source JDBC driver](#) embedded in Drill; however, *the open-source JDBC driver is not tested on the MapR Data Platform*. The open-source driver supports Kerberos and Plain authentication mechanisms, but does not support the data-fabric-SASL authentication mechanism. After you install Drill from the `mapr-drill` package, you can find the open-source JDBC driver files in the following directories:

- `$DRILL_HOME/jars/jdbc-driver/drill-jdbc-all-<drill-version>.jar`
- `$DRILL_HOME/jars/drill-jdbc-<drill-version>.jar`

Drill JDBC Driver Download

Use the version of the driver that correlates with the version of the installed Drill server. Although older versions of the driver may connect to an upgraded version of Drill, the older drivers do not include all the server features available in the newer drivers.

The following table provides links to the download locations for the Drill JDBC drivers that correlate with each of the Drill versions listed:

| Drill Version | JDBC Version |
|---------------|---|
| 1.16.0.x | 1.6.7.1010  Attention: This driver supports JRE 8 only and includes updated driver classes. See Driver Class on page 3546. |
| 1.16.0.x | 1.6.6.1009 |
| 1.16.1.x | 1.6.6.1008 |
| 1.16.0 | 1.6.0.1001 |
| 1.15.0 | 1.6.0.1001 |
| 1.14.0 | 1.6.0.1001 |
| 1.13.0 | 1.5.9.1018 |
| 1.12.0 | 1.5.8.1017 |
| 1.11.0 | 1.5.6.1012 |
| 1.10.0 | 1.5.3.1006 |

Driver Class

 **Important:** The [Drill JDBC Driver](#) installation and configuration PDF document does not include the information provided in the following sections:

Driver Class

The *Registering the Driver Class* section of the [Drill JDBC Driver](#) documentation incorrectly lists the driver classes as `com.simba.drill.jdbc41.Driver` and `com.simba.drill.jdbc41.DataSource`.

- For driver version **1.6.6.1009 and earlier**, the correct driver classes are:
 - `com.mapr.drill.jdbc41.Driver`
 - `com.mapr.drill.jdbc41.DataSource`
- For driver version **1.6.7.1010**, the correct driver classes are:
 - `com.mapr.drill.jdbc.Driver`
 - `com.simba.drill.jdbc.DataSource`

JDBC Connection String

You can indicate the `schema` parameter in the connection string, as shown in the following example:

```
jdbc:drill:zk=10.10.100.30:5181,10.10.100.31:5181,10.10.100.32:5181/drill/drillbits1;schema=hive
```

You can also include the authentication mechanism in the connection string using the `AuthMech` or `auth` parameter. For data-fabric-SASL, use `auth=MAPRSASL`.

- If using the data-fabric-SASL or Plain authentication mechanism, you must add the Drill JDBC JAR files and `/opt/mapr/lib/*` to the classpath of the third-party client tool, as shown in the following example for SquirrelL when the path to the driver is `C:\driver\MapRDrillJDBC41-1.5.6.1012`:

```
-cp
"%SQUIRREL_CP%;C:\driver\MapRDrillJDBC41-1.5.6.1012\*;C:\opt\mapr\lib\*"

```

The driver JAR files should appear before `/opt/mapr/lib/*` in the classpath.

Using Data Fabric-SASL for Authentication on Windows

Drill is automatically configured with [MapR security](#) when you install Drill on a cluster configured with default security. To successfully connect to Drill from a Windows JDBC client, a user ticket must exist on the Windows client in the `%TEMP%` directory or in the location specified by the `$MAPR_TICKETFILE_LOCATION` environment variable.

The JDBC driver locates user tickets for the current Windows user in the default ticket location, `%TEMP%`, or in the location specified by the environment variable, `$MAPR_TICKETFILE_LOCATION`. See [Tickets](#) and [Generating a MapR User Ticket](#) for more information.

You can either copy a user ticket that was generated on the cluster into the default location (`%TEMP%`), or you can install the data-fabric client on the Windows client and then run the `maprlogin` command to generate the ticket on the Windows client.

Note: The JDBC user must be the same as the Windows user that created the ticket.

Example

If you want to connect to Drill as the `mapr` user, you must create a ticket for the `mapr` user, as shown:

```
$ maprlogin password -user mapr
[Password for user 'mapr' at cluster 'Cluster1':]

```

The credentials for the `mapr` user in `Cluster1` are written to `/tmp/maprticket_1000`.

Next, place the ticket in the `%TEMP%` directory on the Windows client. For example, the default location for a Windows 10 user named Tabettha Stephens is shown:

```
'C:\Users\TABETH~1\AppData\Local\Temp\maprticket_Tabettha Stephens'
```

To override this location, set the `"MAPR_TICKETFILE_LOCATION"` global variable for the Windows user.

Note: Using the `MAPR_TICKETFILE_LOCATION` is recommended because the `%TEMP%` directory differs between Windows versions. You may also want to set the `MAPR_TICKETFILE_LOCATION` per user on the operating system to prevent all users from using the same user ticket on the client.

Avoiding Driver Conflicts

If you download and use the Drill JDBC driver, rename the embedded JDBC driver files to avoid any conflict between the downloaded driver and the open-source driver. The embedded JDBC driver files are in the following directories after you install Drill:

```
$DRILL_HOME/jars/jdbc-driver/drill-jdbc-all-1.10.0.jar
$DRILL_HOME/jars/drill-jdbc-1.10.0.jar

```

Changing the file extension to rename these files, as shown in the following example, prevents Drill or any other application, such as SQLLine, from picking up the embedded driver:

```
$DRILL_HOME/jars/jdbc-driver/drill-jdbc-all-1.10.0.jar.original
$DRILL_HOME/jars/drill-jdbc-1.10.0.jar.original
```

Connecting to Drill via the Drill Shell (SQLLine)

See [Connecting to Drill via the Drill Shell \(SQLLine\)](#) on page 3548.

Driver Limitations

When using data-fabric-SASL with JDBC or ODBC drivers, there is no way to specify the target cluster name as part of the connection parameters. Data Fabric-SASL reads the first entry in the `/opt/mapr/conf/mapr-clusters.conf` file and assumes it is the target cluster name.

For example, if the `mapr-clusters.conf` file has an entry for `'cluster1'` followed by an entry for `'cluster2'` and you want to connect to a node in `'cluster2'`, authentication fails. As a workaround, manually switch the order of entries in the `mapr-clusters.conf` file.

Connecting to Drill via the Drill Shell (SQLLine)

SQLLine is a JDBC application that is packaged with Drill and serves as the Drill shell. When you issue queries from the SQLLine client, SQLLine passes the queries to the connected Drillbit (Drill node).

You can connect to Drill through Sqlline directly or through a connection-property file. To avoid exposing credentials, connect through the connection-property file.

A JDBC connection string supplies the connection information to a Drill node or ZooKeeper cluster. When you connect to a ZooKeeper cluster, ZooKeeper selects the Drillbit for SQLLine to connect to.

JDBC Connection String Example

Here is an example of a JDBC connection string that connects SQLLine to `drillnode1`:

```
jdbc:drill:drillbit=drillnode1:31010
```

The default port on a Drill node is 31010.

Connection Parameters

You can include SQLLine connection parameters in the connection string and run various shell commands, as described in [Configuring the Drill Shell](#).

In the following example, `-u` is the connection parameter for the JDBC connection string, `-n` is the parameter for the username, and `-p` is the parameter for the password:

```
/opt/mapr/drill/drill-<version>/bin/sqlline -u
"jdbc:drill:drillbit=drillnode1:31010" -n mapr -p mapr
```

Starting SQLLine

Start SQLLine from the Drill installation directory, as shown:

```
/opt/mapr/drill/drill-<version>/bin/sqlline -u
jdbc:drill:drillbit=drillnode1:31010
```

Configuration Options

You can also include configuration options, such as `schema`:

```
/opt/mapr/drill/drill-<version>/bin/sqlline -u "jdbc:drill:drillbit
drillnode1:31010;schema=dfs" -n <username> -p <password>
```

Schema

The `schema` is the name of a [storage plugin](#) configuration to use as the default for queries. If you indicate the schema in the connection URL, you do not have to run the `USE <schema>;` query to switch to the schema you want to use. All queries run against the schema indicated in the JDBC connection string.

Authentication

If authentication (Plain, MAPRSASL, or Kerberos) is enabled, include the `auth` option in the connection string. If Drill is installed on a cluster secured by default security, set `auth=MAPRSASL`.

For additional configuration options, refer to the *Driver Configuration Options* section in the [JDBC Installation and Configuration Guide](#).

Connecting to a Specific Drill Node

Indicate which Drill node you want SQLLine to connect to in the JDBC connection string by using the following JDBC connection string format:

```
jdbc:drill:drillbit=<host>:<port>
```

Note that properties are case-sensitive. The `host` is the DNS or IP address of the server (Drill node). By default, the driver connects to port 31010.

Example

The following example shows how to run SQLLine with the JDBC connection string and includes the username, password, and `auth` parameters to authenticate to the server with Plain authentication:

```
/opt/mapr/drill/drill-<version>/bin/
sqlline -u
"jdbc:drill:drillbit=<ip-address>:<por
t>;auth=PLAIN" -n <username> -p
<password>
```

If you installed Drill on a cluster with default security enabled, set the `auth` type to `maprsasl`:

```
/opt/mapr/drill/drill-<version>/bin/
sqlline -u
"jdbc:drill:drillbit=<ip-address>:<por
t>;auth=MAPRSASL" -n <username> -p
<password>
```

Connecting to ZooKeeper

When you include the ZooKeeper nodes in the JDBC connection string, ZooKeeper selects an available Drill node for SQLLine to use.

Indicate the ZooKeeper cluster you want SQLLine to connect to in the JDBC connection string, using the following JDBC connection string format:

```
jdbc:drill:zk=<zk-server-list>/drill/<clustername>
```

The `zk-server-list` is a comma-separated list of the ZooKeeper nodes in the cluster. The `clustername` is the unique name of the Drillbit cluster that you want to connect to.

Important: You can locate the name of the Drillbit cluster in `/opt/mapr/drill/drill-<version>/conf/drill-distrib.conf`. The default name of the Drillbit cluster is `drillbits1`. The name is set by the `cluster-id` property. If you have multiple Drill clusters, you might want to override the Drillbit cluster name in `drill-override.conf`. However, first [back-up your storage plugin configurations](#), as they might reset to the defaults when you change the cluster name. Restart Drill after you edit `drill-override.conf`.

Note that properties are case-sensitive. The `host` is the DNS or IP address of the server (ZooKeeper node).

Example

The following example shows you how to configure the JDBC connection string to connect SQLLine to the ZooKeeper cluster:

```
/opt/mapr/drill/drill-<version>/bin/
sqlline
jdbc:drill:zk=<node-ip>:<port>,<node-i
p>:<port>,<node-ip>:<port>/drill/
drillbits1;auth=PLAIN
```

Note: The default port for ZooKeeper nodes in a data-fabric cluster is 5181.

If you installed Drill on a secure cluster, set the `auth` type to `maprsasl`:

```
/opt/mapr/drill/drill-<version>/bin/
sqlline
jdbc:drill:zk=<node-ip>:<port>,<node-i
p>:<port>,<node-ip>:<port>/drill/
drillbits1;auth=MAPRSASL
```

Using a Connection-Property File with SQLLine

If you use a connection-property file, make sure you restrict user permission on the file to only those users you want to have access.

Complete the following steps to create a connection-property file and connect to Drill:

1. Create a connection-property file named `login.properties` with the following information:

```
url:<jdbc-connection-url>
user:<username>
password:<password>

//Example
cat login.properties
url:jdbc:drill:schema=dfs;drillbit=drill-lab-node01
user:drilluser
password:letsdrill
```

2. To connect to Drill, run SQLLine, as shown:

```
sqlline <sqlline args> <path/to/login.properties file>
```

The following examples show you how to connect to Drill through the connection-property file and how to verify that log in details are safe:

Example 1: Connecting to Drill via the connection-property file

```
sqlline login.properties

Java HotSpot(TM) 64-Bit Server VM
warning: ignoring option
MaxPermSize=512M; support was removed
in 8.0
apache drill 1.16.0
"drill baby drill"
0: jdbc:drill:schema=dfs> !list
1 active connection:
 #0 open
jdbc:drill:schema=dfs;drillbit=drill-1
ab-node01
0: jdbc:drill:schema=dfs>!q
```

Example 2 : Submitting a query when connecting to Drill via the connection-property file

```
sqlline -q "SELECT version FROM
sys.version" login.properties
Java HotSpot(TM) 64-Bit Server VM
warning: ignoring option
MaxPermSize=512M; support was removed
in 8.0
apache drill 1.16.0
"the only truly happy people are
children, the creative minority and
drill users"
0: jdbc:drill:schema=dfs> select
version from sys.version
. . . . . > +-----+
| version |
+-----+
| 1.16.0 |
+-----+
1 row selected (0.295 seconds)
0: jdbc:drill:schema=dfs> Closing:
org.apache.drill.jdbc.impl.DrillConnec
tionImpl
$
```

Example 3: Use the properties command to connect to Drill via the connection-property file

```
Run sqlline from /opt/mapr/drill/
drill-<version>/bin sqlline

Java HotSpot(TM) 64-Bit Server VM
warning: ignoring option
MaxPermSize=512M; support was removed
in 8.0
apache drill 1.16.0
"a little sql for your nosql"

sqlline> !properties /home/drilluser/
login.properties
0: jdbc:drill:schema=dfs>
```

```
0: jdbc:drill:schema=dfs> !list
1 active connection:
#0 open
jdbc:drill:schema=dfs;drillbit=drill-1
ab-node01
0: jdbc:drill:schema=dfs>
```

Example 4: Verify that Login Details are Safe

You can verify sqlline process information to confirm login details are not exposed to other users.

```
ps -ef | grep sqlline
drilluser      18938 21924 99 14:14
pts/0          00:00:03 /opt/
jdk1.8.0_141/bin/
java -XX:MaxPermSize=512M -Djava.secur
ity.auth.login.config=/opt/mapr/conf/
mapr.login.conf \
-Dzookeeper.sasl.client=false -Dhadoop
.login=simple -Dlog.path=/opt/mapr/
drill/drill-1.10.0/logs/
sqlline.log -Dlog.query.path=/opt/
mapr/drill/drill-1.16.0/logs/
sqlline_queries.json \
-cp /opt/mapr/drill/drill-1.10.0/
conf:/opt/mapr/drill/drill-1.16.0/
jars/*:/opt/mapr/drill/drill-1.16.0/
jars/ext/*:/opt/mapr/drill/
drill-1.16.0/jars/3rdparty/*:/opt/
mapr/drill/drill-1.16.0/jars/classb/*
sqlline.SqlLine -d
org.apache.drill.jdbc.Driver --maxWidt
h=10000 --color=true login.properties
drilluser      20119 1691 0 14:14
pts/1          00:00:00 grep sqlline
```

How to Protect the Password

Use the `!connect` command to mask and protect the password, as shown in the following example:

```
sqlline> !connect
jdbc:drill:drillbit=ip-10-0-0-33.eu-west-2.compute.internal:31010

Enter username for
jdbc:drill:drillbit=ip-10-0-0-33.eu-west-2.compute.internal:31010: alice
Enter password for
jdbc:drill:drillbit=ip-10-0-0-33.eu-west-2.compute.internal:31010: *****
```

Start|Stop the Drill Service

You can start|stop|restart the Drillbit service on one or more nodes by using the Control System or the following command:

```
maprcli node services -name drill-bits -action start|restart|stop -nodes
<node host names separated by a space>
```

Use the host name if possible. Using host names instead of IP addresses is a best practice.

Drill Log Files

You can access the Drill log files in `/opt/mapr/drill/drill-<version>/logs/drillbit.log`.

Using the Drill JDBC Driver with SQuirreL

You can use the Drill JDBC driver with SQuirreL to connect to Drill and query the data sources configured in Drill.

To use the Drill JDBC Driver with SQuirreL, verify that your system meets the prerequisites and then download and configure the driver.

Prerequisites

Verify that the system meets the following prerequisites:

- Java Runtime Environment (JRE), version 7.0 or later, installed on each machine where you plan to use the JDBC driver.
- Drill installed in distributed mode on one or multiple nodes in a cluster with data sources configured. See [Connecting Drill to Data Sources](#).
- Verify that the system can resolve the hostnames of the ZooKeeper nodes of the Drill cluster. You can do this by configuring DNS for all of the systems. Alternatively, you can edit the hosts file to include the hostnames and IP addresses of all the ZooKeeper nodes used with the Drill cluster.
 - For Windows, create the entry in the `%WINDIR%\system32\drivers\etc\hosts`.
 - For Linux and Mac, create the entry in `/etc/hosts`.

Example: `127.0.1.1 maprdemo`

Downloading and Configuring the Driver

This topic provides instructions for downloading and configuring the Drill JDBC driver for SQuirreL.

When you configure the driver, you define the driver and create an alias. The alias is a specific instance of the driver configuration. SQuirreL uses the driver definition and alias to connect to Drill so you can access data sources that you have registered with Drill. When you create the alias, you provide a connection URL that includes the name of the Drill directory stored in ZooKeeper and the cluster ID. The URL has the following format:

```
jdbc:drill:zk=<zookeeper_quorum>/<drill_directory_in_zookeeper>/<cluster_ID>
```

The following example shows a URL for Drill installed on a single node:

```
jdbc:drill:zk=10.10.100.56:5181/drill/demo_mapr_com-drillbits
jdbc:drill:zk=10.10.100.24:2181/drill/drillbits1
```

The following example shows a URL for Drill installed in distributed mode with a connection to a ZooKeeper quorum:

```
jdbc:drill:zk=10.10.100.30:5181,10.10.100.31:5181,10.10.100.32:5181/drill/
drillbits1
```

**Note:**

- The ZooKeeper port is 2181. In a data-fabric cluster, the ZooKeeper port is 5181.
- The Drill directory stored in ZooKeeper is /drill.
- The Drill default cluster ID is drillbits1. To determine the cluster ID, check the following file:

```
<drill-installation>/conf/drill-override.conf
```

For example:

```
... drill.exec: { cluster-id: "docs41cluster-drillbits", zk.connect:
"centos23.lab:5181,centos28.lab:5181,centos29.lab:5181" } ...
```

To use the Drill JDBC driver with SquirrelL, complete the following steps:

1. [Download the latest Drill JDBC Driver](#) and then unzip the file. The Drill JDBC Driver JAR files must exist in a directory on your machine before you can configure the driver in the SquirrelL client.
2. *If using the data-fabric-SASL or Plain authentication mechanism, add the Drill JDBC JAR files and /opt/mapr/lib/* to Squirrel's classpath, as shown in the following example when the path to the driver is C:\driver\MapRDrillJDBC41-1.5.6.1012:*

```
-cp
"%SQUIRREL_CP%;C:\driver\MapRDrillJDBC41-1.5.6.1012\*;C:\opt\mapr\lib\*"
```

Note: The driver JAR files should appear before /opt/mapr/lib/* in the classpath.

3. Define the driver.
 - a) Open the SquirrelL client.
 - b) In the SquirrelL toolbar, select **Drivers > New Driver**. The Add Driver dialog appears.
 - c) Enter the following information:
 - **Name** - Name for the Drill JDBC Driver
 - **Example URL** - jdbc:drill:zk=<zookeeper_quorum>
Example: jdbc:drill:zk=maprdemo:5181
 - **Website URL** - jdbc:drill:zk=<zookeeper_quorum>
Example: jdbc:drill:zk=maprdemo:5181
Example: jdbc:drill:zk=10.10.100.113:5181,10.10.100.115:5181
 - d) Select **Extra Class Path**, and click **Add**.
 - e) Navigate to the directory that contains the JDBC JAR files.
 - f) Select all of the files in the directory, and click **Choose**.
 - g) In the Class Name drop-down field, select the driver class. For driver version 1.6.6.1009 and earlier, select **com.mapr.drill.jdbc41.Driver** or type **com.mapr.drill.jdbc41.Driver** in the field if the option does not appear. For driver version 1.6.7.1010, select **com.mapr.drill.jdbc.Driver** or type **com.mapr.drill.jdbc.Driver** in the field if the option does not appear.

- h) Click **Ok**. The SQuirreL client displays a message stating that the driver registration is successful, and you can see the driver in the Drivers panel.
4. Create a database alias.
- Select the **Aliases** tab.
 - In the SQuirreL toolbar, select **Aliases > New Alias**. The Add Alias dialog box appears.
 - Enter the following information and click **Ok**.
 - Alias Name** - A unique name for the Drill JDBC Driver alias
 - Driver** - Select the Drill JDBC Driver
 - URL** - Enter the connection URL with the name of the Drill directory stored in ZooKeeper and the cluster ID.
 - User Name** - admin
 - Password** - admin

The *Connect to:* dialog appears.
 - Click **Connect**. SQuirreL displays a message stating that the connection is successful.
 - Click **Ok**. SQuirreL is connected to Drill through the Drill JDBC driver. You can run your queries.

Running a Drill Query from SQuirreL

Query sample data in Drill to verify that the SQuirreL client is successfully connected to the cluster through the Drill JDBC driver.

Run a test query on sample data to test the Drill connection.

To query sample data with Squirrel, complete the following steps:

- Click the **SQL** tab.
- Enter the following query in the query box: `SELECT * FROM cp.`employee.json`;`
- Press **Ctrl+Enter** to run the query. The query results display.

You have successfully run a Drill query from the SQuirreL client!

Java Sample Code

To use the Drill JDBC driver in an application, you must include all of the JAR files from the ZIP archive in the classpath for the Java project.

The following Java code demonstrates how to use the JDBC API to:

- Register the driver for Drill
- Establish a connection to a Drill server
- Query the database
- Parse a result set
- Handle exceptions
- Clean up to avoid memory leakage

```
// java.sql packages are required
import java.sql.*;
```

```

class DrillJDBCExample {
    // Define a string as the fully qualified class name
    // (FQCN) of the desired JDBC driver
    private static final String JDBC_DRIVER =
        "com.mapr.drill.jdbc.Driver";
    // Define a string as the connection URL
    private static final String CONNECTION_URL =
        "jdbc:drill:drillbit=192.168.1.1:31010";

    public static void main(String[] args) {
        Connection con = null;
        Statement stmt = null;
        ResultSet rs = null;
    // Define a plain query
    String query = "SELECT first_name, last_name, emp_id
    FROM `hive`.`default`.`emp`";

        try {

            // Register the driver using the class name
            Class.forName(JDBC_DRIVER);
            // Establish a connection using the connection
            // URL
            con = DriverManager.getConnection(CONNECTION_
            URL);
            // Create a Statement object for sending SQL
            // statements to the database
            stmt = con.createStatement();

            // Execute the SQL statement
            rs = stmt.executeQuery(query);
            // Display a header line for output appearing in
            // the Console View
            System.out.printf("%20s%20s%20s\r\n", "FIRST
            NAME", "LAST NAME" , "EMPLOYEE ID");

            // Step through each row in the result set
            // returned from the database
            while(rs.next()) {
                // Retrieve values from the row where the

                // cursor is currently positioned using
                // column names
                String FirstName = rs.getString("first_
                name");
                String LastName = rs.getString("last_name");
                String EmployeeID = rs.getString("emp_id");

                // Display values in columns 20 characters
                // wide in the Console View using the
                // Formatter
                System.out.printf("%20s%20s%20s\r\n",
                FirstName, LastName, EmployeeID);
            }
        } catch (SQLException se) {
            // Handle errors encountered during interaction
            // with the data source
        } catch (Exception e) {
            // Handle other errors
        } finally {
            // Perform clean up
        }
    }
}

```

```

    }
  } catch (SQLException se1) {
    // Log this
  }
  try {
    if (stmt != null) {
      stmt.close();
    }
  } catch (SQLException se2) {
    // Log this
  }
  try {
    if (con != null) {
      con.close();
    }
  } catch (SQLException se3) {
    // Log this
  } // End try
} // End try
} // End main
} // End DrillJDBCExample

```

Drill ODBC Driver

HPE Ezmeral Data Fabric provides a Drill ODBC driver that you can download and use on all platforms to connect BI tools, such as Tableau, to Drill.

Use the version of the driver that correlates with the version of the installed Drill server. Although older versions of the driver may be able to connect to an upgraded version of Drill, the older drivers do not include all the server features available in the newer drivers.

The following table provides links to the download locations for the Drill ODBC drivers that correlate with each of the Drill versions listed:

| Drill Version | ODBC Version |
|------------------------|-----------------------------|
| 1.16.0.100, 1.16.1.100 | 1.5.1.1002 |
| 1.16.0, 1.16.1.0 | 1.3.22.1055 |
| 1.15.0 | 1.3.22.1055 |
| 1.14.0 | 1.3.22.1055 |
| 1.13.0 | 1.3.16.1049 |
| 1.12.0 | 1.3.15.1048 |
| 1.11.0 | 1.3.15.1046 |
| 1.10.0 | 1.3.8.1030 |

Important:

- Detailed documentation for the Drill ODBC driver is available at [Drill ODBC Driver](#).
- The 32-bit version of the Drill ODBC driver does not support MapR-SASL. MapR-SASL is only supported in the 64-bit Drill ODBC driver.
- If you plan to use MapR-SASL for authentication on Windows, review the following section for additional information and instructions.

Using MapR-SASL for Authentication on Windows

Drill is automatically configured with default security when you install Drill 1.11 and later on a secure (version 6.x or later) cluster configured with the [default security](#). To successfully connect to Drill from a Windows ODBC client, the data-fabric client must be installed and a `mapr` user ticket must exist on the Windows client in the `%TEMP%` directory or in the location specified by the `$MAPR_TICKETFILE_LOCATION` environment variable.

The ODBC driver locates user tickets for the current Windows user in the default ticket location, `%TEMP%`, or in the location specified by the environment variable, `$MAPR_TICKETFILE_LOCATION`. See [Tickets](#) and [Generating a MapR User Ticket](#) for more information.

You can either copy a user ticket that was generated on the cluster into the default location (`%TEMP%`), or you can run the `maprlogin` command to generate the ticket on the Windows client.

If you copy a user ticket that was generated on the cluster, you must copy the `mapr-clusters.conf` file to the client machine. Copy the file from `/opt/mapr/conf/mapr-clusters.conf` to `C:/opt/mapr/conf/mapr-clusters.conf` on the client machine. Verify that the cluster to which the client is connecting is listed as the first entry in the `mapr-clusters.conf` file. Also, if the cluster is secure, verify that `secure=true` for the cluster entry in the file.

Note: The ODBC user must be the same as the Windows user that created the ticket.

Example

If you want to connect to Drill as the `mapr` user, you must create a ticket for the `mapr` user, as shown:

```
$ maprlogin password -user mapr
[Password for user 'mapr' at cluster 'Cluster1':]
```

The credentials for the `mapr` user in `Cluster1` are written to `/tmp/maprticket_1000`.

Next, place the ticket in the `%TEMP%` directory on the Windows client. For example, the default location for a Windows 10 user named Tabetha Stephens is shown:

```
'C:\Users\TABETH~1\AppData\Local\Temp\maprticket_Tabetha Stephens'
```

To override this location, set the "MAPR_TICKETFILE_LOCATION" global variable for the Windows user.

Note: Using the `MAPR_TICKETFILE_LOCATION` is recommended because the `%TEMP%` directory differs between Windows versions. You may also want to set the `MAPR_TICKETFILE_LOCATION` per user on the operating system to prevent all users from using the same user ticket on the client.

Driver Limitations

When using MapR-SASL with JDBC or ODBC drivers, there is no way to specify the target cluster name as part of the connection parameters. MapR-SASL reads the first entry in the `/opt/mapr/conf/mapr-clusters.conf` file and assumes it is the target cluster name.

For example, if the `mapr-clusters.conf` file has an entry for `'cluster1'` followed by an entry for `'cluster2'` and you want to connect to a node in `'cluster2'`, authentication fails. As a workaround, manually switch the order of entries in the `mapr-clusters.conf` file.

Drill Configuration Files

The Drill installation includes configuration files with start-up options that you can modify prior to starting Drill.

The configuration files reside in a [HOCON](#) configuration file format, which is a hybrid between a properties file and a JSON file. The files have a nested relationship and a hierarchical structure, where one file overrides another. You can locate the files in the `/opt/mapr/drill/drill-<version>/conf` directory.

The configuration files are listed below in their hierarchical order. The drill-distrib.conf file overrides the drill-module.conf file, and the drill-override.conf file overrides the drill-distrib.conf file.

- drill-override.conf
- drill-distrib.conf
- drill-module.conf

Environment variables are also overridden in the same way, in the order listed below:

- drill-env.sh (or explicitly defined in environment)
- distrib-env.sh
- drill-config.sh

The following table lists the configuration files with their descriptions:

| File Name | Description | Default Configuration with Secure Installation |
|--------------------|---|---|
| drill-distrib.conf | Contains distribution-specific configurations for Drill. Automatically updated by configure.sh when you configure the cluster. | <ul style="list-style-type: none"> • Enables authentication, impersonation, and encryption with HPE Ezmeral Data Fabric-SASL as the default mechanism. • Enables TLS for the HTTPS channel. <p> Note: By default, HTTPS uses the SSL certificate provided by the cluster installation; however, an administrator can specify a certificate in a keystore.</p> <ul style="list-style-type: none"> • Enables the inbound impersonation policy for administrators to impersonate any other user. |
| distrib-env.sh | Contains distribution-specific defaults for various environment variables. | <ul style="list-style-type: none"> • Enables authentication between the Drillbits and ZooKeeper. • Configures the location of the default security configuration file, mapr.login.conf, used by Drill. |
| drill-env.sh | The drill-env.sh file contains the cluster administrator-specific environment variables that can differ from the defaults. You can modify this file to override the default values of system properties defined in the distrib-env.sh file or to define a new system property. For example, you can configure the amount of heap and direct memory allocated to Drill. See Configuring Drill Memory on page 3451. | Empty upon installation. |

| | | |
|---------------------|--|--|
| drill-override.conf | Use the drill-override.conf file to override the default values obtained from drill-module.conf and drill-distrib.conf. A cluster administrator can update this file to configure a Drillbit as required (different from default installation) | When you first install Drill, drill-override.conf contains ZooKeeper and Drillbit configuration information; however, after you run configure.sh -R, the entries are removed and the file does not contain any configurations. |
|---------------------|--|--|

Monitoring Drill Metrics

You can monitor Drill metrics and logs using the Kibana and Grafana interfaces that are available through [MapR Monitoring](#). The [Kibana](#) interface is a log monitoring tool. The [Grafana](#) interface is a metrics monitoring tool where you can view system-level metrics for Drill.

Drill uses JMX ([Java Management Extensions](#)) to monitor queries at runtime. JMX provides the architecture to dynamically manage and monitor applications. JMX collects Drill system-level metrics that you can access through Grafana or through the Metrics page in the [Drill Web Console](#).

You must install a specific set of services on cluster nodes to use the Kibana and Grafana monitoring tools. You can install the services using the [MapR installer](#), or you can [install these services manually](#). If you install the monitoring services in a cluster running Drill, you must restart Drill in order for Drill to communicate with JMX. However, if you install Drill after the monitoring services are installed, you must run the `configure.sh` command and restart the Drillbit service in order for the monitoring services to recognize that a new application is running in the cluster.

The following table lists the predefined Drill system-level metrics that you can view in Grafana:

| Metric | Description |
|--------------------------------|--|
| mapr.drill.allocator_root_used | The amount of memory used by the internal memory allocator. Measured in bytes. |
| mapr.drill.queries_running | The number of queries running for which the Drillbit is the foreman. |
| mapr.drill.queries_completed | The number of completed, cancelled, or failed queries for which the Drillbit was the foreman. |
| mapr.drill.fragments_running | The number of query fragments currently running in the Drillbit. |
| mapr.drill.allocator_root_peak | The peak amount of memory used by the internal memory allocator. Measured in bytes. |
| mapr.drill.heap_used | The amount of heap memory used by the JVM. Measured in bytes. |
| mapr.drill.non_heap_used | The amount of non-heap memory used by the JVM. Measured in bytes. |
| mapr.drill.count | The number of live daemon and non-daemon threads. |
| mapr.drill.fd_usage | The ratio of used file descriptors to total file descriptors. |
| mapr.drill.runnable_count | The number of threads executing in the JVM. This metric is useful for debugging Drill issues. |
| mapr.drill.waiting_count | The number of threads waiting to be executed. This may occur when a thread waits on another thread to perform an action before proceeding. This metric is useful for debugging Drill issues. |
| mapr.drill.blocked_count | The number of blocked threads waiting for a monitor lock. This metric is useful for debugging Drill issues. |

Optimizing Queries with Indexes

HPE Ezmeral Data Fabric Database provides a highly scalable key-value database platform on which you can run SQL queries using Drill. As of the 6.0 release of the MapR Data Platform, HPE Ezmeral Data Fabric Database natively supports indexes on secondary fields in JSON tables.

Note: HPE Ezmeral Data Fabric Database does not support indexes on binary tables.

An index is a special table that stores a subset of document fields from a JSON table. The primary field in a JSON table is the `_id` field (unique key field). By default, HPE Ezmeral Data Fabric Database sorts the JSON table by the `_id` field. All other fields in the JSON table are secondary fields. You can create indexes on the secondary fields in a JSON table to eliminate full tables scans and significantly improve query performance. See [HPE Ezmeral Data Fabric Database as a Document Database](#) and [Secondary Index Concepts](#) for more information.

Benefits of Indexes

Well-designed indexes can optimize access to data stored in HPE Ezmeral Data Fabric Database JSON tables and improve performance for high read operations, fast integrated analytics, and complex operational analytics. See [Secondary Indexes](#) for more information about the benefits of indexes.

Types of Queries that Benefit from Indexes

Indexes primarily benefit queries with filters in the WHERE clause and queries with an ORDER BY clause for sorting, as described in the following table:

| Query Type | Description |
|-------------|--|
| Equality | Equality queries contain equality conditions, such as <code>a=1</code> and can also include IN. See Equality Queries . |
| Range | Range queries contain range conditions, such as <code><=</code> , <code>>=</code> , and the LIKE pattern matching condition. See Range Queries . Note: The LIKE operator only works on fields that have varchar data types. To use the LIKE operator in queries, use the CAST function to explicitly cast fields to varchar. To use indexes for such queries, create indexes on the cast expressions, as explained in Using Casts in Secondary Indexes . |
| ORDER BY | ORDER BY queries specify a sort order. If the ordering and sorting of the index key list match the ordering specified in a query, the optimizer in Drill does not have to sort the data after the index scan. See ORDER BY Queries . |
| Multi-index | Multi-index queries contain conditions on multiple fields. Drill can scan multiple indexes and use the intersection of the matching documents to optimize these queries. Multi-index queries are an alternative to using composite key indexes . See Multi-Index Queries . |

Drill can create index plans for queries with and without filters in the WHERE clause. For example, Drill can create an index plan for an ORDER BY query that does not have filters.

Drill 1.12 and later also supports the following types of queries without filters :

- GROUP BY
- JOIN
- DISTINCT

See [Index Planning in Drill](#) for more information.

Types of Indexes Supported by HPE Ezmeral Data Fabric Database

HPE Ezmeral Data Fabric Database supports several types of indexes on JSON tables including simple, composite, hashed, covering, and indexes with the CAST function.

Note: HPE Ezmeral Data Fabric Database enforces certain [restrictions](#) on indexes, such as a limit of 32 KB on the collective size of all indexed keys for each index. See [Restrictions on Secondary Indexes](#) for a full list of restrictions and [Data Types Supported for Secondary Indexes](#).

The following table lists the supported index types with brief descriptions and links to topics that provide more information:

| Index Type | Description |
|--------------------------------|---|
| Simple | Simple indexes are indexes with a single indexed field (or key). See Simple Indexes . |
| Composite | Composite indexes are indexes that have more than one indexed field (or key). See Composite Indexes . |
| Hashed | Hashed indexes are indexes that distribute keys across logical partitions to avoid the creation of hot spots when HPE Ezmeral Data Fabric Database updates the index with new keys from the JSON table. See Hashed Indexes . |
| Covering | A covering index is an index that allows HPE Ezmeral Data Fabric Database to process a query using only the secondary indexes. HPE Ezmeral Data Fabric Database does not have to read data in the JSON table. See Covering Indexes on page 522. |
| Indexes with the CAST function | Indexes with the CAST function convert the indexed field to the data type specified by the CAST function and store the results. See Using Casts in Secondary Indexes . |

Steps Required to Use Indexes

To use the index functionality with Drill, complete the following steps:

1. Install the latest version of the required data-fabric software on the cluster. See [Preparing Clusters for Querying using Secondary Indexes on JSON Tables](#) and [Installing Drill](#).
2. Evaluate your queries and design indexes that support the queries. See [Understanding the Secondary Index Workflow](#) and [Designing Secondary Indexes](#).
3. Create indexes on JSON tables in HPE Ezmeral Data Fabric Database. See [Adding Secondary Indexes on JSON Tables](#) and [Managing Secondary Indexes](#).

Note: The user that creates indexes on a JSON table must have created the table or have the `indexperm` permission in addition to `readAce` on the volume and `lookupdir` on directories in the table path. If you do not have these permissions, consult with your system administrator.

4. Issue queries.
5. Verify that Drill uses the available indexes. See [Determining Index Use](#) and [Troubleshooting Indexes](#).

Additional Information

- To see how Drill selects a query plan, see [Selection and Execution of Secondary Indexes](#).

- To learn about the index planning and execution configuration options available in Drill, see [Index Planning and Execution Configuration Options](#).
- For information about index architecture, see [Implementation of Secondary Indexes](#).

Index Planning in Drill

Index planning reduces the I/O operation costs associated with full table scans. If an index is available, Drill can use the index to improve query performance.

Drill can use indexes to create query plans for queries that filter on indexed fields or fields included in an index. Fields in COUNT, COUNT DISTINCT, JOIN, GROUP BY, and ORDER BY also determine index use. Drill can create index-based query plans for queries with and without filters (WHERE clause).

Note: In Drill 1.11 and earlier, if a query does not have a filter, the query must have an ORDER BY clause.

Drill can create index plans for queries with an ORDER BY clause whether or not the query contains a filter, as shown in the following example:

```
SELECT L_LINENUMBER FROM lineitem ORDER BY L_LINENUMBER;
```

Note: In this example, L_LINENUMBER is an indexed field in the index selected for the query plan.

In Drill 1.12 and later, Drill can also create index-based query plans for the following types of queries when they do not have filters (WHERE clause):

- **GROUP BY** queries, as shown in the following example where L_COMMITDate is an indexed field in the index selected for the query plan:

```
SELECT L_COMMITDate FROM lineitem GROUP BY L_COMMITDate;
```

- **JOIN** queries, as shown in the following example where L_ORDERKEY and O_ORDERKEY are indexed fields and L_LINESTATUS is an included field in the index selected for the query plan:

```
SELECT L.L_LINESTATUS FROM lineitem L, orders O WHERE
L.L_ORDERKEY=O.O_ORDERKEY;
```

Note: If the planner picks two indexes, one for lineitem and one for orders, a sort merge join is used instead of a hash join.

- Queries with **DISTINCT** projections, as shown in the following examples where L_LINENUMBER is an indexed field in the index selected for the query plan:

```
SELECT DISTINCT L_LINENUMBER FROM lineitem;
SELECT COUNT(DISTINCT L_LINENUMBER) FROM lineitem;
```

Drill can use indexes for queries that GROUP BY or ORDER BY the leading fields in an index. Drill does not use indexes for queries that GROUP BY or ORDER BY the trailing or included fields in an index.

When a query contains GROUP BY and ORDER BY operations on the leading indexed column, Drill can use the sort order of the index to create index-based query plans that use streaming aggregates and merge joins to improve query performance.

You can run the [EXPLAIN PLAN FOR](#) command with a query to see the query plan that Drill creates. See [Covering and Non-Covering Queries](#) for more information about index planning in Drill.

Index Planning and Execution Configuration Options

The 1.11 release of Drill introduces options that affect how Drill uses indexes when planning and executing queries. You can set the query planning and execution options, at the system or session level, using the ALTER SYSTEM|SESSION SET commands, as shown:

```
ALTER SYSTEM SET `planner.enable_index_planning` = true
ALTER SESSION SET `planner.enable_index_planning` = false
```

Options set at the session level only apply to queries that you run during the current Drill connection. Options set at the system level affect the entire system and persist between restarts. Session level settings override system level settings. Typically, you set the options at the session level unless you want the setting to persist across all sessions.

The following table lists the index planning and execution options that you can enable, disable, or modify:

Note: The planning option names are prefaced by planner, for example `planner.enable_index_planning`. The execution options are prefaced by exec, for example `exec.query.rowkeyjoin_batchsize`.

| Option | Description | Default Value | Possible Values |
|---|---|---------------|-----------------|
| <code>planner.enable_index_planning</code> | Enables or disables index planning | true | true false |
| <code>planner.index.force_sort_noncovering</code> | Forces Drill to sort for non-covering indexes. If the query has an ORDER-BY on index columns and a non-covering index is chosen, by default Drill leverages the sortedness of the index columns and does not sort. Fast changing primary table data may produce a partial sort. This option forces a sort within Drill. Note: (Drill 1.11 only) You must enable this option for Drill to return the results of a non-covering query in sorted order. | false | true false |
| <code>planner.enable_rowkeyjoin_conversion</code> | Introduced in Drill 1.13. Drill can push down the rowkey filter to HPE Ezmeral Data Fabric Database during runtime. For a query to qualify for runtime filter pushdown, the join condition must filter on a rowkey. A rowkey is the value of the <code>_id</code> field in a JSON document, for example: <pre>SELECT t.mscIdentities FROM dfs.root.`/user/mapr/MixTable` t WHERE t.row_key IN (SELECT max(convert_fromutf8(i.KeyA.ENTRY_KEY)) FROM dfs.root.`/user/mapr/TableIMSI` i WHERE i.row_key='460021050005636')</pre> Drill evaluates the results of the subquery at runtime. The subquery yields a list of rowkeys from the TableIMSI table. Drill pushes down the list of rowkeys to HPE Ezmeral Data Fabric Database. HPE Ezmeral Data Fabric Database uses the rowkeys to locate the corresponding documents in the MixTable table and sends the results to Drill. Note: Currently, Drill does not support runtime filters for queries with equality conditions. The query planner in Drill converts an equality condition to a left join. As a workaround, use the IN operator instead of the equality (=) operator for queries in which you want Drill to push down the rowkey filter to HPE Ezmeral Data Fabric Database. Drill does not perform runtime filter pushdown for queries that filter on rowkeys in small fact tables when the rowcount is generated from the right side of the join. | true | true false |

| | | | |
|---|---|-------|---------------------|
| planner.rowkeyjoin_conversion_selectivity_threshold | Introduced in Drill 1.13. Sets the selectivity (as a percentage) under which Drill uses a rowkey join for eligible queries. | 0.01 | Range : 0.0-1.0 |
| planner.rowkeyjoin_conversion_using_hashjoin | Introduced in Drill 1.13. When enabled, Drill uses the hash join operator instead of a rowkey join. | false | true false |
| planner.index.covering_selectivity_threshold | For covering indexes, this option specifies the filter selectivity that corresponds to the leading prefix of the index below which the index is considered for planning. For example, for the filter 'a > 10 AND b < 20' if an index has indexed fields (a, b, c) and the combined selectivity of the above condition is less than the threshold, the index is considered for the query plan. | 0.75 | 0 - 1.0 |
| planner.index.noncovering_selectivity_threshold | For non-covering indexes, this option specifies the filter selectivity that corresponds to the leading prefix of the index below which the index is considered for planning. | 0.025 | 0 - 1.0 |
| planner.index.max_chosen_indexes_per_table | The maximum number of "chosen" indexes for a table after index costing and ranking. | 5 | 0 - 100 |
| planner.index.rowkeyjoin_cost_factor | The cost factor that provides some control over the I/O cost for non-covering indexes when the rowkey join back to the primary table causes random I/O from the primary table. | 0.1 | 0 - max_double |
| planner.enable_statistics | Enable or disable statistics for the filter conditions on indexed columns. | true | true false |
| exec.query.rowkeyjoin_batchsize | For batch GET operations, this option specifies the batch size in terms of the number of rowkeys. Used for non-covering index plans when doing joins back to primary table. | 128 | 0 - Long. MAX_VALUE |
| exec.query.progress.update | Enable or disable updating transient query state in ZooKeeper. Disable this option for short running operational queries. When disabled, you do not see the query state , such as STARTING and RUNNING in the Drill Web Console. | true | true false |
| exec.udf.use_dynamic | Enable or disable using dynamic UDFs for the queries. Disable this option for operational queries. When disabled, you cannot use dynamic UDFs for queries. | true | true false |
| exec.query_profile.save | Enable or disable saving query profiles for the queries. Disable this option for operational queries. When disabled, Drill does not save query profiles and they are not available for analysis or debugging. | true | true false |
| planner.use_simple_optimizer | Enable or disable using simple optimizer for queries. Simple optimizer applies fewer rules to reduce planning time and is meant to be used only for simple operational queries that use limit, sort, and filter. This optimizer applies rules for leveraging secondary indexes when index planning is enabled. Enable this option for operational queries. | false | true false |

Index Planning and Execution Options for Operational Queries

The following table lists the index planning and execution options for operational queries that you can enable, disable, or modify:

| Option | Description | Default Value | Possible Values |
|--------|-------------|---------------|-----------------|
|--------|-------------|---------------|-----------------|

| | | | |
|------------------------------|--|-------|------------|
| exec.query.progress.update | Enable or disable updating transient query state in ZooKeeper. Disable this option for short running operational queries. When disabled, you do not see the query state, such as STARTING and RUNNING in the Drill Web Console. | true | true false |
| exec.udf.use_dynamic | Enable or disable using dynamic UDFs for the queries. Disable this option for operational queries. When disabled, you cannot use dynamic UDFs for queries. | true | true false |
| exec.query_profile.save | Enable or disable saving query profiles for the queries. Disable this option for operational queries. When disabled, Drill does not save query profiles and they are not available for analysis or debugging. | true | true false |
| planner.use_simple_optimizer | Enable or disable using simple optimizer for queries. Simple optimizer applies fewer rules to reduce planning time and is meant to be used only for simple operational queries that use limit, sort, and filter. This optimizer applies rules for leveraging secondary indexes when index planning is enabled. Enable this option for operational queries. | false | true false |

Covering and Non-Covering Queries

Drill uses a cost-based approach to determine an optimal query plan. When queries are eligible for index planning, the queries are either covering or non-covering.

For covering queries, only the index is needed to process the query. Drill creates an index-based query plan that includes an index scan. Covering queries avoid the overhead of fetching data from the primary table.

For non-covering queries, the index only contains a subset of the data required to process the query. Drill creates a query plan that includes an index scan and a join back to the primary table. In some scenarios, a full table scan is more cost efficient than an index scan and Drill will not create an index plan.

Note: (Drill 1.11 only) You must enable the `planner.index.force_sort_noncovering` option for Drill to return the results of a non-covering query in sorted order. See [Index Planning and Execution Configuration Options](#)

Indexes for covering and non-covering queries can contain indexed fields, or a combination of indexed and included fields. HPE Ezmeral Data Fabric Database stores included fields in the index. Each field added to the index increases the storage requirement for the index. As the storage size increases, the cost of reading the index also increases. Likewise, for the cost of adding and updating documents. Consider the impact on storage and updates when adding included fields to an index.

- For information about how Drill selects a query plan, see [Selection and Execution of Secondary Indexes](#).
- For information about the types of queries that qualify for index-based plans, see [Queries that Benefit from Secondary Indexes](#).
- For index concepts, see [Secondary Index Concepts](#).

Covering and Non-Covering Query Examples

A query can be covering or non-covering based on the fields referenced in the query and the fields on which an index is created and/or includes.

The following query examples use an index, `L_comp_1`, created on a table, `lineitem`.

The `L_comp_1` index was created using the `maprcli table index add` command, as shown:

```
maprcli table index add -path /drill/testdata/tpch/sf1/
maprdb/json/range/lineitem -index l_comp_1 -indexedfields
L_LINENUMBER,L_ORDERKEY -includedfields L_LINESTATUS,L_QUANTITY
```

Covering Query Example

The following query references the `L_LINESTATUS`, `L_QUANTITY`, `L_LINENUMBER`, and `L_ORDERKEY` fields in the `lineitem` table:

```
SELECT L_LINESTATUS, L_QUANTITY FROM lineitem WHERE L_LINENUMBER = 1 AND
L_ORDERKEY BETWEEN 40 AND 75;
```

Because the `L_comp_1` index includes all fields referenced in the query, Drill creates a query plan that uses the index only.

Running the [EXPLAIN PLAN FOR](#) command with the query shows that Drill created a query plan that only uses the index to process the query:

```
EXPLAIN PLAN FOR SELECT L_LINESTATUS, L_QUANTITY FROM lineitem WHERE
L_LINENUMBER = 1 AND L_ORDERKEY BETWEEN 40 AND 75;

00-00    Screen
00-01      Project(L_LINESTATUS=[0], L_QUANTITY=[1])
00-02      Scan(table=[[si, tpch_sf1_maprdb_range,
lineitem]], groupscan=[JsonTableGroupScan [ScanSpec=JsonScanSpec
[tableName=maprfs:///drill/testdata/tpch/sf1/maprdb/json/range/lineitem,
condition=((L_LINENUMBER = {"$numberLong":1}) and (L_ORDERKEY
>= {"$numberLong":40})) and (L_ORDERKEY <= {"$numberLong":75}))],
indexName=l_comp_1], columns=[`L_LINESTATUS`, `L_QUANTITY`]])
```

Reading the query plan, you can see that the plan includes an index scan, as indicated by `groupscan=JsonTableGroupScan` and `indexName`. Drill and HPE Ezmeral Data Fabric Database can process this query using only the index.

Non-Covering Query Example

The following query references the `L_RETURNFLAG`, `L_LINESTATUS`, `L_QUANTITY`, `L_LINENUMBER`, and `L_ORDERKEY` fields in the `lineitem` table:

```
SELECT L_RETURNFLAG, L_LINESTATUS, L_QUANTITY FROM lineitem WHERE
L_LINENUMBER = 1 AND L_ORDERKEY BETWEEN 40 AND 75;
```

Because the `L_comp_1` index does not include the `L_RETURNFLAG` field, Drill creates a query plan that uses the index, but also includes a join on the primary table.

Running the EXPLAIN PLAN FOR command with the query shows that Drill includes an index scan and a table scan:

```
EXPLAIN PLAN FOR SELECT L_RETURNFLAG, L_LINESTATUS, L_QUANTITY FROM
lineitem WHERE L_LINENUMBER = 1 AND L_ORDERKEY BETWEEN 40 AND 75;

00-00    Screen
00-01      Project(L_RETURNFLAG=[0], L_LINESTATUS=[1], L_QUANTITY=[2])
00-02        Project(L_RETURNFLAG=[2], L_LINESTATUS=[3], L_QUANTITY=[4])
00-03          Project(L_LINENUMBER=[0], L_ORDERKEY=[1],
L_RETURNFLAG=[2], L_LINESTATUS=[3], L_QUANTITY=[4])
00-04            RowKeyJoin(condition=[=(5, 6)], joinType=[inner])
00-05              Scan(table=[[si, tpch_sf1_maprdb_range,
lineitem]], groupscan=[RestrictedJsonTableGroupScan [ScanSpec=JsonScanSpec
[tableName=maprfs:///drill/testdata/tpch/sf1/maprdb/json/range/lineitem,
condition=((L_LINENUMBER = {"$numberLong":1}) and (L_ORDERKEY
>= {"$numberLong":40})) and (L_ORDERKEY <= {"$numberLong":75}))],
columns=[`L_LINENUMBER`, `L_ORDERKEY`, `L_RETURNFLAG`, `L_LINESTATUS`,
`L_QUANTITY`, `_id`], rowcount=60012.15000000001]])
00-06              Scan(table=[[si, tpch_sf1_maprdb_range,
lineitem]], groupscan=[JsonTableGroupScan [ScanSpec=JsonScanSpec
[tableName=maprfs:///drill/testdata/tpch/sf1/maprdb/json/range/lineitem,
condition=((L_LINENUMBER = {"$numberLong":1}) and (L_ORDERKEY
>= {"$numberLong":40})) and (L_ORDERKEY <= {"$numberLong":75}))],
indexName=l_comp_1, columns=[`_id`]])
```

Reading the query plan, you can see that the plan includes an index scan, as indicated by the `groupscan=[JsonTableGroupScan` and `indexName`, and also a scan on the primary table, as indicated by the `groupscan=[RestrictedJsonTableGroupScan` and the `RowKeyJoin`. To process this query, Drill and HPE Ezmeral Data Fabric Database can use the index, but HPE Ezmeral Data Fabric Database must also use the rowkey to perform a join on the primary table to fetch data in the `L_RETURNFLAG` field.

If this query ran on a regular basis, you could remove the `l_comp_1` index and create a new index that includes all fields referenced in the query, including the `L_RETURNFLAG` field, to improve query performance. However, running a query only once or a few times may not justify the overhead of removing the old index and creating a new index.

Non-Hashed and Hashed Indexes

You can create non-hashed and hashed indexes for queries on JSON tables in HPE Ezmeral Data Fabric Database.

Non-hashed indexes support conditional queries with an `ORDER BY` clause because HPE Ezmeral Data Fabric Database sorts the data in non-hashed indexes. When processing `ORDER BY` queries, Drill does not have to perform sort operations on the data.

Hashed indexes support the same conditional queries as non-hashed indexes, but they do not have a guaranteed sort order. Hashed indexes enable HPE Ezmeral Data Fabric Database to evenly distribute new writes on an index across logical partitions to avoid hot spotting. Drill must perform a sort for `ORDER BY` queries that use hashed indexes. Sorting the data can increase the CPU costs and negatively impact performance. See [Hashed Indexes](#) for additional information.

If you notice performance issues with `ORDER BY` queries that use hashed indexes, review the query plans to see if the plans include sort and merge operations. If this is the case, create non-hashed indexes to support the queries and achieve the best performance.

Examples of Hashed and Non-Hashed Index Plans for an ORDER BY Query

The examples here show the difference between a hashed and non-hashed index plan for the following query on the `lineitem` table that contains the **ORDER BY** clause:

```
SELECT L_LINESTATUS, L_QUANTITY FROM lineitem WHERE L_LINENUMBER = 1 AND
L_ORDERKEY BETWEEN 40 AND 75 ORDER BY L_LINENUMBER;
```

Hashed Index Plan Example

A hashed index, `l_hash_comp_1`, was created using the `maprcli table index add` command on a table, `lineitem`, as shown:

```
maprcli table index add -path /drill/testdata/tpch/sf1/
maprdb/json/hash/lineitem -index l_hash_comp_1 -indexedfields
L_LINENUMBER,L_ORDERKEY -includedfields L_LINESTATUS,L_QUANTITY -hashed true
```

Running the example query with the **EXPLAIN PLAN FOR** command shows that Drill produces an index plan with sort and merge operations to process the query when using the hashed index, as follows:

```
EXPLAIN PLAN FOR SELECT L_LINESTATUS, L_QUANTITY FROM lineitem WHERE
L_LINENUMBER = 1 AND L_ORDERKEY BETWEEN 40 AND 75 ORDER BY L_LINENUMBER;

00-00      Screen
00-01      Project(L_LINESTATUS=[0], L_QUANTITY=[1])
00-02      SingleMergeExchange(sort0=[2])
01-01      SelectionVectorRemover
01-02      Sort(sort0=[2], dir0=[ASC])
01-03      Project(L_LINESTATUS=[2], L_QUANTITY=[3],
L_LINENUMBER=[0])
01-04      Scan(table=[[si, tpch_sf1_maprdb_hash,
lineitem]], groupscan=[JsonTableGroupScan [ScanSpec=JsonScanSpec
[tableName=maprfs:///drill/testdata/tpch/sf1/maprdb/json/hash/lineitem,
condition=((L_LINENUMBER = {"$numberLong":1}) and (L_ORDERKEY
>= {"$numberLong":40})) and (L_ORDERKEY <= {"$numberLong":75}))],
indexName=l_hash_comp_1, columns=[`L_LINENUMBER`, `L_ORDERKEY`,
`L_LINESTATUS`, `L_QUANTITY`]]])
```

Reading the query plan, you can see that Drill uses the hashed index in the plan, as indicated by `indexName=l_hash_comp_1`. To process the query, HPE Ezmeral Data Fabric Database can use the index, but Drill must sort and merge the data, as indicated by the `Sort` and `SingleMergeExchange` operations in the query plan.

Using the hashed index plan for this **ORDER BY** query requires additional processing and negatively impacts performance.

Non-Hashed Index Plan Example

A non-hashed index, `l_comp_1`, was created using the `maprcli table index add` command on a table, `lineitem`, as shown:

```
maprcli table index add -path /drill/testdata/tpch/sf1/
maprdb/json/range/lineitem -index l_comp_1 -indexedfields
L_LINENUMBER,L_ORDERKEY -includedfields L_LINESTATUS,L_QUANTITY
```

Running the example query with the **EXPLAIN PLAN FOR** command shows that Drill produces an index plan without the additional sort and merge operations when using the non-hashed index to process the query, as follows:

```
EXPLAIN PLAN FOR SELECT L_LINESTATUS, L_QUANTITY FROM lineitem WHERE
L_LINENUMBER = 1 AND L_ORDERKEY BETWEEN 40 AND 75 ORDER BY L_LINENUMBER;
```

```

00-00      Screen
00-01      Project(L_LINESTATUS=[0], L_QUANTITY=[1])
00-02      Project(L_LINESTATUS=[2], L_QUANTITY=[3], L_LINENUMBER=[0])
00-03      Scan(table=[si, tpch_sf1_maprdb_range,
lineitem]], groupscan=[JsonTableGroupScan [ScanSpec=JsonScanSpec
[tableName=maprfs:///drill/testdata/tpch/sf1/maprdb/json/range/lineitem,
condition=((L_LINENUMBER = {"$numberLong":1}) and (L_ORDERKEY
>= {"$numberLong":40})) and (L_ORDERKEY <= {"$numberLong":75}))],
indexName=l_comp_1, columns=[`L_LINENUMBER`, `L_ORDERKEY`, `L_LINESTATUS`,
`L_QUANTITY`]]])

```

Reading the query plan, you can see that Drill uses the non-hashed index plan, as indicated by *indexName=l_comp_1*. To process the query, HPE Ezmeral Data Fabric Database uses the index and Drill does not have to perform sort and merge operations on the data, as indicated by the absence of the Sort and SingleMergeExchange operations in the query plan. HPE Ezmeral Data Fabric Database sorted the data in the index when the index was created.

Writing Drill Queries that Leverage Indexes on Array Fields

Starting in EEP 6.0, the query planner in Drill can leverage indexes created on MapR Database JSON document fields with array data types, such as "NUMBERS": [1, 2, 3, 4, 5] and "ADDRESSES": [{"CITY": "SAN JOSE"}, {"CITY": "PALO ALTO"}].

See [JSON Document Data Types](#) and [Data Types and Secondary Index Fields](#) for definitions and detailed examples.

If you want the query planner in Drill to leverage an index created on a field with an array data type, you must write the Drill query such that it includes specific SQL syntax, as shown in bold in the following example:

```

SELECT NAME, PHONE
FROM CUSTOMERS
WHERE _id IN ( SELECT _id
                FROM ( SELECT _id, FLATTEN(ADDRESSES) as f
                    FROM CUSTOMERS) as t
                WHERE t.f.CITY = 'SAN JOSE' and t.f.STATE = 'CA')
;

```

The specific SQL syntax indicates (to the query planner in Drill) that the query is eligible for an index-based query plan.

The [FLATTEN function](#) separates elements in an array into individual records in a table. For example, if an array consists of five elements, FLATTEN separates each element into a single row, creating a table with five rows.

The IN operator prevents Drill from returning duplicate rows. For example, when an array is flattened into a table, duplicate values may exist for a particular _id (rowkey). Using IN prevents Drill from returning rows with duplicate values.

Example

Suppose a JSON primary table named CUSTOMERS exists in MapR Database with the following data:

```

{ "_id": "001",
  "NAME": "ALICE",
  "PHONE": "408-555-1212",
  "ADDRESSES": [{"CITY": "SAN JOSE", "ZIPCODE": 95124, "STATE": "CA", "UNITS": [{"UNIT_NO": 555, "FLOOR": 5}, {"UNIT_NO": 777, "FLOOR": 7}]}], {"CITY": "PALO ALTO", "ZIPCODE": 94020, "STATE": "CA", "UNITS": [{"UNIT_NO": 555, "FLOOR": 5}, {"UNIT_NO": 777, "FLOOR": 7}]}], {"CITY": "SANTA CLARA", "ZIPCODE": 95050, "STATE": "CA", "UNITS": [{"UNIT_NO": 555, "FLOOR": 5}, {"UNIT_NO": 777, "FLOOR": 7}]}],
  "QTY": [11, 25, 16, 2, 10, 39, 5, 8, 7, 11]

```

```

}
{
  "_id": "002",
  "NAME": "BOB",
  "PHONE": "408-555-1313",
  "ADDRESSES": [{"CITY": "SAN JOSE", "ZIPCODE": 95132, "STATE": "CA", "UNITS": [{"UNIT_NO":838, "FLOOR": 8}, {"UNIT_NO":888, "FLOOR": 8}]}, {"CITY": "SAN JOSE", "ZIPCODE": 95127, "STATE": "CA", "UNITS": [{"UNIT_NO":555, "FLOOR": 5}, {"UNIT_NO":777, "FLOOR": 7}]}, {"CITY": "SAN RAMON", "ZIPCODE": 94582, "STATE": "CA", "UNITS": [{"UNIT_NO":123, "FLOOR": 1}, {"UNIT_NO":124, "FLOOR": 1}]}],
  "QTY": [2, 8, 1, 4, 3, 10, 2, 23]
}
{
  "_id": "003",
  "NAME": "CHRIS",
  "PHONE": "408-555-1414",
  "ADDRESSES": [{"CITY": "MOUNTAIN VIEW", "ZIPCODE": 94043, "STATE": "CA", "UNITS": [{"UNIT_NO":922, "FLOOR": 9}, {"UNIT_NO":958, "FLOOR": 9}]}, {"CITY": "PALO ALTO", "ZIPCODE": 94020, "STATE": "CA", "UNITS": [{"UNIT_NO":666, "FLOOR": 6}, {"UNIT_NO":728, "FLOOR": 7}]}, {"CITY": "SUNNYVALE", "ZIPCODE": 94086, "STATE": "CA", "UNITS": [{"UNIT_NO":226, "FLOOR": 2}, {"UNIT_NO":333, "FLOOR": 3}]}],
  "QTY": [56, 19, 45, 25, 4, 77, 110, 3, 2, 1]
}

```

Note: The QTY field is an array. The ADDRESSES field is an array of maps.

The following query on the CUSTOMERS table returns the result of flattening the “ADDRESSES” array field into a column aliased as “f” where each element in the array is flattened into individual rows:

Note: In the results, notice that Bob has two addresses where the “CITY” is “SAN JOSE”. Later in this example, you will see that using the IN operator prevents the query from returning duplicate rows.

```

SELECT NAME, PHONE, f FROM (SELECT NAME, PHONE, FLATTEN(ADDRESSES) AS f
FROM CUSTOMERS);

```

| NAME | PHONE | f |
|-------|--------------|---|
| ALICE | 408-555-1212 | {"CITY": "SAN JOSE", "STATE": "CA", "UNITS": [{"FLOOR": 5, "UNIT_NO": 555}, {"FLOOR": 7, "UNIT_NO": 777}], "ZIPCODE": 95124} |
| ALICE | 408-555-1212 | {"CITY": "PALO ALTO", "STATE": "CA", "UNITS": [{"FLOOR": 5, "UNIT_NO": 555}, {"FLOOR": 7, "UNIT_NO": 777}], "ZIPCODE": 94020} |
| ALICE | 408-555-1212 | {"CITY": "SANTA CLARA", "STATE": "CA", "UNITS": [{"FLOOR": 5, "UNIT_NO": 555}, {"FLOOR": 7, "UNIT_NO": 777}], "ZIPCODE": 95050} |
| BOB | 408-555-1313 | {"CITY": "SAN JOSE", "STATE": "CA", "UNITS": [{"FLOOR": 8, "UNIT_NO": 838}, {"FLOOR": 8, "UNIT_NO": 888}], "ZIPCODE": 95132} |
| BOB | 408-555-1313 | {"CITY": "SAN JOSE", "STATE": "CA", "UNITS": [{"FLOOR": 5, "UNIT_NO": 555}, {"FLOOR": 7, "UNIT_NO": 777}], "ZIPCODE": 95127} |

```

| BOB      | 408-555-1313 | {"CITY": "SAN RAMON", "STATE": "CA", "UNITS" :
[ {"FLOOR": 1, "UNIT_NO": 123},
{"FLOOR": 1, "UNIT_NO": 124} ], "ZIPCODE": 94582}
|
| CHRIS    | 408-555-1414 | {"CITY": "MOUNTAIN VIEW", "STATE": "CA", "UNITS" :
[ {"FLOOR": 9, "UNIT_NO": 922},
{"FLOOR": 9, "UNIT_NO": 958} ], "ZIPCODE": 94043}
|
| CHRIS    | 408-555-1414 | {"CITY": "PALO ALTO", "STATE": "CA", "UNITS" :
[ {"FLOOR": 6, "UNIT_NO": 666},
{"FLOOR": 7, "UNIT_NO": 728} ], "ZIPCODE": 94020}
|
| CHRIS    | 408-555-1414 | {"CITY": "SUNNYVALE", "STATE": "CA", "UNITS" :
[ {"FLOOR": 2, "UNIT_NO": 226},
{"FLOOR": 3, "UNIT_NO": 333} ], "ZIPCODE": 94086}
|
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+

```

The following query returns the results of filter conditions on the fields "CITY" and "STATE" if the CITY is SAN JOSE and STATE is CA.

```

SELECT NAME, PHONE, f FROM (SELECT NAME, PHONE, FLATTEN(ADDRESSES) AS f
FROM CUSTOMERS) AS t WHERE t.f.CITY = 'SAN JOSE' and t.f.STATE = 'CA';

```

```

+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| NAME   | PHONE   |
f
|
|
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| ALICE  | 408-555-1212 | {"CITY": "SAN JOSE", "STATE": "CA", "UNITS" :
[ {"FLOOR": 5, "UNIT_NO": 555},
{"FLOOR": 7, "UNIT_NO": 777} ], "ZIPCODE": 95124}
|
| BOB    | 408-555-1313 | {"CITY": "SAN JOSE", "STATE": "CA", "UNITS" :
[ {"FLOOR": 8, "UNIT_NO": 838},
{"FLOOR": 8, "UNIT_NO": 888} ], "ZIPCODE": 95132}
|
| BOB    | 408-555-1313 | {"CITY": "SAN JOSE", "STATE": "CA", "UNITS" :
[ {"FLOOR": 5, "UNIT_NO": 555},
{"FLOOR": 7, "UNIT_NO": 777} ], "ZIPCODE": 95127}
|
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+

```

Suppose a composite index exists on `ADDRESSES[].CITY` and `ADDRESSES[].STATE` with "NAME" as an included field. For the query planner to use the index, you must write the query using the specific SQL syntax that indicates that the query is eligible for an index-based query plan, as shown:

```

SELECT NAME, PHONE
FROM CUSTOMERS
WHERE _id IN ( SELECT _id
               FROM ( SELECT _id, FLATTEN(ADDRESSES) as f
                     FROM CUSTOMERS) as t
               WHERE t.f.CITY = 'SAN JOSE' and t.f.STATE = 'CA');

//Issuing this query against the data in the CUSTOMERS table returns the
following results:
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| NAME   | PHONE   |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+

```

| | |
|-------|--------------|
| ALICE | 408-555-1212 |
| BOB | 408-555-1313 |

Note: Although Bob has two addresses where the "CITY" is "SAN JOSE", the query returns only one result. The IN operator prevents the query from returning duplicate rows.

The following list summarizes key points about this query:

- The innermost subquery projects on the `_id` field (rowkey) and includes the `FLATTEN` function to separate the array elements in the "ADDRESSES" field. The field "ADDRESSES" is flattened into a table aliased as "t", in a column aliased as "f".
- The query uses the `IN` operator to ensure that the results returned contain unique values only; no duplicates. `DISTINCT` on the subquery to the right of `IN` is implicit. The SQL query pattern indicates to the query planner that the query is eligible for an index-based query plan.
- The query projects on column "NAME" and "PHONE". "PHONE" requires a join back to the primary table on the `_id` field (rowkey) because it is not included in the composite index.
- The query planner recognizes that `t.f.CITY` references `t.ADDRESSES[].CITY` and `t.f.STATE` references `t.ADDRESSES[].STATE` and creates an index-based query plan.
- The index table in MapR Database is already flattened for the array field, "ADDRESSES". Flatten is not evaluated in Drill. Drill pushes the filter conditions on the array field into MapR Database.

Filter Conditions on Various Types of Array Fields

The following table shows examples of filter conditions on various types of array fields and includes the MapR Database notation for the array field with the filter condition, as well as the SQL syntax for writing queries against the array fields.

Note: The queries in the table are written against the CUSTOMERS data used in the previous example.

| Filter condition on ... | Example using MapR Database notation (not SQL notation) | SQL | | | | | | | | |
|-------------------------|---|---|------|-------|-------|--------------|-----|--------------|-------|--------------|
| Array of scalar values | <code>QTY[] < 10</code> | <pre>SELECT NAME, PHONE FROM CUSTOMERS WHERE _id IN (SELECT _id FROM (SELECT _id, FLATTEN(Q FROM CUSTOMERS) as t WHERE t.f<10);</pre> <p>This query returns the following results:</p> <table border="1"> <tr> <td>NAME</td> <td>PHONE</td> </tr> <tr> <td>ALICE</td> <td>408-555-1212</td> </tr> <tr> <td>BOB</td> <td>408-555-1313</td> </tr> <tr> <td>CHRIS</td> <td>408-555-1414</td> </tr> </table> | NAME | PHONE | ALICE | 408-555-1212 | BOB | 408-555-1313 | CHRIS | 408-555-1414 |
| NAME | PHONE | | | | | | | | | |
| ALICE | 408-555-1212 | | | | | | | | | |
| BOB | 408-555-1313 | | | | | | | | | |
| CHRIS | 408-555-1414 | | | | | | | | | |

| <p>Map field within an array of maps</p> | <p>ADDRESSES[].ZIPCODE > 94000 and ADDRESSES[].ZIPCODE < 95000</p> | <pre>SELECT NAME, PHONE FROM CUSTOMERS WHERE _id IN (SELECT _id FROM (SELECT _id, FLATTEN(ADDR FROM CUSTOMERS) as t WHERE t.f.ZIPCODE BETWEEN 94000</pre> <p>This query returns the following results:</p> <table border="1"> <thead> <tr> <th>NAME</th> <th>PHONE</th> </tr> </thead> <tbody> <tr> <td>ALICE</td> <td>408-555-1212</td> </tr> <tr> <td>BOB</td> <td>408-555-1313</td> </tr> <tr> <td>CHRIS</td> <td>408-555-1414</td> </tr> </tbody> </table> | NAME | PHONE | ALICE | 408-555-1212 | BOB | 408-555-1313 | CHRIS | 408-555-1414 |

Performance Considerations

When writing queries that leverage indexes on array fields, consider the following points about performance:

- Query patterns that match those described previously in this document are pushed down to MapR Database. Drill does not evaluate the filter conditions, which adds considerable performance benefits even when the query planner does not select an index-based query plan.

- Deduplication on the `_id` is an extra operation (compared to regular, non-complex, indexes) that requires the overhead of hash aggregation.
- Try to avoid array columns in included fields within an index table, as they add a significant amount of storage overhead. However, this may result in the query planner selecting non-covering plans.
- Indexes with deeply nested array elements, such as `a[] . b[] . c[] . . . x . y`, can add to the MapR Database storage overhead and can potentially make Drill queries longer and more complex.

Limitations

Drill queries that leverage indexes on array fields have the following limitations:

- Only queries with patterns similar to those described previously in this document are eligible for index planning, assuming that the index is defined on an array field.
- The following conditions do not produce a covering index plan:
 - Pushdown conditions on indexed fields and included fields on same array element. For example, if an index has indexed fields `a[] . b` and included fields `a[] . c`, `elementAND(a[], b > 10, c > 20)` does not produce a covering index plan.
 - Pushdown conditions on scalar indexed fields and included fields containing an array element. For example, an index with indexed field `m` and included fields `a[] . b`, `m = 10 AND a[] . b > 20` does not produce a covering index plan.
- For included array fields, the element must be provided without the `[]` for the query planner to pick covering plans. For example, `a` and not `a[]`. Note that MapR Database considers both `a` and `a[]` syntaxes as equivalent for included fields.
- Index planning is disabled for queries with multi-level flattens and intermediate filters that reference multi-level flattens. A filter can reference the root level flatten, but not the intermediate flattens.

Determining Index Use

Evaluate the query plan to analyze query performance and determine if Drill uses indexes. You can view query plans in the Drill Web Console or through the command line using the `EXPLAIN` command. You can also disable the indexing option in Drill and compare an index-based plan to a full table scan plan.

Drill leverages indexes during the physical planning phase of the query. Drill estimates the cost of an index-based plan and a plan that includes a full table scan. See [Selection and Execution of Secondary Indexes](#) for information about how Drill selects a query plan. In cases where Drill does not select the index-based plan and instead selects a full table scan plan, you may want to remove the indexes to free up storage space and eliminate the overhead of the indexes.

The following example shows you how to determine if Drill selected an index-based plan for a query through the query profile in the Drill Web Console and the `EXPLAIN PLAN FOR` output.

Example

The subsequent sections assume that an index exists on a table named "lineitem." The index, `I_single_c_5`, is a single field index created on the `L_QUANTITY` field. The index also covers the `L_SUPPKEY`, `L_DISCOUNT`, `L_SHIPDate`, and `L_SHIPMODE` fields. If a query contains fields covered by the index, the query is a covering query. If a query contains fields not covered by the index, the query is non-covering and requires a lookup back into the primary table to retrieve data.

The following list summarizes the assumptions:

- **Table name:** `lineitem`
- **Index name:** `I_single_c_5`

- **Indexed field:** L_QUANTITY
- **Included fields:** L_SUPPKEY, L_DISCOUNT, L_SHIPDate, L_SHIPMODE

Query Profile

View the query plan on the **Profiles** tab in the Drill Web Console. See [Starting the Web Console](#). Select the query you want to evaluate and then select the **Physical Plan** tab. You can see the physical plan that Drill used to execute the query.

The following image shows the physical plan that Drill used to execute this simple equality query:

```
SELECT L_SHIPDate FROM lineitem WHERE L_QUANTITY = 5;
```

Query Profile
 STATE: COMPLETED
 FOREMAN: sid#11
 TOTAL FRAGMENTS: 1
 DURATION: 0.523 sec
 PLANNING: 0.502 sec
 QUEUED: Not Available
 EXECUTION: 0.021 sec

In the plan, you can see that Drill scanned the index, l_single_c_5, instead of the primary table. The query was completely covered by the index because the index contains all fields referenced in the query and the query filtered on the indexed field.

EXPLAIN PLAN

Alternatively, you can issue the **EXPLAIN** command to see how Drill executes a query. To see the chosen physical execution plan for a query without running the query, issue the **EXPLAIN PLAN FOR** command. This command shows you if Drill plans to use the index when executing the query.

The following image shows the physical plan that Drill plans to use to execute this simple equality query:

```
EXPLAIN PLAN FOR SELECT L_SHIPDate FROM lineitem WHERE L_QUANTITY = 5 LIMIT 10;
```

```
+-----+-----+
| text | json |
+-----+-----+
| 00-00 | Screen
00-01 | Project(L_SHIPDate=[0])
00-02 | SelectionVectorRemover
00-03 | Limit(fetch=[10])
00-04 | Limit(fetch=[10])
00-05 | Project(L_SHIPDate=[1])
00-06 | Scan(groupscan=[JsonTableGroupScan
[ScanSpec=JsonScanSpec [tableName=maprfs:///drill/testdata/tpch/sf1/maprdb/
json/lineitem, condition=(L_QUANTITY = {"$numberLong":5}),
indexName=l_single_c_5, columns=['L_QUANTITY`, `L_SHIPDate`]]])
```

In the plan, you can see that Drill plans to use the index, `l_single_c_5`, instead of performing a full table scan. The query is completely covered by the index because the index contains all fields referenced in the query and the query filters on the indexed field.

Compare Plans

If you want to compare an index-based plan against a plan with a full table scan, disable the `planner.enable_index_planning` option in Drill, and run the `EXPLAIN PLAN FOR` command for the query. Running this command with the `planner.enable_index_planning` option disabled forces Drill to generate a plan that includes a full table scan. You can compare the full table scan plan against the index-based plan to compare the costs and resource consumption of each plan.

You can see in the following query, with the indexing feature turned on, Drill generated a plan using the index:

```
EXPLAIN PLAN FOR SELECT L_SHIPDate FROM lineitem WHERE L_QUANTITY = 5 LIMIT
10;
+-----+-----+
| text | json |
+-----+-----+
| 00-00 | Screen
00-01 | Project(L_SHIPDate=[0])
00-02 | SelectionVectorRemover
00-03 | Limit(fetch=[10])
00-04 | Limit(fetch=[10])
00-05 | Project(L_SHIPDate=[1])
00-06 | Scan(groupscan=[JsonTableGroupScan
[ScanSpec=JsonScanSpec [tableName=maprfs:///drill/testdata/tpch/sf1/maprdb/
json/lineitem, condition=(L_QUANTITY = {"$numberLong":5}),
indexName=l_single_c_5], columns=[`L_QUANTITY`, `L_SHIPDate`]]])
```

If you turn the option off, as shown:

```
ALTER SESSION SET planner.enable_index_planning = false
```

You can run the `EXPLAIN PLAN FOR` command again to see the plan with a full table scan included:

```
EXPLAIN PLAN FOR SELECT L_SHIPDate FROM lineitem WHERE L_QUANTITY = 5 LIMIT
10;
+-----+-----+
| text | json |
+-----+-----+
| 00-00 | Screen
00-01 | Project(L_SHIPDate=[0])
00-02 | SelectionVectorRemover
00-03 | Limit(fetch=[10])
00-04 | UnionExchange
01-01 | SelectionVectorRemover
01-02 | Limit(fetch=[10])
01-03 | Project(L_SHIPDate=[1])
01-04 | Scan(groupscan=[JsonTableGroupScan
[ScanSpec=JsonScanSpec [tableName=maprfs:///drill/testdata/tpch/sf1/maprdb/
json/lineitem, condition=(L_QUANTITY = {"$numberLong":5})],
columns=[`L_QUANTITY`, `L_SHIPDate`]]])
|
```

Note: To see the cost of each plan, go to the Drill Web Console and view the query profile for each `EXPLAIN PLAN FOR` command that you issue through the command line.

Drill Limitations

Provides information about Drill limitations.

Working with subqueries

- The SELECT list in a scalar subquery can only contain one item/column.
- Correlated subqueries should return exactly one row.
- A WHERE clause of a subquery should not refer to more than one column of the table in the outer query.

Flume

Important: This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

Apache Flume™ is a distributed, reliable, and available service for efficiently collecting, aggregating, and moving large amounts of log data. It has a simple and flexible architecture based on streaming data

flows. It is robust and fault tolerant with tunable reliability mechanisms and many failover and recovery mechanisms. It uses a simple extensible data model that allows for online analytic application.

This section provides information about installing, configuring, and using Flume with MapR, but does not duplicate Apache documentation. You can refer also to documentation available from the [Apache Flume Project](#) and the [Flume Release Notes](#) for MapR.

Configuring Flume

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

This section contains information about configuring Flume with MapR. Additional documentation is available on the [Apache Flume](#) website.

Configure a Secure HBase Sink

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

Configure Flume agents to use Kerberos when you want to write sinks to secure HBase.

1. Create a keytab file called `flume.keytab` that contains a principal that matches the Kerberos identity of the user that will be running `flume-ng`. For example:

```
# kadmin
: addprinc -randkey username/<FQDN@REALM>
: ktadd -k /opt/mapr/conf/flume.keytab username/<FQDN@REALM>
```

The `flume.keytab` file must be owned and readable only by the `mapr` user.

2. In the `flume.conf` file, configure the following properties:

| Property | Value | Description |
|--|--------------------------------------|--|
| <code><agent>.sinks.<hbaseSink>.kerberosPrincipal</code> | <code>username/FQDN@REALM.COM</code> | The Kerberos identity of the user running <code>flume-ng</code> . |
| <code><agent>.sinks.<hbaseSink>.kerberosKeytab</code> | <code>path_to_keytab</code> | The path to a valid keytab file (<code>flume.keytab</code>) for the user running <code>flume-ng</code> . |

For additional properties that you may want to configure, see the [Apache Flume documentation](#).

 **Note:** Once Kerberos is enabled, the `maprlogin` ticket generation is performed implicitly.

Configure a Secure File System Sink

When writing to the file system on a secure data-fabric cluster, you must configure Flume agents to use either a user ticket or a Kerberos ticket.

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

A secure data-fabric cluster may use either SASL or Kerberos to provide authentication. Therefore, the user that launches the `flume-ng` JVM agent on a secure cluster can authenticate with the data-fabric file system using a data-fabric user ticket or a Kerberos ticket. When you authenticate with Kerberos, the user does not need to run the `maprlogin` utility to authenticate with the cluster as long as a valid kerberos ticket is present. When you authenticate with a `mapr` user ticket, you must run the `maprlogin` utility to generate a ticket before you launch the `flume-ng` JVM agent.

Configure Flume agents to use data-fabric user tickets when writing to data-fabric file system

If you use data-fabric SASL (data-fabric user ticket) to authenticate, configure a dummy value for the Kerberos principal and keytab file in the `flume.conf`. Example:

```
agent1.sinks.sink1.hdfs.kerberosPrincipal = mapr
agent1.sinks.sink1.hdfs.kerberosKeytab = /opt/mapr/conf/cldb.conf
```

These dummy Kerberos principal and keytab files are not used with the HDFSSink operations. However, when the dummy Kerberos properties are not configured, Flume agent error logs display the following error messages:

```
Dec 2013 13:01:42,448 ERROR [conf-file-poller-0]
    (org.apache.flume.sink.hdfs.HDFSEventSink.authenticate:510) -
Hadoop running in secure
    mode, but Flume config doesn't specify a principal to use for
Kerberos auth.
10 Dec 2013 13:01:42,448 ERROR [conf-file-poller-0]
    (org.apache.flume.sink.hdfs.HDFSEventSink.configure:241) - Failed
to authenticate!
```

These errors relate to Kerberos authentication prerequisite failures and can be ignored when you are not using Kerberos. Secure Flume operations with `maprlogin`-mediated tickets continue to be available.

Configure Flume agents to use a Kerberos ticket when writing to data-fabric file system

1. Create a keytab file called `flume.keytab` which contains a principal that matches the Kerberos identity of the user that will be running `flume-ng`. Example:

```
# kadmin
: addprinc -randkey username/<FQDN@REALM>
: ktadd -k /opt/mapr/conf/flume.keytab username/<FQDN@REALM>
```

The `flume.keytab` file must be owned and readable only by the `mapr` user.

2. In the `flume.conf` file, configure the following properties:

| Property | Value | Comment |
|--|-------------------------|--|
| <code><agent>.sinks.<sink>.type</code> | HDFS | |
| <code><agent>.sinks.<sink>.hdfs.proxyUser</code> | weblogs | |
| <code><agent>.sinks.<sink>.hdfs.kerberosPrincipal</code> | username/FQDN@REALM.COM | The user component of the principal must be the username of the user running <code>flume-ng</code> . |
| <code><agent>.sinks.<sink>.hdfs.kerberosKeytab</code> | <i>path to file</i> | Provide the path to your <code>flume.keytab</code> file. |

Note: Flume does not support any authentication mechanism for an Avro client.

For additional properties that you may want to configure, see the [Apache Flume documentation](#).

Flume Thrift Security Parameters

On a secure cluster, SSL for Flume Thrift Source and Sink is automatically configured.

Important: This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

In your MapR secure cluster, if the `flume-agent` configuration file does not specify SSL parameters, they are automatically supplied as follows:

- In EEP 6.0.0, SSL for Flume Thrift Source and Sink is automatically configured.
- In EEP 6.0.1, SSL for Flume Thrift and Avro Source and Sink is automatically configured.

Flume Thrift clients have the following configuration parameters for wire-level security:

Parameter for SSL

| | |
|------------------|--|
| <code>ssl</code> | Enables SSL. If set to <code>true</code> , the <code>keystore</code> and <code>keystore-password</code> parameters must also be specified. Default: <code>false</code> . If the <code>ssl</code> parameter is not specified, it is defaulted to <code>true</code> for Thrift clients if cluster security is enabled. |
|------------------|--|

Parameters for Thrift Source

| | |
|--------------------------------|--|
| <code>keystore</code> | Specifies the path to the Java keystore. The <code>ssl_keystore</code> uses the same <code>ssl_keystore</code> specified in the <code>ssl.server.keystore.location</code> section of <code>/opt/mapr/conf/ssl-client.xml</code> , <code>/opt/mapr/conf/ssl_keystore</code> . |
| <code>keystore-password</code> | Specifies the password for the Java keystore. The <code>keystore-password</code> uses the same password specified in the <code>ssl.client.keystore.password</code> of <code>/opt/mapr/conf/ssl-client.xml</code> , <code><ssl-keystore-password></code> . |
| <code>keystore-type</code> | Specifies the type of the Java keystore: JKS or PKCS12. The <code>keystore-type</code> uses the same <code>ssl_keystore</code> specified in the <code>ssl.client.keystore.type</code> section of <code>/opt/mapr/conf/ssl-client.xml</code> . |

Parameters for Thrift Sink

| | |
|----------------------------------|---|
| <code>truststore</code> | Specifies the path to the Java truststore. The <code>truststore</code> uses the same <code>ssl_keystore</code> specified in the <code>ssl.client.truststore.location</code> section of <code>/opt/mapr/conf/ssl-client.xml</code> . |
| <code>truststore-password</code> | Specifies the password for the Java truststore. The <code>truststore-password</code> uses the same <code>ssl_keystore</code> specified in the <code>ssl.client.truststore.password</code> section of <code>/opt/mapr/conf/ssl-client.xml</code> . |
| <code>truststore-type</code> | Specifies the type of the Java keystore. This can be JKS or PKCS12. The <code>truststore-type</code> uses the same <code>ssl_keystore</code> specified in the <code>ssl.client.truststore.type</code> section of <code>/opt/mapr/conf/ssl-client.xml</code> . |

Configure User Impersonation for Flume

Configure impersonation for Flume agents to allow one user (the mapr super user) to access data and submit jobs on behalf of another user.

Important: This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

1. Complete the steps to [enable Impersonation for the mapr Superuser](#).
2. Configure the `flume.conf` file with the following properties:

| Property | Value | Comment |
|--|----------------------------------|---|
| <code><agent>.sinks.<sink>.type</code> | HDFS | |
| <code><agent>.sinks.<sink>.hdfs.proxyUser</code> | <i>user ID of target user</i> | Can be any valid MapR user identity. |
| <code><agent>.sinks.<sink>.hdfs.kerberosPrincipal</code> | <code>mapr/FQDN@REALM.COM</code> | The user component of the principal must be the username of the user running <code>flume-ng</code> . Flume agents that use impersonation must run as the user <code>mapr</code> on the cluster. |
| <code><agent>.sinks.<sink>.hdfs.kerberosKeytab</code> | <i>path to file</i> | If you are not using Kerberos to authenticate, this can be the path to any valid file. If you are using Kerberos to authenticate, provide the path to your <code>flume.keytab</code> file. |

3. In the `flume-ng` file (`/opt/mapr/flume/flume-<version>/bin/flume-ng`), add `export MAPR_IMPERSONATION_ENABLED=1` after the `HADOOP_HOME` setting:

Example for Flume 1.6 and Later

```
if [ $HADOOP_VERSION == 1.0.3 ];
then
  export HADOOP_HOME=${BASEMAPR}/
  hadoop/hadoop-<current_version>/
else
  export HADOOP_HOME=${BASEMAPR}/
  hadoop/${HADOOP_VERSION}/
fi
export MAPR_IMPERSONATION_ENABLED=1
```

Example for Flume 1.5 and Earlier

```
HADOOP_VERSION=`readlink -f `which
hadoop` | awk -F "/" '{print$5}' `
export HADOOP_HOME=${BASEMAPR}/
hadoop/${HADOOP_VERSION}/
export MAPR_IMPERSONATION_ENABLED=1
```

Integrate Flume with HPE Ezmeral Data Fabric Event Streams

Integrate Flume 1.6 with HPE Ezmeral Data Fabric Event Streams when you want to write Flume source data to a HPE Ezmeral Data Fabric Event Streams topic or when you want to write HPE Ezmeral Data Fabric Event Streams topics to a Flume sink.

Important: This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

You can use Flume and HPE Ezmeral Data Fabric Event Streams for many different use cases; however, here are a few examples:

Write HPE Ezmeral Data Fabric Event Streams topics to file on the MapR filesystem

To write HPE Ezmeral Data Fabric Event Streams topics to the MapR filesystem, create an agent with a Kafka source and a HDFS sinks.

Write HPE Ezmeral Data Fabric Event Streams topics to HPE Ezmeral Data Fabric Database

To write HPE Ezmeral Data Fabric Event Streams topics to HPE Ezmeral Data Fabric Database, create an agent with a Kafka source and a HPE Ezmeral Data Fabric Database sink.

Write data from any supported Flume source to HPE Ezmeral Data Fabric Event Streams topics

To write data from any supported Flume source to HPE Ezmeral Data Fabric Event Streams topics, create an agent with the appropriate Flume source type and a Kafka sink or Kafka channel. For example, you can use a syslogs source to turn logs into a MapR stream topic.

Note: Before you integrate Flume with HPE Ezmeral Data Fabric Event Streams, verify that the Streams Client is installed on all Flume nodes. For more information, see [Installing Flume](#) on page 172.

Read and Write HPE Ezmeral Data Fabric Event Streams Messages With Flume

Important: This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

Flume uses agent files to define the data flow. To read or write HPE Ezmeral Data Fabric Event Streams data, you configure Flume agent files with Flume sources, channels, and sinks.

When you read HPE Ezmeral Data Fabric Event Streams topics, you use a Kafka source or a Kafka channel. When you write to a HPE Ezmeral Data Fabric Event Streams topic, you can use a Kafka channel or a Kafka sink.

See the following topics for information on how to configure the agent file:

- [Read HPE Ezmeral Data Fabric Event Streams Using a Kafka Source](#) on page 3584
- [Read or Write to HPE Ezmeral Data Fabric Event Streams using a Kafka Channel](#) on page 3585
- [Write to HPE Ezmeral Data Fabric Event Streams using a Kafka Sink](#) on page 3586

See [Example Agents Files: Flume 1.6 or Lower and HPE Ezmeral Data Fabric Event Store Integration](#) on page 3588 and [Example Agents Files: Flume 1.7 or Above and HPE Ezmeral Data Fabric Event Store Integration](#) on page 3587 for example agent files.

Read HPE Ezmeral Data Fabric Event Streams Using a Kafka Source

Important: This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

The following parameters are required when configuring Kafka source to read data from MapR Streams topics:

| Property Name | Description |
|-------------------------|--|
| channels | If the source writes events to a channel, this is the name of the channel that the source writes events to. |
| type | This property must be set to <code>org.apache.flume.source.kafka.KafkaSource</code> |
| kafka.consumer.group.id | A unique identifier of the consumer group. This defaults to <code>flume</code> . Setting the same id in multiple sources or agents indicates that they are part of the same consumer group; when these sources or agents |

| Property Name | Description |
|---------------------|---|
| | are running at the same time, they will each read a unique set of partitions for the topics in the group. |
| kafka.topics | <p>A comma separated list of HPE Ezmeral Data Fabric Event Streams topics where each topic is specified with the volume path and stream name. For example:</p> <pre>/volume_path/stream_name:topic_name1, /volume_path/stream_name:topic_name2</pre> <p> Note: It is critical that the path to the topic starts with a slash(/), as the slash is what distinguishes the topic as a HPE Ezmeral Data Fabric Event Streams topic.</p> |
| batchDurationMillis | Maximum number of milliseconds to wait before closing a batch. The default value is 1000. |

For additional properties that you may want to configure, see the [Flume documentation](#). However, note that `kafka.bootstrap.servers` is not required for reading HPE Ezmeral Data Fabric Event Streams.

Tip: To increase throughput, set the `batchSize` to a higher value. The `batchSize` is the maximum number of messages written to Channel in one batch. By default, it is set to 1000.

Read or Write to HPE Ezmeral Data Fabric Event Streams using a Kafka Channel

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

Using a Kafka channel without a Flume sink or Flume source is more reliable; it also involves less code. A Kafka channel is also useful when you want to use one agent to store messages in a topic and then copy the messages to another type of sink.

 **Note:** Do not use a Kafka Channel when you have the following requirements:

- Maintain of the order of each event.
- Read or write data from more than one topic.
- Good performance. Writing messages to a topic with a Kafka sink can be twice as fast as a Kafka channel.

The following parameters are required when configuring Kafka channel to read or write data in HPE Ezmeral Data Fabric Event Streams:

| Property Name | Description |
|---------------|--|
| type | <p>This property must be set to</p> <pre>org.apache.flume.channel.kafka.KafkaChannel</pre> |
| kafka.topic | <p>A topic is specified with the volume path and stream name. For example:</p> <pre>/volume_path/stream_name:topic_name1</pre> |

| Property Name | Description |
|---------------------|--|
| |  Note: It is critical that the path to the topic starts with a slash (/), as the slash is what distinguishes the topic as a HPE Ezmeral Data Fabric Event Streams topic as opposed to a Kafka topic. |
| kafka.pollTimeout | The maximum amount of time in milliseconds the channel will wait for events if they are not available. The default is 500. |
| parseAsFlumeEvent | This must be set to <code>false</code> if other channels or sinks write to the same topic. |
| producer.linger.ms | These properties are used to configure the Kafka Producer. Any producer property supported by Kafka can be used. The only requirement is to prepend the property name with the prefix <code>kafka.producer</code> . For example: <pre>kafka.producer.linger.ms=0</pre> |
| capacity | The maximum number of events stored in the channel. The default value is 100. |
| transactionCapacity | The maximum number of events the channel will take from a source or give to a sink per transaction. The default value is 100. |

For additional properties that you may want to configure for the Kafka channel, see the [Flume documentation](#). Note that `brokerList` is not required when writing to HPE Ezmeral Data Fabric Event Streams.

Write to HPE Ezmeral Data Fabric Event Streams using a Kafka Sink

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

The following parameters are required when configuring Kafka sink to write to a MapR Stream:

| Property Name | Description |
|---------------|---|
| type | This property must be set to <pre>org.apache.flume.sink.kafka.KafkaSink</pre> |
| kafka.topic | A topic specified with the volume path and stream name. For example: <pre>/streaming_data/flume_stream:topic1</pre>  Note: It is critical that the path to the topic starts with a slash(/), as the slash is what distinguishes the topic as a HPE Ezmeral Data Fabric Event Streams topic. The default is "default-flume-topic".  Note: If the header for a given message contains a "topic" field, the message will be published to that topic instead of the topic that you configure here. |

For additional properties that you may want to configure for the Kafka sink, see the [Flume documentation](#).

Note: `kafka.flumeBatchSize` sets the number of messages to process in a batch and the default is 100. To ensure that the events are written in the original order, set `kafka.flumeBatchSize=1` and specify a topic with a single partition. If maintaining the order is not required, you can increase the value. However, note that larger batches improve throughput while also adding latency.

Example Agents Files: Flume 1.7 or Above and HPE Ezmeral Data Fabric Event Store Integration

Important: This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

The following examples can be used to understand how you might want to configure Flume agent files in Flume version 1.7 and above.

Example: Read HPE Ezmeral Data Fabric Event Store topics and Write to HPE Ezmeral Data Fabric

In this example, the agent reads two topics (`log_topic1` and `log_topic2`), stores the event data in memory channel, and then writes the event data to a file on the filesystem (`maprfs:///flume/log_data`).

```
agent1.sources = source1
agent1.channels = channel1
agent1.sinks = sink1
agent1.sources.source1.channels = channel1
agent1.sinks.sink1.channel = channel1
agent1.sources.source1.type = org.apache.flume.source.kafka.KafkaSource
agent1.sources.source1.kafka.topics = /streaming_data/
flume_stream:log_topic1,
/streaming_data/flume_stream:log_topic2
agent1.sources.source1.kafka.consumer.group.id = flume
agent1.sources.source1.batchSize = 20
agent1.sources.source1.batchDurationMillis = 1000
agent1.sinks.sink1.type = hdfs
agent1.sinks.sink1.hdfs.path = maprfs:///flume/log_data
agent1.sinks.sink1.hdfs.filePrefix = source
agent1.sinks.sink1.hdfs.rollCount = 0
agent1.sinks.sink1.hdfs.rollInterval = 0
agent1.sinks.sink1.hdfs.rollSize = 10485760
agent1.sinks.sink1.hdfs.fileType = DataStream
agent1.channels.channel1.type = memory
agent1.channels.channel1.capacity = 10000
agent1.channels.channel1.transactionCapacity = 1000
```

Example: Read Log File and Write Log File to a Streams Topic

In this example, the agent uses an `exec` source to read messages from a local error log file, stores data in a channel, and then publishes the data as messages in a HPE Ezmeral Data Fabric Event Store topic (`/streaming_data/error_stream:error_log_topic`).

```
agent1.sources = source1
agent1.channels = channel1
agent1.sinks = sink1
agent1.sources.source1.channels = channel1
agent1.sinks.sink1.channel = channel1
agent1.sources.source1.type = exec
agent1.sources.source1.command = tail -f /opt/app/logs/error_log_file
agent1.channels.channel1.type = memory
agent1.channels.channel1.capacity = 10000
agent1.channels.channel1.transactionCapacity = 1000
agent1.sinks.sink1.type = org.apache.flume.sink.kafka.KafkaSink
```

```
agent1.sinks.sink1.kafka.topic = /streaming_data/
error_stream:error_log_topic
agent1.sinks.sink1.flumeBatchSize = 5
```

Example: Read Log Events and Write to an HPE Ezmeral Data Fabric File

In this example, the agent reads events from syslogtcp server, uses a Kafka channel to store events in a streams topic (/streaming_data/flume_stream:syslogtcp_topic), and then writes the data to a file on the filesystem (maprfs:///flume/analytics).

```
agent1.sources = source1
agent1.channels = channel1
agent1.sinks = sink1
agent1.sources.source1.channels = channel1
agent1.sinks.sink1.channel = channel1
agent1.sources.source1.type = syslogtcp
agent1.sources.source1.host=syslog_host
agent1.sources.source1.port=5140
agent1.channels.channel1.type = org.apache.flume.channel.kafka.KafkaChannel
agent1.channels.channel1.kafka.pollTimeout = 500
agent1.channels.channel1.kafka.topic = /streaming_data/
flume_stream:syslogtcp_topic
agent1.channels.channel1.transactionCapacity = 1000
agent1.channels.channel1.capacity = 1000
agent1.channels.channel1.producer.linger.ms=0
agent1.sinks.sink1.type = hdfs
agent1.sinks.sink1.hdfs.path = maprfs:///flume/analytics
agent1.sinks.sink1.hdfs.rollInterval = 5
agent1.sinks.sink1.hdfs.rollSize = 0
agent1.sinks.sink1.hdfs.rollCount = 0
agent1.sinks.sink1.hdfs.fileType = DataStream
```

Example Agents Files: Flume 1.6 or Lower and HPE Ezmeral Data Fabric Event Store Integration

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

The following examples can be used to understand how you might want to configure Flume agent files in Flume version 1.6 or lower.

Example: Read HPE Ezmeral Data Fabric Event Store topics and Write to HPE Ezmeral Data Fabric

In this example, the agent reads two topics (log_topic1 and log_topic2), stores the event data in memory channel, and then writes the event data to a file on the filesystem (maprfs:///flume/log_data).

```
agent1.sources = source1
agent1.channels = channel1
agent1.sinks = sink1
agent1.sources.source1.channels = channel1
agent1.sinks.sink1.channel = channel1
agent1.sources.source1.type = org.apache.flume.source.kafka.v09.KafkaSource
agent1.sources.source1.kafka.topics = /streaming_data/
flume_stream:log_topic1,
/streaming_data/flume_stream:log_topic2
agent1.sources.source1.kafka.consumer.group.id = flume
agent1.sources.source1.batchSize = 20
agent1.sources.source1.batchDurationMillis = 1000
agent1.sinks.sink1.type = hdfs
agent1.sinks.sink1.hdfs.path = maprfs:///flume/log_data
agent1.sinks.sink1.hdfs.filePrefix = source
```

```

agent1.sinks.sink1.hdfs.rollCount = 0
agent1.sinks.sink1.hdfs.rollInterval = 0
agent1.sinks.sink1.hdfs.rollSize = 10485760
agent1.sinks.sink1.hdfs.fileType = DataStream
agent1.channels.channell.type = memory
agent1.channels.channell.capacity = 10000
agent1.channels.channell.transactionCapacity = 1000

```

Example: Read Log File and Write Log File to a Streams Topic

In this example, the agent uses an exec source to read messages from a local error log file, stores data in a channel, and then publishes the data as messages in a HPE Ezmeral Data Fabric Event Store topic (/streaming_data/error_stream:error_log_topic).

```

agent1.sources = source1
agent1.channels = channell
agent1.sinks = sink1
agent1.sources.source1.channels = channell
agent1.sinks.sink1.channel = channell
agent1.sources.source1.type = exec
agent1.sources.source1.command = tail -f /opt/app/logs/error_log_file
agent1.channels.channell.type = memory
agent1.channels.channell.capacity = 10000
agent1.channels.channell.transactionCapacity = 1000
agent1.sinks.sink1.type = org.apache.flume.sink.kafka.v09.KafkaSink
agent1.sinks.sink1.kafka.topic = /streaming_data/
error_stream:error_log_topic
agent1.sinks.sink1.flumeBatchSize = 5

```

Example: Read Log Events and Write to a HPE Ezmeral Data Fabric File

In this example, the agent reads events from syslogtcp server, uses a Kafka channel to store events in an HPE Ezmeral Data Fabric Event Store topic (/streaming_data/flume_stream:syslogtcp_topic), and then writes the data to a file on the filesystem (maprfs:///flume/analytics).

```

agent1.sources = source1
agent1.channels = channell
agent1.sinks = sink1
agent1.sources.source1.channels = channell
agent1.sinks.sink1.channel = channell
agent1.sources.source1.type = syslogtcp
agent1.sources.source1.host=syslog_host
agent1.sources.source1.port=5140
agent1.channels.channell.type =
org.apache.flume.channel.kafka.v09.KafkaChannel
agent1.channels.channell.kafka.pollTimeout = 500
agent1.channels.channell.kafka.topic = /streaming_data/
flume_stream:syslogtcp_topic
agent1.channels.channell.transactionCapacity = 1000
agent1.channels.channell.capacity = 1000
agent1.channels.channell.producer.linger.ms=0
agent1.sinks.sink1.type = hdfs
agent1.sinks.sink1.hdfs.path = maprfs:///flume/analytics
agent1.sinks.sink1.hdfs.rollInterval = 5
agent1.sinks.sink1.hdfs.rollSize = 0
agent1.sinks.sink1.hdfs.rollCount = 0
agent1.sinks.sink1.hdfs.fileType = DataStream

```

Using Flume

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

Start a Flume Agent

You can start a Flume agent with the following command:

```
/opt/mapr/flume/flume-<version>/bin/flume-ng agent --conf-file <path to conf file> -name <agent name>
```

 **Note:** To send debugging output to the console, add the flag `-Dflume.root.logger=DEBUG,console`. To send debugging output to a log file, add the flag `-Dflume.root.logger=DEBUG,LOGFILE`. You can configure the location of this logfile in the `flume-<version>/conf/log4j.properties` file.

Additional Documentation

You can also refer to the following documents available on the [Apache Flume website](#):

- [Flume User Guide](#)
- [Flume Developer Guide](#)

Flume 1.7.0 API

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

This section contains the following:

New API in Flume 1.7.0

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

Flume 1.7.0 includes the following new classes and interfaces.

New Classes

| Class | Description |
|---|---|
| org.apache.flume.source.taildir.ReliableTaildirEventReader | Creates a <code>ReliableTaildirEventReader</code> to watch the directory. |
| org.apache.flume.source.taildir.TaildirMatcher | Identifies and caches the files matched by single file pattern for <code>TAILDIR</code> source. |
| org.apache.flume.source.taildir.TaildirSource | lass is responsible for starting, stoping and configuring taildir source |
| org.apache.flume.source.taildir.TaildirSourceConfigurationConstants | Constants used for configuration <code>TaildirSource</code> |

| | |
|---|--|
| org.apache.flume.source.taildir.TailFile | lass is responsible for reading and writing positions of event |
| org.apache.flume.auth.KerberosUser | Simple Pair class used to define a unique (principal, keyTab) combination. |
| org.apache.flume.conf.LogPrivacyUtil | Utility class to help any Flume component determine whether logging potentially sensitive information is allowed or not. |
| org.apache.flume.formatter.output.DefaultPathManager | Creates the files used by the RollingFileSink. |
| org.apache.flume.formatter.output.DefaultPathManager.Builder | Constructs path manager |
| org.apache.flume.formatter.output.PathManagerFactory | Creates PathManager instances. |
| org.apache.flume.formatter.output.PathManagerType | Enum that specify Builder class |
| org.apache.flume.formatter.output.RollTimePathManager | Appends time to end of file |
| org.apache.flume.formatter.output.RollTimePathManager.Builder | Constructs path manager from given context |
| org.apache.flume.source.http.BLOBHandler | BLOBHandler for HTTPSource that accepts any binary stream of data as event. |
| org.apache.flume.source.kafka.KafkaSource.Subscriber | This class is a helper to subscribe for topics by using different strategies |

New Interfaces

| Interface | Description |
|---|--|
| org.apache.flume.formatter.output.PathManager.Builder | Knows how to construct this path manager. Note: Implementations MUST provide a public a no-arg constructor. |

Removed API in Flume 1.7.0

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

The following API classes have been removed in Flume 1.7.0

| Class |
|---|
| org.apache.flume.sink.kafka.KafkaSinkUtil |
| org.apache.flume.source.kafka.KafkaSourceUtil |

Changed API in Flume 1.7.0

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

Flume 1.7.0 includes the following changed classes.

Changed Classes

| Class | Description and notes |
|---|--|
| org.apache.flume.channel.kafka.KafkaChannel | lass responsible for starting, stoping and configuring kafka channel |

| | |
|--|--|
| org.apache.flume.channel.kafka.KafkaChannelConfiguration | Configuration for Kafka Channel |
| org.apache.flume.client.avro.ReliableSpoolingFileEventReader.Builder | Special builder class for ReliableSpoolingFileEventReader |
| org.apache.flume.formatter.output.BucketPath | These are useful to other classes which might want to search for tags in strings. |
| org.apache.flume.formatter.output.PathManager | Creates the files used by the RollingFileSink |
| org.apache.flume.serialization.AvroEventSerializerConfigurationConstants | Configuration constants |
| org.apache.flume.serialization.ResettableFileInputStream | This class makes the following assumption: The underlying file is not changing while it is being read |
| org.apache.flume.sink.hbase.HBaseSinkConfigurationConstants | Constants used for configuration of HBaseSink and AsyncHBaseSink |
| org.apache.flume.sink.kafka.KafkaSink | A Flume Sink that can publish messages to Kafka |
| org.apache.flume.sink.kafka.KafkaSinkConstants | Kafka sink constants |
| org.apache.flume.source.NetcatSourceConfigurationConstants | Configuration constants |
| org.apache.flume.source.SpoolDirectorySource | Track of which files have been converted into Flume events and which still need to be processed |
| org.apache.flume.source.SpoolDirectorySourceConfigurationConstants | Configuration constants |
| org.apache.flume.source.SyslogUDPSource | Process Syslog from given source |
| org.apache.flume.source.kafka.KafkaSourceConstants | Configuration constants |
| org.apache.flume.tools.TimestampRoundDownUtil | Utility class for timestamps |

Deprecated API in Flume 1.7.0

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

The following interfaces, classes, fields, constructors, and methods have been deprecated in Flume 1.7.0.

Deprecated Interfaces

| Interface |
|--|
| org.apache.flume.formatter.output.EventFormatter |

Deprecated Classes

| Class | Use this instead |
|---|--|
| org.apache.flume.source.SyslogTcpSource | MultiportSyslogTCPSource |

Deprecated Fields

| Deprecated Field | Use this instead |
|---|------------------|
| org.apache.flume.source.SpoolDirectorySourceConfigurationConstants.BUFFER_MAX_LINE_LENGTH | |

| | |
|---|---|
| org.apache.flume.source.SpoolDirectorySourceConfigurationConstants.BUFFER_MAX_LINES | |
| org.apache.flume.source.SpoolDirectorySourceConfigurationConstants.DEFAULT_BUFFER_MAX_LINE_LENGTH | |
| org.apache.flume.source.SpoolDirectorySourceConfigurationConstants.DEFAULT_BUFFER_MAX_LINES | |
| org.apache.flume.channel.jdbc.ConfigurationConstants.OLD_CONFIG_CREATE_FK | ConfigurationConstants.CONFIG_CREATE_FK |
| org.apache.flume.channel.jdbc.ConfigurationConstants.OLD_CONFIG_CREATE_INDEX | ConfigurationConstants.CONFIG_CREATE_INDEX |
| org.apache.flume.channel.jdbc.ConfigurationConstants.OLD_CONFIG_CREATE_SCHEMA | ConfigurationConstants.CONFIG_CREATE_SCHEMA |
| org.apache.flume.channel.jdbc.ConfigurationConstants.OLD_CONFIG_DATABASE_TYPE | ConfigurationConstants.CONFIG_DATABASE_TYPE |
| org.apache.flume.channel.jdbc.ConfigurationConstants.OLD_CONFIG_JDBC_DRIVER_CLASS | ConfigurationConstants.CONFIG_JDBC_DRIVER_CLASS |
| org.apache.flume.channel.jdbc.ConfigurationConstants.OLD_CONFIG_JDBC_PROPS_FILE | ConfigurationConstants.CONFIG_JDBC_PROPS_FILE |
| org.apache.flume.channel.jdbc.ConfigurationConstants.OLD_CONFIG_JDBC_SYSPROP_PREFIX | ConfigurationConstants.CONFIG_JDBC_SYSPROP_PREFIX |
| org.apache.flume.channel.jdbc.ConfigurationConstants.OLD_CONFIG_MAX_CAPACITY | ConfigurationConstants.CONFIG_MAX_CAPACITY |
| org.apache.flume.channel.jdbc.ConfigurationConstants.OLD_CONFIG_MAX_CONNECTIONS | ConfigurationConstants.CONFIG_MAX_CONNECTIONS |
| org.apache.flume.channel.jdbc.ConfigurationConstants.OLD_CONFIG_PASSWORD | ConfigurationConstants.CONFIG_PASSWORD |
| org.apache.flume.channel.jdbc.ConfigurationConstants.OLD_CONFIG_TX_ISOLATION_LEVEL | ConfigurationConstants.CONFIG_TX_ISOLATION_LEVEL |
| org.apache.flume.channel.jdbc.ConfigurationConstants.OLD_CONFIG_URL | ConfigurationConstants.CONFIG_URL |
| org.apache.flume.channel.jdbc.ConfigurationConstants.OLD_CONFIG_USERNAME | ConfigurationConstants.CONFIG_USERNAME |

Deprecated Constructors

| |
|--|
| Constructor |
| org.apache.flume.conf.FlumeConfiguration(Properties) |

Deprecated Methods

| Deprecated Method |
|--|
| org.apache.flume.formatter.output.BucketPath.containsTag(string) |
| org.apache.flume.formatter.output.BucketPath.expandShorthand(char) |
| org.apache.flume.formatter.output.BucketPath.getEscapeMapping(string, Map) |
| org.apache.flume.formatter.output.BucketPath.getEscapeMapping(String, Map, Boolean, int, int) |
| org.apache.flume.api.RpcClientFactory.getInstance(string, integer) |
| org.apache.flume.api.RpcClientFactory.getInstance (string, integer, integer) |
| org.apache.flume.formatter.output.BucketPath.replaceShorthand(char, Map) |
| org.apache.flume.formatter.output.BucketPath.replaceShorthand(char, Map, Boolean, int, int) |
| org.apache.flume.formatter.output.BucketPath.replaceShorthand(char, Map, TimeZone, Boolean, int, int, Boolean) |

Hadoop

Starting from release 6.2.0, Hadoop (YARN) is decoupled from the core platform and exists as an ecosystem component as part of EEP. This is an essential requirement to support multi-tenant computer clusters for the HPE Ezmeral Data Fabric. For more information about YARN, see [YARN](#) on page 4359.

HBase

Apache HBase™ is the Hadoop database, a distributed, scalable, big data store. You can use Apache HBase when you need random, realtime read-write access to your Big Data. This section describes how to use HBase with the MapR Platform, but does not duplicate Apache documentation.

The goal of Apache HBase is to host very large tables – billions of rows with millions of columns – atop clusters of commodity hardware. Apache HBase is an open-source, distributed, versioned, column-oriented store modeled after Google's Bigtable: A Distributed Storage System for Structured Data by Chang et al. Just as Bigtable leverages the distributed data storage provided by the Google File System, Apache HBase provides Bigtable-like capabilities on top of Hadoop and Hadoop-compatible filesystems, such as the filesystem.

Installing Apache HBase on a MapR cluster involves storing all HBase components in a single volume mapped to directory `/hbase` in the cluster. Tables are stored in a flat namespace, not grouped logically with related files. Because all Apache HBase data resides in one volume, only one set of storage policies can be applied to the entire Apache HBase datastore. Mirrors and snapshots of the HBase volume do not provide functional replication of the datastore. Despite this limitation, mirrors can be used to back up HLogs and HFiles in order to provide a recovery point for Apache HBase data.

This section documents how to work with HBase on the MapR Converged Data Platform. You can refer also to documentation available from the [Apache HBase project](#).

Note: The HPE Ezmeral Data Fabric Database provides native storage for table data, compatible with the HBase API. For new applications, consider using HPE Ezmeral Data Fabric Database binary tables for increased performance, more versatile table operations, and easier cluster administration.

Configuring HBase

Configure MapR-SASL Security (Authentication and Encryption) for HBase

This section describes the manual method for configuring security in HBase.

Starting with EEP 6.3.0, HBase services are secured by default with MapR-SASL. After installing HBase, you configure it by running the `$MAPR_HOME/server/configure.sh` script with the `-R` option. There are two methods to configure HBase to be secure by default:

- Automatic Method
- Manual Method

Automatic Method

If you installed HBase by using the MapR Installer, the MapR Installer configures HBase daemons during installation. Additional configuration is not required.

Manual Method

After a new manual installation, to generate a valid default ecosystem configuration, run:

```
$MAPR_HOME/server/configure.sh -R
```

Four HBase services require configuration:

- HBase Master
- HBase RegionServer
- HBase Thrift
- HBase REST

Each service can be configured for authentication and encryption, as shown later on this page:

HBase Master and RegionServer

The Master and RegionServer services require the same configuration for security.

Authentication

To enable MapR-SASL authentication, include the following property in the `hbase-site.xml` file:

```
<property>
  <name>hbase.security.authentication</name>
  <value>maprsasl</value>
</property>
```

Encryption

To enable MapR-SASL encryption, include the following property in the `hbase-site.xml` file:

```
<property>
  <name>hbase.rpc.protection</name>
  <value>privacy</value>
</property>
```

Possible values for the `hbase.rpc.protection` property are:

- authentication (auth)
- integrity (auth-int)
- privacy (auth-conf)

The best practice is to spell out the values (authentication/integrity/privacy). The abbreviated values (in parentheses) can work, but using them is not recommended. Encryption is enabled only for the highest level of security (privacy).

HBase Thrift

It is possible to configure the HBase Thrift service to work over sockets or over the HTTP protocol. For authentication purposes, configuration is the same for both cases. For encryption, configuration is different for each case. Note that starting with the `EEP6.3.0` property, `hbase.thrift.security.authentication` is no longer used to configure HBase Thrift for authentication.

Authentication

HBase Thrift relies on the same property used for Master and RegionServer. To enable authentication, include the following property in the `hbase-site.xml` file:

```
<property>
  <name>hbase.security.authentication</name>
  <value>maprsasl</value>
</property>
```

Encryption for Thrift over Sockets

To enable encryption with MapR-SASL for Thrift over sockets, make sure that the `hbase.regionserver.thrift.http` property is set to `false` and the following property is present in the `hbase-site.xml` file:

```
<property>
  <name>hbase.thrift.security.qop</name>
  <value>auth-conf</value>
</property>
```

Possible values for `hbase.thrift.security.qop` are:

- auth
- auth-int
- auth-conf

Encryption is enabled only for the highest level of security (`auth-conf`).

Encryption for Thrift over HTTP

To enable Thrift to work over the HTTP protocol, include the following property in the `hbase-site.xml` file:

```
<property>
  <name>hbase.regionserver.thrift.http</name>
  <value>true</value>
</property>
```

To enable Thrift over HTTP encryption through SSL, include the following property in the `hbase-site.xml` file:

```
<property>
  <name>hbase.thrift.ssl.enabled</name>
  <value>true</value>
</property>
```

HBase REST

Authentication

To enable HBase REST authentication, include the following property in the `hbase-site.xml` file:

```
<property>
  <name>hbase.rest.authentication.type</name>

  <value>org.apache.hadoop.security.authentication.server.MultiMechsAuthenticati
  onHandler</value>
</property>
```

With the `MultiMechsAuthenticationHandler`, MapR-SASL, Kerberos, and PAM authentication headers are supported. A custom `AuthenticationHandler` could be implemented and specified with the full class name in this property.

Encryption

To enable HBase REST SSL encryption, include the following property in the `hbase-site.xml` file:

```
<property>
  <name>hbase.rest.ssl.enabled</name>
  <value>true</value>
</property>
```

HBase Services Web UIs

Web UIs are available for each HBase service. The Web UIs run simultaneously with the service and within the same process. Security for these UIs must be configured too.

Authentication

To enable HBase Web UI authentication, include the following property in the `hbase-site.xml` file:

```
<property>
  <name>hbase.security.authentication</name>
  <value>maprsasl</value>
</property>
```

Authentication is implemented through the `MultiMechsAuthenticationHandler` and therefore supports MapR-SASL, Kerberos, and PAM authentication headers.

Encryption

To enable HBase Web UI SSL encryption, include the following property in the `hbase-site.xml` file:

```
<property>
  <name>hbase.ssl.enabled</name>
  <value>true</value>
</property>
```

Configure HBase to use Kerberos

HBase supports MapR-SASL and Kerberos security, and can run securely independently of the security status of your HPE Ezmeral Data Fabric cluster.

To configure HBase to use Kerberos, perform the following steps:

1. Install the `mapr-hbase-master` and `mapr-hbase-regionserver` packages on the cluster.
2. On all HBase nodes, perform the following steps:
 - a) Install the `krb5` packages and configure the Kerberos client as per the configuration for your environment.

- b) Set up the HBase Kerberos principal `mapr/<fqdn>@<realm>`. Each node requires a unique keytab file and Kerberos identity.
- c) Create an `hbase.keytab` file with the HBase Kerberos principal with the [same process](#) used to generate the CLDB keytab.
- d) Copy the `hbase.keytab` file to the `/opt/mapr/conf` directory.
- e) Use the `chown` command to change the keytab file's ownership to `mapr:mapr`.
- f) Use the `chmod` command to set the file's permissions to `600`.
- g) Update the `hbase-site.xml` file by adding the following section:

```
<property>
  <name>hbase.security.authentication</name>
  <value>kerberos</value>
</property>
<property>
  <name>hbase.security.authorization</name>
  <value>>true</value>
</property>
<property>
  <name>hbase.regionserver.kerberos.principal</name>
  <value>mapr/_HOST@<KERBEROS_REALM></value>
</property>
<property>
  <name>hbase.master.kerberos.principal</name>
  <value>mapr/_HOST@<KERBEROS_REALM></value>
</property>
```

- h) On a HPE Ezmeral Data Fabric cluster with security features enabled, replace the `${SIMPLE_LOGIN_OPTS}` value of the `MAPR_HBASE_SERVER_OPTS` property with `${KERBEROS_LOGIN_OPTS}` and the value of the `MAPR_HBASE_CLIENT_OPTS` property with `${HYBRID_LOGIN_OPTS}`. Also remove the `-Dzookeeper.sasl.client=false` option from the definition of `MAPR_HBASE_CLIENT_OPTS`.

These properties are located in the `/opt/mapr/conf/env.sh` file.

- i) On a HPE Ezmeral Data Fabric cluster with security features disabled, replace the `${SIMPLE_LOGIN_OPTS}` value of the `MAPR_HBASE_SERVER_OPTS` and `MAPR_HBASE_CLIENT_OPTS` properties in the `/opt/mapr/conf/env.sh` file with `${KERBEROS_LOGIN_OPTS}`.

3. On all HBase regionserver nodes, update the `hbase-site.xml` file by adding the following section:

```
<property>
  <name>hbase.regionserver.keytab.file</name>
  <value>/opt/mapr/conf/hbase.keytab</value>
</property>
<property>
  <name>hbase.coprocessor.region.classes</name>
  <value>
org.apache.hadoop.hbase.security.token.TokenProvider,org.apache.hadoop.hbase.security.access.AccessController</value>
</property>
```

4. On the HBase master node, update the `hbase-site.xml` file by adding the following section:

```
<property>
  <name>hbase.master.keytab.file</name>
  <value>/opt/mapr/conf/hbase.keytab</value>
</property>
<property>
  <name>hbase.coprocessor.master.classes</name>
  <value>org.apache.hadoop.hbase.security.access.AccessController</value>
</property>
```

5. Restart the HBase master and regionserver nodes.

Enable Impersonation for HBase

HBase can be configured to offer impersonation, with or without Kerberos. This means that users can send commands to HBase through Hue without losing the fact that they will be run under their own credentials, instead of the `hue` user.

For instructions, see [Enable Impersonation for HBase Thrift Gateway](#).

Configure HBase ACLs

HBase supports Access Control Lists (ACLs) to limit the privileges of users on the system. Before you can use ACLs, you need to perform the steps to enable ACLs.

HBase ACLs support the following privileges:

- Read
- Write
- Execute
- Create tables
- Administrator

The possible scopes are:

- Superuser
- Global
- Namespace
- Table
- ColumnFamily
- Cell

For information about each scope, see [Understanding Access Levels](#).

Once you enable the use of ACLs, you can grant and remove privileges from users by using the `grant` and `revoke` commands from the HBase shell. The following example grants user `jfoo` read privileges from column family `cf1` of table `mytable`:

```
hbase(main):001:0> grant 'jfoo' 'R' 'mytable','cf1'
```

This example removes user `kbar`'s administrative privileges on the cluster:

```
hbase(main):001:0> revoke 'kbar' 'A'
```

Enable HBase Access Control

The following steps explain how to enable HBase ACLs.

1. On the HBase Region Server, edit the `/opt/mapr/hbase/hbase-<version>/conf/hbase-site.xml` file, and add the following section:

```
<property>
  <name>hbase.coprocessor.region.classes</name>

  <value>org.apache.hadoop.hbase.security.token.TokenProvider,org.apache.ha
doop.hbase.security.access.AccessController</value>
</property>
<property>
  <name>hbase.superuser</name>
  <value><admin1>,<admin2>,@<group1>,...</value> <!-- group names are
prefixed with '@' -->
</property>
```

2. On the HBase Master, edit the `/opt/mapr/hbase/hbase-<version>/conf/hbase-site.xml` file, and add the following section:

```
<property>
  <name>hbase.coprocessor.master.classes</name>
  <value>org.apache.hadoop.hbase.security.access.AccessController</
value>
</property>
<property>
  <name>hbase.superuser</name>
  <value><admin1>,<admin2>,@<group1>,...</value> <!-- group names are
prefixed with '@' -->
</property>
```

3. Restart HBase on every node.

Set Up Compression with HBase

Using compression with HBase reduces the number of bytes transmitted over the network and stored on disk. These benefits often outweigh the performance cost of compressing the data on every write and uncompressing it on every read.

GZip Compression

GZip compression is included with most Linux distributions and works natively with HBase. To use GZip compression, specify it in the per-column family compression flag while creating tables in HBase shell. For example:

```
create 'mytable', {NAME=>'colfam', COMPRESSION=>'gz' }
```

LZ4 Compression

The LZ4 algorithm gives a slightly worse compression ratio than the LZ0 algorithm – which in turn is worse than algorithms like DEFLATE. However, compression speeds are similar to LZ0 and several times faster

than DEFLATE, while decompression speeds can be significantly higher than LZO. Here is an example of configuring LZ4 compression:

```
create 'mytable1', {NAME=>'colfam', COMPRESSION=>'lz4'}
```

Snappy Compression

The Snappy compression algorithm is optimized for speed over compression. Snappy compression is included in the core MapR installation, and no additional configuration is required.

Configure the Default Database for HBase Clients

For HBase version 1.1 and later, a default database configuration determines whether clients connect to HBase tables or HPE Ezmeral Data Fabric Database tables. You can change the default setting for all HBase clients, or you can set the database for a particular job. This setting is ignored for HBase 0.98.12 client connections.

Set the Default Database using configure.sh

`configure.sh` automatically sets the default database for a node based on the presence of the following `mapr` packages:

- `mapr-hbase-master`
- `mapr-hbase-regionserver`

`configure.sh` also provides a parameter that you can use to set the default database. To explicitly set the default database to either `maprdb` or `hbase`, run `configure.sh` with the `-defaulttdb` parameter. For example:

```
configure.sh -R -defaulttdb maprdb
```

The following table describes the effect of various `configure.sh` commands on the default database setting:

Table

| If ... | And you run <code>configure.sh</code> with the following <code>-defaulttdb</code> parameter ... | | |
|---|---|---|---|
| | No <code>-defaulttdb</code> parameter specified | <code>-defaulttdb hbase</code> | <code>-defaulttdb maprdb</code> |
| <code>hbasemaster</code> or <code>hbaseregionserver</code> is installed on a node | The default database is set to <code>hbase</code> . | The default database is set to <code>hbase</code> | The default database is set to <code>hbase</code> , and the <code>maprdb</code> setting is ignored. |
| <code>hbasemaster</code> and <code>hbaseregionserver</code> are NOT installed on a node | The default database is set to <code>maprdb</code> . | The default database is set to <code>hbase</code> . However, this configuration does not work because HBase is not running. | The default database is set to <code>maprdb</code> . |

For more information about `configure.sh`, see [configure.sh](#) on page 2331.

Set the Default Database using hbase-site.xml

You can configure the `mapr.hbase.default.db` property in the `hbase-site.xml` to override the default database that is set for the cluster:

1. In the `hbase-site.xml`, edit the default value of `mapr.hbase.default.db`, and set it to either `hbase` or `maprdb`.

For example:

```
<property>
  <name>mapr.hbase.default.db</name>
  <value>hbase</value>
</property>
```

2. Copy the property to the `hbase-site.xml` on each node that runs HBase, including any HBase client nodes.

Set the Database Type in the Job Configuration

To set the database type in the job configuration you can add the following code:

- To connect to HPE Ezmeral Data Fabric Database tables:

```
Configuration conf = HBaseConfiguration.create();
conf.set("mapr.hbase.default.db", "maprdb");
Connection connection = ConnectionFactory.createConnection(conf);
Table table = connection.getTable(<TABLE_NAME>);
```

- To connect to HBase tables:

```
Configuration conf = HBaseConfiguration.create();
conf.set("mapr.hbase.default.db", "hbase");
Connection connection = ConnectionFactory.createConnection(conf);
Table table = connection.getTable(<TABLE_NAME>);
```

HBase Configuration Properties

This section describes and shows examples of the configuration properties used in the `hbase-site.xml` file.

Table

| Category | Property | Description |
|----------------------------------|---|---|
| Basic Properties | Hbase.rootdir | Specifies where the HBase data is stored. If not specified, by default HBase uses the /tmp/ local folder. It is possible to use the local filesystem and filesystem or a remote filesystem instance. |
| | <pre><property> <name>hbase.rootdir</name> <value>maprfs:///hbase</value> </property></pre> | |
| | HBase.cluster.distributed | The mode the cluster will be in. Possible values are <code>false</code> for standalone mode and <code>true</code> for distributed mode. If <code>false</code> , startup runs all HBase and ZooKeeper daemons together in the one JVM. Default: <code>false</code> . |
| | <pre><property> <name>hbase.cluster.distributed</name> <value>true</value> </property></pre> | |
| | Hbase.zookeeper.quorum | Comma-separated list of servers in the ZooKeeper ensemble. For example, "host1.mydomain.com,host2.mydomain.com,host3.mydomain.com". By default this property is set to localhost for local and pseudo-distributed modes of operation. For a fully-distributed setup, this property should be set to a full list of ZooKeeper ensemble servers. If HBASE_MANAGES_ZK is set in <code>hbase-env.sh</code> , this is the list of servers that HBase will start or stop ZooKeeper on as part of cluster start or stop. Client-side, we will take this list of ensemble members and put it together with the <code>hbase.zookeeper.property.clientPort</code> config. and pass it into the Zookeeper constructor as the <code>connectString</code> parameter. Port could be specified together with hosts. In this case, the <code>hbase.zookeeper.property.clientPort</code> configuration is useless. |
| | <pre><property> <name>hbase.zookeeper.quorum</name> <value>node11.cluster.com:5181</value> </property></pre> | |
| | Dfs.support.append | Specifies whether DFS allows appends to files. |
| | <pre><property> <name>dfs.support.append</name> <value>true</value> </property></pre> | |
| | Hbase.fsutil.maprfs.impl | Specifies the FSUtil class (the utility methods for interacting with the underlying filesystem) used in HBase. |
| | <pre><property> <name>hbase.fsutil.maprfs.impl</name> <value>org.apache.hadoop.hbase.util.FSMapRUtils</value> </property></pre> | |
| Hbase.regionserver.handler.count | Sets the count of RPC Listener instances spun up on RegionServers. The Same property is used by the Master for a count of master handlers. Too many handlers can be counter-productive. Make it a multiple of the CPU count. If mostly read-only, handlers count close to CPU count does well. Start with | |

Table (Continued)

| Category | Property | Description |
|---|--|--|
| Security Properties* | Hbase.security.authorization | Specifies whether authorization is enabled or not. |
| | <pre><property> <name>hbase.security.authorization</name> <value>true</value> </property></pre> | |
| | Hbase.security.exec.permission.checks | Without this option, all users continue to have access to execute endpoint coprocessors. This option is not enabled when you enable HBase Secure Authorization for backward compatibility. |
| | <pre><property> <name>hbase.security.exec.permission.checks</name> <value>true</value> </property></pre> | |
| | hbase.coprocessor.master.classes | A comma-separated list of coprocessors that are loaded by the master (MasterObserver coprocessors). The AccessController has to be active to support authorization. |
| | <pre><property> <name>hbase.coprocessor.master.classes</name> <value>org.apache.hadoop.hbase.security.access. AccessController</value> </property></pre> | |
| | Hbase.coprocessor.region.classes | A comma-separated list of RegionObserver and Endpoint coprocessors. TokenProvider and AccessController must be active to support authorization. |
| <pre><property> <name>hbase.coprocessor.region.classes</name> <value>org.apache.hadoop.hbase.security.token.TokenProvider. org.apache.hadoop.hbase.security.access.AccessController</value> </property></pre> | | |

Table (Continued)

| Category | Property | Description |
|---|--|---|
| Authentication and Encryption Properties | hbase.security.authentication | Defines whether to use SASL mechanisms in HBase to authenticate RPC connections from clients to HBase Master and RegionServer. Also defines whether to support authentication for HBaseThrift. Specifying <code>maprsasl</code> enables authentication for HBaseThrift over http. |
| | <pre><property> <name>hbase.security.authentication</name> <value>maprsasl</value> </property></pre> | |
| | hbase.rpc.protection | Enables or disables transport security encryption. To support encryption, the <code>auth-conf</code> (privacy) value must be specified. Possible values are: <ul style="list-style-type: none"> • <code>auth</code> or <code>authentication</code> • <code>auth-int</code> or <code>integrity</code> • <code>auth-conf</code> or <code>privacy</code> |
| | <pre><property> <name>hbase.rpc.protection</name> <value>auth-conf</value> </property></pre> | |
| | hbase.ssl.enabled | Enables or disables SSL encryption for HBase WebUIs. |
| | <pre><property> <name>hbase.ssl.enabled</name> <value>>true</value> </property></pre> | |
| | hbase.thrift.ssl.enabled | Enables or disables SSL encryption for HBaseThrift. Works only for HBaseThrift over http (the <code>hbase.regionserver.thrift.http</code> property must be set to true). |
| | <pre><property> <name>hbase.thrift.ssl.enabled</name> <value>>true</value> </property></pre> | |
| | Hbase.thrift.security.qop | Enables or disables transport security encryption for HBaseThrift. Use the <code>Auth-conf</code> value to support encryption. This property works only for HBaseThrift over sockets (the <code>hbase.regionserver.thrift.http</code> property must be set to false). Possible values are: <ul style="list-style-type: none"> • <code>auth</code> • <code>auth-int</code> • <code>auth-conf</code> |
| <pre><property> <name>hbase.thrift.security.qop</name> <value>auth-conf</value></pre> | | |

Table (Continued)

| Category | Property | Description |
|--------------------------|---|---|
| Impersonation Properties | hbase.thrift.support.proxyuser | Enables or disables impersonation for HBaseThrift. Works only for thrift over http (the hbase.regionserver.thrift.http property must be set to true). |
| | <pre><property> <name>hbase.thrift.support.proxyuser</name> <value>true</value> </property></pre> | |
| | hbase.rest.support.proxyuser | Enables or disables impersonation for HBaseRest. |
| | <pre><property> <name>hbase.rest.support.proxyuser</name> <value>true</value> </property></pre> | |
| | hbase.regionserver.thrift.http | Defines whether to use HBaseThrift over http (if true is specified) or over sockets. Used to support impersonation for thrift over http. |
| | <pre><property> <name>hbase.regionserver.thrift.http</name> <value>true</value> </property></pre> | |

*To support authorization, four properties must be enabled:

- hbase.security.authorization
- hbase.security.exec.permission.checks
- hbase.coprocessor.master.classes
- hbase.coprocessor.region.classes

If any of them is missing, authorization will not be fully supported.

Using HBase

- [Search the MapR Blog for HBase topics](#)

This section includes the following topics about working with HBase:

Getting Started in HBase

In this section, we'll create an HBase table on the cluster, enter some data, query the table, then clean up the data and exit.

HBase tables are organized by column, rather than by row. Furthermore, the columns are organized in groups called *column families*. When creating an HBase table, you must define the column families before inserting any data. Column families should not be changed often, nor should there be too many of them, so it is important to think carefully about what column families will be useful for your particular data. Each column family, however, can contain a very large number of columns. Columns are named using the format `family:qualifier`.

Unlike columns in a relational database, which reserve empty space for columns with no values, HBase columns simply don't exist for rows where they have no values. This not only saves space, but means that different rows need not have the same columns; you can use whatever columns you need for your data on a per-row basis.

1. Start the HBase shell by typing the following command:

```
hbase shell
```

2. Create a table called `weblog` with one column family named `stats`:

```
create 'weblog', 'stats'
```

3. Verify the table creation by listing everything:

```
list
```

4. Add a test value to the `daily` column in the `stats` column family for row 1:

```
put 'weblog', 'row1', 'stats:daily', 'test-daily-value'
```

5. Add a test value to the `weekly` column in the `stats` column family for row 1:

```
put 'weblog', 'row1', 'stats:weekly', 'test-weekly-value'
```

6. Add a test value to the `weekly` column in the `stats` column family for row 2:

```
put 'weblog', 'row2', 'stats:weekly', 'test-weekly-value'
```

7. Type `scan 'weblog'` to display the contents of the table. Sample output:

```
ROW                COLUMN+CELL
 row1              column=stats:daily, timestamp=1321296699190,
 value=test-daily-value
 row1              column=stats:weekly, timestamp=1321296715892,
 value=test-weekly-value
 row2              column=stats:weekly, timestamp=1321296787444,
 value=test-weekly-value
 2 row(s) in 0.0440 seconds
```

8. Type `get 'weblog', 'row1'` to display the contents of row 1. Sample output:

```
COLUMN            CELL
 stats:daily      timestamp=1321296699190, value=test-daily-value
 stats:weekly     timestamp=1321296715892, value=test-weekly-value
 2 row(s) in 0.0330 seconds
```

9. Type `disable 'weblog'` to disable the table.
10. Type `drop 'weblog'` to drop the table and delete all data.
11. Type `exit` to exit the HBase shell.

Running MapReduce Jobs with HBase

To run MapReduce applications with data stored in HBase, use a command such as the following to export table data to the HPE Ezmeral Data Fabric filesystem:

```
$ hadoop jar /opt/mapr/hbase/hbase-1.1.13/lib/
hbase-server-1.1.13.0-mapr-1912.jar export t1 /user/mapr/t1
```

or

```
$ hbase org.apache.hadoop.hbase.mapreduce.Export t1 /user/mapr/t4
```

The result is the same because of the tools included in the `hbase-server.jar` file:

```
$ hadoop fs -ls /user/mapr/t1/
Found 2 items
-rwxr-xr-x   3 mapr mapr          0 2019-11-11 15:00 /user/mapr/t1/_SUCCESS
-rw-r--r--   3 mapr mapr       249 2019-11-11 15:00 /user/mapr/t1/
part-m-00000
$ hadoop fs -ls /user/mapr/t4/
Found 2 items
-rwxr-xr-x   3 mapr mapr          0 2019-11-11 15:09 /user/mapr/t4/_SUCCESS
-rw-r--r--   3 mapr mapr       249 2019-11-11 15:09 /user/mapr/t4/
part-m-00000
$
```

Following is an example of the full output:

```
$ hadoop jar /opt/mapr/hbase/hbase-1.1.13/lib/
hbase-server-1.1.13.0-mapr-1912.jar export t1 /user/mapr/t1

The following table shows the tools included in the hbase-server.jar:

| Name ¹ | Class ² | Description |
|-------------------|-----------------------|---|
| rowcounter | RowCounter | Count rows in HBase table |
| CellCounter | CellCounter | Count cells in HBase table |
| export | Export | Write table data to HPE Ezmeral Data Fabric filesystem |
| import | Import | Import data written by Export |
| importtsv | ImportTsv | Import data in TSV format |
| completebulkload | LoadIncrementalHFiles | Complete a bulk data load |
| copytable | CopyTable | Export a table from local cluster to peer cluster |
| verifyrep | VerifyReplication | Compare the data from tables in two different clusters  Note: This function does not work for incrementColumnValues cells since the timestamp is changed after being appended to the log. |
| WALPlayer | WALPlayer | Replay WAL files |
| exportsnapshot | ExportSnapshot | Export the specific snapshot to a given FileSystem |

¹ Class is used for `hbase.org.apache.hadoop.hbase.mapreduce.<class>...`

² Name is used for `hadoop jar /opt/mapr/hbase/hbase-1.1.13/lib/hbase-server-1.1.13.0-mapr-1912.jar <name>...`

Using the libhbase Library

libhbase is a JNI-based, thread-safe C library that implements a native HBase client. You can use libhbase to build applications that access HBase.

This page contains the following topics:

- Installing libhbase
- Upgrading libhbase
- Building applications with libhbase
- Configuring the application environment
- Running a libhbase performance test

For examples that show how to use the APIs, see the [sample source file](#).

Installing libhbase

Install libhbase on the nodes from which you will build and run the application.

Complete the following steps to install libhbase from a repository:

1. Configure the repository to point to <http://package.mapr.hpe.com/releases/MEP/MEP-6.3.0/>.
2. Based on your operating system, run one of the following commands to install the package:
 - On Red Hat /Centos: `yum install mapr-libhbase`
 - On SLES: `zypper install mapr-libhbase`
 - On Ubuntu: `apt-get install mapr-libhbase`

Once the installation completes, the libhbase installation includes the following directories under `/opt/mapr/libhbase/libhbase-<version>`:

```

/
+---bin/
+---conf/
+---include/
|   +---hbase/
+---lib/
|   +---native/
+---src
    +---examples/
    |   +---async/
    +---test/
        +---native/
            +---common/

```

Note: The `include` folder contains the headers required to build applications. The `lib/native` directory contains shared libraries.

Upgrading libhbase

To upgrade to a more recent version of libhbase:

1. Install the new version.
2. Re-configure the application environment to refer to the new libraries.

Building Applications with libhbase

libhbase should be installed on each node that builds the application.

Note the following items when you build applications with libhbase:

- The headers required to build applications are located under `/opt/mapr/libhbase/libhbase-<version>/include`.
- libhbase shared library is located in the following directory: `/opt/mapr/libhbase/libhbase-<version>/lib/native`.
- Since libhbase uses JNI, you must also link your application against libjvm. In general, the libjvm library is located within the JDK/JRE installation directory.

For example, the following command builds the `hello_hbase` application with the `hello_hbase.c` source code:

```

gcc -o hello_hbase hello_hbase.c -I/opt/mapr/libhbase/libhbase-0.98.7/include -L/opt/mapr/libhbase/libhbase-0.98.7/lib/native -lhbase -L/usr/lib/jvm/java-7-sun/jre/lib/amd64/server -ljvm

```

Configuring the Application Environment

Complete the following steps to configure the node from which you run the application:

- Verify that libhbase is installed on the node.
- Verify that both the libhbase and libjvm shared libraries are in the application's library search path. The libhbase shared library is located under `/opt/mapr/libhbase/libhbase-<version>/lib/native`. In general, the libjvm library is located within the JDK/JRE installation directory.
- Specify any JARs required by the application with one of the following environment variables: `CLASSPATH` or `HBASE_LIB_DIR`.
- Specify custom JVM options, such as `-Xmx`, using the environment variable `LIBHBASE_OPTS`.

Running a libhbase Performance Test

libhbase 0.98.7 includes a performance test that supports sequential/random gets and puts. In libhbase 0.98.9, the performance test utility also includes support for Zipfian, support for uniform random key generation, and it test for scans. You can run the test using this [shell script](#).

HBase Client and HPE Ezmeral Data Fabric Database Binary Tables

MapR 6.0.x and 6.1 provide Apache HBase-compatible APIs and client interfaces but do not support HBase as an ecosystem component. HPE Ezmeral Data Fabric Database binary tables provide native storage for table data and include high performance and availability, versatile table operations, and streamlined cluster administration. The following APIs and tools are available for HPE Ezmeral Data Fabric Database binary tables:

HBase Client

- After installing the HBase Client, you can use HBase Shell commands to manipulate HPE Ezmeral Data Fabric Database binary tables on a remote machine. See [Installing HBase on a Client Node](#) on page 176 and [HPE Ezmeral Data Fabric Database HBase Shell \(Binary Tables\)](#) on page 5528.
- HPE Ezmeral Data Fabric Database supports binary tables through the libMapRClient (a library of C APIs) and Apache HBase Java APIs. See [Developing Applications for Binary Tables](#) on page 2735.

HBase REST Gateway

- The HBase REST Gateway allows users to manipulate HPE Ezmeral Data Fabric Database binary tables through the HBase REST API. See [Installing the HBase REST Gateway](#) on page 178.

HBase Thrift Gateway

- The HBase Thrift Gateway allows users to manipulate HPE Ezmeral Data Fabric Database binary tables through the HBase Thrift API. See [Installing the HBase Thrift Gateway](#) on page 178.

Using the HBase Thrift Gateway

HBase Thrift Gateway includes an API and a service that accepts Thrift requests to connect to HPE Ezmeral Data Fabric Database and HBase tables. The HBase Thrift Gateway is installed as a service that is managed by Warden. When `mapr-hbasethrift` is installed, the `warden.hbasethrift.conf` file is added to the `/opt/mapr/conf/conf.d` directory.

Note: MapR SASL authentication, encryption, and impersonation for HBase Thrift Gateway are enabled by default on secure clusters.

Starting the HBase Thrift Service

To start the HBase thrift service, enter the following command with the name of the host where hbasethrift is running:

```
maprcli node services -name hbasethrift -action start -nodes <node_hostname>
```

Configure Kerberos for HBase Thrift Gateway

1. Add the following to the `hbase-site.xml` file for every Thrift gateway:

```
<property>
  <name>hbase.thrift.keytab.file</name>
  <value>$KEYTAB</value>
</property>
<property>
  <name>hbase.thrift.kerberos.principal</name>
  <value>$USER/_HOST@HADOOP.LOCALDOMAIN</value>
  <!-- This may need to be HTTP/_HOST@<REALM> and _HOST may not work.
You may have to put the concrete full hostname. -->
</property>
<property>
  <name>hbase.thrift.security.qop</name>
  <value>auth-conf</value>
</property>
<!-- Add these if you need to configure a different DNS interface from
the default -->
<property>
  <name>hbase.thrift.dns.interface</name>
  <value>default</value>
</property>
<property>
  <name>hbase.thrift.dns.nameserver</name>
  <value>default</value>
</property>
```

Substitute the appropriate credential and keytab for `$USER` and `$KEYTAB` respectively.

2. If you are running HBase Thrift in HTTP mode, you must add additional properties to the `hbase-site.xml` to enable HTTP connections through Kerberos. This is required if you enabled the following property in the `hbase-site.xml`:

```
<property>
  <name>hbase.regionserver.thrift.http</name>
  <value>>true</value>
</property>
```

Add the following properties to enable HTTP connections through Kerberos:

```
<property>
  <name>hbase.thrift.spnego.principal</name>
  <value>HTTP/_HOST@HADOOP.LOCALDOMAIN</value>
</property>
<property>
  <name>hbase.thrift.spnego.keytab.file</name>
  <value>${KEYTAB}</value>
</property>
```

3. To use HPE Ezmeral Data Fabric Database tables without the full path, add the following property to the `core-site.xml` file:

```
<property>
  <name>hbase.table.namespace.mappings</name>
  <value>*:</value>
</property>
```

Add this property **ONLY** if you are working with HPE Ezmeral Data Fabric Database tables. Working with HBase tables is not possible when this property is present. For more information, see [Considerations for Upgrading to HBase 1.1.13](#) on page 288. For more information about mapping tables, see [Mapping to HBase Table Namespaces](#) on page 386.

The Thrift gateway authenticates with HBase using the supplied credential. No authentication is performed by the Thrift gateway itself. All client access via the Thrift gateway uses the Thrift gateway's credential and has its privilege.

Enable Impersonation for HBase Thrift Gateway

To configure the Thrift gateway to authenticate to HBase on the client's behalf, and to access HBase using a proxy user:

1. To allow proxy users, add the following to the `hbase-site.xml` file for every HBase node:

```
<property>
  <name>hadoop.proxyuser.$USER.groups</name>
  <value>${GROUPS}</value>
</property>
<property>
  <name>hadoop.proxyuser.$USER.hosts</name>
  <value>${GROUPS}</value>
</property>
```

- To enable the doAs feature, add the following to the `hbase-site.xml` file for every Thrift gateway:

```
<property>
  <name>hbase.regionserver.thrift.http</name>
  <value>>true</value>
</property>
<property>
  <name>hbase.thrift.support.proxyuser</name>
  <value>>true</value>
</property>
```

- Restart the Thrift gateway processes for the changes to take effect. If a node is running Thrift, the output of the `jobs` command will list a `ThriftServer` process.

- To restart Thrift on a node, use the following `maprcli` command:

```
maprcli node services -name hbasethrift -action restart -nodes
<node_hostname>
```

Using the HBase REST Gateway

HBase REST Gateway includes an API and a service that accepts REST requests to connect to HPE Ezmeral Data Fabric Database and HBase tables. Starting in version 0.98.9, the HBase REST Gateway is installed as a service that is managed by Warden. When `mapr-hbase-rest` is installed, the `warden.hbase-rest.conf` file is added to the `/opt/mapr/conf/conf.d` directory.

Note: PAM authentication, encryption, and impersonation for HBase REST are enabled by default on secure clusters.

Starting the HBase REST Service

To start the HBase REST service, enter the following command with the name of the host where `hbaserest` is running:

```
maprcli node services -name hbaserest -action start -nodes <node_hostname>
```

Configure Kerberos for HBase REST Gateway

- Add the following to the `hbase-site.xml` file for every REST Gateway:

```
<property>
  <name>hbase.rest.keytab.file</name>
  <value>${KEYTAB}</value>
</property>
<property>
  <name>hbase.rest.kerberos.principal</name>
  <value>${USER}/_HOST@HADOOP.LOCALDOMAIN</value>
</property>
```

Substitute the appropriate credential and keytab for `USER` and `KEYTAB` respectively.

The REST Gateway will authenticate with HBase using the supplied credential.

2. To enable REST Gateway Kerberos authentication for client access, add the following to the `hbase-site.xml` file for every REST Gateway:

```
<property>
  <name>hbase.rest.authentication.type</name>
  <value>kerberos</value>
</property>
<property>
  <name>hbase.rest.authentication.kerberos.principal</name>
  <value>HTTP/_HOST@HADOOP.LOCALDOMAIN</value>
</property>
<property>
  <name>hbase.rest.authentication.kerberos.keytab</name>
  <value>$KEYTAB</value>
</property>
<!-- Add these if you need to configure a different DNS interface from
the default -->
<property>
  <name>hbase.rest.dns.interface</name>
  <value>default</value>
</property>
<property>
  <name>hbase.rest.dns.nameserver</name>
  <value>default</value>
</property>
```

Substitute the keytab for HTTP for `$KEYTAB`.

Enable Impersonation for HBase REST Gateway

To enable HBase REST Gateway impersonation, configure all HBase servers to allow proxy users, then configure every REST Gateway to enable impersonation.

- To enable REST Gateway impersonation, add the following to the `hbase-site.xml` file for every REST gateway:

```
<property>
  <name>hbase.rest.support.proxyuser</name>
  <value>true</value>
</property>
```

HBase REST Gateway and HBase Thrift Gateway Secured By Default to Use SSL

Starting in EEP 6.0.0, HBase REST and HBase Thrift use SSL by default on secured clusters.

1. On a secure cluster, by default, HBase REST and HBase Thrift read the `ssl-client.xml` file and configure SSL using this file.

- To enable HBase REST and Thrift encryption, use the following properties. Note that SSL for Thrift is enabled only when the `hbase.regionserver.thrift.http` property is `true`:

Enabling HBase REST encryption

```
<property>
  <name>hbase.rest.ssl.enabled</name>
  <value>true</value>
</property>
```

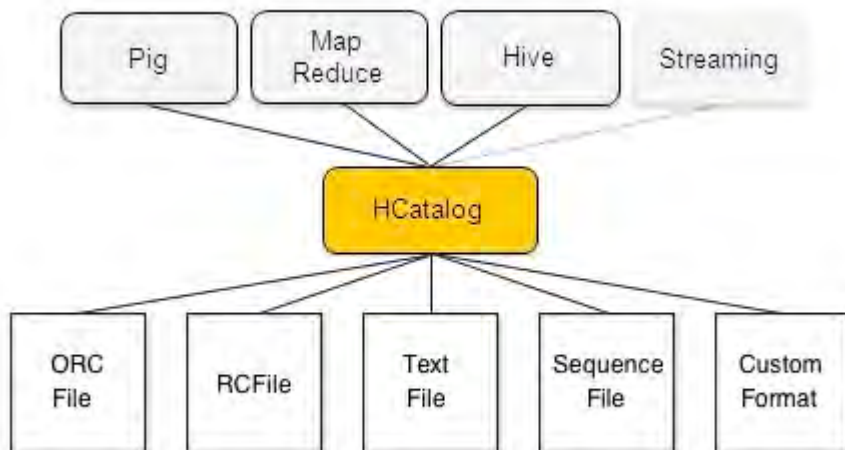

Enabling HBase Thrift encryption

```
<property>
  <name>hbase.thrift.ssl.enabled</name>
  <value>true</value>
</property>
```

HCatalog

HCatalog is a table and storage management layer for Hadoop that enables users with different data processing tools — Pig, MapReduce — to more easily read and write data on the grid. HCatalog's table abstraction presents users with a relational view of data in the Hadoop distributed filesystem (HDFS) and ensures that users need not worry about where or in what format their data is stored — RCFile format, text files, SequenceFiles, or ORC files.

HCatalog supports reading and writing files in any format for which a SerDe (serializer-deserializer) can be written. By default, HCatalog supports RCFile, CSV, JSON, and SequenceFile, and ORC file formats. To use a custom format, you must provide the InputFormat, OutputFormat, and SerDe.

HCatalog is also automatically installed and upgraded along with Hive. For information about using HCatalog with Hive, see [Hive and WebHCat Integration](#) and [Hive and HCatalog Integration](#).

Hive

Apache Hive™ is a data warehouse system for Hadoop that facilitates easy data summarization, ad-hoc queries, and the analysis of large datasets stored in Hadoop-compatible file systems, such as HPE Ezmeral Data Fabric. Hive provides a mechanism to project structure onto this data and query the data using a SQL-like language called HiveQL. At the same time this language also allows traditional map/reduce programmers to plug in their custom mappers and reducers when it is inconvenient or inefficient to express this logic in HiveQL.

You can refer also to documentation available from the [Apache Hive project](#).

Hive components include the following:

- Hive Metastore
- HiveServer2
- HCatalog
- WebHCat
- Hive CLI
- Beeline

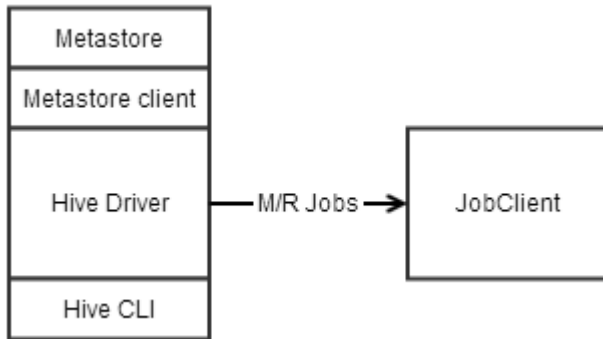

Note: If you installed Hive using the installer with the "Enable Security" check box selected, Hive is secured and no further configuration is required. However, if you installed Hive manually and wish to enable security for Hive, see [Hive Security Configuration Options](#) on page 3639 for information.

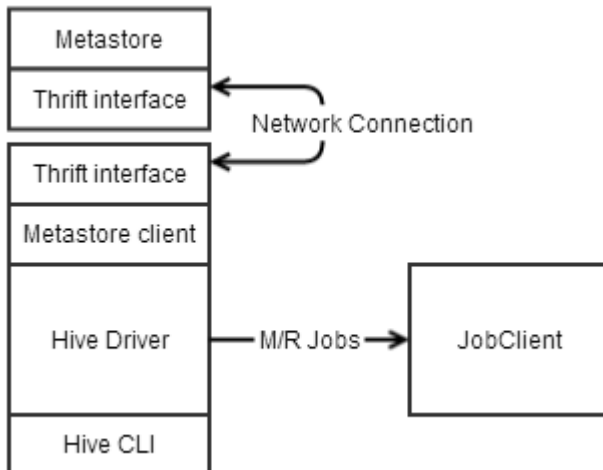

The following examples show how these components communicate with each other and when you might want to configure security features such as authentication and encryption:

Case 1: Jobs Submitted by the Hive CLI, Embedded Metastore

In this case, all the information needed by Hive is contained within a single process, and no security is needed beyond that already provided by the JobClient's communications.

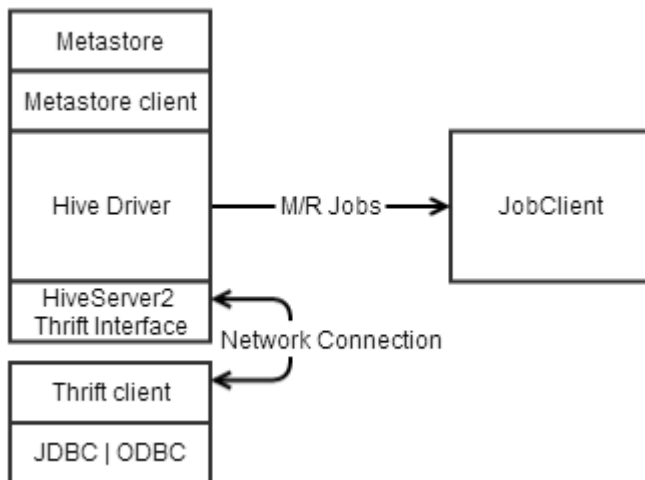

**Case 2: Jobs Submitted by the Hive CLI, Remote Metastore**

In this case, Hive needs to access a metastore remote to Hive's process using a Thrift interface. This communication can be left non-secured, secured with Kerberos, or secured with data-fabric SASL.

**Case 3: Jobs Submitted by HiveServer2, Embedded Metastore**

In this case, JDBC or ODBC on a user's machine sends queries to HiveServer2, which submits the queries to the driver for parsing. The communication between JDBC and HiveServer2 can be secured with username and password with SSL, data-fabric SASL, or with Kerberos. Either approach offers authentication and encryption. JDBC/ODBC can also be configured to use username and password without SSL, which offers authentication *only*.

To use SSL from a client machine the `ssl_truststore` file must be copied from the cluster to the client.

Case 4: Jobs Submitted by HiveServer2, Remote Metastore

In this case, JDBC or ODBC on a user's machine sends queries to HiveServer2, which submits the queries to the driver, which runs the query and returns the results. The metastore is remote. In this case, there are two communications links to secure: the Thrift interface between the metastore client and server, and the Thrift interface between the client JDBC/ODBC and HiveServer2. The security arrangements for these links are identical to Cases 2 and 3.

Getting Started with Hive

In this tutorial, you'll create a Hive table, load data from a tab-delimited text file, and run a couple of basic queries against the table. For details on setting up HiveServer2 and starting BeeLine, see [Using JDBC or Beeline to Connect to HiveServer2](#) on page 3730.

Note: If you are using HiveServer2, you will use the BeeLine CLI instead of the Hive shell, as shown below.

Take a look at the source data

First, take a look at the contents of the file using the terminal:

1. Save the following data to a text file named `sample-table.txt`:

The `sample-table.txt` table columns are delimited by tabs:

```

1320352532    1001    http://www.mapr.com/doc    http://www.mapr.com
192.168.10.1
1320352533    1002    http://www.mapr.com    http://www.example.com
192.168.10.10
1320352546    1001    http://www.mapr.com    http://www.mapr.com/doc
192.168.10.1
  
```

If you are working on the MapR Virtual Machine, we'll be loading the file from the MapR Virtual Machine's local filesystem (not the cluster storage layer), so save the file in the MapR Home directory (for example, `/home/mapr`).

2. Make sure you are in the Home directory where you saved `sample-table.txt` (type `cd ~` if you are not sure).
3. Type `cat sample-table.txt` to display the following output.

```

mapr@mapr-desktop:~$ cat sample-table.txt
1320352532    1001    http://www.mapr.com/doc    http://www.mapr.com
  
```

```
192.168.10.1
1320352533 1002 http://www.mapr.com http://www.example.com
192.168.10.10
1320352546 1001 http://www.mapr.com http://www.mapr.com/doc
192.168.10.1
```

Notice that the file consists of only three lines, each of which contains a row of data fields separated by the TAB character. The data in the file represents a web log.

Create a table in Hive and load the source data:

1. Type the following command to start the Hive shell, using tab-completion to expand the <version>:

```
/opt/mapr/hive/hive-<version>/bin/hive
```

2. At the `hive>` prompt, type the following command to create the table:

```
CREATE TABLE web_log(viewTime INT, userid BIGINT, url STRING, referrer
STRING, ip STRING) ROW FORMAT DELIMITED FIELDS TERMINATED BY '\t';
```

3. Type the following command to load the data from `sample-table.txt` into the table:

```
LOAD DATA LOCAL INPATH '/home/mapr/sample-table.txt' INTO TABLE web_log;
```

Run basic queries against the table

- Try the simplest query, one that displays all the data in the table:

```
SELECT web_log.* FROM web_log;
```

This query would be inadvisable with a large table, but with the small sample table it returns very quickly.

- Try a simple SELECT to extract only data that matches a desired string:

```
SELECT web_log.* FROM web_log WHERE web_log.url LIKE '%doc';
```

This query launches a MapReduce application to filter the data.

Configuring Hive

This section contains the following topics:

Configure Hive Directories

You can configure the following Hive directories:

- Hive Scratch Directory
- Hive Warehouse Directory
- Hive Error Logs Directory

Hive Scratch Directory

In Hive 1.0, HPE Ezmeral Data Fabric configures the Hive scratch directory to be `/user/<user.name>/tmp/hive/<user.name>`. In Hive 0.13, the default scratch directory is `/user/<user.name>/tmp/hive`. The hive user must have write access to the `/user` folder.

To modify this parameter, perform one of the following operations:

- Set this parameter in the `hive-site.xml`. Copy the `hive.exec.scratchdir` property elements from the `$HIVE_HOME/conf/hive-default.xml.template` file and paste them into an XML configuration element in the `$HIVE_HOME/conf/hive-site.xml` file. Then, modify the value elements for these directories in the `hive-site.xml` file.
- Set this parameter from the Hive shell. Example:

```
hive> set hive.exec.scratchdir=/myvolume/tmp
```

Note: You will see better performance when queries import data from a table that is in the same Data Fabric volume as Hive scratch directory.

How Hive Handles Scratch Directories on HPE Ezmeral Data Fabric

When a query requires Hive to query existing tables and create data for new tables, Hive uses the following workflow:

1. Create the query scratch directory `hive_<timestamp>_<randomnumber>` under the Hive scratch directory.
2. Create the following directories as subdirectories of the scratch directory:
 - a. Final query output directory. This directory's name takes the form `-ext-<number>`.
 - b. An output directory for each MapReduce application. These directories' names take the form `-mr-<number>`.
3. Hive executes the tasks, including MapReduce applications and loading data to the query output directory.
4. Hive loads the data from output directory into a table. By default, the table's directory is in the `/user/hive/warehouse` directory. You can configure this location with the `hive.metastore.warehouse.dir` parameter in `hive-site.xml`, unless the table DDL specifies a custom location. Hive renames the output directory to the table directory in order to load the output data to the table.
5. The scratch directories are automatically deleted after the query completes successfully.

HPE Ezmeral Data Fabric uses [Administering Volumes](#) on page 933, which are logical units that enable you to apply policies to a set of files, directories, and sub-volumes. When the output directory and the table directory are in different volumes, this workflow involves moving data across volumes. Moving data across volumes is slower than moving data within a volume. Therefore, HPE Ezmeral Data Fabric sets `hive.optimize.insert.dest.volume` to `true` to automatically create a scratch directory in the same volume as the target table.

Hive Warehouse Directory

Hive tables are stored in the Hive warehouse directory. By default, HPE Ezmeral Data Fabric configures the Hive warehouse directory to be `/user/hive/warehouse` under the root volume. This default is defined in the `$HIVE_HOME/conf/hive-default.xml.template` file.

To modify this parameter, perform one of the following operations:

- Set this parameter in the `hive-site.xml`. Copy the `hive.metastore.warehouse.dir` property elements from the `$HIVE_HOME/conf/hive-default.xml.template` file and paste them into an XML configuration element in the `$HIVE_HOME/conf/hive-site.xml` file. Then, modify the value elements for these directories in the `hive-site.xml` file.

- Set this parameter from the Hive shell. Example:

```
hive> set hive.metastore.warehouse.dir=/myvolume/mydirectory
```

Note: You will see better performance when queries move data between tables in the same volume.

Hive Error Logs Directory

The log files are stored in `/opt/mapr/hive/hive-<version>/logs/<user>` by default.

To modify the log location:

1. Configure `hive.log.dir` in `$HIVE_HOME/conf/hive-log4j.properties` file. Example:

```
hive.log.dir=<other_location>
```

2. Set the sticky bit on the new directory. Example:

```
chmod 1777 <other_location>
```

Configuring Hive Client on Data Fabric Client Node

This topic describes how to configure the Hive client on a Data Fabric client node.

Configuring Hive Client for Previous EEP 8.1.0

To use the Hive client with secure and non-secure clusters for previous EEP 8.1.0, perform the following steps:

1. Install Data Fabric client. See [Installing the Data Fabric Client on CentOS, RedHat, Oracle Linux](#) on page 341.
2. Copy the `daemon.conf` file from the `MAPR_HOME/conf` directory on the cluster to the `MAPR_HOME/conf` directory on the Data Fabric client.

Configuring Hive Client for EEP 8.1.0 and Later

To use the Hive client with secure and non-secure clusters for EEP 8.1.0 and later, perform the following steps:

1. Install Data Fabric client. See [Installing the Data Fabric Client on CentOS, RedHat, Oracle Linux](#) on page 341.
2. Copy the `daemon.conf` file from the `MAPR_HOME/conf` directory on the cluster to the `MAPR_HOME/conf` directory on the Data Fabric client.
3. Copy `maprtrustcreds.jceks` from the `MAPR_HOME/conf` directory on the cluster to the `MAPR_HOME/conf` directory on the Data Fabric client.

Configuring MSCK REPAIR TABLE

This section guides you through configuring `MSCK REPAIR TABLE` command to compare and update the partitions in Hive Metastore and file systems.

Use the `MSCK REPAIR TABLE` command to manually update (ADD, DROP, SYNC) the partitions on Hive metastore with respect to file systems like HDFS, Amazon S3, filesystem, and others.

For example: You specify the location of filesystem when you create a Hive table. When you add or delete the partitions to or from the filesystem, the partitions in filesystem and Hive metastore becomes inconsistent.

Run `MSCK REPAIR TABLE` command to compare the partitions in filesystem and the partitions in Hive metastore and update the partitions in Hive metastore.

```
MSCK [REPAIR] TABLE <table name> [ADD/DROP/SYNC PARTITIONS];
```

Configure the Hive Metastore with the following Hive property:

| Property | Default | Description |
|------------------------------------|---------|---|
| hive.msck.repair.batch.max.retries | 0 | Maximum number of retries for the msck repair command when adding unknown partitions. If the value is greater than zero it will retry adding unknown partitions until the maximum number of attempts is reached or batch size is reduced to 0, whichever is earlier. In each retry attempt, it will reduce the batch size by a factor of 2 until it reaches zero. If the value is set to zero it will retry until the batch size becomes zero as described above. |

Configuring Database for Hive Metastore

The metadata for Hive tables and partitions are stored in the Hive Metastore. By default, the Hive Metastore stores all Hive metadata in an embedded Apache Derby database in the filesystem. The following sections describe how to configure other DBs for Hive Metastore.

 **CAUTION:** Do not use `datanucleus.schema.autoCreateAll` for populating underlying databases. For more details, see [prohibited usage of datanucleus.schema.autoCreateAll property](#).

Use MySQL for the Hive Metastore

The metadata for Hive tables and partitions are stored in the Hive Metastore. By default, the Hive Metastore stores all Hive metadata in an embedded Apache Derby database in the HPE Ezmeral Data Fabric filesystem. Derby only allows one connection at a time; if you want multiple concurrent Hive sessions, you can use MySQL for the Hive Metastore.

Review the following prerequisites before you begin:

- Verify that MySQL (version 5.6.17 or later) is installed on the machine that will host the Hive metastore, and also verify that you can connect to the MySQL server from the Hive machine. You can run the Hive metastore on any machine that is accessible from Hive. You can test this with the following command:

```
mysql -h <hostname> -u <user>
```

- The database administrator must create a database for the Hive metastore data, and the username specified in `javax.jdo.option.ConnectionUserName` must have permissions to access it. The database can be specified using the `ConnectionURL` parameter. The tables and schemas are created automatically when the metastore is first started.

Tip: In MapR 6.1.0 and earlier releases, the following steps can be used interchangeably for MariaDB.

Complete the following steps to configure Hive to use MySQL for the Hive Metastore:

! **Important:** For **MySQL 8**, set the `javax.jdo.option.ConnectionDriverName` property to `com.mysql.cj.jdbc.Driver`. The `com.mysql.jdbc.Driver` is deprecated. The new driver class is `com.mysql.cj.jdbc.Driver`. However, the driver is automatically registered via the Service Provider Interface, so manual loading of the driver class is generally unnecessary.

1. Update the `hive-site.xml` in the Hive configuration directory (`/opt/mapr/hive/hive-<version>/conf`) with the following contents:

```
<configuration>
  <property>
    <name>javax.jdo.option.ConnectionURL</name>
    <value>jdbc:mysql://localhost:3306/hive?
createDatabaseIfNotExist=true</value>
    <description>JDBC connect string for a JDBC metastore</description>
  </property>
  <property>
    <name>javax.jdo.option.ConnectionDriverName</name>
    <value>com.mysql.jdbc.Driver</value>
    <description>Driver class name for a JDBC metastore</description>
  </property>
  <property>
    <name>javax.jdo.option.ConnectionUserName</name>
    <value>root</value>
    <description>username to use against metastore database</description>
  </property>
  <property>
    <name>javax.jdo.option.ConnectionPassword</name>
    <value><fill in with password></value>
    <description>password to use against metastore database</description>
  </property>
  <property>
    <name>hive.metastore.uris</name>
    <value>thrift://localhost:9083</value>
  </property>
</configuration>
```

2. Run the `schematool` command as an initialization step.

```
/opt/mapr/hive/hive-<version>/bin/schematool -dbType mysql -initSchema
```

3. To connect to an existing MySQL metastore, make sure the `ConnectionURL` parameter and the `Thrift URIs` parameters in `hive-site.xml` point to the metastore's host and port.
4. To set a specific port for Thrift URIs, add the command `export METASTORE_PORT=<port>` into the file `hive-env.sh` (if `hive-env.sh` does not exist, create it in the Hive configuration directory). Example:

```
export METASTORE_PORT=9083
```

5. Start the Hive Metastore service using one of the following commands:

If you want the Hive Metastore to be managed by Warden, the maprcli, and the Control System:

```
maprcli node services -name hivemeta -action start -nodes <space
delimited list of nodes>
```

If you want the Hive Metastore to be managed with standard hive commands:

```
/opt/mapr/hive/hive-<version>/bin/hive --service metastore --start
```

You can also use `nohup hive --service metastore` to run the Metastore in the background.

 **Warning:** If you have not configured a MySQL Metastore, do not run the Hive shell from an NFS mount location. If you try to do this, Hive will fail. The same problem will occur if you use the `hive-site.xml` file to configure the Metastore on an NFS mount location. Avoid both of these configurations.

Configuring a Remote MySQL Database for the Hive Metastore

After installing MySQL, perform the following steps to configure Hive Metastore on MySQL

1. Install the MySQL connector. To install:

- **MySQL connector on a RHEL 6+ system**

On the Hive Metastore server host, install `mysql-connector-java` and symbolically link the file to the `/opt/mapr/hive/hive-<version>/lib/` directory.

```
$ sudo yum install
mysql-connector-java
$ ln -s /usr/share/
java/mysql-connector-java.jar /opt/
mapr/hive/hive-<version>/lib/
mysql-connector-java.jar
```

- **MySQL connector on a SLES system**

On the Hive Metastore server host, install `mysql-connector-java` and symbolically link the file to the `/opt/mapr/hive/hive-<version>/lib/` directory.

```
$ sudo zypper install
mysql-connector-java
$ ln -s /usr/share/
java/mysql-connector-java.jar /opt/
mapr/hive/hive-<version>/lib/
mysql-connector-java.jar
```

- **MySQL connector on a Debian/Ubuntu system**

On the Hive Metastore server host, install `mysql-connector-java` and symbolically link the file into the `/opt/mapr/hive/hive-<version>/lib/` directory.

```
$ sudo apt-get install
libmysql-java
$ ln -s /usr/
share/java/libmysql-java.jar /opt/
```

```
mapr/hive/hive-<version>/lib/
mysql-connector-java.jar
```

2. Create the database and an associated user. The following commands are for a Hive Metastore with hostname `metastorehost` to create a MySQL user with name `hive` and password `mypassword`:

```
$ mysql -u root -p

mysql> CREATE DATABASE metastore;
mysql> CREATE USER 'hive'@'metastorehost' IDENTIFIED BY 'mypassword';
...
mysql> REVOKE ALL PRIVILEGES, GRANT OPTION FROM 'hive'@'metastorehost';
mysql> GRANT ALL PRIVILEGES ON metastore.* TO 'hive'@'metastorehost';
mysql> FLUSH PRIVILEGES;
mysql> quit;
```

3. Configure the Metastore service to communicate with the MySQL database by setting the necessary properties (shown below) in the `/opt/mapr/hive//hive-<version>/conf/hive-site.xml` file. Suppose a MySQL database running on `myhost` and the user account `hive` with the password `mypassword`, set the following properties (overwriting any existing values) in the `hive-site.xml` file:

```
<property>
  <name>javax.jdo.option.ConnectionURL</name>
  <value>jdbc:mysql://myhost/metastore</value>
  <description>the URL of the MySQL database</description>
</property>

<property>
  <name>javax.jdo.option.ConnectionDriverName</name>
  <value>com.mysql.jdbc.Driver</value>
</property>

<property>
  <name>javax.jdo.option.ConnectionUserName</name>
  <value>hive</value>
</property>

<property>
  <name>javax.jdo.option.ConnectionPassword</name>
  <value>mypassword</value>
</property>

<property>
  <name>hive.metastore.uris</name>
  <value>thrift://<n.n.n.n>:9083</value>
  <description>IP address (or fully-qualified domain name) and port of
the metastore host</description>
</property>
```

Note: Though you can set the same `hive-site.xml` properties on all the hosts (client, Metastore, HiveServer), `hive.metastore.uris` is the only property that must be configured on all the hosts; the other properties are only needed on the Metastore host.

4. Run `schemaTool` to create the initial DB structure.

```
/opt/mapr/hive/hive-<version>/bin/schematool -dbType mysql -initSchema
```

Configuring a Remote PostgreSQL Database for the Hive Metastore

Before you can run the Hive metastore with a remote PostgreSQL database, you must configure a JDBC driver to the remote PostgreSQL database, set up the initial database schema, and configure the PostgreSQL user account for the Hive user.

After installing PostgreSQL, perform the following steps to configure Hive Metastore on PostgreSQL.

Installing and Configuring PostgreSQL for the Hive Metastore

1. Download the PostgreSQL JDBC driver.

Refer to the official [PostgreSQL JDBC Driver website](#) to download the JDBC driver and get information about the latest updates. Determine the appropriate database version and get the released drivers and JAR file.

2. Run the following commands using `sudo`:

- a. Move the JAR into the Java share directory:

```
sudo mv <postgresql-jdbc.jar> /usr/share/java/postgresql-jdbc.jar
```

- b. Change the access mode of the JAR file to 644:

```
sudo chmod 644 /usr/share/java/postgresql-jdbc.jar
```

- c. Create symbolic link to the `/usr/lib/hive/lib/` directory, for example:

```
sudo ln -s /usr/share/java/postgresql-jdbc.jar /opt/mapr/hive/hive-<version>/lib/postgresql-jdbc.jar
```

3. Create the Metastore database and user accounts:

```
$ sudo -u postgres psql
postgres=# CREATE USER hiveuser WITH PASSWORD 'mypassword';
postgres=# CREATE DATABASE metastore;
```

To verify the connection from the Metastore service host, run the following command:

```
psql -h myhost -U hiveuser -d metastore
metastore=#
```

4. Configure the Metastore service to communicate with the PostgreSQL database by setting the necessary properties (shown below) in the `/opt/mapr/hive/hive-<version>/conf/hive-site.xml` file. Suppose a PostgreSQL database running on host `myhost` under the user account `hive` with the password `mypassword`, set the following configuration properties in the `hive-site.xml` file:

```
<property>
  <name>javax.jdo.option.ConnectionURL</name>
  <value>jdbc:postgresql://myhost/metastore</value>
</property>

<property>
  <name>javax.jdo.option.ConnectionDriverName</name>
  <value>org.postgresql.Driver</value>
</property>

<property>
  <name>javax.jdo.option.ConnectionUserName</name>
  <value>hiveuser</value>
</property>

<property>
  <name>javax.jdo.option.ConnectionPassword</name>
  <value>mypassword</value>
</property>

<property>
  <name>hive.metastore.uris</name>
  <value>thrift://<n.n.n.n>:9083</value>
  <description>IP address (or fully-qualified domain name) and port of
the metastore host</description>
</property>
```

Note: Though you can use the same `hive-site.xml` properties on all the hosts (client, metastore, HiveServer), `hive.metastore.uris` is the only property that must be configured on all of the hosts; the other properties are only needed on the Metastore host.

5. Run `schemaTool` to create the initial DB structure:

```
/opt/mapr/hive/hive-<version>/bin/schematool -dbType postgres -initSchema
```

Configuring a Remote Oracle Database for the Hive Metastore

After installing Oracle, perform the following steps to configure Hive Metastore on Oracle.

1. Install the Oracle JDBC Driver.
 - a) Download the Oracle JDBC Driver (`ojdbc6.jar`) from the Oracle [website](#).
 - b) Move the `ojdbc6.jar` file to `/opt/mapr/hive/hive-<version>/lib/` directory

2. Create the Metastore database and user account.

Connect to your Oracle database as administrator, create the user that will use the Hive Metastore, and create the Metastore schema. For example:

```
$ sqlplus "sys as sysdba"
SQL> create user hiveuser identified by mypassword;
SQL> grant connect to hiveuser;
SQL> grant all privileges to hiveuser;
SQL>CREATE DATABASE metastore
```

3. Configure the Metastore service to communicate with the Oracle database by setting the necessary properties (shown below) in the `/opt/mapr/hive/hive-<version>/conf/hive-site.xml` file.

Suppose an Oracle database running on `myhost` and the user account `hiveuser` with the password `mypassword`, set the following properties (overwriting any existing values) in the `hive-site.xml` file:

```
<property>
  <name>javax.jdo.option.ConnectionURL</name>
  <value>jdbc:oracle:thin:@//myhost/metastore</value>
</property>

<property>
  <name>javax.jdo.option.ConnectionDriverName</name>
  <value>oracle.jdbc.OracleDriver</value>
</property>

<property>
  <name>javax.jdo.option.ConnectionUserName</name>
  <value>hiveuser</value>
</property>

<property>
  <name>javax.jdo.option.ConnectionPassword</name>
  <value>mypassword</value>
</property>

<property>
  <name>hive.metastore.uris</name>
  <value>thrift://<n.n.n.n>:9083</value>
  <description>IP address (or fully-qualified domain name) and port of
the metastore host</description>
</property>
```

Note: Though you can set the same `hive-site.xml` properties on all the hosts (client, Metastore, HiveServer), `hive.metastore.uris` is the only property that must be configured on all the hosts; the other properties are only needed on the Metastore host.

4. Run `schemaTool` to create the initial DB structure.

```
/opt/mapr/hive/hive-<version>/bin/schematool -dbType oracle -initSchema
```

Configuring an Oracle Schema

You must create schemas for Oracle databases manually.

Use `schematool` to view and create relational database management system (RDBMS) schemas.

See [Apache Hive documentation](#) for the detailed steps.

Configuring a Remote MS SQL SERVER Database for the Hive Metastore

After installing MS SQL, perform the following steps to configure Hive Metastore on MS SQL.

1. Create hiveuser and Metastore schema.

```
1>CREATE DATABASE metastore;  
2>GO  
1>CREATE LOGIN <hiveuser> with password='<mypassword>;  
2>CREATE USER <hiveuser> for login <hiveuser>;  
3>GRANT <PRIVILEGES> to <hiveuser>;  
4>GO
```

2. Download JDBC Driver from [here](#), untar the file, and follow instructions in the `install.txt` file to install the driver.

3. Copy the JAR file to `/opt/mapr/hive/hive-version>/lib/` directory.

- For Java 7

```
cp ~/sqljdbc_6.0/enu/jre7/sqljdbc41.jar /opt/mapr/hive/  
hive-<version>/lib/
```

- For Java 8

```
cp ~/sqljdbc_6.0/enu/jre8/sqljdbc42.jar /opt/mapr/hive/  
hive-<version>/lib/
```

- Configure the Metastore service to communicate with the MS SQL database by setting the necessary properties (shown below) in the `/opt/mapr/hive/hive-<version>/conf/hive-site.xml` file. Suppose an MS SQL database running on `myhost` and the user account `hiveuser` with the password `mypassword`, set the following properties (overwriting any existing values) in the `hive-site.xml` file:

```
<property>
  <name>javax.jdo.option.ConnectionURL</name>
  <value>jdbc:sqlserver://<SERVER_NAME>:1433;DatabaseName=metastore;</value>
</property>

<property>
  <name>javax.jdo.option.ConnectionDriverName</name>
  <value>com.microsoft.sqlserver.jdbc.SQLServerDriver</value>
</property>

<property>
  <name>javax.jdo.option.ConnectionUserName</name>
  <value>hiveuser</value>
</property>

<property>
  <name>javax.jdo.option.ConnectionPassword</name>
  <value>mypassword</value>
</property>

<property>
  <name>hive.metastore.uris</name>
  <value>thrift://<n.n.n.n>:9083</value>
  <description>IP address (or fully-qualified domain name) and port of
the metastore host</description>
</property>
```

Note: Though you can set the same `hive-site.xml` properties on all the hosts (client, Metastore, HiveServer), `hive.metastore.uris` is the only property that must be configured on all the hosts; the other properties are only needed on the Metastore host.

- Run `schemaTool` to create the initial DB structure.

```
/opt/mapr/hive/hive-<version>/bin/schematool -dbType mssql -initSchema
```

Configuring MariaDB for the Hive Metastore

Installing MariaDB

To install MariaDB, use the MariaDB Repository Configuration Tool. See [MariaDB Downloads](#).

Configuring Repositories

The following steps describe how to configure a repository and install the latest available stable version of MariaDB for different operating systems.

- Configure a repository for MariaDB:

- **Red Hat / CentOS and SLES**

Copy and paste the following custom MariaDB repository entry into a file under `/etc/yum.repos.d/`. You can name the file `MariaDB.repo` or something similar:

```
# MariaDB 10.4 RedHat repository list
# http://downloads.mariadb.org/mariadb/repositories/
[mariadb]
name = MariaDB
baseurl = http://yum.mariadb.org/10.4/rhel7-amd64
gpgkey=https://yum.mariadb.org/RPM-GPG-KEY-MariaDB
gpgcheck=1
```

- **Ubuntu**

You can also create a custom MariaDB `sources.list` file. To do so, after importing the signing key as outlined above, copy and paste the following into a file under `/etc/apt/sources.list.d/`. You can name the file `MariaDB.list` or something similar. Or you can add it to the bottom of your `/etc/apt/sources.list` file:

```
# MariaDB 10.4 repository list - created 2020-04-17 08:34 UTC
# http://downloads.mariadb.org/mariadb/repositories/
deb [arch=amd64,arm64,ppc64el] http://mirror.mephi.ru/mariadb/repo/
10.4/ubuntu bionic main
deb-src http://mirror.mephi.ru/mariadb/repo/10.4/ubuntu bionic main
```

2. After the `sources.list` file is in place, install MariaDB:

- **Red Hat / CentOS**

```
sudo yum clean all && sudo yum install MariaDB-server MariaDB-client
```

- **SLES**

```
sudo zypper update && sudo zypper install mariadb
```

- **Ubuntu**

```
sudo apt update && sudo apt install mariadb-server
```

3. Start the MariaDB server:

- **Red Hat / CentOS and Ubuntu**

```
sudo service mariadb start
```

- **SLES**

```
sudo systemctl start mariadb
```

4. In the command line, run the `mysql_secure_installation` shell script:

```
sudo mysql_secure_installation
Enter current password for root (enter for none): press Enter
Set root password? Y
New password: Type new root password
Re-enter new password: Confirm the password
Remove anonymous users? Y
Disallow root login remotely? Y
Remove test database and access to it? Y
Reload privilege tables now? Y
```

Configuring a JDBC Driver for MariaDB

Before you can run the Hive Metastore with a MariaDB database, you must:

- Configure a JDBC driver for the MariaDB database.
- Set up the initial database schema.
- Configure the MariaDB user account for the Hive user.

Use the following steps:

1. Install the MariaDB Connector/J manually with a `.jar` file. The MariaDB Connector/J can also be installed by manually installing a `.jar` file to a directory in your CLASSPATH. Download the MariaDB Connector/J `.jar` files from the following URL: <https://downloads.mariadb.com/Connectors/java/connector-java-2.5.4/>.
2. Copy the `.jar` files to the `/opt/mapr/hive/hive-<version>/lib/` directory:

```
cp mariadb-java-client-2.5.4-sources.jar /opt/mapr/hive-<version>/lib/
cp mariadb-java-client-2.5.4.jar /opt/mapr/hive/hive-<version>/lib/
cp mariadb-java-client-2.5.4-javadoc.jar /opt/mapr/hive/
hive-<version>/lib/
```

3. Restart Hive services:

```
maprcli node services -name hivemeta -action restart -nodes 'hostname -f'
maprcli node services -name hs2 -action restart -nodes 'hostname -f'
```

4. Create the Hive Metastore database and user accounts:

```
$ mysql -u root -p <password>

MariaDB [(none)]> CREATE USER hiveuser IDENTIFIED BY PASSWORD 'password';
MariaDB [(none)]> CREATE DATABASE metastore;
MariaDB [(none)]> REVOKE ALL PRIVILEGES, GRANT OPTION FROM
'hiveuser'@'metastorehost';
MariaDB [(none)]> GRANT ALL PRIVILEGES ON metastore.* TO
'hiveuser'@'metastorehost';
MariaDB [(none)]> FLUSH PRIVILEGES;
MariaDB [(none)]> quit;
```

Configuring the Hive Metastore on MariaDB

Use these steps:

1. In the Hive configuration directory (`/opt/mapr/hive/hive-<version>/conf`), update the `hive-site.xml` file with the following properties. Beginning with EEP 7.0.0, you must use the MySQL driver with MariaDB:

```
<property>
  <description>the URL of the MariaDB database</description>
  <name>javax.jdo.option.ConnectionURL</name>
  <value>jdbc:mysql://<hostname>:3306/metastore</value>
</property>
<property>
  <name>javax.jdo.option.ConnectionDriverName</name>
  <value>org.mariadb.jdbc.Driver</value>
</property>
<property>
  <name>javax.jdo.option.ConnectionUserName</name>
  <value>hiveuser</value>
</property>
<property>
  <name>javax.jdo.option.ConnectionPassword</name>
  <value><fill in with password></value>
</property>
<property>
  <description>IP address (or FQDN) and port of the metastore host</
description>
  <name>hive.metastore.uris</name>
  <value>thrift://<hostname>:9083</value>
</property>
```

2. Run the `schematool` command as an initialization step:

```
/opt/mapr/hive/hive-<version>/bin/schematool -dbType mysql -initSchema
```

User Impersonation for Hive

User impersonation enables Hive to submit jobs as a particular user. Without impersonation, Hive submits queries and hadoop commands as the user that started HiveServer2 and Hive Metastore. On a MapR cluster, this user is typically the `mapr` user or the user specified in the `MAPR_USER` [environment variable](#).

Note: Impersonation is enabled by default.

Enable User Impersonation

On non-secure clusters

1. Set the following properties in the `/opt/mapr/hive/<version>/conf/hive-site.xml` file on the nodes where HiveServer2 is installed:

```
<property>
  <name>hive.server2.enable.doAs</name>
  <value>true</value>
  <description>Set this property to enable impersonation in Hive Server
  2</description>
</property>
<property>
  <name>hive.metastore.execute.setugi</name>
  <value>true</value>
  <description>Set this property to enable Hive Metastore service
  impersonation in non-secure mode. In non-secure mode, setting this
  property to true will cause the metastore to execute DFS operations
  using the client's reported user and group permissions. Note that this
  property must be set on both the client and server sides. If the client
  sets it to true and the server sets it to false, the client setting will
  be ignored.</description>
</property>
```

2. Set the following property `/opt/mapr/hive/<version>/conf/hive-site.xml` file on the nodes where Hive Metastore is installed:

```
<property>
  <name>hive.metastore.execute.setugi</name>
  <value>true</value>
  <description>Set this property to enable Hive Metastore service
  impersonation in non-secure mode. In non-secure mode, setting this
  property to true will cause the metastore to execute DFS operations
  using the client's reported user and group permissions. Note that this
  property must be set on both the client and server sides. If the client
  sets it to true and the server sets it to false, the client setting will
  be ignored.</description>
</property>
```

On secure (MAPR-SASL and Kerberos) clusters

1. Set the following properties in the `/opt/mapr/hive/<version>/conf/hive-site.xml` file on the nodes where HiveServer2 is installed:

```
<property>
  <name>hive.server2.enable.doAs</name>
  <value>true</value>
  <description>Set this property to enable impersonation in Hive Server
  2</description>
</property>
<property>
  <name>hive.metastore.execute.setugi</name>
  <value>>false</value>
  <description>Set this property to enable Hive Metastore service
  impersonation in non-secure mode. In non-secure mode, setting this
  property to true will cause the metastore to execute DFS operations
  using the client's reported user and group permissions. Note that this
  property must be set on both the client and server sides. If the client
  sets it to true and the server sets it to false, the client setting will
  be ignored.</description>
</property>
```

2. Set the following property `/opt/mapr/hive/<version>/conf/hive-site.xml` file on the nodes where Hive Metastore is installed:

```
<property>
  <name>hive.metastore.execute.setugi</name>
  <value>>false</value>
  <description>Set this property to enable Hive Metastore service
  impersonation in non-secure mode. In non-secure mode, setting this
  property to true will cause the metastore to execute DFS operations
  using the client's reported user and group permissions. Note that this
  property must be set on both the client and server sides. If the client
  sets it to true and the server sets it to false, the client setting will
  be ignored.</description>
</property>
```

Note: The `hive.metastore.execute.setugi` property is set to false automatically after `/opt/mapr/server/configure.sh -R` is running.

On both secure and non-secure clusters

On nodes where the **Resource Manager** and the **Node Manager** are installed, set the following properties in the `/opt/mapr/hadoop/hadoop-<version>/etc/hadoop/core-site.xml` file:

```
<property>
  <name>hadoop.proxyuser.mapr.groups</name>
  <value>*</value>
  <description>Allow the superuser mapr to impersonate any member of any
  group</description>
</property>
<property>
  <name>hadoop.proxyuser.mapr.hosts</name>
  <value>*</value>
  <description>The superuser can connect from any host to impersonate a
  user</description>
</property>
```

Warning: The impersonated user must have write permissions to `/user/hive/warehouse` and `/user/mapr-user/tmp/hive` directories.

Verify that User Impersonation is Enabled

To verify that Hive queries do not run as the `mapr` user, connect to HiveServer2 as a user other than `mapr`. Then run queries and verify that queries were run as the user that connected to HiveServer2.

To verify that hadoop commands submitted by Hive do not run as the `mapr` user, start the shell or connect to HiveServer2 as a user other than `mapr`. Then create some tables, and verify that the tables in `/user/hive/warehouse` are created under the user that started the shell or the user connected to HiveServer2.

Example: Hive Impersonation

The following examples illustrate Hive impersonation:

Example 1

1. Log in as a non-`mapr` user and generate a MapR ticket:

```
$ su mapruser1
$ maprlogin password
```

2. Connect to HiveServer2:

```
$ hive --service beeline
Beeline version 2.3.3-mapr-SNAPSHOT by Apache Hive
beeline> !connect jdbc:hive2://node4.cluster.com:10000/
default;ssl=true;auth=maprsasl
Connecting to jdbc:hive2://node4.cluster.com:10000/
default;ssl=true;auth=maprsasl
Connected to: Apache Hive (version 2.3.3-mapr-SNAPSHOT)
Driver: Hive JDBC (version 2.3.3-mapr-SNAPSHOT)
Transaction isolation: TRANSACTION_REPEATABLE_READ
```

3. Create a table, and upload data:

```
0: jdbc:hive2://node4.cluster.com:10000/defau> create table
impersonation_example_first (id int, username string);
0: jdbc:hive2://node4.cluster.com:10000/defau> insert into
impersonation_example_first values (1, 'mapruser1');
```

4. To check that impersonation works, use the following commands to check the `/warehouse` directory of the MapR file system:

```
$ hadoop fs -ls /user/hive/warehouse
Found 1 items
drwxr-xr-x - mapruser1 mapruser1 1 2019-05-22 14:40
/user/hive/warehouse/impersonation_example_first

$ hadoop fs -ls /user/hive/warehouse/impersonation_example_first
Found 1 items
-rwxrwxrwx 3 mapruser1 mapruser1 12 2019-10-15 07:21
/user/hive/warehouse/impersonation_example_first/000000_0
```

Example 2

1. Generate a MapR ticket for a non-mapr user.
2. Connect through JDBC using the `hive.server2.proxy.user` option with a non-mapr user name as an argument:

```
$ hive --service beeline
beeline> !connect
jdbc:hive2://node4.cluster.com:10000/
default;auth=maprsasl;ssl=true;hive.server2.proxy.user=mapruser1
Connecting to
jdbc:hive2://node4.cluster.com:10000/
default;auth=maprsasl;ssl=true;hive.server2.proxy.user=mapruser1
Client: auth-conf,auth-int,auth.Using Server one
Connected to: Apache Hive (version 2.3.3-mapr-SNAPSHOT)
Driver: Hive JDBC (version 2.3.3-mapr-SNAPSHOT)
Transaction isolation: TRANSACTION_REPEATABLE_READ
```

3. Create a table and upload data:

```
0: jdbc:hive2://node4.cluster.com:10000/default> create table
impersonation_example_second (id int);
0: jdbc:hive2://node4.cluster.com:10000/default> insert into table
impersonation_example_second values (1), (2), (3), (5);
```

4. Check the owner of the table and data:

```
$ hadoop fs -ls /user/hive/warehouse/impersonation_example_second
Found 1 items
drwxrwxrwx - mapruser1 mapruser1 1 2019-05-23 12:29
/user/hive/warehouse/impersonation_example_second

$ hadoop fs -ls /user/hive/warehouse/impersonation_example_second
Found 1 items
-rwxrwxrwx 3 mapruser1 mapruser1 8 2019-05-23 12:29
/user/hive/warehouse/impersonation_example_second/000000_0
```

Hive Security

You can configure the following features for Hive security:

Hive Security Configuration Options

This section describes changes made in Hive default configuration. It shows how to configure Hive after manual installation.

Unlike the previous releases, starting in EEP 4.0, Hive should be configured by running the `$MAPR_HOME/server/configure.sh` script with the `-R` option after installing Hive. Hive demons will not start automatically if Hive is not configured correctly. The security configuration are described in the following sections:

1. Automatic
2. Manual
3. Custom

Note: Do not use ecosystem `$HIVE_HOME/bin/configure.sh` script for Hive configuration. Every configuration of Hive should be done via the `$MAPR_HOME/server/configure.sh` utility by running it with the `-R` option. The core `$MAPR_HOME/server/configure.sh` utility invokes the ecosystem `configure.sh` script automatically with appropriate security option.

Automatic

If you installed Hive using the MapR Installer, the MapR Installer configures Hive daemons during installation. Additional configuration is not required.

Manual

After a new manual installation, to generate a valid default ecosystem configuration, run:

```
$MAPR_HOME/server/configure.sh -R
```

Table

| Node, Package | Hive | HiveServer2 | Hive Metastore | WebHCat |
|---------------|------|-------------|----------------|---------|
| Node 1 | X | X | | |
| Node 2 | X | | X | |
| Node 3 | X | | | X |

- After a manual installation, run the following command on Node 1, Node 2, and Node 3:

```
$MAPR_HOME/server/configure.sh -R
```

As a result:

- All Hive daemons are configured to support MapR-SASL. If the `hive.metastore.sasl.enabled` property is enabled in the `hive-site.xml` file, its value is set to `true`. If the property is not present, it is added in the `configuration` section as follows:

```
<property>
  <name>hive.metastore.sasl.enabled</name>
  <value>true</value>
</property>
```

- HiveServer2 is configured to support encryption between Hiveserver2 and Hive clients. If the `hive.server2.thrift.sasl.qop` property is available in the `hive-site.xml` file, its value is set to `auth-conf`. If the property is not present, it is added in the `configuration` section as follows:

```
<property>
  <name>hive.server2.thrift.sasl.qop</name>
  <value>auth-conf</value>
</property>
```

- The `configure.sh` script creates a backup folder for the current Hive configuration before it changes the configuration. All configuration properties including `*.conf`, `*.properties`, and `*.xml` are saved in the backup folder.

```
$HIVE_HOME/conf.YYYYMMDD_HHMMSS
```

- 644 Unix permissions are applied to all configuration files. Each run of `configure.sh` with the `-R` option overwrites permissions of the configuration files to 644.
- The Hive default ports listed below are verified as available. If a port is not available, the `configure.sh` script generates an error message during configuration.

Hive default ports are as follows:

| Role | Default Port |
|----------------|--------------|
| Hive Metastore | 9083 |
| HiveServer2 | 10000 |
| HiveWebHCat | 50111 |

Custom

For PAM, LDAP, and Kerberos custom configurations, run `configure.sh` with the `-R` option:

```
$MAPR_HOME/server/configure.sh -R
```

The `hive-site.xml` file is not changed. However, Warden files are copied and a `HIVE_HOME/conf` backup folder is created.

Preventing a Non-Administrative User from Installing Hooks

For a fresh install of EEP 6.1, a non-administrative user is prevented from installing hooks by default. For a minor version update (for example, EEP 6.0.0 to EEP 6.1.0 or EEP 5.0.1 to EEP 5.0.2), you need to modify the Hive configuration to prevent a malicious user from using Hive hooks to install malware on your MapR cluster.

In general, a hook is a mechanism for intercepting events, messages, or function calls during processing. Hive hooks are a mechanism to tie into the internal workings of Hive without the need of re-compiling Hive. Hive hooks, in this sense, provide the ability to extend and integrate external functionality with Hive.

Any user using beeline can install Java code as a Hive hook. On the MapR platform, these hooks run as the `mapr` user, which could represent a security vulnerability. To prevent a malicious user from using Hive hooks to install malware on a MapR cluster, the cluster admin should add the following properties to the default value of `hive.conf.restricted.list` in the `hive-site.xml` file, and then restart HiveServer 2 (HS2):

- `hive.exec.pre.hooks`
- `hive.exec.post.hooks`
- `hive.exec.failure.hooks`
- `hive.exec.query.redactor.hooks`

Adding the properties prevents a non-admin user from installing hooks into Hive.

1. Add all hook-related properties to the default value of `hive.conf.restricted.list` in the `hive-site.xml` file:

Hive 2.3

- `hive.exec.pre.hooks`
- `hive.exec.post.hooks`
- `hive.exec.failure.hooks`

- `hive.exec.query.redactor.hooks`
- `hive.semantic.analyzer.hook`
- `hive.query.lifetime.hooks`
- `hive.exec.driver.run.hooks`
- `hive.server2.session.hook`

Hive 2.1

- `hive.exec.pre.hooks`
- `hive.exec.post.hooks`
- `hive.exec.failure.hooks`
- `hive.exec.query.redactor.hooks`
- `hive.semantic.analyzer.hook`
- `hive.exec.driver.run.hooks`
- `hive.server2.session.hook`

2. Make sure `hive.conf.restricted.list` configuration parameter already has a default value which contains:

Hive 2.3

```
hive.security.authenticator.manager
hive.security.authorization.manager
Hive.security.metastore.authorization.manager
hive.security.metastore.authenticator.manager
Hive.users.in.admin.role,hive.server2.xsrf.filter.enabled
hive.security.authorization.enabled
hive.server2.authentication.ldap.basedn
hive.server2.authentication.ldap.url
hive.server2.authentication.ldap.Domain
hive.server2.authentication.ldap.groupDNPattern
hive.server2.authentication.ldap.groupFilter
hive.server2.authentication.ldap.useRDNPattern
hive.server2.authentication.ldap.useRFilter
hive.server2.authentication.ldap.groupMembershipKey
hive.server2.authentication.ldap.useRMembershipKey
hive.server2.authentication.ldap.groupClassKey
hive.server2.authentication.ldap.customLDAPQuery
```

Hive 2.1

```
hive.security.authenticator.manager
hive.security.authorization.manager
hive.users.in.admin.role
hive.server2.xsrf.filter.enabled
```

3. Add the default values already present in `hive.conf.restricted.list` to the `hive-site.xml` file:

Hive 2.3

```
<property>
  <name>hive.conf.restricted.list</
name>
  <value>

hive.security.authenticator.manager,
hive.security.authorization.manager,
hive.security.metastore.authorizatio
n.manager,
hive.security.metastore.authenticato
r.manager,
hive.users.in.admin.role,hive.server
2.xsrf.filter.enabled,
hive.security.authorization.enabled,
hive.server2.authentication.ldap.bas
eDN,
hive.server2.authentication.ldap.url
,
hive.server2.authentication.ldap.Dom
ain,
hive.server2.authentication.ldap.gro
upDNPattern,
hive.server2.authentication.ldap.gro
upFilter,
hive.server2.authentication.ldap.use
rDNPattern,
hive.server2.authentication.ldap.use
rFilter,
hive.server2.authentication.ldap.gro
upMembershipKey,
hive.server2.authentication.ldap.use
rMembershipKey,
hive.server2.authentication.ldap.gro
upClassKey,
hive.server2.authentication.ldap.cus
```

```
tomLDAPQuery,
    hive.exec.pre.hooks,
    hive.exec.post.hooks,
    hive.exec.failure.hooks,
    hive.exec.query.redactor.hooks,
    hive.semantic.analyzer.hook,
    hive.query.lifetime.hooks,
    hive.exec.driver.run.hooks,
    hive.server2.session.hook,
  </value>
</property>
```

Hive 2.1

```
<property>
  <name>hive.conf.restricted.list</
name>
  <value>

hive.security.authenticator.manager,
hive.security.authorization.manager,
  hive.users.in.admin.role,

hive.server2.xsrf.filter.enabled,
  hive.exec.pre.hooks,
  hive.exec.post.hooks,
  hive.exec.failure.hooks,
  hive.exec.query.redactor.hooks,
  hive.semantic.analyzer.hook,
  hive.exec.driver.run.hooks,
  hive.server2.session.hook,
  </value>
</property>
```

Note: Values of the `hive.conf.restricted.list` are split into separate lines for better readability. In the actual `hive-site.xml` file, no spaces or newlines exist between the commas.

Configuring Security Headers for Web Servers

This section describes how to configure response headers for REST API servers used in Hive WebHCat and the HiveServer2 web UI.

About the Headers File

The XML file with security headers is located at:

```
/opt/mapr/hive/hive-<version>/conf/headres.xml
```

The `headres.xml` file contains the following headers:

```
<?xml version="1.0" encoding="utf-8" ?>
<!DOCTYPE properties SYSTEM "http://java.sun.com/dtd/properties.dtd">
<properties>
  <entry key="X-Content-Type-Options">nosniff</entry>
  <entry key="X-XSS-Protection">1; mode=block</entry>
  <entry key="Strict-Transport-Security">max-age=31536000;
includeSubDomains</entry>
  <entry key="Content-Security-Policy">default-src https:</entry>
</properties>
```

This table describes each header:

| Header | Description | Default Value |
|---------------------------|--|------------------------------------|
| X-XSS-Protection | Stops pages from loading when reflected cross-site scripting (XSS) is detected. Supported by IE, Chrome, and Safari. | 1: mode=block |
| X-Content-Type-Options | Indicates that the MIME types advertised in the Content-Type headers should not be changed and should be followed. | nosniff |
| Strict-Transport-Security | Tells all browsers that the website should only be accessed using HTTPS instead of using HTTP. | max-age=31536000;includeSubDomains |
| Content-Security-Policy | Allows web-site administrators to control resources the user agent is allowed to load for a given page. This helps guard against cross-site scripting attacks (XSS). | default-src https: |

Configuring Security Headers for WebHCat

To enable security headers for WebHCat, add the following to the `webhcat-site.xml` file, and replace `<version>` with your Hive version:

```
<property>
<name>templeton.jetty.response.headers.file</name>
<value>/opt/mapr/hive/hive-<version>/conf/headers.xml</value>
</property>
```

After configuring and restarting WebHCat, you should see security headers in the server response. For example:

```
< HTTP/1.1 200 OK
< Date: Thu, 03 Oct 2019 11:35:39 GMT
< Set-Cookie:
hadoop.auth="u=mapr&p=mapr&t=multiauth&e=1570138539451&s=CpX+tI7sScnnSUZpAlK
df+7hamM="; Path=/; Domain=.cluster.com; Expires=Thu, 03-Oct-2019 21:35:39
GMT; Secure; HttpOnly
< Content-Security-Policy: default-src https:
< X-XSS-Protection: 1; mode=block
< X-Content-Type-Options: nosniff
< Strict-Transport-Security: max-age=31536000
< Content-Type: application/json
< Transfer-Encoding: chunked
< Server: Jetty(9.4.19.v20190610)
```

Configuring Security Headers for HiveServer2 Web UI

To enable security headers for the Hiveserver2 Web UI, add the following to the `hive-site.xml` file, replacing `<version>` with your Hive version:

```
<property>
  <name>hive.server2.webui.jetty.response.headers.file</name>
  <value>/opt/mapr/hive/hive-<version>/conf/headers.xml</value>
</property>
```

Then restart HiveServer2.

Configuring Custom Headers

To configure custom headers for web servers, edit the `headers.xml` file, and add `Custom-header` as follows:

```
<entry key="Custom-header">custom-value</entry>
```

Security Headers Auto-Configuration

If you install Hive on a secure cluster (MapR SASL or Kerberos) and run the following command after Hive installation, Hive automatically configures itself to enable security headers, and no additional action is needed:

```
/opt/mapr/server/configure.sh -R
```

Hive Authentication

The authentication method that you configure for the Hive Metastore, HiveServer2, and WebHcat determines how these Hive components access and connect to each other.

Clients of these components may require additional configuration and specific connection strings based on the selected authentication method.

To enable and use authentication for Hive, complete the following steps:

1. Determine which authentication methods are supported for each component and its clients.
2. Configure authentication for Hive components and their clients. See the following topics:
 - [Authentication for Hive Metastore](#)
 - [Authentication for HiveServer2](#)
 - [Authentication for WebHCat](#)
3. Determine how clients connect to each component. See [Connecting to Hive](#).

Hive Metastore Authentication Support

The following table describes the different supported authentication methods for Hive Metastore and how it impacts the authentication options for its clients:

| MapR Cluster | Hive Metastore (Remote) Authentication | HiveServer 2 Authentication Options | WebHCat Authentication Options |
|--------------|--|---|--------------------------------------|
| Secure | NONE | <ul style="list-style-type: none"> • NONE • KERBEROS • LDAP • PAM • CUSTOM • MAPRSASL • NOSASL | PAM |
| Secure | KERBEROS | KERBEROS | KERBEROS with SPNEGO |
| Secure | MAPRSASL (default)* | MAPRSASL (default)* | PAM |

| MapR Cluster | Hive Metastore (Remote) Authentication | HiveServer 2 Authentication Options | WebHCat Authentication Options |
|--------------|--|-------------------------------------|---|
| Not Secure | NONE | NONE | Simple authentication with <user.name> only |

*As of Hive 0.13-1504 and Hive 1.0-1504, Hive Metastore supports MapR-SASL and MapR-SASL is enabled by default when the MapR cluster is secure.

HiveServer2 Authentication Support

The following table describes the different supported authentication option for HiveServer2 based on the authentication method configured for Hive Metastore:

| MapR Cluster | Hive Metastore (Remote) Authentication | HiveServer 2 Authentication Options |
|--------------|--|-------------------------------------|
| Secure | NONE | NONE |
| Secure | NONE | KERBEROS |
| Secure | NONE | LDAP |
| Secure | NONE | PAM (default)* |
| Secure | NONE | CUSTOM |
| Secure | NONE | MAPRSASL* |
| Secure | KERBEROS | KERBEROS |
| Secure | MAPRSASL (default)* | MAPRSASL* |
| Not Secure | NONE | NONE |

*As of Hive 0.13-1510, Hive 1.0-1510, and Hive 1.2.1-1510, PAM and MapR-SASL are enabled by default when the cluster is secure. In Hive 0.13-1508 and Hive 1.0-1508, PAM is enabled by default when the cluster is secure. In Hive 0.13-1504 and Hive 1.0-1504, MapR-SASL is supported and enabled by default when the MapR cluster is secure.

Clients of HiveServer2 authenticate with the same authentication method that is configured for HiveServer2. Clients of HiveServer 2 include ODBC, JDBC, and Beeline.

Note: Connections to HiveServer2 using ODBC do not support MapR-SASL.

WebHCat Authentication Support

The following table describes the different authentication options for WebHCat based on the authentication method configured for Hive Metastore :

| MapR Cluster | Hive Metastore (Remote) Authentication | WebHCat Authentication |
|--------------|--|---|
| Secure | KERBEROS | KERBEROS with SPNEGO |
| Secure | KERBEROS | PAM |
| Secure | MAPRSASL (default)* | PAM |
| Not Secure | NONE | Simple authentication with user.name only |

| MapR Cluster | Hive Metastore (Remote) Authentication | WebHCat Authentication |
|---|--|------------------------|
| *As of Hive 0.13-1504 and Hive 1.0-1504, Hive Metastore supports MapR-SASL and MapR-SASL is enabled by default when the MapR cluster is secure. | | |

Clients of WebHCat authenticate with the same authentication method that is configured for WebHCat. Web browsers are clients of WebHCat.

Description of Security Values

The following table describes the different security values:

| Authentication Options | Description |
|------------------------|---|
| NONE | No authentication check |
| LDAP | LDAP/AD based authentication |
| KERBEROS | Kerberos/GSSAPI authentication |
| CUSTOM | Custom authentication provider (use with property <code>hive.server2.custom.authentication.class</code>) |
| PAM | Pluggable authentication module |
| NOSASL | Raw transport |
| MAPRSASL | MapR SASL security |

Authentication for Hive Metastore

You can configure authentication for in-bound client connections to the Hive Metastore when the metastore is remote, not embedded. Clients of Hive Metastore include the HiveCLI, HCatalog, HiveServer2, and WebHCat.

Hive Metastore supports the following authentication methods:

- MapR-SASL authentication
- Kerberos Authentication

MapR-SASL Authentication

MapR-SASL is available starting with the 1504 release of Hive 0.13 and Hive 1.0 and it is the default authentication method when the cluster is secure.

Kerberos Authentication

When the cluster is secure, you can configure Hive Metastore to use Kerberos authentication. You must also configure Hive Metastore clients to use Kerberos when authenticating with Hive Metastore.

Configuring Hive Metastore Authentication

This section describes how to configure the `hive.metastore.authentication` property for secured and unsecured clusters. It describes cases when the property must be configured explicitly and when it can be omitted from `hive-site.xml`.

Hive Metastore supports two types of authentication: `MAPRSASL` and `KERBEROS`. At startup, Hive Metastore reads the system property `metastore.auth`. If `metastore.auth` is equal to null, then the authentication type is `NONE`. Otherwise, Hive Metastore takes the value of the

system property `metastore.auth` and assigns it to the Hive Metastore configuration property `hive.metastore.authentication`.

You do not need to set up the `metastore.auth` system property manually. If a cluster is secured, Hive assigns the `MAPRSASL` value to the `metastore.auth` property. If a cluster is not secured, Hive assigns the `NONE` value to the `metastore.auth` property.

To enable Kerberos authentication, set the value of `hive.metastore.authentication` directly in `hive-site.xml`, as shown in the following table:

Table

| Security | Value of <code>hive.metastore.authentication</code> | Notes |
|--------------------|---|--|
| No security | NONE | The value is set automatically. You do not need to make an entry in <code>hive-site.xml</code> . |
| MapR SASL security | MAPRSASL | The value is set automatically. You do not need to make an entry in <code>hive-site.xml</code> . |
| Kerberos security | KERBEROS | You must make the following entry in <code>hive-site.xml</code> : <pre><property> <name>hive.metastore.authentication</name> <value>KERBEROS</value> </property></pre> |

Configure Hive Metastore to use MapR-SASL

Edit the `/opt/mapr/conf/env.sh` file and set the following properties:

```
MAPR_HIVE_LOGIN_OPTS="-Dhadoop.login=maprsasl"
MAPR_HIVE_SERVER_LOGIN_OPTS="-Dhadoop.login=maprsasl_keytab"
```

Configuring Hive Metastore Clients to use MapR-SASL

The Hive metastore clients are configured to use MapR-SASL when authenticating with Hive Metastore.

Note: Hive Metastore clients must provide a valid MapR ticket to connect to the Hive Metastore. See [Connecting to Hive](#) on page 3729 for details.

1. Ensure that the cluster is secure.
2. Edit the `/opt/mapr/conf/env.sh` file and set the following property:

```
MAPR_HIVE_LOGIN_OPTS="-Dhadoop.login=maprsasl"
```

Configure Hive Metastore to use Kerberos

Enabling Hive Metastore to use Kerberos authentication requires a kerberos principal, kerberos keytab, and the following configurations.

Complete the following steps on each node where a Hive Metastore is installed:

1. Create a Kerberos server identity and add it to a keytab file. You can use the following commands in a Linux-based Kerberos environment to set up the identity and update the keytab file:

Note: MapR clusters do not provide Kerberos infrastructure. The tips in this step assume a Linux-based Kerberos environment, and the specific commands for your environment may vary. Consult with your Kerberos administrator for assistance.

```
# kadmin
: addprinc -randkey username/<FQDN@REALM>
: ktadd -k /opt/mapr/conf/hive.keytab username/<FQDN@REALM>
```

The `hive.keytab` file must be owned and readable only by the `mapr` user.

2. Configure the following properties in the following file:

```
/opt/mapr/hive/hive-<version>/conf/hive-site.xml
```

| Property | Value |
|--|---|
| <code>hive.metastore.kerberos.keytab.file</code> | The Keytab file that contains the HiveMetastore principal. |
| <code>hive.metastore.kerberos.principal</code> | <The HiveMetastore principal. For example, <code>mapr/<FQDN@REALM>.</code></code> |

```
<property>
  <name>hive.metastore.kerberos.keytab.file</name>
  <value>/opt/mapr/conf/metastore.keytab</value>
  <description>The path to the Kerberos Keytab file
  containing the metastore thrift server's service principal.</
  description>
</property>
<property>
  <name>hive.metastore.kerberos.principal</name>
  <value>mapr/<FQDN@REALM></value>
  <description>The service principal for the metastore thrift server.
  The special string _HOST will be replaced automatically with the correct
  hostname.</description>
</property>
```

3. Configure the following properties in `/opt/mapr/conf/env.sh` on each node where the Hive Metastore is installed:

- Set `MAPR_HIVE_LOGIN_OPTS` to

```
"-Dhadoop.login=hybrid"
```

- Set `MAPR_HIVE_SERVER_LOGIN_OPTS` to

```
"-Dhadoop.login=hybrid"
```

Configure Hive Metastore Clients to use Kerberos

When the Hive Metastore is configured to use Kerberos authentication, you must also configure Hive Metastore Clients to use Kerberos when authenticating with Hive Metastore.

Complete the following steps on each node where a Hive Metastore client is installed:

1. Configure MAPR_HIVE_LOGIN_OPTS to " -Dhadoop.login=hybrid" in /opt/mapr/conf/env.sh.
2. Configure the following property in hive-site.xml:

| Property | Value |
|-----------------------------------|--|
| hive.metastore.kerberos.principal | The HiveMetastore principal. For example, mapr/<FQDN@REALM>. |

```
<property>
  <name>hive.metastore.kerberos.principal</name>
  <value>mapr/<FQDN@REALM></value>
  <description>The service principal for the metastore thrift server.
  The special string _HOST will be replaced automatically with the correct
  hostname.</description>
</property>
```

See [Connecting to Hive](#) on page 3729 for details on how to connect to HiveMetastore once the server and client node are configured to use Kerberos.

Note: The MAPR_HIVE_LOGIN_OPTS and MAPR_HIVE_SERVER_LOGIN_OPTS were added in 1504 release of Hive 0.13 and Hive 1.0. If you have Hive 0.13 from a prior release, you do not need to configure these properties. Instead, set MAPR_ECOSYSTEM_LOGIN_OPTS and MAPR_ECOSYSTEM_SERVER_LOGIN_OPTS to " -Dhadoop.login=hybrid" in /opt/mapr/conf/env.sh.

Authentication for HiveServer2

You can configure authentication for in-bound client connection to HiveServer2. Clients of HiveServer 2 include beeline and odbc/jdbc client applications.

Credentials are submitted from the HiveServer2 clients to HiveServer2 as plain text. To secure the credential transmission, MapR supports SSL encryption for HiveServer2. For information about how to configure encryption, see [Hive Encryption](#).

HiveServer2 supports the following authentication methods:

Configure MapR-SASL Authentication for HiveServer 2

MapR-SASL is available starting with the 1504 release of Hive 0.13 and Hive 1.0. However, the configuration requirements for MapR-SASL differ based on the version of Hive that you have installed:

- As of Hive 0.13-1501, Hive 1.0-1510, and Hive 1.2-1510, MapR-SASL and PAM are enabled by default on a secure cluster; no configuration is required. Complete the steps below if you want HiveServer2 to only accept MapR-SASL authentication.
- In Hive 0.13-1508 and Hive 1.0-1508, MapR-SASL is not the default and must be configured.

- In Hive 0.13-1504 and Hive 1.0-1504, MapR-SASL is the default authentication method when the cluster is secure. No configuration is required.

1. Configure the following property in hive-site.xml on each node where HiveServer2 is installed:

| Property | Value |
|-----------------------------|----------|
| hive.server2.authentication | MAPRSASL |

```
<property> <name>hive.server2.authentication</name> <value>MAPRSASL</value></property>
```

2. Restart HiveServer2 to apply these changes.

```
maprcli node services -name hs2 -action restart -nodes <comma separated list of nodes>
```

Configure HiveServer2 to use LDAP Authentication

1. Configure the following properties in the hive-site.xml file on each node where HiveServer2 is installed:

| Property | Value |
|--|--|
| hive.server2.authentication | LDAP |
| hive.server2.authentication.ldap.url | The access URL for your LDAP server |
| hive.server2.authentication.ldap.baseDN | The base LDAP DN for your LDAP server. For example, ou=People,dc=mycompany,dc=com. |
| hive.server2.authentication.ldap.userDNPattern | User DN Pattern - A DN pattern that can be used to directly login users to the LDAP database. This pattern is used for creating a DN string for "direct" user authentication, where the pattern is relative to the base DN in ldapUrl. |

```
<property>
  <name>hive.server2.authentication</name>
  <value>LDAP</value>
</property>
<property>
  <name>hive.server2.authentication.ldap.url</name>
  <value><LDAP URL></value>
</property>
<property>
  <name>hive.server2.authentication.ldap.baseDN</name>
  <value><LDAP Base DN></value>
</property>
```

For generic LDAP servers, you must use:

- a. hive.server2.authentication.ldap.baseDN
- b. hive.server2.authentication.ldap.userDNPattern

However, Active Directory (AD) does not require the above two options, they can be replaced by the following property:

- hive.server2.authentication.ldap.Domain

| Property | Value |
|---|---|
| hive.server2.authentication.ldap.Domain | The active directory domain for your environment. |

```
<property>
  <name>hive.server2.authentication.ldap.Domain</name>
  <value><AD Domain Name></value>
</property>
```

- Restart HiveServer2 to apply these changes.

```
maprcli node services -name hs2 -action restart -nodes <comma separated list of nodes>
```

Configure HiveServer2 to use PAM Authentication

You can configure HiveServer2 to use Pluggable Access Modules (PAM). The configuration requirements for PAM differ based on the version of Hive that you have installed.

| Hive Version | | Default Configuration | Configuration Requirement |
|--------------|------|---|-------------------------------|
| Hive 2.3 | 1904 | MapR-SASL and PAM are enabled by default on a secure cluster. | No configuration is required. |
| | 1901 | MapR-SASL and PAM are enabled by default on a secure cluster. | No configuration is required. |
| | 1808 | MapR-SASL and PAM are enabled by default on a secure cluster. | No configuration is required. |
| Hive 2.1 | 1904 | MapR-SASL and PAM are enabled by default on a secure cluster. | No configuration is required. |
| | 1901 | MapR-SASL and PAM are enabled by default on a secure cluster. | No configuration is required. |
| | 1808 | MapR-SASL and PAM are enabled by default on a secure cluster. | No configuration is required. |
| | 1803 | MapR-SASL and PAM are enabled by default on a secure cluster. | No configuration is required. |

Configure HiveServer2 to explicitly use PAM Authentication

- In the `hive-site.xml` on each HiveServer2 node, set the `hive.server2.authentication` property to PAM:

```
<property>
  <name>hive.server2.authentication</name>
  <value>PAM</value>
</property>
```

- Restart HiveServer2 to apply these changes:

```
maprcli node services -name hs2 -action restart -nodes <comma-separated list of nodes>
```

Configure HiveServer 2 to use Custom Authentication

1. Create a custom Authenticator class derived from the following interface:

```
public interface PasswdAuthenticationProvider {
    /**
     * The Authenticate method is called by the HiveServer2 authentication
     layer
     * to authenticate users for their requests.
     * If a user is to be granted, return nothing/throw nothing.
     * When a user is to be disallowed, throw an appropriate {@link
     AuthenticationException}.
     *
     * For an example implementation, see {@link
     LdapAuthenticationProviderImpl}.
     *
     * @param user - The username received over the connection request
     * @param password - The password received over the connection request
     * @throws AuthenticationException - When a user is found to be
     * invalid by the implementation
     */
    void Authenticate(String user, String password) throws
    AuthenticationException;
}
```

The [SampleAuthenticator.java](#) on page 3654 code has an example implementation that has stored usernames and passwords.

2. Configure the following properties in the `hive-site.xml` file on each node where HiveServer2 is installed:

| Property | Value |
|--|---|
| hive.server2.authentication | CUSTOM |
| hive.server2.custom.authentication.class | The authentication class name. For example, <code>hive.server2.custom.authentication.class</code> |

```
<property>
<name>hive.server2.authentication</name>
<value>CUSTOM</value>
</property>

<property>
<name>hive.server2.custom.authentication.class</name>
<value>hive.test.SampleAuthenticator</value>
</property>
```

3. Restart Hiveserver2 to apply the changes:

```
maprcli node services -name hs2 -action restart -nodes <comma separated
list of nodes>
```

SampleAuthenticator.java

```
package hive.test;

import java.util.Hashtable;
import javax.security.sasl.AuthenticationException;
import org.apache.hive.service.auth.PasswdAuthenticationProvider;
```

```

/*
javac -cp $HIVE_HOME/lib/hive-service-0.11-mapr.jar
SampleAuthenticator.java -d .
jar cf sampleauth.jar hive
cp sampleauth.jar $HIVE_HOME/lib/.
*/

public class SampleAuthenticator implements PasswdAuthenticationProvider {

    Hashtable<String, String> store = null;

    public SampleAuthenticator () {
        store = new Hashtable<String, String>();
        store.put("user1", "passwd1");
        store.put("user2", "passwd2");
    }

    @Override
    public void Authenticate(String user, String password)
        throws AuthenticationException {

        String storedPasswd = store.get(user);

        if (storedPasswd != null && storedPasswd.equals(password))
            return;

        throw new AuthenticationException("SampleAuthenticator: Error
validating user");
    }
}

```

Configure HiveServer 2 to use Kerberos

Note: You can configure HiveServer2 to use Kerberos authentication. MapR clusters do not provide Kerberos infrastructure. The tips in this section assume a Linux-based Kerberos environment, and the specific commands for your environment may vary. Consult with your Kerberos administrator for assistance.

Enabling HiveServer to use Kerberos authentication requires following steps on each node where HiveServer 2 is installed:

1. Create a Kerberos Identity and keytab. You can use the following commands in a Linux-based Kerberos environment to set up the identity and update the keytab file: The `hive.keytab` file must be owned and readable only by the `mapr` user.

```

# kadmin
: addprinc -randkey username/<FQDN@REALM>
: ktadd -k /opt/mapr/conf/hive.keytab username/<FQDN@REALM>

```

2. Configure the following properties in `hive-site.xml` on each node where `hiveserver2` is installed:

| Property | Value |
|---|---|
| <code>hive.server2.authentication</code> | KERBEROS |
| <code>hive.server2.authentication.kerberos.principal</code> | <HiveServer2 Principle. For example, <code>mapr/FQDN@REALM</code> > |

| Property | Value |
|---|--|
| hive.server2.authentication.kerberos.keytab | <The keytab file for the HiveServer2 principle. For example, /opt/mapr/conf/hive.keytab> |

```
<property>
  <name>hive.server2.authentication</name>
  <value>KERBEROS</value>
  <description>authenticationtype</description>
</property>
<property>
  <name>hive.server2.authentication.kerberos.principal</name>
  <value>mapr/FQDN@REALM</value>
  <description>HiveServer2 principal. If _HOST is used as the FQDN
portion, it will be replaced with the actual hostname of the running
instance.</description>
</property>
<property>
  <name>hive.server2.authentication.kerberos.keytab</name>
  <value>/opt/mapr/conf/hive.keytab</value>
  <description>Keytab file for HiveServer2 principal</description>
</property>
```

3. Reconfigure the following options in `env.sh (/opt/mapr/conf/env.sh)` on each node where `hiveserver2` is installed:

Note: These configurations are listed in the portion of the file that begins with `if ["$MAPR_SECURITY_STATUS" = "true"];`. However, you should make the changes in the `/opt/mapr/conf/env_override.sh` file. For more information, see [About env_override.sh](#) on page 2576.

| Existing Configuration | Required Configuration |
|--|--|
| <pre>MAPR_HIVE_SERVER_LOGIN_OPTS="-Dhadoop.login=maprsasl_keytab" MAPR_HIVE_LOGIN_OPTS="-Dhadoop.login=maprsasl"</pre> | <pre>MAPR_HIVE_SERVER_LOGIN_OPTS="-Dhadoop.login=hybrid" MAPR_HIVE_LOGIN_OPTS="-Dhadoop.login=hybrid"</pre> |

4. Restart HiveServer2 to apply these changes.

```
maprcli node services -name hs2 -action restart -nodes <comma separated list of nodes>
```

Configure HiveServer 2 Clients to use Kerberos

When HiveServer 2 is configured to use Kerberos authentication, you must also configure HiveServer2 clients to use Kerberos.

On each node where HiveServer2 clients (not including Beeline) are installed, reconfigure the following option in `env.sh (/opt/mapr/conf/env.sh)` file:

| Existing Configuration | Required Configuration |
|---|---|
| <pre>MAPR_HIVE_LOGIN_OPTS="-Dhadoop.login=maprsasl"</pre> | <pre>MAPR_HIVE_LOGIN_OPTS="-Dhadoop.login=hybrid"</pre> |

 **Note:** This configuration is listed in the portion of the file that begins with `if ["$MAPR_SECURITY_STATUS" = "true"];`. However, you should make the change in the `/opt/mapr/conf/env_override.sh` file. For more information, see [About env_override.sh](#) on page 2576.

On each node where Beeline is installed, reconfigure the following option in `beeline.sh` (`$hive_home/bin/ext/beeline.sh`) file:

| Existing Configuration | Required Configuration |
|---|--|
| <code>HADOOP_OPTS="\$HADOOP_OPTS\$ {MAPR_HIVE_LOGIN_OPTS}"</code> | <code>HADOOP_OPTS="\$HADOOP_OPTS\$ {KERBEROS_LOGIN_OPTS}"</code> |

For more information, see [Connecting to Hive](#) on page 3729.

 **Note:** The `MAPR_HIVE_LOGIN_OPTS` and `MAPR_HIVE_SERVER_LOGIN_OPTS` were added in 1504 release of Hive 0.13 and Hive 1.0. If you have Hive 0.13 from a prior release, you do not need to configure these properties. Instead, set `MAPR_ECOSYSTEM_LOGIN_OPTS` and `MAPR_ECOSYSTEM_SERVER_LOGIN_OPTS` to `"-Dhadoop.login=hybrid"` in `/opt/mapr/conf/env.sh`.

Configure HiveServer2 Web UI to use PAM Authentication

You can configure HiveServer2 web UI to use Pluggable Access Modules (PAM) authentication. The following Hive properties are added to enable PAM authentication for the HiveServer2 web UI:

```
hive.server2.webui.use.pam
Default value: false
Description: If true, the HiveServer2 WebUI will be secured with PAM
```

```
hive.server2.webui.pam.authenticator
Default value: org.apache.hive.http.security.PamAuthenticator
Description: Class for PAM authentication
```

Modifying the hive-site.xml file:

Configure the following properties in the `hive-site.xml` file to enable authentication on each node where HiveServer2 is installed:

```
<!-- HS2 web UI PAM -->
<property>
  <name>hive.server2.webui.use.pam</name>
  <value>true</value>
</property>

<!-- HS2 web UI SSL -->
<property>
  <name>hive.server2.webui.use.ssl</name>
  <value>true</value>
</property>

<property>
  <name>hive.server2.webui.keystore.path</name>
  <value>/opt/mapr/conf/ssl_keystore</value>
</property>

<property>
  <name>hive.server2.webui.keystore.password</name>
```

```
<value><ssl-keystore-password></value>
</property>
```

 **Note:** After running `/opt/mapr/server/configure.sh -R`, all properties needed for HiveServer2 Web UI to use PAM authentication is added automatically to `hive-site.xml` on the MapR-SASL secure cluster. Connections to HiveServer2 using ODBC do not support MapR-SASL.

Authentication for WebHCat

You can configure authentication for in-bound client connections to WebHCat. Clients of WebHCat include web browsers. WebHCat is a client of Hive Metastore.

WebHCat supports the following authentication methods:

Configure Kerberos Authentication for WebHCat

When security features are enabled on your MapR cluster and Kerberos is in use, communications between WebHCat and its clients can use Kerberos with [SPNEGO](#).

To enable WebHCat to use Kerberos, complete the following steps on the node where WebHCat is installed.

1. Create the principal `HTTP/<FQDN@REALM>` for WebHCat and add the principal to the keytab file. For example:

```
kadmin: addprinc -randkey HTTP/<FQDN@REALM>
kadmin: xst -k /opt/mapr/HTTP.keytab HTTP/<FQDN>
```

2. Verify the following:
 - The principal was added to the `/opt/mapr/conf/HTTP.keytab` file and that the file is only readable by the `mapr` user. For example: `chown mapr /opt/mapr/conf/HTTP.keytab`
 - The node where the WebHCat server is running has an HTTP user with a valid `maprlogin` password.
3. Add the following section to the `/opt/mapr/hive/hive-<version>/hcatalog/etc/webhcat/webhcat-site.xml` file:

```
<property>
  <name>templeton.kerberos.secret</name>
  <value>secret value</value>
</property>
<property>
  <name>templeton.kerberos.principal</name>
  <value>HTTP/<FQDN@REALM></value>
</property>
<property>
  <name>templeton.kerberos.keytab</name>
  <value>/opt/mapr/conf/HTTP.keytab</value>
</property>
```

4. Add the following section to the `/opt/mapr/hadoop/hadoop-<version>/etc/hadoop/core-site.xml` file:

```
<property>
  <name>hadoop.proxyuser.HTTP.groups</name>
  <value>*</value>
  <description>Allow the superuser mapr to impersonate any member of
any group</description>
</property>
<property>
  <name>hadoop.proxyuser.HTTP.hosts</name>
  <value>*</value>
  <description>The superuser can connect from any host to
impersonate a user</description>
</property>
```

5. Start WebHCat. See [Managing the WebHCat Server](#).
6. To test if the connection is working, generate a Kerberos ticket with the `kinit` utility and then run the following command:

```
curl --negotiate -i -u : 'http://<FQDN>:50111/templeton/v1/ddl/
database/'
```

Configure Simple Authentication for WebHCat

When the MapR cluster is not secure, simple authentication is enabled for WebHCat. No configuration is required.

Configure PAM Authentication for WebHCat

When the MapR cluster is secure, username and password authentication is enabled for WebHCat. No configuration is required.

Configuring Hive for SCRAM Token Authentication

This topic describes the manual and automatic options to configure Hive for SCRAM token authentication.

Starting from EEP 8.1.0, Hive supports SCRAM token and SCRAM-SHA-256 authentication in HPE Ezmeral Data Fabric.

Table

| # | Property | Data Type | Default value | Description |
|---|--------------------------------------|-----------|---------------|---|
| 1 | hive.delegation.token.authentication | String | DIGEST | Delegation token authentication method. Possible values are DIGEST, SCRAM |

To connect to HiveServer2 on EEP 8.1.0 from Hive client on EEP 8.0.x, set `hive.delegation.token.authentication` property in HPE Ezmeral Data Fabric.

Manually Configuring SCRAM Token Authentication

To configure SCRAM token and SCRAM-SHA-256 authentication, set the following property on `HIVE_HOME/conf/hive-site.xml` file:

```
<property>
  <name>hive.delegation.token.authentication</name>
  <value>SCRAM</value>
</property>
```

The default value for `hive.delegation.token.authentication` is DIGEST.

To use `hive.delegation.token.authentication` for Hive, configure Hadoop for SCRAM:

- Set the value of `hadoop.security.token.authentication.method` property to SCRAM-SHA-256 in `yarn-site.xml` file.
- Set `scram.password` property and ensure encrypted password file is available in filesystem.

To learn more, see Hadoop documentation.

Auto Configuring SCRAM Token Authentication

Execute `MAPR_HOME/server/configure.sh -R` script on a newly installed Data-Fabric SASL or KERBEROS secured cluster to automatically configure the following authentications:

1. For a FIPS enabled cluster, Hive configures `hive.delegation.token.authentication=SCRAM` authentication.
2. For a non-FIPS cluster if you configure Hadoop with `hadoop.security.token.authentication.method=SCRAM` authentication, Hive configures the SCRAM authentication.
3. For other clusters, Hive configures `hive.delegation.token.authentication=DIGEST` authentication.

For non-secure clusters, Hive configures `hive.delegation.token.authentication=DIGEST` authentication.

You can see `hive.delegation.token.authentication` property in `HIVE_HOME/conf/hive-site.xml` when you execute `configure.sh` command on newly installed cluster.

When you upgrade Hive, the upgrade does not update the value of the set `hive.delegation.token.authentication` property.

Manually set the value of `hive.delegation.token.authentication` property when you change the cluster settings from FIPS to non-FIPS or from non-FIPS to FIPS.

Hive Encryption

When you configure encryption, the thrift messages sent between the Hive Metastore, HiveServer 2, and HiveServer2 clients are encrypted.

When you configure encryption, the thrift messages sent between the Hive Metastore, HiveServer 2, and HiveServer2 clients are encrypted.

Encryption is supported when HiveServer2 has no authentication or when it is configured to use MapR-SASL or Kerberos authentication.

This section contains the following topics:

Configure Encryption with MapR-SASL or Kerberos Authentication

Complete the following steps on each node where HiveServer2 is installed:

1. In `hive-site.xml` file, set the following property:

| Property | Value |
|---|------------------------|
| <code>hive.server2.thrift.sasl.qop</code> | <code>auth-conf</code> |

Note: As of Hive 0.13-1504 and Hive 1.0-1504, `hive.server2.thrift.sasl.qop` is set to `auth-conf` by default on secure clusters.

```
<property>
  <name>hive.server2.thrift.sasl.qop</name>
  <value>auth-conf</value>
  <description>Sasl QOP value; one of 'auth', 'auth-int' and
'auth-conf'</description>
</property>
```

2. Restart HiveServer2 to apply these changes.

```
maprcli node services -name hs2 -action restart -nodes <comma separated
list of nodes>
```

Configure Encryption without Authentication

Complete the following steps on each node where HiveServer2 is installed:

1. In `hive-site.xml` file, set the following properties:

| Property | Value |
|---|--|
| <code>hive.server2.use.SSL</code> | <code>true</code> |
| <code>hive.server2.ssl.keystore</code> | <code><path to keystore file></code> |
| <code>hive.server2.ssl.keystore.password</code> | <code><password></code> |

Warning: If you specify the password in the `hive-site.xml` file, protect the file with the appropriate file permissions. HiveServer2 automatically prompts for the keystore password during startup when no password is stored in the `hive-site.xml` file.

```
<property>
  <name>hive.server2.use.ssl</name>
  <value>true</value>
  <description>enable/disable SSL communication</description>
</property>
<property>
  <name>hive.server2.ssl.keystore</name>
  <value><path-to-keystore-file></value>
  <description>path to keystore file</description>
</property>

<property>
  <name>hive.server2.ssl.keystore.password</name>
  <value><password></value>
  <description>keystore password</description>
</property>
```

2. Restart HiveServer2 to apply these changes.

```
maprcli node services -name hs2 -action restart -nodes <comma separated
list of nodes>
```

Configure HiveServer2 Clients to use Encryption

Based on the encryption method, the requirements for clients to connect to HiveServer2 differ.

- When HiveServer2 uses encryption with MapR-SASL or Kerberos authentication, the client must specify the same sasl qop value that is set for HiveServer2 (auth-conf is the default, recommended option).
- When HiveServer2 uses SSL encryption without authentication, the client must specify a truststore. The `ssl_truststore` file must be copied from the cluster to the client. Specifying a truststore password is optional.

For details, see [Connecting to Hive](#) on page 3729.

Configure the TLS (SSL) Protocol Version in Hive

Beginning with EEPs 6.3.1 and 7.0.0, the default protocol version for TLS (SSL) is `TLSv1.2`, but you can use the `hive.ssl.protocol.version` property to set a custom value for TLS (SSL).

Setting the TLS (SSL) Protocol Version

To enable the direct configuration of the TLS (SSL) version, Hive provides the following property:

| Property | Type | Default Value | Description |
|--|--------|----------------------|---|
| <code>hive.ssl.protocol.version</code> | String | <code>TLSv1.2</code> | SSL protocol versions for all Hive servers. |

To set a custom value for the TLS (SSL) protocol version in Hive:

1. Add the following to the `hive-site.xml` file:

```
<property>
  <name>hive.ssl.protocol.version</name>
  <value><custom_value></value>
</property>
```

In this example, `<custom_value>` can be one of the following:

- `SSLv2`
- `SSLv3`
- `SSLv2Hello`
- `TLSv1`
- `TLSv1.1`
- `TLSv1.2`

For more information, see the following table:

| # | Algorithm Name (TLS/SSL Version) | Description |
|---|----------------------------------|--|
| 1 | Default | Use the default algorithm. |
| 2 | SSL | Supports some versions of SSL; may support other versions. |
| 3 | SSLv2 | Supports SSL version 2 or later; may support other versions. |
| 4 | SSLv3 | Supports SSL version 3; may support other versions. |
| 5 | TLS | Supports some versions of TLS; may support other versions. |
| 6 | TLSv1 | Supports RFC 2246: TLS version 1.0 ; may support other versions. |
| 7 | TLSv1.1 | Supports RFC 4346: TLS version 1.1 ; may support other versions. |

| # | Algorithm Name (TLS/SSL Version) | Description |
|---|----------------------------------|--|
| 8 | TLSv1.2 | Supports RFC 5246: TLS version 1.2 ; may support other versions. |

- Restart all Hive services.

Special Considerations for Protocol Versions

Note these special considerations for the protocol versions:

- When `hive.ssl.protocol.version` is set to `TLSv1.2`, the protocol supports TLS 1.2. When `hive.ssl.protocol.version` is set to `TLSv1`, the protocol supports TLS versions up to TLS 1.0 (but not TLS 1.1 and 1.2). When `hive.ssl.protocol.version` is set to `TLSv1.1`, the protocol supports versions up to TLS 1.1 (but not TLS 1.2).
- `SSLv2Hello` is not a real encryption protocol. It merely enables clients to find out which encryption protocols are supported by the server to which they connect. As long as `SSLv2Hello` is used only by clients and servers to negotiate a safe protocol, such as `TLSv1.1` or `TLSv1.2`, it does not pose a security risk.
- Hive has a property called `hive.ssl.protocol.blacklist` with a default value of `SSLv2, SSLv3, SSLv2Hello, TLSv1, TLSv1.1`. If you want to enable `TLSv1.1`, for example, you must remove it from the blacklist above. For example:

```
<property>
<name>hive.ssl.protocol.blacklist</name>
<value>SSLv2, SSLv3, SSLv2Hello, TLSv1</value>
</property>

<property>
<name>hive.ssl.protocol.version</name>
<value>TLSv1.1</value>
</property>
```

- If you use the TLS (SSL) protocol version from the blacklist, you will get the following exception when connecting to Hiveserver2 via JDBC:

```
Unknown HS2 problem when communicating with Thrift server.
Error: Could not open client transport with JDBC
Uri: jdbc:hive2://<hostname>:10000/default;auth=maprsasl;ssl=true:
javax.net.ssl.SSLHandshakeException: Received fatal alert:
handshake_failure (state=08S01,code=0)
```

- Empty values are allowed for `hive.ssl.protocol.version`. Hive uses the default value in that case. The same is true for `hive.ssl.protocol.blacklist`.
- The `hive.ssl.protocol.version` property is out of scope for a secure-by-default configuration. This means that it will not appear in the `hive-site.xml` after you use the `Hive configure.sh` script. Nevertheless, the default value of `hive.ssl.protocol.version` is still `TLSv1.2`, and you do not need to set it explicitly.

Hive Password Encryption

EEP 4.0 introduces default configuration for Hive Metastore password encryption using the MapR Installer. The password is stored in the `hive-site.xml` file.

EEP 4.0 introduces default configuration for Hive Metastore password encryption using the MapR Installer. The password is stored in the `hive-site.xml` file.

 **Note:** For Hive-2.1 (EEP-5.0.0 and later) and Hive-2.3 (EEP-6.0.0 and later) installed using the MapR Installer, `javax.jdo.option.ConnectionPassword` is automatically encrypted.

```
<property>
  <name>javax.jdo.option.ConnectionPassword</name>
  <value>{password}</value>
</property>
```

The `hadoop.security.credential.provider.path` configuration property replaces the `javax.jdo.option.ConnectionPassword` property in the `hive-site.xml` file that contains the path to the keystore file created by the Hadoop Credential Provider. Credential providers store and protect passwords out of clear text for the underlying database. By default, the MapR Installer creates the keystore file in MapR filesystem. `/user/${MAPR_USER}/hivemetastore.jceks`.

 **Note:** Starting from Hive-2.3 EEP 6.0.0, SSL keystore passwords, `hive.server2.webui.keystore.password`, `hive.server2.keystore.password`, and `templeton.keystore.password`, are automatically read from the `/opt/mapr/conf/ssl-client.xml` file without any additional steps from your side. But you can still encrypt them manually and store them in the `*jceks` files.

Reset MapR Installer Default Configuration

To remove changes made by the MapR Installer and reset Hive to its default setting:

1. Open the `hive-site.xml` file.
2. Delete the `hadoop.security.credential.provider.path` property.
3. Add the `javax.jdo.option.ConnectionPassword` property.
4. Save and close the `hive-site.xml` file.

Manual Password Encryption

 **Note:** For any user to use Hive, the keystore file requires read permission (644). To limit keystore file access to a smaller number of Hive users, modify permissions as necessary.

To encrypt a password manually:

1. Create the keystore file using the Hadoop Credential Provider as follows:

```
hadoop credential create javax.jdo.option.ConnectionPassword -provider
<path-to-keystore>
```

Where `<path-to-keystore>` is `jceks://<file-system-name>/<path-to-keystore>`.

For example, `jceks://maprfs/user/mapr/hivemetastore.jceks`.

2. Delete the `javax.jdo.option.ConnectionPassword` property in the `hive-site.xml` file:

```
<property>
  <name>javax.jdo.option.ConnectionPassword</name>
  <value>{yourpassword}</value>
</property>
```

3. Add the `hadoop.security.credential.provider.path` property to the `/opt/mapr/hive/hive-2.3/conf/hive-site.xml` file:

```
<property>
  <name>hadoop.security.credential.provider.path</name>
  <value>jceks://maprfs/user/mapr/hivemetastore.jceks</value>
  <description>password to use against metastore database</description>
</property>
```

4. Restart the Hive services to update the configuration:

```
maprcli node services -name hivemeta -action restart -nodes `hostname -f`
maprcli node services -name hs2 -action restart -nodes `hostname -f`
maprcli node services -name hcat -action restart -nodes `hostname -f`
```

Hive Authorization

MapR Data Platform has built-in platform authorization that protects all data regardless of the execution engine. This topic describes alternative authorization modes you can choose to implement.

For more information, refer to [Authorization in Data Fabric](#) on page 655.

In addition to the centralized authorization provided by the MapR Data Platform, you can use several authorization modes for Hive. The use cases and trade-offs for these authorization modes are described in the sections below.

Understanding Hive Authorization Use Cases

Table Storage Layer and SQL Query Engine are the two primary use cases for client-based authorization protection, delivered as part of the open source project.

Use Case 1: Table Storage Layer

This is the use case for Hive [HCatalog API](#) users.

In this case, Hive provides a table abstraction and metadata for files on storage (typically MapR filesystem). You have direct access to MapR filesystem and the metastore server (which provides an API for metadata access).

MapR filesystem access is authorized through the use of MapR filesystem [permissions](#). You need to authorize metadata access using Hive configuration.

Use Case 2: SQL Query Engine

This is one of the most common use cases of Hive. This is the "Hive view" of SQL users and BI tools. This use case has the following two subcategories:

- Hive command line users - You have direct access to MapR filesystem and the Hive metastore, which makes this use case similar to use case 1.
- ODBC/JDBC and other HiveServer2 API users (Beeline CLI is an example) - You have all data or metadata access through HiveServer2. You do not have direct access to MapR filesystem or the metastore.

Understanding Hive Authorization Modes

Different modes of Hive authorization are available to satisfy different use cases.

Secure by Default Configuration (Storage Based Authorization in the Metastore Server)

Hive default security configuration is the storage based authorization in the Metastore server. Managed by `mapr-tickets` and impersonation level, Hive configurations control the data access and MapR filesystem permissions act as one source of truth for the table storage access. By enabling storage based

authorization in the metastore server, you can use this single source for truth and have a consistent data and metadata authorization policy.

For use cases where the users have direct access to the data, Hive configurations do not control the data access. The MapR filesystem permissions act as the one source of truth for table storage access. To control metadata access on the metadata objects such as databases, tables, and partitions, MapR filesystem checks if you have permission to access the corresponding directories on the filesystem.

You can also protect access through HiveServer2 ([use case 2.2](#)) by ensuring that the queries run as the end user. The `hive.server2.enable.doAs` option should be `true` in the HiveServer2 configuration, this is a default value.

For more information, see [Hive Security Configuration Options](#) on page 3639.

SQL Standards Based Authorization in HiveServer2

Although storage based authorization provides access control at the level of databases, tables, and partitions, it can only control authorization at finer levels such as columns and views for MapR Database tables and not for files because the access control provided by the filesystem is at the level of directory and files. SQL standards authorization makes authorization possible for files BUT at the expense of not being able to enforce that access from any other tool.

For enabling SQL standards based authorization, refer to [SQL Standards-Based Hive Authorization](#) on page 3666.

Legacy Hive Authorization

Old default authorization is the authorization mode that has been available in earlier versions of Hive. However, this mode does not have a complete access control model, leaving many security gaps unaddressed.

For example, the permissions needed to grant privileges for a user are not defined, and any user can grant themselves access to a table or database.

This model is similar to the SQL standards based authorization mode, in that it provides grant or revoke statement-based access control. However, the access control policy is different from SQL standards based authorization, and they are not compatible. Use of this mode is also supported for Hive command line users. However, for reasons mentioned under the discussion of SQL standards based authorization, it is not a secure mode of authorization for the Hive command line.

Related Links

For information related to Hive authorization modes, see:

- [Storage Based Authorization in the Metastore Server](#)
- [HCatalog Authorization](#)
- [SQL Standard Based Hive Authorization](#)
- [Hive deprecated authorization mode / Legacy Mode](#)
- [Hive security design document](#)
- [Hive security document](#)

SQL Standards-Based Hive Authorization

Using EEP 6.0.0 and later, you can configure SQL standards-based authorization to enable fine grained access control with SQL commands.

The SQL standards-based authorization mode can be used in conjunction with storage-based authorization on the Metastore server. Similar to the current default authorization in Hive, SQL

standards-based authorization is also enforced at query compilation time. To provide security through this option, the client will have to be secured. You can do this by allowing users access only through HiveServer2, and by restricting the user code and non-SQL commands that can be run. The checks will happen against the user who submits the request, but the query will run as the Hive server user. The directories and files for input data would have read access for this Hive server user. For users who do not have the need to protect against malicious users, this could potentially be supported through the Hive command line as well.

1. Add the following properties to `hive-site.xml`:

```
<!-- SQL standard based authorization -->
<property>
  <name>hive.server2.enable.doAs</name>
  <value>>false</value>
</property>
<property>
  <name>hive.users.in.admin.role</name>
  <value>mapr</value>
</property>
<property>
  <name>hive.security.metastore.authorization.manager</name>

  <value>org.apache.hadoop.hive.ql.security.authorization.MetaStoreAuthzAPI
  AuthorizerEmbedOnly</value>
</property>
<property>
  <name>hive.security.authorization.manager</name>

  <value>org.apache.hadoop.hive.ql.security.authorization.plugin.sqlstd.SQL
  StdConfOnlyAuthorizerFactory</value>
</property>
```

2. Create a `hiveserver2-site.xml` configuration file:

```
touch /opt/mapr/hive/hive-<version>/conf/hiveserver2-site.xml
```

Add the following properties to the `hiveserver2-site.xml` file:

```
<configuration>
<property>
  <name>hive.security.authorization.manager</name>

  <value>org.apache.hadoop.hive.ql.security.authorization.plugin.sqlstd.SQL
  StdHiveAuthorizerFactory</value>
</property>
<property>
  <name>hive.security.authorization.enabled</name>
  <value>>true</value>
</property>
<property>
  <name>hive.security.authenticator.manager</name>

  <value>org.apache.hadoop.hive.ql.security.SessionStateUserAuthenticator</
  value>
</property>
<property>
  <name>hive.metastore.uris</name>
  <value></value>
</property>
</configuration>
```

3. Change owner of the `hiveserver2-site.xml` file to `mapr`, and restart Hive services:

```
chown mapr:mapr /opt/mapr/hive/hive-<version>/conf/hiveserver2-site.xml

maprcli node services -name hs2 -action restart -nodes `hostname -f`
maprcli node services -name hivemeta -action restart -nodes `hostname -f`
```

If you are a database administrator and want to run commands such as `create role` and `drop role` or to access objects without being given explicit access, you must run the `set role` command.

1. Create a test role:

```
hive> set role admin;
OK
Time taken: 0.02 seconds

hive> create role example_role;
OK
Time taken: 0.099 seconds

hive> show roles;
OK
admin
public
role1
example_role
Time taken: 0.02 seconds, Fetched: 3 row(s)
```

2. Grant access:

```
hive> GRANT example_role to USER testuser;
OK
Time taken: 0.058 seconds

hive> GRANT SELECT on table eg_test to role example_role;
OK
Time taken: 0.146 seconds
```

3. Using the test role, check access:

```
sudo -u mapruser1 hive
```

If there is an access violation, correct it. The following is an example of an access violation error:

```
hive> insert into table eg_test values (4), (5), (6);
FAILED: RuntimeException Cannot create staging directory
'maprfs:///user/hive/warehouse/
eg_test/.hive-staging_hive_2018-06-08_10-24-11_566_5325052587659005252-1'
:
User mapruser1(user id 5001) has been denied access to
create .hive-staging_hive_2018-06-08_10-24-11_566_5325052587659005252-1
```

You can apply access restrictions to all actions except for `READ` access.

The following are examples of permitted access operations:

- **Select:**

```
hive> select count (*) from eg_test;
OK
3
Time taken: 2.491 seconds, Fetched: 1 row(s)
```

- **Describe:**

```
hive> describe extended eg_test;
OK
id                int

Detailed Table Information
Table(tableName:eg_test, dbName:default, owner:mapr,
createTime:1528453013, lastAccessTime:0, retention:0,

```

- **Show columns:**

```
hive> SHOW COLUMNS from eg_test;
OK
id
Time taken: 0.049 seconds, Fetched: 1 row(s)
```

Note: For more information about privileges required for Hive operations, see the [open source documentation](#).

Configure Hive Metastore to use Storage-Based Authorization

You can enable storage-based authorization (SBA) for the Hive Metastore server.

Storage-based authorization controls access to the data using HDFS permissions (HDFS ACL). To control metadata access on the metadata objects, such as Databases, Tables, and Partitions, it checks if you have permission on the corresponding directories on the filesystem.

To enable storage-based authorization for the Hive Metastore server, set these properties in `hive-site.xml`:

| Property | Value | Description |
|--|--|---|
| hive.metastore.pre.event.listeners | org.apache.hadoop.hive.ql.security.authorization.AuthorizationPreEventListener* | Turns on Metastore security. A MetaStorePreEventListener that performs authorization or authentication checks on the metastore side. Note that this can only perform authorization checks on defined metastore PreEventContexts, such as the adding, dropping, and altering of databases, tables, and partitions. |
| hive.security.metastore.authorization.manager | org.apache.hadoop.hive.ql.security.authorization.StorageBasedAuthorizationProvider*  Note: The StorageBasedAuthorizationProvider setting first appeared, on the Metastore side only, in Hive 0.10.0. With Hive 0.12.0 and later, it can also run on the client side.  Note: Starting from EEP 6.1.0, hive.security.metastore.authorization.manager is set to the StorageBasedAuthorizationProvider value by default. | StorageBasedAuthorizationProvider - Specifies use of an HDFS permission-based model (recommended) for the Metastore-side authorization provider. DefaultHiveMetastoreAuthorizationProvider - This default implements the standard Hive grant/revoke model. |
| hive.security.metastore.authenticator.manager | org.apache.hadoop.hive.ql.security.HadoopDefaultMetastoreAuthenticator (default) | Authentication manager class name to be used in the metastore for authentication. The user-defined authenticator should implement the org.apache.hadoop.hive.ql.security.HiveAuthenticationProvider interface. |
| hive.security.metastore.authorization.auth.reads | true (default) | Default value (does not appear in hive-site.xml file). Set to true, Metastore authorization also performs a read authorization check (first supported in Hive 0.14.0). |
| hive.server2.enable.doAs | true (default) | Use for protected access through HiveServer2. |

* In secure clusters, the MapR "Secure-by-Default" configuration implicitly configures these properties in the hive-site.xml file.

SBA configuration example in hive-site.xml File

```
<property>
  <name>hive.security.metastore.authorization.manager</name>

  <value>org.apache.hadoop.hive.ql.security.authorization.StorageBasedAuthorizationProvider</value>
</property>

<property>
  <name>hive.security.metastore.authenticator.manager</name>
```

```
<value>org.apache.hadoop.hive.ql.security.HadoopDefaultMetastoreAuthenticato
r
  </value>
</property>

<property>
  <name>hive.security.metastore.authorization.auth.reads</name>
  <value>true</value>
</property>

<property>
  <name>hive.server2.enable.doAs</name>
  <value>true</value>
</property>

<property>
  <name>hive.metastore.pre.event.listeners</name>

<value>org.apache.hadoop.hive.ql.security.authorization.AuthorizationPreEven
tListener</value>
</property>
```

If you use storage-based authorization, you still need to use one of the following authorization models to protect actions within the HiveServer2:

- [Configuring Fallback Hive Authorizer](#) on page 3671
- [Configure Hive to use Sentry Authorization](#) on page 4036 (supported only for Impala users)
- [SQL Standards-Based Hive Authorization](#) on page 3666

Fallback Hive Authorizer

Fallback Hive Authorizer is used by Hive DDL (Data Definition Language) tasks for access control and for checking authorization from `Driver.doAuthorization()`.

It is designed to prevent [CVE-2018-11777](#).

In addition to the centralized authorization provided by the MapR Data Platform, you can use several authorization modes for Hive. The use cases and trade-offs for these authorization modes are described in the sections below.

Configuring Fallback Hive Authorizer

You can enable protection of actions within the HiveServer2 instance by using the Fallback Authorizer.

Use the Fallback Authorizer when you want to protect access for Hive clients (JDBC/ODBC, Beeline CLI, and other HiveServer2 API users).

To enable Fallback Authorization for Hive clients, set these properties in the `hive-site.xml` file:

| Property | Value | Description |
|--|--|---|
| <code>hive.security.authorization.enabled</code> | <code>true*</code> | Enable or disable the Hive client authorization. |
| <code>hive.security.authorization.manager</code> | <code>org.apache.hadoop.hive.ql.security.authorization.plugin.fallback.FallbackHiveAuthorizerFactory*</code> | Class name for the Hive client authorization manager. |

| Property | Value | Description |
|--------------------------|-------|---|
| hive.users.in.admin.role | mapr* | Comma-separated list of users who need to be added to the <code>admin</code> role. Note that a user who belongs to the <code>admin</code> role needs to run the <code>set role</code> command before getting the privileges of the <code>admin</code> role, as the <code>admin</code> role is not in <code>current roles</code> by default. |

* In secure clusters, the MapR "Secure-by-Default" configuration implicitly configures the Fallback Authorizer in the `hive-site.xml` file.

Fall Back Authorizer applies the following restrictions:

- Allows `set` only for selected whitelist parameters.
- Disallows `dfs` commands except for `admin`.
- Disallows local file location in SQL statements except for `admin`.
- Disallows `ADD JAR`, `COMPILE`, and `TRANSFORM` statements.

Fallback Authorization Configuration Example in `hive-site.xml` File

```
<property>
  <name>hive.security.authorization.enabled</name>
  <value>true</value>
</property>

<property>
  <name>hive.security.authorization.manager</name>

  <value>org.apache.hadoop.hive.ql.security.authorization.plugin.fallback.Fall
backHiveAuthorizerFactory</value>
</property>

<property>
  <name>hive.users.in.admin.role</name>
  <value>mapr</value>
</property>
```

Action Restrictions with Fallback Hive Authorizer

After enabling Fallback Hive Authorizer, you can perform action restriction operations.

- Disallow local file location in SQL statements for all except the administrator.
- Allow `set` for selected white list parameters.
- Disallow `dfs` commands for all except the administrator.
- Disallow `ADD JAR` statements for all except the administrator.
- Disallow `COMPILE` statements for all except the administrator.
- Disallow `TRANSFORM` statements.

Using a White List with Fallback Hive Authorizer

You can add an exception to Fallback Hive Authorizer restrictions using the `hive.security.authorization.sqlstd.confwhitelist.append` property.

The `hive.security.authorization.sqlstd.confwhitelist` property is list of comma-separated Java regexes that you can append to. Appending to this list instead of updating the original list means that you can append to the default set by SQL-standard authorization instead of replacing it entirely.

You can modify the configurations parameters that match these regexes when SQL-standard authorization is enabled.

To get the default value, use the `set <param>` command. The `hive.conf.restricted.list` checks are still enforced after the white-list check.

An example of a white-list configuration is as follows:

```
<property>
  <name>hive.security.authorization.sqlstd.confwhitelist.append</name>
  <value>hive.reloadable.aux.jars.path</value>
</property>
```

- After adding this configuration to the `hive-site.xml` file, execute the following command:

```
set hive.reloadable.aux.jars.path=/path/to/jar
```

Integrating Hive

Hive and HPE Ezmeral Data Fabric Database Integration

You can create HPE Ezmeral Data Fabric Database binary tables from Hive that can be accessed by both Hive and HPE Ezmeral Data Fabric Database. You can run Hive queries on HPE Ezmeral Data Fabric Database binary tables, convert existing HPE Ezmeral Data Fabric Database binary tables into Hive-HPE Ezmeral Data Fabric Database tables, and run Hive queries on those tables as well.

Install and Configure Hive

1. Install and configure Hive if it is not already installed. See [Installing Hive](#) on page 179 for details.
2. Execute the `jps` command and ensure that all relevant Hadoop, MapR, and Zookeeper processes are running. Example:

```
$ jps
1549 jenkins.war
15051 QuorumPeerMain

15293 ResourceManager
15328 NodeManager
15131 WardenMain
```

3. Open the `hive-site.xml` file with your favorite editor, or create a `hive-site.xml` file if it doesn't already exist:

```
$ cd $HIVE_HOME
$ vi conf/hive-site.xml
```

4. Copy the following XML code and paste it into the `hive-site.xml` file.

Note: If you already have an existing `hive-site.xml` file with a configuration element block, just copy the `property` element block code below and paste it inside the configuration element block in the `hive-site.xml` file. Be sure to use the correct values for the paths to your auxiliary JARs and ZooKeeper IP numbers.

Example configuration:

```
configuration>

<property>
  <name>hive.aux.jars.path</name>
  <value>file:///opt/mapr/hive/hive-<version>/lib/
hive-hbase-handler-<version>-mapr.jar,
file:///opt/mapr/hbase/hbase-<version>/lib/
hbase-client-<version>-mapr.jar, file:///opt/mapr/hbase/
hbase-<version>/lib/hbase-server-<version>-mapr.jar,file:///opt/mapr/
hbase/hbase-<version>/lib/hbase-protocol-<version>-mapr.jar,file:///opt/
mapr/zookeeper/zookeeper-<version>/zookeeper-<version>.jar</value>
  <description>A comma separated list (with no spaces)
of the jar files required for Hive-HBase integration</description>
</property>

<property>
  <name>hbase.zookeeper.quorum</name>
  <value>xx.xx.x.xxx,xx.xx.x.xxx,xx.xx.x.xxx</value>
  <description>A comma separated list (with no spaces) of
the IP addresses of all ZooKeeper servers in the cluster.</description>
</property>

<property>
  <name>hbase.zookeeper.property.clientPort</name>
  <value>5181</value>
  <description>The Zookeeper
client port. The MapR default clientPort is 5181.</description>
</property>

</configuration>
```

5. Save and close the `hive-site.xml` file.

If you have successfully completed all of the steps in this section, you're ready to begin the tutorial in the next section.

Getting Started with Hive and HPE Ezmeral Data Fabric Database Binary Integration

In this tutorial we will:

- Create a Hive table
- Populate the Hive table with data from a text file
- Query the Hive table
- Create a Hive-HPE Ezmeral Data Fabric Database table
- Introspect the Hive-HPE Ezmeral Data Fabric Database table from the HBase shell
- Populate the Hive-HPE Ezmeral Data Fabric Database table with data from the Hive table
- Query the Hive-HPE Ezmeral Data Fabric Database table from Hive

- Convert an existing HPE Ezmeral Data Fabric Database table into a Hive-MapR table

Be sure that you have successfully completed all of the steps in [Installing Hive](#) on page 179 and review the HPE Ezmeral Data Fabric Database topics before beginning this Getting Started tutorial.

This Getting Started tutorial is based on the Hive-HBase Integration section of the Apache Hive Wiki. However, please note that there are some significant differences.

Create a Hive table with two columns

Change to your Hive installation directory if you're not already there and start Hive:

```
$ cd $HIVE_HOME
$ bin/hive
```

Execute the CREATE TABLE command to create the Hive pokes table

```
hive> CREATE TABLE pokes (foo INT, bar STRING);
```

To see if the pokes table has been created successfully, execute the SHOW TABLES command

```
hive> SHOW TABLES;
OK
pokes
Time taken: 0.74 seconds
```

The pokes table appears in the list of tables. **Populate the Hive pokes table with data:**

The kv1.txt file is provided in the \$HIVE_HOME/examples/files directory. Execute the LOAD DATA LOCAL INPATH command to populate the Hive pokes table with data from the kv1.txt file.

```
hive> LOAD DATA LOCAL INPATH './examples/files/kv1.txt' OVERWRITE INTO
TABLE pokes;
```

A message appears confirming that the table was created successfully, and the Hive prompt reappears:

```
Copying data from file:
...
OK
Time taken: 0.278 seconds
hive>
```

Execute a SELECT query on the Hive pokes table

```
hive> SELECT * FROM pokes WHERE foo = 98;
```

The SELECT statement executes, runs a MapReduce application, and prints the application output:

```
OK
98      val_98
98      val_98
Time taken: 18.059 seconds
```

The output of the SELECT command displays two identical rows because there are two identical rows in the Hive pokes table with a key of 98.

Warning:

Hive tables can have multiple identical keys. As we will see shortly, HPE Ezmeral Data Fabric Database tables cannot have multiple identical keys, only unique keys.

Create a Hive-HPE Ezmeral Data Fabric Database table

Enter these four lines of code at the Hive prompt:

```
hive> CREATE TABLE mapr_table_1(key int, value string)
  > STORED BY 'org.apache.hadoop.hive.hbase.HBaseStorageHandler'
  > WITH SERDEPROPERTIES ("hbase.columns.mapping" = ":key,cfl:val")
  > TBLPROPERTIES ("hbase.table.name" = "/user/mapr/xyz");
```

After a brief delay, a message appears confirming that the table was created successfully:

```
OK
Time taken: 5.195 seconds
```

Note: The TBLPROPERTIES command is not required, but those new to Hive-HPE Ezmeral Data Fabric Database integration may find it easier to understand what's going on if Hive and HPE Ezmeral Data Fabric Database use different names for the same table.

In this example, Hive will recognize this table as "mapr_table_1" and HPE Ezmeral Data Fabric Database will recognize this table as "xyz".

Start the HBase shell

Keeping the Hive terminal session open, start a new terminal session for HBase, then start the HBase shell:

```
$ cd $HBASE_HOME
$ bin/hbase shell
HBase Shell; enter 'help<RETURN>' for list of supported commands.
Type "exit<RETURN>" to leave the HBase Shell
Version 0.90.4, rUnknown, Wed Nov  9 17:35:00 PST 2011

hbase(main):001:0>
```

Execute the `list` command to see a list of HBase tables

```
hbase(main):001:0> list
TABLE
/user/mapr/xyz
1 row(s) in 0.8260 seconds
```

HBase recognizes the Hive-HPE Ezmeral Data Fabric Database table named `xyz` in directory `/user/mapr`. This is the same table known to Hive as `mapr_table_1`.

Display the description of the `/user/mapr/xyz` table in the HBase shell

```
hbase(main):004:0> describe "/user/mapr/xyz"
DESCRIPTION                                     ENABLED
{NAME => '/user/mapr/xyz', FAMILIES => [{NAME => 'cfl', DATA_B true
LOCK_ENCODING => 'NONE', BLOOMFILTER => 'NONE', REPLICATION_SCOPE => '0', VERSIONS => '3', MIN_VERSION
S => '0', TTL => '2147483647', KEEP_DELETED_CELLS => 'false', BLOCKSIZE => '65536', IN_MEMORY => 'false', ENCODE_ON_DISK => 'true', BLOCKCACHE => 'true'}
]}
1 row(s) in 0.0240 seconds
```

From the Hive prompt, insert data from the Hive table `pokes` into the Hive-HPE Ezmeral Data Fabric Database table `mapr_table_1`

```
hive> INSERT OVERWRITE TABLE mapr_table_1 SELECT * FROM pokes WHERE foo=98;
...
```

```
2 Rows loaded to mapr_table_1
OK
Time taken: 13.384 seconds
```

Query `mapr_table_1` to see the data we have inserted into the Hive-HPE Ezmeral Data Fabric Database table

```
hive> SELECT * FROM mapr_table_1;
OK
98      val_98
Time taken: 0.56 seconds
```

Even though we loaded two rows from the Hive `pokes` table that had the same key of 98, only one row was actually inserted into `mapr_table_1`. This is because `mapr_table_1` is a HPE Ezmeral Data Fabric Database table, and although Hive tables support duplicate keys, HPE Ezmeral Data Fabric Database tables only support unique keys. HPE Ezmeral Data Fabric Database tables arbitrarily retain only one key, and silently discard all of the data associated with duplicate keys.

Convert a pre-existing HPE Ezmeral Data Fabric Database table to a Hive-HPE Ezmeral Data Fabric Database table

To convert a pre-existing HPE Ezmeral Data Fabric Database table to a Hive-HPE Ezmeral Data Fabric Database table, enter the following four commands at the Hive prompt.

Note that in this example the existing HPE Ezmeral Data Fabric Database table is `my_mapr_table` in directory `/user/mapr`.

```
hive> CREATE EXTERNAL TABLE mapr_table_2(key int, value string)
> STORED BY 'org.apache.hadoop.hive.hbase.HBaseStorageHandler'
> WITH SERDEPROPERTIES ("hbase.columns.mapping" = "cfl:val")
> TBLPROPERTIES("hbase.table.name" = "/user/mapr/my_mapr_table");
```

Now we can run a Hive query against the pre-existing HPE Ezmeral Data Fabric Database table `/user/mapr/my_mapr_table` that Hive sees as `mapr_table_2`:

```
hive> SELECT * FROM mapr_table_2 WHERE key > 400 AND key < 410;
Total MapReduce jobs = 1
Launching Job 1 out of 1
Number of reduce tasks is set to 0 since there's no reduce operator
...
OK
401      val_401
402      val_402
403      val_403
404      val_404
406      val_406
407      val_407
409      val_409
Time taken: 9.452 seconds
```

Optimizing HPE Ezmeral Data Fabric Database Tables Search by ID

Starting from the 1904 release (EEP 6.0.2, EEP 6.1.1, and EEP 6.2.0), search by ID is supported with Hive HPE Ezmeral Data Fabric Database JSON tables.

Property of Optimization

The property name is `hive.mapr.db.json.fetch.by.id.task.conversion` and the value has a boolean type and by default is set to `true`, which means it is enabled.

- To disable optimization, set `hive.mapr.db.json.fetch.by.id.task.conversion` to `false`.

Conditions for Optimization

- This optimizer is designed for queries such as:

```
SELECT *
FROM <mapr_db_json_table>
WHERE _id = <constant_string_value>;
```

or:

```
SELECT *
FROM <mapr_db_json_table>
WHERE _id = <constant_string_value> AND (<condition_1>) AND
(<condition_2>) ... AND (<condition_N>);
```

or:

```
SELECT *
FROM <mapr_db_json_table>
WHERE <Constant false operator>
```

where `_id` is a key column of HPE Ezmeral Data Fabric Database JSON table. It provides usage of the `findById()` method of the HPE Ezmeral Data Fabric Database JSON table. The following functionality is not supported:

- joins
- group by
- distinct
- lateral view
- subquery
- create table as select (CTAS) or insert
- analyze
- single source

The predicate is not actually a part of the filter, so it is ignored by push down:

```
SELECT * FROM t WHERE (CASE WHEN _id = 'value_a' THEN 2 ELSE 4 END) > 3;
```

Using Optimization

- Consider the following HPE Ezmeral Data Fabric Database JSON table:

```
CREATE TABLE t(doc_id string, col1 string, col2 string)
STORED BY 'org.apache.hadoop.hive.maprdb.json.MapRDBJsonStorageHandler'
TBLPROPERTIES("maprdb.table.name" = "/user/mapr/
db_json_table", "maprdb.column.id" = "doc_id");
```

- Run the `EXPLAIN` command:

```
EXPLAIN SELECT col1 FROM t WHERE doc_id='id_004';
```

3. The following output is produced:

```

STAGE DEPENDENCIES:
  Stage-0 is a root stage

STAGE PLANS:
  Stage: Stage-0
  MapR DB JSON Fetch By Id Operator
  limit: -1
  Processor Tree:
  TableScan
  alias: t_small
  filterExpr: (doc_id = 'id_004') (type: boolean)
  Statistics: Num rows: 1 Data size: 0 Basic stats: PARTIAL Column
stats: NONE
  Filter Operator
  predicate: (doc_id = 'id_004') (type: boolean)
  Statistics: Num rows: 1 Data size: 0 Basic stats: PARTIAL Column
stats: NONE
  Select Operator
  expressions: coll (type: string)
  outputColumnNames: _col0
  Statistics: Num rows: 1 Data size: 0 Basic stats: PARTIAL Column
stats: NONE
  ListSink
    
```

An important part of a query plan is that it shows if optimization is available for the query:

```

STAGE PLANS:
  Stage: Stage-0
  MapR DB JSON Fetch By Id Operator
    
```

Connecting Using Hive HPE Ezmeral Data Fabric Database JSON Connector

This section describes the Hive connector for HPE Ezmeral Data Fabric Database JSON table.

The Hive connector supports the creation of HPE Ezmeral Data Fabric Database based Hive tables. You can create a JSON table on HPE Ezmeral Data Fabric Database and load CSV data and/or JSON files to HPE Ezmeral Data Fabric Database using the connector. HPE Ezmeral Data Fabric Database based Hive tables can be:

- Queried just like filesystem based Hive tables.
- Combined with filesystem based Hive tables in joins and sub-queries.

Note: If you use Drill to query Hive tables based on MapR Database tables, you can [enable the native Drill reader](#), which can improve query performance.

The following table lists the Hive data type and the corresponding (supported) HPE Ezmeral Data Fabric Database OJAI type:

| Hive Type | HPE Ezmeral Data Fabric Database OJAI Type |
|-----------|--|
| BOOLEAN | BOOLEAN |
| BINARY | BINARY |
| TINYINT | BYTE |
| DATE | DATE |
| DOUBLE | DOUBLE |

| Hive Type | HPE Ezmeral Data Fabric Database OJAI Type |
|-----------|--|
| FLOAT | FLOAT |
| INT | INT |
| BIGINT | LONG |
| SMALLINT | SHORT |
| STRING | STRING |
| TIMESTAMP | TIMESTAMP |

The Hive connector for HPE Ezmeral Data Fabric Database JSON table also supports the use of the following complex data types:

- map
- array
- struct

Note: The HPE Ezmeral Data Fabric Database JSON tables do not support ACID transactions, bucketing, and alteration.

Creating a HPE Ezmeral Data Fabric Database JSON Table and Hive Table Using Hive

- To create a table, run the command similar to the following:

Note: The required properties are shown in bold.

```
CREATE TABLE primitive_types (
  id string,
  bo boolean,
  d double,
  da date,
  f double,
  i int,
  s string,
  ts timestamp)
STORED BY 'org.apache.hadoop.hive.mapadb.json.MapRDBJsonStorageHandler'
TBLPROPERTIES("mapadb.table.name" = "/tbl", "mapadb.column.id" = "id");
```

Here:

- The `mapadb.table.name`, `mapadb.column.id` and `STORED BY 'org.apache.hadoop.hive.mapadb.json.MapRDBJsonStorageHandler'` are mandatory properties.
- The value for `mapadb.column.id` column should be of type string or binary.

To create a Hive table that exists on HPE Ezmeral Data Fabric Database, specify `EXTERNAL` in the table DDL. If the table created is `EXTERNAL`, when the table is dropped, only its metadata is deleted; the underlying HPE Ezmeral Data Fabric Database data remains intact. On the other hand, if the table is not `EXTERNAL`, dropping the table deletes both the metadata associated with the table and the underlying HPE Ezmeral Data Fabric Database data.

For example, suppose a JSON table named `/apps/my_users` with the following values:

```
{"_id": "001", "first_name": "John", "last_name": "Doe", "age": 34}
{"_id": "002", "first_name": "Jack", "last_name": "Smith", "age": 26}
```

To create a Hive table over existing HPE Ezmeral Data Fabric Database JSON table:

```
CREATE EXTERNAL TABLE primitive_types (
  user_id string,
  first_name string,
  last_name string,
  age int)
STORED BY 'org.apache.hadoop.hive.maprdb.json.MapRDBJsonStorageHandler'
TBLPROPERTIES("maprdb.table.name" = "/apps/my_users","maprdb.column.id" =
"user_id");
```

Now, because table `primitive_types` points to HPE Ezmeral Data Fabric Database table, you can perform ETL query similar to filesystem based Hive tables:

```
SELECT COUNT(*) FROM test_external;
SELECT MAX(age) AS label FROM test_external;
...
```

Loading CSV Data to HPE Ezmeral Data Fabric Database JSON Table

1. Create intermediate table.

For example:

```
CREATE TABLE stage(id STRING, name STRING, age INT) ROW FORMAT DELIMITED
FIELDS TERMINATED BY ',';
```

2. Load data to table.

For example:

```
LOAD DATA INPATH '/data' into table stage;
```

3. Create HPE Ezmeral Data Fabric Database table in Hive.

For example:

```
CREATE TABLE users(id STRING, name STRING, age INT)
STORED BY 'org.apache.hadoop.hive.maprdb.json.MapRDBJsonStorageHandler'
TBLPROPERTIES("maprdb.table.name" = "/users","maprdb.column.id" = "id");
```

4. Insert data through stage table.

For example:

```
INSERT INTO TABLE users select id, name, age from stage;
```

Loading JSON Files to HPE Ezmeral Data Fabric Database JSON Table

1. Add SerDe JAR for JSON.

For example:

```
add jar /opt/mapr/hive/hive-<version>/hcatalog/share/hcatalog/
hive-hcatalog-core-<version>-mapr.jar
```

2. Create intermediate table.

For example:

```
CREATE EXTERNAL TABLE stage(id string, name string, age int)
ROW FORMAT SERDE 'org.apache.hive.hcatalog.data.JsonSerDe'
STORED AS TEXTFILE;
```

3. Load data in stage table.

For example:

```
LOAD DATA INPATH '/data' into table stage;
```

Note: If there is a key in the JSON file that starts with "_" (for example, "_id"), then treat the names as literals upon creating the schema and query using the same literal syntax. For example, specify ``_id` string` without any special serde properties. Then in the query, use `select `_id` from sometable;` Alternatively, you can use `'org.openx.data.jsonserde.JsonSerDe'` and add `WITH SERDEPROPERTIES ("mapping.id" = "_id")` to your table definition.

4. Create HPE Ezmeral Data Fabric Database table in Hive.

For example:

```
CREATE TABLE users(id STRING, name STRING, age INT)
STORED BY 'org.apache.hadoop.hive.maprdb.json.MapRDBJsonStorageHandler'
TBLPROPERTIES("maprdb.table.name" = "/users", "maprdb.column.id" = "id");
```

5. Insert data through stage table.

For example:

```
INSERT INTO TABLE users select id, name, age from stage;
```

If there is a key in your JSON file that starts with "_" (for example, "_id"), treat the names as literals upon creating the schema and also query using the same literal syntax. In the above example, it would look like ``_id` string` without any special serde properties for it. Then, use again in query as shown below:

```
select `_id` from sometable;
```

Alternatively, use `org.openx.data.jsonserde.JsonSerDe` and add `WITH SERDEPROPERTIES ("mapping.id" = "_id")` to your table definition.

Refer to [Hive MapR Database JSON Connector Tutorial](#) for a connector example.

Understanding the UPDATE Statement

Starting with EEP 6.0.0 (Hive 2.3), EEP 5.0.1 (Hive 2.1), EEP 4.1.2, and EEP 3.0.4, the UPDATE statement is supported with Hive HPE Ezmeral Data Fabric Database JSON tables.

You can use the UPDATE statement to update primitive, complex, and complex nested data types in HPE Ezmeral Data Fabric Database JSON tables, using the Hive connector.

Updating Primitive Data Types

This section describes how to use the UPDATE statement to update primitive data types in HPE Ezmeral Data Fabric Database JSON tables, using the Hive connector.

1. Create a HPE Ezmeral Data Fabric Database JSON table and a Hive table:

```
CREATE TABLE simple_types_update (
>>>>>> Incorporated edit comments
  doc_id string,
  bo boolean,
  d double,
  da date,
  f float,
  i int,
  s string,
  ts timestamp,
  ti tinyint,
  bi bigint,
  si smallint,
  bin binary)
STORED BY 'org.apache.hadoop.hive.maprdb.json.MapRDBJsonStorageHandler'
TBLPROPERTIES("maprdb.table.name" = "/"
simple_types_update", "maprdb.column.id" = "doc_id");
```

2. Insert data into the table:

```
INSERT INTO TABLE simple_types_update VALUES ('1', true, 124.14,
'2017-11-29', 9192.12,
214566190, 'text', '2017-03-17 00:14:13', 125, 9223372036854775806,
23434, "binary string");
```

3. Run the UPDATE command on the table:

```
UPDATE simple_types_update
SET da = '2018-12-11',
bo = FALSE,
f = 91.777
WHERE doc_id = '1';
```

4. Verify that the data is inserted in both Hive and HPE Ezmeral Data Fabric Database JSON tables.

- Verifying Hive table data:

```
hive> SELECT * FROM simple_types_update;

1      false      124.14      2018-12-11      91.777      214566190      text
2017-03-17 00:14:13      125      9223372036854775806      23434      binary
string
```

- Verifying HPE Ezmeral Data Fabric Database JSON table data:

```
find '/simple_types_update'

{"_id":"1","bi":{"$numberLong":9223372036854775806},"bin":
{"$binary":"YmluYXJ5IHNOcmVudWAAAAA=="},
"bo":false,"d":124.14,"da":{"$dateDay":"2018-12-11"},
"f":{"$numberFloat":91.777},"i":{"$numberInt":214566190},
"s":"text","si":{"$numberShort":23434},"ti":{"$numberByte":125},"ts":
{"$date":"2017-03-17T00:14:13.000Z"}}
```

Updating Complex Data Types

This section describes how to use the `UPDATE` statement to update complex data types in HPE Ezmeral Data Fabric Database JSON tables, using the Hive connector.

1. Create a HPE Ezmeral Data Fabric Database JSON table and a Hive table:

```
CREATE TABLE complex_types_update (
  doc_id string,
  info MAP<STRING, INT>,
  pets ARRAY<STRING>,
  user_info STRUCT<name:STRING, surname:STRING, age:INT, gender:STRING>)
STORED BY 'org.apache.hadoop.hive.maprdb.json.MapRDBJsonStorageHandler'
TBLPROPERTIES("maprdb.table.name" = "/"
complex_types_update", "maprdb.column.id" = "doc_id");
```

2. Insert data into the table:

```
INSERT INTO TABLE complex_types_update SELECT '1', map('age', 28),
array('Cat', 'Cat', 'Cat'),
named_struct('name', 'Santa', 'surname', 'Claus', 'age', 1000, 'gender',
'MALE');
```

3. Run the `UPDATE` command on the table:

```
UPDATE complex_types_update SET
info = map('year', 32),
pets = array('Dog', 'Cat', 'Pig'),
user_info = named_struct('name', 'Vasco', 'surname', 'da Gama', 'age',
558, 'gender', 'MALE')
WHERE doc_id = '1';
```

4. Verify that the data is inserted in both Hive and HPE Ezmeral Data Fabric Database JSON tables.

- Verifying Hive table data:

```
hive> SELECT * FROM complex_types_update;

1      {"year":32}      ["Dog","Cat","Pig"]
{"name":"Vasco","surname":"da Gama","age":558,"gender":"MALE"}
```

- Verifying HPE Ezmeral Data Fabric Database JSON table data:

```
find '/complex_types_update'

{"_id":"1","info":{"year":{"$numberInt":32}},"pets":
["Dog","Cat","Pig"],"user_info":{"age":{"$numberInt":558},
"gender":"MALE","name":"Vasco","surname":"da Gama"}}
```

Updating Complex Nested Data Types

This section describes how to use the `UPDATE` statement to update complex nested data types in HPE Ezmeral Data Fabric Database JSON tables, using the Hive connector.

1. Create a HPE Ezmeral Data Fabric Database JSON table and a Hive table using Hive:

```
CREATE TABLE complex_nested_data_type_update
(
    entry STRING,
    num INT,
    postal_addresses MAP <STRING,
    struct
<USER_ID:STRING,ADDRESS:STRING,ZIP:STRING,COUNTRY:STRING>>
)
stored BY 'org.apache.hadoop.hive.maprdb.json.MapRDBJsonStorageHandler'
tblproperties
(
    "maprdb.table.name" = "/complex_nested_data_type_update",
    "maprdb.column.id" = "entry"
);
```

2. Insert data into the table:

```
INSERT INTO TABLE complex_nested_data_type_update
SELECT '001', '1',
MAP ( 'Bill',
Named_struct ('user_id', '1', 'address', '3205 Woodlake ct', 'zip',
'45040', 'country', 'USA'));
```

3. Run the UPDATE command on the table by updating the COUNTRY value in map(struct):

```
UPDATE complex_nested_data_type_update
SET postal_addresses = MAP ('Bill',
Named_struct ('user_id', '1', 'address', '3205 Woodlake ct', 'zip',
'45040', 'country', 'Hun'))
WHERE entry = '001';
```

4. Verify that the data is inserted in both Hive and HPE Ezmeral Data Fabric Database JSON tables.

- Verifying Hive table data:

```
hive> SELECT * FROM complex_nested_data_type_update;

001    1    {"Bill":{"user_id":"1","address":"3205 Woodlake
ct","zip":"45040","country":"Hun"}}
```

- Verifying HPE Ezmeral Data Fabric Database JSON table data:

```
find '/complex_nested_data_type_update'
{"_id":"001","num":{"$numberInt":1},"postal_addresses":{"Bill":
{"address":"3205 Woodlake
ct","country":"Hun","user_id":"1","zip":"45040"}}}
```

UPDATE Statement Limitations

This section describes the features that the `UPDATE` statement does not support.

The `UPDATE` statement has the following known limitations:

- The UPDATE statement is fully supported only for primitive data types (see [Connecting to HPE Ezmeral Data Fabric Database](#)).
- The UPDATE statement is partly supported for complex data types; you can replace only the whole value of a complex type with new a value.
- You cannot update the `maprdb.column.id` value.

Understanding the INSERT INTO Statement

This section describes how to use the `INSERT INTO` statement to insert or overwrite rows in nested HPE Ezmeral Data Fabric Database JSON tables, using the Hive connector.

- [Single-row insert](#) on page 3686
- [Multiple-row insert](#) on page 3688
- [Overwriting data](#) on page 3691

Note: The output shown in these examples is for illustration only; actual Hive CLI output varies, depending on your specific situation.

Single-row insert

You can use the `INSERT INTO` statement to insert a single table row into a nested HPE Ezmeral Data Fabric Database table using one of two methods.

For example, imagine that you have the following Hive HPE Ezmeral Data Fabric Database JSON table, `nested_data_insert`:

```
CREATE TABLE nested_data_insert
(
  entry STRING,
  num INT,
  postal_addresses MAP <STRING,
  struct <USER_ID:STRING,ADDRESS:STRING,ZIP:STRING,COUNTRY:STRING>>
)
stored BY 'org.apache.hadoop.hive.maprdb.json.MapRDBJsonStorageHandler'
tblproperties
(
  "maprdb.table.name" = "/nested_data_insert",
  "maprdb.column.id" = "entry"
);
```

- You can insert the new row into your table by using a dummy table:

```
WITH dummy_table AS
(SELECT '001' AS KEY,
      '1' AS num,
      MAP ('Adam',
          Named_struct ('user_id', '1', 'address', '3205 Woodlake
ct', 'zip', '45040', 'country', 'Usa'),
          'Wilfred',
          Named_struct ('user_id', '2', 'address', '777 Brockton
Avenue', 'zip', '34000', 'country', 'Ita')) AS postal_addresses)
INSERT INTO nested_data_insert
SELECT *
FROM dummy_table;
```

- Alternatively, you can insert the new row into your table by using a `SELECT` statement:

```
INSERT INTO TABLE nested_data_insert
SELECT '002',
      '2',
      MAP ('Bill',
          Named_struct ('user_id', '1', 'address', '328 Virginia Ave',
                        'zip', '54956', 'country', 'Bol'),
          'Stiv',
          Named_struct ('user_id', '2', 'address', 'Schererville',
                        'zip', '46375', 'country', 'Efi'));
```

After you insert data, you should verify that the data is inserted in both Hive and HPE Ezmeral Data Fabric Database JSON tables:

- Verify the insertion into the Hive table by using the `SELECT * FROM` syntax.

```
SELECT * FROM nested_data_insert;
```

Sample output:

Table

| entry | num | postal_address | | | | |
|------------|-----|----------------|---------|---------------------|-------|---------|
| | | | USER_ID | ADDRESS | ZIP | COUNTRY |
| 001 | 1 | Adam | 1 | 3205 Woodlake ct | 45040 | Usa |
| | | Wilfred | 2 | 777 Brockton Avenue | 34000 | Ita |
| 002 | 2 | Bill | 1 | 328 Virginia Ave | 54956 | Bol |
| | | Stiv | 2 | Schererville | 46375 | Efi |

- Verify the insertion into the HPE Ezmeral Data Fabric Database JSON table data using the `find` statement:

```
find '/nested_data_insert'

{
  "Adam": {
    "user_id": "1",
    "address": "3205 Woodlake ct",
    "zip": "45040",
    "country": "Usa"
  },
  "Wilfred": {
    "user_id": "2",
    "address": "777 Brockton Avenue",
    "zip": "34000",
    "country": "Ita"
  }
}

{
  "Bill": {
    "user_id": "1",
    "address": "328 Virginia Ave",
    "zip": "54956",
    "country": "Bol"
  },
  "Stiv": {
    "user_id": "2",
    "address": "Schererville",
    "zip": "46375",
    "country": "Efi"
  }
}
```

Multiple-row insert

Now imagine that you want to insert three rows of data into `nested_data_insert`.

- You can insert the new rows into your table by using a dummy table:

```
WITH dummy_table AS
  (SELECT '003' AS KEY,
         '3' AS num,
         MAP ('Rony',
             Named_struct ('user_id', '1', 'address', '4333 Backer
str', 'zip', '12311', 'country', 'Hun')) AS postal_addresses
  UNION ALL SELECT '004' AS KEY,
                  '4' AS num,
                  MAP ('Ivan',
                      Named_struct ('user_id', '1', 'address', '833
Bridle Avenue', 'zip', '95111', 'country', 'CA')) AS postal_addresses
  UNION ALL SELECT '005' AS KEY,
                  '5' AS num,
                  MAP ('Ivan',
                      Named_struct ('user_id', '1', 'address', '664
Devon Ave', 'zip', '92021', 'country', 'Tog')) AS postal_addresses)
INSERT INTO nested_data_insert
SELECT *
FROM dummy_table;
```

- Alternatively, you can insert the new rows into your table by using a `SELECT` statement:

```
INSERT INTO TABLE nested_data_insert
SELECT '006',
      '6',
      MAP ('Rony',
           Named_struct ('user_id', '1', 'address', '150 National City',
                         'zip', '91950', 'country', 'Hun'))
UNION ALL
SELECT '007',
      '7',
      MAP ('Tomason',
           Named_struct ('user_id', '1', 'address', '272 Ocean Circle' ,
                         'zip', '92801', 'country', 'CA'))
UNION ALL
SELECT '008',
      '8',
      MAP ('Davin',
           Named_struct ('user_id', '1', 'address', '81 Augusta Ave',
                         'zip', '93905', 'country', 'CA'));
```

After you insert data, you should verify that the data is inserted in both Hive and HPE Ezmeral Data Fabric Database JSON tables:

- Verify the insertion into the Hive table by using the `SELECT * FROM` syntax.

```
SELECT * FROM nested_data_insert WHERE entry > '002' ;
```

Sample output:

Table

| entry | num | postal_address | | | | |
|-------|-----|----------------|---------|-------------------|-------|---------|
| | | | USER_ID | ADDRESS | ZIP | COUNTRY |
| 003 | 3 | Rony | 1 | 4333 Backer str | 12311 | Hun |
| 004 | 4 | Ivan | 1 | 833 Bridle Avenue | 95111 | CA |
| 005 | 5 | Ivan | 1 | 664 Devon Ave. | 92021 | Tog |
| 006 | 6 | Rony | 1 | 150 National City | 91950 | Hun |
| 007 | 7 | Tomason | 1 | 272 Ocean Circle | 92801 | CA |
| 008 | 8 | Davin | 1 | 81 Augusta Ave | 93905 | CA |

- Verify the insertion into the HPE Ezmeral Data Fabric Database JSON table data using the `find` statement:

```

find '/nested_data_insert'

{
  "_id": "003",
  "num": {
    "$numberInt": 3
  },
  "postal_addresses": {
    "Rony": {
      "address": "4333 Backer str",
      "country": "Hun",
      "user_id": "1",
      "zip": "12311"
    }
  }
}

{
  "_id": "004",
  "num": {
    "$numberInt": 4
  },
  "postal_addresses": {
    "Ivan": {
      "address": "833 Bridle Avenue",
      "country": "CA",
      "user_id": "1",
      "zip": "95111"
    }
  }
}

{
  "_id": "005",
  "num": {
    "$numberInt": 5
  },
  "postal_addresses": {
    "Ivan": {
      "address": "664 Devon Ave",
      "country": "Tog",
      "user_id": "1",
      "zip": "92021"
    }
  }
}

{
  "_id": "006",
  "num": {
    "$numberInt": 6
  },
  "postal_addresses": {
    "Rony": {
      "address": "150 National City",
      "country": "Hun",
      "user_id": "1",
      "zip": "91950"
    }
  }
}

{
  "_id": "007",

```

```

    "num": {
      "$numberInt": 7
    },
    "postal_addresses": {
      "Tomason": {
        "address": "272 Ocean Circle",
        "country": "CA",
        "user_id": "1",
        "zip": "92801"
      }
    }
  }
}
{
  "_id": "008",
  "num": {
    "$numberInt": 8
  },
  "postal_addresses": {
    "Davin": {
      "address": "81 Augusta Ave",
      "country": "CA",
      "user_id": "1",
      "zip": "93905"
    }
  }
}
}

```

Overwriting data

Still using sample table `nested_data_insert`, you can use the `INSERT` statement on a dummy table to overwrite one or more complete rows.

For example, to overwrite the first row in `nested_data_insert` (001) with new values, use the following syntax:

```

WITH dummy_table AS
(SELECT '001' AS KEY,
 '1' AS num,
 MAP ('newAdam',
 Named_struct ('user_id', '1', 'address', 'newAdress', 'zip', 'newZip',
 'country', 'newCountry')) AS postal_addresses)
INSERT INTO nested_data_insert
SELECT *
FROM dummy_table;

```

After you overwrite data, you should verify that the data is changed in both Hive and HPE Ezmeral Data Fabric Database JSON tables:

- Verify the data into the Hive table by using the `SELECT * FROM` syntax.

```
hive> SELECT * FROM nested_data_insert WHERE entry = '001';
```

Sample output:

Table

| entry | num | postal_address | | | | |
|-------|-----|----------------|---------|------------|--------|------------|
| | | | USER_ID | ADDRESS | ZIP | COUNTRY |
| 001 | 1 | newAdam | 1 | newAddress | newZip | newCountry |

- Verify the data in the HPE Ezmeral Data Fabric Database JSON table data using the `findbyid` statement:

```
findbyid '/nested_data_insert' --id 001

{
  "_id": "001",
  "num": {
    "$numberInt": 1
  },
  "postal_addresses": {
    "newAdam": {
      "address": "newAddress",
      "country": "newCountry",
      "user_id": "1",
      "zip": "newZip"
    }
  }
}
```

For another example, imagine that you want to overwrite 003 and 004 rows in `nested_data_insert` with new values:

```
WITH dummy_table AS (
  SELECT '003' AS KEY,
  '3' AS num,
  MAP ('newName1',
  Named_struct ('user_id', '1', 'address', 'newAdress1', 'zip', 'newZip1',
  'country', 'newCountry1')) AS postal_addresses
  UNION ALL
  SELECT '004' AS KEY,
  '4' AS num,
  MAP ('newName2',
  Named_struct ('user_id', '1', 'address', 'newAdress2', 'zip', 'newZip2',
  'country', 'newCountry2')) AS postal_addresses)
INSERT INTO nested_data_insert
SELECT * FROM dummy_table;
```

After you overwrite the data, you should verify that the data is changed in both Hive and HPE Ezmeral Data Fabric Database JSON tables.

- Verify the data in the Hive table by using the `SELECT * FROM` syntax.

```
hive> SELECT * FROM nested_data_insert WHERE entry IN ('003', '004');
```

Sample output:

Table

| entry | num | postal_address | | | | |
|-------|-----|----------------|---------|-------------|---------|-------------|
| | | | USER_ID | ADDRESS | ZIP | COUNTRY |
| 003 | 3 | newName1 | 1 | newAddress1 | newZip1 | newCountry1 |
| 004 | 4 | newName2 | 1 | newAddress2 | newZip2 | newCountry2 |

Verify the data in the HPE Ezmeral Data Fabric Database JSON table data using the `findbyid` statement:

```
findbyid '/nested_data_insert' --id 003
{
```

```

    "_id": "003",
    "num": {
      "$numberInt": 3
    },
    "postal_addresses": {
      "newName1": {
        "address": "newAddress1",
        "country": "newCountry1",
        "user_id": "1",
        "zip": "newZip1"
      }
    }
  }
}

findbyid '/nested_data_insert' --id 004
{
  "_id": "004",
  "num": {
    "$numberInt": 4
  },
  "postal_addresses": {
    "newName2": {
      "address": "newAddress2",
      "country": "newCountry2",
      "user_id": "1",
      "zip": "newZip2"
    }
  }
}
}

```

Warning: If you exclude columns both from the SELECT statement in your INSERT statement and from the table schema, the value of this column changes to NULL.

Finally, imagine that you want to overwrite the first row in `nested_data_insert` (001) with new values and overwrite the `num` column to NULL:

```

WITH dummy_table AS
(SELECT '001' AS KEY,
MAP ('newAdam',
Named_struct ('user_id', '1', 'address', 'newAddress', 'zip', 'newZip',
'country', 'newCountry')) AS postal_addresses)
INSERT INTO nested_data_insert (entry, postal_addresses)
SELECT * FROM dummy_table;

```

After you overwrite data, you should verify that the data is changed in both Hive and HPE Ezmeral Data Fabric Database JSON tables.

- Verify the data in the Hive table by using the `SELECT * FROM` syntax.

```
hive> SELECT * FROM nested_data_insert WHERE entry = '001';
```

Sample output:

Table

| entry | num | postal_address | | | | |
|-------|------|----------------|---------|------------|--------|------------|
| | | | USER_ID | ADDRESS | ZIP | COUNTRY |
| 001 | NULL | newAdam | 1 | newAddress | newZip | newCountry |

- Verify the data in the HPE Ezmeral Data Fabric Database JSON table (num row is not present):

```
findbyid '/nested_data_insert' --id 001

{
  "_id": "001",
  "postal_addresses": {
    "newAdam": {
      "address": "newAddress",
      "country": "newCountry",
      "user_id": "1",
      "zip": "newZip"
    }
  }
}
```

Understanding the MERGE Statement

You can use the `MERGE` statement to perform record-level `INSERT` and `UPDATE` operations efficiently within Hive tables.

The `MERGE` statement can be a key tool of MapR-cluster data management. It is based on ANSI-standard SQL.

The following scenarios can help you understand how to use the `MERGE` statement:

- [Simple merge.maprdb.column.id is the join key](#) on page 3694
- [Simple merge.maprdb.column.id is not the join key](#) on page 3695
- [DELETE syntax in the MERGE statement](#) on page 3695
- [Multiple source rows match a given target row \(cardinality violation\)](#) on page 3696
- [Merge on mixed data types](#) on page 3697
- [Merge into external HPE Ezmeral Data Fabric Database JSON tables](#) on page 3698
- [Merge into partitioned HPE Ezmeral Data Fabric Database JSON tables](#) on page 3698
- [Merge into temporary HPE Ezmeral Data Fabric Database JSON tables](#) on page 3698

Simple merge.maprdb.column.id is the join key

Consider merging the following example source and target tables:

Table

| id | first_name | last_name | age |
|-----|------------|-----------|------|
| 001 | Dorothi | Hogward | 7777 |
| 002 | Alex | Bowee | 7777 |
| 088 | Robert | Dowson | 25 |

Table

| id | first_name | last_name | age |
|-----|------------|-----------|-----|
| 001 | John | Smith | 45 |
| 002 | Michael | Watson | 27 |
| 003 | Den | Brown | 33 |

You can use the following SQL-standard MERGE statement:

```
MERGE into customer_db_json_target trg
USING customer_source src
ON src.id = trg.id
WHEN MATCHED THEN UPDATE SET age = src.age
WHEN NOT MATCHED THEN
INSERT VALUES (src.id, src.first_name, src.last_name, src.age);
```

The result is:

| id | first_name | last_name | age |
|-----|------------|-----------|------|
| 001 | John | Smith | 7777 |
| 002 | Michael | Watson | 7777 |
| 003 | Den | Brown | 33 |
| 088 | Robert | Dowson | 25 |

Note: The age column is updated and a new id column is inserted.

Simple `merge.maprdb.column.id` is not the join key

Merging when `merge.maprdb.column` is not the join key is not recommended.

DELETE syntax in the MERGE statement

This section describes how to use the DELETE syntax in the MERGE statement for HPE Ezmeral Data Fabric Database JSON tables. Included are examples of usage and limitations.

Consider two tables: `tgt` which is the target table of the MERGE statement, and `src`, which is the source table from which data will be taken. Both tables use `MapRDBJsonStorageHandler` to store data. The following table shows the initial contents of the `tgt` table:

Table

| id | Value |
|----|-------|
| 1 | AAA |
| 2 | BBB |
| 3 | CCC |
| 4 | DDD |
| 5 | EEE |

The following table shows the initial contents of the `src` table:

Table

| id | Value |
|-----|--------|
| 1 | AAA |
| 222 | BBB--- |
| 3 | CCC |
| 444 | DDD--- |
| 5 | EEE |

The following merge statement contains a `WHEN MATCHED THEN DELETE` clause. It means that if the `id` from the `tgt` table equals the `id` from the `src` table, the row is removed from the `tgt` table. When the value of `id` does not match, a new row is inserted into the `tgt` table:

```
MERGE INTO tgt
USING src ON tgt.id=src.id
WHEN MATCHED THEN DELETE
WHEN NOT MATCHED THEN INSERT VALUES (src.id, src.value);
```

The following table shows the result of the merge:

Table

| id | Value |
|-----|--------|
| 2 | BBB |
| 222 | BBB--- |
| 4 | DDD |
| 444 | DDD--- |

Here we removed rows with `id` 1, 3, and 5 from the `tgt` table because they existed in the `src` table, and they matched values from the `tgt` table. We did not touch rows with `id` 2 and 4, because there were no such values in the `src` table. We inserted new rows with `id` values 222 and 444 because they existed in the `src` table and did not exist in the `tgt` table.

Limitations

The preceding solution has three limitations:

1. Subqueries are not supported as a source when `DELETE` is used.
2. The source table should be a HPE Ezmeral Data Fabric Database JSON table when deletion is used in a `MERGE` operator.
3. The `DELETE` operator is not supported with additional conditions after `WHEN MATCHED`. Use either a single `UPDATE` or `DELETE`.

Limitation #3 means that queries like the following are not supported:

```
MERGE INTO tgt
USING src
ON tgt._id = src._id
WHEN MATCHED AND [boolean expression1] THEN DELETE
WHEN MATCHED AND [boolean expression2] THEN UPDATE
WHEN NOT MATCHED THEN INSERT
```

Multiple source rows match a given target row (cardinality violation)

Consider merging the two tables `customer_db_json` and `customer_new`:

Table

| id | first_name | last_name | age |
|-----|------------|-----------|-----|
| 001 | John | Smith | 45 |
| 002 | Michael | Watson | 27 |
| 003 | Den | Brown | 33 |

And:

Table

| id | first_name | last_name | age |
|-----|------------|-----------|-----|
| 001 | Dorothi | Hogward | 77 |
| 001 | Dorothi | Hogward | 77 |
| 088 | Robert | Dowson | 25 |

To MERGE customer_new and customer_db_json:

```
MERGE INTO customer_db_json trg
USING customer_new src ON src.id = trg.id
WHEN MATCHED THEN UPDATE
SET first_name = src.first_name,
last_name = src.last_name
WHEN NOT MATCHED THEN INSERT VALUES
(src.id, src.first_name, src.last_name, src.age);
```

This example causes an exception because of duplicate values in the id column in the customer_new table:

```
Caused by: org.apache.hadoop.hive.ql.metadata.HiveException: Error
evaluating cardinality_violation(_col0)
```

To avoid cardinality violation, set `hive.merge.cardinality.check=false`, but in this case the result is unpredictable because there is no rule that defines the order of duplicated data that will be inserted by using the MERGE statement.

Merge on mixed data types

The merge operation also supports mixed data types, such as arrays, maps, and structures.

Consider two tables `mixed_types_source` and `mixed_types_target`:

Table

| doc_id | user_info |
|--------|---|
| 1 | {"name":"Brandon","surname":"Lee","age":31,"gender":"MALE"} |
| 2 | {"name":"Johnson","surname":"Fall","age":23,"gender":"MALE"} |
| 3 | {"name":"Mary","surname":"Dowson","age":11,"gender":"FEMALE"} |
| 4 | {"name":"Paul","surname":"Rodgers","age":41,"gender":"MALE"} |

And:

Table

| id | user_info |
|----|---|
| 1 | {"name":"Lexx","surname":"Comfuzer","age":31,"gender":"MALE"} |

To merge `mixed_types_source` and `mixed_types_target`:

```
MERGE INTO mixed_types_target trg
USING mixed_types_source src
ON src.doc_id = old.doc_id
WHEN MATCHED THEN UPDATE
SET user_info = src.user_info
```

```
WHEN NOT MATCHED THEN INSERT VALUES
(src.doc_id, src.user_info);
```

The result is:

Table

| id | first_name |
|----|--|
| 1 | { "name": "Brandon", "surname": "Lee", "age": 31, "gender": "MALE" } |
| 2 | { "name": "Johnson", "surname": "Fall", "age": 23, "gender": "MALE" } |
| 3 | { "name": "Mary", "surname": "Dowson", "age": 11, "gender": "FEMALE" } |
| 4 | { "name": "Paul", "surname": "Rodgers", "age": 41, "gender": "MALE" } |

Note that you cannot update only a part of a complex structure field. For example, suppose you have a structure stored as one field in a Hive table:

```
{ "name": "Johnson", "surname": "Fall", "age": 23, "gender": "MALE" }
```

You cannot update only the `age` field in the structure. You can only replace all values of the structure with new ones. For details, see [Understanding the UPDATE Statement](#) on page 3682.

Merge into external HPE Ezmeral Data Fabric Database JSON tables

The `MERGE` operator is also available for external HPE Ezmeral Data Fabric Database JSON tables. You can use the `MERGE` statement to insert and update values in external MapR database JSON table targets.

Merge into partitioned HPE Ezmeral Data Fabric Database JSON tables

Partitioned HPE Ezmeral Data Fabric Database JSON tables are not supported.

Merge into temporary HPE Ezmeral Data Fabric Database JSON tables

The `MERGE` operator is also available for temporary HPE Ezmeral Data Fabric Database JSON tables. Use temporary tables as target tables for merge. No additional syntax is needed.

Understanding the DELETE FROM Operation

In EEP 6.3.1 and later, you can use the `DELETE FROM` operation with HPE Ezmeral Data Fabric Database JSON tables.

Delete All Data from a Table

To delete all data from a HPE Ezmeral Data Fabric DatabaseJSON table use the following operator:

```
DELETE FROM <table_name>;
```

Example. In this example we create a table, insert data, and delete all rows:

```
DROP TABLE IF EXISTS customer;
CREATE TABLE customer(doc_id STRING, first_name STRING, last_name STRING)
STORED BY 'org.apache.hadoop.hive.maprdb.json.MapRDBJsonStorageHandler'
TBLPROPERTIES("maprdb.table.name" = "/customer", "maprdb.column.id" =
"doc_id");
INSERT INTO TABLE customer VALUES ("001", "Max", "Born"), ("002", "Demmy",
"John"), ("003", "Robby", "Smart");
SELECT doc_id, first_name, last_name FROM customer;
```

Table

| doc_id | first_name | last_name |
|--------|------------|-----------|
| 001 | Max | Born |
| 002 | Demmy | John |
| 003 | Robby | Smart |

The following query gives an empty set. Deletions are supported only for HPE Ezmeral Data Fabric Database JSON tables and transactional tables.

```
DELETE FROM customer;
SELECT doc_id, first_name, last_name FROM customer;
```

Example. In this example, we try to delete data from a non-transactional and non-MapR Database JSON table:

```
DROP TABLE IF EXISTS simple_data;
CREATE TABLE simple_data (id INT);
INSERT INTO TABLE simple_data VALUES (1), (2), (3);
DELETE FROM simple_data;
```

The result is:

```
FAILED: SemanticException Operation is not supported. Table is nor ACID
neither MapRDbJSON
```

Delete a Single Row from a Table

To delete a single row from a HPE Ezmeral Data Fabric Database JSON table, use the following syntax:

```
DELETE FROM <table_name> WHERE <id> = <value>;
```

Where:

<table_name> is the HPE Ezmeral Data Fabric Database JSON table.

<id> is a key column of the MapR Database JSON table. It corresponds to the `maprdb.column.id` property.

<value> is the value to be deleted.

Example. In this example, we create a table, insert data, and delete a single row:

```
DROP TABLE IF EXISTS customer;
CREATE TABLE customer(doc_id STRING, first_name STRING, last_name STRING)
STORED BY 'org.apache.hadoop.hive.maprdb.json.MapRDBJsonStorageHandler'
TBLPROPERTIES("maprdb.table.name" = "/customer", "maprdb.column.id" =
"doc_id");
INSERT INTO customer VALUES ("001", "Max", "Born"), ("002", "Demmy",
"John"), ("003", "Robby", "Smart");
SELECT doc_id, first_name, last_name FROM customer;
```

Table

| doc_id | first_name | last_name |
|--------|------------|-----------|
| 001 | Max | Born |
| 002 | Demmy | John |
| 003 | Robby | Smart |

The following query deletes a single row using the `WHERE` clause:

```
DELETE FROM customer WHERE doc_id = "002";
SELECT doc_id, first_name, last_name FROM customer;
```

Table

| doc_id | first_name | last_name |
|--------|------------|-----------|
| 001 | Max | Born |
| 003 | Robby | Smart |

Note. Deletions are supported only for key columns of HPE Ezmeral Data Fabric Database JSON tables.

Example. In this example, we try to use a column other than a key column of the MapR Database JSON table in deletion.

```
DROP TABLE IF EXISTS customer;
CREATE TABLE customer(doc_id STRING, first_name STRING, last_name STRING)
STORED BY 'org.apache.hadoop.hive.maprdb.json.MapRDBJsonStorageHandler'
TBLPROPERTIES("maprdb.table.name" = "/customer", "maprdb.column.id" =
"doc_id");
INSERT INTO customer VALUES ("001", "Max", "Born"), ("002", "Demmy",
"John"), ("003", "Robby", "Smart");
SELECT doc_id, first_name, last_name FROM customer;
```

Column `first_name` is not the key column of the table.

```
DELETE FROM customer WHERE first_name = "Max";
```

The result is:

```
FAILED: SemanticException Deletion over column first_name is forbidden. Use
only key column of MapR Db Json table: doc_id
```

Delete Several Rows from a Table

To delete several rows from a table, use the following syntax:

```
DELETE FROM <table_name> WHERE <id> IN (<value1>, <value2>, ...);
```

Where:

<table_name> is the HPE Ezmeral Data Fabric Database JSON table.

<id> is a key column of the MapR Database JSON table. It corresponds to the `maprdb.column.id` property.

<value1>, <value2>, are values to be deleted.

Example. In this example, we create a table, insert data, and delete several rows:

```
DROP TABLE IF EXISTS customer;
CREATE TABLE customer(doc_id STRING, first_name STRING, last_name STRING)
STORED BY 'org.apache.hadoop.hive.maprdb.json.MapRDBJsonStorageHandler'
TBLPROPERTIES("maprdb.table.name" = "/customer", "maprdb.column.id" =
"doc_id");
INSERT INTO TABLE customer VALUES ("001", "Max", "Born"), ("002", "Demmy",
"John"), ("003", "Robby", "Smart");
SELECT doc_id, first_name, last_name FROM customer;
```

Table

| doc_id | first_name | last_name |
|--------|------------|-----------|
| 001 | Max | Born |
| 002 | Demmy | John |
| 003 | Robby | Smart |

The following query deletes several rows using the WHERE ... IN clause:

```
DELETE FROM customer WHERE doc_id IN ("001", "002");
SELECT doc_id, first_name, last_name FROM customer;
```

Table

| doc_id | first_name | last_name |
|--------|------------|-----------|
| 003 | Robby | Smart |

Delete All Rows in a Table Except Listed Rows

To delete all rows from a table except a listed row, use the following syntax:

```
DELETE FROM <table_name> WHERE <id> NOT IN (<value1>, <value2>, ...);
```

Where:

<table_name> is the HPE Ezmeral Data Fabric Database JSON table.

<id> is a key column of the MapR Database JSON table. It corresponds to the `maprdb.column.id` property.

<value1>, <value2>, are values to be preserved.

Example. In this example, we create a table, insert data, and delete all rows except the listed rows:

```
DROP TABLE IF EXISTS customer;
CREATE TABLE customer(doc_id STRING, first_name STRING, last_name STRING)
STORED BY 'org.apache.hadoop.hive.maprdb.json.MapRDBJsonStorageHandler'
TBLPROPERTIES("maprdb.table.name" = "/customer", "maprdb.column.id" =
"doc_id");
INSERT INTO TABLE customer VALUES ("001", "Max", "Born"), ("002", "Demmy",
"John"), ("003", "Robby", "Smart");
SELECT doc_id, first_name, last_name FROM customer;
```

Table

| doc_id | first_name | last_name |
|--------|------------|-----------|
| 001 | Max | Born |
| 002 | Demmy | John |
| 003 | Robby | Smart |

The following query deletes all rows except the listed rows:

```
DELETE FROM customer WHERE doc_id NOT IN ("003");
SELECT doc_id, first_name, last_name FROM customer;
```

Table

| doc_id | first_name | last_name |
|--------|------------|-----------|
| 003 | Robby | Smart |

Limitations of the DELETE FROM Operation

The following are three limitations of the current implementation:

- The current implementation does not support arbitrary conditions in the `WHERE` clause of the `DELETE` statement even if a key column is used.

Example. In this example, `DELETE FROM` is used with an arbitrary condition:

```
DELETE FROM customer WHERE doc_id == "003" OR doc_id <> "005";
```

The result is:

```
FAILED:
      SemanticException This condition is not supported for MapR Db
      Json deletions. Supported
      WHERE clauses are: <id> = value, <id> IN (value1, value2, ...),
      <id> NOT IN (value1, value2,
      ...)
```

- The current implementation does not support subqueries in the `WHERE` clause.
- The current implementation does not support deletions in the `MERGE` statement.

Hive and HBase Integration

You can create HBase tables from Hive that can be accessed by both Hive and HBase. This allows you to run Hive queries on HBase tables. You can also convert existing HBase tables into Hive-HBase tables and run Hive queries on those tables as well.

Install and Configure Hive and HBase

1. Install and configure Hive if it is not already installed. See [Installing Hive](#) on page 179.
2. Install and configure HBase if it is not already installed. See [Installing HBase](#) on page 175.
3. Run the `jps` command, and ensure that all relevant Hadoop, HBase and Zookeeper processes are running:

```
$ jps
21985 HRegionServer
1549 jenkins.war
15051 QuorumPeerMain
30935 Jps
15551 CommandServer
15698 HMaster
15293 ResourceManager
15328 NodeManager
15131 WardenMain
```

Getting Started with Hive-HBase Integration

In this tutorial you will:

- Create a Hive table

- Populate the Hive table with data from a text file
- Query the Hive table
- Create a Hive-HBase table
- Introspect the Hive-HBase table from HBase
- Populate the Hive-Hbase table with data from the Hive table
- Query the Hive-HBase table from Hive
- Convert an existing HBase table into a Hive-HBase table

Be sure that you have successfully completed all the steps in the Install and Configure Hive and HBase section before beginning this Getting Started tutorial. This Getting Started tutorial closely parallels the Hive-HBase Integration section of the Apache Hive Wiki, and thanks to Samuel Guo and other contributors to that effort.

Create a Hive table with two columns:

Change to your Hive installation directory if you're not already there and start Hive:

```
$ cd $HIVE_HOME
$ bin/hive
```

Execute the CREATE TABLE command to create the Hive pokes table:

```
hive> CREATE TABLE pokes (foo INT, bar STRING);
```

To see if the pokes table has been created successfully, execute the SHOW TABLES command:

```
hive> SHOW TABLES;
OK
pokes
Time taken: 0.74 seconds
```

The `pokes` table appears in the list of tables.

Populate the Hive pokes table with data

Execute the `LOAD DATA LOCAL INPATH` command to populate the Hive `pokes` table with data from the `kv1.txt` file.

The `kv1.txt` file is provided in the `$HIVE_HOME/examples` directory.

```
hive> LOAD DATA LOCAL INPATH './examples/files/kv1.txt' OVERWRITE INTO
TABLE pokes;
```

A message appears confirming that the table was created successfully, and the Hive prompt reappears:

```
Copying data from file:
...
OK
Time taken: 0.278 seconds
hive>
```

Execute a SELECT query on the Hive pokes table:

```
hive> SELECT * FROM pokes WHERE foo = 98;
```

The SELECT statement executes, runs a MapReduce application, and prints the job output:

```
OK
98      val_98
98      val_98
Time taken: 18.059 seconds
```

The output of the SELECT command displays two identical rows because there are two identical rows in the Hive `pokes` table with a key of 98. Note: This is a good illustration of the concept that Hive tables can have multiple identical keys. As we will see shortly, HBase tables cannot have multiple identical keys, only unique keys.

To create a Hive-HBase table, enter these four lines of code at the Hive prompt:

```
hive> CREATE TABLE hbase_table_1(key int, value string)
> STORED BY 'org.apache.hadoop.hive.hbase.HBaseStorageHandler'
> WITH SERDEPROPERTIES ("hbase.columns.mapping" = ":key,cfl:val")
> TBLPROPERTIES ("hbase.table.name" = "xyz");
```

After a brief delay, a message appears confirming that the table was created successfully:

```
OK
Time taken: 5.195 seconds
```

Note: The TBLPROPERTIES command is not required, but those new to Hive-HBase integration may find it easier to understand what's going on if Hive and HBase use different names for the same table.

In this example, Hive will recognize this table as "hbase_table_1" and HBase will recognize this table as "xyz".

Start the HBase shell:

Keeping the Hive terminal session open, start a new terminal session for HBase, then start the HBase shell:

```
$ cd $HBASE_HOME
$ bin/hbase shell
HBase Shell; enter 'help<RETURN>' for list of supported commands.
Type "exit<RETURN>" to leave the HBase Shell
Version 0.90.4, rUnknown, Wed Nov  9 17:35:00 PST 2011

hbase(main):001:0>
```

Execute the list command to see a list of HBase tables:

```
hbase(main):001:0> list
TABLE
xyz
1 row(s) in 0.8260 seconds
```

HBase recognizes the Hive-HBase table named `xyz`. This is the same table known to Hive as `hbase_table_1`.

Display the description of the xyz table in the HBase shell:

```
hbase(main):004:0> describe "xyz"
DESCRIPTION
  ENABLED
  {NAME => 'xyz', FAMILIES => [{NAME => 'cfl', BLOOMFILTER => 'NONE',
REPLICATI true
  ON_SCOPE => '0', COMPRESSION => 'NONE', VERSIONS => '3', TTL =>
'2147483647', BL
```

```
OCKSIZE => '65536', IN_MEMORY => 'false', BLOCKCACHE => 'true'}}}
1 row(s) in 0.0190 seconds
```

From the Hive prompt, insert data from the Hive table `pokes` into the Hive-HBase table `hbase_table_1`

```
hive> INSERT OVERWRITE TABLE hbase_table_1 SELECT * FROM pokes WHERE foo=98;
...
2 Rows loaded to hbase_table_1
OK
Time taken: 13.384 seconds
```

Query `hbase_table_1` to see the data we have inserted into the Hive-HBase table:

```
hive> SELECT * FROM hbase_table_1;
OK
98      val_98
Time taken: 0.56 seconds
```

Even though we loaded two rows from the Hive `pokes` table that had the same key of 98, only one row was actually inserted into `hbase_table_1`. This is because `hbase_table_1` is an HBASE table, and although Hive tables support duplicate keys, HBase tables only support unique keys. HBase tables arbitrarily retain only one key, and will silently discard all the data associated with duplicate keys.

Convert a pre-existing HBase table to a Hive-HBase table

To convert a pre-existing HBase table to a Hive-HBase table, enter the following four commands at the Hive prompt.

Note that in this example the existing HBase table is `my_hbase_table`.

```
hive> CREATE EXTERNAL TABLE hbase_table_2(key int, value string)
> STORED BY 'org.apache.hadoop.hive.hbase.HBaseStorageHandler'
> WITH SERDEPROPERTIES ("hbase.columns.mapping" = "cfl:val")
> TBLPROPERTIES("hbase.table.name" = "my_hbase_table");
```

Now we can run a Hive query against the pre-existing HBase table `my_hbase_table` that Hive sees as `hbase_table_2`:

```
hive> SELECT * FROM hbase_table_2 WHERE key > 400 AND key < 410;
Total MapReduce jobs = 1
Launching Job 1 out of 1
Number of reduce tasks is set to 0 since there's no reduce operator
...
OK
401      val_401
402      val_402
403      val_403
404      val_404
406      val_406
407      val_407
409      val_409
Time taken: 9.452 seconds
```

Hive and HPL/SQL Integration

Note: This feature is presented as a developer preview. Developer previews are not tested for production environments, and should be used with caution.

HPL/SQL includes a Hive UDF function that allows you to execute HPL/SQL scripts (user-defined functions written in HPL/SQL language) in Hive queries.

HPL/SQL uses the `hplsql_locals.sql` file to parse a prepared procedure that can be used in the Hive query. If you want to add and use multiple functions, you should add each function to the `hplsql_locals.sql` file.

For example, to call the `hello` function from a Hive query, you can add a `hello` function to the `hplsql_locals.sql` file:

```
CREATE FUNCTION hello(text STRING)
  RETURNS STRING
  BEGIN
    RETURN 'Hello, ' || text || '!';
  END;
```

There are two possible ways to run the HPL/SQL `hello` function:

Running HPL/SQL from Hive CLI/Hive Beeline

The `hplsql_locals.sql` file must be located in the directory where the Hive CLI is started or in the `/opt/mapr/hive/hive-<version>/bin` directory if you are using Beeline. After adding the `hello` function to the `hplsql_locals.sql` file, register the HPL/SQL UDF in Hive as follows:

```
CREATE TEMPORARY FUNCTION hplsql AS 'org.apache.hive.hplsql.Udf';
```

To use the `hello` function written in HPL/SQL language in Hive, use a query such as the following:

```
SELECT hplsql('hello(:1)', name) FROM users;
```

Running HPL/SQL from the HPL/SQL CLI

When you run HPL/SQL scripts using the HPL/SQL CLI, you can use user-defined functions the same way you use built-in functions:

```
hplsql -e "SELECT hello(name) FROM users;"
```

The HPL/SQL CLI automatically connects to HiveServer2 using the configuration from the `hplsql-site.xml` file, registers the Hive UDF, and modifies the function call in the SQL statements. But you must ensure that the `hplsql_locals.sql` file containing the user-defined functions is located in the `/opt/mapr/hive/hive-<version>/bin` directory, where HiveServer2 can parse it.

For more information, see [User-Defined Functions and Stored Procedures](#).

Hive and HCatalog Integration

The [HCatalog](#) on page 3617 library provides applications with a table view of the filesystem layer in your cluster, expanding your application's options from read/write data streams to add table operations such as `get row` and `store row`. The HCatalog library stores the metadata required for its operations in the Hive Metastore.

The `hcat` utility can execute any of the data definition language (DDL) commands available in Hive that do not involve launching a MapReduce application. Internally, the `hcat` utility passes DDL commands to the `hive` program. Data stored in the MapR filesystem is serialized and deserialized through

`InputStorageFormats` and `OutputStorageFormats` objects for records. Fields within a record are parsed with `SerDes`.

Warning:

The `hive-json-serde-0.2.jar` JSON serializer/deserializer has not implemented a `serialize()` method and as a result does not function.

The WebHCat server provides a REST-like web API for HCatalog. For more information about using WebHCat, see [Hive and WebHCat Integration](#) on page 3709.

This section contains the following topics:

Accessing HCatalog Tables from Hive

To access tables created in HCatalog in Hive, use the following command to append paths to your `HADOOP_CLASSPATH` environment variable:

```
export HADOOP_CLASSPATH=${HADOOP_CLASSPATH}:$HCAT_HOME/share/hcatalog/
storage-handlers/hbase/lib/hbase-storage-handler-<version>.jar:$HCAT_HOME/
share/hcatalog/hcatalog-core-<version>-mapr.jar:$HCAT_HOME/share/hcatalog/
hcatalog-pig-adapter-<version>-mapr.jar:$HCAT_HOME/share/hcatalog/
hcatalog-server-extensions-<version>-mapr.jar
```

Loading and Retrieving Data from Pig

To use the HCatalog library `HCatLoader` and `HCatStorer` to load and retrieve data from Pig:

1. Create a table with the `hcat` utility.

```
hcat -e "create table hcatpig(key int, value string)"
```

2. Verify that the table and table definition both exist.

```
hcat -e "describe formatted hcatpig"
```

3. Load data into the table from Pig: Copy the `$HIVE_HOME/examples/files/kv1.txt` file into the MapRFS file system, then start Pig and load the file with the following commands:

```
pig -useHCatalog -Dfs.default.name=maprfs://CLDB_Host:7222/
grunt> A = LOAD 'kv1.txt' using PigStorage('\u0001') AS(key:INT,
value:chararray);
grunt> STORE A INTO 'hcatpig' USING
org.apache.hive.hcatalog.pig.HCatStorer();
```

4. Retrieve data from the `hcatpig` table with the following Pig commands: Another way to verify that the data is loaded into the `hcatpig` table is by looking at the contents of `maprfs://user/hive/warehouse/hcatpig/`. HCatalog tables are also accessible from the Hive CLI. All Hive queries work on HCatalog tables.

```
B = LOAD 'default.hcatpig' USING
org.apache.hive.hcatalog.pig.HCatLoader();
dump B; // this should display the records in kv1.txt
```

Running MapReduce Applications

This example uses a sample MapReduce program named `HCatalogMRTest.java`.

1. From the command line, issue the following commands to define the environment:

```

export LIB_JARS=
$HCAT_HOME/share/hcatalog/hcatalog-core-<version>-mapr.jar,
$HIVE_HOME/lib/hive-metastore-<version>-mapr.jar,
$HIVE_HOME/lib/libthrift-<version>.jar,
$HIVE_HOME/lib/hive-exec-<version>-mapr.jar,
$HIVE_HOME/lib/libfb303-<version>.jar,
$HIVE_HOME/lib/jdo2-api-<version>-ec.jar,
$HIVE_HOME/lib/slf4j-api-<version>.jar

export HADOOP_CLASSPATH=
$HCAT_HOME/share/hcatalog/hcatalog-core-<version>-mapr.jar:
$HIVE_HOME/lib/hive-metastore-<version>-mapr.jar:
$HIVE_HOME/lib/libthrift-<version>.jar:
$HIVE_HOME/lib/hive-exec-<version>-mapr.jar:
$HIVE_HOME/lib/libfb303-<version>.jar:
$HIVE_HOME/lib/jdo2-api-<version>-ec.jar:
$HIVE_HOME/conf:
$HADOOP_HOME/conf:
$HIVE_HOME/lib/slf4j-api-<version>.jar

```

2. Compile `HCatalogMRTest.java`:

```

javac -cp `hadoop classpath`:${HCAT_HOME}/share/hcatalog/
hcatalog-core-<version>-mapr.jar HCatalogMRTest.java -d .

```

3. Create a JAR file:

```

jar -cf hcatmrtest.jar org

```

4. Create an output table:

```

hcat -e "create table hcatpigoutput(key int, value int)"

```

5. Run the job: At the end of the job, the file `hcatpigoutput` should have entries in the form `key, count`.

```

hadoop --config $HADOOP_HOME/conf jar ./hcatmrtest.jar
org.myorg.HCatalogMRTest -libjars $LIB_JARS hcatpig hcatpigoutput

```

Running Non-MapReduce Applications

This example uses a sample MapReduce program named `TestReaderWriter.java`.

1. Add the following JAR files to your `$HADOOP_CLASSPATH` environment variable with the following command:

```

export HADOOP_CLASSPATH=$HADOOP_CLASSPATH:/opt/
mapr/hive/hive-<version>/lib/antlr-runtime-3.4.jar:/opt/mapr/hive/
hive-<version>/lib/hive-cli-<version>-mapr.jar

```

2. Compile the test program with the following command:

```
javac -cp `hadoop classpath`:${HCAT_HOME}/share/hcatalog/hcatalog-core-<version>-mapr.jar TestReaderWriter.java -d <directory>
```

3. Create a JAR file with the following command:

```
jar -cf hcatrwtest.jar org
```

4. Run the job with the following command:

```
hadoop jar /root/<username>/hcatalog/hcatrwtest.jar org.apache.hive.catalog.data.TestReaderWriter -libjars $LIB_JARS
```

The last command should result in a table named `mytbl` that is populated with data.

Hive and WebHCat Integration

The WebHCat server provides a REST-like web API for HCatalog. Applications make HTTP requests to run Pig, Hive, and HCatalog DDL from within applications.

This topic contains the following sections:

Configuring the WebHCat Server

The properties to configure WebHCat are in the following file:

```
/opt/mapr/hive/hive-<version>/hcatalog/etc/webhcat/webhcat-site.xml
```

When you set up WebHCat, you can configure filesystem and Zookeeper as storage.

1. To configure storage for WebHCat, add the MapRFS location property.

```
<property> <name>templeton.storage.class</name>
<value>org.apache.hive.hcatalog.templeton.tool.HDFSStorage</value> </
property> <property> <name>templeton.storage.root</name> <value>/user/
mapr/webhcat</value> <description>The path to the directory to use for
storage</description> </property>
```

2. To configure WebHCat for Pig:

- a) Compress the Pig installation, then move the compressed file to the MapRFS layer.

```
# cd /opt/mapr/pig
# tar -czvf /tmp/pig-<version>.tar.gz pig-<version>/
# hadoop fs -mkdir /user/mapr/webhcat
# hadoop fs -put /tmp/pig-<version>.tar.gz /user/mapr/webhcat/
```

- b) Set the value of the `templeton.pig.archive` property to the location of the compressed file.

```
<property> <name>templeton.pig.archive</name> <value>maprfs:///user/
mapr/webhcat/pig-<version>.tar.gz</value> </property>
```

- c) Set the value of the `templeton.pig.path` property to the path inside the compressed Pig file where the Pig binary is located.

```
<property>
  <name>templeton.pig.path</name>
  <value>pig-<version>.tar.gz/pig-<version>/bin/pig</value>
</property>
```

3. To configure WebHCat for Hive:

- a) Compress the Hive installation, then move the compressed file to the filesystem layer.

```
# cd /opt/mapr/hive
# tar -czvf /tmp/hive-<version>.tar.gz hive-<version>/
# hadoop fs -mkdir /user/mapr/webhcat
# hadoop fs -put /tmp/hive-<version>.tar.gz /user/mapr/webhcat
```

- b) Set the value of the `templeton.hive.archive` property to the location of the compressed file.

```
<property> <name>templeton.hive.archive</name> <value>maprfs:///user/
mapr/webhcat/hive-<version>.tar.gz</value> </property>
```

- c) Set the value of the `templeton.hive.path` property to the path inside the compressed Hive file where the Hive binary is located.

```
<property>
  <name>templeton.hive.path</name>
  <value>hive-<version>.tar.gz/hive-<version>/bin/hive</value>
</property>
```

4. To Configure WebHCat for streaming:

- a) Copy the Streaming JAR to the filesystem layer.

```
# hadoop fs -put
/opt/mapr/hadoop/hadoop-<version>/contrib/streaming/
hadoop-<version>-dev-streaming.jar /user/mapr/webhcat
```

- b) Set the `templeton.streaming.jar` property to the location of the streaming JAR.

```
<property> <name>templeton.streaming.jar</name> <value>maprfs:///user/
mapr/webhcat/hadoop-<version>-dev-streaming.jar</value> </property>
```

Configure WebHCat Server to use SSL Encryption

You can configure WebHCat REST-API to use SSL (Secure Sockets Layer) encryption. The following WebHCat properties are added to enable SSL:

```
templeton.use.ssl
Default value: false
Description: Set this to true for using SSL encryption for WebHCat server

templeton.keystore.path
Default value: <empty string>
Description: SSL certificate keystore location for WebHCat server

templeton.keystore.password
```

```

Default value: <empty string>
Description: SSL certificate keystore password for WebHCat server

templeton.ssl.protocol.blacklist
Default value: SSLv2,SSLv3
Description: SSL Versions to disable for WebHCat server

templeton.host
Default value: 0.0.0.0
Description: The host address the WebHCat server will listen on

```

Modifying the webhcat-site.xml file:

Configure the following properties in the `webhcat-site.xml` file to enable SSL encryption on each node where HWebHCat is installed:

```

<!-- WebHCat SSL -->
<property>
  <name>templeton.use.ssl</name>
  <value>>true</value>
</property>

<property>
  <name>templeton.keystore.path</name>
  <value>/opt/mapr/conf/ssl_keystore</value>
</property>

<property>
  <name>templeton.keystore.password</name>
  <value><ssl-keystore-password></value>
</property>

```

Note: After running `/opt/mapr/server/configure.sh -R`, all properties needed to enable SSL encryption for WebHCat are added automatically to `webhcat-site.xml` on the MapR-SASL secure cluster.

To check status of WebHCat server configured for SSL encryption, use following command:

```
curl -k 'https://<user>:<password>@<host>:50111/templeton/v1/status'
```

Requirements for Using Automatically Generated PEM Files

To use automatically generated PEM files for the WebHCat REST API on a MapR-SASL cluster, you need to have a cluster with a host name that consists at least of three parts: administrator user name and password, and WebHCat REST API host.

Check the status of the WebHCat REST API to make sure you have a cluster with a host name that consists of the administrator user name and password, and WebHCat REST API host service:

```
curl --cacert /opt/mapr/conf/ssl_truststore.pem -u
<cluster_admin_user>:<cluster_admin_password>
"https://<myhost.mapr.com>:50111/templeton/v1/status" -v
```

The sample output for this example is as follows:

```

* TCP_NODELAY set
* Connected to c74v610.mapr.com (192.168.122.254) port 50111 (#0)
* Cipher selection: ALL:!EXPORT:!EXPORT40:!EXPORT56:!aNULL:!LOW:!
RC4:@STRENGTH
* successfully set certificate verify locations:
CAfile: /opt/mapr/conf/ssl_truststore.pem

```

```

CApath: none
* (303) (OUT), TLS Unknown, Certificate Status (22):
* (303) (OUT), TLS handshake, Client hello (1):
* (303) (IN), TLS handshake, Server hello (2):
* (303) (IN), TLS handshake, Certificate (11):
* (303) (IN), TLS handshake, Server key exchange (12):
* (303) (IN), TLS handshake, Server finished (14):
* (303) (OUT), TLS handshake, Client key exchange (16):
* (303) (OUT), TLS change cipher, Client hello (1):
* (303) (OUT), TLS handshake, Finished (20):

```

Managing the WebHCat Server

As of Hive 0.13-1504 and Hive 1.0-1504, WebHCat is managed by Warden. Therefore, you can start and stop WebHCat using `maprccli` and the Control System.

Starting the WebHCat Server

Applies to versions prior to Hive 0.13-1504 and Hive 1.0-1504:

```
# ./webhcat_server.sh start
```

Starting WebHCat Using the `maprccli`

1. Make a list of nodes on which Hive Metastore is configured.
2. Issue the `maprccli node services` command:

```
maprccli node services -name hcat -action start -nodes <space delimited
list of nodes>
```

Stopping WebHCat Using the `maprccli`

1. Make a list of nodes on which Hive Metastore is configured.

2. Issue the `maprccli node services` command:

```
maprccli node services -name hcat -action stop -nodes <space delimited
list of nodes>
```

Starting or Stopping WebHCat Using the Control System

1. In the Navigation pane, expand the Cluster Views pane and click **Dashboard**.
2. In the Services pane, click **WebHcat** to open the Nodes screen displaying all the nodes on which Hive Metastore is configured.
3. On the Nodes screen, click the hostname of each node to display its Node Properties screen.
4. On each Node Properties screen, use the **Stop/Start** button in the WebHcat row under Manage Node Services to start WebHcat.

Checking the Error Logs

Go to the following folder:

```
/opt/mapr/hive/hive-<version>/logs/<user.name>/webhcat
```

Note: If you are running a Hive 0.13 version prior to Hive 0.13-1504, go to the `/tmp/<user.name>/webhcat` folder to view the error logs.

Verifying the Server's Status

In a web browser, navigate to:

```
http://hostname:50111/templeton/v1/status?user.name=root
```

A healthy server will return the string `{"status": "ok", "version": "v1"}`. You can change the port number from the default value of 50111 by editing the `webhcat-site.xml` file.

Running Jobs on the WebHCat Server

REST Calls in WebHCat

The base URI for REST calls in WebHCat is `http://<host>:<port>/templeton/v1/`. The following table lists elements appended to the base URI and DDL commands.

| URI | Description |
|---|---|
| Server Information | |
| <code>/status</code> | Shows WebHCat server status. |
| <code>/version</code> | Shows WebHCat server version. |
| DDL Commands | |
| <code>/ddl/database</code> | List existing databases. |
| <code>/ddl/database/<mydatabase></code> | Shows properties for the database named <i>mydatabase</i> . |
| <code>/ddl/database/<mydatabase>/table</code> | Shows tables in the database named <i>mydatabase</i> . |
| <code>/ddl/database/<mydatabase>/table/<mytable></code> | Shows the table definition for the table named <i>mytable</i> in the database named <i>mydatabase</i> . |

| URI | Description |
|---|---|
| /ddl/database/<mydatabase>/table/<mytable>/property | Shows the table properties for the table named <i>mytable</i> in the database named <i>mydatabase</i> . |

Launching a MapReduce Job with WebHCat

WebHCat launches two jobs for each MapReduce job. The first job, `TempletonControllerJob`, has one map task. The map task launches the actual job from the REST API call. Check the status of both jobs and the output directory contents.

1. Copy the MapReduce example job to the MapRFS layer:

```
hadoop fs -put /opt/mapr/hadoop/hadoop-<version>/
hadoop-<version>-dev-examples.jar /user/mapr/webhcat/examples.jar
```

2. Use the `curl` utility to launch the job:

```
curl -s -d jar=examples.jar -d class="terasort" -d
arg=teragen.test -d arg=whop3 'http://localhost:50111/templeton/v1/
mapreduce/jar?user.name=<username>'
```

Launching a Streaming MapReduce Job with WebHCat

1. Use the `curl` utility to launch the job:

```
curl -s -d arg=teragen.test -d output=mycounts -d mapper=/bin/cat -d
reducer="/usr/bin/wc -w" 'http://localhost:50111/templeton/v1/mapreduce/
streaming?user.name=<username>'
```

2. Check the job status for both WebHCat jobs at the jobtracker page in the Control System.

Launching a Pig Job with WebHCat

1. Copy a data file into MapRFS:

```
hadoop fs -put $HIVE_HOME/examples/files/kv1.txt /user/<user name>/
```

2. Create a `test.pig` file with the following contents:

```
A = LOAD 'kv1.txt' using PigStorage('\u0001') AS(key:INT,
value:chararray);
STORE A INTO 'pig.output';
```

3. Copy the `test.pig` file into MapR filesystem:

```
hadoop fs -put test.pig /user/<user name>/
```

4. Run the Pig REST API command:

```
curl -s -d file=test1.pig -d arg=-v 'http://localhost:50111/templeton/v1/
pig?user.name=<username>'
```

5. Monitor the contents of the `pig.output` directory.

6. Check the JobTracker page for two jobs: `TempletonControllerJob` and `PigLatin`.

Launching a Hive Job with WebHCat

1. Create a table:

```
curl -s -d execute="create+external+table+ext3(t+TIMESTAMP)+location /
user/<user name>/ext3" 'http://localhost:50111/templeton/v1/hive?
user.name=<username>'
```

2. Load data into the table:

```
curl -s -d execute="insert+overwrite+table+ext3+select+*+from+datetable"
'http://localhost:50111/templeton/v1/hive?user.name=<username>'
```

3. List the tables:

```
curl -s -d execute="show+tables" -d statusdir='hive.output' 'http://
localhost:50111/templeton/v1/hive?user.name=<username>'
```

The list of tables is in `hive.output/stdout`.

The Job Queue

To show HCatalog jobs for a particular user, navigate to the following address:

```
http://<hostname>:<port>/templeton/v1/queue/?user.name=<username>
```

The default port for HCatalog is 50111.

Hive and Tez Integration

You can use Tez, instead of MapReduce, for generic data processing tasks. Tez significantly increases the processing speed. Tez, working with Hive, provides lower latency for interactive queries and higher throughput for batch queries.

Configuring Hive and Tez

To configure Hive on Tez, repeat the following steps on each node where you want to configure Hive on Tez. Tez mode for MR jobs is not compatible with all MR jobs, so do not set up the whole cluster to work on Tez.

There is a known issue related to the incomplete removal of previously installed Tez packages. The issue affects platforms on which Tez was installed but later removed using `sudo apt-get remove mapr-tez`. Because of Ubuntu-specific behavior and Tez source-code issues, the `remove` command removes Tez only partially in some installations. If this happens, an error is generated when you try to re-install Tez on Ubuntu, as described following in step 1. If you believe your installation might have this issue, you can prevent the error. Before performing the following steps, use the `purge` command to completely remove all previously installed Tez packages.

1. Install Tez if it is already not installed. To install Tez, run the following command:

| | |
|--------------------|---------------------------------------|
| On CentOS / RedHat | <code>yum install mapr-tez</code> |
| On SLES | <code>zypper install mapr-tez</code> |
| On Ubuntu | <code>apt-get install mapr-tez</code> |

Note: Repeat this step on each node where you want Hive on Tez to be configured.

2. Create the /apps/tez directory on MapR filesystem.

To create, run the following commands:

```
hadoop fs -mkdir /apps
hadoop fs -mkdir /apps/tez
```

3. Upload the Tez libraries to the /tez directory on the MapR file system.

To upload, run the following commands:

```
hadoop fs -put /opt/mapr/tez/tez-<version> /apps/tez
hadoop fs -chmod -R 755 /apps/tez
```

4. Verify the upload.

To verify, run the following command:

```
hadoop fs -ls /apps/tez/tez-<version>
```

5. Set the Tez environment variables. To set, open the /opt/mapr/hive/hive-<version>/conf/hive-env.sh file, add the following lines, and save the file:

```
export TEZ_CONF_DIR=/opt/mapr/tez/tez-<version>/conf
export TEZ_JARS=/opt/mapr/tez/tez-<version>/*:/opt/mapr/tez/
tez-<version>/lib/*
export HADOOP_CLASSPATH=$TEZ_CONF_DIR:$TEZ_JARS:$HADOOP_CLASSPATH
```

Note: Repeat this step on each node where you want Hive on Tez to be configured.

6. Configure Hive for Tez engine. To configure, open the `/opt/mapr/hive/hive-<version>/conf/hive-site.xml` file, add the following lines, and save the file.

```
<property>
  <name>hive.execution.engine</name>
  <value>tez</value>
</property>
```

Add the `hive.exec.pre.hooks`, `hive.exec.post.hooks`, and `hive.exec.failure.hooks` properties with value `org.apache.hadoop.hive.ql.hooks.ATSHook` to use the Hive queries page in the Tez UI.

Note: Starting from EEP 7.1.0, the following execution-hooks properties are managed by running `configure.sh` command with `-R` option.

```
<property>
  <name>hive.exec.pre.hooks</name>
  <value>org.apache.hadoop.hive.ql.hooks.ATSHook</value>
</property>

<property>
  <name>hive.exec.post.hooks</name>
  <value>org.apache.hadoop.hive.ql.hooks.ATSHook</value>
</property>

<property>
  <name>hive.exec.failure.hooks</name>
  <value>org.apache.hadoop.hive.ql.hooks.ATSHook</value>
</property>
```

Note: Repeat this step on each node where you want Hive on Tez to be configured.

7. Run `configure.sh` with the `-R` option.

```
/opt/mapr/server/configure.sh -R
```

Note: Starting in EEP 6.0.1 and later, Tez should be configured by running the `$MAPR_HOME/server/configure.sh` script with the `-R` option.

8. Configure Tez shuffle on a secured cluster:
Refer to [Tez Shuffle](#) on page 3725 to configure SSL encryption on shuffle.

Known Issues and Restrictions

Sqoop importing data into Hive fails when the entire cluster is configured to use Tez.

This is because of Sqoop's incompatibility with Tez.

Workaround: Do not configure the entire cluster to use Tez.

Percentage sampling is not supported in `org.apache.hadoop.hive.ql.io.HiveInputFormat`.

Hive uses `org.apache.hadoop.hive.ql.io.HiveInputFormat` by default and so queries like `'SELECT * FROM tablename TABLESAMPLE(20 percent);'` will not work for Hive on Tez.

Workaround: Instead of `org.apache.hadoop.hive.ql.io.HiveInputFormat`, use

```
org.apache.hadoop.hive ql.io.CombineHive
InputFormat.
```

To change input format, do one of the following:

- Set `hive.tez.input.format` in hive shell. For example:

```
hive> set
hive.tez.input.format=org.apache.ha
doop.hive.ql.io.CombineHiveInputFor
mat;
```

- Add `org.apache.hadoop.hive.ql.io.CombineHiveInputFormat` to `hive-site.xml` file. For example:

```
<property>
  <name>hive.tez.input.format</
name>

  <value>org.apache.hadoop.hive.ql.io
.CombineHiveInputFormat</value>
</property>
```

Hive on Tez does not work well with Sequence Files Schema changes

TEZ-2741

Limitations with common joins

HIVE-11693: The `CommonMergeJoinOperator` only sets big table position when it has inputs for big table. If the input is empty, the method is not called.

HiveServer2 on Tez doesn't support concurrent queries within one session

HIVE-9223: When multiple queries are submitted in the same HS2 session concurrently, some queries fail with an error.

Tez upgrade issues

- No support for preserving configuration from EEP-5.0.0 and EEP-4.1.1 (ECO-1803) to EEP-6.0.0(1808) or EEP-5.0.1(1808) on Ubuntu.
- No support for preserving Tomcat configuration from previous EEPs to EEP-6.0.0 (1808).
- You should manually stop the Tomcat service and delete the tomcat folder as a precondition if you are updating or upgrading Tez from the following EEPs:
EEP-4.0.0
EEP-4.1.0

Tez shuffle SSL encryption issue

During a shuffle phase, the `javax.net.ssl.SSLException` error could occur on a multi-node cluster due to insufficient Tez shuffle SSL encryption configuration, see [Tez Shuffle](#) on page 3725 for a solution.

SQL Limitations

The following is a list of SQL limitations on Hive on Tez:

| Issue | Summary |
|------------|--|
| HIVE-11693 | CommonMergeJoinOperator throws exception with Tez. |

| Issue | Summary |
|------------|--|
| HIVE-9989 | Hive on Tez group by with cast(NULL AS BIGINT) throws NPE. |
| HIVE-11270 | Tez gives different responses when run on Physical tables and logical views. |
| HIVE-9223 | HiveServer2 on Tez doesn't support concurrent queries within one session. |
| HIVE-13623 | Hive on Tez produces wrong results when withClause and (outer) joins. |
| TEZ-2741 | Hive on Tez does not work well with Sequence Files Schema changes. |
| HIVE-13926 | Cannot limit reduce (not both Map and Reduce) memory in Tez engine. |

Hive-on-Tez User Interface

This section describes how to install, configure, manage, and start the Hive-on-Tez user interface.

 **Warning:** The Hive-on-Tez user interface supports RM HA only starting from the 1803 release (EEP 4.1.1 and EEP-5.0.0).

Installing the Hive-on-Tez User Interface

This topic describes installation of the Hive-on-Tez user interface by using the MapR Installer or manual steps.

Installation Using the MapR Installer

When you use the MapR Installer to install Tez, the timeline server for the Hive-on-Tez user interface is installed automatically. If the **Enable MapR Secure Cluster** option is enabled in the MapR Installer, the timeline server is installed to be secure.

The Tomcat server is installed into this folder:

```
/opt/mapr/tez/tez-<version>/tomcat/apache-tomcat-<version>
```

To start using the Hive-on-Tez user interface if the **Enable MapR Secure Cluster** option is enabled or if the cluster is Kerberized, you must log in to the timeline server user interface:

```
https://<hostname>:8190
```

Manual Installation

To install the Hive-on-Tez user interface manually:

1. Install and configure `mapr-tez` as described in [Configuring Hive and Tez](#) on page 3715.
2. Install the timeline server:

| | |
|----------------------------|--|
| On CentOS / Red Hat | <code>yum install mapr-timelineserver</code> |
| On SLES | <code>zypper install mapr-timelineserver</code> |
| On Ubuntu | <code>apt-get install mapr-timelineserver</code> |

Note: Install the timeline server on a single node. The Hive-on-Tez user interface does not support High Availability (HA).

Configuring the Timeline Server to Use the Hive-on-Tez User Interface

This topic describes how to configure the timeline server to use the Hive-on-Tez user interface. This topic includes security configuration information.

When the timeline server is installed using the MapR Installer, the installer secures the timeline server automatically. When you install the timeline server manually, use these steps.

 **Note:** This procedure assumes that you have previously configured the cluster using the `configure.sh` script.

1. Run `configure.sh -R` (on all Hive nodes), replacing `<hostname>` with the name of your timeline server node:

```
sudo /opt/mapr/server/configure.sh -R -TL <hostname>
```

 **Note:** Make sure the hostname matches the CN in `ssl_keystore` for secure clusters. If not, all hive and yarn jobs fail. The hostname can be obtained using the `$hostname -f` command.

Running `configure.sh -R` configures the timeline server properties in `/opt/mapr/hadoop/hadoop-2.7.0/etc/hadoop/yarn-site.xml` for enhanced security.

2. To use the timeline server with Kerberos, you need to make additional entries to the `/opt/mapr/hadoop/hadoop-2.7.0/etc/hadoop/yarn-site.xml` file. Replace the following variables with real values:

- `MAPR_PRINCIPAL`
- `PATH_TO_KEYTAB`
- `HTTP_PRINCIPAL`

```
<property>
  <name>yarn.timeline-service.principal</name>
  <value>MAPR_PRINCIPAL</value>
</property>
<property>
  <name>yarn.timeline-service.keytab</name>
  <value>PATH_TO_KEYTAB</value>
</property>
<property>
  <name>yarn.timeline-service.http-authentication.kerberos.principal</name>
  <value>HTTP_PRINCIPAL</value>
</property>
<property>
  <name>yarn.timeline-service.http-authentication.kerberos.keytab</name>
  <value>PATH_TO_KEYTAB</value>
</property>
```

3. Restart the resource manager:

```
maprcli node services -name resourcemanager -action restart -nodes
<hostname>
```

Configuring the Tomcat Server

This topic describes how to configure and manage the Tomcat server for the Hive-on-Tez user interface.

Extracting the Tomcat Server

You can only extract the Tomcat server after you manually install Tez. Tez has a built-in Tomcat Server archive with the latest version. You can find the archive at:

```
$TEZ_HOME/tomcat/tomcat.tar.gz
```

To extract the Tomcat server, use these commands in the command line:

```
cd $TEZ_HOME/tomcat/
sudo tar -zxvf tomcat.tar.gz -C $TEZ_HOME/tomcat
```

Change the permissions for the tomcat directory to the user who will be running the Tomcat server:

```
sudo chown -R <$USER>:<$USER_GROUP> $TEZ_HOME/tomcat
```

Configuring the Timeline Server Base URL and Resource Manager WEB URL

To set the `timelineBaseUrl` and `RMWebUrl`, update the Tez configuration file.

The file location is:

```
nano $TEZ_HOME/tomcat/apache-tomcat-<version>/webapps/tez-ui/config/
configs.js
```

To configure the Timeline Server Base URL and Resource Manager WEB URL:

1. Replace `TIME_LINE_BASE_URL` with the real URL, for example:

- For a non-secure configuration:

```
'http://localhost:8188'
```

- For a secure configuration:

```
'https://localhost:8190'
```

2. Replace `RM_WEB_URL` with the real URL, for example:

- For a non-secure configuration:

```
'http://localhost:8088'
```

- For a secure configuration:

```
'https://localhost:8090'
```

- For a proxy server, specify the user-defined URL in the `yarn-site.xml` file, as shown:

```
<property>
  <name>yarn.web-proxy.address</name>
  <value><hostname>:<port></value>
</property>
```

Replace `RM_WEB_URL` with the value specified as the `yarn.web-proxy.address` property.

Configuring SSL for the Tomcat Server on a Secure Cluster

To start the Tomcat server with the exposed SSL port, edit the following properties in the `$TEZ_HOME/tomcat/apache-tomcat-9.0.1/conf/server.xml` file, replacing `<ssl-keystore-password>` with the real SSL keystore password.

1. Find default configuration of the exposed port:

```
<Connector port="9383"
  protocol="HTTP/1.1"
  connectionTimeout="20000"
  redirectPort="8443" />
```

2. Change configuration for SSL:

```
<Connector port="9393"
  SSLEnabled="true"
  maxThreads="150"
  scheme="https"
  secure="true"
  clientAuth="false"
  sslProtocol="TLS"
  keystoreFile="/opt/mapr/conf/ssl_keystore"
  keystorePass="<ssl-keystore-password>" />
```

Note: If you used Installer version 1.15.0.0 to install the cluster, see [Hive-on-Tez User Interface Known Issues](#) on page 3724.

Starting and Stopping the Tomcat Server

To start the Tomcat server, run this script:

```
$TEZ_HOME/tomcat/apache-tomcat-<version>/bin/startup.sh
```

To stop the Tomcat server, run this script:

```
$TEZ_HOME/tomcat/apache-tomcat-<version>/bin/shutdown.sh
```

Note: The `timelineBaseUrl` maps to the YARN Timeline Server, and the `RMWebUrl` maps to the YARN Resource Manager. For default port information, see [Ports Used by HPE Ezmeral Data Fabric Software](#) on page 2579.

Configuring the Tez UI (Tomcat) to be Managed by Warden

This section describes how to use manual steps to configure and verify that the Tez UI (Apache Tomcat) is managed by Warden.

Using the Installer to install Tez configures the Tez UI to be managed by *Warden* by default.

Prerequisites

Before continuing, ensure that the following prerequisites are met:

- Hive and Tez are installed on the node.
- You have completed all of the tasks described under [Hive-on-Tez User Interface](#) on page 3719.
- The Tez UI is up and running and functioning properly.

Manually Configure the Tez UI Server

To manually configure the Tez UI server so that it can be managed by Warden and the Control System, copy and rename the `warden.tezui.conf.template` file in the Tez conf dir:

```
mv /opt/mapr/tez/tez-<version>/conf/warden.tezui.conf.template /opt/mapr/conf/conf.d/warden.tezui.conf
```

Verify that the Tez UI Is Managed by Warden

After configuration, to verify that the Tez UI is managed by Warden, you can try using the Tez UI directly, or use the command line to check the list of open files (specify port 9383 or 9393):

```
lsof -i:<port>
```

The following example shows that the Tomcat service is running:

```
lsof -i:9383
COMMAND  PID USER  FD  TYPE DEVICE SIZE/OFF NODE NAME
java     31580 mapr   56u IPv6 271941      0t0  TCP *:9383 (LISTEN)
```

Use maprcli Commands to Stop, Start, or Restart the Tez UI

The following `maprcli` commands help you manage the Tomcat server. Use these commands to confirm that you can manage the Tez UI through the `maprcli`. You can also use these commands to stop, start, or restart the Tomcat server after configuration changes.

To stop node services for the Tez UI:

```
/opt/mapr/bin/maprcli node services -name tezui -action stop -nodes
<tez_ui_node_name>
```

To start node services for the Tez UI:

```
/opt/mapr/bin/maprcli node services -name tezui -action start -nodes
<tez_ui_node_name>
```

To restart node services for the Tez UI:

```
/opt/mapr/bin/maprcli node services -name tezui -action restart -nodes
<tez_ui_node_name>
```

Use the Control System Commands to Stop, Start, or Restart the Tez UI

In the Control System, the procedure is generally the same for stopping, starting, and restarting the Tez UI:

1. Log in to the Control System and click **Services** to display the list of services on the cluster.
2. Click one of the following icons for the Tez UI service:
 - To stop the service, click .
 - To start the service, click .
 - To restart the service, click .

Integrating the Hive-on-Tez User Interface with Tez

This topic describes how to integrate the Hive-on-Tez user interface with Tez.

1. Add the following entry to the `/opt/mapr/tez/tez-<version>/conf/tez-site.xml` file, replacing `<hostname>: <port>` with the real host name. You can use 9383 or 9393 for the port. 9383 is HTTP and 9393 is HTTPS Tomcat port for the Hive-on-Tez user interface.

```
<property>
  <description>Enable Tez to use the Timeline Server for History
  Logging</description>
  <name>tez.history.logging.service.class</name>

  <value>org.apache.tez.dag.history.logging.ats.ATSHistoryLoggingService</
  value>
</property>

<property>
  <description>URL for where the Tez UI is hosted</description>
  <name>tez.tez-ui.history-url.base</name>
  <value>http(s)://<hostname>:<port>/tez-ui/</value>
</property>
```

Repeat this step on each node where you want the Hive-on-Tez user interface to be configured.

Connecting to the Hive-on-Tez User Interface

This topic describes how to connect to the Hive-on-Tez user interface.

To start using the Hive-on-Tez user interface on a MapR secure or Kerberized cluster or non-secure cluster, you must log in to the timeline server user interface and RM UI:

```
https://<hostname>:8190
```

```
https://<hostname>:8090
```

To connect to the Hive-on-Tez user interface on secure clusters, use a browser to navigate to:

```
https://<hostname>:9393/tez-ui/
```

where `<hostname>` is the host where the Tomcat server is running.

Hive-on-Tez User Interface Known Issues

This topic describes known issues that you should be aware of while troubleshooting.

Installer Configuration Known Issues

If you used Installer version 1.15.0.0 to install the cluster, re-assign the following existing truststore SSL variables with the correct keystore SSL variables:

| Existing variables (truststore) | Correct variables (keystore) |
|---|---|
| <code>keystoreFile="/opt/mapr/conf/ssl_truststore"</code> | <code>keystoreFile="/opt/mapr/conf/ssl_keystore"</code> |
| <code>keystorePass="<ssl-truststore-password>" /></code> | <code>keystorePass="<ssl-keystore-password>" /></code> |

Timeline Server Known Issues

(Issue 29538) After an incremental install or rolling upgrade to MapR 6.1, the timeline server does not start. To resolve this issue, add the following entry to `/opt/mapr/hadoop/hadoop-2.7.0/etc/hadoop/yarn-env.sh`:

```
export YARN_TIMELINESERVER_OPTS="$ {YARN_TIMELINESERVER_OPTS} $
{MAPR_LOGIN_OPTS} "
```

To grant administrative privileges to any user(s), modify `yarn-site.xml`, as shown:

```
<property>
  <name>yarn.admin.acl</name>
  <value><user_name></value>
</property>
```

After the `yarn.admin.acl` property takes effect, the user specified by `<user_name>` has administrative privileges and access to all jobs.

For example, User-A can access all the jobs owned by User-A, by default. If User-A needs access to jobs owned by other users, administrative privileges can be granted to User-A through the `yarn.admin.acl` property.

Tez Shuffle

Tez uses `org.apache.hadoop.mapred.ShuffleHandler` provided by MapReduce version 2.0 (MRv2) as an auxiliary service, which you can choose to configure via the `/opt/mapr/hadoop/hadoop-<version>/etc/hadoop/mapred-site.xml` file.

On a secured cluster, Tez shuffle, SSL encryption configuration is enabled in `/opt/mapr/tez/tez-<version>/conf/tez-site.xml` by default:

| | |
|---|-------------------|
| <code>tez.runtime.shuffle.ssl.enable</code> | <code>true</code> |
| <code>tez.runtime.shuffle.keep-alive.enabled</code> | <code>true</code> |

Also, you must configure Tez shuffle for YARN by adding the following property to the `mapred-site.xml` file. Edit the `/opt/mapr/hadoop/hadoop-<version>/etc/hadoop/mapred-site.xml` file:

| | |
|--|-------------------|
| <code>mapreduce.shuffle.ssl.enabled</code> | <code>true</code> |
|--|-------------------|

Queue Management with Hive-on-Tez

HiveServer2 provides built-in functionality to set-up and handle a pool of Tez sessions in default queues. Tez initiates a session and keeps it alive to run sequential queries. Queries can be submitted through HiveServer2 clients, such as Beeline and the Hive CLI. You can manage queues through properties in `hive-site.xml`.

Queue management is strongly connected to the type of YARN Scheduler used. By default, an HPE Ezmeral Data Fabric cluster uses Fair Scheduler and Hive-on-Tez to run queries in queues with a user name. If a query is submitted from the Hive CLI, the real user name is used. If a query is submitted from a HiveServer2 client, such as Beeline, the queue name depends on the HiveServer2 impersonation configuration property, `hive.server2.enable.doAs`, where the queue name could be the real user name or the user name of the Hiveserver2 process.

With Capacity Scheduler, Hive queries submitted from the CLI and Beeline are configured through the `capacity-scheduler.xml` file. Default queue names are chosen from the scheduler settings, but you can also use the `tez.queue.name=<queue_name>` property to run queries in a specific queue.

Application Masters (AM) are strongly bound to YARN. You cannot change the queue for an AM that is already started. If impersonation is enabled for HiveServer2, a new AM starts next to an existing AM for a default queue. Do not use or close a default queue at the end of a lifetime.

Note: HiveServer2 works with or without impersonation. Impersonation is set through the `hive.server2.enable.doAs` property.

Run Queries in a Specific Queue

If you want all queries to run in a specific queue, you can configure a queue name through the `tez.queue.name` property. When you configure a queue name through the `tez.queue.name` property, Tez sets the queue name for all jobs submitted from the client to the configured `tez.queue.name`. You can set this property before each query through the Hive SET command, as shown:

```
set tez.queue.name=<queue_name>;
```

Or, you can set the property in the `hive-site.xml` file, as shown:

```
<property>
  <name>tez.queue.name</name>
  <value>my_queue</value>
</property>
```

Important: If you set `tez.queue.name` in `hive-site.xml`, and you want the queue name to persist across all queries in the session, you must also set the `hive.server2.tez.unset.tez.queue.name` property in `hive-site.xml` to `false`, as shown:

```
<property>
  <name>tez.queue.name</name>
  <value>my_queue</value>
</property>
<property>
  <name>hive.server2.tez.unset.tez.queue.name</name>
  <value>>false</value>
</property>
```

If `hive.server2.tez.unset.tez.queue.name` is set to `true`, Hive will not persist the `tez.queue.name` across queries and instead uses the default cluster queue names.

Configuration Properties

HiveServer2 has several settings related to queue management. Specify the following properties in the `hive-site.xml` file:

| Property | Description | Default Value |
|---|---|-------------------------------------|
| <code>tez.queue.name</code> | The queue name for all jobs submitted from a given client. Set through the Hive CLI via the SET command before running a query or through <code>hive-site.xml</code> . If you set the property through <code>hive-site.xml</code> , and you want the setting to persist across all queries that run, set <code>hive.server2.tez.unset.tez.queue.name</code> to <code>false</code> . | No default. Must be explicitly set. |
| <code>hive.server2.tez.initialize.default.sessions</code> | When set to <code>true</code> , enables you to use HiveServer2 without turning on Tez for HiveServer2. Useful when you want to run queries over Tez without the pool of sessions. | <code>false</code> |
| <code>hive.server2.tez.default.queues</code> | A list of comma-separated values that correspond to YARN queues of the same name. When HiveServer2 is launched in Tez mode, this configuration must be set to enable multiple Tez sessions to run in parallel on the cluster. | empty string |

| Property | Description | Default Value |
|---|---|---------------|
| hive.server2.tez.sessions.per.default.queue | A positive integer that determines the number of Tez sessions that should launch in each of the queues specified by <code>hive.server2.tez.default.queues</code> . Determines the parallelism on each queue. For example, if you specify two default queues and two sessions per default queue, four application masters start. | 1 |
| hive.server2.tez.session.lifetime | Defines the lifetime of the Tez sessions launched by HiveServer2 when default sessions are enabled. Set to 0 to disable session expiration. | 162h |
| hive.server2.tez.unset.tez.queue.name | Controls whether the <code>tez.queue.name</code> persists across all queries in a session. Must be set to <code>false</code> for the <code>tez.queue.name</code> to persist. When set to <code>true</code> , the <code>tez.queue.name</code> only applies to the first query that runs; thereafter, the default cluster queue names are used.  Note: This functionality was introduced in EEP 7.01 and EEP 6.3.2. A patch for previous EEP versions is available. See Applying a Patch . | true |

Managing Hive Services

This section includes the following topics:

Starting Hive

You can start the Hive shell from `HIVE_HOME/bin/` with the `hive` command. Example:

```
/opt/mapr/hive/hive-<version>/bin/hive
```

When the Hive shell starts, it reads an initialization file called `.hiverc` which is located in the `HIVE_HOME/bin/` or `$HOME/` directories. You can edit this file to set custom parameters or commands that initialize the Hive command-line environment, one command per line.

When you run the Hive shell, you can specify a MySQL initialization script file using the `-i` option. Example:

```
/opt/mapr/hive/hive-<version>/bin/hive -i <filename>
```

Setting the Execution Engine

Consider the following definitions:

- Runtime: execution time of job.
- Session time: time from the start of Hive shell or Beeline until you exit.

You can change the execution engine during a session (session time), but not while executing job in the session (runtime). If you specify the execution engine before starting the job, it will override the `hive.execution.engine` property in `hive-site.xml` file. For example, to specify the execution engine:

```
hive> set hive.execution.engine=tez;
hive> *perform some query here*
```

If you open another session of hive shell or beeline, you will not see the setting in the session from before and you can set needed properties for every session.

Hewlett Packard Enterprise highly recommends configuring Tez as an execution engine instead of MR execution engine. MR execution engine is deprecated in Hive.

If you are currently using the MR execution engine for accessing Hive CLI and HS2, Hive will throw the following warning message:

```
Hive-on-MR is deprecated in Hive 2 and may not be available in the future
versions. Consider using a different execution engine (i.e. spark, tez) or
using Hive 1.X releases.
```

To install and configure Tez as an execution engine for Hive, see [Configuring Hive and Tez](#).

Managing Hive Metastore

The Hive Metastore is started automatically by the warden at installation time if the `mapr-hivemetastore` package is installed. It is sometimes necessary to start or stop the service (for example, after changing the configuration). You can start and stop Hive Metastore in two ways:

- Using the `maprccli node services` command - Using this command, you can start Hive Metastore on multiple nodes at one time.
- Using the MapR Control System

To start Hive Metastore using the maprccli:

1. Make a list of nodes on which Hive Metastore is configured.
2. Issue the `maprccli node services` command:

```
/opt/mapr/bin/maprccli node services -name hivemeta -action start -nodes
<space delimited list of nodes>
```

To stop Hive Metastore using the maprccli:

1. Make a list of nodes on which Hive Metastore is configured.
2. Issue the `maprccli node services` command:

```
maprccli node services -name hivemeta -action stop -nodes <space
delimited list of nodes>
```

To start or stop Hive Metastore using the Control System:

1. In the Navigation pane, expand the Cluster Views pane and click **Dashboard**.
2. In the Services pane, click **Hive Metastore** to open the Nodes screen displaying all the nodes on which Hive Metastore is configured.
3. On the Nodes screen, click the hostname of each node to display its Node Properties screen.
4. On each Node Properties screen, use the **Stop/Start** button in the Hive Metastore row under Manage Node Services to start Hive Metastore.

Managing Hiveserver2

Hiveserver2 is started automatically at installation time by the warden if the `mapr-hiveserver2` package is installed. It is sometimes necessary to start or stop the service (for example, after changing the configuration). You can start and stop Hiveserver2 in two ways:

- Using the `maprccli node services` command - Using this command, you can start Hiveserver2 on multiple nodes at one time.

- Using the MapR Control System

To start Hiveserver2 using the maprccli:

1. Make a list of nodes on which Hiveserver2 is configured.
2. Issue the maprccli node services command:

```
maprccli node services -name hs2 -action start -nodes <space delimited list of nodes>
```

To stop Hiveserver2 using the maprccli:

1. Make a list of nodes on which Hiveserver2 is configured.
2. Issue the maprccli node services command:

```
maprccli node services -name hs2 -action stop -nodes <space delimited list of nodes>
```

To start or stop Hiveserver2 using the Control System:

1. In the Navigation pane, expand the Cluster Views pane and click **Dashboard**.
2. In the Services pane, click **Hiveserver2** to open the Nodes screen displaying all the nodes on which Hiveserver2 is configured.
3. On the Nodes screen, click the hostname of each node to display its Node Properties screen.
4. On each Node Properties screen, use the **Stop/Start** button in the Hiveserver2 row under Manage Node Services to start Hiveserver2.

Connecting to Hive

This section contains the following topics:

Connecting to Hive Metastore

The connection requirements Hive Metastore clients use to connect to Hive Metastore is based on the Hive Metastore authentication method:

| Authentication Method | Connection Requirements |
|-----------------------|--|
| MapR-SASL | Client nodes require the following: <ul style="list-style-type: none"> • They are configured to use MapR-SASL when authenticating with Hive Metastore. • A valid MapR ticket. |
| Kerberos | Client nodes require the following: <ul style="list-style-type: none"> • They are configured to use Kerberos when authenticating with Hive Metastore. • A valid Kerberos ticket. |
| No Authentication | If the cluster is not secure, client nodes do not require any MapR tickets. |

Connecting to HMS is provided by the thrift service. You can configure it in hive-site.xml with hive.metastore.uris property:

```
<property>
  <name>hive.metastore.uris</name>
  <value>thrift://<n.n.n.n<:9083</value>
  <description>IP address (or fully-qualified domain name) and port of the
  metastore host</description>
</property>
```

Connecting to HiveServer2

The method that HiveServer2 clients use to connect to HiveServer2 is based on the HiveServer2 Authentication method and the type of client.

Using JDBC or Beeline to Connect to HiveServer2

The HiveServer2 authentication method and client type determine how the HiveServer2 clients connect to HiveServer2.

Tip: For details on how to install and use ODBC to connect to Hive, see [Using ODBC to Connect to HiveServer2](#) on page 3736. When connecting to Hive via ODBC, the client must have a valid MapR or Kerberos ticket.

Using JDBC or Beeline to Connect to HiveServer2

The default port for HiveServer2 is 10000.

The following table lists HiveServer2 authentication mechanisms with the connection parameters required in the JDBC connection string. For a complete list of the JDBC connection string parameters, refer to the next section, Hive JDBC Connection String Parameters.

| HiveServer2 Authentication | Connection Requirements |
|----------------------------|--|
| No Authentication | <p>Connection String: jdbc:hive2://<hs2_hostname>:10000<database>; You must enter a valid user name.</p> <p>For encryption, JDBC requires a truststore and an optional truststore password.</p> <ul style="list-style-type: none"> <p>Connection String with Encryption: jdbc:hive2://<hs2_hostname>:10000/<database>; You must enter a valid user name.ssl=true;sslTrustStore=<path-to-truststore>;sslTrustStorePassword=<password></p> <p>Connection String with Encryption (truststore passed in JVM arguments): jdbc:hive2://<hs2_hostname>:<port>/<database>;ssl=true</p> <p> Note: Prior to connecting to an application that uses JDBC, such as Beeline, you can run the following command to pass the truststore parameters as Java arguments:</p> <pre>export HADOOP_OPTS="-Djavax.net.ssl.trustStore=<path-to-trust-store-file> -Djavax.net.ssl.trustStorePassword=<password>"</pre> |

| HiveServer2 Authentication | Connection Requirements |
|--|--|
| <p>MapR-SASL (included as part of the secure by default configuration)</p> | <p>Connection String: jdbc:hive2://<hs2_hostname>:10000/<database>;auth=maprsasl;ssl=true;</p> <p>MapR-SASL encryption is enabled by default. For more information, see Configuring JDBC Connection String with SSL Encryption Enabled or Disabled.</p> <p> Note: MapR-SASL is not supported for Hive in HTTP mode.</p> <p>Connection for Java Application: Use the -D flag to append the JVM argument: -Dhadoop.login=maprsasl.</p> |
| <p>PAM</p> | <p>Connection String: jdbc:hive2://<hs2_hostname>:10000/<database>;user=<user>;password=<password></p> |
| <p>PAM + SSL (included as part of the secure by default configuration)</p> | <p>Connection String: jdbc:hive2://<hs2_hostname>:10000/<database>;ssl=true;user=<user>;password=<password>. For more information, see Configuring JDBC Connection String with SSL Encryption Enabled or Disabled.</p> |
| <p>Kerberos</p> | <p>Connection String: jdbc:hive2://<hostname>:10000/default;principal=mapr/<FQDN@REALM></p> <p>Connection for Java Application: Use the -D flag to append the JVM argument: -Dhadoop.login=hybrid</p> <p> Note: The client nodes must also have a Kerberos ticket and be configured to connect to HiveServer2 to use Kerberos.</p> |
| <p>LDAP</p> | <p>Connection String: jdbc:hive2://<hs2_hostname>:10000/<database>;user=<ldap_user>;password=<ldap_password></p> |
| <p>ZooKeeper</p> | <p>Connection String: jdbc:hive2://<hostname>:<port>,<hostname>:<port>/;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=hiveserver2</p> <p>Example:</p> <pre>hive --service beeline -u 'jdbc:hive2:// zookeeper1.com:5181,zookeeper2.com:5181, zookeeper3.com:5181/;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=hiveserver2' -n mapr -p</pre> |

Hive JDBC Connection String Parameters

The following example shows a common Hive JDBC connection string:

```
jdbc:hive2://zookeeper_quorum|hs2_host:port/[db]
[;principal=<hs2_principal>/<hs2_host>|_HOST@<KDC_REALM>]
```

```
[;transportMode=binary|http][;httpPath=<http_path>]
[;serviceDiscoveryMode=zookeeper;zooKeeperNamespace=<z_k_namespace>]
[;auth=maprsasl][;ssl=true|false][;sslKeyStore=<key_store_path>]
[;keyStorePassword=<key_store_password>][;sslTrustStore=<trust_store_path>]
[;trustStorePassword=<trust_store_password>][;twoWay=true|false]
```

The following table lists all the Hive JDBC connection string parameters with default values where applicable:

| JDBC Parameter | Default | Comment |
|--|--|--|
| zookeeper_quorum | | Zookeeper quorum. Used only if HA mode for HiveServer2 is enabled. |
| hs2_host | | The hostname of the node with an active HS2 server running. |
| port | 10000/10001 | HiveServer2 port. Defaults to 10000 in binary mode. Defaults to 10001 in HTTP transport mode. |
| [db] | default | The database name to which you want to connect. |
| [;principal=<hs2_principal>/<hs2_host> _HOST@<KDC_REALM>] | | Kerberos principal. Used with Kerberos security only. |
| [;transportMode=binary http] | binary | HS2 uses a TThreadPoolServer (from Thrift) for TCP (binary) mode, or a Jetty server for the HTTP mode. HTTP mode is required when a proxy is needed between the client and server, for example, for load balancing or security reasons. |
| [;httpPath=<http_path>] | cliservice or / | The corresponding HTTP endpoint. The default value is cliservice or /. See conf hive.server2.thrift.http.path |
| [;serviceDiscoveryMode=zookeeper;zooKeeperNamespace=<z_k_namespace>] | | <z_k_namespace> is the parent node in ZooKeeper used by HiveServer2 when supporting dynamic service discovery. |
| [;auth=maprsasl] | | Used with MapR SASL security. |
| [;ssl=true false] | false | Used to enable SSL encryption. |
| [;sslKeyStore=<key_store_path>] | Default value is read from \$MAPR_HOME/conf/ssl-client.xml | This parameter only takes effect when ssl=true. Path is the path to the keystore. |
| [;keyStorePassword=<key_store_password>] | Default value is read from \$MAPR_HOME/conf/ssl-client.xml | This param will take effect only when ssl=true. Keystore password. |

| | | |
|--|--|--|
| [;sslTrustStore=<trust_store_path>] | Default value is read from \$MAPR_HOME/conf/ssl-client.xml | This param will take effect only when ssl=true. Path is the path to the truststore. |
| [;trustStorePassword=<trust_store_password>] | Default value is read from \$MAPR_HOME/conf/ssl-client.xml | This parameter only takes effect when ssl=true. Password is the truststore password. |
| [;twoWay=true false] | | HIVE-10447 enabled the JDBC driver to support 2-way SSL in HTTP mode. Currently, HiveServer2 does not support 2-way SSL. This features is useful when there is an intermediate server, such as Knox, which requires the client to support 2-way SSL. |

Beeline Examples

This page shows examples for connecting to HiveServer2 using Beeline.

The following table is a guide for interpreting the examples on this page. In the examples, replace the variables (information in brackets) with your site-specific values. Be sure to remove the brackets when you insert your information:

| Variable | Description |
|----------------|--|
| <hs2_hostname> | The name of the host where HiveServer2 is installed. |
| <database> | The database name to connect to. |
| <username> | The JDBC username. |
| <password> | The password for the JDBC user. |
| <FQDN@realm> | Fully qualified domain name & Kerberos realm. |

Using Beeline with no Encryption and no Authentication

```
hive --service beeline
Beeline version 2.3.3-mapr-1901 by Apache Hive
beeline> !connect jdbc:hive2://<hs2_hostname>:10000/<database>;
Connecting to jdbc:hive2://<hs2_hostname>:10000/<database>;
Enter username for jdbc:hive2://<hs2_hostname>:10000/<database>;: <username>
0: jdbc:hive2://<hs2_hostname>:10000/<database>
```

Using Beeline with Encryption and no Authentication

```
hive --service beeline
Beeline version 2.3.3-mapr-1901 by Apache Hive
beeline> !connect jdbc:hive2://<hs2_hostname>:10000/
<database>;ssl=true;sslTrustStore=truststore.jks;sslTrustStorePassword=tsp
Connecting to jdbc:hive2://<hs2_hostname>:10000/
<database>;ssl=true;sslTrustStore=truststore.jks;sslTrustStorePassword=tsp
Enter username for jdbc:hive2://<hs2_hostname>:10000/
<database>;ssl=true;sslTrustStore=truststore.jks;sslTrustStorePassword=tsp:
<username>
0: jdbc:hive2://<hs2_hostname>:10000/<database>
```

Connecting to HiveServer2 with MapR-SASL Authentication

```
hive --service beeline
Beeline version 2.3.3-mapr-1901 by Apache Hive
beeline> !connect jdbc:hive2://<hs2_hostname>:10000/
<database>;auth=maprsasl;ssl=true
Connecting to jdbc:hive2://<hs2_hostname>:10000/
<database>;auth=maprsasl;ssl=true
19/01/31 12:15:33 [main]: WARN maprsasl.MaprSaslClient: SASL
Server qopProperty: auth-confis different from Client:
auth-conf,auth-int,auth.Using Server one
Connected to: Apache Hive (version 2.3.3-mapr-1901)
Driver: Hive JDBC (version 2.3.3-mapr-1901)
Transaction isolation: TRANSACTION_REPEATABLE_READ
0: jdbc:hive2://<hs2_hostname>:10000/<database>
```

Starting from EEP 6.0.0, with secure by default configuration, it is a default connection string for a secure cluster. For more information, see [Configuring JDBC Connection String with SSL Encryption Enabled or Disabled](#).

Using Beeline with PAM Authentication

```
hive --service beeline
Beeline version 2.3.3-mapr-1901 by Apache Hive
beeline> !connect jdbc:hive2://<hs2_hostname>:10000/<database>;
Connecting to jdbc:hive2://<hs2_hostname>:10000/<database>;
Enter username for jdbc:hive2://<hs2_hostname>:10000/<database>;: <username>
Enter password for jdbc:hive2://<hs2_hostname>:10000/<database>;:
<password>
Connected to: Apache Hive (version 2.3.3-mapr-1901)
Driver: Hive JDBC (version 2.3.3-mapr-1901)
Transaction isolation: TRANSACTION_REPEATABLE_READ
0: jdbc:hive2://<hs2_hostname>:10000/<database>
```

Connecting to HiveServer2 with ZooKeeper

```
hive --service beeline -u
'jdbc:hive2://
zookeeper1.com:5181,zookeeper2.com:5181,zookeeper3.com:5181;/serviceDiscover
yMode=zooKeeper;zooKeeperNamespace=hiveserver2' -n mapr -p
```

Connecting to HiveServer2 with PAM Authentication and SSL Encryption

```
hive --service beeline
Beeline version 2.3.3-mapr-1901 by Apache Hive
beeline> !connect jdbc:hive2://<hs2_hostname>:10000/<database>;ssl=true;
Connecting to jdbc:hive2://<hs2_hostname>:10000/<database>;ssl=true;
Enter username for jdbc:hive2://<hs2_hostname>:10000/<database>: <username>
Enter password for jdbc:hive2://<hs2_hostname>:10000/<database>: <password>
Connected to: Apache Hive (version 2.3.3-mapr)
Driver: Hive JDBC (version 2.3.3-mapr)
Transaction isolation: TRANSACTION_REPEATABLE_READ
0: jdbc:hive2://<hs2_hostname>:10000/<database>
```

Starting from EEP 6.0.0, with secure-by-default configurations, the default connection string is for a secure cluster. For more information, see [Configuring JDBC Connection String with SSL Encryption Enabled or Disabled](#).

Using Beeline with Kerberos

Beeline must pass the Kerberos principal for HiveServer2 in the JDBC connection string. The connection strings you pass to Beeline must use the principal name that you configured for HiveServer2.

The following example shows a sample Beeline authentication with Kerberos:

```
hive --service beeline
Beeline version 2.3.3-mapr-1901 by Apache Hive
beeline> !connect jdbc:hive2://<hs2_hostname>:10000/
<database>;principal=mapr<FQDN@REALM>
Connecting to jdbc:hive2://<hs2_hostname>:10000/<database>;principal=mapr/
<FQDN@REALM>
Transaction isolation: TRANSACTION_REPEATABLE_READ
0: jdbc:hive2://<hs2_hostname>:10000/def>
Connected to: Apache Hive (version 2.3.3-mapr)
Driver: Hive JDBC (version 2.3.3-mapr)
Transaction isolation: TRANSACTION_REPEATABLE_READ
0: jdbc:hive2://<hs2_hostname>:10000/<database>
```

Using Beeline with Encryption but no Authentication (truststore parameters passed as JVM arguments)

```
Hive --service beeline
Beeline version 2.3.3-mapr-1901 by Apache Hive
beeline> !connect jdbc:hive2://<hs2_hostname>:1000/<database>;ssl=true
Connecting to jdbc:hive2://<hs2_hostname>:10000/<database>;ssl=true
Enter username for jdbc:hive2://<hs2_hostname>:10000/<database>;ssl=true:
<username>
Enter password for jdbc:hive2://<hs2_hostname>:10000/<database>;ssl=true:
<password>
Connected to: Apache Hive (version 2.3.3-mapr)
Driver: Hive JDBC (version 2.3.3-mapr)
Transaction isolation: TRANSACTION_REPEATABLE_READ
0: jdbc:hive2://<hs2_hostname>:10000/<database>
```

Generating a Kerberos Ticket

Use the `kinit` utility to generate the ticket and then use `klist` to verify that a ticket exists.

```
# kinit <username>/<FQDN@REALM>
# klist

Credentials cache: API:501:9
    Principal: username/<FQDN@REALM>
    Cache version: 0

Server: krbtgt/<FQDN@REALM>
Client: username/<FQDN@REALM>
Ticket etype: aes128-cts-hmac-sha1-96
Ticket length: 256
Auth time: Jun 11 10:01:48 2014
End time: Jun 12 18:01:34 2014
Renew till: Jun 18 10:01:48 2014
Ticket flags: pre-authent, initial, renewable, forwardable
Addresses: addressless
```

Configuring JDBC Connection String with SSL Encryption Enabled or Disabled

You can configure a JDBC connection string with SSL encryption enabled or disabled.

SSL encryption to HiveServer2 is enabled (hive.server2.use.SSL=true)

The following table describes the JDBC connection string when SSL encryption is enabled between the Hive client and HiveServer2.

Table

| Authentication Type | JDBC Parameter | Example |
|---------------------|----------------|--|
| PAM | ssl=true | jdbc:hive2:// <hostname>:10000/ default;ssl=true <login> <password> |
| MapR-SASL | ssl=true | jdbc:hive2:// <hostname>:10000/ default;auth=maprsasl;ssl=t rue |
| Kerberos | ssl=true | jdbc:hive2:// <hostname>:10000/ default;principal=<user/ fqdn@EXAMPLE.COM>;ssl=true |

SSL encryption to HiveServer2 is disabled (hive.server2.use.SSL=false)

The following table describes the JDBC connection string when SSL encryption is disabled between the Hive client and HiveServer2.

Table

| Authentication Type | JDBC Parameter | Example |
|---------------------|----------------|--|
| PAM | -- | jdbc:hive2:// <hostname>:10000/default; <login> <password> |
| MapR-SASL | -- | jdbc:hive2:// <hostname>:10000/ default;auth=maprsasl |
| Kerberos | -- | jdbc:hive2:// <hostname>:10000/ default;principal=<user/ fqdn@EXAMPLE.COM |

Using ODBC to Connect to HiveServer2

This section contains details about setting up and using the ODBC Connector for Hive.

Before You Begin

The MapR Hive ODBC Connector is an ODBC driver for Apache Hive 0.7.0 and later that complies with the ODBC 3.52 specification. You can download the Hive ODBC connector from https://package.mapr.hpe.com/tools/MapR-ODBC/MapR_Hive/. After downloading the driver, refer to documentation for [Hive ODBC Driver](#) to install and configure the driver.

The [Hive ODBC Driver](#) supports the following Advanced Options:

- Enable Auto Reconnect
- Driver Config Take Precedence
- Fast SQL Prepare
- Get Tables With Query

- Invalid Session Auto Recover
- Show System Table
- Socket Timeout
- Default String Column Length
- Rows Fetched Per Block
- Use Native Query

To use the ODBC driver, configure a *Data Source Name* (DSN), a definition that specifies how to connect to Hive. DSNs are typically managed by the operating system and may be used by multiple applications. Some applications do not use DSNs. You will need to refer to your particular application's documentation to understand how it connects using ODBC.

The standard query language for ODBC is SQL. HiveQL, the standard query language for Hive, includes a subset of ANSI SQL-92. Applications that connect to Hive using ODBC may need queries altered if the queries use SQL features that are not present in Hive. Applications that use SQL will recognize HiveQL, but might not provide access to HiveQL-specific features such as multi-table insert.

Please refer to the [Hive Language Manual](#) for up-to-date information on HiveQL.

The SQL Connector

The SQL Connector feature translates standard SQL-92 queries into equivalent HiveQL queries. The SQL Connector performs syntactical translations and structural transformations. For example:

- **Quoted Identifiers:** When quoting identifiers, HiveQL uses back quotes (`), while SQL uses double quotes ("). Even when a driver reports the back quote as the quote character, some applications still generate double-quoted identifiers.
- **Table Aliases:** HiveQL does not support the AS keyword between a table reference and its alias.
- The `JOIN`, `INNER JOIN`, and `CROSS JOIN` SQL syntaxes are translated to the HiveQL `JOIN` syntax.
- SQL `TOP N` queries are transformed to HiveQL `LIMIT` queries.

Hive ODBC Connector on Linux

System Requirements

- The 32-bit and 64-bit version of the following operating systems:
 - Red Hat® Enterprise Linux® (RHEL) 6 or 7
 - CentOS 6 or 7
 - SUSE Linux Enterprise Server (SLES) 11 or 12
 - Debian 8 or 9
 - Ubuntu 14.04, 16.04, or 18.04
- 45 MB of available disk space.
- An installed ODBC driver manager:
 - iODBC 3.52.7 or above (OR)
 - unixODBC 2.2.12 or above

The HPE Ezmeral Data Fabric ODBC Driver with SQL Connector for Apache Hive requires a Hadoop cluster with the Hive service installed and running. The HPE Ezmeral Data Fabric ODBC Driver with SQL Connector for Apache Hive is suitable for use with all versions of Hive. Download the ODBC connector from the following location: [MapR_Hive](#).

The RPM files are applicable for:

- Red Hat® Enterprise Linux® (RHEL) 6 or 7
- CentOS 6 or 7
- SUSE Linux Enterprise Server (SLES) 11 or 12

The DEB files are applicable for:

- Debian 8 or 9
- Ubuntu 14.04, 16.04, or 18.04

The latest version of the Hive ODBC connector is at version [2.6.1.1001](#).

Install the Hive ODBC Connector on Linux

The MapR ODBC Driver with SQL Connector for Apache Hive driver files are installed in the following directories:

- `/opt/mapr/hiveodbc/ErrorMessage` – Error messages files directory
- `/opt/mapr/hiveodbc/Setup` – Sample configuration files directory
- `/opt/mapr/hiveodbc/lib/32` – 32-bit shared libraries directory
- `/opt/mapr/hiveodbc/lib/64` – 64-bit shared libraries directory

To install the MapR ODBC Driver with SQL Connector for Apache Hive:

1. Log in as the `root` user.
2. Use RPM to install the rpm package corresponding to your Linux distribution:
 - [32-bit](#)
 - [64-bit](#)

The MapR ODBC Driver with SQL Connector for Apache Hive depends on the following resources:

- `cyrus-sasl-2.1.22-7` or later
- `cyrus-sasl-gssapi-2.1.22-7` or later
- `cyrus-sasl-plain-2.1.22-7` or later

If the package manager in your Linux distribution cannot resolve the dependencies automatically when installing the driver, download and manually install the packages required by the version of the driver that you want to install.

Configure the Hive ODBC Connector Driver on Linux

The `LD_LIBRARY_PATH` environment variable must include the paths to the:

- Libraries for the installed ODBC driver manager
- Shared libraries for the MapR ODBC Driver with SQL Connector for Apache Hive

Important: The Linux version of the driver bundles together functionality for both 32-bit and 64-bit environments. Do not include the paths to both 32- and 64-bit shared libraries in LD_LIBRARY_PATH at the same time. Include only the path to the shared libraries corresponding to the driver matching the bitness of the client application used. For example, if you are using a 64-bit client application and ODBC driver manager libraries are installed in /usr/local/lib, then set LD_LIBRARY_PATH as follows:

```
export LD_LIBRARY_PATH=/usr/local/lib:/opt/mapr/hiveodbc/lib/64
```

For more information about how to set environment variables permanently, refer to your Linux shell documentation.

Configuring ODBC Connections for Linux

Files

ODBC driver managers use configuration files to define and configure ODBC data sources and drivers. By default, the following configuration files residing in the user's home directory are used:

- `.odbc.ini` – The file used to define ODBC data sources (required)
- `.odbcinst.ini` – The file used to define ODBC drivers (optional)
- `.mapr.hiveodbc.ini` – The file used to configure the MapR ODBC Driver with SQL Connector for Apache Hive (required)

Sample Files

The driver installation contains the following sample configuration files in the Setup directory:

- `odbc.ini`
- `odbcinst.ini`
- `mapr.hiveodbc.ini`

The names of the sample configuration files do not begin with a period (.) so that they will appear in directory listings by default. A filename beginning with a period (.) is hidden. For `odbc.ini` and `odbcinst.ini`, if the default location is used, then the filenames must begin with a period (.). For `mapr.hiveodbc.ini`, the filename must begin with a period (.) and must reside in the user's home directory. If the configuration files do not already exist in the user's home directory, then the sample configuration files can be copied to that directory and renamed. If the configuration files already exist in the user's home directory, then the sample configuration files should be used as a guide for modifying the existing configuration files.

Configuring the Environment

By default, the configuration files reside in the user's home directory. However, two environment variables, ODBCINI and ODBCYSINI, can be used to specify different locations for the `odbc.ini` and `odbcinst.ini` configuration files. Set ODBCINI to point to your `odbc.ini` file. Set ODBCYSINI to point to the directory containing the `odbcinst.ini` file. For example, if your `odbc.ini` file is located in `/etc` and your `odbcinst.ini` file is located in `/usr/local/odbc`, then set the environment variables as follows:

```
export ODBCINI=/etc/odbc.ini export ODBCYSINI=/usr/local/odbc
```

```
export ODBCINI=/etc/odbc.ini export ODBCYSINI=/usr/local/odbc
```

For version 2.1.8 and above, you must also set MAPRHIVEINI to point to the `mapr.hiveodbc.ini` file in the user's home directory:

```
export MAPRHIVEINI=/etc/.mapr.hiveodbc.ini
```

For version 2.1.5 and below, you set MAPRINI to point to the `mapr.hiveodbc.ini` file in the user's home directory:

```
export MAPRINI=<user_home>/mapr.hiveodbc.ini
```

Configuring the `odbc.ini` File

ODBC Data Sources are defined in the `odbc.ini` configuration file. The file is divided into several sections:

- `[ODBC]` is optional and used to control global ODBC configuration, such as ODBC tracing.
- `[ODBC Data Sources]` is required, listing DSNs and associating DSNs with a driver.
- A section having the same name as the data source specified in the `[ODBC Data Sources]` section is required to configure the data source.

Here is an example `odbc.ini` configuration file for Linux:

```
[ODBC Data Sources]
Sample MapR Hive DSN 32=MapR Hive ODBC Driver 32-bit
[Sample MapR Hive DSN 32]
Driver=/opt/mapr/hiveodbc/lib/32/libmaprhiveodbc32.so
HOST=MyHiveServer
PORT=10000
```

To create a data source:

1. Open the `.odbc.ini` configuration file in a text editor.
2. Add a new entry to the `[ODBC Data Sources]` section. Type the data source name (DSN) and the driver name.
3. To set configuration options, add a new section having a name matching the data source name (DSN) you specified in step 2. Specify configuration options as keyvalue pairs.
4. Save the `.odbc.ini` configuration file.

Note: You can set configuration options in your `odbc.ini` and `.mapr.hiveodbc.ini` files. Configuration options set in a `.mapr.hiveodbc.ini` file apply to all connections, whereas configuration options set in an `odbc.ini` file are specific to a connection. Configuration options set in `odbc.ini` take precedence over configuration options set in `.mapr.hiveodbc.ini`.

Configuring the `odbcinst.ini` File

ODBC Drivers are defined in the `odbcinst.ini` configuration file. The configuration file is optional because drivers can be specified directly in the `odbc.ini` configuration file. The `odbcinst.ini` file is divided into the following sections:

- `[ODBC Drivers]` lists the names of all the installed ODBC drivers.
- section having the same name as the driver name specified in the `[ODBC Drivers]` section lists driver attributes and values.

Here is an example `odbcinst.ini` file for Linux:

```
[ODBC Drivers]
MapR Hive ODBC Driver 32-bit=Installed
MapR Hive ODBC Driver 64-bit=Installed
[MapR Hive ODBC Driver 32-bit]
Description=MapR Hive ODBC Driver (32-bit)
```

```
Driver=/opt/mapr/hiveodbc/lib/32/libmaprhiveodbc32.so
[Mapr Hive ODBC Driver 64-bit]
Description=Mapr Hive ODBC Driver (64-bit)
Driver=/opt/mapr/hiveodbc/lib/64/libmaprhiveodbc64.so
```

To define a driver:

1. Open the `.odbcinst.ini` configuration file in a text editor.
2. Add a new entry to the [ODBC Drivers] section. Type the driver name, and then type **=Installed**
 -  **Note:** Assign the driver name as the value of the Driver attribute in the data source definition instead of the driver shared library name.
3. In `.odbcinst.ini`, add a new section having a name matching the driver name you typed in step 2, and then add configuration options to the section based on the sample `odbcinst.ini` file provided with the MapR ODBC Driver with SQL Connector for Apache Hive in the Setup directory. Specify configuration options as keyvalue pairs.
4. Save the `.odbcinst.ini` configuration file.

Configuring the `mapr.hiveodbc.ini` File

To configure the MapR ODBC Driver with SQL Connector for Apache Hive to work with your ODBC driver manager:

1. Open the `.mapr.hiveodbc.ini` configuration file in a text editor.
2. Edit the `DriverManagerEncoding` setting. The value usually must be UTF-16 or UTF-32, depending on the ODBC driver manager you use. `iODBC` uses UTF-32 and `unixODBC` uses UTF-16. Consult your ODBC Driver Manager documentation for the correct setting to use.
3. Edit the `ODBCInstLib` setting. The value is the name of the `ODBCInst` shared library for the ODBC driver manager you use. The configuration file defaults to the shared library for `iODBC`. In Linux, the shared library name for `iODBC` is `libiodbcinst.so`.

-  **Note:** Consult your ODBC driver manager documentation for the correct library to specify. You can specify an absolute or relative filename for the library. If you intend to use the relative filename, then the path to the library must be included in the library path environment variable. In Linux, the library path environment variable is named `LD_LIBRARY_PATH`.

4. Save the `.mapr.hiveodbc.ini` configuration file.

Configuring Authentication

You can configure the following types of authentication:

- No authentication
- User name
- User name and password
- Kerberos

When `hive.server2.authentication` is set to `KERBEROS`, then you must configure your connection to use Kerberos.

To find out the authentication setting your Hive Server 2 is set to use, review the following properties in the `hive-site.xml` file:

- `hive.server2.authentication`
- `hive.server2.enable.doAs`

Using No Authentication

To use no authentication, set the AuthMech configuration key for the DSN to 0.

Using User Name

To configure User Name authentication:

1. Set the AuthMech configuration key for the DSN to 2.
2. Set the UID key to the appropriate user name recognized by the Hive server.

Using User Name and Password

To configure User Name and Password authentication:

1. Set the AuthMech configuration key for the DSN to 3.
2. Set the UID key to the appropriate user name recognized by the Hive server.
3. Set the PWD key to the password corresponding to the user name you provided in step 2.

Using Kerberos

To configure Kerberos authentication:

1. Set the H2SAuthMech configuration key for the DSN to 1.
2. If your Kerberos setup does not define a default realm or if the realm of your Hive server is not the default, then set the appropriate realm using the HS2KrbRealm key.
3. Set the HS2HostFQDN key to the fully qualified domain name of the Hive Server 2 host.
4. Set the HS2KrbServiceName key to the service name of the Hive Server 2 host.

Hive ODBC Connector on Windows

There are versions of the connector for 32-bit and 64-bit applications. The 64-bit version of the connector works only with 64-bit DSNs; the 32-bit connector works only with 32-bit DSNs. Because 64-bit Windows machines can run both 64-bit and 32-bit applications, install both versions of the connector in order to set up DSNs to work with both types of applications. If both the 32-bit connector and the 64-bit connector are installed, you must configure DSNs for each independently, in their separate Data Source Administrators.

Install the Hive ODBC Connector on Windows

To use MapR Hive ODBC Connector on Windows requires:

- Windows® 7 Professional or Windows® 2008 R2. Both 32 and 64-bit editions are supported.
- The Microsoft Visual C++ 2010 Redistributable Package (runtimes required to run applications developed with Visual C++ on a computer that does not have Visual C++ 2010 installed.)
- A Hadoop cluster with the Hive service installed and running. You should find out from the cluster administrator the hostname or IP address for the Hive service and the port that the service is running on. (The default port for Hive is 10000.)

1. Run the installer to get started:

- To install the 64-bit connector, download and run the following package:

```
https://package.mapr.hpe.com/tools/MapR-ODBC/MapR_Hive/MapRHive_odbc_2.6.1.1001/MapRHiveODBC64.msi
```

- To install the 32-bit connector, download and run the following package:

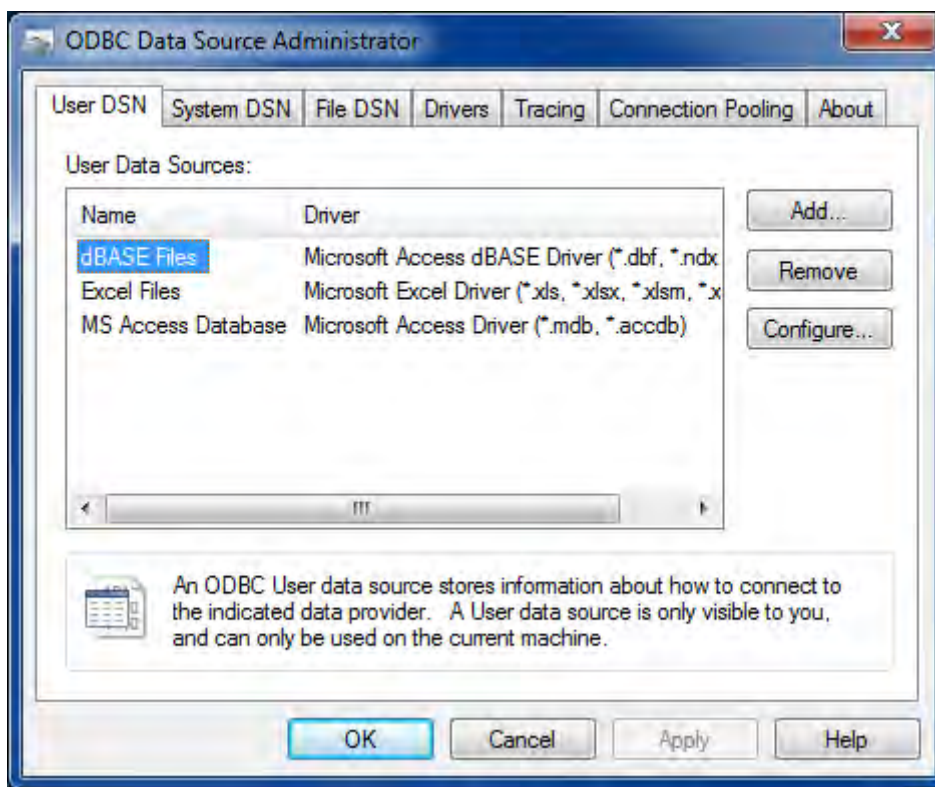

```
https://package.mapr.hpe.com/tools/MapR-ODBC/MapR_Hive/MapRHive_odbc_2.6.1.1001/MapRHiveODBC32.msi
```

- Accept the license agreement.
- Select an installation folder.
- On the Information window, click **Next**.
- On the Completing... window, click **Finish**.
- Install a DSN corresponding to your Hive server.

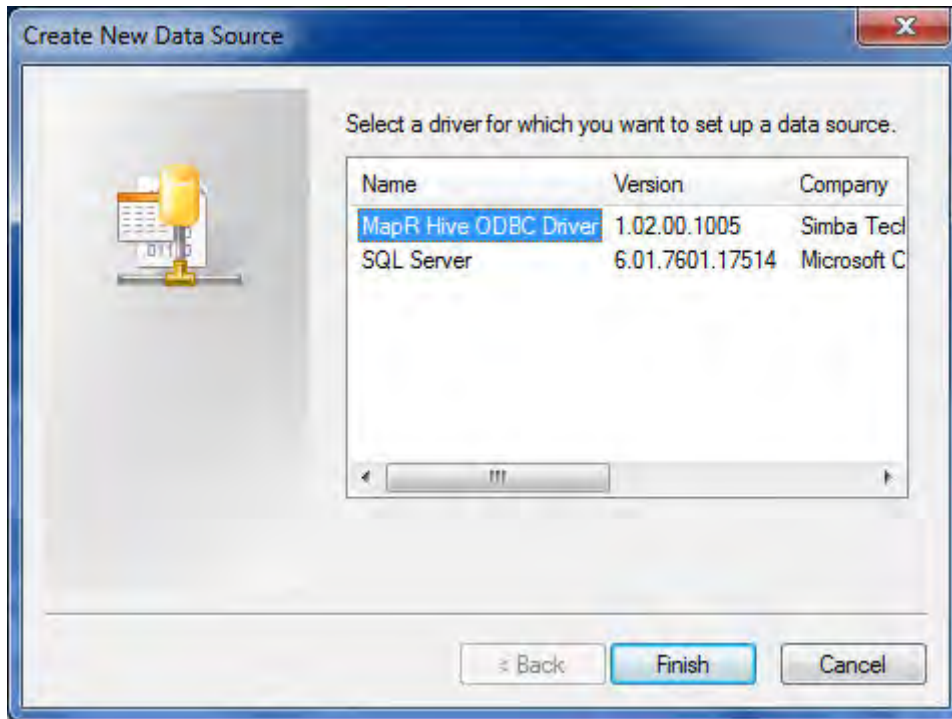

Configure Hive ODBC Connections on Windows

To create a Data Source Name (DSN)

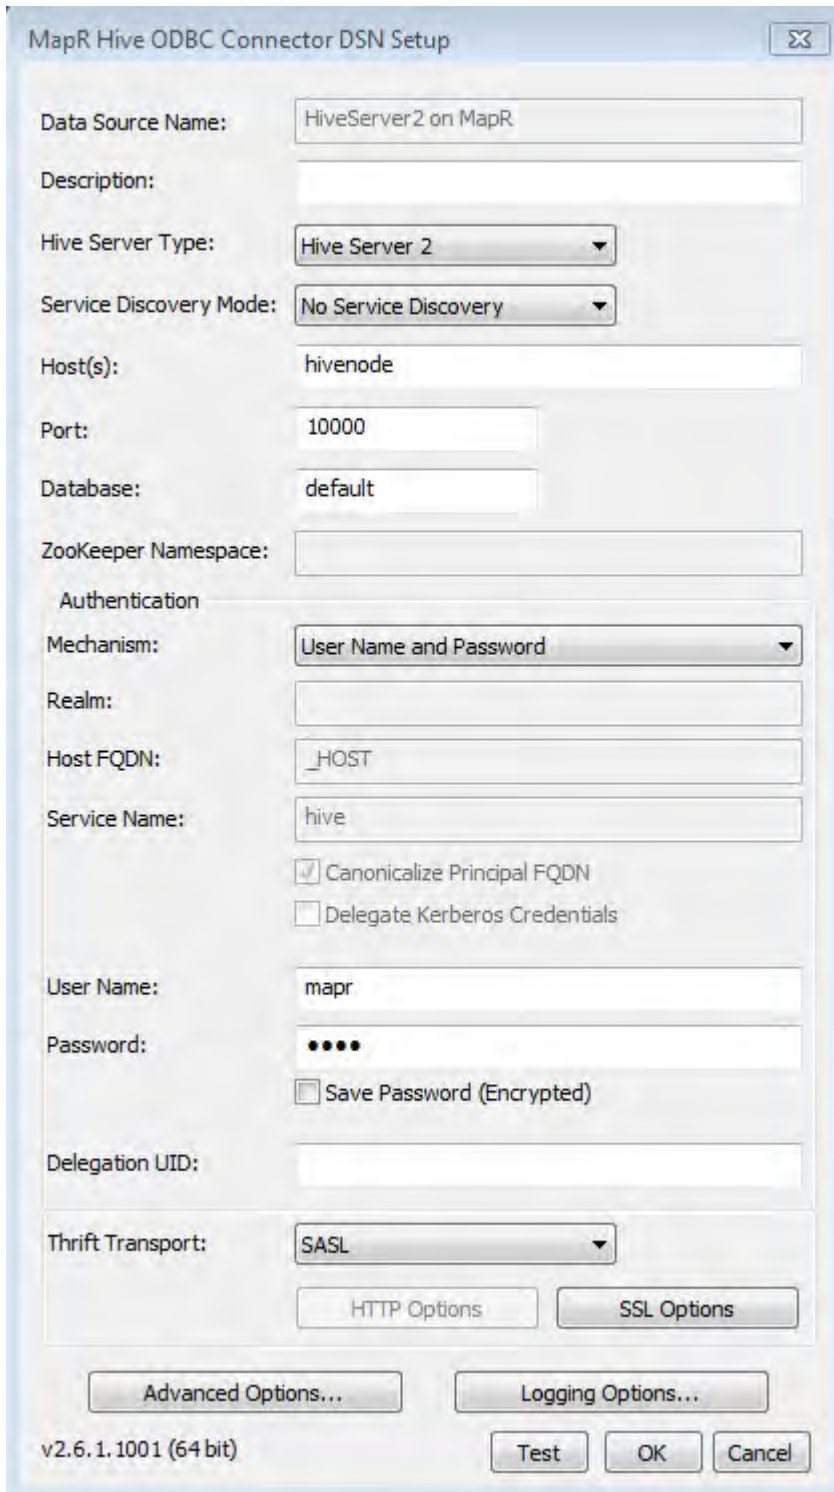

- Open the Data Source Administrator from the Start menu. Example: **Start > MapR Hive ODBC Driver 2.0 > 64-Bit ODBC Driver Manager**
- On the **User DSN** tab click **Add** to open the Create New Data Source dialog.

- Select **MapR Hive ODBC Connector** and click **Finish** to open the Hive ODBC Driver DSN Setup window.

4. Enter the connection information for the Hive instance:

MapR Hive ODBC Connector DSN Setup

Data Source Name: HiveServer2 on MapR

Description:

Hive Server Type: Hive Server 2

Service Discovery Mode: No Service Discovery

Host(s): hivenode

Port: 10000

Database: default

ZooKeeper Namespace:

Authentication

Mechanism: User Name and Password

Realm:

Host FQDN: _HOST

Service Name: hive

Canonicalize Principal FQDN

Delegate Kerberos Credentials

User Name: mapr

Password: ••••

Save Password (Encrypted)

Delegation UID:

Thrift Transport: SASL

HTTP Options SSL Options

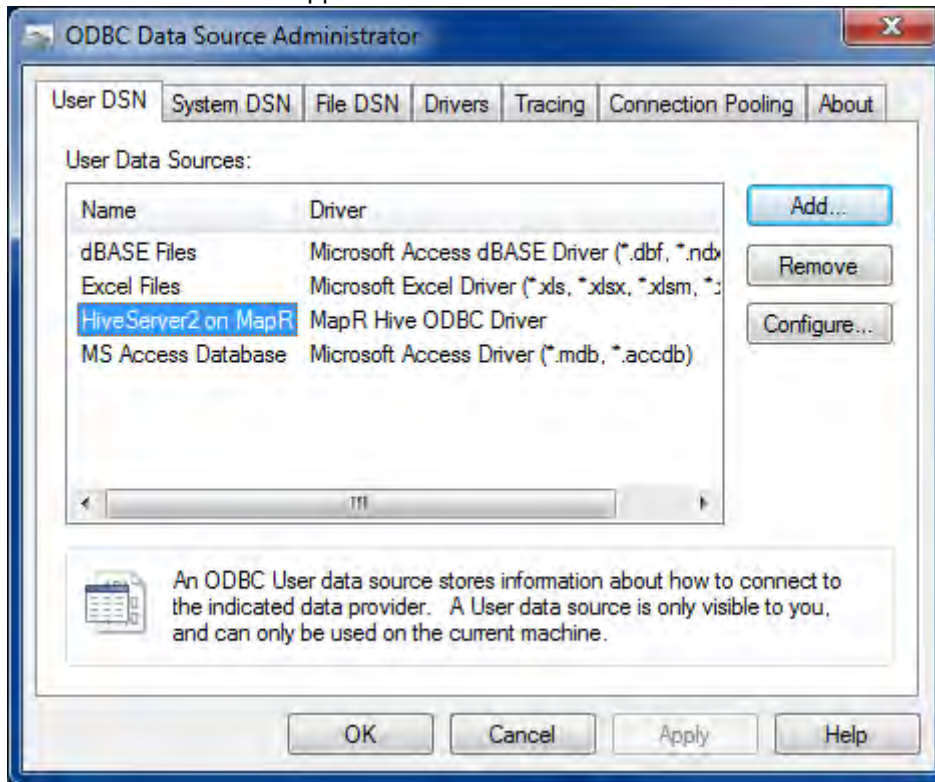

Advanced Options... Logging Options...

v2.6.1.1001 (64 bit) Test OK Cancel

- **Data Source Name** — Specify a name for the DSN.
- **Description** — Enter an optional description for the DSN.
- **Host** — Enter the hostname or IP of the server running HiveServer1 or HiveServer2.
- **Port** — Enter the listening port for the Hive service.

- **Database** — Leave as `default` to connect to the default Hive database, or enter a specific database name.
 - **Hive Server Type:** — Set to `HiveServer1` or `HiveServer2`.
 - **Authentication** — If you are using `HiveServer2`, set the following.
 - **Mechanism:** — Set to the authentication mechanism you're using. The MapR ODBC driver supports user name, user name and password, username and password over SSL authentication, and Kerberos.
 - **User Name:** — Set the user to run queries as.
 - **Password:** — The user's password, if your selected authentication mechanism requires one.
5. Optionally, click **Test** to test the connection.
 6. Click **OK**.

Your new connector will appear in the User Data Sources list.

For steps to apply custom configurations, see [Hive ODBC Driver](#).

Hive ODBC Connector on Mac OS X

System Requirements

- Mac OS X version 10.6.8 or later
- 100 MB of available disk space
- iODBC 3.52.7 or above
- unixODBC 2.2.12 or above

The MapR ODBC Driver with SQL Connector for Apache Hive requires a Hadoop cluster with the Hive service installed and running. The MapR ODBC Driver with SQL Connector for Apache Hive is suitable for use with all versions of Hive. The driver supports both 32- and 64-bit client applications.

Download the MacOS Hive ODBC connector from https://package.mapr.hpe.com/tools/MapR-ODBC/MapR_Hive/MapRHive_odbc_2.6.1.1001/MapRHiveODBC.dmg.

Installation

The MapR ODBC Driver with SQL Connector for Apache Hive driver files are installed in the following directories:

- `/opt/mapr/hiveodbc/ErrorMessage`s – Error messages files directory
- `/opt/mapr/hiveodbc/Setup` – Sample configuration files directory
- `/opt/mapr/hiveodbc/lib/universal` – Binaries directory

To install the MapR ODBC Driver with SQL Connector for Apache Hive:

1. Double-click to mount the `MapRHiveODBC.dmg` disk image.
2. Double-click `MapRHiveODBC.pkg` to run the Installer.
3. Follow the instructions in the Installer to complete the installation process.
4. When the installation completes, click **Close**.

Configuration

Setting the DYLD_LIBRARY_PATH Environment Variable

The `DYLD_LIBRARY_PATH` environment variable must include the paths to:

- Installed ODBC driver manager libraries
- Installed MapR ODBC Driver with SQL Connector for Apache Hive shared libraries

For example, if ODBC driver manager libraries are installed in `/usr/local/lib`, then set `DYLD_LIBRARY_PATH` as follows:

```
export DYLD_LIBRARY_PATH=/usr/local/lib/opt/mapr/hiveodbc/lib/universal
```

Refer to your Mac OS X shell documentation for details on how to set environment variables permanently.

Configure Hive ODBC Connections on Mac OS X

See [Configuring ODBC Connections for Linux](#) for details on creating ODBC connections.

Configuring Encryption for ODBC Connection

Explains how to configure SSL encryption between ODBC connection to Hiveserver2 on non-secure cluster.

Hive uses cyrus-sasl-plain package for ODBC connection.

1. Generate `ssl_keystore/ssl_truststore` by running the following command:

```
sudo bash /opt/mapr/server/manageSSLKeys.sh create -ug mapr:mapr
```

Important: Make a note of the `CN=HOST_NAME` parameter in the output.

2. Configure SSL for Hive as described in [Configure Encryption without Authentication](#) on page 3661.
3. Generate the `.pem` file. To generate:
 - a) Verify that `ssl_keystore` and `ssl_truststore` are present on the system.

```
cd /opt/mapr/conf
ll *ssl*store*
```

If `ssl_keystore` and `ssl_truststore` are not present, then generate them.

- b) Generate `.pem` file using `<ssl-keystore-password> password`.

```
keytool -importkeystore -srckeystore ssl_keystore -destkeystore
ssl_keystore.p12 -srcstoretype jks -deststoretype pkcs12
```

- c) Verify that the `ssl_keystore.p12` and `ssl_keystore.pem` files are created.

For example:

```
openssl pkcs12 -in ssl_keystore.p12 -out ssl_keystore.pem
openssl x509 -text -in ssl_keystore.pem
```

4. Configure SSL for ODBC driver by making the following changes in the `/etc/odbc.ini`, `/etc/odbcinst.ini`, and `/etc/mapr.hiveodbc.init` files. That is, in the:

- `/etc/odbc.ini` file:

- a. Replace <HOST_NAME> with the host name.
- b. Set the value for TrustedCerts to path to ssl_keystore.pem file.
- c. Add the following to the file:

```
[ODBC Data Sources]
Sample MapR Hive DSN=Hive Hive ODBC Driver 64-bit
[Hive]
Driver=/opt/mapr/hiveodbc/lib/64/libmaprhiveodbc64.so
HOST=<HOST_NAME>
PORT=10000
SSL=1
CAIssuedCertNamesMismatch=1
TrustedCerts=/opt/mapr/conf/ssl_keystore.pem
AuthMech=4
```

- /etc/odbcinst.ini file, add the following:

```
[ODBC Drivers]
Mapr Hive ODBC Driver=Installed
[Mapr Hive ODBC Driver 64-bit]
Description=Mapr Hive ODBC Driver (64-bit)
Driver=/opt/mapr/hiveodbc/lib/64/libmaprhiveodbc64.so
```

- etc/mapr.hiveodbc.ini file, add the following:

```
[Driver]
ErrorMessagesPath=/opt/mapr/hiveodbc/ErrorMessage/
LogLevel=0
LogPath=
SwapFilePath=/tmp
```

Sample /etc/odbc.ini file

```
[ODBC Data Sources]
Sample MapR Hive DSN=Hive Hive ODBC Driver 64-bit
[Hive]
Driver=/opt/mapr/hiveodbc/lib/64/libmaprhiveodbc64.so
HOST=<HOST_NAME>
PORT=10000
SSL=1
CAIssuedCertNamesMismatch=1
TrustedCerts=/opt/mapr/conf/ssl_keystore.pem
AuthMech=4
```

Sample /etc/odbcinst.ini file

```
[ODBC Drivers]
Mapr Hive ODBC Driver=Installed
[Mapr Hive ODBC Driver 64-bit]
Description=Mapr Hive ODBC Driver (64-bit)
Driver=/opt/mapr/hiveodbc/lib/64/libmaprhiveodbc64.so
```

Sample /etc/mapr.hiveodbc.ini file

```
[Driver]
ErrorMessagesPath=/opt/mapr/hiveodbc/ErrorMessage/
LogLevel=0
```

```
LogPath=
SwapFilePath=/tmp
```

Connecting to WebHCat

The method that WebHCat clients use to connect to WebHCat is based on the WebHCat Authentication method:

| WebHCat Authentication | Connection Requirements |
|------------------------|--|
| Simple | <p>Clients pass the username as the <code>user.name</code> parameter in the REST call. No password is required. Example:</p> <pre>http://<hostname>:50111/templeton/v1/ddl/database/default/table/table01?user.name=juser</pre> |
| PAM | <p>Clients enter username and password authentication through a pop-up dialog box in the web browser session.</p> |
| Kerberos with SPNEGO | <p>Clients can use one of the following methods:</p> <ul style="list-style-type: none"> curl example: <pre>curl --negotiate -i -u : 'http://<FQDN>:50111/templeton/v1/ddl/database/'</pre> Web browser with user name and password. For more information, see Configuring SPNEGO on MapR on page 1553 <p> Note: With either method you must also have a Kerberos ticket in the cache. See Example: Generating a Kerberos Ticket</p> |

Enabling High Availability for Hive

This section describes how to enable High Availability for HiveServer2 and HiveMetastore.

Note: You can achieve High Availability(HA) through HA tools like HAProxy or F5. Based on the tools used, you need to configure reverse DNS lookups and implement other security features. However, the HPE Ezmeral Data Fabric does not support any HA tool.

Related concepts

[Enabling High Availability for Spark Thrift Server](#) on page 4269

Enabling High Availability for HiveServer2

Perform the following steps to enable High Availability for HiveServer2.

Configuring Hive

1. Modify the `warden.hs2.conf` file as shown below on all the nodes where Hive is installed.

```
services=hs2:all
```

2. Add the following properties to the `hive-site.xml` file on all the nodes where HiveServer2 is installed.

| Property | Value | Description |
|---|--|--|
| <code>hive.server2.support.dynamic.service.discovery</code> | true (default is false) | Set to true to enable HiveServer2 dynamic service discovery for its clients. |
| <code>hive.server2.zookeeper.namespace</code> | hiveserver2 (default value) | The parent node in ZooKeeper, which is used by HiveServer2 when supporting dynamic service discovery. |
| <code>hive.zookeeper.quorum</code> | <code><hostname>:5181,<hostname>:5181,<hostname>:5181</code> | List of ZooKeeper servers to talk to. Used in connection string by JDBC/ODBC clients instead of URI of specific HiveServer2 instance. |
| <code>hive.zookeeper.client.port</code> | 5181 (default value) | The port of the ZooKeeper servers to talk to. If the list of Zookeeper servers specified in <code>hive.zookeeper.quorum</code> does not contain port numbers and so, this value is used. |
| <code>hive.zookeeper.session.timeout</code> | 600000 (default value) | Zookeeper client's session timeout value. The client is disconnected, and as a result, all locks are released if a heartbeat is not sent within the timeout period. |

- Restart all the nodes where Hive service is installed after updating the configuration.

Connecting with JDBC/ODBC Clients

- Connect to HiveServer2 with JDBC/ODBC clients using the following connection string:

```
jdbc:hive2://<zookeeper_ensemble>;serviceDiscoveryMode=zooKeeper;
zooKeeperNamespace=<hiveserver2_zookeeper_namespace>
```

Here:

| | |
|--|--|
| <code><zookeeper_ensemble></code> | Specifies a comma-separated list of ZooKeeper servers that form the ensemble. For example: <code><zk_host1>:<zk_port1>,<zk_host2>:<zk_port2>,<zk_host3>:<zk_p</code> |
| <code><hiveserver2_zookeeper_namespace></code> | Specifies the namespace on Zookeeper under which HiveServer2 znodes are added. The namespace value is configured in <code>hive.server2.zookeeper.namespace</code> |

Deregistering HiveServer2 Instances from Zookeeper

Remove a HiveServer2 instance from Zookeeper by running the following commands (in the ZooKeeper command line interface) to deregister the server.

- Launch the ZooKeeper command line interface and get the HiveServer2 znode by running the following commands:

```
/opt/mapr/zookeeper/zookeeper-<version>/bin/zkCli.sh -server <ip:port of
zookeeper instance>
ls /<hive.server2.zookeeper.namespace>
```

- Run the command to deregister HiveServer2. To deregister:

- A particular HiveServer2, run the following command:

```
delete /hiveserver2 serverUri=<hostname:port>;version=<hive
version>;sequence=<sequence number>
```

After you deregister the HiveServer2 from Zookeeper, it will not return the deregistered HiveServer2 for new client connections. However, active client sessions are not affected by deregistering the HiveServer2 from Zookeeper.

- All HiveServer2 instances of a particular version, run the following command:

```
hive --service hiveserver2 --deregister <version_number>
```

Example HiveServer2 High Availability Setup

This section describes a High Availability set up for HiveServer2 on a sample HPE Ezmeral Data Fabric cluster. Suppose a three node cluster with the following (optional) IP addresses and host names:

| IP Address | Host Name |
|---------------|-----------|
| 192.168.33.11 | node1 |
| 192.168.33.12 | node2 |
| 192.168.33.13 | node3 |

Connection to HiveServer2 can be accomplished using the following string:

```
jdbc:hive2://
node1:5181,node2:5181,node3:5181/;serviceDiscoveryMode=zooKeeper;zooKeeperNa
mespace=hiveserver2
```

To deregister HiveServer2:

1. Launch the ZooKeeper command line interface using the following command:

```
/opt/mapr/zookeeper/zookeeper-3.4.5/bin/zkCli.sh -server
192.168.33.13:5181
```

2. Look at the ZooKeeper namespace using the following command:

```
ls /hiveserver2
```

Output:

```
[serverUri=node3:10000;version=2.1.1-mapr-1703;sequence=0000000004,
serverUri=node1:10000;version=2.1.1-mapr-1703;sequence=0000000006]
```

3. Deregister:

- HiveServer2 on node3:

```
delete
serverUri=node3:10000;version=2.1.1-mapr-1703;sequence=0000000004
```

- All HiveServer2 instances:

```
hive --service hiveserver2 --deregister 2.1.1-mapr-1703
```

Enabling High Availability for Hive Metastore

To enable High Availability for Hive Metastore, perform the following steps:

1. Enable remote access to the underlying database from different nodes.
2. Add all Metastore instances to `hive.metastore.uris` on all the nodes:

```
<property>
  <name>hive.metastore.uris</name>
  <value>thrift://<hostname>:9083,thrift://<hostname>:9083</value>
</property>
```

3. Restart Hive.

Note that enabling high availability for the Hive Metastore does not require changes to the `warden.hivemetastore.conf` file. Active-active mode is not supported for Hive Metastore.

Example

Suppose HiveMetastore is on the following two nodes:

| IP Address | Host Name |
|---------------|-----------|
| 192.168.33.11 | node1 |
| 192.168.33.12 | node2 |

1. Change the MySQL configuration:

```
nano /etc/my.cnf
```

2. Comment out the following properties:

```
#bind-address
#skip-networking
```

If these properties are not in `my.cnf`, you can skip editing `my.cnf`. Restart the MySQL server.

3. Enable remote access for the underlying database by granting permissions in the underlying database:

```
mysql> GRANT ALL PRIVILEGES ON metastore.* TO 'root'@'192.168.33.11'
IDENTIFIED BY 'secret' WITH GRANT OPTION;
```

```
mysql> GRANT ALL PRIVILEGES ON metastore.* TO 'root'@'192.168.33.12'
IDENTIFIED BY 'secret' WITH GRANT OPTION;
```

4. Verify the connection to the MySQL server from `node1` and `node2`. For example, run the following commands:

- On `node1`:

```
mysql -h node1 -uroot -psecret
```

- On node2:

```
mysql -h node2 -uroot -psecret
```

5. Add all Metastore instances to `hive.metastore.uris` on all nodes with the Hive instance:

```
<property>
  <name>hive.metastore.uris</name>
  <value>thrift://192.168.33.11:9083,thrift://192.168.33.12:9083</value>
</property>
```

6. Restart Hive.

Hive Features in HPE Ezmeral Data Fabric

Describes HPE Ezmeral Data Fabric-specific features in Hive.

Removing Temporary Hive Files

Starting from EEP 8.1.0 and EEP 6.3.6, to remove the temporary Hive files created during the Hive session, set the value of `hive.scratchdir.lock` property to `true` on `hive-site.xml` file.

```
<property>
  <name>hive.scratchdir.lock</name>
  <value>true</value>
</property>
```

For the previous EEP versions, manually remove the temporary Hive files that are not used by the active Hive sessions.

You have two different situations:

- If you have configured the HiveServer2 in a node, set `hive.scratchdir.lock` property on the `hive-site.xml` file to automatically remove the temporary Hive files.
- If you have not configured the HiveServer2 in a node, set the `hive.scratchdir.lock` property and run the following command to remove the temporary Hive files.

```
hive --service cleardanglingscratchdir
```

Symbolic Link Support in Hive

Starting from EEP 7.1.0, all [hadoop fs](#) commands support operations on symlinks (symbolic links). Hive supports symlinks in EEP 8.0.0 onwards. You can create symlinks through the command line interface or file system API (MapRFileSystem.java).

Symlink creation via CLI has the following requirements:

- [NFS installed](#)
- [NFS mounted](#) (mount `hadoop fs` to the local file system)

Creating Symlinks

The following examples demonstrate how to create symbolic links via CLI and MapRFileSystem API:

- Create a *relative* symlink via CLI:

```
ln -rs /mountPoint/path/to/file /mountPoint/path/to/symlink
```

- Create an *absolute* symlink via CLI:

```
ln -s /mountPoint/path/to/file /mountPoint/path/to/symlink
```

- Create a symlink via MapRFileSystem API:

```
MapRFileSystem maprFS = MapRFileSystem.get(new Configuration());
maprFS.createSymlink(pathToTarget, pathToLink, createParentFlag);
```

Using Symlinks for Hive Operations

Once a symlink is created, you can use the symlink for Hive operations, such as table location and data file, as demonstrated in the following steps:

1. Create a table directory:

```
mkdir /mapr/my.cluster.com/user/hive/warehouse/ext_tbl_symlink
```

2. Create a symlink from a data source to a table location:

```
ln -s /mapr/my.cluster.com/user/mapr/source_files/data.txt /mapr/
my.cluster.com/user/hive/warehouse/ext_tbl_mh120/data_link.txt
```

3. Create an external Hive table in the `ext_tbl_symlink` directory (created in step 1):

```
CREATE EXTERNAL TABLE file_link_table (...) ROW FORMAT DELIMITED FIELDS
TERMINATED BY "," STORED AS TEXTFILE LOCATION '/user/hive/warehouse/
ext_tbl_symlink';
```

The Hive table has a symbolically linked text file as the data source. Data can be processed as if it is a regular data file.

Hive 2.3 API Changes

This topic describes the public API changes that occurred between Hive 2.1 EEP 5.0.0 and Hive 2.3 EEP 6.0.0.

For more information, see the [Hive 2.1.1-1803 \(EEP 4.1.1 and EEP 5.0.0\) Release Notes](#) on page 6175 and [Hive 2.3.3-1808 \(EEP 6.0.0\) Release Notes](#) on page 6150.

JDBC classes API changes

This section contains changes made to classes related to the JDBC API in Hive.

Table

| Method | Description |
|--|---|
| <code>List<String> parseInitFile(String initFile)</code> | Parses initial SQL file skipping comments that starts with # or --. |

Table

| Method | Description |
|--|---|
| <code>void setInPlaceUpdateStream(InPlaceUpdate stream)</code> | Only used by the beeline client to set the stream on which in place progress updates are to be shown. |

Table

| Method | Description |
|---|---|
| JdbcConnectionParams parseURL(String uri) | <p>Parse JDBC connection URL. The new format of the URL is:</p> <pre>jdbc:hive2://:,:/dbName;sess_var_list? hive_conf_list#hive_var_list</pre> <p>where the optional <code>sess</code>, <code>conf</code>, and <code>var</code> lists are semicolon separated = pairs. For utilizing dynamic service discovery with HiveServer2, multiple comma-separated host:port pairs can be specified as shown above. The JDBC driver resolves the list of URIs and picks a specific server instance to connect to. Currently, dynamic service discovery using ZooKeeper is supported, in which case the host:port pairs represent a ZooKeeper ensemble. As before, if the host/port is not specified, the driver runs an embedded Hive:</p> <ul style="list-style-type: none"> • <code>jdbc:hive2://ubuntu:11000/db2?hive.cli.conf.println=true;hive.exec.mode.local.auto.inputbytes.max=9999#stab=salesTable;icol=customerID</code> • <code>jdbc:hive2://?hive.cli.conf.println=true;hive.exec.mode.local.auto.inputbytes.max=9999#stab=salesTable;icol=customerID</code> • <code>jdbc:hive2://ubuntu:11000/db2;user=foo;password=bar</code> <p>Connect to <code>http://server:10001/hs2</code>, with specified basicAuth credentials and initial database:</p> <pre>jdbc:hive2://server:10001/ db;user=foo;password=bar? hive.server2.transport.mode= http;hive.server2.thrift.http.path=hs2</pre> |

Security-related API changes

The following properties are removed from the default `hive-site.xml` configuration on a secured cluster:

Table

| Property | Value |
|---|---|
| <code>hive.server2.webui.keystore.path</code> | <code>/opt/mapr/conf/ssl_keystore.</code> |
| <code>hive.server2.webui.keystore.password</code> | Default keystore password. |

The following property is added to the default `hive-site.xml` configuration on a secured cluster:

Table

| Method | Description |
|--|-------------------|
| <code>hive.server2.use.SSL true</code> | <code>true</code> |

Since the HiveServer2 server is configured to use SSL encryption by default starting from Hive-2.3 EEP-6.0.0, add `ssl=true;` to a JDBC connection string when PAM or MAPR-SASL authentication is used.

For example:

Old JDBC connection string with PAM authentication:

```
beeline> !connect jdbc:hive2://<host>:10000/default;
```

New JDBC connection string with PAM authentication:

```
beeline> !connect jdbc:hive2://<host>:10000/default;ssl=true;
```

Note: All API functionality changes are compatible with previous versions.

Hive 2.1 API

This section contains the following:

New Classes in Hive 2.1

Hive 2.1 includes the following new classes:

| Class | Description |
|---|---|
| org.apache.hadoop.hive.common. DiskRangeInfo | Contains disk range information including disk ranges and total length. |
| org.apache.hadoop.hive.common. JvmPauseMonitor | This is based on the <code>JvmPauseMonitor</code> from Hadoop. |
| org.apache.hadoop.hive.common. StringableMap | A utility class that can convert a <code>HashMap</code> of Properties into a colon separated string, and can take the same format of string and convert it to a <code>HashMap</code> of Properties. |
| org.apache.hadoop.hive.common. ValidCompactorTxnList | An implementation of <code>org.apache.hadoop.hive.common.ValidTxnList</code> for use by the compactor. |
| org.apache.hadoop.hive.common.io. .DiskRange | The sections of a file. |
| org.apache.hadoop.hive.common.io. DiskRangeList | Alternative for Java linked list iterator interface to support concurrent modifications of the same list by multiple iterators. |
| org.apache.hadoop.hive.common.jsonexplain.tez. Printer | Creation of output string to show JSON plan. |
| org.apache.hadoop.hive.common.jsonexplain.tez. TezJsonParserUtils | JsonParser for Tez that prints a <code>JSONObject</code> into <code>OutputStream</code> . |

| Class | Description |
|--|--|
| org.apache.hadoop.hive.common.metrics. LegacyMetrics | The Metrics Subsystem allows exposure of a number of named parameters/counters via JMX, is intended to be used as a static subsystem, and has a couple of primary ways in which it can be used: <ul style="list-style-type: none"> Using the set and get methods to set and get named parameters. Using the incrementCounter method to increment and set named parameters in one go, rather than having to make a get and then a set. Using the startScope and endScope methods to start and end named "scopes" that record the number of times they have been instantiated and amount of time (in milliseconds) spent inside the scopes. |
| org.apache.hadoop.hive.common.type. RandomTypeUtil | Creates random data of different object types. |
| org.apache.hadoop.hive.conf. VariableSubstitution | Substitution of environment variables. |
| org.apache.hadoop.hive.contrib.genericudf.example. GenericUDFAdd10 | Initializes the GenericUDF (once per instance), evaluates the GenericUDF with the arguments, and gets the string to display. |
| org.apache.hadoop.hive.io. HdfsUtils | Utils to resolve file properties in MAPR filesystem. |
| org.apache.hadoop.hive.metastore. AcidEventListener | It handles cleanup of dropped partition/table/database in ACID related metastore tables. |
| org.apache.hadoop.hive.metastore. FileMetadataHandler | The base implementation of a file metadata handler for a specific file type. |
| org.apache.hadoop.hive.metastore. FileMetadataManager | Handle storage functions of metadata. |
| org.apache.hadoop.hive.metastore. HMSMetricsListener | Report metrics of metadata added and deleted by this Hive Metastore. |
| org.apache.hadoop.hive.metastore. Metastore | Class to arrange work with Metastore. |
| org.apache.hadoop.hive.metastore. PartFilterExprUtil | Utility functions for working with partition filter expressions. |
| org.apache.hadoop.hive.metastore.api. AbortTxnsRequest | Class for handling transactions request. |
| org.apache.hadoop.hive.metastore.api. AddForeignKeyRequest | Class for handling foreign key request. |
| org.apache.hadoop.hive.metastore.api. AddPrimaryKeyRequest | Class for handling primary key request. |
| org.apache.hadoop.hive.metastore.api. CacheFileMetadataRequest | Class for caching metadata requests. |
| org.apache.hadoop.hive.metastore.api. CacheFileMetadataResult | Class for caching metadata results. |
| org.apache.hadoop.hive.metastore.api. ClearFileMetadataResult | Class for clearing metadata results. |
| org.apache.hadoop.hive.metastore.api. DropConstraintRequest | Class for dropping constraint requests. |
| org.apache.hadoop.hive.metastore.api. ForeignKeysRequest | Class for handling foreign key requests. |

| Class | Description |
|--|---|
| org.apache.hadoop.hive.metastore.api. ForeignKeysResponse | Class for getting response from all functions. |
| org.apache.hadoop.hive.metastore.api. GetAllFunctionsResponse | Class for getting response from all functions. |
| org.apache.hadoop.hive.metastore.api. GetFileMetadataByExprRequest | Class for getting metadata from expression response. |
| org.apache.hadoop.hive.metastore.api. GetFileMetadataByExprResult | Class for getting metadata from expression result. |
| org.apache.hadoop.hive.metastore.api. MetadataPpdResult | Class for describing metadata rpd result. |
| org.apache.hadoop.hive.metastore.api. PrimaryKeysRequest | Class for describing primary key result. |
| org.apache.hadoop.hive.metastore.api. PrimaryKeysResponse | Class for describing primary key response. |
| org.apache.hadoop.hive.metastore.api. PutFileMetadataRequest | Class for output metadata request to file. |
| org.apache.hadoop.hive.metastore.api. PutFileMetadataResult | Class for output metadata result to file. |
| org.apache.hadoop.hive.metastore.api. SQLForeignKey | Class for describing SQL foreign key. |
| org.apache.hadoop.hive.metastore.api. SQLPrimaryKey | Class for describing SQL primary key. |
| org.apache.hadoop.hive.metastore.api. TableMeta | Class for describing table metadata. |
| org.apache.hadoop.hive.metastore.model. MConstraint | Model of constraints stored in metastore. |
| org.apache.hadoop.hive.metastore.txn. TxnUtils | Class for handling transactions. |
| org.apache.hadoop.hive.ql. CompilationOpContext | Contains the operator sequence ID and a subset of compilation context that is passed to operators to get rid of some globals. |
| org.apache.hadoop.hive.ql. QueryDisplay | Contains limited query information to save for WebUI. The class is synchronized, as WebUI may access information about a running query. |
| org.apache.hadoop.hive.ql. QueryState | The class to store query level info such as queryId. |
| org.apache.hadoop.hive.ql.exec. AbstractMapOperator | Abstract Map operator. |
| org.apache.hadoop.hive.ql.exec. GlobalWorkMapFactory | Get job that has been executed on cluster as a map value. |
| org.apache.hadoop.hive.ql.exec. ObjectCacheWrapper | Wrapping class for ObjectCache class. |
| org.apache.hadoop.hive.ql.exec. SerializationUtilities | Utilities related to serialization and deserialization. |
| org.apache.hadoop.hive.ql.exec. UDFClassLoader | UDFClassLoader is used to dynamically register udf (and related) jars. This was introduced to fix HIVE-11878. Each session will have its own instance of UDFClassLoader to support HiveServer2, which can contain multiple active sessions. |
| org.apache.hadoop.hive.ql.exec.spark. CacheTran | Class for making cache persistent. |
| org.apache.hadoop.hive.ql.exec.spark. SmallTableCache | Class for cache cleaning if new query is present. |
| org.apache.hadoop.hive.ql.exec.spark. SparkDynamicPartitionPruner | The spark version of DynamicPartitionPruner. |

| Class | Description |
|--|--|
| org.apache.hadoop.hive.ql.exec.spark.status.impl. SparkJobUtils | Utilities for spark job. |
| org.apache.hadoop.hive.ql.exec.tez. ColumnarSplitSizeEstimator | Split size estimator for columnar file formats. |
| org.apache.hadoop.hive.ql.exec.tez. HostAffinitySplitLocationProvider | This maps a split (path + offset) to an index based on the number of locations provided. |
| org.apache.hadoop.hive.ql.exec.tez. InPlaceUpdates | Class responsible for inplace updates. |
| org.apache.hadoop.hive.ql.exec.tez. KeyValuesFromKeyValue | Provides a key/values (note the plural values) interface out of a KeyValueReader, needed by ReduceRecordSource when reading input from a key/value source. |
| org.apache.hadoop.hive.ql.exec.tez. KeyValuesFromKeyValues | Provides a key/values interface out of a KeyValuesReader for use by ReduceRecordSource. |
| org.apache.hadoop.hive.ql.exec.tez. LlapObjectCache | Llap implementation for the shared object cache. |
| org.apache.hadoop.hive.ql.exec.tez. Utils | Utilities for running tez jobs. |
| org.apache.hadoop.hive.ql.exec.vector. IntervalDayTimeColumnVector | This class represents a nullable interval day time column vector capable of handling a wide range of interval day time values. |
| org.apache.hadoop.hive.ql.exec.vector. ListColumnVector | The representation of a vectorized column of list objects. |
| org.apache.hadoop.hive.ql.exec.vector. MapColumnVector | The representation of a vectorized column of map objects. |
| org.apache.hadoop.hive.ql.exec.vector. MultiValuedColumnVector | The representation of a vectorized column of multi-valued objects, such as lists and maps. |
| org.apache.hadoop.hive.ql.exec.vector. StructColumnVector | The representation of a vectorized column of struct objects. |
| org.apache.hadoop.hive.ql.exec.vector. TimestampColumnVector | This class represents a nullable timestamp column vector capable of handling a wide range of timestamp values. |
| org.apache.hadoop.hive.ql.exec.vector. UnionColumnVector | The representation of a vectorized column of struct objects. |
| org.apache.hadoop.hive.ql.exec.vector. VectorSparkHashTableSinkOperator | Vectorized version of SparkHashTableSinkOperator. It delegates all the work to super class Copied from VectorFileSinkOperator. |
| org.apache.hadoop.hive.ql.exec.vector. VectorSparkPartitionPruningSinkOperator | Vectorized version for SparkPartitionPruningSinkOperator. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. BRoundWithNumDigitsDoubleToDouble | Banking rounding implementation. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. CastDoubleToTimestamp | Cast double type to timestamp type. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. CastLongToTimestamp | Cast long type to timestamp type. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. CastMillisecondsLongToTimestamp | Cast milliseconds long type to timestamp. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. CastStringGroupToString | Cast string group type to string type. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. CastTimestampToBoolean | Cast timestamp type to boolean. |

| Class | Description |
|---|--|
| org.apache.hadoop.hive.ql.exec.vector.expressions.CastTimestampToDate | Cast timestamp type to decimal type. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.CastTimestampToDouble | Cast timestamp type to double type. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.CastTimestampToLong | Cast timestamp type to long type. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.DateColSubtractDateColumn | Subtract two variables of date type. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.DateColSubtractDateScalar | Subtract two variables of date type. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.DateScalarSubtractDateColumn | Subtract two variables of date type. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.FilterStructColumnInList | Evaluates an IN filter on a batch for a vector of structs. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.FilterTimestampColumnInList | Evaluates IN filter on a batch for a vector of timestamps. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.FunctionBRoundWithNumDigitsDecimalToDecimal | Banking rounding for decimal digits. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.FunctionDecimalToTimestamp | This is a superclass for unary decimal functions and expressions returning timestamps that operate directly on the input and set the output. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.FunctionTimestampToDecimal | This is a superclass for unary timestamp functions and expressions returning decimals that operate directly on the input and set the output. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.FunctionTimestampToLong | This is a superclass for unary timestamp functions and expressions returning long that operate directly on the input and set the output. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.IfExprDoubleColumnDoubleColumn | Computes IF(expr1, expr2, expr3) for 3 input column expressions. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.IfExprIntervalDayTimeColumnColumn | Computes IF(expr1, expr2, expr3) for 3 input column expressions. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.IfExprIntervalDayTimeColumnScalar | Computes IF(expr1, expr2, expr3) for 3 input column expressions. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.IfExprIntervalDayTimeScalarColumn | Computes IF(expr1, expr2, expr3) for 3 input column expressions. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.IfExprIntervalDayTimeScalarScalar | Computes IF(expr1, expr2, expr3) for 3 input column expressions. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.IfExprLongColumnLongColumn | Computes IF(expr1, expr2, expr3) for 3 input column expressions. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.IfExprTimestampColumnColumn | Computes IF(expr1, expr2, expr3) for 3 input column expressions. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.IfExprTimestampColumnColumnBase | Computes IF(expr1, expr2, expr3) for 3 input column expressions. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.IfExprTimestampColumnScalar | Computes IF(expr1, expr2, expr3) for 3 input column expressions. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.IfExprTimestampColumnScalarBase | Computes IF(expr1, expr2, expr3) for 3 input column expressions. |

| Class | Description |
|--|--|
| org.apache.hadoop.hive.ql.exec.vector.expressions.IfExprTimestampScalarColumn | Computes IF(expr1, expr2, expr3) for 3 input column expressions. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.IfExprTimestampScalarColumnBase | Computes IF(expr1, expr2, expr3) for 3 input column expressions. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.IfExprTimestampScalarScalar | Computes IF(expr1, expr2, expr3) for 3 input column expressions. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.IfExprTimestampScalarScalarBase | Computes IF(expr1, expr2, expr3) for 3 input column expressions. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.LongColEqualLongColumn | If equal two columns as vectors. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.LongColEqualLongScalar | If equal long column and long scalar as vectors. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.LongColGreaterEqualLongColumn | If greater or equal two columns as vectors. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.LongColGreaterEqualLongScalar | If greater or equal long column and long scalar. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.LongColGreaterLongColumn | If greater two columns as vectors. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.LongColGreaterLongScalar | If greater long column and long scalar as vectors. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.LongColLessEqualLongColumn | If less equal two columns as vectors. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.LongColLessEqualLongScalar | If less equal long column and long scalar as vectors. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.LongColLessLongColumn | If less two columns as vectors. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.LongColLessLongScalar | If less long column and long scalar as vectors. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.LongColNotEqualLongColumn | If not equal two columns as vectors. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.LongColNotEqualLongScalar | If not equal long column and long scalar as vectors. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.LongScalarEqualLongColumn | If equal long scalar and long column. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.LongScalarGreaterEqualLongColumn | If greater equal long scalar and long column as vector. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.LongScalarGreaterLongColumn | If greater long scalar and long column as vectors. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.LongScalarLessEqualLongColumn | If less equal long scalar and long column as vector. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.LongScalarLessLongColumn | If less long scalar and long column as vectors. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.LongScalarNotEqualLongColumn | If not equal long scalar and long column as vectors. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.SelectStringColLikeStringScalar | Select like statement for string column and string scalar. |

| Class | Description |
|---|--|
| org.apache.hadoop.hive.ql.exec.vector.expressions. StructColumnInList | Evaluates an IN boolean expression (not a filter) on a batch for a vector of structs. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. TimestampColumnInList | Returns a boolean value indicating if a column is IN a list of constants. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. TimestampToStringUnaryUDF | This is a superclass for unary long functions returning strings that operate directly on the input and set the output. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. VectorUDFDateTimestamp | Vectorized version of TO_DATE(timestamp). |
| org.apache.hadoop.hive.ql.exec.vector.expressions. VectorUDFDayOfMonthDate | Expression to get day of month. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. VectorUDFDayOfMonthTimestamp | Expression to get day of month. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. VectorUDFHourDate | Returns hour of day. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. VectorUDFHourTimestamp | Returns hour of day. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. VectorUDFMinuteDate | Returns minute value. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. VectorUDFMinuteTimestamp | Returns minute value. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. VectorUDFMonthDate | Returns month value. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. VectorUDFMonthTimestamp | Returns month value. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. VectorUDFSecondDate | Expression to get seconds. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. VectorUDFSecondTimestamp | Expression to get seconds. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. VectorUDFTimestampFieldDate | Abstract class to return various fields from a Timestamp or Date. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. VectorUDFTimestampFieldTimestamp | Abstract class to return various fields from a Timestamp. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. VectorUDFUnixTimeStampDate | Returns Unix Timestamp. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. VectorUDFUnixTimeStampTimestamp | Returns Unix Timestamp. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. VectorUDFWeekOfYearDate | Expression to get week of year. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. VectorUDFWeekOfYearTimestamp | Expression to get week of year. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. VectorUDFYearDate | Expression to get year as a long. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. VectorUDFYearTimestamp | Expression to get year as a long. |

| Class | Description |
|--|---|
| org.apache.hadoop.hive.ql.exec.vector.expressions.aggregates. VectorUDAFVgTimestamp | Generated from template VectorUDAFVg.txt. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.aggregates. VectorUDAFStdPopTimestamp | Vectorized implementation for VARIANCE aggregates. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.aggregates. VectorUDAFStdSampTimestamp | Vectorized implementation for VARIANCE aggregates. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.aggregates. VectorUDAFVarPopTimestamp | Vectorized implementation for VARIANCE aggregates. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.aggregates. VectorUDAFVarSampTimestamp | Vectorized implementation for VARIANCE aggregates. |
| org.apache.hadoop.hive.ql.hooks. LineageLogger | Implementation of a post execute hook that logs lineage info to a log file. |
| org.apache.hadoop.hive.ql.hooks. PostExecOrcFileDump | Post execution hook to print orc file dump for files that will be read by fetch task. |
| org.apache.hadoop.hive.ql.hooks. PostExecTezSummaryPrinter | Post execution hook to print hive tez counters to console error stream. |
| org.apache.hadoop.hive.ql.io. HdfsUtils | Utilities for hadoop fs. |
| org.apache.hadoop.hive.ql.io. IOContextMap | Uses the global static map of IOContext-s inside IOContext, uses threadlocal for Spark, and creates inheritable threadlocal with attemptId (only set in LLAP), which will propagate to all the Tez threads. |
| org.apache.hadoop.hive.ql.io. NullScanFileSystem | Filesystem that does not allow Hive to read files for nullscans. |
| org.apache.hadoop.hive.ql.io. ProxyLocalFileSystem | This class is to workaround existing issues on LocalFileSystem. |
| org.apache.hadoop.hive.ql.io. SyntheticFileId | Create synthetic ID for file. |
| org.apache.hadoop.hive.ql.io.orc. ExternalCache | Metastore-based footer cache storing serialized footers. |
| org.apache.hadoop.hive.ql.io.orc. MetastoreExternalCachesByConf | An implementation of external cache and factory based on metastore. |
| org.apache.hadoop.hive.ql.io.orc. OrcFileFormatProxy | File format proxy for ORC. |
| org.apache.hadoop.hive.ql.io.orc. RecordReaderImpl | Implementation of record reader. |
| org.apache.hadoop.hive.ql.io.parquet.read. ParquetFilterPredicateConverter | Translate the search argument to the filter predicate parquet uses. |
| org.apache.hadoop.hive.ql.io.sarg. ConvertAstToSearchArg | Converting asterisk and use it as a search argument. |
| org.apache.hadoop.hive.ql.io.sarg. SearchArgumentImpl | The implementation of SearchArguments. |
| org.apache.hadoop.hive.ql.lib. PreOrderOnceWalker | This class takes list of starting nodes and walks them in pre-order. |
| org.apache.hadoop.hive.ql.log. HiveEventCounter | A log4J2 appender that simply counts logging events in four levels: fatal, error, warn, and info. |
| org.apache.hadoop.hive.ql.log. NoDeleteRollingFileAppender | Instantiate a RollingFileAppender and open the file designated by filename. The opened filename will become the output destination for this appender. |
| org.apache.hadoop.hive.ql.log. NullAppender | A NullAppender that never outputs a message to any device. |

| Class | Description |
|--|---|
| org.apache.hadoop.hive.ql.log.PidFilePatternConverter | FilePattern converter that converts %pid pattern to @ information obtained at runtime. |
| org.apache.hadoop.hive.ql.metadata.ForeignKeyInfo | ForeignKeyInfo is a metadata structure containing the foreign keys associated with a table. |
| org.apache.hadoop.hive.ql.metadata.PrimaryKeyInfo | PrimaryKeyInfo is a metadata structure containing the primary key associated with a table. |
| org.apache.hadoop.hive.ql.metadata.TableIterable | Gets Table objects for a table list. |
| org.apache.hadoop.hive.ql.optimizer.OperatorComparatorFactory | Comparator for table operators. |
| org.apache.hadoop.hive.ql.optimizer.PartitionColumnsSelector | Takes a Filter expression, and if its predicate contains an IN operator whose children are constant structs or structs containing constant fields, it will try to generate predicate with IN clauses containing only partition columns. |
| org.apache.hadoop.hive.ql.optimizer.PointLookupOptimizer | Takes a Filter expression, and if its predicate contains an OR operator whose children are constant equality expressions, it will try to generate an IN clause (which is more efficient). |
| org.apache.hadoop.hive.ql.optimizer.RedundantDynamicPruningConditionsRemoval | Takes a Filter operator on top of a TableScan and removes dynamic pruning conditions if static partition pruning has been triggered already. |
| org.apache.hadoop.hive.ql.optimizer.SparkRemoveDynamicPruningBySize | Disables pruning if the number of keys for dynamic pruning is too large. |
| org.apache.hadoop.hive.ql.optimizer.calcite.HivePlannerContext | Creating context for Hive Planner. |
| org.apache.hadoop.hive.ql.optimizer.calcite.HiveRelBuilder | Builder for relational expressions in Hive. |
| org.apache.hadoop.hive.ql.optimizer.calcite.HiveRelFactories | Factory class for creating relational operators for queries. |
| org.apache.hadoop.hive.ql.optimizer.calcite.HiveRegistryExecutorImpl | Hive registry executor implementation. |
| org.apache.hadoop.hive.ql.optimizer.calcite.HiveRegistryUtil | Utilities for hive registry executor. |
| org.apache.hadoop.hive.ql.optimizer.calcite.reloperators.HiveBetween | Operand type-inference strategy where an unknown operand type is derived from the first operand with a known type, but the first operand is a boolean. |
| org.apache.hadoop.hive.ql.optimizer.calcite.reloperators.HiveIn | Create in clause instance for hive queries. |
| org.apache.hadoop.hive.ql.optimizer.calcite.reloperators.HiveMultiJoin | A HiveMultiJoin represents a succession of binary joins. |
| org.apache.hadoop.hive.ql.optimizer.calcite.reloperators.HiveSortLimit | Sorting limit in hive queries. |
| org.apache.hadoop.hive.ql.optimizer.calcite.rules.HiveAggregateJoinTransposeRule | Planner rule that pushes an <code>org.apache.calcite.rel.core.Aggregate</code> past a <code>org.apache.calcite.rel.core.Join</code> . |
| org.apache.hadoop.hive.ql.optimizer.calcite.rules.HiveAggregateProjectMergeRule | Planner rule that recognizes a <code>HiveAggregate</code> on top of a <code>HiveProject</code> and if possible, aggregates through the project or removes the project. |
| org.apache.hadoop.hive.ql.optimizer.calcite.rules.HiveAggregatePullUpConstantsRule | Rule for pull up constants aggregation. |

| Class | Description |
|--|---|
| org.apache.hadoop.hive.ql.optimizer.calcite.rules.HiveFilterAggregateTransposeRule | Transpose rule for filter aggregation. |
| org.apache.hadoop.hive.ql.optimizer.calcite.rules.HiveFilterProjectTSTransposeRule | Transpose rule for filtering project TST. |
| org.apache.hadoop.hive.ql.optimizer.calcite.rules.HiveFilterSortTransposeRule | Transpose rule for filtering sort. |
| org.apache.hadoop.hive.ql.optimizer.calcite.rules.HiveJoinProjectTransposeRule | Transpose rule for join project. |
| org.apache.hadoop.hive.ql.optimizer.calcite.rules.HivePointLookupOptimizerRule | Takes a Filter expression, and if its predicate contains an OR operator whose children are constant equality expressions, tries to generate an IN clause (which is more efficient). |
| org.apache.hadoop.hive.ql.optimizer.calcite.rules.HiveProjectFilterPullUpConstantsRule | Planner rule that infers constant expressions from Filter into a Project operator. |
| org.apache.hadoop.hive.ql.optimizer.calcite.rules.HiveProjectSortTransposeRule | Transpose rule for project sort. |
| org.apache.hadoop.hive.ql.optimizer.calcite.rules.HiveReduceExpressionsRule | Collection of planner rules that apply various simplifying transformations on RexNode trees. |
| org.apache.hadoop.hive.ql.optimizer.calcite.rules.HiveReduceExpressionsWithStatsRule | This rule simplifies the condition in Filter operators using the column statistics (if available). |
| org.apache.hadoop.hive.ql.optimizer.calcite.rules.HiveRelColumnsAlignment | Infers the order in Aggregate columns and the order of conjuncts in a Join condition that might be more beneficial to avoid additional sort stages. |
| org.apache.hadoop.hive.ql.optimizer.calcite.rules.HiveSortJoinReduceRule | Planner rule that pushes a org.apache.hadoop.hive.ql.optimizer.calcite.reoperators.HiveSortLimit past a org.apache.hadoop.hive.ql.optimizer.calcite.reoperators.HiveJoin . |
| org.apache.hadoop.hive.ql.optimizer.calcite.rules.HiveSortLimitPullUpConstantsRule | Planner rule that pulls up constant keys through a SortLimit operator. |
| org.apache.hadoop.hive.ql.optimizer.calcite.rules.HiveSortMergeRule | This rule will merge two HiveSortLimit operators. |
| org.apache.hadoop.hive.ql.optimizer.calcite.rules.HiveSortProjectTransposeRule | Transpose rule for sort project. |
| org.apache.hadoop.hive.ql.optimizer.calcite.rules.HiveSortRemoveRule | Planner rule that removes a org.apache.hadoop.hive.ql.optimizer.calcite.reoperators.HiveSortLimit . |
| org.apache.hadoop.hive.ql.optimizer.calcite.rules.HiveSortUnionReduceRule | Planner rule that pushes a org.apache.hadoop.hive.ql.optimizer.calcite.reoperators.HiveSortLimit past a org.apache.hadoop.hive.ql.optimizer.calcite.reoperators.HiveUnion . |
| org.apache.hadoop.hive.ql.optimizer.calcite.rules.HiveUnionPullUpConstantsRule | Planner rule that pulls up constants through a Union operator. |
| org.apache.hadoop.hive.ql.optimizer.calcite.stats.HiveRelMdPredicates | Infers predicates for a project. |
| org.apache.hadoop.hive.ql.optimizer.physical.LlapDecider | LlapDecider takes care of tagging certain vertices in the execution graph as "llap", which in turn causes them to be submitted to an llap daemon instead of a regular yarn container. |

| Class | Description |
|--|--|
| org.apache.hadoop.hive.ql.optimizer.physical. MemoryDecider | MemoryDecider is a simple physical optimizer that adjusts the memory layout of tez tasks. |
| org.apache.hadoop.hive.ql.optimizer.physical. SerializeFilter | SerializeFilter is a simple physical optimizer that serializes all filter expressions in Tablescan Operators. |
| org.apache.hadoop.hive.ql.optimizer.spark. CombineEquivalentWorkResolver | CombineEquivalentWorkResolver searches inside SparkWork, finds and combines equivalent works. |
| org.apache.hadoop.hive.ql.optimizer.spark. SparkPartitionPruningSinkDesc | Description of spark partition pruning sink. |
| org.apache.hadoop.hive.ql.parse. AnalyzeCommandUtils | Utilities for command analysis. |
| org.apache.hadoop.hive.ql.parse. ColumnStatsAutoGatherContext | ColumnStatsAutoGatherContext is passed to the compiler when set hive.stats.autogather is true during the INSERT OVERWRITE command. |
| org.apache.hadoop.hive.ql.parse. MaskAndFilterInfo | Information for masking and filtering. |
| org.apache.hadoop.hive.ql.parse. TableMask | The main purpose for this class is for authorization. |
| org.apache.hadoop.hive.ql.parse.spark. SparkPartitionPruningSinkOperator | This operator gets partition info from the upstream operators and writes them to HDFS. |
| org.apache.hadoop.hive.ql.parse.spark. SplitOpTreeForDPP | This processor triggers on SparkPartitionPruningSinkOperator. |
| org.apache.hadoop.hive.ql.plan. AbortTxnsDesc | Descriptor for aborting transactions. |
| org.apache.hadoop.hive.ql.plan. CacheMetadataDesc | Description for metadata cache. |
| org.apache.hadoop.hive.ql.plan. ShowCreateDatabaseDesc | Shows the name of the database. |
| org.apache.hadoop.hive.ql.plan. VectorPartitionConversion | PartitionConversion. |
| org.apache.hadoop.hive.ql.plan. VectorPartitionDesc | VectorMapDesc. |
| org.apache.hadoop.hive.ql.plan. VectorReduceSinkDesc | VectorReduceSinkDesc. |
| org.apache.hadoop.hive.ql.plan. VectorReduceSinkInfo | VectorGroupByAggregationInfo. |
| org.apache.hadoop.hive.ql.ppd. SimplePredicatePushDown | Implementation of predicate push down. |
| org.apache.hadoop.hive.ql.security.authorization. DefaultHiveAuthorizationTranslator | Default implementation of HiveAuthorizationTranslator. |
| org.apache.hadoop.hive.ql.security.authorization.plugin. AbstractHiveAuthorizer | Abstract class that extends HiveAuthorizer. |
| org.apache.hadoop.hive.ql.session. ClearDanglingScratchDir | A tool to remove dangling scratch directory. |
| org.apache.hadoop.hive.ql.stats. StatsCollectionContext | Creating context for stats collection. |
| org.apache.hadoop.hive.ql.txn.compactor. HouseKeeperServiceBase | Housekeeper for running services. |
| org.apache.hadoop.hive.ql.udf. UDFChr | UDFChr converts an integer into its ASCII equivalent. |
| org.apache.hadoop.hive.ql.udf. UDFCrc32 | UDFCrc32. |
| org.apache.hadoop.hive.ql.udf. UDFMd5 | UDFMd5. |
| org.apache.hadoop.hive.ql.udf. UDFReplace | UDFReplace replaces all substrings that are matched with a replacement substring. |

| Class | Description |
|---|---|
| org.apache.hadoop.hive.ql.udf.UDFSha1 | UDFSha. |
| org.apache.hadoop.hive.ql.udf.UDFVersion | UDFVersion |
| org.apache.hadoop.hive.ql.udf.generic.BaseMaskUDF | User defined function for masking. |
| org.apache.hadoop.hive.ql.udf.generic.GenericUDAFSumEmptyIsZero | User defined aggregation function for summing empty as zeros. |
| org.apache.hadoop.hive.ql.udf.generic.GenericUDFAesBase | Base for user defined functions. |
| org.apache.hadoop.hive.ql.udf.generic.GenericUDFAesDecrypt | User defined function for decryption. |
| org.apache.hadoop.hive.ql.udf.generic.GenericUDFAesEncrypt | User defined function for encryption. |
| org.apache.hadoop.hive.ql.udf.generic.GenericUDFBRound | User defined function for banking rounding. |
| org.apache.hadoop.hive.ql.udf.generic.GenericUDFBaseNWayCompare | Base class for comparison UDF's (Greatest and Least). |
| org.apache.hadoop.hive.ql.udf.generic.GenericUDFMask | User defined function for masking. |
| org.apache.hadoop.hive.ql.udf.generic.GenericUDFMaskFirstN | User defined function for masking first n symbols. |
| org.apache.hadoop.hive.ql.udf.generic.GenericUDFMaskHash | User defined function that returns a hashed value based on str. |
| org.apache.hadoop.hive.ql.udf.generic.GenericUDFMaskLastN | User defined function for masking last n symbols. |
| org.apache.hadoop.hive.ql.udf.generic.GenericUDFMaskShowFirstN | User defined function for showing masked first n symbols. |
| org.apache.hadoop.hive.ql.udf.generic.GenericUDFMaskShowLastN | User defined function for showing masked last n symbols. |
| org.apache.hadoop.hive.ql.udf.generic.GenericUDFParamsUtils | Generic UDF params utility class. |
| org.apache.hadoop.hive.ql.udf.generic.GenericUDFQuarter | GenericUDFQuarter. |
| org.apache.hadoop.hive.ql.udf.generic.GenericUDFRegex | UDF to extract a specific group identified by a java regex. |
| org.apache.hadoop.hive.ql.udf.generic.GenericUDFSha2 | GenericUDFSha2. |
| org.apache.hadoop.hive.ql.udf.generic.GenericUDFSubstringIndex | GenericUDFSubstringIndex. |
| org.apache.hadoop.hive.ql.udf.generic.GenericUDTFGetSplits | GenericUDTFGetSplits. |
| org.apache.hadoop.hive.ql.util.DependencyResolver | Query dependency resolver. |
| org.apache.hadoop.hive.ql.util.ResourceDownloader | Resource downloader. |
| org.apache.hadoop.hive.ql.util.TimestampUtils | Utilities for Timestamps and the relevant conversions. |
| org.apache.hadoop.hive.serde2.DefaultFetchFormatter | Serializes row by user specified serde and calls toString() to make string type result. |
| org.apache.hadoop.hive.serde2.NoOpFetchFormatter | A No-op fetch formatter. |

| Class | Description |
|--|---|
| org.apache.hadoop.hive.serde2.binarysortable. BinarySortableSerDeWithEndPrefix | Serializer desrializer for binary sortable. |
| org.apache.hadoop.hive.serde2.thrift. ColumnBuffer | Column buffer. |
| org.apache.hadoop.hive.serde2.thrift. ThriftFormatter | Thrift formatter. |
| org.apache.hadoop.hive.serde2.thrift. ThriftJDBCBinarySerDe | Serializes the final output to thrift-able objects directly in the SerDe. |
| org.apache.hadoop.hive.thrift. HiveDelegationTokenManager | Delegation token manager. |
| org.apache.hive.beeline. ClientCommandHookFactory | Updates some client side information after executing some Hive commands. |
| org.apache.hive.beeline. ClientHook | This is the client's hook and used for new Hive CLI. |
| org.apache.hive.common.util. DateParser | Date parser class for Hive. |
| org.apache.hive.common.util. FixedSizedObjectPool | Simple object pool of limited size. |
| org.apache.hive.common.util. HashCodeUtil | Utilities for hash code. |
| org.apache.hive.common.util. IntervalDayTimeUtils | DateUtils. |
| org.apache.hive.hcatalog.streaming. AbstractRecordWriter | Class for defining record writer. |
| org.apache.hive.jdbc. HttpTokenAuthInterceptor | The class is instantiated with the username and password, it is then used to add header with these credentials to HTTP requests |
| org.apache.hive.jdbc. XsrfHttpRequestInterceptor | Http request interceptor for xsrf token. |
| org.apache.hive.service.cli.operation. GetCrossReferenceOperation | GetCrossReferenceOperation. |
| org.apache.hive.service.cli.operation. GetPrimaryKeysOperation | GetPrimaryKeysOperation. |
| org.apache.hive.service.cli.operation. SQLOperationDisplay | Used to display some info in the HS2 WebUI. |
| org.apache.hive.service.cli.operation. SQLOperationDisplayCache | Cache some SQLOperation information for WebUI |
| org.apache.hive.service.cli.thrift. RetryingThriftCLIServiceClient | RetryingThriftCLIServiceClient. |

New Interfaces in Hive 2.1

Hive 2.1 includes the following new interfaces:

| Interface | Description |
|---|--|
| org.apache.hadoop.hive.common. Pool | Simple object pool to prevent GC on small objects passed between threads. |
| org.apache.hadoop.hive.common.io. Allocator | An allocator provided externally to storage classes to allocate MemoryBuffer-s. |
| org.apache.hadoop.hive.common.io. DataCache | An abstract data cache that IO formats can use to retrieve and cache data. |
| org.apache.hadoop.hive.conf. HiveVariableSource | Getting hive variables. |
| org.apache.hadoop.hive.metastore. FileFormatProxy | Same as PartitionExpressionProxy, but for file format specific methods for metadata cache. |

| | |
|--|---|
| org.apache.hadoop.hive.metastore. HouseKeeperService | Runs arbitrary background logic inside the metastore service. |
| org.apache.hadoop.hive.metastore.txn. TxnStore | A handler to answer transaction related calls that come into the metastore server. |
| org.apache.hadoop.hive.ql.exec.tez. KeyValuesAdapter | Key-values interface for the Reader used by ReduceRecordSource |
| org.apache.hadoop.hive.ql.exec.vector.expressions. IStructInExpr | Interface used for both filter and non-filter versions of IN to simplify VectorizationContext code. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. ITimestampInExpr | Interface used to process timestamp in expression. |
| org.apache.hadoop.hive.ql.io. ColumnarSplit | Interface when implemented should return the estimated size of columnar projections that will be read from the split. |
| org.apache.hadoop.hive.ql.io. LlapAwareSplit | Split that is aware that it could be executed in LLAP. |
| org.apache.hadoop.hive.ql.io. LlapWrappableInputFormatInterface | Marker interface for LLAP; serves no other purpose. |
| org.apache.hadoop.hive.ql.io. SelfDescribingInputFormatInterface | Marker interface to indicate a given input format is self-describing and can perform schema evolution itself. |
| org.apache.hadoop.hive.ql.io. StreamingOutputFormat | Marker interface for streaming output formats. |
| org.apache.hadoop.hive.ql.security.authorization.plugin. HiveAuthorizationTranslator | This interface has functions that provide the ability to customize the translation from Hive internal representations of Authorization objects to the public API objects This is an interface that is not meant for general use, it is targeted to some specific use cases of Apache Sentry (incubating). |
| org.apache.hadoop.hive.serde2. FetchFormatter | (For internal-use only) Used in ListSinkOperator for formatting final output. |

Changed Classes in Hive 2.1

The following classes have changes in Hive 2.1:

| Class | Description |
|---|---|
| org.apache.hadoop.hive.accumulo.mr. HiveAccumuloTableOutputFormat | Output format for accumulo tables. |
| org.apache.hadoop.hive.cli. CliDriver | CliDriver. |
| org.apache.hadoop.hive.cli. OptionsProcessor | OptionsProcessor. |
| org.apache.hadoop.hive.common. CompressionUtils | Contains methods used for the purposes of compression. This class should not be accessed from code run in Hadoop. |
| org.apache.hadoop.hive.common. FileUtils | Collection of file manipulation utilities common across Hive. |
| org.apache.hadoop.hive.common. HiveStatsUtils | HiveStatsUtils. |
| org.apache.hadoop.hive.common. JavaUtils | Collection of Java class loading/reflection related utilities common across Hive. |
| org.apache.hadoop.hive.common. LogUtils | Utilities common to logging operations. |
| org.apache.hadoop.hive.common. ObjectPair | Creating pair out of templates. |
| org.apache.hadoop.hive.common. ServerUtils | ServerUtils (specific to HiveServer version 1) |

| Class | Description |
|---|--|
| org.apache.hadoop.hive.common. StatsSetupConst | Defines the constant strings used by the statistics implementation. |
| org.apache.hadoop.hive.common. ValidReadTxnList | An implementation of org.apache.hadoop.hive.common.ValidTxnList for use by readers. |
| org.apache.hadoop.hive.common.cli. CommonCliOptions | Reusable code for Hive Cli's. |
| org.apache.hadoop.hive.common.io. NonSyncByteArrayInputStream | A thread-not-safe version of ByteArrayOutputStream, which removes all synchronized modifiers. |
| org.apache.hadoop.hive.common.type. HiveDecimal | HiveDecimal. |
| org.apache.hadoop.hive.common.type. HiveIntervalDayTime | Day-time interval type representing an offset in days/hours/minutes/seconds, with nanosecond precision. |
| org.apache.hadoop.hive.common.type. HiveVarchar | HiveVarChar. |
| org.apache.hadoop.hive.conf. HiveConf | Hive Configuration. |
| org.apache.hadoop.hive.conf. HiveConfUtil | Hive Configuration utils |
| org.apache.hadoop.hive.contrib.serde2. MultiDelimitSerDe | This SerDe allows user to use multiple characters as the field delimiter for a table. |
| org.apache.hadoop.hive.contrib.serde2. RegexSerDe | RegexSerDe uses regular expression (regex) to serialize/deserialize. |
| org.apache.hadoop.hive.contrib.serde2. TypedBytesSerDe | TypedBytesSerDe uses typed bytes to serialize/deserialize. |
| org.apache.hadoop.hive.contrib.serde2.s3. S3LogDeserializer | S3LogDeserializer. |
| org.apache.hadoop.hive.hbase. AbstractHBaseKeyPredicateDecomposer | Simple abstract class to help with creation of a DecomposedPredicate. |
| org.apache.hadoop.hive.hbase. CompositeHBaseKeyFactory | Factory that creates composite keys. |
| org.apache.hadoop.hive.hbase. HBaseLazyObjectFactory | Replaces original keyOI with OI which is create by HBaseKeyFactory provided by serde property for hbase. |
| org.apache.hadoop.hive.hbase. HBaseSerDe | HBaseSerDe can be used to serialize object into an HBase table and deserialize objects from an HBase table. |
| org.apache.hadoop.hive.hbase. HBaseSerDeHelper | Helper class for HBaseSerDe |
| org.apache.hadoop.hive.hbase. HiveHBaseTableInputFormat | HiveHBaseTableInputFormat implements InputFormat for HBase storage handler tables, decorating an underlying HBase TableInputFormat with extra Hive logic such as column pruning and filter pushdown. |
| org.apache.hadoop.hive.hbase. HiveHBaseTableOutputFormat | HiveHBaseTableOutputFormat implements HiveOutputFormat for HBase tables. |
| org.apache.hadoop.hive.hbase. LazyHBaseCellMap | LazyHBaseCellMap refines LazyMap with HBase column mapping. |
| org.apache.hadoop.hive.hwi. HWIContextListener | After getting a contextInitialized event, this component starts an instance of the HiveSessionManager. |
| org.apache.hadoop.hive.hwi. HWIServer | This is the entry point for HWI. |
| org.apache.hadoop.hive.hwi. HWISessionItem | HWISessionItem can be viewed as a wrapper for a Hive shell. |

| Class | Description |
|---|---|
| org.apache.hadoop.hive.hwi.HWISessionManager | HiveSessionManager is a Runnable started inside a web application context. |
| org.apache.hadoop.hive.metastore.Deadline | Monitors long running methods in a thread. |
| org.apache.hadoop.hive.metastore.HiveAlterHandler | Hive specific implementation of alter. |
| org.apache.hadoop.hive.metastore.HiveMetaStore | Removes application logic to a separate interface. |
| org.apache.hadoop.hive.metastore.HiveMetaStoreClient | Hive Metastore Client. |
| org.apache.hadoop.hive.metastore.HiveMetaStoreFsImpl | Class to handle methods for filesystem and data related to metastore. |
| org.apache.hadoop.hive.metastore.LockComponentBuilder | A builder for LockComponents. |
| org.apache.hadoop.hive.metastore.LockRequestBuilder | Builder class to make constructing LockRequest easier. |
| org.apache.hadoop.hive.metastore.MetaStoreSchemaInfo | Information about metastore schemas stored in database. |
| org.apache.hadoop.hive.metastore.MetaStoreUtils | Utilities to handle metastore data. |
| org.apache.hadoop.hive.metastore.ObjectStore | Interface between the application logic and the database store that contains the objects. |
| org.apache.hadoop.hive.metastore.PartitionDropOptions | Generalizes the switches for dropPartitions(). |
| org.apache.hadoop.hive.metastore.RetryingHMSHandler | Handler for hive metastore. |
| org.apache.hadoop.hive.metastore.RetryingMetaStoreClient | RetryingMetaStoreClient. |
| org.apache.hadoop.hive.metastore.StatObjectConverter | Contains conversion logic that creates Thrift stat objects from JDO stat objects and plain arrays from DirectSQL. |
| org.apache.hadoop.hive.metastore.Warehouse | Represents a warehouse where data of Hive tables is stored. |
| org.apache.hadoop.hive.metastore.api.AbortTxnRequest | Aborting transaction request. |
| org.apache.hadoop.hive.metastore.api.AddDynamicPartitions | Adding dynamic partitions. |
| org.apache.hadoop.hive.metastore.api.AddPartitionsRequest | Adding partition request. |
| org.apache.hadoop.hive.metastore.api.AddPartitionsResult | Adding partition result. |
| org.apache.hadoop.hive.metastore.api.AggrStats | Aggregation statistics. |
| org.apache.hadoop.hive.metastore.api.BinaryColumnStatsData | Binary column statistics data. |
| org.apache.hadoop.hive.metastore.api.BooleanColumnStatsData | Boolean column statistics data. |
| org.apache.hadoop.hive.metastore.api.CheckLockRequest | Checking request on acquiring lock. |
| org.apache.hadoop.hive.metastore.api.ColumnStatistics | Column statistics class. |
| org.apache.hadoop.hive.metastore.api.ColumnStatisticsDesc | Column statistics description. |
| org.apache.hadoop.hive.metastore.api.ColumnStatisticsObject | Column statistics object. |

| Class | Description |
|---|--|
| org.apache.hadoop.hive.metastore.api. CommitTxnRequest | Commit transaction request. |
| org.apache.hadoop.hive.metastore.api. CompactionRequest | Compaction request. |
| org.apache.hadoop.hive.metastore.api. CurrentNotificationEventId | Current notification event ID. |
| org.apache.hadoop.hive.metastore.api. Database | Class that describes database. |
| org.apache.hadoop.hive.metastore.api. Date | Date class. |
| org.apache.hadoop.hive.metastore.api. DateColumnStatsData | Date column statistics data. |
| org.apache.hadoop.hive.metastore.api. Decimal | Handling decimal type. |
| org.apache.hadoop.hive.metastore.api. DecimalColumnStatsData | Decimal column statistics data. |
| org.apache.hadoop.hive.metastore.api. DoubleColumnStatsData | Double column statistics data. |
| org.apache.hadoop.hive.metastore.api. DropPartitionsExpr | Drop partitions expression. |
| org.apache.hadoop.hive.metastore.api. DropPartitionsRequest | Drop partitions request. |
| org.apache.hadoop.hive.metastore.api. DropPartitionsResult | Drop partitions result. |
| org.apache.hadoop.hive.metastore.api. EnvironmentContext | Environment context structure. |
| org.apache.hadoop.hive.metastore.api. FieldSchema | Field schema structure. |
| org.apache.hadoop.hive.metastore.api. FireEventRequest | Fire event request. |
| org.apache.hadoop.hive.metastore.api. FireEventResponse | Fire event response. |
| org.apache.hadoop.hive.metastore.api. Function | Function structure. |
| org.apache.hadoop.hive.metastore.api. GetOpenTxnsInfoResponse | Getter for open transactions information about response. |
| org.apache.hadoop.hive.metastore.api. GetOpenTxnsResponse | Getter for open transactions response. |
| org.apache.hadoop.hive.metastore.api. GetPrincipalsInRoleRequest | Getting request for principals in role. |
| org.apache.hadoop.hive.metastore.api. GetPrincipalsInRoleResponse | Getting response for principals in role. |
| org.apache.hadoop.hive.metastore.api. GetRoleGrantsForPrincipalRequest | Getting request for granting role for principal. |
| org.apache.hadoop.hive.metastore.api. GetRoleGrantsForPrincipalResponse | Getting response for granting role for principal. |
| org.apache.hadoop.hive.metastore.api. GrantRevokePrivilegeRequest | Request for revoking granted privilege. |
| org.apache.hadoop.hive.metastore.api. GrantRevokePrivilegeResponse | Response for revoking granted privilege. |

| Class | Description |
|--|--|
| org.apache.hadoop.hive.metastore.api. GrantRevokeRoleRequest | Request for revoking granted role. |
| org.apache.hadoop.hive.metastore.api. GrantRevokeRoleResponse | Response for revoking granted role. |
| org.apache.hadoop.hive.metastore.api. HeartbeatRequest | Request for heartbeat. |
| org.apache.hadoop.hive.metastore.api. HeartbeatTxnRangeRequest | Request for transaction range request. |
| org.apache.hadoop.hive.metastore.api. HeartbeatTxnRangeResponse | Response for transaction range response. |
| org.apache.hadoop.hive.metastore.api. HiveObjectPrivilege | Description of privileges for hive object. |
| org.apache.hadoop.hive.metastore.api. HiveObjectRef | Hive object reference. |
| org.apache.hadoop.hive.metastore.api. Index | Description of index. |
| org.apache.hadoop.hive.metastore.api. InsertEventRequestData | Class to handle data about insert event on request. |
| org.apache.hadoop.hive.metastore.api. LockComponent | Description of lock component. |
| org.apache.hadoop.hive.metastore.api. LockRequest | Description of lock request. |
| org.apache.hadoop.hive.metastore.api. LockResponse | Description of lock response. |
| org.apache.hadoop.hive.metastore.api. LongColumnStatsData | Description of long column statistics data. |
| org.apache.hadoop.hive.metastore.api. NotificationEvent | Description of notification event. |
| org.apache.hadoop.hive.metastore.api. NotificationEventRequest | Description of notification event on request. |
| org.apache.hadoop.hive.metastore.api. NotificationEventResponse | Description of notification event on response. |
| org.apache.hadoop.hive.metastore.api. OpenTxnRequest | Description of open transactions on request. |
| org.apache.hadoop.hive.metastore.api. OpenTxnsResponse | Description of open transactions on response. |
| org.apache.hadoop.hive.metastore.api. Order | Description of order. |
| org.apache.hadoop.hive.metastore.api. Partition | Description of partition. |
| org.apache.hadoop.hive.metastore.api. PartitionListComposingSpec | Description of partition list composing specification. |
| org.apache.hadoop.hive.metastore.api. PartitionSpec | Description of partition specification. |
| org.apache.hadoop.hive.metastore.api. PartitionSpecWithSharedSD | Description of partition specification with shared sd. |
| org.apache.hadoop.hive.metastore.api. PartitionWithoutSD | Description of partition without sd. |
| org.apache.hadoop.hive.metastore.api. PartitionsByExprRequest | Description of partitions by expression request. |
| org.apache.hadoop.hive.metastore.api. PartitionsByExprResult | Description of partitions by expression result. |
| org.apache.hadoop.hive.metastore.api. PartitionsStatsRequest | Description of partition statistics request. |

| Class | Description |
|--|--|
| org.apache.hadoop.hive.metastore.api.PartitionsStatsResult | Description of partitions statistics result. |
| org.apache.hadoop.hive.metastore.api.PrincipalPrivilegeSet | Description of setting principal privilege. |
| org.apache.hadoop.hive.metastore.api.PrivilegeBag | Description of privilege bag. |
| org.apache.hadoop.hive.metastore.api.PrivilegeGrantInfo | Description of granted privilege info. |
| org.apache.hadoop.hive.metastore.api.ResourceUri | Description of resource URI. |
| org.apache.hadoop.hive.metastore.api.Role | Description of role. |
| org.apache.hadoop.hive.metastore.api.RolePrincipalGrant | Description of granted principal role. |
| org.apache.hadoop.hive.metastore.api.Schema | Description of schema. |
| org.apache.hadoop.hive.metastore.api.SerDelInfo | Description of serializer deserializer information. |
| org.apache.hadoop.hive.metastore.api.SetPartitionsStatsRequest | Description of setting partition statistics on request. |
| org.apache.hadoop.hive.metastore.api.ShowCompactRequest | Show compaction on request. |
| org.apache.hadoop.hive.metastore.api.ShowCompactResponse | Show compaction on response. |
| org.apache.hadoop.hive.metastore.api.ShowCompactResponseElement | Show compaction response element. |
| org.apache.hadoop.hive.metastore.api.ShowLocksRequest | Show locks on request. |
| org.apache.hadoop.hive.metastore.api.ShowLocksResponse | Show locks on response. |
| org.apache.hadoop.hive.metastore.api.ShowLocksResponseElement | Show locks response element. |
| org.apache.hadoop.hive.metastore.api.SkewedInfo | Description for skewed information. |
| org.apache.hadoop.hive.metastore.api.StorageDescriptor | Description for storage descriptor. |
| org.apache.hadoop.hive.metastore.api.StringColumnStatisticsData | Description for string column statistics data. |
| org.apache.hadoop.hive.metastore.api.Table | Description for data. |
| org.apache.hadoop.hive.metastore.api.TableStatsRequest | Description for table statistics request. |
| org.apache.hadoop.hive.metastore.api.TableStatsResult | Description for table statistics result. |
| org.apache.hadoop.hive.metastore.api.AlreadyExistsException | Custom exception to handle already exists error. |
| org.apache.hadoop.hive.metastore.api.ConfigValSecurityException | Custom exception to handle configuration value security error. |
| org.apache.hadoop.hive.metastore.api.IndexAlreadyExistsException | Custom exception to handle index already exists error. |
| org.apache.hadoop.hive.metastore.api.InvalidInputException | Custom exception for invalid input error. |
| org.apache.hadoop.hive.metastore.api.InvalidObjectException | Custom exception for invalid object error. |

| Class | Description |
|--|--|
| org.apache.hadoop.hive.metastore.api.InvalidOperationException | Custom exception for invalid operation error. |
| org.apache.hadoop.hive.metastore.api.InvalidPartitionException | Custom exception for invalid partition error. |
| org.apache.hadoop.hive.metastore.api.MetaException | Custom exception for metastore related error. |
| org.apache.hadoop.hive.metastore.api.NoSuchLockException | Custom exception in case of invalid lock. |
| org.apache.hadoop.hive.metastore.api.NoSuchObjectException | Custom exception in case of invalid object. |
| org.apache.hadoop.hive.metastore.api.NoSuchTxnException | Custom exception in case of invalid transaction. |
| org.apache.hadoop.hive.metastore.api.TxnAbortedException | Custom exception in case of aborted transaction. |
| org.apache.hadoop.hive.metastore.api.TxnOpenException | Custom exception in case of not close transaction. |
| org.apache.hadoop.hive.metastore.api.UnknownDBException | Custom exception in case of unknown database. |
| org.apache.hadoop.hive.metastore.api.UnknownPartitionException | Custom exception in case of unknown partition. |
| org.apache.hadoop.hive.metastore.api.UnknownTableException | Custom partition in case of unknown table. |
| org.apache.hadoop.hive.metastore.events.EventCleanerTask | Cleaning tasks from event table. |
| org.apache.hadoop.hive.metastore.parser.ExpressionTree | Represents the filter as a binary tree. |
| org.apache.hadoop.hive.metastore.txn.CompactionInfo | Information on a possible or running compaction. |
| org.apache.hadoop.hive.metastore.txn.CompactionInfo | Utility methods for creating and destroying txn database/schema, plus methods for querying against metastore tables. |
| org.apache.hadoop.hive.ql.Context | Context for Semantic Analyzers. |
| org.apache.hadoop.hive.ql.Driver | Driver to process commands on cluster. |
| org.apache.hadoop.hive.ql.QueryPlan | QueryPlan can be serialized to disk to restart/resume the progress of it in the future, either within or outside of the current JVM. |
| org.apache.hadoop.hive.ql.QueryProperties | QueryProperties. |
| org.apache.hadoop.hive.ql.exec.AbstractFileMergeOperator | Fast file merge operator for ORC and RCfile. |
| org.apache.hadoop.hive.ql.exec.AbstractMapJoinOperator | Class to handle join input's join keys. |
| org.apache.hadoop.hive.ql.exec.AppMasterEventOperator | AppMasterEventOperator sends any rows it receives to the Tez AM. |
| org.apache.hadoop.hive.ql.exec.AutoProgressor | AutoProgressor periodically sends updates to the job tracker so that it doesn't consider this task attempt dead if there is a long period of inactivity. |
| org.apache.hadoop.hive.ql.exec.CollectOperator | Buffers rows emitted by other operators. |
| org.apache.hadoop.hive.ql.exec.ColumnStatsTask | ColumnStatsTask implementation. |

| Class | Description |
|--|--|
| org.apache.hadoop.hive.ql.exec. ColumnStatsUpdateTask | ColumnStatsUpdateTask implementation. |
| org.apache.hadoop.hive.ql.exec. CommonJoinOperator | Join operator implementation. |
| org.apache.hadoop.hive.ql.exec. CommonMergeJoinOperator | Consolidate the join algorithms to either hash based joins (MapJoinOperator) or sort-merge based joins, this operator is being introduced. |
| org.apache.hadoop.hive.ql.exec. ConditionalTask | Conditional Task implementation. |
| org.apache.hadoop.hive.ql.exec. DDLTask | DDLTask implementation. |
| org.apache.hadoop.hive.ql.exec. DefaultBucketMatcher | Finding right bucket. |
| org.apache.hadoop.hive.ql.exec. DemuxOperator | DemuxOperator is an operator used by MapReduce Jobs optimized by CorrelationOptimizer. |
| org.apache.hadoop.hive.ql.exec. DummyStoreOperator | For SortMerge joins, this is a dummy operator, which stores the row for the small table before it reaches the sort merge join operator. |
| org.apache.hadoop.hive.ql.exec. ExplainTask | ExplainTask implementation. |
| org.apache.hadoop.hive.ql.exec. FetchOperator | FetchTask implementation. |
| org.apache.hadoop.hive.ql.exec. FetchTask | FetchTask implementation. |
| org.apache.hadoop.hive.ql.exec. FileSinkOperator | File Sink operator implementation. |
| org.apache.hadoop.hive.ql.exec. FilterOperator | Filter operator implementation. |
| org.apache.hadoop.hive.ql.exec. ForwardOperator | Forward Operator Just forwards. |
| org.apache.hadoop.hive.ql.exec. FunctionRegistry | FunctionRegistry. |
| org.apache.hadoop.hive.ql.exec. FunctionTask | FunctionTask. |
| org.apache.hadoop.hive.ql.exec. GroupByOperator | GroupBy operator implementation. |
| org.apache.hadoop.hive.ql.exec. HashTableDummyOperator | Hash table operator implementation. |
| org.apache.hadoop.hive.ql.exec. HashTableSinkOperator | Hash table sink operator implementation. |
| org.apache.hadoop.hive.ql.exec. JoinOperator | Join operator implementation. |
| org.apache.hadoop.hive.ql.exec. LateralViewForwardOperator | LateralViewForwardOperator. |
| org.apache.hadoop.hive.ql.exec. LateralViewJoinOperator | The lateral view join operator is used for FROM src LATERAL VIEW udtf()... |
| org.apache.hadoop.hive.ql.exec. LimitOperator | Limit operator implementation Limits the number of rows to be passed on. |
| org.apache.hadoop.hive.ql.exec. ListSinkOperator | For fetch task with operator tree, row read from FetchOperator is processed via operator tree and finally arrives to this operator. |
| org.apache.hadoop.hive.ql.exec. MapJoinOperator | Map side Join operator implementation. |
| org.apache.hadoop.hive.ql.exec. MapOperator | Map operator. |
| org.apache.hadoop.hive.ql.exec. MapredContext | Runtime context of MapredTask providing additional information to GenericUDF |
| org.apache.hadoop.hive.ql.exec. MoveTask | MoveTask implementation. |
| org.apache.hadoop.hive.ql.exec. MuxOperator | MuxOperator is used in the Reduce side of MapReduce jobs optimized by Correlation Optimizer. |

| Class | Description |
|--|--|
| org.apache.hadoop.hive.ql.exec. ObjectCacheFactory | ObjectCacheFactory returns the appropriate cache depending on settings in the hive conf. |
| org.apache.hadoop.hive.ql.exec. Operator | Base operator implementation. |
| org.apache.hadoop.hive.ql.exec. OperatorFactory | OperatorFactory. |
| org.apache.hadoop.hive.ql.exec. OperatorUtils | Utilities to handle operators. |
| org.apache.hadoop.hive.ql.exec. OrcFileMergeOperator | Fast file merge operator for ORC files. |
| org.apache.hadoop.hive.ql.exec. PTFOperator | Class to handle partitioned table functions operators. |
| org.apache.hadoop.hive.ql.exec. PTFPartition | Represents a collection of rows that is acted upon by a TableFunction or a WindowFunction. |
| org.apache.hadoop.hive.ql.exec. PTFRollingPartition | Represents a collection of rows that is acted upon by a TableFunction or a WindowFunction. |
| org.apache.hadoop.hive.ql.exec. PTFUtils | Utilities to handle partitioned table functions. |
| org.apache.hadoop.hive.ql.exec. PartitionKeySampler | Class to handle partition key sampler. |
| org.apache.hadoop.hive.ql.exec. RCFileMergeOperator | Fast file merge operator for RC files. |
| org.apache.hadoop.hive.ql.exec. ReduceSinkOperator | Reduce Sink Operator sends output to the reduce stage. |
| org.apache.hadoop.hive.ql.exec. Registry | Function registry. |
| org.apache.hadoop.hive.ql.exec. SMBMapJoinOperator | Sorted Merge Map Join Operator. |
| org.apache.hadoop.hive.ql.exec. ScriptOperator | ScriptOperator. |
| org.apache.hadoop.hive.ql.exec. SelectOperator | Select operator implementation. |
| org.apache.hadoop.hive.ql.exec. SkewJoinHandler | At runtime in Join, output big keys in one table into one corresponding directories, and all same keys in other tables into different dirs (one for each table). |
| org.apache.hadoop.hive.ql.exec. SparkHashTableSinkOperator | Operator for spark hashtable sink. |
| org.apache.hadoop.hive.ql.exec. StatsNoJobTask | StatsNoJobTask is used in cases where stats collection is the only task for the given query (no parent MR or Tez job). |
| org.apache.hadoop.hive.ql.exec. TableScanOperator | Table Scan Operator If the data is coming from the map-reduce framework, just forward it. |
| org.apache.hadoop.hive.ql.exec. Task | Task implementation. |
| org.apache.hadoop.hive.ql.exec. TaskResult | TaskResult implementation. |
| org.apache.hadoop.hive.ql.exec. TemporaryHashSinkOperator | Operator temporary hash sink. |
| org.apache.hadoop.hive.ql.exec. TerminalOperator | Terminal Operator Base Class. |
| org.apache.hadoop.hive.ql.exec. TezDummyStoreOperator | A dummy store operator same as the dummy store operator but for tez. |
| org.apache.hadoop.hive.ql.exec. TopNHash | Stores binary key/value in sorted manner to get top-n key/value TODO: rename to TopNHeap? |
| org.apache.hadoop.hive.ql.exec. UDTFOperator | UDTFOperator. |
| org.apache.hadoop.hive.ql.exec. UnionOperator | Union Operator Just forwards. |
| org.apache.hadoop.hive.ql.exec. Utilities | Utilities. |

| Class | Description |
|--|---|
| org.apache.hadoop.hive.ql.exec.mr. ExecDriver | ExecDriver is the central class in co-ordinating execution of any map-reduce task. |
| org.apache.hadoop.hive.ql.exec.mr. ExecMapper | ExecMapper is the generic Map class for Hive. |
| org.apache.hadoop.hive.ql.exec.mr. ExecMapperContext | ExecMapperContext is the generic Map context class for Hive. |
| org.apache.hadoop.hive.ql.exec.mr. HadoopJobExecHelper | Handle information about hadoop job. |
| org.apache.hadoop.hive.ql.exec.mr. JobDebugger | JobDebugger takes a RunningJob that has failed and grabs the top 4 failing tasks and outputs this information to the Hive CLI. |
| org.apache.hadoop.hive.ql.exec.mr. MapredLocalTask | MapredLocalTask represents any local work (i.e.: client side work) that hive needs to execute. |
| org.apache.hadoop.hive.ql.exec.mr. Throttle | Intelligence to make clients wait if the cluster is in a bad state. |
| org.apache.hadoop.hive.ql.exec.persistence. BytesBytesMultiHashMap | HashMap that maps byte arrays to byte arrays with limited functionality necessary for MapJoin hash tables, with small memory overhead. |
| org.apache.hadoop.hive.ql.exec.persistence. HashMapWrapper | Simple wrapper for persistent Hashmap implementing only the put/get/remove/clear interface. |
| org.apache.hadoop.hive.ql.exec.persistence. HybridHashTableContainer | Hash table container that can have many partitions -- each partition has its own hashmap, as well as row container for small table and big table. |
| org.apache.hadoop.hive.ql.exec.persistence. KeyValueContainer | An eager key/value container that puts every row directly to output stream. |
| org.apache.hadoop.hive.ql.exec.persistence. MapJoinBytesTableContainer | Table container that serializes keys and values using LazyBinarySerDe into BytesBytesMultiHashMap, with very low memory overhead. |
| org.apache.hadoop.hive.ql.exec.persistence. MapJoinKey | The base class for MapJoinKey. |
| org.apache.hadoop.hive.ql.exec.persistence. MapJoinTableContainerSerDe | Serialization/deserialization of table container for join. |
| org.apache.hadoop.hive.ql.exec.persistence. ObjectContainer | An eager object container that puts every row directly to output stream. |
| org.apache.hadoop.hive.ql.exec.persistence. RowContainer | Simple persistent container for rows. |
| org.apache.hadoop.hive.ql.exec.persistence. UnwrapRowContainer | Unwraps values from current key with valueIndex in mapjoin desc. |
| org.apache.hadoop.hive.ql.exec.spark. GroupByShuffler | Shuffle group by operator. |
| org.apache.hadoop.hive.ql.exec.spark. HiveSparkClientFactory | Factory class for spark client. |
| org.apache.hadoop.hive.ql.exec.spark. LocalHiveSparkClient | LocalSparkClient submit Spark job in local driver, it's responsible for build spark client environment and execute spark work. |
| org.apache.hadoop.hive.ql.exec.spark. MapInput | Input for mapper. |
| org.apache.hadoop.hive.ql.exec.spark. MapTran | Mapper tran. |
| org.apache.hadoop.hive.ql.exec.spark. ReduceTran | Reduce tran. |

| Class | Description |
|--|--|
| org.apache.hadoop.hive.ql.exec.spark. RemoteHiveSparkClient | RemoteSparkClient is a wrapper of org.apache.hive.spark.client.SparkClient, which wrap a spark job request and send to an remote SparkContext. |
| org.apache.hadoop.hive.ql.exec.spark. ShuffleTran | Shuffle tran. |
| org.apache.hadoop.hive.ql.exec.spark. SortByShuffler | Sorting class for shuffler. |
| org.apache.hadoop.hive.ql.exec.spark. SparkTask | Description of spark task. |
| org.apache.hadoop.hive.ql.exec.spark. SparkUtilities | Contains utilities methods used as part of Spark tasks. |
| org.apache.hadoop.hive.ql.exec.spark.session. SparkSessionImpl | Implementation of spark session. |
| org.apache.hadoop.hive.ql.exec.spark.status.impl. JobMetricsListener | Listener for job metrics. |
| org.apache.hadoop.hive.ql.exec.spark.status.impl. LocalSparkJobStatus | Spark job local status. |
| org.apache.hadoop.hive.ql.exec.spark.status.impl. RemoteSparkJobStatus | Used with remove spark client. |
| org.apache.hadoop.hive.ql.exec.tez. DagUtils | DagUtils. |
| org.apache.hadoop.hive.ql.exec.tez. DynamicPartitionPruner | DynamicPartitionPruner takes a list of assigned partitions at runtime (split generation) and prunes them using events generated during execution of the dag. |
| org.apache.hadoop.hive.ql.exec.tez. HiveSplitGenerator | Generates splits inside the AM on the cluster. |
| org.apache.hadoop.hive.ql.exec.tez. MapRecordProcessor | Process input from tez LogicalInput and write output - for a map plan Just pump the records through the query plan. |
| org.apache.hadoop.hive.ql.exec.tez. MapRecordSource | Process input from tez LogicalInput and write output - for a map plan Just pump the records through the query plan. |
| org.apache.hadoop.hive.ql.exec.tez. MergeFileRecordProcessor | Record processor for fast merging of files. |
| org.apache.hadoop.hive.ql.exec.tez. RecordProcessor | Process input from tez LogicalInput and write output It has different subclasses for map and reduce processing |
| org.apache.hadoop.hive.ql.exec.tez. ReduceRecordProcessor | Process input from tez LogicalInput and write output - for a map plan Just pump the records through the query plan. |
| org.apache.hadoop.hive.ql.exec.tez. ReduceRecordSource | Process input from tez LogicalInput and write output - for a map plan Just pump the records through the query plan. |
| org.apache.hadoop.hive.ql.exec.tez. SplitGrouper | SplitGrouper is used to combine splits based on head room and locality. |
| org.apache.hadoop.hive.ql.exec.tez. TezJobMonitor | TezJobMonitor keeps track of a tez job while it's being executed. |
| org.apache.hadoop.hive.ql.exec.tez. TezProcessor | Hive processor for Tez that forms the vertices in Tez and processes the data. |
| org.apache.hadoop.hive.ql.exec.tez. TezSessionPoolManager | This class is for managing multiple tez sessions particularly when HiveServer2 is being used to submit queries. |
| org.apache.hadoop.hive.ql.exec.tez. TezSessionState | Holds session state related to Tez |

| Class | Description |
|---|--|
| org.apache.hadoop.hive.ql.exec.tez. TezTask | TezTask handles the execution of TezWork. |
| org.apache.hadoop.hive.ql.exec.tez.tools. KeyValueInputMerger | A KeyValuesReader implementation that returns a sorted stream of key-values by doing a sorted merge of the key-value in LogicalInputs. |
| org.apache.hadoop.hive.ql.exec.tez.tools. KeyValuesInputMerger | A KeyValuesReader implementation that returns a sorted stream of key-values by doing a sorted merge of the key-value in LogicalInputs. |
| org.apache.hadoop.hive.ql.exec.vector. BytesColumnVector | This class supports string and binary data by value reference. |
| org.apache.hadoop.hive.ql.exec.vector. ColumnVector | ColumnVector contains the shared structure for the sub-types, including NULL information, and whether this vector repeats, i.e. |
| org.apache.hadoop.hive.ql.exec.vector. DecimalColumnVector | A vector of HiveDecimalWritable objects. |
| org.apache.hadoop.hive.ql.exec.vector. DoubleColumnVector | This class represents a nullable double precision floating point column vector. |
| org.apache.hadoop.hive.ql.exec.vector. LongColumnVector | This class represents a nullable int column vector. |
| org.apache.hadoop.hive.ql.exec.vector. TimestampUtils | Utilities for Timestamps and the relevant conversions. |
| org.apache.hadoop.hive.ql.exec.vector. VectorAppMasterEventOperator | App Master Event operator implementation. |
| org.apache.hadoop.hive.ql.exec.vector. VectorAssignRow | This class assigns specified columns of a row from a Writable row objects. |
| org.apache.hadoop.hive.ql.exec.vector. VectorColumnOrderedMap | This class collects column information for mapping vector columns, including the hive type name. |
| org.apache.hadoop.hive.ql.exec.vector. VectorColumnInfo | Class to keep information on a set of typed vector columns. |
| org.apache.hadoop.hive.ql.exec.vector. VectorCopyRow | This class copies specified columns of a row from one VectorizedRowBatch to another. |
| org.apache.hadoop.hive.ql.exec.vector. VectorDeserializeRow | This class deserializes a serialization format into a row of a VectorizedRowBatch. |
| org.apache.hadoop.hive.ql.exec.vector. VectorExtractRow | This class extracts specified VectorizedRowBatch row columns into writables. |
| org.apache.hadoop.hive.ql.exec.vector. VectorFileSinkOperator | File Sink operator implementation. |
| org.apache.hadoop.hive.ql.exec.vector. VectorFilterOperator | Filter operator implementation. |
| org.apache.hadoop.hive.ql.exec.vector. VectorGroupByOperator | Vectorized GROUP BY operator implementation. |
| org.apache.hadoop.hive.ql.exec.vector. VectorHashKeyWrapper | A hash map key wrapper for vectorized processing. |
| org.apache.hadoop.hive.ql.exec.vector. VectorLimitOperator | Limit operator implementation Limits the number of rows to be passed on. |
| org.apache.hadoop.hive.ql.exec.vector. VectorMapJoinBaseOperator | The *NON-NATIVE* base vector map join operator class used by VectorMapJoinOperator and VectorMapJoinOuterFilteredOperator. |

| Class | Description |
|---|--|
| org.apache.hadoop.hive.ql.exec.vector. VectorMapJoinOperator | The vectorized version of the MapJoinOperator. |
| org.apache.hadoop.hive.ql.exec.vector. VectorMapJoinOuterFilteredOperator | This is the *NON-NATIVE* vector map join operator for just LEFT OUTER JOIN and filtered. |
| org.apache.hadoop.hive.ql.exec.vector. VectorMapOperator | The vectorized MapOperator. |
| org.apache.hadoop.hive.ql.exec.vector. VectorReduceSinkOperator | The vectorized reduce sink operator. |
| org.apache.hadoop.hive.ql.exec.vector. VectorSMBMapJoinOperator | VectorSMBJoinOperator. |
| org.apache.hadoop.hive.ql.exec.vector. VectorSelectOperator | Select operator implementation. |
| org.apache.hadoop.hive.ql.exec.vector. VectorSerializeRow | This class serializes columns from a row in a VectorizedRowBatch into a serialization format. |
| org.apache.hadoop.hive.ql.exec.vector. VectorizationContext | Context class for vectorization execution. |
| org.apache.hadoop.hive.ql.exec.vector. VectorizedBatchUtil | The vectorized MapOperator. |
| org.apache.hadoop.hive.ql.exec.vector. VectorizedRowBatch | A VectorizedRowBatch is a set of rows, organized with each column as a vector. |
| org.apache.hadoop.hive.ql.exec.vector. VectorizedRowBatchCtx | Context for Vectorized row batch. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. CastDecimalToTimestamp | Type cast decimal to timestamp. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. CastTimestampToDecimal | To be used to cast timestamp to decimal. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. ColAndCol | Evaluate AND of 2 or more boolean columns and store the boolean result in the output boolean column. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. ColOrCol | Evaluate OR of 2 or more boolean columns and store the boolean result in the output boolean column. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. ConstantVectorExpression | Constant is represented as a vector with repeating values. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. DecimalUtil | Utility functions for vector operations on decimal values. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. FilterExprOrExpr | Represents an Or expression. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. FilterStringColumnInList | Evaluate an IN filter on a batch for a vector of strings. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. FuncRoundWithNumDigitsDecimalToDecimal | Function for rounding decimals. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. MathExpr | Math expression evaluation helper functions. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. NullUtil | Utility functions to handle null propagation. |
| org.apache.hadoop.hive.ql.exec.vector.expressions. StringColumnInList | Evaluate an IN boolean expression (not a filter) on a batch for a vector of strings. |

| Class | Description |
|---|---|
| org.apache.hadoop.hive.ql.exec.vector.expressions.StringExpr | String expression evaluation helper functions. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.VectorUDFDateAddColCol | Vectorized user defined function for adding columns. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.VectorUDFDateAddColScalar | Vectorized user defined function for adding column and scalar. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.VectorUDFDateDiffColCol | Vectorized user defined function for finding difference between two columns. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.VectorUDFDateLong | Vectorized version of TO_DATE(TIMESTAMP)/TO_DATE(DATE). |
| org.apache.hadoop.hive.ql.exec.vector.expressions.VectorUDFDateString | Vectorized version of TO_DATE(STRING) As TO_DATE() now returns DATE type, this should be the same behavior as the DATE cast operator. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.VectorMapJoinCommonOperator | Common operator class for native vectorized map join. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.VectorMapJoinGenerateResultOperator | Contains methods for generating vectorized join results and forwarding batches. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.VectorMapJoinInnerBigOnlyGenerateResultOperator | This class has methods for generating vectorized join results for the big table only variation of inner joins. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.VectorMapJoinInnerBigOnlyLongOperator | Specialized class for doing a vectorized map join that is an inner join on a Single-Column Long and only big table columns appear in the join result so a hash multi-set is used. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.VectorMapJoinInnerBigOnlyMultiKeyOperator | Specialized class for doing a vectorized map join that is an inner join on Multi-Key and only big table columns appear in the join result so a hash multi-set is used. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.VectorMapJoinInnerBigOnlyStringOperator | Specialized class for doing a vectorized map join that is an inner join on a Single-Column String and only big table columns appear in the join result so a hash multi-set is used. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.VectorMapJoinInnerGenerateResultOperator | Contains methods for generating vectorized join results for inner joins. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.VectorMapJoinInnerLongOperator | Specialized class for doing a vectorized map join that is an inner join on a Single-Column Long and only big table columns appear in the join result so a hash multi-set is used. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.VectorMapJoinInnerMultiKeyOperator | Specialized class for doing a vectorized map join that is an inner join on a Multi-Key using a hash map. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.VectorMapJoinInnerStringOperator | Specialized class for doing a vectorized map join that is an inner join on a Single-Column String using a hash map. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.VectorMapJoinLeftSemiGenerateResultOperator | Contains methods for generating vectorized join results for left semi joins. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.VectorMapJoinLeftSemiLongOperator | Specialized class for doing a vectorized map join that is an left semi join on a Single-Column Long using a hash set. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.VectorMapJoinLeftSemiMultiKeyOperator | Specialized class for doing a vectorized map join that is an left semi join on Multi-Key using hash set. |

| Class | Description |
|--|--|
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.VectorMapJoinLeftSemiStringOperator | Specialized class for doing a vectorized map join that is an left semi join on a Single-Column String using a hash set. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.VectorMapJoinOuterGenerateResultOperator | Contains methods for generating vectorized join results for outer joins. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.VectorMapJoinOuterLongOperator | Specialized class for doing a vectorized map join that is an outer join on a Single-Column Long using a hash map. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.VectorMapJoinOuterMultiKeyOperator | Specialized class for doing a vectorized map join that is an outer join on Multi-Key using a hash map. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.VectorMapJoinOuterStringOperator | Specialized class for doing a vectorized map join that is an outer join on a Single-Column String using a hash map. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.VectorMapJoinRowBytesContainer | An eager bytes container that puts row bytes to an output stream. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.fast.VectorMapJoinFastBytesHashMap | Bytes key hash map optimized for vector map join. This is the abstract base for the multi-key and string bytes key hash map implementations. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.fast.VectorMapJoinFastBytesHashMultiSet | Bytes key hash multi-set optimized for vector map join. This is the abstract base for the multi-key and string bytes key hash multi-set implementations. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.fast.VectorMapJoinFastBytesHashUtil | Utilities for bytes key hash multi-set optimized for vector map join. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.fast.VectorMapJoinFastHashTable | Vector map join fast hash table. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.fast.VectorMapJoinFastKeyStore | Vector map join fast key store. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.fast.VectorMapJoinFastLongHashMap | Vector map join fast long hash map. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.fast.VectorMapJoinFastLongHashMultiSet | Vector map join fast long hash multi set. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.fast.VectorMapJoinFastLongHashSet | A single LONG key hash set optimized for vector map join. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.fast.VectorMapJoinFastLongHashTable | A single long value map optimized for vector map join. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.fast.VectorMapJoinFastLongHashUtil | Utilities for vector map join of single long value. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.fast.VectorMapJoinFastMultiKeyHashMap | A multi-key value hash map optimized for vector map join. The key is stored as the provided bytes (uninterpreted). |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.fast.VectorMapJoinFastMultiKeyHashMultiSet | A multi-key hash multi-set optimized for vector map join. The key is stored as the provided bytes (uninterpreted). |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.fast.VectorMapJoinFastMultiKeyHashSet | A multi-key hash set optimized for vector map join. The key is stored as the provided bytes (uninterpreted). |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.fast.VectorMapJoinFastStringCommon | A single byte array value hash map optimized for vector map join. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.fast.VectorMapJoinFastTableContainer | HashTableLoader for Tez constructs the hashtable from records read from a broadcast edge. |

| Class | Description |
|--|--|
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.hashtable. VectorMapJoinHashMapResult | Abstract class for a hash map result. For reading the values, one-by-one. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.hashtable. VectorMapJoinHashTableResult | Root abstract class for a hash table result. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.optimized. VectorMapJoinOptimizedCreateHashTable | Create hash table for vector map join. |
| org.apache.hadoop.hive.ql.hooks. HookContext | Hook Context keeps all the necessary information for all the hooks. |
| org.apache.hadoop.hive.ql.hooks. PostExecutePrinter | Implementation of a post execute hook that simply prints out its parameters to standard output. |
| org.apache.hadoop.hive.ql.hooks. PreExecutePrinter | Implementation of a pre execute hook that simply prints out its parameters to standard output. |
| org.apache.hadoop.hive.ql.index. HiveIndex | Holds index related constants. |
| org.apache.hadoop.hive.ql.index. HiveIndexQueryContext | Used to pass information between the IndexProcessor and the plugin IndexHandler during query processing |
| org.apache.hadoop.hive.ql.index. HiveIndexResult | HiveIndexResult parses the input stream from an index query to generate a list of file splits to query. |
| org.apache.hadoop.hive.ql.index. HiveIndexedInputFormat | Input format for doing queries that use indexes. |
| org.apache.hadoop.hive.ql.index. IndexPredicateAnalyzer | IndexPredicateAnalyzer decomposes predicates, separating the parts which can be satisfied by an index from the parts which cannot. |
| org.apache.hadoop.hive.ql.index. IndexSearchCondition | IndexSearchCondition represents an individual search condition found by IndexPredicateAnalyzer. |
| org.apache.hadoop.hive.ql.index. TableBasedIndexHandler | Index handler for indexes that use tables to store indexes. |
| org.apache.hadoop.hive.ql.index.compact. HiveCompactIndexInputFormat | Hive compact index input format. |
| org.apache.hadoop.hive.ql.io. AcidUtils | Utilities that are shared by all of the ACID input and output formats. |
| org.apache.hadoop.hive.ql.io. BucketizedHiveInputFormat | BucketizedHiveInputFormat serves the similar function as hiveInputFormat but its getSplits() always group splits from one input file into one wrapper split. |
| org.apache.hadoop.hive.ql.io. CombineHiveInputFormat | CombineHiveInputFormat is a parameterized InputFormat which looks at the path name and determine the correct InputFormat for that path name from mapredPlan.pathToPartitionInfo(). |
| org.apache.hadoop.hive.ql.io. HiveFileFormatUtils | An util class for various Hive file format tasks. |
| org.apache.hadoop.hive.ql.io. HiveInputFormat | HiveInputFormat is a parameterized InputFormat which looks at the path name and determine the correct InputFormat for that path name from mapredPlan.pathToPartitionInfo(). |
| org.apache.hadoop.hive.ql.io. IOConstants | Input output constants. |
| org.apache.hadoop.hive.ql.io. IOContext | IOContext basically contains the position information of the current key/value. |
| org.apache.hadoop.hive.ql.io. NullRowsInputFormat | NullRowsInputFormat outputs null rows, maximum 100. |
| org.apache.hadoop.hive.ql.io. OneNullRowInputFormat | OneNullRowInputFormat outputs one null row. |

| Class | Description |
|---|---|
| org.apache.hadoop.hive ql.io.RCFileInputFormat | RCFileInputFormat. |
| org.apache.hadoop.hive ql.io.SequenceFileInputFormatChecker | SequenceFileInputFormatChecker. |
| org.apache.hadoop.hive ql.io.avro.AvroContainerOutputFormat | Write to an Avro file from a Hive process. |
| org.apache.hadoop.hive ql.io.merge.MergeFileMapper | Mapper for fast file merging of ORC and RC files. |
| org.apache.hadoop.hive ql.io.merge.MergeFileTask | Task for fast merging of ORC and RC files. |
| org.apache.hadoop.hive ql.io.orc.CompressionKind | An enumeration that lists the generic compression algorithms that can be applied to ORC files. |
| org.apache.hadoop.hive ql.io.orc.OrcFile | Contains factory methods to read or write ORC files. |
| org.apache.hadoop.hive ql.io.orc.OrcFileKeyWrapper | Key for OrcFileMergeMapper task. |
| org.apache.hadoop.hive ql.io.orc.OrcFileStripeMergeRecordReader | Record reader for orc file stripe merge. |
| org.apache.hadoop.hive ql.io.orc.OrcFileValueWrapper | Value for OrcFileMergeMapper. |
| org.apache.hadoop.hive ql.io.orc.OrcInputFormat | A MapReduce/Hive input format for ORC files. |
| org.apache.hadoop.hive ql.io.orc.OrcNewSplit | OrcFileSplit. |
| org.apache.hadoop.hive ql.io.orc.OrcRecordUpdater | A RecordUpdater where the files are stored as ORC. |
| org.apache.hadoop.hive ql.io.orc.OrcSerde | A serde class for ORC. |
| org.apache.hadoop.hive ql.io.orc.OrcSplit | OrcFileSplit. |
| org.apache.hadoop.hive ql.io.orc.ReaderImpl | Implementation of record reader. |
| org.apache.hadoop.hive ql.io.orc.VectorizedOrcInputFormat | A MapReduce/Hive input format for ORC files. |
| org.apache.hadoop.hive ql.io.orc.WriterImpl | An ORC file writer. |
| org.apache.hadoop.hive ql.io.parquet.LeafFilterFactory | Factory class for leaf filter. |
| org.apache.hadoop.hive ql.io.parquet.MapredParquetOutputFormat | A Parquet OutputFormat for Hive (with the deprecated package mapred) |
| org.apache.hadoop.hive ql.io.parquet.convert.DataWritableRecordConverter | A MapWritableReadSupport, encapsulates the tuples |
| org.apache.hadoop.hive ql.io.parquet.convert.ETypeConverter.BinaryConverter | ETypeConverter is an easy way to set the converter for the right type. |
| org.apache.hadoop.hive ql.io.parquet.convert.HiveCollectionConverter | Converter for collections. |
| org.apache.hadoop.hive ql.io.parquet.convert.HiveGroupConverter | Converter for groups. |
| org.apache.hadoop.hive ql.io.parquet.convert.HiveStructConverter | A MapWritableGroupConverter, real converter between hive and parquet types recursively for complex types. |
| org.apache.hadoop.hive ql.io.parquet.read.DataWritableReadSupport | A MapWritableReadSupport Manages the translation between Hive and Parquet |
| org.apache.hadoop.hive ql.io.parquet.read.ParquetRecordReaderWrapper | Wrapper for parquet record reader. |
| org.apache.hadoop.hive ql.io.parquet.serde.ParquetHiveSerDe | A ParquetHiveSerDe for Hive (with the deprecated package mapred) |

| Class | Description |
|--|--|
| org.apache.hadoop.hive.ql.io.parquet.write. DataWritableWriter | DataWritableWriter sends a record to the Parquet API with the expected schema in order to be written to a file. |
| org.apache.hadoop.hive.ql.io.parquet.write. ParquetRecordWriterWrapper | Wrapper for parquet record writer. |
| org.apache.hadoop.hive.ql.io.rcfile.stats. PartialScanMapper | PartialScanMapper. |
| org.apache.hadoop.hive.ql.io.rcfile.stats. PartialScanTask | PartialScanTask. |
| org.apache.hadoop.hive.ql.io.rcfile.stats. PartialScanWork | Partial Scan Work. |
| org.apache.hadoop.hive.ql.io.rcfile.truncate. ColumnTruncateMapper | A factory for creating SearchArguments, as well as modifying those created by this factory. |
| org.apache.hadoop.hive.ql.io.rcfile.truncate. ColumnTruncateTask | Base class for operator graph walker this class takes list of starting ops and walks them one by one. |
| org.apache.hadoop.hive.ql.io.sarg. SearchArgumentFactory | A factory for creating SearchArguments, as well as modifying those created by this factory. |
| org.apache.hadoop.hive.ql.lib. DefaultGraphWalker | Base class for operator graph walker this class takes list of starting ops and walks them one by one. |
| org.apache.hadoop.hive.ql.lib. RuleExactMatch | Implementation of the Rule interface for Nodes Used in Node dispatching to dispatch process/visitor functions for Nodes. |
| org.apache.hadoop.hive.ql.lockmgr. DbLockManager | An implementation of HiveLockManager for use with org.apache.hadoop.hive.ql.lockmgr. DbTxnManager . |
| org.apache.hadoop.hive.ql.lockmgr. DbTxnManager | An implementation of HiveTxnManager that stores the transactions in the metastore database. |
| org.apache.hadoop.hive.ql.lockmgr. HiveLockObject | The class is used to uniquely identify a HiveLockObject. |
| org.apache.hadoop.hive.ql.lockmgr. LockException | Exception from lock manager. |
| org.apache.hadoop.hive.ql.lockmgr.zookeeper. ZooKeeperHiveLock | The class is used to uniquely identify ZookeeperHiveLock. |
| org.apache.hadoop.hive.ql.lockmgr.zookeeper. ZooKeeperHiveLockManager | Zookeeper lock manager. |
| org.apache.hadoop.hive.ql.log. PerfLogger | PerfLogger. |
| org.apache.hadoop.hive.ql.metadata. Hive | Contains functions that implement meta data/DDDL operations using calls to the metastore. |
| org.apache.hadoop.hive.ql.metadata. HiveException | Generic exception class for Hive. |
| org.apache.hadoop.hive.ql.metadata. HiveMetaStoreChecker | Verify that the information in the metastore matches what is on the filesystem. |
| org.apache.hadoop.hive.ql.metadata. HiveUtils | General collection of helper functions. |
| org.apache.hadoop.hive.ql.metadata. Partition | A Hive Table Partition: is a fundamental storage unit within a Table. |
| org.apache.hadoop.hive.ql.metadata. SessionHiveMetaStoreClient | Client for hivemetastore during session. |
| org.apache.hadoop.hive.ql.metadata. Table | A Hive Table: is a fundamental unit of data in Hive that shares a common schema/DDDL. |
| org.apache.hadoop.hive.ql.metadata. VirtualColumn | Provides metadata that is not stored in table itself. |
| org.apache.hadoop.hive.ql.metadata.formatting. JsonMetadataFormatter | Format table and index information for machine readability using json. |

| Class | Description |
|---|---|
| org.apache.hadoop.hive.ql.metadata.formatting.MetadataFormatUtils | This class provides methods to format table and index information. |
| org.apache.hadoop.hive.ql.optimizer.BucketMapJoinOptimizer | this transformation does bucket map join optimization. |
| org.apache.hadoop.hive.ql.optimizer.BucketingSortingReduceSinkOptimizer | This transformation does optimization for enforcing bucketing and sorting. |
| org.apache.hadoop.hive.ql.optimizer.ColumnPruner | Implementation of one of the rule-based optimization steps. |
| org.apache.hadoop.hive.ql.optimizer.ColumnPrunerProcCtx | This class implements the processor context for Column Pruner. |
| org.apache.hadoop.hive.ql.optimizer.ColumnPrunerProcFactory | Factory for generating the different node processors used by ColumnPruner. |
| org.apache.hadoop.hive.ql.optimizer.ConstantPropagate | Implementation of one of the rule-based optimization steps. |
| org.apache.hadoop.hive.ql.optimizer.ConstantPropagateProcCtx | Implements the processor context for Constant Propagate. |
| org.apache.hadoop.hive.ql.optimizer.ConstantPropagateProcFactory | Factory for generating the different node processors used by ConstantPropagate. |
| org.apache.hadoop.hive.ql.optimizer.ConvertJoinMapJoin | ConvertJoinMapJoin is an optimization that replaces a common join (aka shuffle join) with a map join (aka broadcast or fragment replicate join when possible). |
| org.apache.hadoop.hive.ql.optimizer.GenMRProcContext | Processor Context for creating map reduce task. |
| org.apache.hadoop.hive.ql.optimizer.GenMapRedUtils | General utility common functions for the Processor to convert operator into map-reduce tasks. |
| org.apache.hadoop.hive.ql.optimizer.GlobalLimitOptimizer | This optimizer is used to reduce the input size for the query for queries which are specifying a limit. |
| org.apache.hadoop.hive.ql.optimizer.GroupByOptimizer | This transformation does group by optimization. |
| org.apache.hadoop.hive.ql.optimizer.IdentityProjectRemover | This optimization tries to remove SelectOperator from tree which don't do any processing except forwarding columns from its parent to its children. |
| org.apache.hadoop.hive.ql.optimizer.JoinReorder | Implementation of rule-based join table reordering optimization. |
| org.apache.hadoop.hive.ql.optimizer.LimitPushdownOptimizer | Make RS calculate top-K selection for limit clause. |
| org.apache.hadoop.hive.ql.optimizer.MapJoinProcessor | Implementation of one of the rule-based map join optimization. |
| org.apache.hadoop.hive.ql.optimizer.NonBlockingOpDeDupProc | Merges SEL-SEL or FIL-FIL into single operator |
| org.apache.hadoop.hive.ql.optimizer.ReduceSinkMapJoinProc | This processor addresses the RS-MJ case that occurs in Tez on the small/hash table. The work that RS will be a part of must be connected to the MJ work via a broadcast edge. |
| org.apache.hadoop.hive.ql.optimizer.SamplePruner | The transformation step that does sample pruning. |
| org.apache.hadoop.hive.ql.optimizer.SimpleFetchAggregation | Execute final aggregation stage for simple fetch query on fetch task. |

| Class | Description |
|---|---|
| org.apache.hadoop.hive.ql.optimizer. SimpleFetchOptimizer | Tries to convert simple fetch query to single fetch task, which fetches rows directly from location of table/partition. |
| org.apache.hadoop.hive.ql.optimizer. SkewJoinOptimizer | SkewJoinOptimizer. |
| org.apache.hadoop.hive.ql.optimizer. SortedDynPartitionOptimizer | When dynamic partitioning (with or without bucketing and sorting) is enabled, this optimization sorts the records on partition, bucket and sort columns respectively before inserting records into the destination table. |
| org.apache.hadoop.hive.ql.optimizer. SortedMergeBucketMapJoinOptimizer | Replace a bucket map join with a sorted merge map join. |
| org.apache.hadoop.hive.ql.optimizer. StatsOptimizer | There is a set of queries which can be answered entirely from statistics stored in metastore. |
| org.apache.hadoop.hive.ql.optimizer. Transform | Optimizer interface. |
| org.apache.hadoop.hive.ql.optimizer.calcite. HiveCalciteUtil | Generic utility functions needed for Calcite based Hive CBO. |
| org.apache.hadoop.hive.ql.optimizer.calcite. HiveRelOptUtil | Splits different join conditions. |
| org.apache.hadoop.hive.ql.optimizer.calcite. RelOptHiveTable | Class for handling all table metadata. |
| org.apache.hadoop.hive.ql.optimizer.calcite. TraitsUtil | Traits utilities. |
| org.apache.hadoop.hive.ql.optimizer.calcite.cost. HiveRelMdCost | HiveRelMdCost supplies the implementation of cost model. |
| org.apache.hadoop.hive.ql.optimizer.calcite.cost. HiveVolcanoPlanner | Refinement of org.apache.calcite.plan.volcano.VolcanoPlanner for Hive. |
| org.apache.hadoop.hive.ql.optimizer.calcite.reloperators. HiveAggregate | Describing aggregate function as relational operator. |
| org.apache.hadoop.hive.ql.optimizer.calcite.reloperators. HiveFilter | Describing filter function as relational operator. |
| org.apache.hadoop.hive.ql.optimizer.calcite.reloperators. HiveJoin | Describing join function as relational operator. |
| org.apache.hadoop.hive.ql.optimizer.calcite.reloperators. HiveProject | Creates a HiveProject. |
| org.apache.hadoop.hive.ql.optimizer.calcite.reloperators. HiveSemiJoin | Describing semi join operator as relational operator. |
| org.apache.hadoop.hive.ql.optimizer.calcite.reloperators. HiveTableScan | Relational expression representing a scan of a HiveDB collection. |
| org.apache.hadoop.hive.ql.optimizer.calcite.reloperators. HiveUnion | Describing union operator as relational operator. |
| org.apache.hadoop.hive.ql.optimizer.calcite.rules. HiveFilterJoinRule | Creates a PushFilterPastJoinRule with an explicit root operand. |
| org.apache.hadoop.hive.ql.optimizer.calcite.rules. HiveJoinProjectTransposeRule | Transpose rule for hive join project. |
| org.apache.hadoop.hive.ql.optimizer.calcite.rules. HiveFilterSetOpTransposeRule | Creates a HiveFilterSetOpTransposeRule. |
| org.apache.hadoop.hive.ql.optimizer.calcite.rules. HiveInsertExchange4JoinRule | Not an optimization rule. |

| Class | Description |
|---|---|
| org.apache.hadoop.hive.ql.optimizer.calcite.rules. HiveJoinAddNotNullRule | Creates an HiveJoinAddNotNullRule. |
| org.apache.hadoop.hive.ql.optimizer.calcite.rules. HiveJoinPushTransitivePredicatesRule | Planner rule that infers predicates from on a org.apache.calcite.rel.core.Join and creates org.apache.calcite.rel.core.Filters if those predicates can be pushed to its inputs. |
| org.apache.hadoop.hive.ql.optimizer.calcite.rules. HiveJoinToMultiJoinRule | Rule that merges a join with multijoin/join children if the equi compared the same set of input columns. |
| org.apache.hadoop.hive.ql.optimizer.calcite.rules. HivePreFilteringRule | Pull out deterministic expressions from non-deterministic and push down deterministic expressions as a separate filter. |
| org.apache.hadoop.hive.ql.optimizer.calcite.rules. HiveProjectMergeRule | ProjectMergeRule merges a org.apache.calcite.rel.core.Project into another org.apache.calcite.rel.core.Project, provided the projects aren't projecting identical sets of input references. |
| org.apache.hadoop.hive.ql.optimizer.calcite.rules. HiveRelFieldTrimmer | Hive relational expression field trimmer. |
| org.apache.hadoop.hive.ql.optimizer.calcite.stats. HiveRelMdCollation | Hive relational expression metadata collation. |
| org.apache.hadoop.hive.ql.optimizer.calcite.stats. HiveRelMdDistinctRowCount | Hive relational expression metadata. |
| org.apache.hadoop.hive.ql.optimizer.calcite.stats. HiveRelMdDistribution | Hive relational expression metadata distribuiton. |
| org.apache.hadoop.hive.ql.optimizer.calcite.stats. HiveRelMdMemory | Hive relational expression metadata memory |
| org.apache.hadoop.hive.ql.optimizer.calcite.stats. HiveRelMdParallelism | Hive relational expression metadata parallelism. |
| org.apache.hadoop.hive.ql.optimizer.calcite.stats. HiveRelMdRowCount | Hive relational expression metadata row count. |
| org.apache.hadoop.hive.ql.optimizer.calcite.stats. HiveRelMdSelectivity | Hive relational expression metadata selectivity. |
| org.apache.hadoop.hive.ql.optimizer.calcite.stats. HiveRelMdSize | Hive relational expression metadata size. |
| org.apache.hadoop.hive.ql.optimizer.calcite.stats. HiveRelMdUniqueKeys | Hive relational expression metadata unique keys. |
| org.apache.hadoop.hive.ql.optimizer.calcite.translator. ASTConverter | Abstract syntax tree converter. |
| org.apache.hadoop.hive.ql.optimizer.calcite.translator. ExprNodeConverter | Expression node converter. |
| org.apache.hadoop.hive.ql.optimizer.calcite.translator. HiveOpConverter | Hive operation converter. |
| org.apache.hadoop.hive.ql.optimizer.calcite.translator. HiveOpConverterPostProc | Post processing hive operation converter. |
| org.apache.hadoop.hive.ql.optimizer.calcite.translator. PlanModifierForASTConv | Modifying plan for converting abstract syntax tree. |
| org.apache.hadoop.hive.ql.optimizer.calcite.translator. PlanModifierForReturnPath | Modifying plan for operation tree. |

| Class | Description |
|--|---|
| org.apache.hadoop.hive.ql.optimizer.calcite.translator.RexNodeConverter | Row expression node converter. |
| org.apache.hadoop.hive.ql.optimizer.calcite.translator.SqlFunctionConverter | Converting SQL function. |
| org.apache.hadoop.hive.ql.optimizer.correlation.CorrelationOptimizer | Implementation of Correlation Optimizer. |
| org.apache.hadoop.hive.ql.optimizer.correlation.CorrelationUtilities | Utilities for both CorrelationOptimizer and ReduceSinkDeDuplication. |
| org.apache.hadoop.hive.ql.optimizer.correlation.ReduceSinkDeDuplication | If two reducer sink operators share the same partition/sort columns and order, they can be merged. |
| org.apache.hadoop.hive.ql.optimizer.index.RewriteGBUsingIndex | RewriteGBUsingIndex is implemented as one of the Rule-based Optimizations. |
| org.apache.hadoop.hive.ql.optimizer.index.RewriteParseContextGenerator | RewriteParseContextGenerator is a class that offers methods to generate operator tree for input queries. |
| org.apache.hadoop.hive.ql.optimizer.lineage.ExprProcFactory | Expression processor factory for lineage. |
| org.apache.hadoop.hive.ql.optimizer.lineage.Generator | Generates the lineage information for the columns and tables from the plan before it goes through other optimization phases. |
| org.apache.hadoop.hive.ql.optimizer.lineage.LineageCtx | Contains the lineage context that is passed while walking the operator tree in Lineage. |
| org.apache.hadoop.hive.ql.optimizer.lineage.OpProcFactory | Operator factory for the rule processors for lineage. |
| org.apache.hadoop.hive.ql.optimizer.listbucketingpruner.ListBucketingPruner | The transformation step that does list bucketing pruning. |
| org.apache.hadoop.hive.ql.optimizer.metainfo.annotation.AnnotateWithOpTraits | This class annotates each operator with its traits. The OpTraits class specifies the traits that are populated for each operator. |
| org.apache.hadoop.hive.ql.optimizer.pcr.PartitionConditionRemover | The transformation step that does partition condition remover. |
| org.apache.hadoop.hive.ql.optimizer.pcr.PcrExprProcFactory | Expression processor factory for partition condition removing. |
| org.apache.hadoop.hive.ql.optimizer.physical.CrossProductCheck | Check each MapJoin and ShuffleJoin Operator to see they are performing a cross product. |
| org.apache.hadoop.hive.ql.optimizer.physical.Vectorizer | Class to define vectorization. |
| org.apache.hadoop.hive.ql.optimizer.ppr.PartitionExpressionProxyForMetastore | The basic implementation of PartitionExpressionProxy that uses ql package classes. |
| org.apache.hadoop.hive.ql.optimizer.ppr.PartitionPruner | The transformation step that does partition pruning. |
| org.apache.hadoop.hive.ql.optimizer.spark.SparkReduceSinkMapJoinProc | This processor addresses the RS-MJ case that occurs in spark on the small/hash table side of things. The work that RS will be a part of must be connected to the MJ work via be a broadcast edge. |
| org.apache.hadoop.hive.ql.optimizer.stats.annotation.AnnotateWithStatistics | Create a list of top op nodes |
| org.apache.hadoop.hive.ql.optimizer.unionproc.UnionProcessor | FileSinkProcessor is a simple rule to remember seen unions for later processing. |
| org.apache.hadoop.hive.ql.parse.ASTNode | Definition of abstract syntax tree node. |

| Class | Description |
|--|--|
| org.apache.hadoop.hive.ql.parse.BaseSemanticAnalyzer | BaseSemanticAnalyzer. |
| org.apache.hadoop.hive.ql.parse.CalcitePlanner | Cost based optimizer planner. |
| org.apache.hadoop.hive.ql.parse.ColumnAccessAnalyzer | Analysis of column access. |
| org.apache.hadoop.hive.ql.parse.ColumnStatsSemanticAnalyzer | ColumnStatsSemanticAnalyzer. |
| org.apache.hadoop.hive.ql.parse.DDLSemanticAnalyzer | DDLSemanticAnalyzer. |
| org.apache.hadoop.hive.ql.parse.ExplainSQRewriteSemanticAnalyzer | ExplainSQRewriteSemanticAnalyzer. |
| org.apache.hadoop.hive.ql.parse.ExplainSemanticAnalyzer | ExplainSemanticAnalyzer. |
| org.apache.hadoop.hive.ql.parse.ExportSemanticAnalyzer | ExportSemanticAnalyzer. |
| org.apache.hadoop.hive.ql.parse.FunctionSemanticAnalyzer | FunctionSemanticAnalyzer. |
| org.apache.hadoop.hive.ql.parse.GenTezProcContext | GenTezProcContext. |
| org.apache.hadoop.hive.ql.parse.GenTezUtils | GenTezUtils is a collection of shared helper methods to produce TezWork. |
| org.apache.hadoop.hive.ql.parse.GlobalLimitCtx | context for pruning inputs. |
| org.apache.hadoop.hive.ql.parse.ImportSemanticAnalyzer | ImportSemanticAnalyzer. |
| org.apache.hadoop.hive.ql.parse.LoadSemanticAnalyzer | LoadSemanticAnalyzer. |
| org.apache.hadoop.hive.ql.parse.MacroSemanticAnalyzer | MacroSemanticAnalyzer. |
| org.apache.hadoop.hive.ql.parse.MapReduceCompiler | Compiling list of tasks. |
| org.apache.hadoop.hive.ql.parse.MetadataExportListener | Listens for drop events and, if set, exports the table's metadata as JSON to the trash of the user performing the drop |
| org.apache.hadoop.hive.ql.parse.ParseContext | Parse Context: The current parse context. |
| org.apache.hadoop.hive.ql.parse.ParseDriver | ParseDriver. |
| org.apache.hadoop.hive.ql.parse.ParseUtils | Library of utility functions used in the parse code. |
| org.apache.hadoop.hive.ql.parse.QB | Implementation of the query block. |
| org.apache.hadoop.hive.ql.parse.QBParseInfo | Implementation of the parse information related to a query block. |
| org.apache.hadoop.hive.ql.parse.RowResolver | Implementation of the Row Resolver. |
| org.apache.hadoop.hive.ql.parse.SemanticAnalyzer | Implementation of the semantic analyzer. |
| org.apache.hadoop.hive.ql.parse.SemanticAnalyzerFactory | SemanticAnalyzerFactory. |
| org.apache.hadoop.hive.ql.parse.SplitSample | Stores all the information specified in the TABLESAMPLE(...) clause. |
| org.apache.hadoop.hive.ql.parse.TaskCompiler | TaskCompiler is a the base class for classes that compile operator pipelines into tasks. |
| org.apache.hadoop.hive.ql.parse.TezCompiler | TezCompiler translates the operator plan into TezTasks. |

| Class | Description |
|--|---|
| org.apache.hadoop.hive.ql.parse.TypeCheckCtx | This class implements the context information that is used for typechecking phase in query compilation. |
| org.apache.hadoop.hive.ql.parse.TypeCheckProcFactory | The Factory for creating typecheck processors. |
| org.apache.hadoop.hive.ql.parse.UpdateDeleteSemanticAnalyzer | A subclass of the org.apache.hadoop.hive.ql.parse.SemanticAnalyzer that just handles update and delete statements. |
| org.apache.hadoop.hive.ql.parse.WindowingSpec | Windowing Specification. |
| org.apache.hadoop.hive.ql.parse.spark.GenSparkProcContext | GenSparkProcContext maintains information about the tasks and operators as we walk the operator tree to break them into SparkTasks. |
| org.apache.hadoop.hive.ql.parse.spark.GenSparkUtils | GenSparkUtils is a collection of shared helper methods to produce SparkWork Cloned from GenTezUtils. |
| org.apache.hadoop.hive.ql.parse.spark.GenSparkWorkWalker | Walks the operator tree in DFS fashion. |
| org.apache.hadoop.hive.ql.parse.spark.OptimizeSparkProcContext | OptimizeSparkProcContext. |
| org.apache.hadoop.hive.ql.plan.AbstractOperatorDesc | Operator description. |
| org.apache.hadoop.hive.ql.plan.AlterTableDesc | AlterTableDesc. |
| org.apache.hadoop.hive.ql.plan.AlterTableSimpleDesc | Contains information needed to modify a partition or a table |
| org.apache.hadoop.hive.ql.plan.BaseWork | BaseWork. |
| org.apache.hadoop.hive.ql.plan.ColumnStatsDesc | Contains the information needed to persist column level statistics |
| org.apache.hadoop.hive.ql.plan.ColumnStatsWork | ColumnStats Work. |
| org.apache.hadoop.hive.ql.plan.CommonMergeJoinDesc | Description of merge join operator. |
| org.apache.hadoop.hive.ql.plan.CreateTableDesc | CreateTableDesc. |
| org.apache.hadoop.hive.ql.plan.CreateViewDesc | CreateViewDesc. |
| org.apache.hadoop.hive.ql.plan.DDLWork | DDLWork. |
| org.apache.hadoop.hive.ql.plan.DropTableDesc | DropTableDesc. |
| org.apache.hadoop.hive.ql.plan.DynamicPartitionCtx | Dynamic partition context. |
| org.apache.hadoop.hive.ql.plan.DynamicPruningEventDesc | Dynamic pruning event description. |
| org.apache.hadoop.hive.ql.plan.ExplainWork | ExplainWork. |
| org.apache.hadoop.hive.ql.plan.ExprNodeDesc | ExprNodeDesc. |
| org.apache.hadoop.hive.ql.plan.ExprNodeDescUtils | Utilities for expression node description. |
| org.apache.hadoop.hive.ql.plan.FetchWork | FetchWork. |
| org.apache.hadoop.hive.ql.plan.FileSinkDesc | FileSinkDesc. |
| org.apache.hadoop.hive.ql.plan.FilterDesc | FilterDesc. |
| org.apache.hadoop.hive.ql.plan.GroupByDesc | GroupByDesc. |
| org.apache.hadoop.hive.ql.plan.HashTableSinkDesc | Map Join operator Descriptor implementation. |
| org.apache.hadoop.hive.ql.plan.JoinCondDesc | Join conditions Descriptor implementation. |

| Class | Description |
|---|---|
| org.apache.hadoop.hive.ql.plan. JoinDesc | Join operator Descriptor implementation. |
| org.apache.hadoop.hive.ql.plan. LateralViewJoinDesc | LateralViewJoinDesc. |
| org.apache.hadoop.hive.ql.plan. LimitDesc | LimitDesc. |
| org.apache.hadoop.hive.ql.plan. LoadTableDesc | LoadTableDesc. |
| org.apache.hadoop.hive.ql.plan. MapJoinDesc | Map Join operator Descriptor implementation. |
| org.apache.hadoop.hive.ql.plan. MapWork | MapWork represents all the information used to run a map task on the cluster. |
| org.apache.hadoop.hive.ql.plan. MapredWork | MapredWork. |
| org.apache.hadoop.hive.ql.plan. MergeJoinWork | Creating merge join work. |
| org.apache.hadoop.hive.ql.plan. PartitionDesc | PartitionDesc. |
| org.apache.hadoop.hive.ql.plan. PlanUtils | PlanUtils. |
| org.apache.hadoop.hive.ql.plan. ReduceSinkDesc | ReduceSinkDesc. |
| org.apache.hadoop.hive.ql.plan. ReduceWork | ReduceWork represents all the information used to run a reduce task on the cluster. |
| org.apache.hadoop.hive.ql.plan. SelectDesc | SelectDesc. |
| org.apache.hadoop.hive.ql.plan. SparkHashTableSinkDesc | Map Join operator Descriptor implementation. |
| org.apache.hadoop.hive.ql.plan. Statistics | Statistics. |
| org.apache.hadoop.hive.ql.plan. StatsWork | ConditionalStats. |
| org.apache.hadoop.hive.ql.plan. TableScanDesc | Table Scan Descriptor Currently, data is only read from a base source as part of map-reduce framework. |
| org.apache.hadoop.hive.ql.plan. TezWork | TezWork. |
| org.apache.hadoop.hive.ql.plan. UnionWork | Simple wrapper for union all cases. |
| org.apache.hadoop.hive.ql.plan. VectorGroupByDesc | VectorGroupByDesc. |
| org.apache.hadoop.hive.ql.plan.ptf. BoundaryDef | Map-reduce boundaries definition. |
| org.apache.hadoop.hive.ql.plan.ptf. CurrentRowDef | Current row definition. |
| org.apache.hadoop.hive.ql.plan.ptf. OrderExpressionDef | Order expression definition. |
| org.apache.hadoop.hive.ql.plan.ptf. RangeBoundaryDef | Range boundary definition. |
| org.apache.hadoop.hive.ql.plan.ptf. ValueBoundaryDef | Value boundary definition. |
| org.apache.hadoop.hive.ql.plan.ptf. WindowFrameDef | Window frame definition. |
| org.apache.hadoop.hive.ql.ppd. ExprWalkerInfo | Context for Expression Walker for determining predicate pushdown candidates It contains a ExprInfo object for each expression that is processed. |
| org.apache.hadoop.hive.ql.ppd. OpProcFactory | Operator factory for predicate pushdown processing of operator graph Each operator determines the pushdown predicates by walking the expression tree. |
| org.apache.hadoop.hive.ql.ppd. PredicatePushDown | Implements predicate pushdown. |
| org.apache.hadoop.hive.ql.ppd. PredicateTransitivePropagate | Propagates filters to other aliases based on join condition |
| org.apache.hadoop.hive.ql.ppd. SyntheticJoinPredicate | Creates synthetic predicates that represent "IN (keylist other table)" |

| Class | Description |
|--|---|
| org.apache.hadoop.hive.ql.processors. AddResourceProcessor | AddResourceProcessor. |
| org.apache.hadoop.hive.ql.processors. CommandProcessorResponse | Encapsulates the basic response info returned by classes the implement the CommandProcessor interface. |
| org.apache.hadoop.hive.ql.processors. CompileProcessor | Processor allows users to build code inside a hive session, then use this code as a UDF, Serde, or even a more complex entity like an input format or hook. |
| org.apache.hadoop.hive.ql.processors. CryptoProcessor | Processes HADOOP commands used for HDFS encryption. |
| org.apache.hadoop.hive.ql.processors. DeleteResourceProcessor | DeleteResourceProcessor. |
| org.apache.hadoop.hive.ql.processors. DfsProcessor | DfsProcessor. |
| org.apache.hadoop.hive.ql.processors. SetProcessor | SetProcessor. |
| org.apache.hadoop.hive.ql.security.authorization. AuthorizationPreEventListener | AuthorizationPreEventListener : A MetaStorePreEventListener that performs authorization/authentication checks on the metastore-side. |
| org.apache.hadoop.hive.ql.security.authorization. AuthorizationUtils | Utility code shared by hive internal code and sql standard authorization plugin implementation |
| org.apache.hadoop.hive.ql.security.authorization. HiveAuthorizationProviderBase | Class for authorization that returns userNames and groupNames. |
| org.apache.hadoop.hive.ql.security.authorization.plugin. AuthorizationMetaStoreFilterHook | Metastore filter hook for filtering out the list of objects that the current authorization implementation does not allow user to see |
| org.apache.hadoop.hive.ql.security.authorization.plugin. HiveAuthorizerImpl | Convenience implementation of HiveAuthorizer. |
| org.apache.hadoop.hive.ql.security.authorization.plugin. HiveAuthzContext | Provides context information in authorization check call that can be used for auditing and/or authorization. |
| org.apache.hadoop.hive.ql.security.authorization.plugin. HivePrivilegeObject | Represents the object on which privilege is being granted/revoked, and objects being used in queries. |
| org.apache.hadoop.hive.ql.security.authorization.plugin. HiveV1Authorizer | Hive v1 authorization class. |
| org.apache.hadoop.hive.ql.security.authorization.plugin.sqlstd. DummyHiveAuthorizationValidator | A no-op HiveAuthorizationValidator for use from hive cli. |
| org.apache.hadoop.hive.ql.security.authorization.plugin.sqlstd. SQLAuthorizationUtils | Utilities for SQL based authorization. |
| org.apache.hadoop.hive.ql.security.authorization.plugin.sqlstd. SQLStdHiveAccessController | Implements functionality of access control statements for sql standard based authorization |
| org.apache.hadoop.hive.ql.security.authorization.plugin.sqlstd. SQLStdHiveAuthorizationValidator | Class to check if user has privileges to perform certain action according to SQL standart hive authorization. |
| org.apache.hadoop.hive.ql.session. LineageState | LineageState. |
| org.apache.hadoop.hive.ql.session. OperationLog | OperationLog wraps the actual operation log file, and provides interface for accessing, reading, writing, and removing the file. |
| org.apache.hadoop.hive.ql.session. SessionState | SessionState encapsulates common data associated with a session. |

| Class | Description |
|---|---|
| org.apache.hadoop.hive.ql.stats. StatsFactory | A factory of stats publisher and aggregator implementations of the StatsPublisher and StatsAggregator interfaces. |
| org.apache.hadoop.hive.ql.stats. StatsUtils | Utilities of stats publisher and aggregator. |
| org.apache.hadoop.hive.ql.stats.fs. FSSStatsAggregator | File system stats aggregator. |
| org.apache.hadoop.hive.ql.stats.fs. FSSStatsPublisher | File system stats publisher. |
| org.apache.hadoop.hive.ql.txn.compactor. CompactorMR | Performs compactions via an MR job. |
| org.apache.hadoop.hive.ql.txn.compactor. Worker | Performs compactions. |
| org.apache.hadoop.hive.ql.udf.generic. GenericUDFAverage | GenericUDFAverage. |
| org.apache.hadoop.hive.ql.udf.generic. GenericUDAFStreamingEvaluator | User defined aggregate function streaming evaluator. |
| org.apache.hadoop.hive.ql.udf.generic. GenericUDAFSum | GenericUDAFSum. |
| org.apache.hadoop.hive.ql.udf.generic. GenericUDF | A Generic User-defined function (GenericUDF) for the use with Hive. |
| org.apache.hadoop.hive.ql.udf.generic. GenericUDFBasePad | A Generic User-defined function (GenericUDF) for the use with Hive. |
| org.apache.hadoop.hive.ql.udf.generic. GenericUDFBridge | GenericUDFBridge encapsulates UDF to provide the same interface as GenericUDF. |
| org.apache.hadoop.hive.ql.udf.generic. GenericUDFDateAdd | UDFDateAdd. |
| org.apache.hadoop.hive.ql.udf.generic. GenericUDFDateSub | UDFDateSub. |
| org.apache.hadoop.hive.ql.udf.generic. GenericUDFFromUtcTimestamp | Generic user defined function to compute UTC timestamp. |
| org.apache.hadoop.hive.ql.udf.generic. GenericUDFGreatest | GenericUDF Class for SQL construct "greatest(v1, v2, .. |
| org.apache.hadoop.hive.ql.udf.generic. GenericUDFLeast | GenericUDF Class for SQL construct "least(v1, v2, .. |
| org.apache.hadoop.hive.ql.udf.generic. GenericUDFLpad | UDFLpad. |
| org.apache.hadoop.hive.ql.udf.generic. GenericUDFOPAnd | GenericUDF Class for computing and. |
| org.apache.hadoop.hive.ql.udf.generic. GenericUDFOPEqual | GenericUDF Class for operation EQUAL. |
| org.apache.hadoop.hive.ql.udf.generic. GenericUDFOPEqualOrGreaterThan | GenericUDF Class for operation EqualOrGreaterThan. |
| org.apache.hadoop.hive.ql.udf.generic. GenericUDFOPEqualOrLessThan | GenericUDF Class for operation EqualOrLessThan. |
| org.apache.hadoop.hive.ql.udf.generic. GenericUDFOPGreaterThan | GenericUDF Class for operation GreaterThan. |
| org.apache.hadoop.hive.ql.udf.generic. GenericUDFOPLessThan | GenericUDF Class for operation LessThan. |
| org.apache.hadoop.hive.ql.udf.generic. GenericUDFOPNotEqual | GenericUDF Class for operation Not EQUAL. |
| org.apache.hadoop.hive.ql.udf.generic. GenericUDFOPNotNull | GenericUDFOPNotNull. |

| Class | Description |
|---|---|
| org.apache.hadoop.hive.ql.udf.generic.GenericUDFOPNull | GenericUDFOPNull. |
| org.apache.hadoop.hive.ql.udf.generic.GenericUDFOPor | GenericUDF Class for computing or. |
| org.apache.hadoop.hive.ql.udf.generic.GenericUDFRound | Rounding function permits rounding off integer digits in decimal numbers, which essentially downgrades the scale to negative territory. |
| org.apache.hadoop.hive.ql.udf.generic.GenericUDFRpad | UDFRpad. |
| org.apache.hadoop.hive.ql.udf.generic.GenericUDFToUnixTimeStamp | Deterministic version of UDFUnixTimeStamp. |
| org.apache.hadoop.hive.ql.udf.generic.GenericUDFUtils | Util functions for GenericUDF classes. |
| org.apache.hadoop.hive.ql.udf.generic.NumDistinctValueEstimator | Take the average of the index for all the bit vectors and get the estimated NDV (estimateNumDistinctValues). |
| org.apache.hadoop.hive.ql.udf.generic.NumericHistogram | A generic, re-usable histogram class that supports partial aggregations. |
| org.apache.hadoop.hive.ql.udf.generic.RoundUtils | Utility class for generic round UDF. |
| org.apache.hadoop.hive.ql.udf.ptf.WindowingTableFunction | A window function performs a calculation across a set of table rows that are somehow related to the current row. |
| org.apache.hadoop.hive.ql.util.DateTimeMath | Operations involving/returning year-month intervals. |
| org.apache.hadoop.hive.ql.util.DosToUnix | Converting windows script to UNIX. |
| org.apache.hadoop.hive.ql.util.ZooKeeperHiveHelper | Get the ensemble server addresses from the configuration. The format is: host1:port,host2:port |
| org.apache.hadoop.hive.serde2.AbstractSerDe | Abstract class for implementing SerDe. |
| org.apache.hadoop.hive.serde2.ColumnProjectionUtils | ColumnProjectionUtils. |
| org.apache.hadoop.hive.serde2.DelimitedJSONSerDe | DelimitedJSONSerDe. |
| org.apache.hadoop.hive.serde2.MetadataTypedColumnsetSerDe | MetadataTypedColumnsetSerDe. |
| org.apache.hadoop.hive.serde2.OpenCSVSerde | OpenCSVSerde use opencsv to deserialize CSV format. |
| org.apache.hadoop.hive.serde2.RegexSerDe | RegexSerDe uses regular expression (regex) to deserialize data. |
| org.apache.hadoop.hive.serde2.SerDeUtils | SerDeUtils. |
| org.apache.hadoop.hive.serde2.WriteBuffers | The structure storing arbitrary amount of data as a set of fixed-size byte buffers. |
| org.apache.hadoop.hive.serde2.avro.AvroLazyObjectInspector | Lazy objectinspector for avro serialization |
| org.apache.hadoop.hive.serde2.avro.AvroSerDe | Read or write Avro data from Hive. |
| org.apache.hadoop.hive.serde2.avro.AvroSerdeUtils | Utilities useful only to the AvroSerde itself. |
| org.apache.hadoop.hive.serde2.binarysortable.BinarySortableSerDe | BinarySortableSerDe can be used to write data in a way that the data can be compared byte-by-byte with the same order. |
| org.apache.hadoop.hive.serde2.binarysortable.fast.BinarySortableDeserializeRead | Directly deserialize with the caller reading field-by-field the LazyBinary serialization format. |
| org.apache.hadoop.hive.serde2.binarysortable.fast.BinarySortableSerializeWrite | Directly serialize, field-by-field, the BinarySortable format. |

| Class | Description |
|--|--|
| org.apache.hadoop.hive.serde2.io. DateWritable | DateWritable Writable equivalent of java.sql.Date. |
| org.apache.hadoop.hive.serde2.io. HiveDecimalWritable | Get a HiveDecimal instance from the writable and constraint it with maximum precision/scale. |
| org.apache.hadoop.hive.serde2.io. TimestampWritable | TimestampWritable Writable equivalent of java.sql.Timestamp Timestamps are of the format YYYY-MM-DD HH:MM:SS.[fff...] We encode Unix timestamp in seconds in 4 bytes, using the MSB to signify whether the timestamp has a fractional portion. |
| org.apache.hadoop.hive.serde2.lazy. LazyBinary | LazyBinary stores a binary object in a LazyObject. |
| org.apache.hadoop.hive.serde2.lazy. LazyHiveDecimal | LazyHiveDecimal stores hive decimal object in LazyObject. |
| org.apache.hadoop.hive.serde2.lazy. LazyMap | LazyMap stores a map of Primitive LazyObjects to LazyObjects. |
| org.apache.hadoop.hive.serde2.lazy. LazySerDeParameters | SerDeParameters. |
| org.apache.hadoop.hive.serde2.lazy. LazySimpleSerDe | LazySimpleSerDe can be used to read the same data format as MetadataTypedColumnsetSerDe and TCTLSeparatedProtocol. |
| org.apache.hadoop.hive.serde2.lazy. LazyUtils | LazyUtils. |
| org.apache.hadoop.hive.serde2.lazy.fast. LazySimpleDeserializeRead | Directly deserialize with the caller reading field-by-field the LazySimple (text) serialization format. |
| org.apache.hadoop.hive.serde2.lazy.fast. LazySimpleSerializeWrite | Directly serialize, field-by-field, the LazyBinary format. |
| org.apache.hadoop.hive.serde2.lazy.objectinspector. LazyListObjectInspector | LazyListObjectInspector works on array data that is stored in LazyArray. |
| org.apache.hadoop.hive.serde2.lazy.objectinspector. LazyMapObjectInspector | LazyMapObjectInspector works on struct data that is stored in LazyStruct. |
| org.apache.hadoop.hive.serde2.lazy.objectinspector. LazyUnionObjectInspector | LazyUnionObjectInspector works on union data that is stored in LazyUnion. |
| org.apache.hadoop.hive.serde2.lazybinary. LazyBinarySerDe | The LazyBinarySerDe class combines the lazy property of LazySimpleSerDe class and the binary property of BinarySortable class. |
| org.apache.hadoop.hive.serde2.lazybinary.fast. LazyBinaryDeserializeRead | Directly deserialize with the caller reading field-by-field the LazyBinary serialization format. |
| org.apache.hadoop.hive.serde2.lazybinary.fast. LazyBinarySerializeWrite | Directly serialize, field-by-field, the LazyBinary format. |
| org.apache.hadoop.hive.serde2.objectinspector. ObjectInspectorFactory | ObjectInspectorFactory is the primary way to create new ObjectInspector instances. |
| org.apache.hadoop.hive.serde2.objectinspector. ObjectInspectorUtils | ObjectInspectorFactory is the primary way to create new ObjectInspector instances. |
| org.apache.hadoop.hive.serde2.objectinspector. ReflectionStructObjectInspector | ReflectionStructObjectInspector works on struct data that is stored as a native Java object. |
| org.apache.hadoop.hive.serde2.objectinspector. SettableUnionObjectInspector | SettableUnionObjectInspector. |
| org.apache.hadoop.hive.serde2.objectinspector. StandardStructObjectInspector | ListStructObjectInspector works on struct data that is stored as a Java List or Java Array object. |

| Class | Description |
|---|---|
| org.apache.hadoop.hive.serde2.objectinspector. StandardUnionObjectInspector | StandardUnionObjectInspector works on union data that is stored as UnionObject. |
| org.apache.hadoop.hive.serde2.objectinspector. ThriftUnionObjectInspector | Always use the ObjectInspectorFactory to create new ObjectInspector objects, instead of directly creating an instance of this class. |
| org.apache.hadoop.hive.serde2.typeinfo. HiveDecimalUtils | Utilities for decimal precision and scale. |
| org.apache.hadoop.hive.serde2.typeinfo. TypeInfoUtils | TypeInfoUtils. |
| org.apache.hadoop.hive.shims. Hadoop23Shims | Implementation of shims against Hadoop 0.23.0. |
| org.apache.hadoop.hive.shims. HadoopShimsSecure | Base implementation for shims against secure Hadoop 0.20.3/0.23. |
| org.apache.hadoop.hive.shims. ShimLoader | ShimLoader. |
| org.apache.hadoop.hive.shims. Utils | Utilities for split location provider. |
| org.apache.hadoop.hive.thrift. DelegationTokenSecretManager | A Hive specific delegation token secret manager. |
| org.apache.hadoop.hive.thrift. HadoopThriftAuthBridge | Functions that bridge Thrift's SASL transports to Hadoop's SASL callback handlers and authentication classes. |
| org.apache.hadoop.hive.thrift. TokenStoreDelegationTokenSecretManager | Extension of DelegationTokenSecretManager to support alternative to default in-memory token management for fail-over and clustering through plug-able token store (ZooKeeper etc.). |
| org.apache.hive.beeline. BeeLine | A console SQL shell with command completion. |
| org.apache.hive.beeline. Commands | Implementation of beeline commands. |
| org.apache.hive.common.util. BloomFilter | BloomFilter is a probabilistic data structure for set membership check. |
| org.apache.hive.common.util. DateUtils | DateUtils. |
| org.apache.hive.common.util. HiveStringUtils | HiveStringUtils General string utils Originally copied from o.a.hadoop.util.StringUtils |
| org.apache.hive.common.util. HiveTestUtils | Utilities for testing hive. |
| org.apache.hive.common.util. Murmur3 | Murmur3 is successor to Murmur2 fast non-cryptographic hash algorithms. |
| org.apache.hive.common.util. ShutdownHookManager | The ShutdownHookManager enables running shutdownHook in a deterministic order, higher priority first. |
| org.apache.hive.common.util. StreamPrinter | StreamPrinter. |
| org.apache.hive.hcatalog.cli. HCatCli | HCatalog command line interface. |
| org.apache.hive.hcatalog.common. HCatConstants | List of constants used by HCatalog. |
| org.apache.hive.hcatalog.streaming. ConnectionError | Exception to catch connection errors. |
| org.apache.hive.hcatalog.streaming. DelimitedInputWriter | Streaming Writer handles delimited input (eg. |
| org.apache.hive.hcatalog.streaming. HiveEndPoint | Information about the hive end point (i.e. |
| org.apache.hive.hcatalog.streaming. InvalidTable | Exception to catch invalid table. |
| org.apache.hive.hcatalog.streaming. StrictJsonWriter | Streaming Writer handles utf8 encoded Json (Strict syntax). |

| Class | Description |
|--|---|
| org.apache.hive.hcatalog.templeton. AppConfig | The configuration for Templeton. |
| org.apache.hive.hcatalog.templeton. Main | The main executable that starts up and runs the Server. |
| org.apache.hive.jdbc .HiveConnection | HiveConnection. |
| org.apache.hive.jdbc .HiveDatabaseMetaData | HiveDatabaseMetaData. |
| org.apache.hive.jdbc .HivePreparedStatement | HivePreparedStatement. |
| org.apache.hive.jdbc .HiveQueryResultSet | HiveQueryResultSet. |
| org.apache.hive.jdbc .HiveStatement | HiveStatement. |
| org.apache.hive.jdbc .JdbcColumn | Column metadata. |
| org.apache.hive.jdbc .Utils | Utilities for jdbc. |
| org.apache.hive.service. ServiceUtils | Utilities to correctly process domain names etc. |
| org.apache.hive.service.auth. AuthenticationProviderFactory | Helps select a PasswdAuthenticationProvider for a given {@code AuthMethod}. |
| org.apache.hive.service.auth. HiveAuthFactory | Helps in some aspects of authentication. |
| org.apache.hive.service.auth. LdapAuthenticationProviderImpl | Utilities to correctly process domain names etc. |
| org.apache.hive.service.auth. TSetupAddressProcessor | Sets the ipAddress for operations executed via HiveServer2. |
| org.apache.hive.service.cli. CLIService | CLIService. |
| org.apache.hive.service.cli. CLIServiceUtils | CLIServiceUtils. |
| org.apache.hive.service.cli. ColumnBasedSet | ColumnBasedSet. |
| org.apache.hive.service.cli. ColumnDescriptor | ColumnDescriptor. |
| org.apache.hive.service.cli. ColumnValue | Protocols before HIVE_CLI_SERVICE_PROTOCOL_V6 (used by RowBasedSet) |
| org.apache.hive.service.cli. EmbeddedCLIServiceClient | Embedded CLI Service Client. |
| org.apache.hive.service.cli. FetchOrientation | Fetch Orientation. |
| org.apache.hive.service.cli. GetInfoType | Get Info type. |
| org.apache.hive.service.cli. GetInfoValue | Get Info value. |
| org.apache.hive.service.cli. Handle | Handle. |
| org.apache.hive.service.cli. HandleIdentifier | Handle identifier. |
| org.apache.hive.service.cli. HiveSQLException | Hive SQL exception. |

| Class | Description |
|--|--|
| org.apache.hive.service.cli. OperationHandle | Handler for operation. |
| org.apache.hive.service.cli. OperationState | Operation State. |
| org.apache.hive.service.cli. OperationStatus | Operation Status. |
| org.apache.hive.service.cli. OperationType | OperationType. |
| org.apache.hive.service.cli. RowBasedSet | Row Based Set. |
| org.apache.hive.service.cli. RowSetFactory | Row set factory class. |
| org.apache.hive.service.cli. SessionHandle | Session Handle. |
| org.apache.hive.service.cli. TableSchema | Table Schema. |
| org.apache.hive.service.cli. TypeDescriptor | Type Descriptor. |
| org.apache.hive.service.cli. TypeQualifiers | Holds type qualifier information for a primitive type, such as char/varchar length or decimal precision/scale. |
| org.apache.hive.service.cli.operation. ClassicTableTypeMapping | Classic Table Type Mapping. |
| org.apache.hive.service.cli.operation. ExecuteStatementOperation | Implementation of statement execution. |
| org.apache.hive.service.cli.operation. HiveCommandOperation | Executes a HiveCommand. |
| org.apache.hive.service.cli.operation. HiveTableTypeMapping | Hive Table Type Mapping. |
| org.apache.hive.service.cli.operation. LogDivertAppender | Divert appender to redirect operation logs to separate files. |
| org.apache.hive.service.cli.operation. MetadataOperation | Metadata Operation. |
| org.apache.hive.service.cli.operation. Operation | Class to define operation. |
| org.apache.hive.service.cli.operation. OperationManager | Operation Manager. |
| org.apache.hive.service.cli.operation. SQLOperation | SQL Operation. |
| org.apache.hive.service.cli.session. HiveSessionImpl | Hive Session. |
| org.apache.hive.service.cli.session. HiveSessionImplwithUGI | Hive session implementation with UGI. |
| org.apache.hive.service.cli.session. SessionManager | Session Manager. |
| org.apache.hive.service.cli.thrift. ThriftBinaryCLIService | Initialize worker threads in hive CLI startup. |
| org.apache.hive.service.cli.thrift. ThriftCLIService | Thrift CLI Service. |
| org.apache.hive.service.cli.thrift. ThriftCLIServiceClient | Thrift CLI Service Client. |
| org.apache.hive.service.cli.thrift. ThriftHttpCLIService | Service to handle requests over HTTP. |
| org.apache.hive.service.cli.thrift. ThriftHttpServlet | Thrift Http servlet. |
| org.apache.hive.spark.client. MetricsCollection | Provides metrics collected for a submitted job. |
| org.apache.hive.spark.client. SparkClientUtilities | Utilities for spark client. |
| org.apache.hive.spark.client.rpc. Rpc | Encapsulates the RPC functionality. |
| org.apache.hive.spark.client.rpc. RpcConfiguration | Definitions of configuration keys and default values for the RPC layer. |
| org.apache.hive.spark.client.rpc. RpcServer | An RPC server. |

Changed Interfaces in Hive 2.1

The following interfaces have changed in Hive 2.1:

| Interface | Description |
|---|--|
| org.apache.hadoop.hive.common. ValidTxnList | Models the list of transactions that should be included in a snapshot. |
| org.apache.hadoop.hive.metastore. AlterHandler | Interface for Alter Table and Alter Partition code |
| org.apache.hadoop.hive.metastore. IMetaStoreClient | Wrapper around hive metastore thrift api |
| org.apache.hadoop.hive.metastore. RawStore | |
| org.apache.hadoop.hive.metastore. PartitionExpressionProxy | The proxy interface that metastore uses for variety of QL operations (metastore can't depend on QL because QL depends on metastore; creating metastore-client module would be a proper way to solve this problem). |
| org.apache.hadoop.hive ql.exec.persistence. MapJoinTableContainer | |
| org.apache.hadoop.hive ql.exec.spark. SparkShuffler | |
| org.apache.hadoop.hive ql.exec.spark. SparkTran | |
| org.apache.hadoop.hive ql.exec.spark.session. SparkSession | |
| org.apache.hadoop.hive ql.exec.spark.status. SparkJobStatus | SparkJobStatus identify what Hive want to know about the status of a Spark job. |
| org.apache.hadoop.hive ql.exec.vector.expressions. VectorExpressionWriter | Interface used to create Writable objects from vector expression primitives. |
| org.apache.hadoop.hive ql.exec.vector.mapjoin.hashtable. VectorMapJoinHashTable | |
| org.apache.hadoop.hive ql.io. InputFormatChecker | Check for validity of the input files. |
| org.apache.hadoop.hive ql.io.orc. Reader | The interface for reading ORC files. |
| org.apache.hadoop.hive ql.io.orc. RecordReader | A row-by-row iterator for ORC files. |
| org.apache.hadoop.hive ql.io.orc. Writer | The HIVE interface for writing ORC files. |
| org.apache.hadoop.hive ql.io.sarg. SearchArgument | Primary interface for SearchArgument , which are the subset of predicates that can be pushed down to the RecordReader. |
| org.apache.hadoop.hive ql.lockmgr. HiveTxnManager | An interface that allows Hive to manage transactions. |
| org.apache.hadoop.hive ql.metadata.formatting. MetaDateFormat | Interface to format table and index information. |
| org.apache.hadoop.hive ql.plan. OperatorDesc | |
| org.apache.hadoop.hive ql.security.authorization.plugin. HiveAuthorizationValidator | Interface used to check if user has privileges to perform certain action. |
| org.apache.hadoop.hive ql.security.authorization.plugin. HiveAuthorizer | Interface for hive authorization plugins. |
| org.apache.hadoop.hive ql.stats. StatsAggregator | An interface for any possible implementation for gathering statistics. |
| org.apache.hadoop.hive ql.stats. StatsPublisher | An interface for any possible implementation for publishing statics. |

| Interface | Description |
|---|--|
| org.apache.hadoop.hive.shims. HadoopShims | In order to be compatible with multiple versions of Hadoop, all parts of the Hadoop interface that are not cross-version compatible are encapsulated in an implementation of this class. |
| org.apache.hive.hcatalog.streaming. StreamingConnection | Represents a connection to a HiveEndPoint. |
| org.apache.hive.hcatalog.streaming. TransactionBatch | Represents a set of Transactions returned by Hive. |
| org.apache.hive.service.cli. ICLIService | |
| org.apache.hive.service.cli. RowSet | |
| org.apache.hive.service.cli.operation. TableTypeMapping | |
| org.apache.hive.service.cli.session. HiveSession | |
| org.apache.hive.service.cli.session. HiveSessionBase | Methods that don't need to be executed under a doAs context are here. |
| org.apache.hive.spark.client. JobContext | Holds runtime information about the job execution context. |
| org.apache.hive.spark.client. SparkClient | Defines the API for the Spark remote client. |

Removed API in Hive 2.1

The following classes and interfaces are not available with Hive 2.1:

Removed Classes

| Class | Description |
|--|---|
| org.apache.hadoop.hive.common.metrics.Metrics | Metrics Subsystem - allows exposure of a number of named parameters/counters via jmx, intended to be used as a static subsystem Has a couple of primary ways it can be used: (i) Using the set and get methods to set and get named parameters (ii) Using the incrementCounter method to increment and set named parameters in one go, rather than having to make a get and then a set. |
| org.apache.hadoop.hive.hbase.HBaseStatsAggregator | A class that implements the StatsAggregator interface through HBase. |
| org.apache.hadoop.hive.hbase.HBaseStatsPublisher | A class that implements the StatsPublisher interface through HBase. |
| org.apache.hadoop.hive.hbase.HBaseStatsSetupConstants | HBase constants statistics setup. |
| org.apache.hadoop.hive.hbase.HBaseStatsUtils | Utilities for hbase statistics. |
| org.apache.hadoop.hive.metastore.ProtectMode | Protection Mode. |
| org.apache.hadoop.hive.metastore.txn.CompactionTxnHandler | Extends the transaction handler with methods needed only by the compactor threads. |
| org.apache.hadoop.hive.metastore.txn.TxnHandler | A handler to answer transaction related calls that come into the metastore server. |
| org.apache.hadoop.hive.metastore.txn.ValidCompactorTxnList | And implmentation of org.apache.hadoop.hive.common.ValidTxnList for use by the compactor. |
| org.apache.hadoop.hive.ql.exec.DefaultFetchFormatter | Serializes row by user specified serde and call toString() to make string type result |

| Class | Description |
|---|--|
| org.apache.hadoop.hive.ql.exec.Heartbeater | Class to handle heartbeats for MR and Tez tasks. |
| org.apache.hadoop.hive.ql.exec.vector.RandomRowObjectSource | Generates object inspector and random row object[]. |
| org.apache.hadoop.hive.ql.exec.vector.VectorAssignRowDynBatch | Assigns specified columns of a VectorizedRowBatch row from a Writable row Object[]. |
| org.apache.hadoop.hive.ql.exec.vector.VectorAssignRowSameBatch | Assigns specified columns of a VectorizedRowBatch row from a Writable row Object[]. |
| org.apache.hadoop.hive.ql.exec.vector.VectorSerializeRowNoNulls | Serializes columns from a row in a VectorizedRowBatch into a serialization format. |
| org.apache.hadoop.hive.ql.exec.vector.VectorizedColumnarSerDe | VectorizedColumnarSerDe is used by Vectorized query execution engine for columnar based storage supported by RCFile. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.VectorUDFDayOfMonthLong | Expression to get day of month. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.VectorUDFHourLong | Returns hour of day. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.VectorUDFMinuteLong | Returns minute value. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.VectorUDFMonthLong | Returns month value. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.VectorUDFSecondLong | Expression to get seconds. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.VectorUDFTimestampFieldLong | Abstract class to return various fields from a Timestamp or Date. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.VectorUDFUnixTimeStampLong | Return Unix Timestamp. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.VectorUDFWeekOfYearLong | Expression to get week of year. |
| org.apache.hadoop.hive.ql.exec.vector.expressions.VectorUDFYearLong | Expression to get year as a long. |
| org.apache.hadoop.hive.ql.exec.vector.mapjoin.fast.VectorMapJoinFastIntHashUtil | Utilities for mapr join in vectorization mode. |
| org.apache.hadoop.hive.ql.io.VectorizedRCFileInputFormat | A MapReduce/Hive Vectorized input format for RC files. |
| org.apache.hadoop.hive.ql.io.VectorizedRCFileRecordReader | RCFileRecordReader. |
| org.apache.hadoop.hive.ql.io.orc.FileDump | A tool for printing out the file structure of ORC files. |
| org.apache.hadoop.hive.ql.io.orc.InStream | Class to define input stream. |
| org.apache.hadoop.hive.ql.io.orc.Metadata | Metadata stored in underlying db. |
| org.apache.hadoop.hive.ql.io.orc.MetadataReader | Class to read and process metadata. |
| org.apache.hadoop.hive.ql.io.orc.OrcProto | Class to serialize data stored in orc. |
| org.apache.hadoop.hive.ql.io.orc.OrcUtils | Utilities to process orc files. |
| org.apache.hadoop.hive.ql.io.orc.RecordReaderFactory | Factory to create ORC tree readers. |
| org.apache.hadoop.hive.ql.io.orc.RecordReaderUtils | Stateless methods shared between RecordReaderImpl and EncodedReaderImpl. |

| Class | Description |
|---|--|
| org.apache.hadoop.hive.ql.io.orc.StripeStatistics | Information about index data stored in stripe. |
| org.apache.hadoop.hive.ql.io.orc.TreeReaderFactory | Factory for creating ORC tree readers. |
| org.apache.hadoop.hive.ql.log.PidDailyRollingFileAppender | Logging pids in file. |
| org.apache.hadoop.hive.ql.optimizer.calcite.HiveConfigContext | Hive configuration context. |
| org.apache.hadoop.hive.ql.optimizer.calcite.reoperators.HiveLimit | Define limit operator. |
| org.apache.hadoop.hive.ql.optimizer.calcite.reoperators.HiveSort | Define sort operator. |
| org.apache.hadoop.hive.ql.parse.VariableSubstitution | The Hive variable substitution mechanism was designed to avoid some of the code that was getting baked into the scripting language on top of Hive. |
| org.apache.hadoop.hive.ql.session.DependencyResolver | Creating list of dependency jars. |
| org.apache.hadoop.hive.ql.stats.CounterStatsAggregator | Counter statistics aggregator. |
| org.apache.hadoop.hive.ql.stats.CounterStatsAggregatorSpark | Counter statistics aggregator for Spark. |
| org.apache.hadoop.hive.ql.stats.CounterStatsAggregatorTez | This class aggregates stats via counters and does so for Tez Tasks. |
| org.apache.hadoop.hive.ql.stats.CounterStatsPublisher | Counter statistics publisher. |
| org.apache.hadoop.hive.ql.udf.UDFRegExp | UDFRegExp. |
| org.apache.hadoop.hive.shims.Hadoop20SShims | Implementation of shims against Hadoop 0.20 with Security. |
| org.apache.hadoop.hive.shims.HiveEventCounter | Hive event counter. |
| org.apache.hadoop.hive.shims.Jetty20SShims | In order to be compatible with multiple versions of Jetty, all parts of the Jetty interface that are not cross-version compatible are encapsulated in an implementation of this class. |
| org.apache.hadoop.mapred.WebHCatJTShim20S | This is in org.apache.hadoop.mapred package because it relies on JobSubmissionProtocol which is package private |
| org.apache.hive.benchmark.vectorization.VectorizationBenchmark | Measures the performance for vectorization. |
| org.apache.hive.jdbc.ZooKeeperHiveClientHelper | Resolve to a host:port by connecting to ZooKeeper and picking a host randomly. |
| org.apache.hive.service.cli.Column | Column. |
| org.apache.hive.service.cli.Type | Type. |
| org.apache.hive.service.cli.thrift.TArrayTypeEntry | Array type entry. |
| org.apache.hive.service.cli.thrift.TBinaryColumn | Binary column. |
| org.apache.hive.service.cli.thrift.TBoolColumn | Boolean column. |
| org.apache.hive.service.cli.thrift.TBoolValue | Boolean value. |
| org.apache.hive.service.cli.thrift.TByteColumn | Byte column. |
| org.apache.hive.service.cli.thrift.TByteValue | Byte value. |

| Class | Description |
|---|-----------------------------------|
| org.apache.hive.service.cli.thrift.TCLIService | Command line interface service. |
| org.apache.hive.service.cli.thrift.TCLIServiceConstants | Command line interface constants. |
| org.apache.hive.service.cli.thrift.TCancelDelegationTokenReq | Cancel delegation token request. |
| org.apache.hive.service.cli.thrift.TCancelDelegationTokenResp | Cancel delegation token response. |
| org.apache.hive.service.cli.thrift.TCancelOperationReq | Cancel operation request. |
| org.apache.hive.service.cli.thrift.TCancelOperationResp | Cancel operation response. |
| org.apache.hive.service.cli.thrift.TCloseOperationReq | Close operation request. |
| org.apache.hive.service.cli.thrift.TCloseOperationResp | Close operation response. |
| org.apache.hive.service.cli.thrift.TCloseSessionReq | Close session request. |
| org.apache.hive.service.cli.thrift.TCloseSessionResp | Close session response. |
| org.apache.hive.service.cli.thrift.TColumn | Column. |
| org.apache.hive.service.cli.thrift.TColumnDesc | Column description. |
| org.apache.hive.service.cli.thrift.TColumnValue | Column value. |
| org.apache.hive.service.cli.thrift.TDoubleColumn | Double column. |
| org.apache.hive.service.cli.thrift.TDoubleValue | Double value. |
| org.apache.hive.service.cli.thrift.TExecuteStatementReq | Execute statement request. |
| org.apache.hive.service.cli.thrift.TExecuteStatementResp | Execute statement response. |
| org.apache.hive.service.cli.thrift.TFetchOrientation | Fetch orientation. |
| org.apache.hive.service.cli.thrift.TFetchResultsReq | Fetch results request. |
| org.apache.hive.service.cli.thrift.TFetchResultsResp | Fetch results response. |
| org.apache.hive.service.cli.thrift.TGetCatalogsReq | Get catalogs request. |

Removed Interfaces

| Interface | Description |
|--|--|
| org.apache.hadoop.hive.ql.exec. <i>FetchFormatter</i> | (For internal-use only) Used in ListSinkOperator for formatting final output |
| org.apache.hadoop.hive.ql.io.orc. <i>BinaryColumnStatistics</i> | Statistics for binary columns. |
| org.apache.hadoop.hive.ql.io.orc. <i>BooleanColumnStatistics</i> | Statistics for boolean columns. |
| org.apache.hadoop.hive.ql.io.orc. <i>ColumnStatistics</i> | Statistics that are available for all types of columns. |
| org.apache.hadoop.hive.ql.io.orc. <i>CompressionCodec</i> | Compress the in buffer to the out buffer. |
| org.apache.hadoop.hive.ql.io.orc. <i>CompressionCodec.Modifier</i> | Compress the in buffer to the out buffer. |
| org.apache.hadoop.hive.ql.io.orc. <i>ConversionTreeReaderFactory</i> | Factory for creating ORC tree readers. |
| org.apache.hadoop.hive.ql.io.orc. <i>DateColumnStatistics</i> | Statistics for DATE columns. |

| Interface | Description |
|--|--|
| org.apache.hadoop.hive ql.io.orc.DecimalColumnStatistics | Statistics for decimal columns. |
| org.apache.hadoop.hive ql.io.orc.DirectDecompressionCodec | Decompression codec. |
| org.apache.hadoop.hive ql.io.orc.DoubleColumnStatistics | Statistics for float and double columns. |
| org.apache.hadoop.hive ql.io.orc.IntegerColumnStatistics | Statistics for all of the integer columns, such as byte, short, int, and long. |
| org.apache.hadoop.hive ql.io.orc.PositionProvider | An interface used for seeking to a row index. |
| org.apache.hadoop.hive ql.io.orc.StringColumnStatistics | Statistics for string columns. |
| org.apache.hadoop.hive ql.io.orc.StripeInformation | Information about the stripes in an ORC file that is provided by the Reader. |
| org.apache.hadoop.hive ql.io.orc.TimestampColumnStatistics | Statistics for Timestamp columns. |
| org.apache.hadoop.hive ql.stats.StatsCollectionTaskIndependent | Marker interface to differentiate between stats publisher / aggregator which don't track stats per task, as oppose to others which do. |

Deprecated API in Hive 2.1

The following classes, interfaces, and fields have been deprecated in Hive 2.1.

Deprecated Classes

| |
|--|
| org.apache.hadoop.hive ql.exec.ByteWritable |
| org.apache.hadoop.hive.serde.Constants |
| org.apache.hadoop.hive ql.io.FlatFileInputFormat |
| org.apache.hadoop.hive ql.io.FlatFileInputFormat.FlatFileRecordReader |
| org.apache.hadoop.hive ql.io.IgnoreKeyTextOutputFormat <i>use HiveIgnoreKeyTextOutputFormat instead</i> |
| org.apache.hadoop.hive.serde2.lazy.LazySimpleSerDe.SerDeParameters |
| org.apache.hadoop.hive ql.exec.UDAF <i>Either implement GenericUDAFResolver2 or extend AbstractGenericUDAFResolver instead.</i> |

Deprecated Interfaces

| |
|---|
| org.apache.hadoop.hive.serde2.Deserializer |
| org.apache.hadoop.hive ql.udf.generic.GenericUDAFEvaluator.AggregationBuffer <i>use GenericUDAFEvaluator.AbstractAggregationBuffer instead</i> |
| org.apache.hadoop.hive ql.udf.generic.GenericUDAFResolver <i>Use GenericUDAFResolver2 instead.</i> |
| org.apache.hadoop.hive.serde2.SerDe |
| org.apache.hadoop.hive.serde2.Serializer |

Deprecated Fields

| |
|---|
| org.apache.hadoop.hive.serde2.avro.AvroSerdeUtils.AVRO_SERDE_SCHEMA |
| org.apache.hadoop.hive.serde2.avro.AvroSerdeUtils.SCHEMA_DOC |
| org.apache.hadoop.hive.serde2.avro.AvroSerdeUtils.SCHEMA_LITERAL |
| org.apache.hadoop.hive.serde2.avro.AvroSerdeUtils.SCHEMA_NAME |
| org.apache.hadoop.hive.serde2.avro.AvroSerdeUtils.SCHEMA_NAMESPACE |
| org.apache.hadoop.hive.serde2.avro.AvroSerdeUtils.SCHEMA_RETRIEVER |
| org.apache.hadoop.hive.serde2.avro.AvroSerdeUtils.SCHEMA_URL |
| org.apache.hive.hplsql.HplsqlParser.tokenNames <i>Use HplsqlParser.VOCABULARY instead.</i> |
| org.apache.hive.hplsql.HplsqlLexer.tokenNames <i>Use HplsqlLexer.VOCABULARY instead.</i> |

Deprecated Methods

| |
|--|
| org.apache.hadoop.hive.metastore.IMetaStoreClient.addDynamicPartitions(long, String, String, List<String>) <i>in Hive 1.3.0/2.1.0 - will be removed in 2 releases</i> |
| org.apache.hadoop.hive.metastore.HiveMetaStoreClient.addDynamicPartitions(long, String, String, List<String>) |
| org.apache.hadoop.hive.serde2.ColumnProjectionUtils.appendReadColumnIDs(Configuration, List<Integer>) <i>for backwards compatibility with <= 0.12, use appendReadColumns</i> |
| org.apache.hive.hcatalog.api.HCatCreateTableDesc.Builder.bucketCols(List<String>, int) |
| org.apache.hive.hcatalog.api.HCatCreateTableDesc.Builder.collectionItemsTerminatedBy(char) |
| org.apache.hive.hcatalog.api.HCatCreateTableDesc.Builder.comments(String) |
| org.apache.hadoop.hive.metastore.IMetaStoreClient.compact(String, String, String, CompactionType) |
| org.apache.hadoop.hive.metastore.HiveMetaStoreClient.compact(String, String, String, CompactionType) |
| org.apache.hadoop.hive.ql.metadata.HiveStorageHandler.configureTableJobProperties(TableDesc, Map<String, String>) |
| org.apache.orc.impl.InStream.create(String, ByteBuffer[], long[], long, CompressionCodec, int) |
| org.apache.hive.hcatalog.api.HCatCreateTableDesc.create(String, String, List<HCatFieldSchema>) |
| org.apache.hive.hcatalog.api.HCatAddPartitionDesc.create(String, String, String, Map<String, String>) |
| org.apache.hadoop.hive.serde2.lazy.LazyFactory.createColumnarStructInspector(List<String>, List<TypeInfo>, byte[], Text, boolean, byte) |
| org.apache.hadoop.hive.serde2.lazy.LazyFactory.createLazyObjectInspector(TypeInfo, byte[], int, Text, boolean, byte) |
| org.apache.hadoop.hive.serde2.lazy.LazyFactory.createLazyObjectInspector(TypeInfo, byte[], int, Text, boolean, byte, boolean) |
| org.apache.hadoop.hive.serde2.lazy.LazyFactory.createLazyObjectInspector(TypeInfo, byte[], int, Text, boolean, byte, boolean, ObjectInspectorFactory.ObjectInspectorOptions) |
| org.apache.hadoop.hive.serde2.lazy.LazyFactory.createLazyObjectInspector(TypeInfo, byte[], int, Text, boolean, byte, ObjectInspectorFactory.ObjectInspectorOptions) |

| |
|---|
| <code>org.apache.hadoop.hive.serde2.lazy.LazyFactory.createLazyStructInspector(List<String>, List<TypeInfo>, byte[], Text, boolean, boolean, byte)</code> |
| <code>org.apache.hadoop.hive.serde2.lazy.LazyFactory.createLazyStructInspector(List<String>, List<TypeInfo>, byte[], Text, boolean, boolean, byte, boolean)</code> |
| <code>org.apache.hadoop.hive.metastore.IMetaStoreClient.dropTable(String, boolean)</code> <i>As of release 0.6.0 replaced by <code>IMetaStoreClient.dropTable(String, String, boolean, boolean)</code>. This method will be removed in release 0.7.0.</i> |
| <code>org.apache.hadoop.hive.metastore.HiveMetaStoreClient.dropTable(String, boolean)</code> |
| <code>org.apache.hive.hcatalog.api.HCatCreateTableDesc.Builder.escapeChar(char)</code> |
| <code>org.apache.hive.hcatalog.api.HCatCreateTableDesc.Builder.fieldsTerminatedBy(char)</code> |
| <code>org.apache.hive.hcatalog.api.HCatCreateTableDesc.Builder.fileFormat(String)</code> |
| <code>org.apache.hive.hcatalog.api.HCatCreateTableDesc.getBucketCols()</code> |
| <code>org.apache.hive.hcatalog.api.HCatCreateTableDesc.getCols()</code> |
| <code>org.apache.hadoop.hive.serde2.dynamic_type.SimpleCharStream.getColumn()</code> |

Troubleshooting Hive and Tez

This section includes Hive and Tez troubleshooting tips.

HDFS Literal Deprecated

Starting in Hive-2.3, the `hdfs` literal is deprecated. Specifying a table location using the `hdfs` URI scheme will cause queries to fail because the Hive parser recognizes the `hdfs` literal in the `LOCATION` key word and triggers HDFS encryption, which is not supported.

If you use the `hdfs` literal with the `LOCATION` keyword in Hive queries:

```
CREATE TABLE IF NOT EXISTS i (id INT) LOCATION 'hdfs:///i';
```

The system logs the following warning:

```
LOG.warn("hdfs:// is deprecated filesystem and will be removed in future
releases. Use maprfs://
instead");
```

To avoid `hdfs` literal issues, update all instances of `hdfs` with `maprfs` in tables, partitions, and databases. Also update the `hive-site.xml` file to remove `hdfs` from the URI scheme list.

Update hive-site.xml

Remove `hdfs` from the `hive.exim.uri.scheme.whitelist` Hive configuration property in `hive-site.xml`, as shown:

```
<property>
<name>hive.exim.uri.scheme.whitelist</
name>
  <value>maprfs,...,s3</value>
</property>
```

Update Tables and Partitions

To replace the table and partition location with `maprfs`, run:

```
MariaDB [hive]> update SDS set
LOCATION = REPLACE(LOCATION, 'hdfs',
'maprfs') where LOCATION like
'%hdfs%';
```

Update Databases

To replace the database location with `maprfs`, run:

```
MariaDB [hive]> update
DBS set DB_LOCATION_URI =
REPLACE(DB_LOCATION_URI, 'hdfs',
'maprfs') where DB_LOCATION_URI like
'%hdfs%';
```

Prohibited usage of `datanucleus.schema.autoCreateAll` property

The usage of the `datanucleus.schema.autoCreateAll` property is prohibited in all cases. Instead of using this property, you must run the `schematool` command. Refer to [HIVE-21302](#) for more information.

WebHCat

Secure WebHCat operations depend on the Hive metastore having Kerberos enabled. If Kerberos is not enabled for the Hive metastore, null pointer exceptions similar to the following will appear:

```
2013-10-06 20:38:55,198 ERROR metastore.RetryingHMSHandler
(RetryingHMSHandler.java:invoke(134)) -
MetaException(message: java.lang.NullPointerException)

java.util.concurrent.ThreadPoolExecutor$Worker.runTask(ThreadPoolExecutor.ja
va:895)
    at
java.util.concurrent.ThreadPoolExecutor$Worker.run(ThreadPoolExecutor.java:9
18)
```

If you are updating to the `mapr-hive-2.3.6-mapr-1912 (EEP-6.3.0)` package, you should manually replace the old `webhcat-default.xml` configuration file with the new one and restart the WebHCat service:

```
cp /opt/mapr/hive/hive-2.3/hcatalog/etc/webhcat.new/
webhcat-default.xml /opt/mapr/hive/hive-2.3/hcatalog/etc/webhcat/
```

Hive in an Azure Cluster

When Hive services are installed on an Azure cluster, it is possible that the services will not start because Azure assigns too long (over 64 symbols) host names. Perform following steps to fix this issue:

Note: This issue is fixed on MapR core 6.0.1 starting from build 20180320175756.GA-1.x86_64.

1. Edit the `/etc/hosts` file:

```
nano /etc/hosts
```

This is an example of a `/etc/hosts` file for an Azure cluster:

```
127.0.0.1    localhost localhost.localdomain localhost4
localhost4.localhostdomain4
::1         localhost localhost.localdomain localhost6
localhost6.localhostdomain6
172.24.8.4  anaikregtestc73522602-cluster-com-mapr-vm0.izqafobxqxbuzkv4led1p3snic.dx.
internal.cloudapp.net anaikregtestc73522602-cluster-com-mapr-vm0
172.24.8.5  anaikregtestc73522602-cluster-com-mapr-vm1.izqafobxqxbuzkv4led1p3snic.dx.
internal.cloudapp.net anaikregtestc73522602-cluster-com-mapr-vm1
172.24.8.6  anaikregtestc73522602-cluster-com-mapr-vm2.izqafobxqxbuzkv4led1p3snic.dx.
internal.cloudapp.net anaikregtestc73522602-cluster-com-mapr-vm2
172.24.8.7  anaikregtestc73522602-cluster-com-mapr-vm3.izqafobxqxbuzkv4led1p3snic.dx.
internal.cloudapp.net anaikregtestc73522602-cluster-com-mapr-vm3
172.24.8.8  anaikregtestc73522602-cluster-com-mapr-vm4.izqafobxqxbuzkv4led1p3snic.dx.
internal.cloudapp.net anaikregtestc73522602-cluster-com-mapr-vm4
```

2. Add a short alias for each node:

Note: You can use any short alias. In this example, `vm0`, `vm1`, `vm2`, `vm3`, and `vm4` are used:

```
127.0.0.1    localhost localhost.localdomain localhost4
localhost4.localhostdomain4
::1         localhost localhost.localdomain localhost6
localhost6.localhostdomain6
172.24.8.4  anaikregtestc73522602-cluster-com-mapr-vm0.izqafobxqxbuzkv4led1p3snic.dx.
internal.cloudapp.net anaikregtestc73522602-cluster-com-mapr-vm0 vm0
172.24.8.5  anaikregtestc73522602-cluster-com-mapr-vm1.izqafobxqxbuzkv4led1p3snic.dx.
internal.cloudapp.net anaikregtestc73522602-cluster-com-mapr-vm1 vm1
172.24.8.6  anaikregtestc73522602-cluster-com-mapr-vm2.izqafobxqxbuzkv4led1p3snic.dx.
internal.cloudapp.net anaikregtestc73522602-cluster-com-mapr-vm2 vm2
172.24.8.7  anaikregtestc73522602-cluster-com-mapr-vm3.izqafobxqxbuzkv4led1p3snic.dx.
internal.cloudapp.net anaikregtestc73522602-cluster-com-mapr-vm3 vm3
172.24.8.8  anaikregtestc73522602-cluster-com-mapr-vm4.izqafobxqxbuzkv4led1p3snic.dx.
internal.cloudapp.net anaikregtestc73522602-cluster-com-mapr-vm4 vm4
```

3. Perform step 1 and 2 for each node in the cluster.

Tez Upgrade Issues

- Preserving configuration on Ubuntu is not supported from EEP 4.1.1 and EEP 5.0.0 (1803) to EEP 6.0.0 (1808) or EEP 5.0.1 (1808).
- Preserving Tomcat configuration is not supported from any previous EEP to EEP 6.0.0 (1808).

- You must manually stop the Tomcat service and delete the Tomcat folder as a precondition if you are updating or upgrading Tez from the following EEPs:
 - EEP 4.0.0
 - EEP 4.1.0

User Names, Group Names, and LDAP

LDAP configuration allows you to use group names and usernames with spaces, so it is possible to name groups with spaces in them, for example, `domain users`. The following structure is possible in the MapR FileSystem:

```
drwxr-xr-x  - afischer      domain users      0 2018-10-03 16:10 /
user/abc
drwxr-xr-x  - mapr        mapr              0 2018-10-05 16:51 /
user/def
drwxr-xr-x  - dschexnayder domain users      8 2018-10-10 13:30 /
user/xyz
drwxr-xr-x  - mapr        mapr              1 2018-10-09 14:23 /user/
hive
drwxr-xr-x  - mapr        mapr              11 2018-10-10 01:56 /user/
mapr
drwxr-xr-x  - mlitovsky   domain users      0 2018-10-06 11:08 /user/
hjbs
drwxr-xr-x  - pcurtis     domain users      5 2018-10-04 19:33 /user/
jknd
drwxr-xr-x  - mapr        mapr              3 2018-10-08 16:29 /user/
ewkd
drwxr-xr-x  - talvarez    domain users      0 2018-10-04 17:02 /
user/lkd
```

According to [HADOOP-12505](#), the Hadoop community does not allow spaces in group names, and because of that so does Hive. Each time you perform a query in Hive on a group name that has a space, you will see the following exception:

```
-chgrp: 'domain users' does not match expected pattern for group
```

The workaround is to not use spaces in group names or user names.

HiveServer 2 takes time to start because of `get_all_databases`

Materialized view registry and cache is introduced in [HIVE-14496](#) for Hive 2.3.0.

The goal of the cache is to avoid parsing and creating logical plans for the materialized views at query runtime. When a query arrives, you need to consult this cache and extract the logical plans for the views (which are already parsed) from it. Materialized view registry class scans all databases and tables in each database during initialization and that may cause long time to start HiveServer2.

Property `hive.materializedview.enable.views.registry` is added to control the usage of materialized view registry:

Property: `hive.materializedview.enable.views.registry`

Default value: `true`

Description: In case of a large amount of databases and tables in Hive, usage of materialized view registry and cache force HiveServer2 to scan all of them in order to cache the query plan for a view. This leads to an extremely long time for HiveServer2 to start.

This property is used to disable view registry and cache for this case. To disable materialized view registry and cache, add the following to `hive-site.xml` and restart Hive services.

```
<property>
  <name>hive.materializedview.enable.views.registry</name>
  <value>>false</value>
</property>
```

Database and Table Names Containing a Dot (.)

HIVE-16907 rejects queries with database and table names that contain a dot (.), and this behavior is backported to Hive 2.3.

Databases and tables that contain a dot (.) in the name are not supported now. For example:

```
{code}
insert into `tdb.t1` select * from t2;
{code}
Throws error:
{code}
FAILED: SemanticException
org.apache.hadoop.hive.ql.parse.SemanticException: Line 1:12 Table or
database name may not contain dot(.) character 'tdb.t1'
{code}
```

Avoid using unsupported characters in database and table names.

Hive Logging

This section describes Hive logging for Hive 2.1 and later releases and includes information about log splitting.

Hive Logging (Hive 2.3 and Later)

For Hive 2.3 and later starting with EEP 6.3.0, this topic describes the folder structure of the Hive logs and includes details about the log-file contents and how log files are installed in multinode installations.

Hive Log Folder Structure

Table 1 shows the Hive log folder structure:

Table

| Folder or File | | Description |
|---|--|--|
| <code>\${HIVE_HOME}/log</code> | | Root folder for all Hive logs |
| | <pre>hive-\${ADMIN_USER}-hiveserver2-\${HOSTNAME}.out hive-\${ADMIN_USER}-metastore-\${HOSTNAME}.out init_derby_db_\${TIMESTAMP}.log</pre> | Each service has a separate file for logging |
| <code>\${HIVE_HOME}/log/\${ADMIN_USER}</code> | | Root folder for admin cluster logs |
| | <pre>\${ADMIN_USER}-hiveserver2-\${HOSTNAME}.log \${ADMIN_USER}-metastore-\${HOSTNAME}.log \${ADMIN_USER}-cli-\${HOSTNAME}.log</pre> | Cluster admin log files |

Table (Continued)

| Folder or File | | | Description |
|--|--|--|--|
| <code>\${HIVE_HOME}/log/\${ADMIN_USER}/webhcat/</code> | | | Root folder for webHcat logs |
| | | <code>webhcat.log</code> <code>webhcat-console.log</code> <code>webhcat-console-error.log</code> | WebHcat log files |
| <code>\${HIVE_HOME}/log/\${OTHER_USER}</code> | | | Root folder for a user other than the admin user |
| | | <code>\${OTHER_USER}-cli-\${HOSTNAME}.log</code> | CLI log for a user other than the admin user |

In Table 1:

| This element | Represents |
|--|---|
| <code>\${HIVE_HOME}</code> | The Hive home folder, which is usually <code>/opt/mapr/hive/hive</code> . |
| <code>\${ADMIN_USER}</code> | The admin user of a cluster that runs HiveServer2 and HiveMetastore daemons. Usually, this is the <code>mapr</code> user. |
| <code>\${HOSTNAME}</code> | The name of the host where the daemon runs. |
| <code>\${TIMESTAMP}</code> | The date and time of log creation. |
| <code>\${OTHER_USER}</code> | A user other than the admin user. |
| <code>\${OTHER_USER}-cli-\${HOSTNAME}.log</code> | The log file that is created when <code>\${OTHER_USER}</code> launches the Hive CLI. |

Content of Log Files

Table 2 shows the content of the log files:

Table

| File Name | Description |
|---|--|
| <code>hive-\${ADMIN_USER}-hiveserver2-\${HOSTNAME}.out</code> | Contains information about when the HiveServer2 daemon was started and the PID of the file. |
| <code>hive-\${ADMIN_USER}-metastore-\${HOSTNAME}.out</code> | Contains information about when the HiveMetastore daemon was started and the PID of the file. |
| <code>\${ADMIN_USER}-hiveserver2-\${HOSTNAME}.log</code> | Contains information from the HiveServer2 daemons. This file also contains the job progress. |
| <code>\${ADMIN_USER}-metastore-\${HOSTNAME}.log</code> | Contains information from the HiveMetastore daemons. |
| <code>\${ADMIN_USER}-cli-\${HOSTNAME}.log</code> | Created when a user runs the Hive CLI over the <code>\${ADMIN_USER}</code> . This file contains the job progress. |
| <code>\${OTHER_USER}-cli-\${HOSTNAME}.log</code> | Created when a user runs the Hive CLI over the <code>\${OTHER_USER}</code> . This file also contains the job progress. |
| <code>init_derby_db_\${TIMESTAMP}.log</code> | Created if and only if Hive was configured for Apache Derby through cluster installation. |

Log Files in a Multinode Hive Installation

Table 3 shows a Hive multinode installation (that is, Hive packages installed on different nodes):

Table

| | Hive Metastore | HiveServer2 | HiveWebHCat |
|-------|----------------|-------------|-------------|
| node1 | | | |
| node2 | | | |
| node3 | | | |

See Table 4 for the log configurations:

Table

| File or Folder Name | node1 | node2 | node3 |
|--|-------|-------|-------|
| hive- <code>{ADMIN_USER}</code> -metastore- <code>{HOSTNAME}</code> .out | | | |
| <code>{ADMIN_USER}</code> -metastore- <code>{HOSTNAME}</code> .log | | | |
| hive- <code>{ADMIN_USER}</code> -hiveserver2- <code>{HOSTNAME}</code> .out | | | |
| <code>{ADMIN_USER}</code> -hiveserver2- <code>{HOSTNAME}</code> .log | | | |
| /webhcat/ | | | |
| webhcat.log | | | |
| webhcat-console.log | | | |
| webhcat-console-error.log | | | |
| / <code>{ADMIN_USER}</code> / | | | |

Related concepts

[Disabling Log Splitting of Hive Log Files](#) on page 3821

By default, Hive log files are split into HiveServer2 and Metastore log files, but you can disable log splitting by editing the `hive-env.sh` file.

[Splitting Hive Logs into HiveServer2 and Metastore logs by Process ID](#) on page 3821

Starting from the 1904 release, you can split Hive log files into HiveServer2 and Metastore log files by process ID.

Hive Logging (Hive 2.1 and Later)

For certain Hive 2.1 and later releases, this topic describes the folder structure of the Hive logs and includes details about the log-file contents and how log files are installed in multinode installations.

The Hive log information in this topic applies to Hive 2.1 and later releases beginning with the 1803 release-date identifier. Included are the Hive releases in Ezmeral Ecosystem Packs (EEPs) 3.0.3, 3.0.4, 3.0.5, 4.1.1, 4.1.2, 4.1.3, 4.1.4, 5.0.x, 6.0.x, 6.1.1, and 6.2.0. For more information about release-date identifiers, see [Release History for EEPs](#) on page 5819.

Default log folder structure

Hive logs have the following folder structure:

```

{HIVE_HOME}/log
{HIVE_HOME}/log/hive-{ADMIN_USER}-hiveserver2-{HOSTNAME}.out
{HIVE_HOME}/log/hive-{ADMIN_USER}-metastore-{HOSTNAME}.out
{HIVE_HOME}/log/init_derby_db_{TIMESTAMP}.log
{HIVE_HOME}/log/{ADMIN_USER}

```

```

${HIVE_HOME}/log/${ADMIN_USER}/${ADMIN_USER}-hiveserver2-${HOSTNAME}.log
${HIVE_HOME}/log/${ADMIN_USER}/${ADMIN_USER}-metastore-${HOSTNAME}.log
${HIVE_HOME}/log/${ADMIN_USER}/webhcat/
${HIVE_HOME}/log/${ADMIN_USER}/webhcat/webhcat.log
${HIVE_HOME}/log/${ADMIN_USER}/webhcat/webhcat-console.log
${HIVE_HOME}/log/${ADMIN_USER}/webhcat/webhcat-console-error.log
${HIVE_HOME}/log/${OTHER_USER}
${HIVE_HOME}/log/${OTHER_USER}/${OTHER_USER}-hiveserver2-${HOSTNAME}.log

```

Here:

```

${HIVE_HOME} - Hive home folder. Usually this is /opt/mapr/hive/hive.
${ADMIN_USER} - Admin user of cluster that runs HiveServer2 and
HiveMetastore daemons. Usually this is mapr.
${HOSTNAME} - Name of the host where a daemon runs.
${TIMESTAMP} - Date and time of log creation.
${OTHER_USER} - Not an admin user.

```

Content of log files

Files ``${HIVE_HOME}/log/hive-${ADMIN_USER}-hiveserver2-${HOSTNAME}.out`` and ``${HIVE_HOME}/log/hive-${ADMIN_USER}-metastore-${HOSTNAME}.out`` contain information about when HiveServer2 and HiveMetastore daemons are stated, and what are their PIDs.

Files ``${HIVE_HOME}/log/${ADMIN_USER}/${ADMIN_USER}-hiveserver2-${HOSTNAME}.log`` and ``${HIVE_HOME}/log/${ADMIN_USER}/${ADMIN_USER}-hiveserver2-${HOSTNAME}.log`` contain information from HiveServer2 and HiveMetastore daemons. File ``${ADMIN_USER}-hiveserver2-${HOSTNAME}.log`` also contains job progress.

The ``${HIVE_HOME}/log/${OTHER_USER}/${OTHER_USER}-hiveserver2-${HOSTNAME}.log`` file is created when somebody runs Hive CLI over the ``${OTHER_USER}``. The ``${OTHER_USER}-hiveserver2-${HOSTNAME}.log`` file contains job progress.

The ``${HIVE_HOME}/log/init_derby_db-${TIMESTAMP}.log`` file is created if and only if Hive was configured for Derby Db through cluster installation.

Log files on multi node Hive installation

Consider Hive multi node installation (that is Hive packages are installed on different nodes). See Table 1:

Table

| | Hive Metastore | HiveServer2 | HiveWebHCat |
|-------|----------------|-------------|-------------|
| node1 | | | |
| node2 | | | |
| node3 | | | |

See Table 2 for log configurations.

Table

| | node1 | node2 | node3 |
|---|-------|-------|-------|
| <code>`\${HIVE_HOME}/logs/hive-\${ADMIN_USER}-metastore- \${HOSTNAME}.out`</code> | | | |
| <code>`\${HIVE_HOME}/logs/\${ADMIN_USER}/\${ADMIN_USER}-metastore- \${HOSTNAME}.log`</code> | | | |
| <code>`\${HIVE_HOME}/logs/hive-\${ADMIN_USER}-hiveserver2- \${HOSTNAME}.out`</code> | | | |

Table (Continued)

| | node1 | node2 | node3 |
|--|-------|-------|-------|
| <code>\${HIVE_HOME}/logs/\${ADMIN_USER}/\${ADMIN_USER}-hiveserver2-\${HOSTNAME}.log</code> | | | |
| <code>\${HIVE_HOME}/logs/\${ADMIN_USER}/webhcat/</code> | | | |
| <code>\${HIVE_HOME}/logs/\${ADMIN_USER}/webhcat/webhcat.log</code> | | | |
| <code>\${HIVE_HOME}/logs/\${ADMIN_USER}/webhcat/webhcat-console.log</code> | | | |
| <code>\${HIVE_HOME}/logs/\${ADMIN_USER}/webhcat/webhcat-console-error.log</code> | | | |
| <code>\${HIVE_HOME}/logs/\${ADMIN_USER}</code> | | | |

Related concepts

[Disabling Log Splitting of Hive Log Files](#) on page 3821

By default, Hive log files are split into HiveServer2 and Metastore log files, but you can disable log splitting by editing the `hive-env.sh` file.

[Splitting Hive Logs into HiveServer2 and Metastore logs by Process ID](#) on page 3821

Starting from the 1904 release, you can split Hive log files into HiveServer2 and Metastore log files by process ID.

Disabling Log Splitting of Hive Log Files

By default, Hive log files are split into HiveServer2 and Metastore log files, but you can disable log splitting by editing the `hive-env.sh` file.

This information is valid for Hive-2.1+ starting from the EEP-1803 release.

Disabling Log Splitting of Hive Log Files

You can disable splitting the Hive log files into HiveServer2 and Metastore log files. To write all logs to the `hive.log` file, use these steps:

1. Edit the `hive-env.sh` file to set `SPLIT_HIVE_LOGS_INTO_FILES` property to `false`.

```
export SPLIT_HIVE_LOGS_INTO_FILES="false"
```

Note: To restore the default behavior from your previous Hive log configuration, set the `SPLIT_HIVE_LOGS_INTO_FILES` property to `true`, or comment out this property and restart Hive services.

2. Restart Hive services.

Splitting Hive Logs into HiveServer2 and Metastore logs by Process ID

Starting from the 1904 release, you can split Hive log files into HiveServer2 and Metastore log files by process ID.

To enable this feature, you must create a `hive-log4j2.properties` file, if one does not already exist, and then edit it:

1. If the `hive-log4j2.properties` file does not exist, create it from the template:

```
cp /opt/mapr/hive/hive-<version>/conf/
hive-log4j2.properties.template /opt/mapr/hive/hive-<version>/conf/
hive-log4j2.properties
```

2. Edit the `hive-log4j2.properties` file to replace Daily Rolling File Appender (DRFA) with the PID appender:

```
#property.hive.root.logger = DRFA
property.hive.root.logger = PID
#appenders = console, DRFA
appenders = console, PID
```

3. Restart Hive services.

The resultant Hive log structure is as follows:

The HiveServer2 log is located at:

```
${HIVE_HOME}/log/<ADMIN_USER>/
<ADMIN_USER>-hiveserver2-<HOSTNAME>.log.<PID>@<HOSTNAME>
```

Where:

- `${HIVE_HOME}` is the home folder for Hive.
- `<ADMIN_USER>` is the administrator user of the cluster. Typically, `mapr`.
- `<HOSTNAME>` is the host where HiveServer2 log file is placed.
- `<PID>` is the process ID of HiveServer2.

The Metastore log is located at:

```
${HIVE_HOME}/log/<ADMIN_USER>/
<ADMIN_USER>-metastore-<HOSTNAME>.log.<PID>@<HOSTNAME>
```

Where:

- `${HIVE_HOME}` is the home folder for Hive.
- `<ADMIN_USER>` is the administrator user of the cluster. Typically, `mapr`.
- `<HOSTNAME>` is the host where Hive Metastore log file is placed.
- `<PID>` is the process ID of Hive Metastore.

Logging CLI session

After splitting logs for HiveServer2 and Hive Metastore, CLI log appears separately for each CLI session at `${HIVE_HOME}/logs/<USERNAME>`.

A log file is created for every launched CLI session:

```
${HIVE_HOME}/log/<USERNAME>/
<USERNAME>-hiveserver2-<HOSTNAME>.log.<PID>@<HOSTNAME>
```

Where `<PID>` is process identifier of the CLI session.

Viewing Hive Audit Logs

Starting in EEP 7.1.0, you can view Hive audit logs for connected, disconnected, and total connected users.

To view audit logs, add the following property in the `hive-site.xml` file:

```
<property>
  <name>hive.enable.full.list.of.connected.users</name>
  <value>true</value>
</property>
```

By default, logs are updated every five seconds.

The following table describes the Hive Parameters used to manage the user audit logs:

| Parameter | Default value | Description |
|--|---------------|--|
| <code>hive.enable.full.list.of.connected.users</code> | false | Enables the logging of the users currently connected to Hive when set to true. Use for debugging purposes only. |
| <code>hive.full.list.of.connected.users.update.interval</code> | 5 | Enables the log updates for currently connected Hive users in seconds. Must be used with the <code>hive.enable.full.list.of.connected.users</code> parameter. Use for debugging purposes only. |

How to View Audit Logs

Enable the `hive.enable.full.list.of.connected.users` property in `hive-site.xml` file. You can view audit logs for connected, disconnected, and total connected users in HiveServer2 logs located in `${HIVE_HOME}/logs/mapr/mapr-hiveserver2-<hostname>.log` directory.

The following examples show you how the audit logs look in different scenarios:

Logs display for new user connection

Log entries for connected users provide the current session ID, username, IP address of the user, and the authentication type.

```
INFO [HiveServer2-Handler-Pool:
Thread-51] HiveSessionImpl.audit:
Connected:
sessionId=4c25b6d6-6e8e-4d56-83ba-52ea
271d0545 user=mapr ip=192.168.33.11
auth=MAPRSASL
```

Logs display for disconnected user

Log entries for disconnected users provide the current session ID, username, IP address of the user, and the authentication type.

```
INFO [HiveServer2-Handler-Pool:
Thread-51] HiveSessionImpl.audit:
Disconnected:
sessionId=4c25b6d6-6e8e-4d56-83ba-52ea
271d0545 user=mapr ip=192.168.33.11
auth=MAPRSASL
```

Logs display for total connected users

Log entries for total connected users start with a message `-Start of connected users list`, and provides the current session ID, username, IP address of the user, operation count, active time, idle time,

authentication type, and end with a message- End of the connected user's list.

```
INFO [pool-4-thread-1]
SessionManager.audit: Start of the
connected users list

INFO [pool-4-thread-1]
SessionManager.audit:
sessionId=c6261d49-1a71-4404-8cad-9cac
11a28151 user=mapr ip=192.168.33.11
operationCount=0 activeTime(s)=268
IdleTime(s)=268, auth=MAPRSASL

INFO [pool-4-thread-1]
SessionManager.audit:
sessionId=36b4d8d4-f201-43da-90eb-cb68

connected user's list
```

How to Audit a Hive Query

The audit log in HiveServer2 allows you to trace the activities of a Hive query. The log entries for a Hive query includes username, user's IP address, query ID, query type, and query string.

To audit a Hive query, run any Hive query and then see the HiveServer2 logs located in `${HIVE_HOME}/logs/mapr/mapr-hiveserver2-<hostname>.log` directory.

```
INFO [HiveServer2-Background-Pool: Thread-54]
Driver.audit: user=mapr ip=192.168.33.11
queryId=mapr_20210426155754_ace67f82-9a0c-4d0e-9ac5-c529b9798ec7 query
type=SHOWTABLES queryStr=show tables
```

HttpFS

HttpFS provides a service that enables you to submit HTTP REST calls to distributed file systems. You can use HttpFS to perform read and write operations on the filesystem.

This section includes the following topics:

Authentication on Secure Clusters for HttpFS

In secure clusters, HttpFS can use any of the following authentication methods:

- HttpFS authentication, such as native security (data-fabric SASL)
- Kerberos (for which additional configuration is required)

- Plain security using PAM, which is determined automatically

In a secure cluster, HttpFS runs a script to set the following properties by default. In a non-secure cluster, you must add the following properties manually to the `httpfs-site.xml` file:

```
httpfs.hadoop.authentication.type=multiauth
httpfs.authentication.type=multiauth
```

Configuring HttpFS

You can configure the following features to perform distributed filesystem operations securely through HttpFS.

The following topics describe how to configure various security mechanisms for HttpFS.

Kerberos Authentication for HttpFS

Complete the following steps to enable Kerberos security on nodes that run the HttpFS service:

Step 1: Set up a Kerberos Principal and keytab File

Each node running the HttpFS service must have a keytab file (`/opt/mapr/conf/mapr.keytab`) and these two principals:

- `HTTP/<fully.qualified.domain.name>`
- `mapr/<fully.qualified.domain.name>`

Note: For complete instructions on generating a Kerberos principal and keytab file, see [Configuring Kerberos](#).

To check whether the keytab already exists, and if it contains the two necessary principals, run the `klist` command with the `-k` (keytab keys), `-e` (encryption type) and `-t` (timestamp) options:

```
$ klist -ket /opt/mapr/conf/mapr.keytab
```

The output from this command displays the following information:

- KVNO (key version number)
- Timestamp (the time the key was generated)
- Principal names
- Encryption types

If the keytab file does not exist, or does not contain both principals, generate them by following these steps:

1. Generate a Kerberos principal for the `mapr` user. The principal is of the form `mapr/<fully.qualified.domain.name>@<your-realm>.com`, where `<fully.qualified.domain.name>` is unique for each HttpFS node. In the following example, `perfnod153.perf.lab@dev-maprtech.com` is used for the `<fully.qualified.domain.name>@<your-realm>.com`.

```
$ kadmin
kadmin: addprinc -randkey mapr/perfnod153.perf.lab@dev-maprtech.com
```

2. Generate a Kerberos principal for `HTTP/<fully.qualified.domain.name>`. This is required for Kerberos authentication of the HttpFS server using HTTP SPNEGO.

```
$ kadmin
kadmin: addprinc -randkey HTTP/perfnode153.perf.lab@dev-maprtech.com
```

3. If the current node does not already have a keytab file created for another service, create one and name it `mapr.keytab`. Note that each node references the same keytab file (usually located at `/opt/mapr/conf/mapr.keytab`), and each keytab file can have multiple principals.

```
kadmin: ktadd -k /opt/mapr/conf/mapr.keytab mapr/perfnode153.perf.lab
```

4. Change the owner of the keytab file from the `root` user (the default) to the `mapr` user.

```
$ chown mapr:mapr /opt/mapr/conf/mapr.keytab
```

5. Set read-only permissions on the `mapr.keytab` file.

```
$ chmod 600 mapr:mapr /opt/mapr/conf/mapr.keytab
```

Step 2: Verify Credentials in the keytab File

To test that the credentials in the `mapr.keytab` file work, run the `klist` command with the three options:

- `-k` for keytab keys
- `-e` for encryption type
- `-t` for timestamp

Example

```
$ klist -ket /opt/mapr/conf/mapr.keytab
```

Verify that the output lists only one key version number (KVNO) for each principal name. If you see the same principal listed more than once with a different KVNO, this could indicate a problem. The latest version number is used, which means you might not be able to log in to the node and authenticate with your user credentials.

Here is sample output for a node that has the HttpFS and CLDB services installed.

```
Keytab name: FILE:/opt/mapr/conf/mapr.keytab
KVNO Timestamp Principal
-----
-----
2 07/18/14 18:50:07 mapr/perfnode153.perf.lab@dev-maprtech
(aes256-cts-hmac-shal-96)
2 07/18/14 18:50:07 mapr/perfnode153.perf.lab@dev-maprtech (arcfour-hmac)
2 07/18/14 18:50:08 mapr/perfnode153.perf.lab@dev-maprtech (des3-cbc-shal)
2 07/18/14 18:50:08 mapr/perfnode153.perf.lab@dev-maprtech (des-cbc-crc)
2 07/18/14 18:50:26 HTTP/perfnode153.perf.lab@dev-maprtech
(aes256-cts-hmac-shal-96)
2 07/18/14 18:50:26 HTTP/perfnode153.perf.lab@dev-maprtech (arcfour-hmac)
2 07/18/14 18:50:26 HTTP/perfnode153.perf.lab@dev-maprtech (des3-cbc-shal)
2 07/18/14 18:50:26 HTTP/perfnode153.perf.lab@dev-maprtech (des-cbc-crc)
6 07/18/14 18:50:56 mapr/my.cluster.com@dev-maprtech
(aes256-cts-hmac-shal-96)
```

```
6 07/18/14 18:50:56 mapr/my.cluster.com@dev-maprtech (arcfour-hmac)
6 07/18/14 18:50:56 mapr/my.cluster.com@dev-maprtech (des3-cbc-sha1)
6 07/18/14 18:50:57 mapr/my.cluster.com@dev-maprtech (des-cbc-crc)
```

In the example, the following principals are listed for the `perfnode153.perf.lab` node:

- `mapr/perfnode153.perf.lab@dev-maprtech` for authenticating to the HttpFS service
- `HTTP/perfnode153.perf.lab@dev-maprtech` for communicating securely over HTTP
- `mapr/my.cluster.com` for authenticating to the CLDB service

Step 3: Modify the `httpfs-site.xml` File

A Kerberos-ready version of the `httpfs-site.xml` file called `httpfs-site.xml.kerberos` is provided in `/opt/mapr/httpfs/httpfs-<version>/etc/hadoop`. Edit this file and specify the Kerberos principal name for the nodes running HttpFS, restart the HttpFS server, and then test the set-up. Each step is explained here.

Note that the directory differs based on the `httpfs` version:

- In EEP 7.0.1 and earlier, the directory is `/opt/mapr/httpfs/httpfs-1.0/etc/hadoop/httpfs-site.xml`.
- In EEP 7.1.0 and later, the directory is `/opt/mapr/httpfs/httpfs-1.1.0/etc/hadoop/httpfs-site.xml`.

To set up the `httpfs-site.xml` file for each node running the HttpFS service, follow these steps:

1. Assign a new name to the existing `httpfs-site.xml` file (to preserve the original version when the file gets overwritten in step 2).

- In 7.0.1 and earlier, run:

```
cp /opt/mapr/httpfs/httpfs-1.0/etc/hadoop httpfs-site.xml
httpfs-site.xml.original
```

- In 7.1.0 and later, run:

```
cp /opt/mapr/httpfs/httpfs-1.1.0/etc/hadoop httpfs-site.xml
httpfs-site.xml.original
```

2. Copy the kerberos version (`httpfs-site.xml.kerberos`) to the existing `httpfs-site.xml` file.

- In 7.0.1 and earlier, run:

```
cp /opt/mapr/httpfs/httpfs-1.0/etc/hadoop httpfs-site.xml.kerberos
httpfs-site.xml
```

- In 7.1.0 and later, run:

```
cp /opt/mapr/httpfs/httpfs-1.1.0/etc/hadoop httpfs-site.xml.kerberos
httpfs-site.xml
```

3. Edit the `httpfs-site.xml` file and insert the principal name as shown, substituting your fully qualified domain name and realm for `perfnode153.perf.lab@mapr.com`.

```
<property>
  <name>
    httpfs.authentication.kerberos.principal
  </name>
  <value>
    HTTP/perfnode153.perf.lab@mapr.com
  </value>
</property>
```

4. Restart the HttpFS server so the changes will take effect.

```
maprcli node services -name httpfs -action restart -nodes <node_name>
```

5. Test that security is in place by entering the following command to create a file in the filesystem. The command will fail if security is not set up correctly.

```
curl --negotiate -u : -b ~/cookiejar.txt -c ~/cookiejar.txt -i -X PUT
"http://perfnode153.perf.lab:14000/webhdfs/v1/user/mapr/some_file?
op=MKDIRS"
```

(Optional) Configure the HTTP Header Size

For EEP 7.0.1 and earlier, the `maxHttpHeaderSize` parameter defines the maximum size of the request and response HTTP header, specified in bytes. If it is not specified, this parameter defaults to 8192 (8KB).

When Kerberos security is enabled, you may need to increase this value in the `server.xml` file:

```
/opt/mapr/httpfs/httpfs-1.0/share/hadoop/httpfs/tomcat/conf/server.xml
```

Example

```
<Connector port="{httpfs.http.port}" maxHttpHeaderSize="32000"
protocol="HTTP/1.1" connectionTimeout="20000" redirectPort="8443"/>
```

If you do not increase this value, you may encounter errors of the following form:

```
HTTP/1.1 400 Bad Request
```

Note: After making this configuration change, restart the HttpFS server.

PAM Authentication for HttpFS

Complete the following steps to enable PAM authentication for HttpFS.

1. Add the `httpfs.hadoop.authentication.type` and `httpfs.authentication.type` properties to the `/opt/mapr/httpfs/httpfs-version/etc/hadoop/httpfs-site.xml` file, as shown. Note that the directory differs based on the httpfs version:
 - In EEP 7.0.1 and earlier, the directory is `/opt/mapr/httpfs/httpfs-1.0/etc/hadoop/httpfs-site.xml`.

- In EEP 7.1.0 and later, the directory is `/opt/mapr/httpfs/httpfs-1.1.0/etc/hadoop/httpfs-site.xml`.

```
<property>
  <name>httpfs.hadoop.authentication.type</name>
  <value>multiauth</value>
</property>

<property>
  <name>httpfs.authentication.type</name>
  <value>multiauth</value>
</property>
```

Note: On secure clusters, the `multiauth` authentication is enabled by default.

2. Restart the HttpFS service.

```
sudo -u mapr /opt/mapr/httpfs/httpfs-1.0/sbin/httpfs.sh stop
sudo -u mapr /opt/mapr/httpfs/httpfs-1.0/sbin/httpfs.sh start
```

3. After restarting the service, run cURL with the PUT operation, as shown in this example:

Note: If HttpFS is configured with plain authentication through PAM, the cURL request must contain a username and password.

```
curl -X PUT "https://mapr:mapr@node1:14000/webhdfs/v1/tmp/example?
op=mkdirs"
```

SSL Security for HttpFS

On a secure cluster, HttpFS uses the secure-by-default configuration. Use the following topics to explicitly enable custom security on HttpFS.

You also need to enable SSL if [custom security](#) is enabled.

Enabling SSL Security for HttpFS

Enable SSL security for HttpFS using a `ssl_keystore` and `ssl_truststore`. These are generated automatically for a secure cluster in `/opt/mapr/conf/`. When using SSL on insecure clusters, you must manually generate a keystore and truststore.

Complete the steps that correlate with your version of HttpFS.

- For EEP 7.1.x and higher, complete the following steps:
 1. Change the value inside property `httpfs.ssl.enabled` in file `/opt/mapr/httpfs/httpfs-1.1.0/etc/hadoop/httpfs-site.xml` to `true`.
 2. Restart the HttpFS server using the following command:

```
maprcli node services -action restart -name httpfs -nodes <node>
```

- For EEP 7.0.x, complete the following steps:

1. To preserve the original version, rename the existing `server.xml` file (`/opt/mapr/httpfs/httpfs-1.0/share/hadoop/httpfs/tomcat/conf/server.xml`) to `server.xml.orig`.

```
sudo cp /opt/mapr/httpfs/httpfs-1.0/share/hadoop/httpfs/tomcat/conf/
server.xml
/opt/mapr/httpfs/httpfs-1.0/share/hadoop/httpfs/tomcat/conf/
server.xml.orig
```

2. Replace the contents of `server.xml` with the contents of `server.xml.https`.

```
sudo cp /opt/mapr/httpfs/httpfs-1.0/share/hadoop/httpfs/tomcat/conf/
server.xml.https
/opt/mapr/httpfs/httpfs-1.0/share/hadoop/httpfs/tomcat/conf/server.xml
```

3. To enable SSL without certificate-based authentication, set the `clientAuth` attribute to **"false"** and set properties related to `keystore` and `truststore` (on a secure cluster, the defaults are already set) in `server.xml` located in `/opt/mapr/httpfs/httpfs-1.0/share/hadoop/httpfs/tomcat/conf/`. For example:

```
<Connector port="{httpfs.http.port}" SSLEnabled="true"
maxThreads="150" scheme="https" secure="true"
clientAuth="false" sslProtocol="TLS"
keystoreFile="/opt/mapr/conf/ssl_keystore"
keystorePass="<ssl-keystore-password>"
truststoreFile="/opt/mapr/conf/ssl_truststore"
truststorePass="<ssl-keystore-password>"/>
```

Configuring Certificate-Based Authentication for HttpFS

Starting from EEP 7.1.0, configuration of certificate-based authentication for HttpFS is no longer available. To configure certificate-based authentication for HttpFS, for EEP 7.0.x, you need to make changes to the `server.xml` and `web.xml` file and restart the HttpFS server. To use this method, each client requires a client certificate issued by trusted CA.

1. To enable certificate-based authentication, for EEP 7.0.x, perform the following steps:
 - a) Verify that the `clientAuth` attribute is set to **"true"** and set properties related to `keystore` and `truststore` in `server.xml` (`/opt/mapr/httpfs/httpfs-1.0/share/hadoop/httpfs/tomcat/conf/server.xml`).

For example:

```
<Connector port="{httpfs.http.port}" SSLEnabled="true"
maxThreads="150" scheme="https" secure="true" clientAuth="true"
sslProtocol="TLS"
keystoreFile="/opt/mapr/conf/ssl_keystore"
keystorePass="<ssl-keystore-password>"
truststoreFile="/opt/mapr/conf/ssl_truststore"
truststorePass="<ssl-keystore-password>"/>
```

- b) In `web.xml` (`/opt/mapr/httpfs/httpfs-1.0/share/hadoop/httpfs/tomcat/webapps/webhdfs/WEB-INF/web.xml`), un-comment the following section:

```
<security-constraint>
  <web-resource-collection>
    <web-resource-name>Protected Context</web-resource-name>
    <url-pattern>/*</url-pattern>
  </web-resource-collection>
  <auth-constraint>
    <role-name>sample</role-name>
  </auth-constraint>
  <user-data-constraint>
    <transport-guarantee>CONFIDENTIAL</transport-guarantee>
  </user-data-constraint>
</security-constraint>

<security-role>
  <role-name>sample</role-name>
</security-role>

<login-config>
  <auth-method>CLIENT-CERT</auth-method>
</login-config>
```

- c) Verify that `tomcat-users.xml` (`/opt/mapr/httpfs/httpfs-1.0/share/hadoop/httpfs/tomcat/conf/tomcat-users.xml`) contains the roles and users in the certificates.

```
<tomcat-users>
  <role rolename="sample" />
  <user name="CN=<hostname>" password="null" roles="sample" />
</tomcat-users>
```

Note: The name value should include information from your certificate. For example, `<tomcat-users> <role rolename="sample"/> <user name="CN=www.mapr.com, OU=mapr, O=mapr, L=San Jose, ST=San Jose, C=CA" password="null" roles="sample" /> </tomcat-users>` You can run the following command to view the contents of the certificate file: `openssl x509 -text -in /opt/mapr/hue/hue-<version>/cert.pem`

```
<tomcat-users>
  <role rolename="sample" />
  <user name="CN=www.mapr.com, OU=mapr, O=mapr, L=San Jose,
    ST=San Jose, C=CA" password="null" roles="sample" />
</tomcat-users>
```

2. Restart the HttpFS server using the following command:

```
maprcli node services -name httpfs -action restart -nodes <space
delimited list of nodes>
```

Verifying SSL Security for HttpFS

You need to run `curl` commands to verify that HTTPS is enabled for HttpFS.

Run one of the following `curl` commands to check that HTTPS is enabled. These commands fetch the file `some_file.txt` from the file system under `/user/mapr` and attempt to open it securely over HTTPS.

- To check if HTTPS is enabled, run the following command (which differs for non-secure and secure clusters):

- For non-secure clusters:

```
curl "http://localhost:14000/webhdfs/v1/user/mapr/some_file.txt?op=open&user.name=mapr"
```

- For secure clusters:

```
curl -u <user_name> -k "https://localhost:14000/webhdfs/v1/user/mapr/some_file.txt?op=open"
```

- If you configured Hue to use SSL encryption with certificate-based authentication for communication with HttpFS, run the following command (which differs for non-secure and secure clusters):

- For non-secure clusters:

```
curl --cert /opt/mapr/hue/hue-<version>/cert.pem --key /opt/mapr/hue/hue-<version>/hue_private_keystore.pem "http://localhost:14000/webhdfs/v1/user/mapr/some_file.txt?op=open&user.name=mapr"
```

- For secure clusters:

```
curl -u <user_name> -k --cert /opt/mapr/hue/hue-<version>/cert.pem --key /opt/mapr/hue/hue-<version>/hue_private_keystore.pem "https://localhost:14000/webhdfs/v1/user/mapr/some_file.txt?op=open"
```

Enabling SSL Security for HttpFS with Credential Provider

Starting from EEP-7.1.0, you can enable SSL security for HttpFS with credential provider. The CredentialProvider API is used to separate the use of sensitive tokens, secrets, and passwords from the applications. `hadoop credential create` command is used to provision a password to a particular credential store provider.

To enable SSL security for HttpFS with credential provider, perform the following steps:

1. Enable SSL in `etc/hadoop/httpfs-site.xml` configuration file.

```
<property>
  <name>httpfs.ssl.enabled</name>
  <value>>true</value>
  <description>
    Whether SSL is enabled. Default is false, i.e. disabled.
  </description>
</property>
```

2. Use the credential provider to create secure SSL passwords.

```
hadoop credential create ssl.server.keystore.password -value 123 \
  -provider localjceks://file/home/mapr/httpfs.jceks
```

```
hadoop credential create ssl.server.keystore.keypassword -value 123 \
  -provider localjceks://file/home/mapr/httpfs_keypassword.jceks
```

3. Run Java `keytool` command to create an SSL certificate for the HttpFS server.

```
keytool -genkey -alias jetty -keyalg RSA
```

You will be prompted to answer a series of questions to create a keystore file named **.keystore**.

- You must enter the same password for “keystore password” as the value of the property `ssl.server.keystore.password` set while creating secure SSL passwords.
- You must answer “What is your first and last name?” (i.e. “CN”) with the hostname of the machine where the HttpFS Server will be running.

The `.keystore` file will be stored in the `httpfs` user home directory.

4. Configure `etc/hadoop/ssl-server.xml` file to set SSL keystore location.

```
<property>
  <name>ssl.server.keystore.location</name>
  <value>/home/mapr/.keystore</value>
  <description>Keystore to be used. Must be specified.
</description>
</property>
```

5. Configure `etc/hadoop/httpfs-site.xml` file with following property to set credential provider path and enable the credential provider.

```
<property>
  <name>hadoop.security.credential.provider.path</name>
  <value>localjceks://file/home/lmccay/aws.jceks</value>
  <description>Path to interrogate for protected credentials.</
description>
</property>
```

6. Restart the HttpFS server.

```
maprcli node services -action restart -name httpfs -nodes <node>
```

User Impersonation for HttpFS

You can set up proxy user functionality if you want HttpFS to impersonate a user from a set of hosts, or to impersonate a user that belongs to a set of groups. When you configure proxy user functionality, the proxy user can perform “doAs” operations. Add configuration properties to the `httpfs-site.xml` and `core-site.xml` files to configure proxy user functionality.

Complete the following steps to configure user impersonation for HttpFS:

1. Add the following configuration properties to the `httpfs-site-site.xml` file:

- `httpfs.proxyuser.#USER#.hosts`
- `httpfs.proxyuser.#USER#.groups`

2. Replace #USER# with the username of the proxy that can perform “doAs” operations. For the host property, you can add a list of host names as the value. For the group property, you can add a list of groups as the value. Alternatively, you can add a wildcard character (*) as the value for host and group properties. To add multiple users, copy the property and replace #USER# with the proxy user name.

Host Example

```
<property>
  <name>httpfs.proxyuser.mapr.hosts</name>
  <value>*</value>
</property>
```

Group Example

```
<property>
  <name>httpfs.proxyuser.mapr.groups</name>
  <value>*</value>
</property>
```

To use impersonation, issue a cURL command with the `doas=<impersonated_user's name>` parameter.

Example 1

Where `user.name` is `mapr` and `doas` (or the impersonated user's name) is **sampleusername**.

```
curl -i -X PUT -T one
"http://<node_name>:14000/webhdfs/v1/user/mapr/TEST/one
?op=CREATE&user.name=mapr&doas=sampleusername&data=true"
-H "Content-Type:application/octet-stream"
```

Example 2

For any user (and password) other than the `mapr` user (for example, **test_user1**), set the `hadoop.proxyuser.<user_name>.hosts</name>` property in the `/opt/mapr/httpfs/httpfs-<version>/etc/hadoop/httpfs-site.xml` file, as shown. Note that the directory differs based on the version of `httpfs`, for example:

- In EEP 7.0.1 and earlier, the directory is `/opt/mapr/httpfs/httpfs-1.0/etc/hadoop/httpfs-site.xml`.
- In EEP 7.1.0 and later, the directory is `/opt/mapr/httpfs/httpfs-1.1.0/etc/hadoop/httpfs-site.xml`.

```
<property>
  <name>hadoop.proxyuser.<test_user1>.hosts</name>
  <value>*</value>
</property>
```

Run cURL.

Where `trueuser.name` is **test_user1** and `doas` (or the impersonated user's name) is **test_user2**.

```
curl -u fred -i -X PUT -T /etc/hosts --header "Content-Type:application/
octet-stream"
"http://<node_name>:14000/webhdfs/v1/<path_to_test_file>
?op=CREATE&doas=<test_user2>&data=true&user.name=<test_user1>"
```

Finishing HTTPFS Configuration Changes

After making configuration changes for the `mapr-httpfs` package, run the `configure.sh` script on all nodes where the `mapr-httpfs` package was installed:

```
sudo bash /opt/mapr/server/configure.sh -R
```

Troubleshooting HttpFS

To debug authentication issues, follow these steps:

1. Edit the `log4j` properties file located at `/opt/mapr/httpfs/httpfs-1.0/etc/hadoop/httpfs-log4j.properties` and insert the following lines to activate debug capabilities:

```
log4j.logger.org.apache.hadoop.fs.http.server=DEBUG, httpfs
log4j.logger.org.apache.hadoop.lib=DEBUG, httpfs
log4j.logger.org.apache.hadoop.security.authentication.server=DEBUG,
httpfs
```

2. Search the logs located at `/opt/mapr/httpfs/httpfs-1.0/logs` for the words *ERROR* or *Exception*.

Hue

Hue is the open source UI that interacts with Apache Hadoop and its ecosystem components, such as Hive, Pig, and Oozie. It is also a framework for creating interactive Web applications.

For information about Hue versions, see the [Ecosystem Support Matrix](#).

Hue is supported on the following browsers:

| Windows | Linux | Mac |
|----------------------|--------------|--------------|
| Chrome | Chrome | Chrome |
| Firefox 3.6+ | Firefox 3.6+ | Firefox 3.6+ |
| Safari 5+ | | Safari 5+ |
| Internet Explorer 8+ | | |

Hue Feature Support

The following table lists supported and unsupported Hue functionality:

| Supported | Not Supported |
|--|--|
| <p>Query editors</p> <ul style="list-style-type: none"> • Hive (for performing queries on Apache Hive) • Impala (for submitting interactive SQL and HiveQL queries) • DB Query (for viewing data in MySQL, PostgreSQL, Oracle and Sqlite) • Pig (for submitting Pig scripts) • Job Designer (for creating and submitting MapReduce/Streaming/Java jobs) • Spark (beta feature for submitting Spark jobs for hue-3.9.0/3.10.0) • Drill (for performing queries on Apache Drill through JDBC) in hue-3.12 <p>Data browsers</p> <ul style="list-style-type: none"> • Metastore Tables (for managing databases, tables, and partitions of the Hive metastore) • HBase browser (for creating, editing, and searching tables) • Sqoop Transfer (for transferring bulk data between Hadoop and various types of structured datastores) <p>Workflows</p> <ul style="list-style-type: none"> • Oozie (for creating and running workflow and coordinator jobs) <p>Hue 4.X supports ADLS browser for accessing files and directories in Azure Data Lake Store.</p> <p>S3 Browser (for accessing files and directories in Amazon S3)</p> <p>File Browser (for accessing files and directories in filesystem)</p> <ul style="list-style-type: none"> • Job Browser (for accessing MapReduce applications) • User Admin (for adding, deleting, and managing Hue users and groups) | <p>Hue integration with the following components is not supported:</p> <ul style="list-style-type: none"> • Sentry 1.6, 1.7 on a secure cluster that uses data-fabric-SASL authentication. <p> Note: Sentry 1.6, 1.7 on a secure cluster that uses Kerberos authentication is supported.</p> <ul style="list-style-type: none"> • Solr Search • Zookeeper |

Configure Hue

After you install Hue, perform the following configuration steps:

1. Complete the general configuration steps. This includes integrating Hue with ResourceManager and HttpFS.
2. Perform the steps to integrate each additional component that you want to use with Hue.
 - Hive
 - HPE Ezmeral Data Fabric Database
 - Impala

- Oozie
- Spark

You may also want to:

- Configure Security
- Configure DB Query
- Configure Hue Interface Authentication

Note: The `hue.ini` file is the main configuration file for running Hue on a cluster. This file is located at `/opt/mapr/hue/hue-<version>/desktop/conf/hue.ini`. When you update the value of a property in the `hue.ini`, remove any hashes (`##`) that appear directly before the property name. You must also restart Hue for these changes to take effect.

Configure General Hue Settings

The following topics provide instructions for configuring general Hue settings:

Enable User Impersonation for Hue

To enable Hue to submit requests on behalf of any other user, complete the following steps:

1. Verify or configure the following lines to the `/opt/mapr/hadoop/hadoop-<version>/etc/hadoop/core-site.xml` file for all nodes running ResourceManager:

```
<property>
  <name>hadoop.proxyuser.<default_user>.hosts</name>
  <value>*</value>
</property>

<property>
  <name>hadoop.proxyuser.<default_user>.groups</name>
  <value>*</value>
</property>
```

2. To enable the Hue file browser to view files in the filesystem, add the following proxy user settings in the configuration block of the `httpfs-site.xml`:

```
<!-- Hue HttpFS proxy user setting -->
<configuration>
  <property>
    <name>httpfs.proxyuser.<default_user>.hosts</name>
    <value>*</value>
  </property>

  <property>
    <name>httpfs.proxyuser.<default_user>.groups</name>
    <value>*</value>
  </property>
</configuration>
```

3. Perform any additional Hue configurations and then restart Hue so that the changes will take effect. See [Starting the Hue Webservice](#).

In most cases, `mapr` is the `<default_user>`. The `<default_user>` you specify must also be the `default_user` that is configured in the `[desktop]` section of the `hue.ini`.

Note: Based on the ecosystem components that you want to use, additional configuration may be required.

Disable an Application in the Hue Interface (optional)

If you want to disable an application (such as Impala), follow these steps:

1. In the `[desktop]` section of the `hue.ini` file, uncomment the `# app_blacklist=` statement and insert the name of the app you want to disable (`impala` in this example).

Note: Do not remove `search` from the `app_blacklist`. The Hue UI will not work if the search application is enabled.

```
# Comma-separated list of apps not to load at server startup.
# Note that rdbms is the name used for dbquery.
app_blacklist=spark,zookeeper,search,impala,sqoop,rdbms
```

Note: After removing an application from `app_blacklist`, you must update the Hue internal database to create the tables required for the application that was enabled:

```
sudo /opt/mapr/server/configure.sh -R
```

2. Once all changes are made, restart Hue so the changes will take effect.

Note: You can re-enable a blacklisted application at any time, and then restart Hue.

```
maprcli node services -name hue -action restart -nodes <ip_address>
```

Change the File Size Restriction for the File Browser (optional)

The Hue File Browser will not open files that are 1.0 GB or greater. Starting with Hue 4.2, file size limitation equals 1.0 GB with no way to modify it.

Prevent Hue from Creating User Home Directories

Describes how to disable the automatic creation of user home directories.

By default, Hue creates a directory in the filesystem for a user when the user logs in to the Hue service.

For example, if a `/user` volume is configured in the filesystem, Hue creates a `/user/<username>` directory in the volume each time a user logs in to the Hue service. If a quota is not placed on that `/user` volume, a user could potentially place an unlimited amount of data in the volume.

If you do not want Hue to create a home directory for each user that logs in to the Hue service, disable the `ensure_home_directory` option in the `[desktop]` `[[auth]]` section of the `hue.ini` file, as shown:

```
[desktop]
[[auth]]
ensure_home_directory=false
```

Restart the Hue service for the setting to take effect.

Note: This functionality is available by default starting in EEP 7.1.0. Previous versions of EEP can obtain this functionality through a patch. See [Applying a Patch](#) on page 393.

Configure Hue Interface Authentication

You can configure the following user authentication methods for the Hue interface:

| Authentication Method | Description |
|-------------------------|---|
| Hue User Administration | Use the Hue interface to create and manage user accounts for each Hue user. |
| LDAP | Import LDAP users into Hue and then use LDAP to authenticate users with their LDAP credentials. For more information, see Configure Hue with LDAP . |
| PAM | Use multiple PAM modules to authenticate users. PAM authentication is configured by default. When you use this method, you cannot edit users in the Hue interface. |

Using a Non-Default Authentication Method

The default authentication method is PAM.

To edit the authentication method used for the Hue interface, complete the following steps:

1. Set the `backend` property equal to your selected authentication method. For example, to use Hue's user authentication, select `desktop.auth.backend.AllowFirstUserDjangoBackend`.
2. If you choose not to use PAM, comment the `pam_service` property.

Example hue.ini configured to use PAM Authentication

```
[[auth]]
# Authentication backend. Common settings are:
# - django.contrib.auth.backends.ModelBackend (entirely Django backend)
# - desktop.auth.backend.AllowAllBackend (allows everyone)
# - desktop.auth.backend.AllowFirstUserDjangoBackend
# (Default. Relies on Django and user manager, after the first login)
# - desktop.auth.backend.LdapBackend
# - desktop.auth.backend.PamBackend - WARNING: existing users in Hue may be
unaccessible if they not exist in OS
# - desktop.auth.backend.SpnegoDjangoBackend
# - desktop.auth.backend.RemoteUserDjangoBackend
# - libsaml.backend.SAML2Backend
# - libopenid.backend.OpenIDBackend
# - liboauth.backend.OAuthBackend
# (Support Twitter, Facebook, Google+ and LinkedIn
backend=desktop.auth.backend.PamBackend

# The service to use when querying PAM.
pam_service=sudo sshd login
```

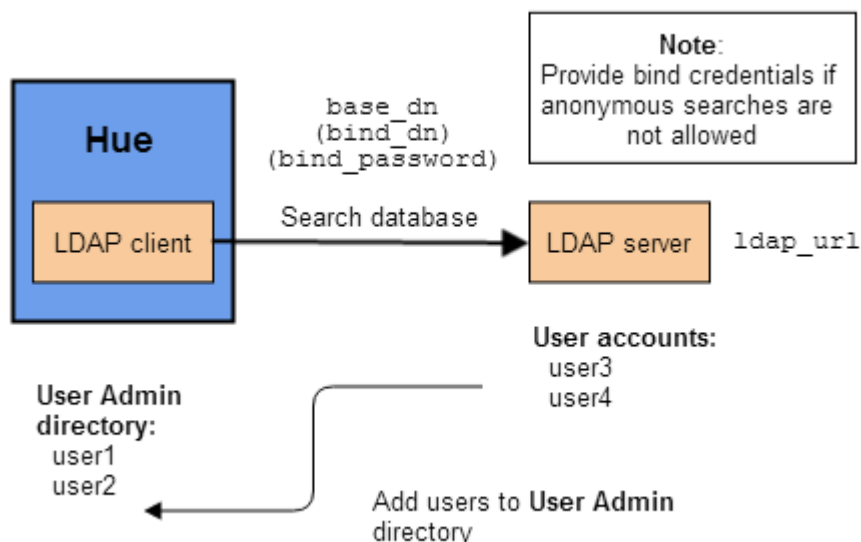

Configure Hue with LDAP

If you use LDAP to authenticate users, you can retrieve user account information from your LDAP database and import it directly into Hue's `User Admin` directory. This way, you do not have to use the Hue interface to create user accounts for each Hue user individually.

Once you import users, you can also use LDAP with Hue to authenticate users with their LDAP credentials. Each of these tasks is explained in the following sections:

Setting up Users from an LDAP Database

This diagram shows how the LDAP client embedded in Hue searches the LDAP server's database for user names, and then adds them to the User Admin directory for Hue.

The following table shows the parameters you need to set in the `ldap` section of the `hue.ini` file so you can import users.

Warning: The `hue.ini` file is located at `/opt/mapr/hue/hue-<version>/desktop/conf/`.

| Parameter | Description | Comments |
|-----------------------------|---|--|
| <code>ldap_url</code> | The URL of your LDAP server. | |
| <code>base_dn</code> | Top of the search tree, which defines the search scope. | |
| <code>bind_dn</code> | Distinguished name (DN) of the user to bind as. | Can be omitted for anonymous searches. |
| <code>bind_password</code> | Password of the bind user. | Can be omitted for anonymous searches. |
| <code>user_filter</code> | Limits the scope of the search by applying a filter. | This parameter is optional. |
| <code>user_name_attr</code> | The attribute used for username in the LDAP schema. | Examples: <code>cn</code> (for common name) or <code>uid</code> (for user ID). |

To set up Hue users by importing information from an LDAP database:

1. Establish communication with the LDAP server by setting the `ldap_url` parameter in the `ldap` section of the `hue.ini` file. Uncomment the line and change the value from the default (`ldap://localhost`) to the URL for your LDAP server.

```
# URL of the LDAP server
##ldap_url=ldap://localhost
```

2. Provide the `base_dn` information to define the search scope. Uncomment the line where `base_dn` is defined and replace with your `base_dn`.

```
# The search base for finding users and groups
## base_dn="DC=mycompany,DC=com"
```

3. If your LDAP server does not support anonymous searches, you need to provide the `bind_dn` and `bind_password`. Uncomment the lines with these parameters and change the values to your `bind_dn` and your `bind_password`.

```
# Distinguished name of the user to bind as -- not necessary if the LDAP
server
# supports anonymous searches
## bind_dn="CN=ServiceAccount,DC=mycompany,DC=com"

# Password of the bind user -- not necessary if the LDAP server
supports
# anonymous searches
## bind_password=
```

4. If you want to narrow the scope of the directory search, specify a `user_filter` in the `users` section under the `ldap` section of the `hue.ini` file. This is optional.

```
[[[users]]]

# Base filter for searching for users
## user_filter="objectclass=*"
```

5. Set the `user_name_attr` parameter in the `users` section under the `ldap` section of the `hue.ini` file. If your LDAP directory schema does *not* use the attribute `sAMAccountName` for the username, uncomment the line and change the value of the `user_name_attr` to the attribute you use. For example, if the directory schema uses the `uid` attribute, change the value of the parameter as shown:

```
[[[users]]]

# The username attribute in the LDAP schema
## user_name_attr=sAMAccountName
```

```
user_name_attr=uid
```

6. Restart `httpfs` so `ldap` settings will take effect.
7. Restart Hue once all configuration changes have been made so the changes will take effect.

Authenticating Hue Users with LDAP Credentials

This section explains how to edit the `ldap` section of the `hue.ini` file to enable Hue user authentication with LDAP credentials. These instructions assume you have completed the steps in [Setting up Users from an LDAP Database](#).

Warning:

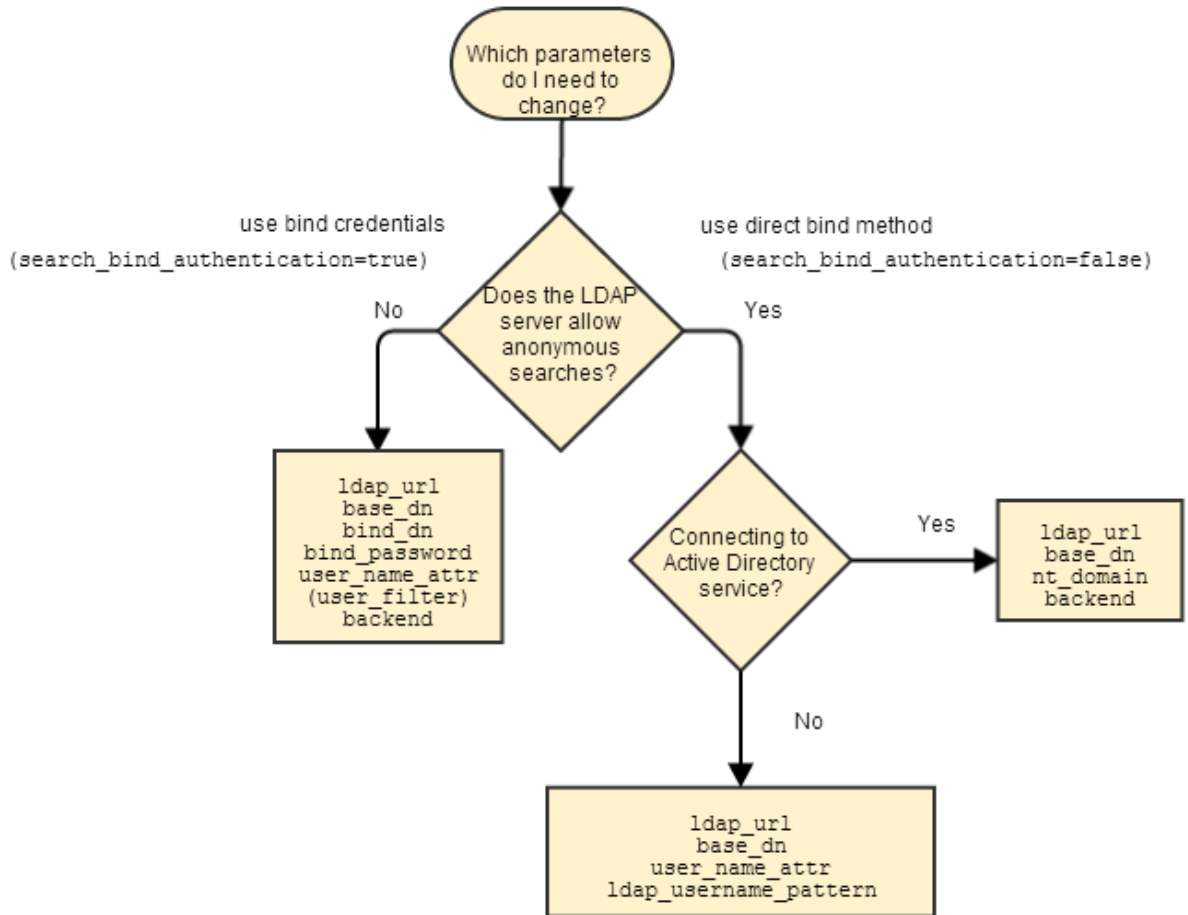

If you switch to authentication through LDAP credentials, the Hue User Admin users will lose superuser privileges unless you take one of the following actions:

- Import one or more superuser accounts from LDAP and assign them superuser permission.
- If you have already enabled the LDAP authentication back end, log into Hue using the LDAP back end, which will create an LDAP user. Next, disable the LDAP authentication back end and use User Admin to give the superuser permission to the new LDAP user.

Before you edit the parameters in the `hue.ini` file, determine whether your LDAP server allows anonymous searches.

- If anonymous searches *are* allowed, use the **direct bind** method.
- If anonymous searches *are not* allowed, use bind credentials (also known as **search and bind**).

The following flow chart shows which parameters you must specify for each of these authentication methods:

These are the parameters you need to set in the `ldap` section of the `hue.ini` file so you can authenticate Hue users with LDAP credentials:

| Parameter | Description | Comments |
|----------------------------|--|---|
| search_bind_authentication | Determines which authentication method to use: search and bind, or direct bind. | <p>When set to <i>true</i>, Hue performs an LDAP search using <code>bind_dn</code> and <code>bind_password</code> as provided in <code>hue.ini</code>. The search can be further limited by the search filter <code>user_filter</code>.</p> <p>When set to <i>false</i>, Hue performs a direct bind to LDAP using the credentials provided from one of these sources:</p> <ul style="list-style-type: none"> the UPN, formed by concatenating <code><shortname></code> (the user name provided on the Hue login page) and <code>nt_domain</code> (if <code>nt_domain</code> is specified) the <code>ldap_username_pattern</code> (if <code>nt_domain</code> is not specified) |
| nt_domain | The NT domain to connect to. This parameter is <i>only</i> used with Active Directory. | Used with the <i>direct bind</i> method of authentication. If <code>nt_domain</code> is specified, then <code>ldap_username_pattern</code> is ignored. |
| ldap_username_pattern | Used to connect to directory services other than Active Directory. | Used with the <i>direct bind</i> method of authentication. Usually takes the form "cn=<username>,dc=example,dc=com" |
| backend | The backend to use for authenticating users. | Needs to be set to <code>desktop.auth.backend.LdapBackend</code> for Hue authentication. |

Using Bind Credentials (Search and Bind)

To use the search and bind method for LDAP authentication, edit these parameters in the `ldap` section of the `hue.ini` file:

1. Set `search_bind_authentication=true`.
2. In the `Authentication backend` section, add the following line after the `##backend=` statement: Hue searches `base_dn` for an entry with `user_name_attr` that contains the user name provided on the Hue login page.

```
backend=desktop.auth.backend.LdapBackend
```

3. Restart Hue once all configuration changes have been made so the changes will take effect.

Using Direct Bind

To use the direct bind method for LDAP authentication, edit these parameters in the `ldap` section of the `hue.ini` file:

1. Set `search_bind_authentication=false`.

2. If you are using the Active Directory directory service, uncomment the line with the `nt_domain` parameter. Change the value from `nt_domain=mycompany.com` to the NT domain you want to connect to.
3. If you are using any other directory service, uncomment the line with `ldap_username_pattern` and specify the format, such as the one shown here: Note that `<username>` will be replaced by the information provided on the Hue login page.

```
ldap_username_pattern="cn=<username>,dc=example,dc=com"
```

4. Restart Hue once all configuration changes have been made so the changes will take effect.

Configure Hue with DB Query

Hue's DB Query application provides a way to view data in these four database formats:

- SQLite
- MySQL
- PostgreSQL
- Oracle

To configure Hue to work with DB Query, edit the `[librdbms]` section of the `hue.ini` file and change the parameters related to the particular database you are using.

 **Warning:** To disable the DB Query application, add `rdbms` to the blacklist as shown in [Disabling an Application](#).

Default librdbms Settings in hue.ini

Database settings are contained in the `[librdbms]` section of the `hue.ini` file. Two databases (SQLite and MySQL) are already configured in their own sections under the `[[databases]]` heading. Note that PostgreSQL and Oracle work similarly to MySQL, so the `[[mysql]]` section can be treated as a template that can be edited for these two databases.

The DB Query application supports four types of databases, which are configured in the `[[databases]]` section.

The default version of the `librdbms` section of the `hue.ini` file looks like this:

```
#####
# Settings for the RDBMS application
#####
[librdbms]
# The RDBMS app can have any number of databases configured in the
databases
# section. A database is known by its section name
# (i.e. sqlite, mysql, psql, and oracle in the list below).
[[databases]]
# sqlite configuration.
## [[sqlite]]
# Name to show in the UI.
## nice_name=SQLite
# For SQLite, name defines the path to the database.
## name=/opt/mapr/hue/hue-<version>/desktop/desktop.db
# Database backend to use.
## engine=sqlite
# mysql, oracle, or postgresql configuration.
```

```

## [[[mysql]]]
# Name to show in the UI.
## nice_name="My SQL DB"
# For MySQL and PostgreSQL, name is the name of the database.
# For Oracle, Name is instance of the Oracle server. For express
edition
# this is 'xe' by default.
## name=mysqlpdb
# Database backend to use. This can be:
# 1. mysql
# 2. postgresql
# 3. oracle
## engine=mysql

# IP or hostname of the database to connect to.
## host=localhost

# Port the database server is listening to. Defaults are:
# 1. MySQL: 3306
# 2. PostgreSQL: 5432
# 3. Oracle Express Edition: 1521
## port=3306

# Username to authenticate with when connecting to the database.
## user=example

# Password matching the username to authenticate with when
# connecting to the database.
## password=example

```

Using DB Query with SQLite

To configure Hue to work with SQLite, edit the `sqlite` section of the `hue.ini` file and replace default values as necessary.

Default sqlite Section

The default version of the `sqlite` section is shown here.

```

# sqlite configuration
## [[[sqlite]]]
# Name to show in the UI.
## nice_name=SQLite

# For SQLite, name defines the path to the database.
## name=/tmp/sqlite.db

# Database backend to use.
## engine=sqlite

```

Modifying the sqlite Section

To configure Hue's DB Query application to work with SQLite, edit the `sqlite` section of the `hue.ini` file as follows:

1. Remove the comment characters (`##`) in front of the `[[[sqlite]]]` statement.
2. Replace the default values for the following parameters as necessary.

| Parameter | Default Value | New Value |
|-----------|----------------|--|
| nice_name | SQLite | The name that you want to appear in the UI |
| name | /tmp/sqlite.db | The path to the SQLite database |

- Remove the comment characters (##) for the parameter values you changed. Otherwise, the default values are used.

Using DB Query with MySQL, PostgreSQL, or Oracle

Instructions for MySQL, PostgreSQL, and Oracle are similar. These instructions show how to configure Hue to work with MySQL. You can adapt the instructions to configure Hue to work with PostgreSQL or Oracle.

The next section shows the default `mysql` section of the `hue.ini` file for illustration. For instructions on configuring Hue so the DB Query application can display data from a MySQL database, see [Modifying the mysql Section](#).

Default mysql Section

The default version of the `mysql` section is shown here.

```
# mysql, oracle, or postgresql configuration.
## [[[mysql]]]
# Name to show in the UI.
## nice_name="My SQL DB"
# For MySQL and PostgreSQL, name is the name of the database.
# For Oracle, Name is the instance of the Oracle server. For      express
edition
# this is 'xe' by default.
## name=mysqlpdb
# Database backend to use. This can be:
# 1. mysql
# 2. postgresql
# 3. oracle
## engine=mysql

# IP or hostname of the database to connect to.
## host=localhost

# Port the database server is listening to. Defaults are:
# 1. MySQL: 3306
# 2. PostgreSQL: 5432
# 3. Oracle Express Edition: 1521
## port=3306

# Username to authenticate with when connecting to the database.
## user=example

# Password matching the username to authenticate with when
# connecting to the database.
## password=example
```

Modifying the mysql Section

To configure Hue so the DB Query application can work with MySQL, edit the `mysql` section of the `hue.ini` file as follows:

- Replace the default values for the following parameters.

| Parameter | Default Value | New Value |
|-----------|---------------|--|
| nice_name | "My SQL DB" | The name that you want to appear in the UI |
| name | mysqldb | The name of the database |
| host | localhost | IP address or hostname of the database to connect to |
| user | example | The username to use for authentication when connecting to the database |
| password | example | The password to use with the username (above) for authentication when connecting to the database |

- Remove the comment characters (##) for the parameter values you changed. Otherwise, the default values are used.

Activating DB Query with MySQL

To activate DBQuery with MySQL, follow these steps:

- Move the mysql python library to a back-up location and regenerate it to match the version on the deployment machine. `mv /opt/mapr/hue/hue-<VERSION>/python2.6/site-packages/MySQL_python-1.2.3c1-py2.6-linux-x86_64.egg MySQL_python-1.2.3c1-py2.6-linux-x86_64.egg.bk`
- Regenerate the mysql python library by running the following command: `/opt/mapr/hue/hue-<VERSION>/build/env/bin/pip install mysql-python`

Modifying the mysql Section for PostgreSQL

If you are working with a PostgreSQL database, edit the `mysql` section of the `hue.ini` file and rename it `postgresql`. Next, replace the MySQL default values as shown:

- Replace the following MySQL default values with PostgreSQL values.

| Parameter | Default Value | New Value |
|-----------|---------------|--|
| nice_name | "My SQL DB" | The name that you want to appear in the UI |
| name | mysqldb | The name of the database |
| engine | mysql | postgresql (the database backend) |
| port | 3306 | 5432 |

- Replace the following default values with your host machine, username, and password.

| Parameter | Default Value | New Value |
|-----------|---------------|--|
| host | localhost | IP address or hostname of the database to connect to |
| user | example | The username to use for authentication when connecting to the database |

| Parameter | Default Value | New Value |
|-----------|---------------|--|
| password | example | The password to use with the username (above) for authentication when connecting to the database |

- Remove the comment characters (##) at the beginning of each line where you changed parameter values. Otherwise, the MySQL default values are used.

Modifying the mysql Section for Oracle

If you are working with an Oracle database, edit the `mysql` section of the `hue.ini` file and rename it `oracle`. Next, replace the MySQL default values as shown:

- Replace the following MySQL default values with Oracle values.

| Parameter | Default Value | New Value |
|-----------|---------------|--|
| nice_name | "My SQL DB" | The name that you want to appear in the UI |
| name | mysqldb | The instance of the Oracle server (for express edition, this is xe by default) |
| engine | mysql | oracle (the database backend) |
| port | 3306 | 1521 (for Oracle Express Edition) |

- Replace the following default values with your host machine, username, and password.

| Parameter | Default Value | New Value |
|-----------|---------------|--|
| host | localhost | IP address or hostname of the database to connect to |
| user | example | The username to use for authentication when connecting to the database |
| password | example | The password to use with the username (above) for authentication when connecting to the database |

- Remove the comment characters (##) at the beginning of each line where you changed parameter values. Otherwise, the mysql default values are used.

Configure the Hue Database

The Hue server stores user-account information, the job submission history, and Hive queries in one of the following supported databases:

- SQLite, the embedded Hue database (the default database)
- MySQL
- PostgreSQL
- Oracle
- MariaDB

 **Note:** Using SQLite is not recommend.

Configure Hue to Store Data in MySQL or MariaDB

Hue supports MySQL 5.5.x - 5.7.x. Hue does not support MySQL 8 and later.

1. Configure the database connection parameters in the `[desktop][[database]]` section of `hue.ini`. Set the following properties with your database connection parameters:

```
[desktop]
...
[[database]]
engine=mysql
host=<host>
port=3306
user=<user>
password='<password>'
name=<database>
```

Example of configuration:

```
[desktop]
...
[[database]]
engine=mysql
host=node1
port=3306
user=hue
password=hue_password
name=hue
```

If the connection is secured through SSL/TLS, specify the CA, Cert, and Key paths, as shown in the following example:

```
[desktop]
[[database]]
...
options='{ "ssl": { "key": "/path/to/client-key.pem", "cert": "/path/to/client-cert.pem", "ca": "/path/to/ca.pem" } }'
```

You can find detailed documentation for other options in the Django [Connecting to the Database](#) documentation.

2. Perform the initial data migration:

```
sudo /opt/mapr/server/configure.sh -R
```

3. Restart Hue:

```
maprcli node services -name hue -action restart -nodes <node_with_hue>
```

Related information

<https://docs.djangoproject.com/en/1.11/ref/databases/#version-support>

Configure Hue to Store Data in PostgreSQL

1. Install the following packages:

| | |
|---------------|---|
| CentOS | <code>yum install gcc python-devel postgresql-devel</code> |
| SLES | <code>zypper install gcc python-devel postgresql-devel</code> |
| Ubuntu | <code>apt-get install gcc python-dev postgresql-server-dev-all</code> |

2. Ensure that the `pg_config` command is in your `PATH`. For example, on CentOS with PostgreSQL 9.4 development package from the [postgresql.org](https://www.postgresql.org) official repository, you need to add the directory with `pg_config` manually:

```
export PATH="/usr/pgsql-9.4/bin:$PATH"
```

3. Install the Python `psycopg2` package in Hue:

```
cd /opt/mapr/hue/hue-<version>
source ./bin/activate
pip install psycopg2
deactivate
```

4. Configure database connection parameters in the `[desktop][[database]]` section of `hue.ini`. Set the following properties for your database connection parameters:

```
[desktop]
...
[[database]]
engine=postgresql_psycopg2
host=<host>
port=5432
user=<user>
password=<password>
name=<database>
schema=<schema>
```

Example of Configuration

```
[desktop]
...
[[database]]
engine=postgresql_psycopg2
host=node1
port=5432
user=hue
password=hue_password
name=hue
schema=public
```

5. Perform the initial data migration:

```
sudo /opt/mapr/server/configure.sh -R
```

6. Restart Hue:

```
maprcli node services -name hue -action restart -nodes <node_with_hue>
```

Configure Hue to Store Data in Oracle Database

Note: To configure Hue with Oracle 12, you need the [Oracle 11 Instant Client](#) Base and SDK.

1. Install the following packages:

| | |
|---------------|--|
| CentOS | <code>yum install gcc python-devel</code> |
| SLES | <code>zypper install gcc python-devel</code> |
| Ubuntu | <code>apt-get install gcc python-dev</code> |

2. Ensure that the library required to install the Oracle module in Hue is available through the `LD_LIBRARY_PATH` environment variable. The module that provides support for Oracle in Hue requires the `libclntsh.so` library to be available through the `LD_LIBRARY_PATH` environment variable. Typically, the library is located under the `$ORACLE_HOME` or `$ORACLE_HOME/lib` directories. Also, the library might include a version in the filename (for example, `libclntsh.so.11.1`), but the Oracle module for Hue requires it to be named `libclntsh.so`.

a) Ensure that the `ORACLE_HOME` environment variable is set:

```
export ORACLE_HOME=<path_to_oracle_installation>
```

b) Use the `find` command to locate the library:

```
find "$ORACLE_HOME" -name "libclntsh.so*"
```

c) Go to the directory and ensure that the library is available and has the proper filename. If not, you can create a symbolic link:

```
ln -s libclntsh.so.11.* libclntsh.so
```

d) Add the following variables to the Hue environment configuration by creating a file in `/opt/mapr/hue/hue-<version>/bin/env.d/`. For example, create `/opt/mapr/hue/hue-<version>/bin/env.d/99custom` with the following content:

```
export ORACLE_HOME="<path_to_oracle_installation>"
export LD_LIBRARY_PATH="$ORACLE_HOME:$LD_LIBRARY_PATH"
```

or the following, depending on your Oracle configuration:

```
export ORACLE_HOME="<path_to_oracle_installation>"
export LD_LIBRARY_PATH="$ORACLE_HOME/lib:$LD_LIBRARY_PATH"
```

3. Depending on the Oracle instant client version installed:

a) Run the shell script:

```
$ sudo sh -c "echo /usr/lib/oracle/<version-number>/client64/lib
> /etc/ld.so.conf.d/oracle-instantclient.conf"
```

- b) Use the `ldconfig` command to create the linking:

```
$ sudo ldconfig
```

- c) Verify the dynamic linking:

```
$ sudo ldconfig -p | grep -i oracle
```

For example:

```
ldconfig -p | grep -i oracle
libocijdbc11.so (libc6,x86-64) => /opt/oracle/instantclient_11_2/
libocijdbc11.so
libociei.so (libc6,x86-64) => /opt/oracle/instantclient_11_2/
libociei.so
libocci.so.11.1 (libc6,x86-64) => /opt/oracle/instantclient_11_2/
libocci.so.11.1
libnnz11.so (libc6,x86-64) => /opt/oracle/instantclient_11_2/
libnnz11.so
libclntsh.so.11.1 (libc6,x86-64) => /opt/oracle/instantclient_11_2/
libclntsh.so.11.1
```

4. Install the Python `cx_Oracle` package in Hue:

```
cd /opt/mapr/hue/hue-<version>
source ./bin/activate
pip install cx_Oracle==5.3
deactivate
```

Note: Python `cx_Oracle` version 5.3 is supported.

5. Configure the database connection parameters in the `[desktop][[database]]` section of `hue.ini`. Note these considerations:

- Make sure that you have the appropriate permissions to use LOBs; for example, `SQL GRANT` on `SYS.DBMS_LOB`.
- SID refers to the Oracle system ID, which is used to uniquely identify the database.

```
[desktop]
...
[[database]]
engine=oracle
host=<host>
port=1521
user=<user>
password=<password>
name=<SID of the database>
```

- To achieve a multithreading environment, you can specify the `options={'threaded':true}` parameter in this section. For example:

```
[desktop]
...
[[database]]
engine=oracle
host=node1
port=1521
user=hue
password=hue_password
name=XE
options={'threaded':true}
```

By setting the `port=0` parameter, you can use the Oracle Service Name instead of specifying the SSID. For example:

```
[desktop]
...
[[database]]
engine=oracle
port=0
user=hue
password=hue_password
name=node1:1521/hue
```

6. Perform the initial data migration:

```
sudo /opt/mapr/server/configure.sh -R
```

7. Restart Hue:

```
maprcli node services -name hue -action restart -nodes <node_with_hue>
```

Configuring an Oracle Schema

You must create schemas for Oracle databases manually.

Edit the `hue.ini` file to use an Oracle database:

For detailed steps, see `inspectdb` and `dumpdb` Hue commands, <http://gethue.com/hue-api-execute-some-builtin-commands/>.

Configure Hue with Security

Based on the Hue version and the version of the other components that Hue communicates with, you can configure the following security features:

Note: You cannot enable both Kerberos and data-fabric-SASL on the same cluster.

Configure Hue to use Kerberos

After you set up a Kerberos principal and keytab file, you can configure Hue to use the Kerberos authentication protocol.

After you set up a Kerberos principal and keytab file, enable the Kerberos Ticket Renewal service, update `hue.ini` and `core-site.xml` with the required parameters, and restart the Warden and Hue services.

Enabling the Kerberos Ticket Renewer Service

The Kerberos Ticket Renewer service (`kt_renewer`) renews tickets for the Hue service. Hue automatically starts the `kt_renewer` process on clusters that use Kerberos for authentication. Kerberos tickets have a default expiration time of 7 days. The `kt_renewer` service extracts the Kerberos ticket from the keytab file and renews the ticket before it expires.

You can access the `kt_renewer` process log files in the following locations:

- `${HUE_HOME}/logs/kt_renewer.out`
- `${HUE_HOME}/logs/kt_renewer.log`

To use the Kerberos Ticket Renewer service:

1. Enable the Kerberos Ticket Renewer Service:
 - In the `kdc.conf` file, add the `max_renewable_life` parameter.
 - In the `krb5.conf` file, add the `renew_lifetime` parameter.
2. Update the `hue.ini` file to include the Kerberos credentials cache path (`ccache_path`) and ticket renewal frequency (`keytab_reinit_frequency`), as shown in the following example:

```
[desktop]
    [[kerberos]]
        ...
        # Path to keep Kerberos credentials cached
        # ccache_path=/tmp/custom_hue_krb5_ccache
        # Frequency in seconds with which Hue will renew its
keytab
        # keytab_reinit_frequency=86400
        ...
```

Modifying the hue.ini File

In the `kerberos` section of the `hue.ini` file, make the following changes:

1. Supply the path to Hue's Kerberos keytab file.
2. Supply the Kerberos principal name for Hue.
3. Supply the path to `kinit`.
4. In the `[[yarn_clusters]] [[default]]` section:
 - If you are using a certificate signed by the CA (Certificate Authority), set the `ssl_cert_ca_verify` value to `True`.
 - If you are using a self-signed certificate or no certificate, leave the value set to `False`.
5. **For Hue with secure Hive:** In the `beeswax` section, make sure that the `hive_conf_dir` property points to a directory containing a valid `hive-site.xml` file (either the original or a synced copy).
6. **Optional:** To enable SSL encryption, see [Enable SSL Encryption Between Hue and Hive](#).

7. Make sure that you specified a fully-qualified domain name (FQDN) for all services integrated with Hue that uses Kerberos:

HttpFS: Set the `webhdfs_url` property in the `[hadoop]` `[[hdfs_clusters]]` `[[[default]]]` section.

HiveServer2: Set the `hive_server_host` property in the `[beeswax]` section.

Impala: Set the `server_host` property in the `[impala]` section.

Spark: Set the `livy_server_url` property in the `[impala]` section.

Note: Support for Kerberos integration with Livy was introduced in Hue 4.X.

Oozie: Set the `oozie_url` property in the `[liboozie]` section.

HBase: Set the `hbase_clusters` property in the `[hbase]` section.

Drill: Refer to section.

The changes are summarized in the following `hue.ini` files, which you can use as a template:

```
[desktop]
  [[kerberos]]
    # Path to Hue's Kerberos keytab file
    hue_keytab=/opt/mapr/conf/mapr.keytab

    # Kerberos principal name for Hue
    # hue_principal=mapr/<hostname>@<realm>
    # Substitute your hostname and realm in the example below
    hue_principal=mapr/perfnodel81.perf.lab@dev-maprtech

    # Path to keep Kerberos credentials cached
    # ccache_path=/tmp/custom_hue_krb5_ccache
    # Frequency in seconds with which Hue will renew its keytab
    # keytab_reinit_frequency=86400

    # Path to kinit
    # Note that the actual path depends on which Linux OS you are using
    kinit_path=/usr/bin/kinit

[beeswax]
  # If Kerberos security is enabled, use fully-qualified domain name
  # (FQDN)
  hive_server_host=<FQDN of Hive Server>
  # Hive configuration directory, where hive-site.xml is located.
  hive_conf_dir=/opt/mapr/hive/hive-<version>/conf
  # Change this if your Hive is secured
  security_enabled=true
  # Security mechanism of authentication none/GSSAPI/MAPR-SECURITY
  mechanism=GSSAPI

[impala]
  # Host of the Impala Server (one of the Impalad)
  server_host=<FQDN of Impalad>
  # Kerberos principal
  impala_principal=mapr/perfnodel81.perf.lab@dev-maprtech

[hadoop]
  ...
  [[hdfs_clusters]]
    [[[default]]]
    # Enter the filesystem uri
    fs_defaultfs=maprfs:///
```

```

# Use WebHdfs/HttpFs as the communication mechanism.
# Domain should be the NameNode or HttpFs host.
# Default port is 14000 for HttpFs.
webhdfs_url=https://<FQDN of HttpFS>:14000/webhdfs/v1

# Change this if your HDFS cluster is secured
security_enabled=True

# Security mechanism of authentication none/GSSAPI/MAPR-SECURITY
mechanism=GSSAPI
...
[[yarn_clusters]]
[[[default]]]
# Enter the host on which you are running the ResourceManager
## resourcemanager_host=localhost

# The port where the ResourceManager IPC listens on
## resourcemanager_port=8032

# Whether to submit jobs to this cluster
submit_to=true

# Change this if your YARN cluster is secured
security_enabled=true

# URL of the ResourceManager API
## resourcemanager_api_url=https://localhost:8090

# URL of the ProxyServer API
## proxy_api_url=https://localhost:8090

# URL of the HistoryServer API
history_server_api_url=https://localhost:19890

# Security mechanism of authentication none/GSSAPI/MAPR-SECURITY
mechanism=GSSAPI

# In secure mode (HTTPS), if SSL certificates from Resource Manager's
# Rest Server have to be verified against certificate authority
ssl_cert_ca_verify=False

[spark]
# The Livy Server URL.
livy_server_url=https://<FQDN of Livy Server>:8998

# Whether Livy requires client to perform Kerberos authentication.
security_enabled=True

# Security mechanism of authentication none/GSSAPI/MAPR-SECURITY.
mechanism=GSSAPI

[liboozie]
# The URL where the Oozie service runs on. This is required in order for
# users to submit jobs.
oozie_url=https://<FQDN of Oozie>:<oozie_port_number>/oozie

# Requires FQDN in oozie_url if enabled
security_enabled=true
# Security mechanism of authentication none/GSSAPI/MAPR-SECURITY
mechanism=GSSAPI

[hbase]
# Comma-separated list of HBase Thrift servers for clusters in the format

```

```
of '(name|host:port)'.
# Use full hostname with security.
# If using Kerberos we assume GSSAPI SASL, not PLAIN.
hbase_clusters=(Cluster|<FQDN of Hbase Thrift Server>:9090)
# Security mechanism of authentication none/GSSAPI/MAPR-SECURITY
mechanism=GSSAPI
```

Note: You need to manually set `security_enabled` property to `true` and `mechanism` property to `GSSAPI` for a Kerberised environment. These options are automatically configured only on a `data-fabric-SASL` cluster.

Modifying the `core-site.xml` File

In the `core-site.xml` file, provide the shortname for the Kerberos principal as shown. In addition, verify that you configured the proxyuser during configuration. See [Configure Hue](#) for details.

```
<!-- Hue security configuration -->
<property>
  <name>hue.kerberos.principal.shortname</name>
  <value>mapr</value>
</property>
<property>
  <name>hadoop.proxyuser.mapr.groups</name>
  <value>*</value> <!-- A group that all users of Hue belong to, or the
wildcard value "*" -->
</property>
<property>
  <name>hadoop.proxyuser.mapr.hosts</name>
  <value><hue_server_FQDN></value>
</property>
```

Restarting Warden and Hue

After you make all the changes to the files listed above, restart Warden and Hue so the changes will take effect.

Configure Hue to use Data Fabric-SASL

You can configure Hue to use Data Fabric-SASL for its communications with various components on a secure cluster. Hue automatically detects and sets the security configuration of the cluster and its components. Therefore, in some cases, minimal configuration is required.

The following components are supported by Hue with Data Fabric-SASL:

- HttpFS
- YARN and Spark History Server
- Hive
- Livy
- HBase Thrift
- Oozie
- Drill

Note: For secure by default clusters or for clusters where the `customSecurity` flag is not added, Hue automatically sets `security_enabled` to `true` and `mechanism` to `MAPR-SECURITY` for these components. In all other cases, `${security_enabled}` and `${mechanisms}` variables are set to `false` and `none` respectively, but these options can be configured manually for custom setups.

An example of a default configuration with automatically defined `security_enabled` and `mechanism` properties for HttpFS is as follows:

```
[hadoop]
[[hdfs_clusters]]
# HA support by using HttpFs
[[[default]]]
...
# Change this if your HDFS cluster is secured
security_enabled=${security_enabled}

# Security mechanism of authentication none/GSSAPI/MAPR-SECURITY
mechanism=${mechanism}
...
```

An example of a manual configuration of `security_enabled` and `mechanism` properties for HttpFS is as follows:

```
[hadoop]
[[hdfs_clusters]]
# HA support by using HttpFs
[[[default]]]
...
# Change this if your HDFS cluster is secured
security_enabled=true

# Security mechanism of authentication none/GSSAPI/MAPR-SECURITY
mechanism=MAPR-SECURITY
...
```

Note: After you configure the `hue.ini`, you must restart Hue. However, if you configure multiple sections of the same file, you can restart Hue one time after your updates are complete.

Configure LDAP Authentication Between Hue and Hive

You can configure Hue to use LDAP Authentication when it communicates with HiveServer2. Before you configure Hue to use LDAP authentication with HiveServer2, verify that HiveServer2 is configured to use LDAP authentication. For more information, see [Configure HiveServer2 to use LDAP Authentication](#) on page 3652.

Complete the following steps to configure LDAP authentication between Hue and Hive:

1. Configure Hue to connect to Hive with LDAP authentication:
 - a) Configure the `[beeswax]` section of the `hue.ini`: set `mechanism` option.

```
[beeswax]
...
# Security mechanism of authentication none/GSSAPI/MAPR-SECURITY
mechanism=LDAP
```

- b) Configure the [beeswax] section of the hue.ini (for Hive integration only):

```
[beeswax]
...
# Override the default desktop username and password of the hue user
used for authentications with other services.
# e.g. Used for LDAP/PAM pass-through authentication.
auth_username=sampleuser
auth_password=123456
...
```

Or configure the [desktop] section of the hue.ini to set the username and password for all services that require username/password authentication:

```
[desktop]
...
# Default LDAP/PAM/.. username and password of the hue user used
for authentications with other services.
# Inactive if password is empty.
# e.g. LDAP pass-through authentication for HiveServer2 or Impala.
Apps can override them individually.
auth_username=sampleuser
auth_password=123456
...
```

2. **Optional:** Configure Hue to authenticate users through LDAP. See [Configure Hue with LDAP](#).
3. Restart Hue:

```
maprcli node services -name hue -action restart -nodes <space delimited
list of nodes>
```

Configure PAM Authentication Between Hue and Hive

In Hue 3.10, you can configure Hue to use PAM authentication when it communicates with HiveServer2. Before you configure Hue to use PAM authentication with HiveServer2, verify that HiveServer2 is configured to use PAM authentication. See [Configure HiveServer2 to Use PAM Authentication](#) for more information.

Complete the following steps to configure PAM authentication between Hue and Hive:

1. Configure the [beeswax] section of the hue.ini file. Set the mechanism option to none. Set the auth_username and auth_password options in the [desktop] or [beeswax] sections of hue.ini (where auth_username and auth_password are the user credentials for the user who authenticates the Hue service with HiveServer2).

The following example summarizes these changes:

```
[desktop]
...
# Default LDAP/PAM/.. username and password of the Hue user used
for authentication with other services.
# Inactive if password is empty.
# e.g. LDAP pass-through authentication for HiveServer2 or Impala.
Apps can override them individually.
auth_username=mapr
auth_password=<user_password>
...
[beeswax]
...
# Security mechanism of authentication none/GSSAPI/MAPR-SECURITY
mechanism=none
```

2. Restart Hue:

```
maprcli node services -name hue -action restart -nodes <Hue node>
```

Enable SSL Encryption Between Hue and Hive

Hue automatically determines when SSL encryption is enabled in Hive by reading the hive-site.xml file.

Note: Starting from EEP 6.0.0, SSL encryption is enabled by default for Hive in a secured cluster. To configure SSL for Hive on a non-secure cluster, refer to [Hive Encryption](#) on page 3660.

1. The following example shows how to correctly configure the directory path where the hive-site.xml file is located in the hive_conf_dir property in [beeswax] section of the hue.ini file:

```
[beeswax]
...
# Hive configuration directory, where hive-site.xml is located
hive_conf_dir=/opt/mapr/hive/hive-2.3/conf
```

- The following examples show how to enable or disable Hue verification of service certificates by configuring `ssl_cacerts` and `ssl_validate` properties in `[desktop]` section of the `hue.ini` file:

Example for enabling certificate verification:

```
[desktop]
...

# Path to default Certificate Authority certificates. As example: /
path/to/cacert.pem
ssl_cacerts=/opt/mapr/conf/ssl_truststore.pem

# Choose whether Hue should validate certificates received from the
server.
ssl_validate=true
```

Example for disabling certificate verification:

```
[desktop]
...

# Path to default Certificate Authority certificates. As an example: /
path/to/cacert.pem
# ssl_cacerts=

# Choose whether Hue should validate certificates received from the
server.
ssl_validate=false
```

- After you change these properties, restart Hue to apply your changes:

```
maprcli node services -name hue -action start -nodes <hostname>
```

Enable SSL Encryption Between Hue and HttpFS

As of HttpFS 1.0-1504 and Hue 3.7-1505, you can enable SSL encryption and mutual-based authentication between Hue and HttpFS on a secure cluster that is version 4.0.2 or greater.

Complete the following steps to enable SSL encryption and mutual-based authentication between Hue and HttpFS on a secure cluster:

- Configure HttpFS to use SSL or verify that HttpFS is configured to use SSL. For details, see [SSL Security for HttpFS](#).
- Set the `webhdfs_url` property in the `[hadoop] [[hdfs_clusters]] [[[default]]]` section of the `hue.ini` file to contain the correct URL for HttpFS with the HTTPS schema and domain of the HttpFS server:

```
[hadoop]
[[hdfs_clusters]]
[[[default]]]
# Use WebHdfs/HttpFs as the communication mechanism.
# Domain should be the NameNode or HttpFs host.
# Default port is 14000 for HttpFs.
webhdfs_url=https://node1.cluster.com:14000/webhdfs/v1
```

- You can enable or disable Hue verification of service certificates by configuring `ssl_cacerts` and `ssl_validate` properties in the `[desktop]` section of the `hue.ini` file.

Example for enabling certificate verification:

```
[desktop]
...

# Path to default Certificate Authority certificates. As example: /
path/to/cacert.pem
ssl_cacerts=/opt/mapr/conf/ssl_truststore.pem

# Choose whether Hue should validate certificates received from the
server.
ssl_validate=true
```

Example for disabling certificate verification:

```
[desktop]
...

# Path to default Certificate Authority certificates. As example: /
path/to/cacert.pem
# ssl_cacerts=

# Choose whether Hue should validate certificates received from the
server.
ssl_validate=false
```

- [OPTIONAL] Configure mutual authentication between Hue and HttpFS. Add the following configuration in the `hue.ini` file under the `[hadoop]` `[[hdfs_clusters]]` `[[[default]]]` section.

- `mutual_ssl_auth=True`
- `ssl_cert=/path/to/certificate.pem`
- `ssl_key=/path/to/private_key.pem`

Use absolute paths for `ssl_cert` and `ssl_key`. Hue does not support private keys with a passphrase in this step.

The changes are summarized in the following example in the `hue.ini` file, which you can use as a template:

```
[hadoop]
[[hdfs_clusters]]
# HA support by using HttpFs
[[[default]]]
# Use WebHdfs/HttpFs as the communication mechanism.
# Domain should be the NameNode or HttpFs host.
# Default port is 14000 for HttpFs.
webhdfs_url=https://node1.cluster.com:14000/webhdfs/v1
...
# SSL certificate based authentication
ssl_cert=/path/to/certificate.pem
ssl_key=/path/to/private_key.pem
```

5. Restart Hue.

```
maprcli node services -name hue -action start -nodes <ip_address>
```

6. To test that SSL encryption is enabled for HttpFS, run the following command:

```
curl -k --cert /path/to/certificate.pem --key /path/to/private_key.pem
"https://node1.cluster.com:14000/webhdfs/v1?
op=GETFILESTATUS&user.name=mapr"
```

Troubleshoot Hue Security Issues

To troubleshoot Kerberos security issues, enable the debugger by changing the following setting in the `/opt/mapr/conf/env.sh` file:

```
# uncomment the following line to debug client kerberos issues
#MAPR_KERBEROS_DEBUG="-Dsun.security.krb5.debug=true -Dsun.security.spnego.d
ebug=true -Djavax.net.debug=all"
```

Under the Hue installation directory, check `logs/runcpserver.log` for errors. Some sample error messages are shown below.

Could not start SASL

If you see this message, try using [renewable tickets](#):

```
TypeError: TTransportException('Could not start SASL: Error in
sasl_client_start (-1) SASL(-1): generic failure: GSSAPI Error: Unspecified
GSS failure. Minor code may provide more information (Ticket expired)',)
is not JSON serializable
```

Run the `kinit` command to generate a new ticket with a long running lifetime, then restart the Hue webserver.

Configuration Error

If you see this message, it means that the ticket generated by the `kinit` command from `maprlogin` kerberos was not copied to `/tmp/hue_krb5_ccache`:

```
Caused by: javax.security.auth.login.LoginException: Configuration Error -
useTicketCache should be set to true to use the ticket cache /tmp/
hue_krb5_ccache
```

This can happen when you generate a new ticket after the original ticket expires and forget to copy it into the ticket cache. Run the following command to copy the ticket into the ticket cache:

```
kinit -k -t /opt/mapr/conf/mapr.keytab -c /tmp/hue_krb5_ccache mapr/
perfnodel81.perf.lab@dev-maprtech
```

Password incorrect while getting initial credentials

This message (Password incorrect while getting initial credentials) appears when you create a keytab file, but try to authenticate with a password. The act of creating a keytab causes a new random key to be placed in the Kerberos database and into the keytab file (`/opt/mapr/conf/mapr.keytab`). That key does not have a password associated with it, so you can only authenticate using the keytab.

If you want to authenticate with a password, run the `cpw` command in `kadmin` instead of the `ktadd` command.

Integrate Hue

This section contains the following topics with information for integrating Hue with other ecosystem components:

Integrate Hue with HPE Ezmeral Data Fabric Database Binary Tables

You can use the Hue HBase application to access HPE Ezmeral Data Fabric Database binary tables.

Note: In order to use the Hue HBase application, you need to install the HBase Client and the HBase Thrift Gateway. For more information, see the [Installing Core and Ecosystem Components](#) on page 87.

Step 1: Setting up HPE Ezmeral Data Fabric Database Binary Table Mapping

To use the Hue HBase application to access HPE Ezmeral Data Fabric Database binary tables, you need to set the `hbase.table.namespace.mappings` property.

Table Mapping Naming Conventions

A table mapping takes the form `name:map`, where `name` is the table name to redirect and `map` is the modification made to the name. The value in `name` can be a literal string or contain the `*` wildcard. When mapping a name with a wild card, the mapping is treated as a directory. Requests to tables with names that match the wild card are sent to the directory in the mapping.

When mapping a name that is a literal string, you can choose from two different behaviors:

- End the mapping with a slash to indicate that this mapping is to a directory. For example, the mapping `mytable1:/user/aaa/` sends requests for table `mytable1` to the full path `/user/aaa/mytable1`.
- End the mapping without a slash, which creates an alias and treats the mapping as a full path. For example, the mapping `mytable1:/user/aaa` sends requests for table `mytable1` to the full path `/user/aaa`.

Example: Map Table Names to HPE Ezmeral Data Fabric Database

In the following example, the `hbase.table.namespace.mappings` property is set so that any flat table name, such as `mytable`, is treated as a HPE Ezmeral Data Fabric Database table in the directory `/tables_dir/mytable`.

```
<property>
  <name>hbase.table.namespace.mappings</name>
  <value>*:/tables_dir</value>
</property>
```

Once you finish enabling table mapping in the `core-site.xml` file, start (or restart) the HBase thrift server so the changes will take effect.

```
maprcli node services -name hbasethrift -action start -nodes node001
```

Step 2: Configure Hue for HPE Ezmeral Data Fabric Database

To configure Hue for HPE Ezmeral Data Fabric Database, edit the `hbase` section of the `hue.ini` file, which looks like this:

```
[hbase]
# Comma-separated list of HBase Thrift servers for
# clusters in the format of '(name|host:port)'
```

```
## hbase_clusters=(Cluster|localhost:9090)

# Hard limit of rows or columns per row fetched before truncating.
## truncate_limit = 500
```

In this file, make the following changes:

1. Uncomment the `## hbase_clusters=(Cluster|localhost:9090)` statement and provide the list of HBase Thrift servers.

```
hbase_clusters=(<clustername1>|<hostname1>:9090),(<clustername2>|
<hostname2>:9090)[,...]
```

2. Uncomment the `truncate_limit` statement and change the value if necessary.

Integrate Hue with Hive

Describes how to integrate Hue with Hive through settings in the `hue.ini` file.

By default, Hue connects to a single instance of HiveServer2 through the `hive_server_host` parameter in `hue.ini`; however, if high availability (HA) is enabled for HiveServer2, Hue can leverage that. If one instance of HiveServer2 goes down, the client automatically connects to another instance of HiveServer2.

Verify the Hive Version

Before you integrate Hue with HiveServer2 (HA or single instance), verify that the path specified in the `hive_conf_dir` property applies to the Hive version that you have installed. If needed, update the path to reflect the Hive version that you have installed.

```
# Hive configuration directory, where hive-site.xml is located
hive_conf_dir=/opt/mapr/hive/hive-<version>/conf
```

If Hue and Hive are installed on separate nodes, you must also copy the Hive `conf` directory to the Hue node.

Integrating Hue with HiveServer2 High Availability

If you want Hue to leverage HiveServer2 HA, [enable high availability for HiveServer2](#), and update the `hue.ini` file to include the following properties and settings:

```
[beeswax]
#Whether to use service discovery for llap.
hive_discovery_llap = true
#Is llap (hive server interactive) running in HA.
hive_discovery_llap_ha = true
#Whether to use service discovery for HiveServer2.
hive_discovery_hs2 = true
[libzookeeper]
#ZooKeeper ensemble; comma-separated list of host/port.
ensemble=<host:port>:5181
```

Note that the `hive_server_host` and `hive_server_port` properties in `hue.ini` are not required if using HiveServer2 HA. Service discovery overrides the server and thrift port.

Perform any additional Hue configurations and then restart Hue for changes to take effect. See [Starting the Hue Webservice](#).

Integrating Hue with a Single Instance of HiveServer2

Update the beeswax section of the `hue.ini` file to include the following properties and settings:

 **Note:** This is not required on a single node cluster.

```
[beeswax]

# Host where HiveServer2 is running.
# If Kerberos security is enabled, use fully-qualified domain name (FQDN).
hive_server_host=<FQDN of Hive Server>

# Port that HiveServer2 Thrift server runs on.
hive_server_port=10000
```

Perform any additional Hue configurations and then restart Hue for changes to take effect. See [Starting the Hue Webservice](#).

Configuring Data and Metadata Directories

When Hue and Hive are used together, they are usually configured to share metadata and data directories. However, you can create separate directories for Hue and Hive.

The locations of the shared directories are specified by the following properties in the `hive-site.xml` file:

- `hive.metastore.uris` (the hostname and port of the Hive Metastore node)
- `hive.metastore.warehouse.dir` (the directory where the default database for the warehouse is located)

See [Configure Shared Hive Data and Metadata Directories for Hue](#) and [Configure Separate Hive Data and Metadata Directories for Hue](#) for more information.

Configure Shared Hive Data and Metadata Directories for Hue

To configure shared Hive data and metadata directories for Hue:

1. Change the `hive.metastore.uris` property as shown:

```
<property>
  <name>hive.metastore.uris</name>
  <value>thrift://localhost:9083</value>
  <description> URI where clients contact Hive metastore server </
description>
</property>
```

 **Note:** The `hive.metastore.warehouse.dir` property can keep its default value and does not need to be changed.

2. Enable Hue impersonation by setting the following property to `true`.

```
<property>
  <name>hive.metastore.execute.setugi</name>
  <value>true</value>
  <description> Set this property to enable Hive Metastore service
impersonation in unsecure mode.
  In unsecure mode, setting this property to true causes the metastore
to execute DFS operations
  using the client's reported user and group permissions. Note that
this property must be set on
  BOTH the client and server sides. </description>
</property>
```

3. Set the location of the sharelib.

```
<property>
  <name>oozie.service.WorkflowAppService.system.libpath</name>
  <value>/oozie/share/lib</value>
</property>
```

4. To enable the Hive Metastore service to share the embedded Derby database, add the following property blocks to the `hive-site.xml` file on the node running `hiveserver2` to point to the location of the Derby metastore:

```
<property>
  <name>javax.jdo.option.ConnectionURL</name>
  <value>jdbc:derby:;databaseName=/<local_dir>/metastore_db;create=true</value>
  <description>JDBC connect string for a JDBC metastore</description>
</property>

<property>
  <name>javax.jdo.option.ConnectionDriverName</name>
  <value>org.apache.derby.jdbc.EmbeddedDriver</value>
  <description>Driver class name for a JDBC metastore</description>
</property>
```

5. To enable the Hive Metastore service to share a MySQL database, add the following property blocks to the `hive-site.xml` file:

```
<property>
  <name>javax.jdo.option.ConnectionURL</name>
  <value>jdbc:mysql://<ip_address>:3306/hive_11?
createDatabaseIfNotExist=true</value>
</property>

<property>
  <name>javax.jdo.option.ConnectionDriverName</name>
  <value>com.mysql.jdbc.Driver</value>
</property>

<property>
  <name>javax.jdo.option.ConnectionUserName</name>
  <value><UserName></value>
  <description>Substitute the actual username</description>
</property>

<property>
  <name>javax.jdo.option.ConnectionPassword</name>
  <value><Password></value>
  <description>Substitute the actual password</description>
</property>
```

Configure Separate Hive Data and Metadata Directories for Hue

If you want to store Hue data and metadata in separate directories from Hive data and metadata, follow these steps:

1. Copy `hive-site.xml` to a new location. (The original `hive-site.xml` file remains in the previous location for use by Hive.)

2. Edit `hue.ini` and change the `hive_conf_dir` property so it points to the new location for `hive-site.xml`.
3. Change the `hive.metastore.warehouse.dir` property in the new `hive-site.xml` file so it points to the directory where Hue data will be located.
4. Change the `hive.metastore.uris` property so it points to the directory for Hue's `metastore_db`.
5. Set the `hive.metastore.execute.setugi` property to `true`.

```
<property>
  <name>hive.metastore.execute.setugi</name>
  <value>true</value>
  <description> Set this property to enable Hive Metastore service
  impersonation in non-secure mode.
  In non-secure mode, setting this property to true causes the
  metastore to execute DFS operations
  using the client's reported user and group permissions. Note that
  this property must be set on
  BOTH the client and server sides. </description>
</property>
```

Integrate Hue with Impala

Hue's Impala application supports interactive SQL and HiveQL queries from within your browser. Hue provides additional functionality with Impala that is not available from the command line such as parameterized queries, syntax highlighting, and saving queries.

For information about installing Impala, see [Installing Impala](#).

 **Warning:** To disable the Impala application, see [Disabling an Application](#).

To configure Hue to work with Impala, edit the `impala` section of the `hue.ini` file and change parameter values as necessary. The next section shows the default version of the Impala settings in `hue.ini`. For instructions on how to change Impala settings, see [Modifying the hue.ini File](#).

Default Impala Settings in hue.ini

The default version of the `impala` section of the `hue.ini` file is shown below.

```
#####
# Settings to configure Impala
#####

[impala]
# Host of the Impala Server (one of the Impalad)
## server_host=localhost

# Port of the Impala Server
## server_port=21050

# Turn on/off impersonation mechanism when talking to Impala
## impersonation_enabled=False
```

Modifying the hue.ini File

To configure Hue to work with Impala, change the values of the following parameters in the `impala` section of the `hue.ini` file:

| Parameter | Default Value | Description |
|-----------------------|---------------|--|
| server_host | localhost | The hostname or IP address of the Impala server |
| server_port | 21050 | The port of the Impala server |
| impersonation_enabled | False | Turns the impersonation mechanism on or off when talking to Impala |

1. If `server_host` is not `localhost`, change the hostname (and remove the `##` characters to uncomment the line).

```
## server_host=<hostname>
```

2. If you are *not* using the default server port (21050), change the `server_port` setting to the port you are using (and remove the `##` characters to uncomment the line).

```
## server_port=<port_number>
```

3. Enable impersonation in Impala so the user `mapr` can impersonate any Linux PAM user on the cluster:
 - a) Edit the `/opt/mapr/impala/impala-<version>/conf/env.sh` file, and add the following property to the section `IMPALA_SERVER_ARGS=*`:

```
authorized_proxy_user_config=mapr=*
```

- b) Restart Impala.

```
sudo maprcli node services -name impalaserver -action restart -nodes <ip_address>
```

4. Enable impersonation for Impala in the `hue.ini` file by setting `impersonation_enabled` to `true` (and remove the `##` characters to uncomment the line).

```
## impersonation_enabled=true
```

5. Restart Hue so the changes will take effect.

Integrate Hue with Oozie

Complete the following steps to integrate Hue with Oozie:

1. Edit the `hue.ini` file to configure the location where the Oozie service is running. The path to the `hue.ini` file is: `/opt/mapr/hue/hue-<version>/desktop/conf/hue.ini`.

```
[liboozie]
# The URL (host IP address) where the Oozie service is running. This is
required in order for # users to submit jobs.
oozie_url=http://<ip_address>:<oozie_port_number>/oozie
```

The `<oozie_port_number>` depends on whether your cluster is secure.

2. Enable user impersonation for Oozie through Hue:

- a) Add the following lines to the `oozie-site.xml` file (the path to the file is: `/opt/mapr/oozie/oozie-4.2.0/conf/oozie-site.xml`):

```
<property>

<name>oozie.service.ProxyUserService.proxyuser.<default_user>.hosts</name>
  <value>*</value>
</property>
<property>

<name>oozie.service.ProxyUserService.proxyuser.<default_user>.groups</name>
  <value>*</value>
</property>
```

In most cases, `mapr` is the `<default_user>`. This should be the same default user that is specified in the `hue.ini` and the `core-site.xml`.

- b) Restart Oozie. To restart Oozie, first stop Oozie then start it:

```
maprcli node services -name oozie -action restart -nodes <ip_address>
```

To verify that the Oozie server started, enter:

```
lsof -i:<oozie_port_number>
```

The output from this command should look similar to this:

```
COMMAND PID USER FD TYPE DEVICE SIZE/OFF NODE NAME java 16644 mapr
35u IPv6 69926776 0t0 TCP *:irisa (LISTEN)
```

You can also check Oozie logs to verify that Oozie started. The log is found here: `/opt/mapr/oozie/oozie-<version>/logs/oozie.log`

3. Perform any additional Hue configurations and then restart Hue so that the changes will take effect. See [Starting the Hue Webserver](#).

Integrate Hue with Spark (Experimental Only)

You can configure Hue to use the Spark Notebook UI. This allows users to submit Spark jobs from Hue.

Note: Spark Notebook is a feature that utilizes the Spark REST Job Server (Livy). The `mapr-livy` package must be installed on a node where the `mapr-spark` package is installed or the Livy service will not start.

1. In the `[spark]` section of the `hue.ini`, set the `livy_server_host` parameter to the host where the Livy server is running.

```
[spark]
# IP or hostname of livy server.
livy_server_url=https://<host>:8998
```

Note: If the Livy server runs on the same node as the Hue UI, you are not required to set this property as the value defaults to the local host.

2. Restart Hue.

```
maprcli node services -name hue -action restart -nodes <hue node>
```

Additional Information

- If needed, you can use the Control System or `maprcli` to start, stop, or restart the Livy Server. For more information, see [Managing Services](#) on page 904.

Note: Troubleshooting Tip

If you have more than one version of Python installed, you may see the following error when executing Python samples:

```
Py4JJavaError: An error occurred while calling
z:org.apache.spark.api.python.PythonRDD.collectAndServe...
```

Workaround:

Set the following environment variables in `/opt/mapr/spark/spark-<version>/conf/spark-env.sh`:

```
export PYSPARK_PYTHON=/usr/bin/python2.7
export PYSPARK_DRIVER_PYTHON=/usr/bin/python2.7
```

Integrate Hue with Drill

Starting in EEP 6.0, Drill is officially supported with Hue. When you integrate Drill with Hue, users can run Drill queries from the Hue interface and visualize data.

Drill integrates with Hue through configuration options in the `/opt/mapr/hue/hue-<version>/conf/hue.ini` file. A user can authenticate to Hue through Plain, Kerberos, or data-fabric-SASL authentication. The user that authenticates to Hue is the user that runs the Drill queries from Hue.

When connecting to Drill, Hue performs outbound impersonation to Drill as the user that authenticated to Hue. Drill accepts the outbound impersonation from Hue as an inbound impersonation. Drill then performs outbound impersonation to the filesystem or MapR Database.

Note: In a secure cluster, you can only access the Hue interface through HTTPS.

Note: SSL encryption is currently not supported.

Prerequisites

Note the following prerequisites before you integrate Hue with Drill:

- The cluster must have the latest versions of [Hue](#), [Drill](#), and [HTTPFS](#) installed. Hue uses HTTPFS to communicate with the file system. You can see the latest component versions in the [Component Versions for Released EEPs](#). If you install Hue and Drill on a secure cluster, Hue and Drill are installed with the default security configurations and outbound impersonation is enabled.
 - **Installer**

When you install Hue and Drill using the Installer, HTTPFS is installed automatically, and Hue is automatically configured to integrate Drill without having to perform any manual configuration. The installer configures a Zookeeper connection to Drill in `hue.ini`, by default.
 - **Manual Installation**
 - Install HTTPFS and then configure Hue, as described in the following section, *Configuring Hue*
- In a secure cluster, Drill must have [user impersonation enabled](#).

- Drill has an inbound impersonation policy option, `exec.impersonation.inbound_policies`, that allows the Hue process user (proxy user) to impersonate the Hue authenticated user as an outbound impersonation from Hue to Drill. This option is automatically configured when Drill and Hue are installed using the Installer with default security enabled, or when you run `configure.sh` on a secure cluster. If you do not run `configure.sh`, you must manually add this option to the impersonation configuration in the `/opt/mapr/drill/drill-<version>/conf/drill-override.conf` file, as shown:

```
impersonation.enabled: true,
impersonation.max_chained_user_hops: 3,
exec.impersonation.inbound_policies: "[{proxy_principals:{users:
[\"mapr\"]},target_principals:{users:[\"*\"]}}]\",
```

- If you plan to use Kerberos for authentication, you will need to include the Hue keytab file and Kerberos principal name for Hue in the `hue.ini` file. If needed, complete the steps listed in the [Creating a Kerberos Principal and Extracting the Kerberos Ticket from the keytab File](#) sections on the [Configure Hue to use Kerberos](#) on page 3853 page.

Configuring Hue

If you manually installed Hue, Drill, and HTTPFS, you must modify the `hue.ini` file to include the configuration information needed for Hue to connect with Drill and HTTPFS. The `hue.ini` file contains sections where you configure Hue to integrate with various components, like Drill and HTTPFS. You can access the `hue.ini` file in the `/opt/mapr/hue/hue-<version>/desktop/conf` directory. Start/Restart the services after you update the `hue.ini` file.

Note: If you installed Hue and Drill using the Installer, these options are populated automatically in the `hue.ini` file; no configuration is required. In a secure cluster, the authentication mechanism defaults to MAPR-SECURITY.

Complete the following steps to integrate Hue with Drill:

1. Edit the Drill configuration in `hue.ini`.

The `hue.ini` file contains a `[[[drill]]]` section under which you can see configuration options needed for Hue to connect with Drill. You must uncomment an option (remove the `#` character) in the `hue.ini` file for the option to take effect.

The following tables list and describe the Drill options with possible values and also provide examples:

| Options | Descriptions | Examples |
|-------------------------------|---|--|
| <code>connection_type=</code> | <p>Tells Hue how to connect to Drill. Enter one of the following values:</p> <ul style="list-style-type: none"> • <code>direct</code> • <code>zookeeper</code> <p>A direct connection is a connection in which Hue connects directly to a Drillbit. A ZooKeeper connection is a connection in which Hue communicates with ZooKeeper and ZooKeeper provides Hue with a Drillbit to connect with.</p> | <code>connection_type=zookeeper</code> |

| | | |
|----------------|--|--|
| drillbits= | Enter the node IP address of the Drillbit that Hue connects with. Only enter a node address if using the "direct" connection_type. | drillbits=10.10.100.2:31010 To list multiple Drillbits, separate each IP address by a comma, as shown: drillbits=10.10.100.2:31010, 10.10.100.3:31010  Note: Port 31010 is the user port between nodes in a Drill cluster. This port is needed for an external client to connect into the cluster nodes and for the Drill Web Console. |
| zk_quorum= | Enter the list of ZooKeeper node IP addresses in the ZooKeeper quorum. Only enter the IP addresses for the ZooKeeper quorum if using the "zookeeper" connection_type. | zk_quorum=10.10.100.3:5181, 10.10.100.4:5181, 10.10.100.5:5181 |
| zk_cluster_id= | Enter the name of the Drill cluster that you want Hue to connect to. | zk_cluster_id=dev-drillbits |
| mechanism= | The type of authentication enabled. Enter one of the following values: <ul style="list-style-type: none"> • None • GSSAPI • Data Fabric-SECURITY Use None for Plain authentication. Use GSSAPI for Kerberos authentication. Use MAPR-SECURITY for maprsasl. If you set the mechanism to "none" and impersonation is enabled, you must set the username and password to the admin or proxy user that will impersonate Hue end users. You can set these with the user= and password= options. If you set the mechanism to GSSAPI, you must also include the ccache_path= option. For this option, enter the caching location for Kerberos credentials, for example: ccache_path=/tmp/hue_krb5_ccache  Note: See Configure Hue to use Kerberos on page 3853 You can set the Drill Kerberos principal and/or Hue impersonation using the option named "options=." See "options=" below. | mechanism=none |

| | | |
|------------------|---|--|
| user= | <p>If using Plain authentication, enter the username. If using another authentication mechanism, do not enter a value.</p> <p>Set the username to the admin or proxy user that will impersonate Hue end users.</p> <p>If impersonation is disabled, the you can set the user to any user. Hue will connect to Drill as the user specified.</p> | user=mapr |
| password= | <p>If using Plain authentication, enter the password. If using another authentication mechanism, do not enter a value.</p> <p>Set the password for the admin or proxy user that will impersonate Hue end users.</p> <p>If impersonation is disabled, set the password for the use specified.</p> | password=mapr8 |
| password_script= | <p>Indicates which script to run for the database password when a password is required and the password= option is not set. Enter the location of the script.</p> <p>The following shell script is an example of a password script:</p> <pre>#!/bin/bash case \$1 in drill) echo "password_1" ;; some-output) echo "password_2" ;; *) echo "wrong argument" >&2 exit 1 ;; esac</pre> | password_script='/root/hue_password_script/password_script.sh drill' |
| options= | <p>Additional options related to impersonation and Kerberos authentication. This option takes the following values:</p> <ul style="list-style-type: none"> • impersonation • principal <p>Impersonation enables or disables outbound impersonation in Hue. Principal is the Drill service principal when Kerberos authentication is enabled.</p> | <pre>options={"impersonation": true, "principal": "mapr/localhost@REALM"}</pre> <pre>options={"impersonation": true}'</pre> <pre>options={"impersonation": false}'</pre> |

2. Add the HTTPFS URL in `hue.ini`.

The `hue.ini` file contains a `[[[default]]]` section in the `[hadoop]` block under which you can see HDFS configuration options. You must uncomment an option (remove the `#` character) in the `hue.ini` file for the option to take effect.

In the `[[[default]]]` section of the `[hadoop]` block, enter the IP address of the HTTPFS node as the value for the `webhdfs_url=` option, as shown:

```
# Use WebHdfs/HttpFs as the communication mechanism.
# Domain should be the NameNode or HttpFs host.
# Default port is 14000 for HttpFs.
webhdfs_url=https://<httpfs-node-ip-address>:14000/webhdfs/v1
```

3. Start the services.

Start/Restart Hue, Drill, and HTTPS to apply the updated configurations, as shown in the following examples:

```
maprcli node services -name hue -action start -nodes
<hue-node-ip-address>

maprcli node services -name drill-bits -action start -nodes
<list-of-drill-node-ip-addresses>

maprcli node services -name httpfs -action start -nodes
<httpfs-node-ip-address>
```

Run Drill Queries in Hue

Once you have configured Hue and started the services, you can run Drill queries from Hue and visualize your data.

Complete the following steps to run Drill queries in Hue:

1. In your web browser, enter the Hue URL to navigate to the Hue web interface, as shown:

```
http://hue-node-ip-address:8888
```

2. If prompted, enter your user credentials. The Hue interface opens.
3. In the **Query** drop-down, select **Editor > Drill**. The left navigation panel displays the list of schemas available in Drill.
4. Select a schema, for example `dfs.default`, and then enter a query in the text field.
5. Click the blue play button to execute the query. Query results display.
6. Optionally, you can use the buttons to the left of the query results to visualize the data.

Configure Hue to use Drill on a Data Fabric-SASL-Secured Cluster

You can configure Hue to use Drill on a data-fabric-SASL cluster.

1. Configure Hue to use Drill:

- a) In the `hue.ini`, go to the Drill section, and set the parameters. For example:

```
[librdbms]
  [[databases]]
    ...
    [[[drill]]]

    # Name to show in the UI.
    nice_name="Drill"

    # Database backend to use.
    engine=drill

    # Connection type. This can be:
    # 1. direct
    # 2. zookeeper
    connection_type=direct

    # Drillbit address for direct connection.
    drillbits=<node>:31010

    # Security mechanism of authentication none/GSSAPI/MAPR-SECURITY.
    mechanism=MAPR-SECURITY

    # Available options:
    # "impersonation" to enable or disable outbound impersonation.
    # "principal" of Drill service. Used when Kerberos authentication
    is enabled.
    options='{ "impersonation": true, "principal": "mapr/
<node>@REALM" }'
```

2. Restart Hue to apply the updated configuration:

```
maprcli node services -name hue -action restart -nodes <node>
```

Configure Hue to use Drill on Kerberos-Secured Cluster

You can configure Hue to use Drill on a Kerberos-secured cluster.

1. Configure Hue to use Drill:

- a) In the `hue.ini`, go to the Drill section, and set the parameters. For example:

```
[librdbms]
  [[databases]]
    ...
    [[[drill]]]

    # Name to show in the UI.
    nice_name="Drill"

    # Database backend to use.
    engine=drill

    # Connection type. This can be:
    # 1. direct
    # 2. zookeeper
    connection_type=direct

    # Drillbit address for direct connection.
    drillbits=<node>:31010

    # Security mechanism of authentication none/GSSAPI/MAPR-SECURITY.
    mechanism=GSSAPI

    # Available options:
    # "impersonation" to enable or disable outbound impersonation.
    # "principal" of Drill service. Used when Kerberos authentication
    is enabled.
    options='{ "impersonation": true, "principal": "mapr/
    <node>@REALM" }'
```

2. Restart Hue to apply the updated configuration:

```
maprcli node services -name hue -action restart -nodes <node>
```

Configure Hue to use Drill on PAM-Secured Cluster

You can configure Hue to use Drill on a Pluggable Authentication Modules (PAM) secured cluster.

1. Configure Hue to use Drill:

- a) In the `hue.ini`, go to the Drill section, and set the parameters. For example:

```
[librdbms]
  [[databases]]
    ...
    [[[drill]]]

    # Name to show in the UI.
    nice_name="Drill"

    # Database backend to use.
    engine=drill

    # Connection type. This can be:
    # 1. direct
    # 2. zookeeper
    connection_type=direct

    # Drillbit address for direct connection.
    drillbits=<node>:31010

    # Security mechanism of authentication none/GSSAPI/MAPR-SECURITY.
    mechanism=none

    # Username to authenticate with when connecting to the database.
    # Used with plain authentication (mechanism set to "none").
    user=<user>

    # Password matching the username to authenticate with when
    # connecting to the database.
    # Used with plain authentication (mechanism set to "none").
    password=<password>
```

2. Restart Hue to apply the updated configuration:

```
maprcli node services -name hue -action restart -nodes <node>
```

Configure Hue to use Drill on an Unsecured Cluster

You can configure Hue to use Drill on an unsecure cluster.

1. Configure Hue to use Drill:

- a) In the `hue.ini`, go to the Drill section, and set the parameters. For example:

```
[librdbms]
  [[databases]]
    ...
    [[[drill]]]

    # Name to show in the UI.
    nice_name="Drill"

    # Database backend to use.
    engine=drill

    # Connection type. This can be:
    # 1. direct
    # 2. zookeeper
    connection_type=direct

    # Drillbit address for direct connection.
    drillbits=<node>:31010

    # Security mechanism of authentication none/GSSAPI/MAPR-SECURITY.
    mechanism=none
```

2. Restart Hue to apply the updated configuration:

```
maprcli node services -name hue -action restart -nodes <node>
```

Configure Hue to Connect to Drill Using the Drill ODBC Driver

Describes how to connect Hue to Drill using the Drill ODBC Driver.

Starting in EEP 7.0.0 (Hue 4.6.0.0 and Drill 1.16.1.0), you can install the Drill ODBC driver and then use the driver to connect Hue to Drill. Note that the Drill ODBC Driver is not available for Ubuntu.

For Hue, the ODBC Driver provides better performance than the JDBC Driver. The ODBC Driver is invoked directly from the Python VM of the Hue process whereas Hue must launch a separate Java Gateway process with the JDBC Driver to translate the Python instructions to JVM instructions, which degrades performance.

Prerequisites

Before you connect Hue to Drill:

- [Install the Drill ODBC Driver on your system.](#)
- Install the `unixODBC` package on your system:

```
yum install unixODBC
```

- (Optional) Configure the ODBC DSN (Data Source Name) in the `~/.odbc.ini` file, as described in [Apache Drill Docs: Configuring ODBC on Linux.](#)

Configuring Hue to Connect to Drill

To configure Hue to connect to Drill through the Drill ODBC Driver, add the Drill ODBC interpreter entry in the `notebook` section of `hue.ini` using the `sqlalchemy` interface, as shown in the following example:

```
[notebook]
# ...
```

```
[[interpreters]]
# ...
[[[drillodbc]]]
name=Drill ODBC
interface=sqlalchemy
## Specify Drill ODBC connection parameters separated by "&".
## Ensure that Drill ODBC drivers and unixODBC installed.
options='{ "url": "drill+odbc:///?"<ODBC connection parameters>" }'
```

The following example shows a Hue configuration with the ODBC DSN (Data Source Name) configured in `~/.odbc.ini`. Note that the `DelegationUID=${USER}` property enables outbound impersonation from Hue to Drill.

```
[notebook]
# ...
[[interpreters]]
# ...
[[[drillodbc]]]
name=Drill ODBC
interface=sqlalchemy
options='{ "url": "drill+odbc:///?DSN=MapR Drill 64-bit&DelegationUID=${USER}" }'
```

The following example shows a Hue configuration that uses a Drillbit connection with default security (MapRSASL) enabled:

```
[notebook]
# ...
[[interpreters]]
# ...
[[[drillodbc]]]
name=DrillODBC
interface=sqlalchemy
options='{ "url": "drill+odbc:///?Driver=/opt/mapr/drill/lib/64/
libdrillodbc_sb64.so&ConnectionType=Direct&HOST=node1.cluster.com&PORT=31010
&AuthenticationType=MapRSASL&DelegationUID=${USER}" }'
```

Note: If you do not use the DSN, you must manually specify the full path to the Drill ODBC Driver, for example:

```
Driver=/opt/mapr/drill/lib/64/libdrillodbc_sb64.so
```

Integrate Hue With Spark

Important: Hue integration with Spark is an experimental feature.

1. In the `[spark]` section of the `hue.ini` file, set the `livy_server_host` and `livy_server_port` parameters to the host and port where the Livy server is running:

```
[spark]
# The Livy Server URL.
livy_server_url=https://node10.cluster.com:8998
```

2. To configure Hue to use Spark modes, modify `livy.conf` (`vim /opt/mapr/livy/livy-<version>/conf/livy.conf`):

- a) If Spark jobs run on local mode, set the `livy.spark.master` property:

```
...
# What spark master Livy sessions should use.
livy.spark.master = local[*]
...
```

- b) If Spark jobs run on YARN mode, set the `livy.spark.master` and `livy.spark.deployMode` properties (client or cluster). For example:

```
...
# What spark master Livy sessions should use.
livy.spark.master = yarn
# What spark deploy mode Livy sessions should use.
livy.spark.deployMode = cluster
...
```

- c) If Spark jobs run on Standalone mode, set the `livy.spark.master` property. For example:

```
# What spark master Livy sessions should use.
livy.spark.master = spark://ubuntu500:7077
```

- d) If Spark jobs run on Mesos mode, set the `livy.spark.master` property. For example:

```
# What spark master Livy sessions should use.
livy.spark.master = mesos://<mesos-master-node-ip>:5050
```

Note: Integration of Spark on Mesos with Hue is not supported in cluster deployment mode.

3. If you want to be able to access Hive through Spark in Hue, you should configure Spark with Hive, and set `livy.repl.enableHiveContext` to `true` in `livy.conf`. For example:

```
...
# Whether to enable HiveContext in livy interpreter, if it is true
hive-site.xml will be detected
# on user request and then livy server classpath automatically.
livy.repl.enableHiveContext = true
...
```

4. If you are planning to use PySpark, you will need to set the `PYTHONPATH` environment variable in `livy-env.sh` (`/opt/mapr/livy/livy-<version>/conf/livy-env.sh`):

```
...
export PYTHONPATH=$SPARK_HOME/python/lib/py4j-<version>-
src.zip:$SPARK_HOME/python/:$PYTHONPATH
```

For example:

```
...
export PYTHONPATH=$SPARK_HOME/python/lib/py4j-0.10.7-
src.zip:$SPARK_HOME/python/:$PYTHONPATH
```

5. Make sure that R is installed on the node if you are planning to run SparkR. To install R to run SparkR jobs:

On Ubuntu

```
sudo apt-get install r-base
```

On Red Hat / CentOS

```
sudo yum install R
```

6. Restart the Spark REST Job Server (Livy).

```
maprcli node services -name livy -action restart -nodes <livy node>
```

7. Restart Hue:

```
maprcli node services -name hue -action restart -nodes <hue node>
```

Use Hue

This section provides information about using Hue, but it does not duplicate the Hue documentation.

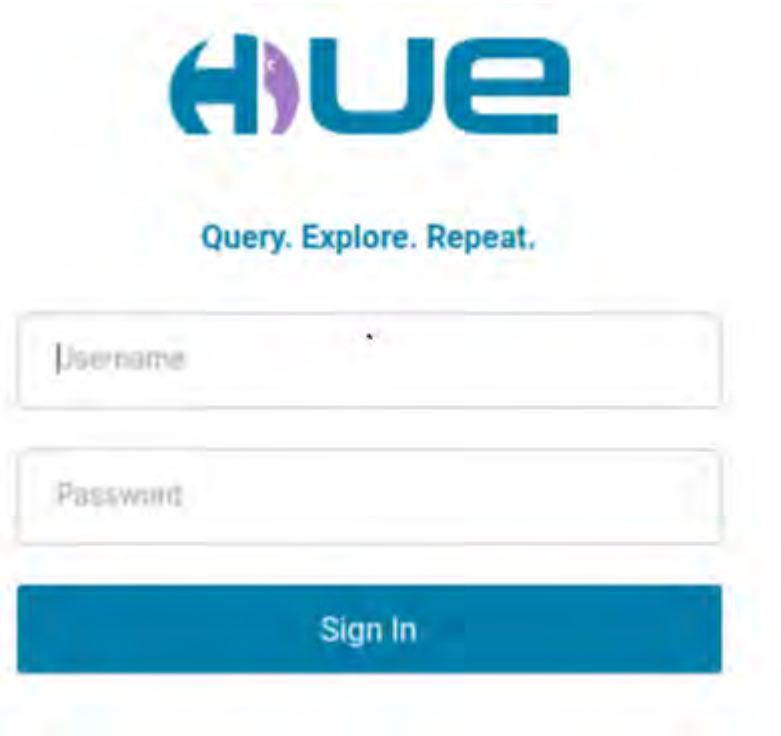

You can also refer to the [Hue documentation](#).

This section includes the following topics:

Logging in to Hue 4.X

Once Hue is installed and the configuration files have been edited, direct your browser to the IP address where you installed Hue.

- Open the Hue homepage: `ip_address>:8888`
The following screen appears:

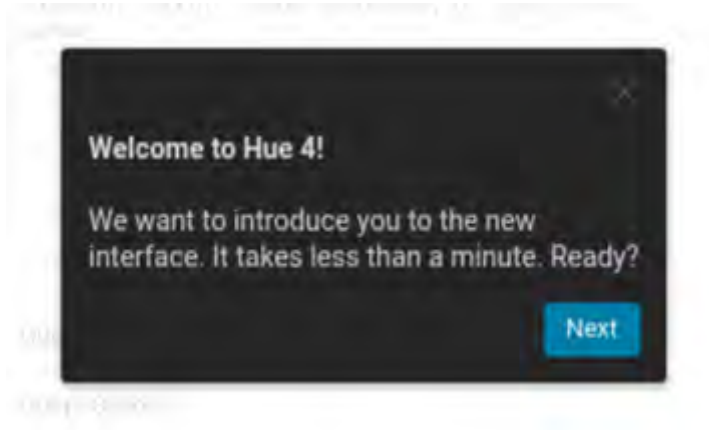

- Sign in with your username, enter the password `mapr` and click **Sign in**. You can find your username in the `/opt/mapr/conf/daemon.conf` file.

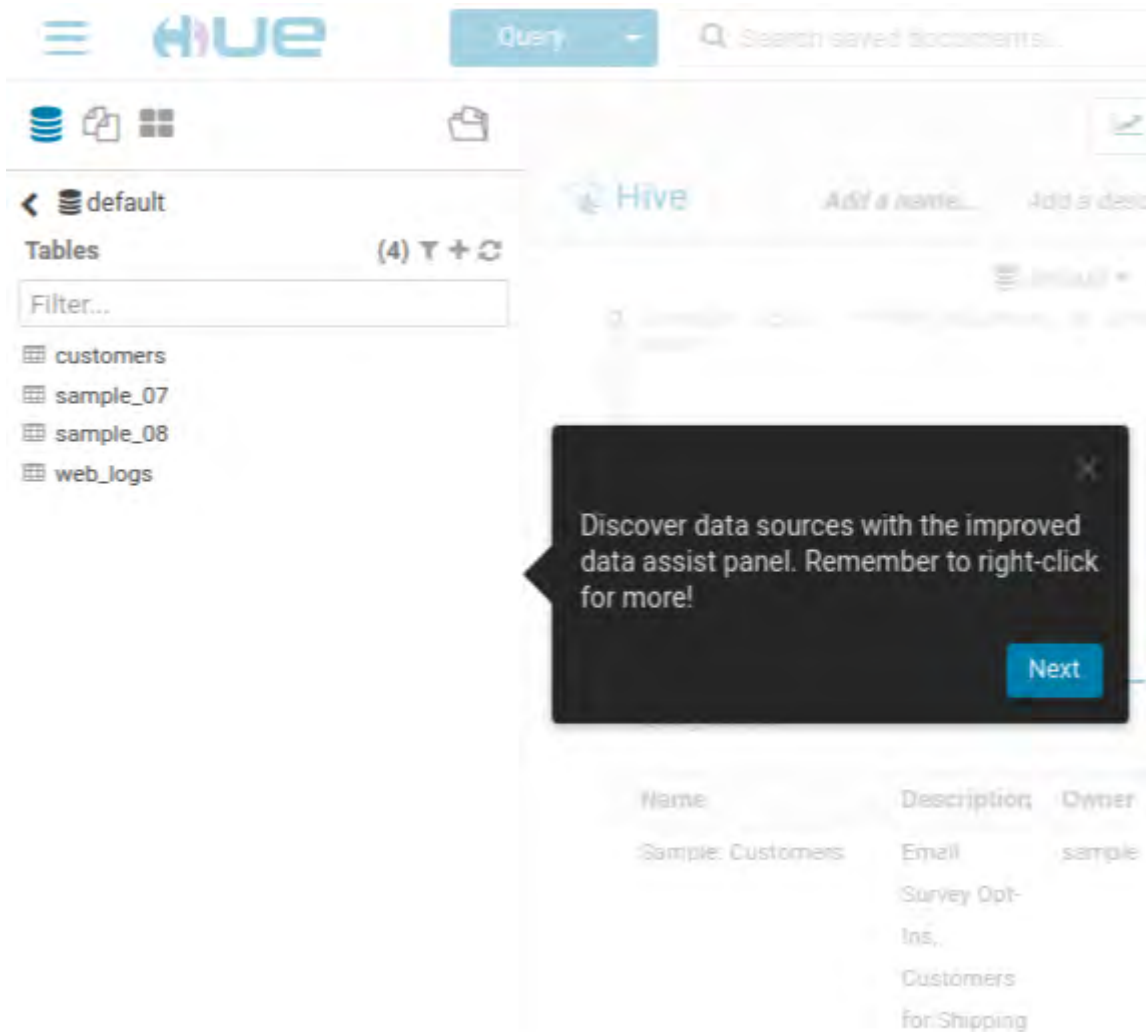

Using Hue Welcome Tour

After your first login, you will be introduced to the new features in Hue 4 by the "Welcome Hue 4!" tour.

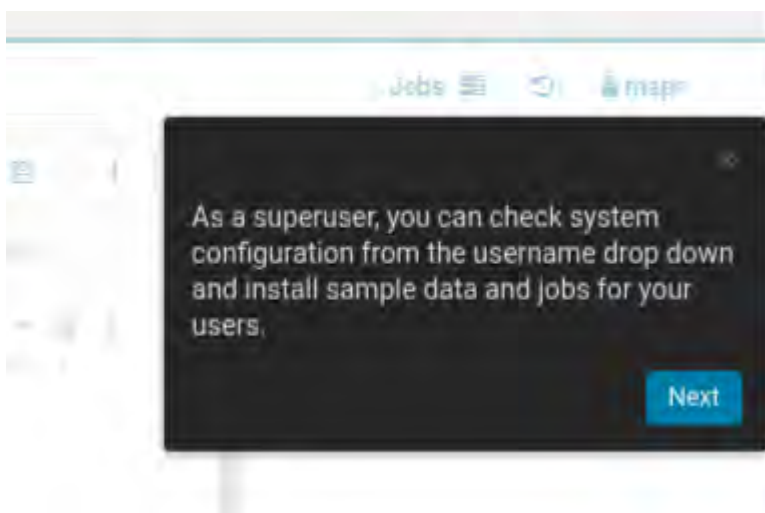

1. Start the welcome tour.
The following screen appears:

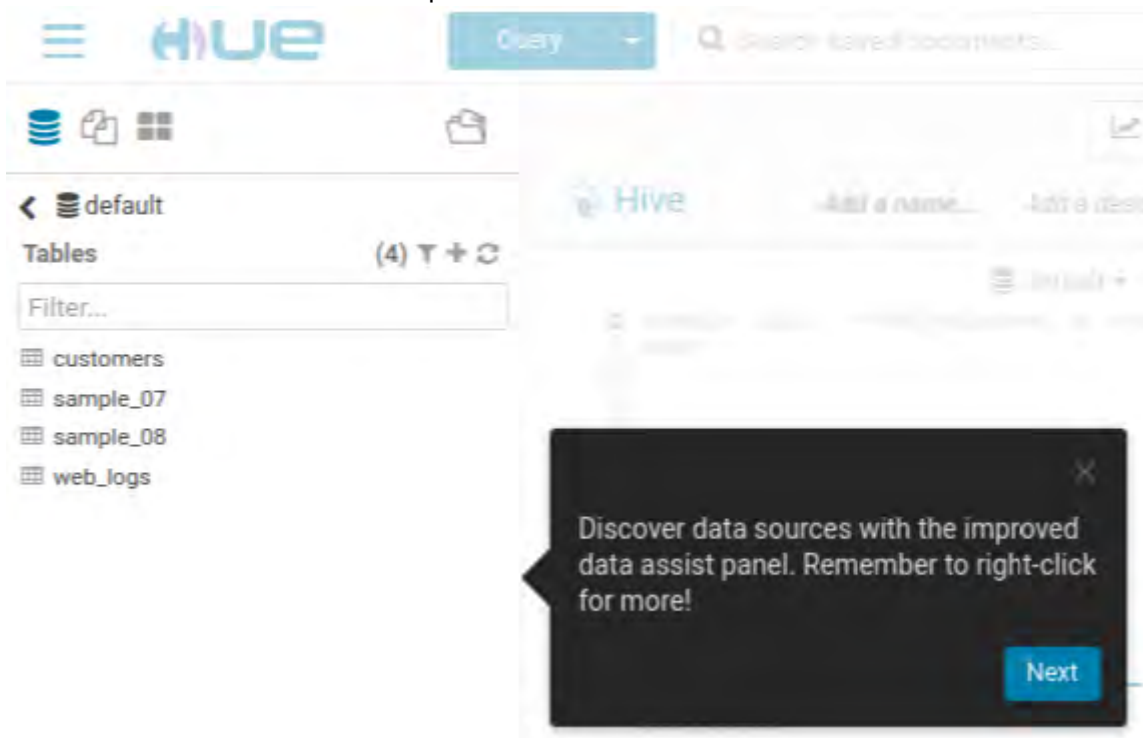

2. You are first introduced to the navigation bar:

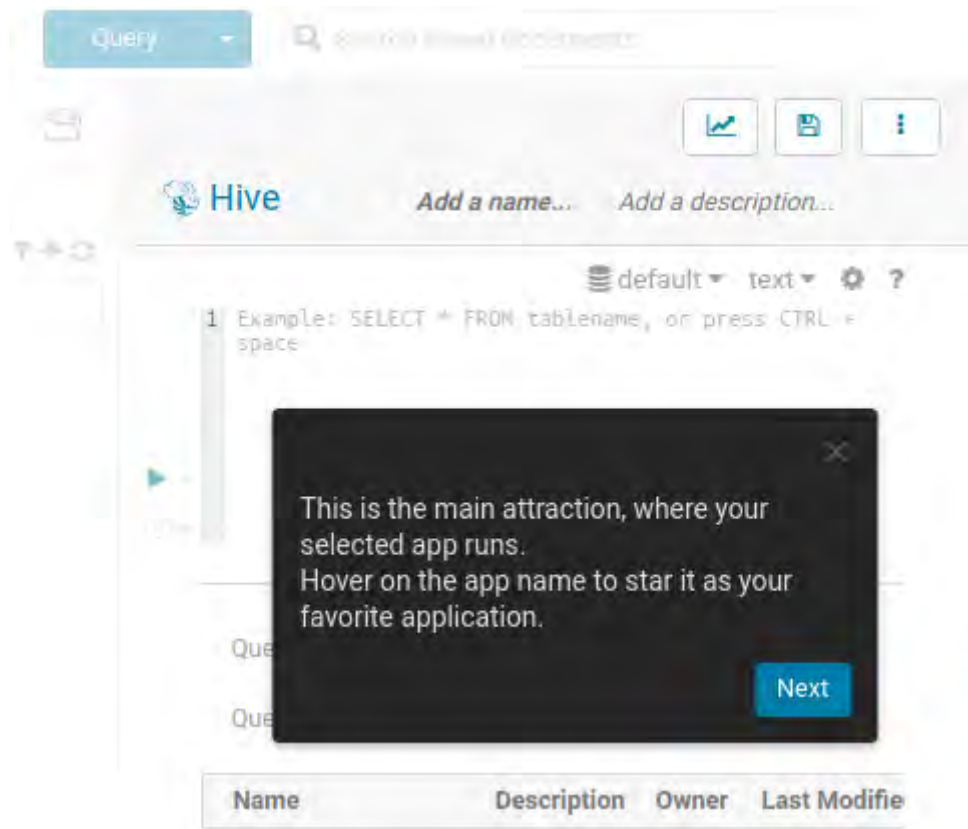

3. You are introduced to the superuser menu:

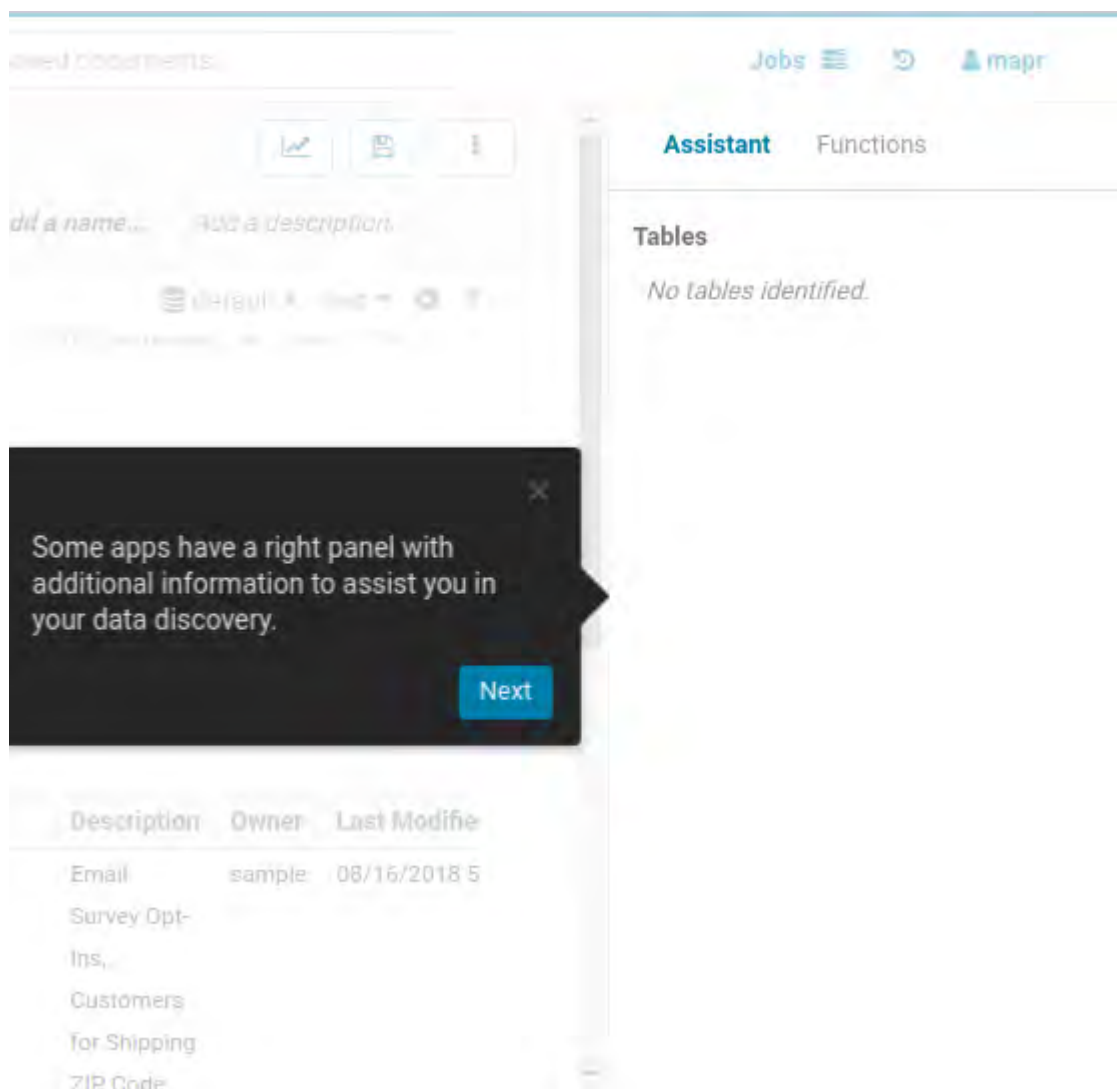

4. You are introduced to the left assist panel:

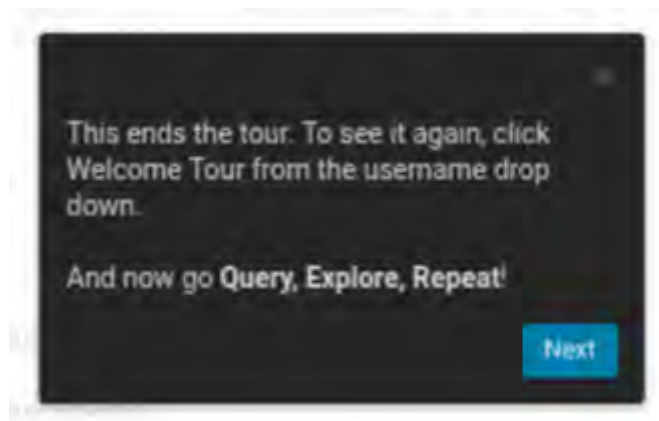

5. You are introduced to the main working zone:

6. You are introduced to the right assist panel:

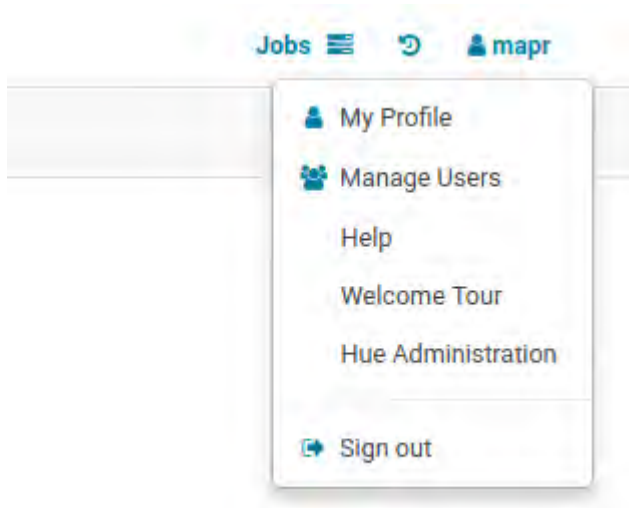

7. You then come to the end of the tour:

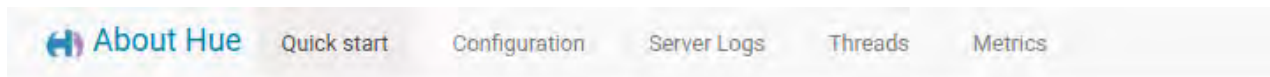

Getting Started with the Quick Start Wizard (Hue 4.X)

With the Quick Start Wizard you can check configuration, install examples, and create users.

Click on **Hue Administration** in the user menu:

Step 1: Check Configuration

Quick Start Wizard - Hue™ 4.2.0 - Query. Explore. Repeat.

- Step 1: Check Configuration
- Step 2: Examples
- Step 3: Users
- Step 4: Go!

Checking current configuration

Configuration files located in `/opt/mapr/hue/hue-4.2.0/desktop/conf`

All OK. Configuration check passed.

Step 2: Examples

The screenshot shows the Hue Quick Start Wizard interface. At the top, there is a navigation bar with the following items: About Hue, Quick start, Configuration, Server Logs, Threads, and Metrics. The main heading is "Quick Start Wizard - Hue™ 4.2.0 - Query. Explore. Repeat." Below this, there are four steps listed on the left: Step 1: Check Configuration, Step 2: Examples (highlighted in a blue box), Step 3: Users, and Step 4: Go! On the right side, under the heading "Install individual application examples", there is a list of application examples with download icons: Hive, Spark, Oozie Editor/Dashboard, HBase Browser, Pig Editor, and Job Editor.

Step 3: Users

The screenshot shows the Hue Quick Start Wizard interface. At the top, there is a navigation bar with the following items: About Hue, Quick start, Configuration, Server Logs, Threads, and Metrics. The main heading is "Quick Start Wizard - Hue™ 4.2.0 - Query. Explore. Repeat." Below this, there are four steps listed on the left: Step 1: Check Configuration, Step 2: Examples, Step 3: Users (highlighted in a blue box), and Step 4: Go! On the right side, under the heading "Create or import users", there is a list of user options: User Admin. Below this, under the heading "Anonymous usage analytics", there is a checkbox labeled "Help improve Hue with anonymous usage analytics." which is checked.

Note: By default, the Hue interface is configured to use PAM for authentication; so you cannot create or import users. For more information, see [Configure Hue Interface Authentication](#).

User Administration in Hue 4.X

By default, the Hue interface is configured to use PAM for authentication; so you cannot use the Hue interface to create users or edit their passwords.

Note: For more information, see [Configure Hue Interface Authentication](#).

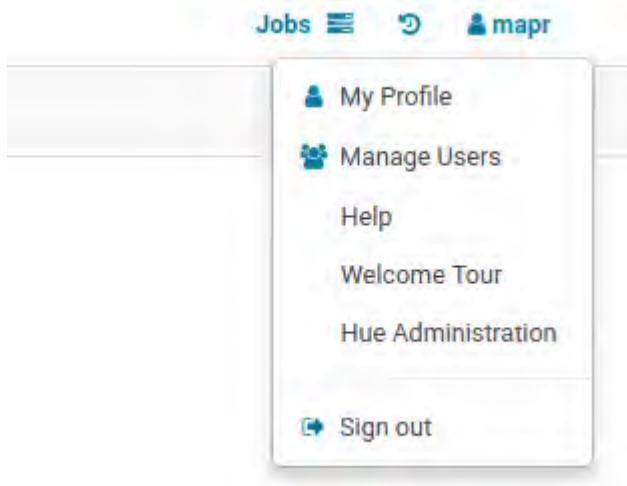

This section contains the following topics:

Changing Your Password

Once you log in, you can change your Hue password.

To change your Hue password, perform the following steps:

1. Click on your **Username** at the top right of the navigation menu bar and select **Edit Profile** from the drop-down menu. In this example, the username is **mapr**.

The *Hue Users* dialog box opens.

2. Enter your current password in the *Current password* field and enter your new password in the *New Password* field. Retype the password in the *Password confirmation* field.

User Admin **Users** Groups Permissions

Hue Users - Edit user: mapr

Step 1: Credentials (required) Step 2: Names and Groups Step 3: Advanced

Username

Password

Password confirmation

Create home directory

[Back](#) [Next](#) [Update user](#)

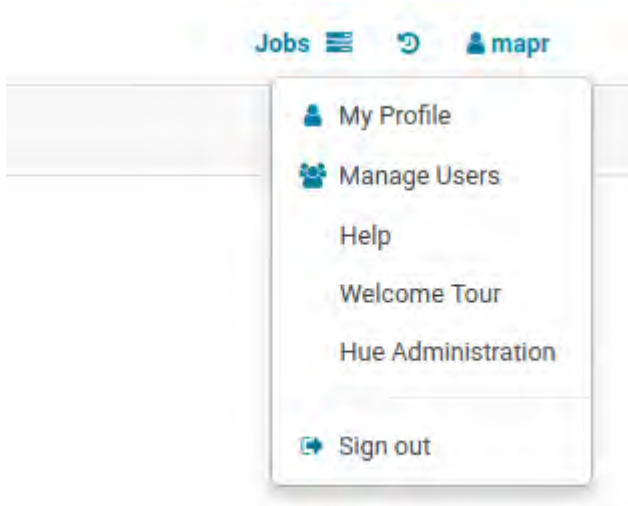

3. Click **Update user**.

Adding Users

When you click on your username, all users are displayed.

To create more users, follow these steps:

1. Click on your **Username** at the top right of the navigation menu bar and select **Manage Users** from the drop-down menu.

In this example, the username is **mapr**.

- The *Hue Users - Create user* dialog box opens.

Click **Add user** to finish the process. If you want to assign superuser privileges to the user, click **Next** to proceed to the next screen.

- Fill in the *Username*, *New Password*, and *Password confirmation* fields.
- (Optional) Fill in the user's name and email address, and assign a group.

User Admin Users Groups Permissions

Hue Users - Create user

Step 1: Credentials (required) Step 2: Profile and Groups Step 3: Advanced

First name

Last name

Email address

- (Optional) Assign superuser privileges to the user that you just added by checking the *Superuser status* box.

User Admin Users Groups Permissions

Hue Users - Create user

Step 1: Credentials (required) Step 2: Profile and Groups Step 3: Advanced

Active

Superuser status

- Click **Add User**.

Managing HPE Ezmeral Data Fabric Database Binary Tables in Hue 4.X

You can create and manage HPE Ezmeral Data Fabric Database binary tables in the HBase Browser of the Hue interface.

This section includes the following sections:

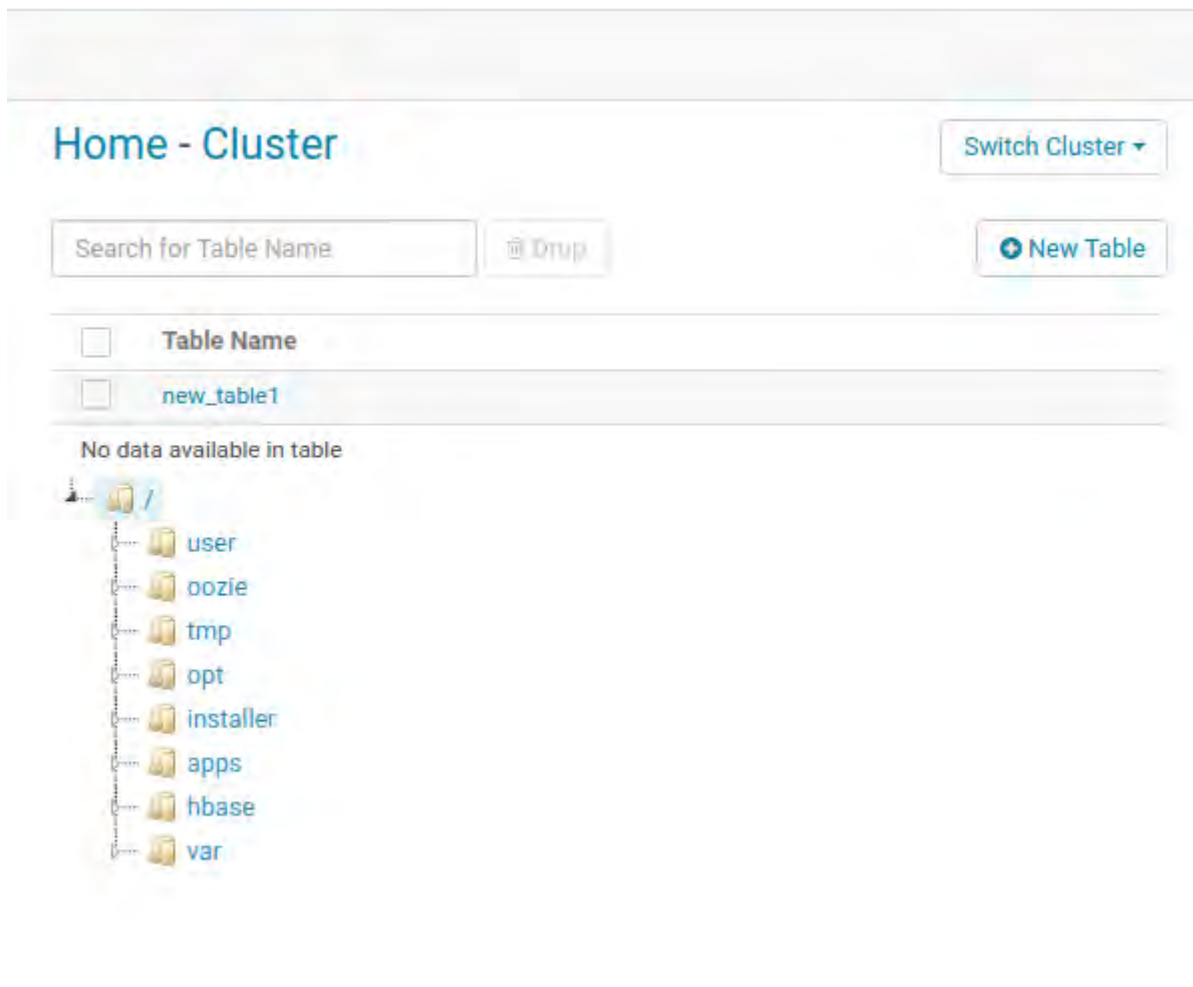

Using the Hbase Browser

When you open the Hbase Browser, you can view all the directories and HPE Ezmeral Data Fabric Database binary tables available in MapR Filesystem.

You can use the HBase Browser to create, edit, and search for HPE Ezmeral Data Fabric Database binary tables. However, you cannot enable, disable, or drop HPE Ezmeral Data Fabric Database binary tables.

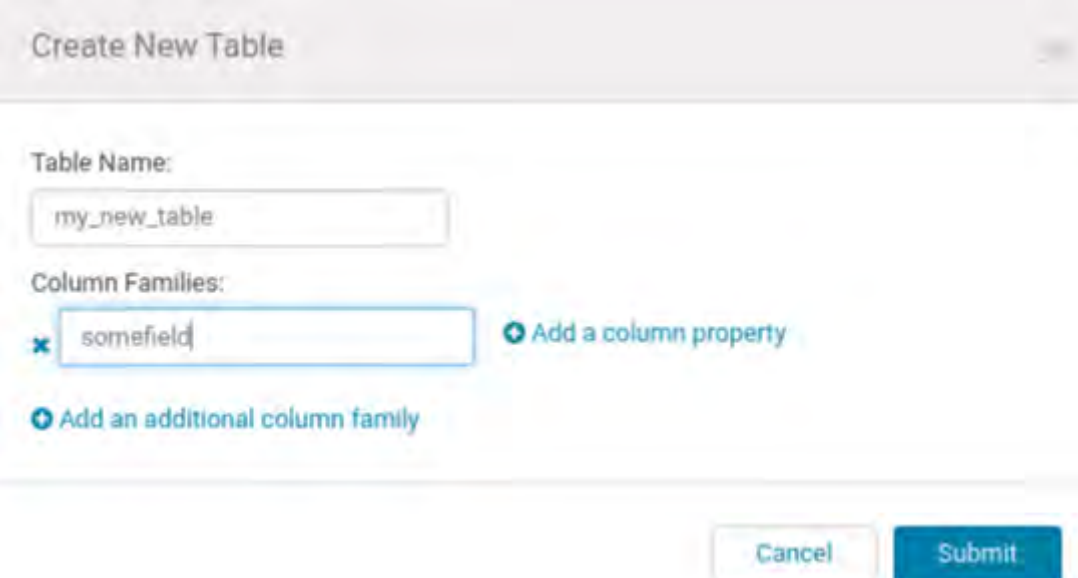

Note: The browser also lists HPE Ezmeral Data Fabric Database JSON tables. However, their appearance is not different from that of HPE Ezmeral Data Fabric Database binary tables. You cannot edit JSON tables.

Creating a HPE Ezmeral Data Fabric Database Binary Table

You can create a new HPE Ezmeral Data Fabric Database Binary Table.

1. In the Hbase Browser, click **New Table**.
2. In the **Table Name** field, provide the full name of the table that you want to create. For example, my_new_table.

Create New Table

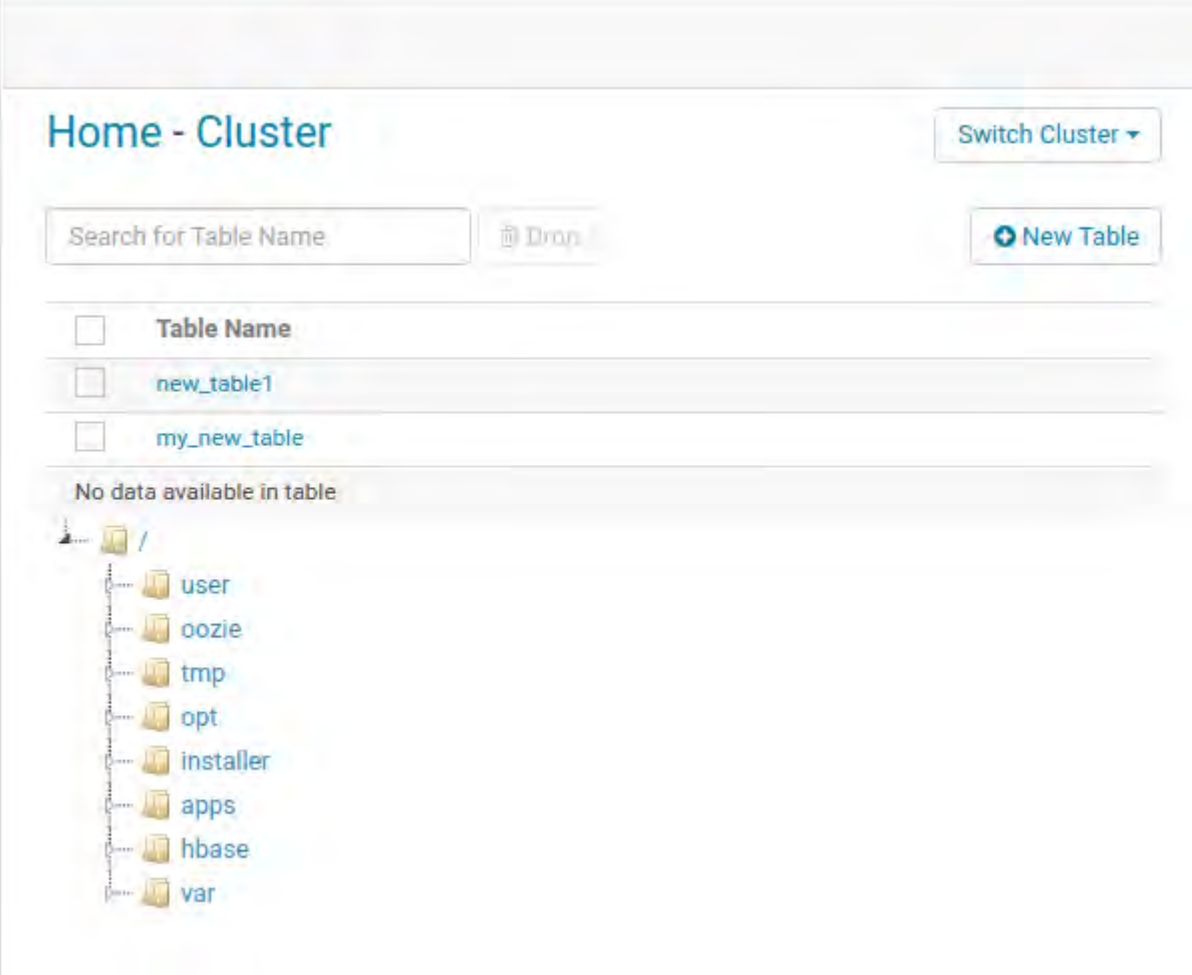

Table Name:
my_new_table

Column Families:
* somefield [Add a column property](#)

[Add an additional column family](#)

Cancel Submit

3. In the *Column Families* field, you can add column families and column properties.
4. Click **Submit**. The table that you created appears in the Hbase Browser:

Home - Cluster [Switch Cluster](#)

Search for Table Name [Drop](#) [New Table](#)

| <input type="checkbox"/> | Table Name |
|--------------------------|--------------|
| <input type="checkbox"/> | new_table1 |
| <input type="checkbox"/> | my_new_table |

No data available in table

- user
- oozie
- tmp
- opt
- installer
- apps
- hbase
- var

Starting the Hue Webserver

After you configure the `hue.ini`, you need to start the Hue Webserver and verify that it has started.

1. To start/restart the Hue Webserver, run the following command:

- If Hue is installed on a cluster node (the common use case and recommended practice), run the following command to start the Hue webserver:

```
maprcli node services -name hue -action start -nodes <ip_address>
```

- If Hue is installed on a cluster node (the common use case and recommended practice), run the following command to restart the Hue webserver:

```
maprcli node services -name hue -action restart -nodes <ip_address>
```

- If Hue is installed on an edge node (not recommended), run the following command to start the Hue webserver:

```
/opt/mapr/hue/hue-<version>/bin/hue-server start
```

2. To verify that the Hue webserver started, enter: `lsof -i:8888`

The output from this command should look similar to this:

| COMMAND | PID | USER | FD | TYPE | DEVICE | SIZE/OFF | NODE | NAME |
|-----------------------|-------|------|----|------|----------|----------|------|-------------|
| python2.6 (LISTEN) | 27688 | mapr | 3u | IPv4 | 69955314 | 0t0 | TCP | *:ddi-tcp-1 |
| python2.6 (LISTEN) | 27691 | mapr | 3u | IPv4 | 69955314 | 0t0 | TCP | *:ddi-tcp-1 |

You can also check Hue webserver logs to verify that Hue webserver started. If the Hue webserver was installed on a *cluster* node or an *edge* node, the log is found here:

```
/opt/mapr/hue/hue-<version>/logs/runcpserver.log
```

Impala

Important: This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

Overview

Impala is an open source, interactive SQL engine for Hadoop that you can use to access data on clusters. With Impala, you can use business intelligence (BI) tools to run ad-hoc queries directly on Hadoop. Impala provides the following benefits:

- Broad availability of Hadoop data to the business community
- Leverages familiar SQL tools and skill sets on Hadoop
- Full fidelity data analysis
- Cost savings by offloading from traditional DWH/Analytics platforms
- Time savings because you do not have to move around data

Impala uses the Apache Hive query language (HiveQL) and Hive metadata. You can use the most common SQL-92 features of HiveQL, including SELECT, joins, and aggregate functions to query data in your cluster.

You can issue queries from the `impala-shell` command-line tool, or through an ODBC or JDBC client. When you submit a query, Impala works with other components in the cluster to process the query.

Impala uses the Hive metastore to store metadata. The Hive metastore is typically the same database that Hive uses to store metadata. Impala can access tables you create in Hive when they contain datatypes, file formats, and compression codecs that Impala supports.

If you have HPE Ezmeral Data Fabric Database configured to store table data, you can define the tables in Hive and then map them to equivalent tables in HPE Ezmeral Data Fabric Database. After you map the tables, you can use Impala to query the HPE Ezmeral Data Fabric Database tables and perform table joins between HPE Ezmeral Data Fabric Database and Hive tables.

The following table contains a list of components that work together to process a query issued to Impala:

| Component | Description |
|---|---|
| Clients | The <code>impala-shell</code> , JDBC client, or ODBC client that you connect to Impala from. You issue a query to Impala from the client. |
| Hive Metastore | Stores information about the tables that Impala can access. |
| Impala (<code>impalad</code> , <code>statedored</code> , <code>catalogd</code>) | <code>Impalad</code> is a process that runs on designated nodes in the cluster. It coordinates and runs queries. Each node running the Impala process can receive, plan, and coordinate queries sent from a client. <code>Statedored</code> tracks the state of the <code>Impalad</code> processes in the cluster. <code>Catalogd</code> communicates new or updated metadata to all the other Impala nodes when Impala changes table data or metadata on a node. |
| filesystem/HPE Ezmeral Data Fabric Database | <code>filesystem</code> is the filesystem that stores data files and tables. HPE Ezmeral Data Fabric Database stores tables natively. |

Impala Daemon

The Impala daemon (`impalad`) is the core Impala process. Install the `impala` server package on all nodes that you want to run the Impala service on. You can submit queries to any node configured with the Impala daemon. When you submit a query to a node running the Impala daemon process, the node becomes the central coordinator for the query. The coordinator distributes work to the other nodes running the Impala daemon process to complete the query request.

The coordinator node running the Impala daemon process completes the following tasks:

- Accepts the query from the client
- Parallelizes queries and distributes pieces of the query to other `impalad` nodes
- Receives query results from other `impalad` nodes
- Builds the final result set for the query and passes it to the client
- Communicates with the `statestore` service

All nodes running the Impala daemon process perform the following tasks:

- Read and write data to files
- Transmit partial query results back to the coordinator

- Communicate with the statestore service

Impala Statestore

The Impala statestore service (statestored) verifies the health of nodes running the Impala daemon process. The node running the statestore service communicates node health to all nodes running the Impala daemon process. The statestore service ensures that impalad nodes only pass query work to active nodes running the Impala daemon process.

If the node running the statestore service goes offline, other Impala nodes continue the query work. If any of the other Impala nodes go offline while the statestore service is unavailable, query time may increase. The statestore service can automatically communicate with the Impala nodes and resume work when the node is back online.

Catalog Service

The catalog service (catalogd) resides on the same node as statestored. The catalog service communicates new or updated metadata to all of the other Impala nodes when Impala changes table data or metadata on one node. You no longer need to use the `REFRESH` or `INVALIDATE METADATA` statements after issuing the following statements to Impala:

- `CREATE TABLE`

- `ALTER TABLE`

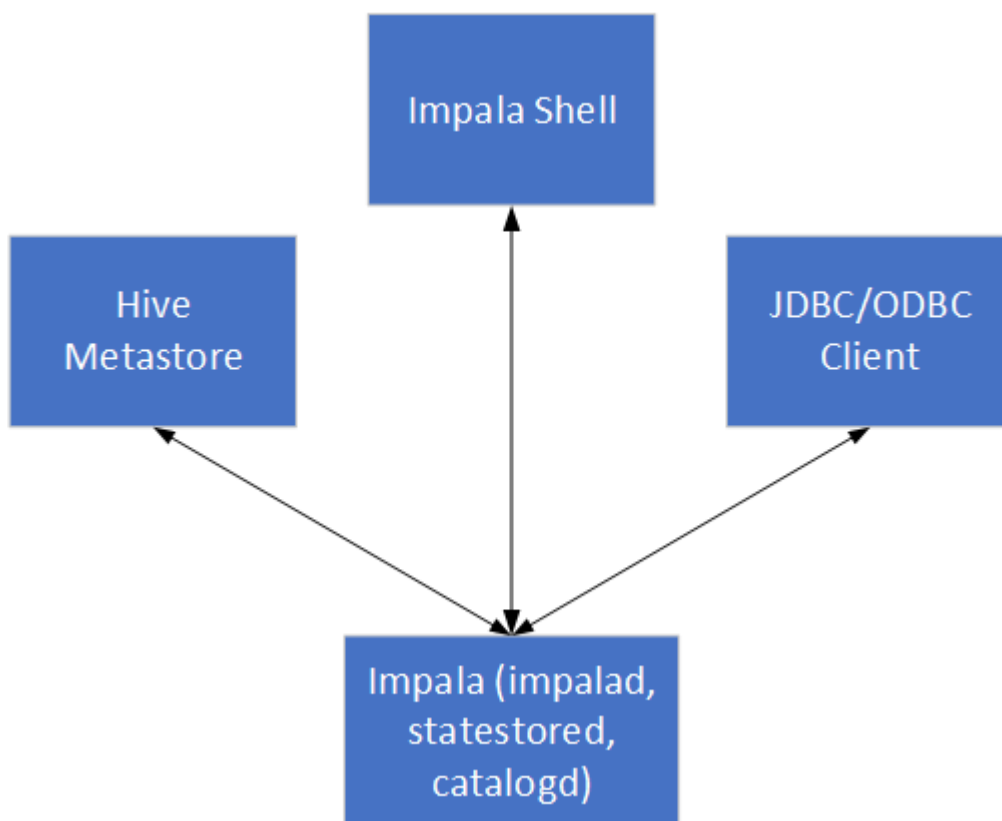

- `DROP TABLE`

- `INSERT`

- `LOAD DATA`

The catalog service only works on operations performed through Impala. If you perform operations through the Hive shell or through filesystem, you must issue the `REFRESH` and `INVALIDATE METADATA` statements. The catalog service broadcasts the results of the `REFRESH` and `INVALIDATE METADATA` operations to other Impala nodes so that you only have to issue the statements once.

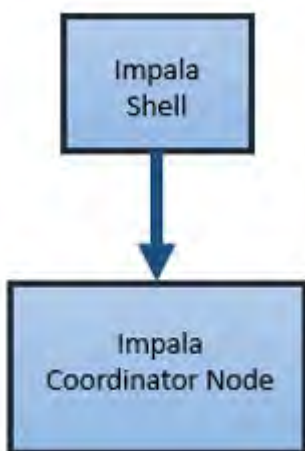

The following image represents how the various components communicate:

Query Execution

Each node running the Impala service can receive, plan, and coordinate queries. The Impala daemon process on each node listens for requests from clients on each node. Requests from the impala-shell are routed to the impala daemons through one particular port. JDBC and ODBC requests are routed through other ports.

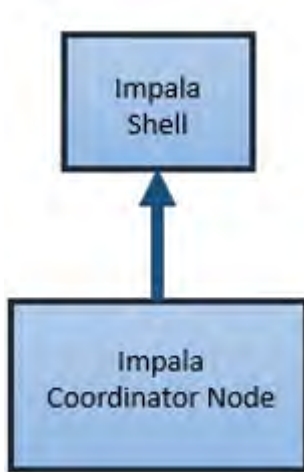

When you send a query to Impala, the client connects to a node running the Impala process. The node that the client connects to becomes the coordinator for the query.

The coordinator node parses the query into fragments and analyzes the query to determine what tasks the nodes running Impala must perform. The coordinator distributes the fragments across other nodes running the Impala daemon process. The nodes process the query fragments and return the data to the coordinator node.

The coordinator node sends the result set back to the client.

New Features in Impala

! **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

Each release of Impala has new features for improved performance and functionality. Refer to the following sections for a list of new features in each release of Impala:

New Features in Impala 2.10

! **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

Impala 2.10.0 introduces some new features that enhance the behavior and performance of Impala.

Functions

The following sections provide information about new and improved Impala functions:

String function, `replace()`

Faster than `regexp_replace()` for simple string substitutions.

Description: `replace(string initial, string target, string replacement)`

Purpose: Returns the initial argument with all occurrences of the target string replaced by the replacement string.

Return type: string

Usage notes: Because this function does not use any regular expression patterns, it is typically faster than `regexp_replace()` for simple string substitutions. If any argument is NULL, the return value is NULL. The matching is case-sensitive. If the replacement string contains another instance of the target string, the expansion is only performed once, instead of applying it again to the newly constructed string.

Example:

```
[localhost:21000] > select replace('hello world','world','earth');
Query: select replace('hello world','world','earth')
Query submitted at: 2018-02-08 05:10:11 (Coordinator: http://
localhost.lab:25000)
Query progress can be monitored at: http://localhost:25000/query_plan?
query_id=5e4686bd9b870724:f281e86f00000000
+-----+
| replace('hello world', 'world', 'earth') |
+-----+
| hello earth |
+-----+
Fetched 1 row(s) in 0.02s
```

Date/time function, last_day()

For finding the date corresponding to the last day of a particular month.

Description: last_day(timestamp t)

Purpose: timestamp

Usage notes: If the input argument does not represent a valid Impala **TIMESTAMP** including both date and time portions, the function returns **NULL**. For example, if the input argument is a string that cannot be implicitly cast to **TIMESTAMP**, does not include a date portion, or is out of the allowed range for Impala **TIMESTAMP** values, the function returns **NULL**.

Example:

```
[localhost:21000] > select
> now() as right_now
> , dayofmonth(now()) as day
> , extract(day from now()) as also_day
> , dayofmonth(last_day(now())) as last_day
> , extract(day from last_day(now())) as also_last_day;
Query: select now() as right_now
, dayofmonth(now()) as day
, extract(day from now()) as also_day
, dayofmonth(last_day(now())) as last_day
, extract(day from last_day(now())) as also_last_day
Query submitted at: 2018-02-08 05:07:59 (Coordinator: http://
localhost:25000)
Query progress can be monitored at: http://localhost:25000/query_plan?
query_id=5147af5bc88d7632:1e42f5c100000000
+-----+-----+-----+-----+-----+
| right_now | day | also_day | last_day | also_last_day |
+-----+-----+-----+-----+-----+
| 2018-02-08 05:07:59.999909000 | 8 | 8 | 28 | 28 |
+-----+-----+-----+-----+-----+
```

Date/time function, last_day()

Provides a simple way to get a stable, interoperable representation of a **TIMESTAMP** value without using a chain of functions to convert between representations and apply a specific timezone.

Other Features**Impala Query History**

You can re-execute previously queries via `@query_number(from start)` or `@-query_number(from end)`:

```
[localhost:21000] >@1;
Rerunning invalidate metadata;
Query: invalidate metadata
[localhost:21000] > @-1;
Rerunning show tables in default;
Query: show tables in default
```

Drop partitions via special symbols (<, >, <>, !=, <=, >=)

ALTER TABLE query for DROP partition can use special symbols for drop range of the partitions:

```
ALTER TABLE db.table DROP PARTITION (partition<=partition_value);
```

CREATE TABLE with SORT BY

Introduced SORT BY clause in the CREATE TABLE statement:

```
CREATE TABLE sorted_tbl (id int, name char(22), age int) SORT BY (age);
```

TRUNK() can now apply to numeric types (FLOAT, DOUBLE, and DECIMAL) in addition to TIMESTAMP

Although this functionality was already available through the truncate() function, the new signatures for trunc() make it easier to port code from other popular database systems to Impala.

Support ENUM type for parquet tables

The CREATE TABLE LIKE PARQUET statement can now handle Parquet files produced outside of Impala and containing ENUM types. The ENUM columns become STRING columns in the target table, and the ENUM values are turned into corresponding STRING values.

New Features in Impala 2.7.0

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

Impala 2.7.0 introduces some new features that enhance the behavior and performance of Impala.

Performance Improvements

Impala 2.7.0 introduces the following performance improvements:

- Overall performance improvements for secure clusters.
- Overall performance improvements for join queries. A pre-fetching mechanism is used while building the in-memory hash table to evaluate join predicates.
- Improved query time for queries run against DECIMAL columns in Avro tables. The code that parses DECIMAL values from Avro now uses native code generation.
- Improved efficiency in LLVM code generation that can reduce codegen time, especially for short queries.
- Improved performance reading Parquet files.
- Improved performance for top-N queries, or queries that include both ORDER BY and LIMIT clauses.

Support for the Amazon S3 File System

You can use Impala to query data in the Amazon S3 filesystem. Impala can query any file type supported by the S3 filesystem.

To run Impala on the Amazon S3 filesystem, add the properties below to the `core-site.xml` file, copy the `core-site.xml` file to the `IMPALA_CONF_DIR` (located in `/opt/mapr/impala/impala-2.7.0/conf`), and restart the Warden service.

```
<property>
<name>fs.s3a.access.key</name>
<value><ACCESS_KEY></value>
</property>

<property>
<name>fs.s3a.secret.key</name>
<value><SECRET_KEY></value>
</property>
```

Note:

If you plan to run Impala on a secure cluster, create and add the root Certificate Authority (CA) certificate that signed the Amazon S3 certificate to the truststore. Alternatively, you can add the following property to `core-site.xml`:

```
<property>
  <name>fs.s3a.connection.ssl.enabled</name>
  <value>>false</value>
</property>
```

Impala Web User Interface Improvements

In version 2.7.0, Impala provides the following Web User Interface improvements:

- Forced session expiry from the **/sessions** tab. You can force a session to end by clicking on the link provided in the tab.
- Additional Impala memory information on the **/memz** tab.
- A **Memory** tab on the **Details** page for a query.

Set Column Stats Clause

In version 2.7.0, you can use the SET COLUMN STATS clause with the ALTER TABLE statement to set a specific statistical value for a column. You can set a column to the number of distinct values, number of nulls, maximum size, or average size using the respective case-insensitive symbolic names:

`numDVs`, `numNulls`, `avgSize`, `maxSize`

Note: This operation applies to an entire table, not a specific partition. You must use single quotation marks around the symbolic name and value.

Run the ALTER TABLE command with the SET COLUMN STATS clause from the `impala-shell`, as shown in the following example:

```
$ impala-shell -i localhost
...
[localhost:21000] > create table example (id int);
[localhost:21000] > insert into example values (1), (2), (3);
[localhost:21000] > show column stats example;
+-----+-----+-----+-----+-----+-----+-----+

```

```

+-----+-----+-----+-----+-----+-----+
| Column | Type   | #Distinct Values | #Nulls | Max Size | Avg Size |
+-----+-----+-----+-----+-----+-----+
| id     | INT   | -1                | -1     | 4        | 4        |
+-----+-----+-----+-----+-----+-----+
[localhost:21000] > alter table example set column stats id
('numDvs'='3', 'numNulls'='0');
[localhost:21000] > show column stats example;
+-----+-----+-----+-----+-----+-----+
| Column | Type   | #Distinct Values | #Nulls | Max Size | Avg Size |
+-----+-----+-----+-----+-----+-----+
| id     | INT   | 3                 | 0      | 4        | 4        |
+-----+-----+-----+-----+-----+-----+

```

SOURCE Command

The SOURCE command runs SQL statements from an SQL source file. You issue the SOURCE command from the impala-shell. The source file can contain SQL statements and impala-shell commands, as well as additional SOURCE commands. Each statement or command must end with a semicolon (;), except for the last statement or command in the file.

Including additional SOURCE commands inside the source file allows you to set up flexible statement sequences for use cases, such as schema setup, ETL, or reporting.

Run the SOURCE command from the impala-shell, as shown in the following example:

```

$ cat example.sql
show databases;
show tables in customers;
$ impala-shell -i localhost
...
[localhost:21000] > source example.sql;
Query: show databases
+-----+-----+
| name          | comment                |
+-----+-----+
| customers     | Stores customer records |
| default      | Default Hive database  |
+-----+-----+
Fetched 2 row(s) in 0.06s
Query: show tables in customers
+-----+
| name          |
+-----+
| customer_001 |
| customer_002 |
| customer_003 |
| customer_004 |
| customer_005 |
+-----+
Fetched 5 row(s) in 0.03s

```

Additionally, you can run the SOURCE command on an SQL file that contains statements and calls a SOURCE command from another SQL file, as shown in the following example:

```

$ cat example1.sql
show databases;
source example2.sql
$ cat example2.sql
show tables in customers;

$ impala-shell -i localhost
...

```

```
[localhost:21000] > source example1.sql;
```

```
Query: show databases
```

```
+-----+-----+
| name           | comment                               |
+-----+-----+
| customers      | Stores customer records              |
| default        | Default Hive database                 |
+-----+-----+
```

```
Fetches 2 row(s) in 0.06s
```

```
Query: show tables in customers
```

```
+-----+
| name          |
+-----+
| customer_001 |
| customer_002 |
| customer_003 |
| customer_004 |

New Runtime Filter Options

The Runtime Filtering feature was introduced in [Impala 2.5.0](#) to optimize queries against partitioned tables or to evaluate join conditions when partial table data is needed. Impala 2.7.0 introduces two new filtering options that fine-tune the sizes of the Bloom filter structures used in runtime filtering:

The following table lists the new query options and their descriptions. Only modify these options when tuning long-running queries with a combination of large partitioned tables and joins on large tables.

| Option | Description | Type | Default |
|-------------------------|---|---------|--|
| RUNTIME_FILTER_MIN_SIZE | Adjusts runtime filtering settings. Defines the minimum size for a filter, regardless of the estimates produced by the planner. This setting overrides any smaller value set for the RUNTIME_BLOOM_FILTER_SIZE option. Impala rounds filter sizes up to the nearest power of two. | integer | 0 (indicates that the value from the corresponding impalad startup option is used) |
| RUNTIME_FILTER_MAX_SIZE | Adjusts runtime filtering settings. Defines the maximum size for a filter, regardless of the estimates produced by the planner. This setting overrides any smaller value set for the RUNTIME_BLOOM_FILTER_SIZE option. Impala rounds filter sizes up to the nearest power of two. | integer | 0 (indicates that the value from the corresponding impalad startup option is used) |

New Features in Impala 2.5.0

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

Impala 2.5.0 introduces some new features that enhance the behavior and performance of Impala.

Performance Improvements

The following updates improve the performance of Impala:

- Impala caches file handles to avoid the overhead of repeatedly opening the same file which improves I/O performance.
- Basic query types, such as counting the elements of a complex column, use an optimized code path that improves the performance of queries involving nested complex types.
- Impala uses code generation in certain parts of queries, such as evaluating functions in the WHERE clause, even when code generation is not used in some phases of query execution.
- Using DECIMAL values in a GROUP BY clause triggers code generation optimization, which speeds up queries that group by values, such as prices, and improves performance and reliability of the DECIMAL data type.
- Improved coordination and parallelization between Impala nodes results in faster query startup time for queries that involve tables with many partitions or complex queries with many fragments.
- The coordinator node requires less memory, making it faster and less resource-intensive when performing joins that involve several tables with thousands of partitions.
- Impala only re-evaluates metadata for partitions that are affected by a DDL operation, not all partitions in the table. While a DDL or insert statement is in progress, other Impala statements that attempt to modify metadata for the same table wait until the first one finishes, improving performance and reliability of DDL and insert operations on partitioned tables with a large number of partitions.
- A new query option, OPTIMIZE_PARTITION_KEY_SCANS, speeds up aggregation operations that involve only the partition key columns of partitioned tables. This optimization can produce different results when files in a partition are manually deleted or are empty.

Security

This release of Impala provides the following new security features:

Column-Level Authorization

You can use column-level authorization to define access to particular columns within a table instead of the entire table. Creating views to set up authorization schemes for subsets of information is not required. This functionality requires Sentry 1.6

Column-level authorization has the following syntax:

```
GRANT SELECT(column_name) ON TABLE
table_name TO ROLE role_name;
REVOKE SELECT(column_name) ON TABLE
table_name FROM ROLE role_name;
```

LDAP Password Retrieval

You can use a new impala-shell command line option, `--ldap_password_cmd`, to retrieve the LDAP password. The resulting password is used to authenticate the impala-shell command with the LDAP server.

Scripting Capability Improvements

Scripting capability improvements for the impala-shell enable you to define substitution variables and use them in SQL statements that you execute through command-line options. The `--var` command-line option

passes key-value pairs to the impala-shell. The shell substitutes the values into an SQL statement where it contains the notation `${var:varname}` before Impala executes the query.

You can use the SET and UNSET commands in a session to define or clear substitution variables with the `SET|UNSET VAR:variable_name=value` notation or a script file processed by the `-f` option. You cannot define your own substitution variables through the SET statement in a JDBC or ODBC application.

Dynamic Partition Pruning

Dynamic partition pruning is a technique that prevents Impala from reading data files from partitions that are not included in the result set. This occurs when a query references a partition key column in the WHERE clause and the column values are unknown until the query runs. Impala evaluates the predicate and skips the I/O for unnecessary partitions. This technique is useful for join queries that involve large partitioned tables.

You can control the level of dynamic partition pruning through the `RUNTIME_FILTER_MODE` query option. By default, this option is enabled and set at medium level: `RUNTIME_FILTER_MODE=LOCAL`). The maximum setting uses more memory for queries than in previous releases. You can set `RUNTIME_FILTER_MODE=GLOBAL` to fully enable dynamic partition pruning. Before you run a query, check the EXPLAIN output to verify that partition pruning is applied.

Nested Loop Join Queries

Nested loop joins make additional non-equi-join queries possible and optimize queries that retrieve values from complex type columns. Some join queries that previously needed equality comparisons can use operators.

Live Progress Reporting

The live progress reporting feature enables you to monitor the status of queries through two command-line options, `--live_progress` and `--live_summary`. The live progress option provides an interactive progress bar that represents the percent completion for queries submitted through the impala-shell command. The live summary option summarizes the work performed in various stages of a query with the measurements updated in real time as the query progresses. These query options are disabled by default. To enable these options, start the impala-shell with the `--live_progress` and `--live_summary` command-line options, or use the SET command with `LIVE_SUMMARY` and `LIVE_PROGRESS` during a session:

```
set live_progress=true|false;
set live_summary=true|false;
```

Runtime Filtering

Runtime filtering is technique where Impala determines the filter conditions as a query runs and broadcasts the information to the Impala nodes reading a table. This technique is useful for optimizing queries against partitioned tables or to evaluate join conditions when only partial table data is needed. The technique eliminates the I/O required to read all of the partitioned data, as well as unnecessary network traffic.

The following table lists the new query options related to runtime filtering:

| Option | Description | Type | Default |
|--------------------------------------|---|--|-------------------|
| <code>RUNTIME_FILTER_MODE</code> | Adjusts the settings, turns the feature on and off, and controls how extensively the filters are transmitted between hosts. | numeric (0, 1, 2) or corresponding mnemonic strings (OFF, LOCAL, GLOBAL) | 1 (same as LOCAL) |
| <code>MAX_NUM_RUNTIME_FILTERS</code> | Sets an upper limit on the number of runtime filters produced for each query. | integer | 10 |

| | | | |
|-------------------------------|--|---|------------------------------|
| RUNTIME_BLOOM_FILTER_SIZE | Size (in bytes) of Bloom filter data structure used by the runtime filtering feature. | integer | 1048576 (1 MB) Max: 16 MB |
| RUNTIME_FILTER_WAIT_TIME_MS | Maximum filter wait time in milliseconds. By default, each scan node waits for up to 1 second (1000 milliseconds) for filters to arrive. If all filters have not arrived within the specified interval, the scan node proceeds, using whatever filters did arrive to help avoid reading unnecessary data. If a filter arrives after the scan node begins reading data, the scan node applies that filter to the data that is read after the filter arrives, but not to the data that was already read. | integer | 1000 milliseconds |
| DISABLE_ROW_RUNTIME_FILTERING | Reduces the scope of the runtime filtering feature. Queries still dynamically prune partitions, but do not apply the filtering logic to individual rows within partitions. Only applies to queries against Parquet tables. For other file formats, Impala only prunes at the level of partitions, not individual rows. | Boolean; recognized values are 1 and 0, or true and false; any other value interpreted as false | false |

Data Types

Impala now supports new complex data types that can encode multiple named fields, positional items, or key-value pairs within a single column. You can combine these types to produce nested types with arbitrarily deep nesting. Currently, complex data types are only supported for the Parquet file format.

The following table lists the complex data types and the syntax for each:

| Data Type | Syntax |
|-----------|---|
| STRUCT | <i>column_name</i> STRUCT < <i>name</i> : <i>type</i> [COMMENT ' <i>comment_string</i> '], ... > <i>type</i> ::= <i>primitive_type</i> <i>complex_type</i> |
| ARRAY | <i>column_name</i> ARRAY < <i>type</i> > <i>type</i> ::= <i>primitive_type</i> <i>complex_type</i> |
| MAP | <i>column_name</i> MAP < <i>primitive_type</i> , <i>type</i> > <i>type</i> ::= <i>primitive_type</i> <i>complex_type</i> |

Operators

The following table provides the new and improved operators with descriptions and syntax:

| Operator | Description | Syntax |
|------------------------|--|---|
| ILIKE | Improvements enable the ILIKE operator to perform case-insensitive wildcard matches or regular expression matches, rather than explicitly converting column values with UPPER or LOWER. | <i>string_expression</i> ILIKE <i>wildcard_expression</i> <i>string_expression</i> NOT ILIKE <i>wildcard_expression</i> |
| IREGEXPR | Improvements enable the IREGEXPR operator to perform case-insensitive wildcard matches or regular expression matches, rather than explicitly converting column values with UPPER or LOWER. | <i>string_expression</i> IREGEXP <i>regular_expression</i> |
| IS [NOT] DISTINCT FROM | Compares values for a true or false result, even if one or both values are NULL. The IS NOT DISTINCT FROM operator, or its equivalent <=> notation, improves the efficiency of join queries that treat key values that are NULL in both tables as equal. | <i>expression1</i> IS DISTINCT FROM <i>expression2</i> <i>expression1</i> IS NOT DISTINCT FROM <i>expression2</i> <i>expression1</i> <=> <i>expression2</i> |

Statements

The following table lists new or improved statements with their descriptions and syntax:

| Statement | Description | Syntax |
|------------------------|--|---|
| TRUNCATE TABLE | Removes all data from a table without removing the table itself. The statement accepts the IF EXISTS clause, making TRUNCATE TABLE easier to use in setup or ETL scripts where the table might or might not exist. | TRUNCATE TABLE [IF EXISTS] <i>[db_name.]table_name</i> |
| CREATE TABLE AS SELECT | The CREATE TABLE AS SELECT statement accepts a PARTITIONED BY clause. You can create a partitioned table and insert data into the table with a single statement. | CREATE [EXTERNAL] TABLE [IF NOT EXISTS] <i>db_name.table_name</i> [PARTITIONED BY (<i>col_name</i> [, ...])] [COMMENT ' <i>table_comment</i> '] [WITH SERDEPROPERTIES (' <i>key1</i> '= <i>value1</i> ', ' <i>key2</i> '= <i>value2</i> ', ...)] [[ROW FORMAT <i>row_format</i>] [STORED AS <i>file_format</i>]] [LOCATION ' <i>hdfs_path</i> '] [TBLPROPERTIES (' <i>key1</i> '= <i>value1</i> ', ' <i>key2</i> '= <i>value2</i> ', ...)] [CACHED IN ' <i>pool_name</i> ' [WITH REPLICATION = <i>integer</i>] UNCACHED] AS <i>select_statement</i> |

| | | |
|---------------------------------------|---|---|
| SHOW DATABASES | The SHOW DATABASES statement returns two columns rather than one. The second column includes the associated comment string, if it exists, for each database. | SHOW DATABASES; |
| DESCRIBE | The DESCRIBE statement displays metadata about a database. | DESCRIBE DATABASE db_name; |
| DROP DATABASE | The DROP DATABASE statement works for a nonempty database. When you specify the optional CASCADE clause, any tables in the database are dropped before the database itself is removed. | DROP (DATABASE SCHEMA) [IF EXISTS] database_name [RESTRICT CASCADE]; |
| DROP TABLE/ALTER TABLE DROP PARTITION | The DROP TABLE, ALTER TABLE, and DROP PARTITION statements have an optional keyword, PURGE. PURGE causes Impala to immediately remove the relevant data files rather than sending them to the trashcan. This feature can help to avoid out-of-space errors on storage devices, and to avoid files being left behind in case of a problem with the trashcan. PURGE works when the trashcan is enabled. | DROP TABLE [IF EXISTS] [db_name.]table_name [PURGE] ALTER TABLE name { ADD [IF NOT EXISTS] DROP [IF EXISTS] } PARTITION (partition_spec) [PURGE] |

Functions

The following sections provide information about new and improved Impala functions.

User-Defined Functions

User-defined functions written in C++ persist when the catalog service is restarted. You no longer have to run the CREATE FUNCTION statements again after a restart. You must still reissue the CREATE FUNCTION statement for any Java-based user-defined functions. User-defined aggregate functions have more flexibility for intermediate data types.

Analytic (Window) Functions

The following table lists the new analytic functions:

| Function | Description | Syntax |
|----------|-------------|--------|
|----------|-------------|--------|

| | | |
|--------------|--|---|
| PERCENT_RANK | Calculates the rank, expressed as a percentage, of each row within a group of rows. If rank is the value for that same row from the RANK() function (from 1 to the total number of rows in the partition group), then the PERCENT_RANK() value is calculated as $(rank - 1) / (rows_in_group - 1)$. If there is only a single item in the partition group, its PERCENT_RANK() value is 0. The ORDER BY clause is required. The PARTITION BY clause is optional. The window clause is not allowed. | PERCENT_RANK (<i>expr</i>) OVER ([<i>partition_by_clause</i>] <i>order_by_clause</i>) |
| NTILE | Returns the "bucket number" associated with each row, between 1 and the value of an expression. For example, creating 100 buckets puts the lowest 1% of values in the first bucket, while creating 10 buckets puts the lowest 10% of values in the first bucket. Each partition can have a different number of buckets. The ORDER BY clause is required. The PARTITION BY clause is optional. The window clause is not allowed. | NTILE (<i>expr</i> [, <i>offset</i> ...]) OVER ([<i>partition_by_clause</i>] <i>order_by_clause</i>) |

| | | |
|-----------|--|--|
| CUME_DIST | Returns the cumulative distribution of a value. The value for each row in the result set is greater than 0 and less than or equal to 1. The ORDER BY clause is required. The PARTITION BY clause is optional. The window clause is not allowed. | CUME_DIST (expr) OVER ([partition_by_clause] order_by_clause) |
|-----------|--|--|

Math Functions

The following table lists the new math functions:

| Function | Description | Return Type |
|---------------------------|---|-------------|
| cot(double a) | Returns the cotangent of the argument. | double |
| factorial(integer_type a) | Computes the factorial of an integer value and works with any integer type. You can use either the factorial() function or the ! operator. The factorial of 0 is 1. The factorial() function returns 1 for any negative value. The maximum positive value for the input argument is 20; a value of 21 or greater overflows the range for a BIGINT and causes an error. | bigint |
| radians(double a) | Converts the argument value from degrees to radians. | double |

String Functions

The following table lists the new string functions:

| Function | Description | Return Type |
|----------|-------------|-------------|
|----------|-------------|-------------|

| | | |
|---|---|--------|
| btrim(string a), btrim(string a, string chars_to_trim) | Removes all instances of one or more characters from the start and end of a STRING value. By default, removes only spaces. If a non-NULL optional second argument is specified, the function removes all occurrences of characters in that second argument from the beginning and end of the string. | string |
| chr(int character_code) | Returns a character specified by a decimal code point value. The interpretation and display of the resulting character depends on your system locale. Because consistent processing of Impala string values is only guaranteed for values within the ASCII range, only use this function for values corresponding to ASCII characters. In particular, parameter values greater than 255 return an empty string. | string |

| | | |
|--|---|----------------|
| <p>regex_like(string source, string pattern[, string options])</p> | <p>Returns true or false to indicate whether the source string contains anywhere inside it the regular expression given by the pattern. The optional third argument consists of letter flags that change how the match is performed, such as i for case-insensitive matching.</p> | <p>boolean</p> |
| <p>split_part(string source, string delimiter, bigint n)</p> | <p>Returns the nth field within a delimited string. The fields are numbered starting from 1. The delimiter can consist of multiple characters, not just a single character. All matching of the delimiter is done exactly, not using any regular expression patterns.</p> | <p>string</p> |

Date/Time Functions

The following table lists the new date and time functions:

| Function | Description | Return Type |
|---|---|-------------|
| <p>int_months_between(timestamp newer, timestamp older)</p> | <p>Returns the number of months between the date portions of two TIMESTAMP values, as an INT representing only the full months that passed.</p> | <p>int</p> |

| | | |
|--|--|--------------------------------|
| months_between(timestamp newer, timestamp older) | Returns the number of months between the date portions of two TIMESTAMP values. Can include a fractional part representing extra days in addition to the full months between the dates. The fractional component is computed by dividing the difference in days by 31 (regardless of the month). | double |
| timeofday() | Returns a string representation of the current date and time, according to the time of the local system, including any time zone designation. | string |
| timestamp_cmp(timestamp t1, timestamp t2) | Tests if one TIMESTAMP value is newer than, older than, or identical to another TIMESTAMP. | int (either -1, 0, 1, or NULL) |

Bit Manipulation Functions

The following table lists the new bit manipulation functions:

| Function | Description | Return Type |
|-------------------------------------|---|-------------------------|
| bitand(integer_type a, same_type b) | Returns an integer value representing the bits that are set to 1 in both of the arguments. If the arguments are of different sizes, the smaller is promoted to the type of the larger. Equivalent to the & binary operator. | Same as the input value |

| | | |
|--|--|-------------------------|
| bitnot(integer_type a) | Inverts all the bits of the input argument. Equivalent to the ~ unary operator. | Same as the input value |
| bitor(integer_type a, same_type b) | Returns an integer value representing the bits that are set to 1 in either of the arguments. If the arguments are of different sizes, the smaller is promoted to the type of the larger. Equivalent to the binary operator. | Same as the input value |
| bitxor(integer_type a, same_type b) | Returns an integer value representing the bits that are set to 1 in one but not both of the arguments. If the arguments are of different sizes, the smaller is promoted to the type of the larger. Equivalent to the ^ binary operator. | Same as the input value |
| countset(integer_type a [, int zero_or_one]) | By default, returns the number of 1 bits in the specified integer value. If the optional second argument is set to zero, it returns the number of 0 bits instead. | Same as the input value |

| | | |
|--------------------------------------|---|-------------------------|
| getbit(integer_type a, int position) | Returns a 0 or 1 representing the bit at a specified position. The positions are numbered right to left, starting at zero. The position argument cannot be negative. When you use a literal input value, it is treated as an 8-bit, 16-bit, and so on value, the smallest type that is appropriate. The type of the input value limits the range of the positions. Cast the input value to the appropriate type if you need to ensure it is treated as a 64-bit, 32-bit, and so on value. | Same as the input value |
|--------------------------------------|---|-------------------------|

| | | |
|---|--|--------------------------------|
| <p>rotateleft(integer _type a, int positions)</p> | <p>Rotates an integer value left by a specified number of bits. As the most significant bit is taken out of the original value, if it is a 1 bit, it is "rotated" back to the least significant bit. Therefore, the final value has the same number of 1 bits as the original value, just in different positions.</p> <p>Specifying a second argument of zero leaves the original value unchanged. Rotating a -1 value by any number of positions still returns -1, because the original value has all 1 bits and all the 1 bits are preserved during rotation. Similarly, rotating a 0 value by any number of positions still returns 0. Rotating a value by the same number of bits as in the value returns the same value. Because this is a circular operation, the number of positions is not limited to the number of bits in the input value. For example, rotating an 8-bit value by 1, 9, 17, and so on positions returns an identical result in each case.</p> | <p>Same as the input value</p> |
|---|--|--------------------------------|

| | | |
|---|--|--------------------------------|
| <p>rotateright(integer_type a, int positions)</p> | <p>Rotates an integer value right by a specified number of bits. As the least significant bit is taken out of the original value, if it is a 1 bit, it is "rotated" back to the most significant bit. Therefore, the final value has the same number of 1 bits as the original value, just in different positions. Specifying a second argument of zero leaves the original value unchanged. Rotating a -1 value by any number of positions still returns -1, because the original value has all 1 bits and all the 1 bits are preserved during rotation. Similarly, rotating a 0 value by any number of positions still returns 0. Rotating a value by the same number of bits as in the value returns the same value. Because this is a circular operation, the number of positions is not limited to the number of bits in the input value. For example, rotating an 8-bit value by 1, 9, 17, and so on positions returns an identical result in each case.</p> | <p>Same as the input value</p> |
|---|--|--------------------------------|

| | | |
|---|--|--------------------------------|
| <p>setbit(integer_type a, int position [, int zero_or_one])</p> | <p>By default, changes a bit at a specified position to a 1, if it is not already. If the optional third argument is set to zero, the specified bit is set to 0 instead. If the bit at the specified position was already 1 (by default) or 0 (with a third argument of zero), the return value is the same as the first argument. The positions are numbered right to left, starting at zero. (Therefore, the return value could be different from the first argument even if the position argument is zero.) The position argument cannot be negative.</p> <p>When you use a literal input value, it is treated as an 8-bit, 16-bit, and so on value, the smallest type that is appropriate. The type of the input value limits the range of the positions. Cast the input value to the appropriate type if you need to ensure it is treated as a 64-bit, 32-bit, and so on value.</p> | <p>Same as the input value</p> |
|---|--|--------------------------------|

| | | |
|---|--|-------------------------|
| shiftright(integer_type a, int positions) | <p>Shifts an integer value right by a specified number of bits. As the most significant bit is taken out of the original value, it is discarded and the least significant bit becomes 0. The final value has either the same number of 1 bits as the original value, or fewer. Shifting an 8-bit value by 8 positions, a 16-bit value by 16 positions, and so on produces a result of zero. Specifying a second argument of zero leaves the original value unchanged. Shifting any value by 0 returns the original value. Shifting any value by 1 is the same as multiplying it by 2, as long as the value is small enough; larger values eventually become negative when shifted, as the sign bit is set. Starting with the value 1 and shifting it left by N positions gives the same result as 2 to the Nth power, or $\text{pow}(2,N)$.</p> | Same as the input value |
|---|--|-------------------------|

| | | |
|--|---|-------------------------|
| shiftright(integer _type a, int positions) | Shifts an integer value right by a specified number of bits. As the least significant bit is taken out of the original value, it is discarded and the most significant bit becomes 0. Therefore, the final value has either the same number of 1 bits as the original value, or fewer. Shifting an 8-bit value by 8 positions, a 16-bit value by 16 positions, and so on produces a result of zero. Specifying a second argument of zero leaves the original value unchanged. Shifting any value by 0 returns the original value. Shifting any positive value right by 1 is the same as dividing it by 2. Negative values become positive when shifted right. | Same as the input value |
|--|---|-------------------------|

Miscellaneous Functions

The following table lists a new miscellaneous function:

| Function | Description | Syntax |
|----------|-------------|--------|
|----------|-------------|--------|

| | | |
|--------------------|--|--|
| uuid() | The uuid() function generates an alphanumeric value that you can use as a guaranteed unique identifier. The uniqueness applies across tables in cases where an ascending numeric sequence is not suitable. | select uuid(); |
| typeof(type value) | A type conversion function that returns the name of the data type corresponding to an expression. For types with extra attributes, such as length for CHAR and VARCHAR, or precision and scale for DECIMAL, includes the full specification of the type. | select typeof(type value); Returns the type For example, select typeof('xyz'); returns STRING For example, select typeof(5.30001 / 2342.1); returns DECIMAL(13,11) |

New Features in Impala 2.2.0

Important: This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

Spill to Disk

Impala 2.2.0 introduces the "spill to disk" feature which prevents queries that use memory-intensive operations, such as large sort, join, aggregation, or analytic function operations, from failing with out-of-memory errors. Impala automatically writes data to disk when queries with memory-intensive operations exceed the set memory limit on an Impala node. You can enable or disable the spill to disk feature in `/opt/mapr/impala/impala-<version>/conf/env.sh`. You can also change the `DISABLE_UNSAFE_SPILLS` setting at the session level to allow or prevent data spills.

See [Spill to Disk](#) for more information about this feature.

Security

You can use SQL statements to create roles and grant/revoke privileges on objects.

Note: This security functionality requires Sentry 1.6 .

The following statements create roles and grant privileges:

- `CREATE ROLE` - creates roles for users and groups

- GRANT - grants privileges on objects

The following statements revoke roles and privileges:

- DROP ROLE - removes roles from the metastore database
- REVOKE - revokes roles or privileges on a specified object from groups

The following statements display role related information:

- SHOW GRANT ROLE - list all the grants for the given role name
- SHOW ROLES - displays roles
- SHOW ROLE GRANT GROUP - lists all the roles assigned to a specified group

Smaller Parquet and filesystem Block Size

The default setting for the `PARQUET_FILE_SIZE` query option has changed from 1 GB to 256 MB. This makes the file more accurate and reduces the amount of memory reserved during an INSERT into Parquet tables, potentially avoiding out-of-memory errors and improving scalability when inserting data into Parquet tables

.impalarc Configuration File

You can specify impala-shell options from the command line or in the `$HOME/.impalarc` configuration file. You can define a set of default options for your impala-shell environment in the `$HOME/.impalarc` configuration file. For every command line option, there is an equivalent setting in the `$HOME/.impalarc` configuration file. Options specified from the impala-shell command line override corresponding options in the configuration file. See Impala-Shell Command Line Options for more information. The configuration file must contain a header label `[impala]`, followed by the options specific to impala-shell. This is a standard convention for configuration files that enables a single file to hold configuration options for multiple applications. To specify a different filename or path for the configuration file, specify the argument

```
--config_file=path_to_config_file
```

on the impala-shell command line.

Files

Impala can read GZIP, BZIP, or Snappy compressed text files. The files do not require special table settings to work in an Impala text table. Impala ignores temporary files typically produced by ETL tools, such as those with the suffixes `.copying` and `.tmp`.

Log Rotation

Log rotation is the automatic removal of unneeded or old log files. By default, Impala switches out old log files every 5 seconds, based on the default interval specified in the `logbufsecs` setting. The `-max_log_files` configuration option specifies how many log files to keep at each severity level (INFO, WARNING, ERROR, and FATAL). You can configure the

`-max_log_files` option for each Impala daemon (`impalad`, `statedored`, and `catalogd`) in the `env.sh` configuration file. By default, Impala preserves the latest 10 log files for each severity level and removes old logs based on the `logbufsecs` setting. Setting `-max_log_files` to 0 preserves all of the log files. This setting requires manual log rotation. Setting `-max_log_files` to 1 preserves only the latest log file.

Impala Debug Web Interface

The Impala debug web interface displays a visual representation of the query plan. You can access the Impala debug web interface at

`http://<impala-node-hostname>:25000/`. To see visual representation of the query plan, select the **/queries** tab and click **Details** for a particular query. The Details page includes a Plan tab with a plan diagram for which you can zoom in or out using your mouse or trackpad.

Date and Time Improvements

Flexibility to interpret `TIMESTAMP` values using the UTC time zone or using the local time zone, for compatibility with `TIMESTAMP` values produced by Hive.

Startup flags for the `impalad` daemon enable a higher level of compatibility with `TIMESTAMP` values written by Hive and more flexibility for working with date and time data using the local time zone instead of UTC. To enable these features, set the `impalad` startup flags `-use_local_tz_for_unix_timestamp_conversions=true` and `-convert_legacy_hive_parquet_utc_timestamps=true`.

The `-use_local_tz_for_unix_timestamp_conversions` setting controls how the `unix_timestamp()`, `from_unixtime()`, and `now()` functions handle time zones. By default, this setting disabled, and Impala considers all `TIMESTAMP` values to be in the UTC time zone when converting to or from Unix time values. When this setting is enabled, Impala treats `TIMESTAMP` values passed to or returned from these functions to be in the local time zone. When this setting is enabled, verify that all hosts in the cluster have the same timezone settings to avoid inconsistent results depending on which host reads or writes `TIMESTAMP` data.

The `-convert_legacy_hive_parquet_utc_timestamps` setting causes Impala to convert `TIMESTAMP` values to the local time zone when it reads them from Parquet files written by Hive. This setting only applies to data using the Parquet file format where Impala can use metadata in the files to reliably determine that the files were written by Hive. If in the future Hive changes the way it writes `TIMESTAMP` data in Parquet, Impala will automatically handle that new `TIMESTAMP` encoding.

Built-in functions that accept or return integers representing `TIMESTAMP` values use the `BIGINT` type for parameters and return values rather than `INT`. This change prevents the date and time functions from having overflow errors that would otherwise occur on January 19th, 2038 (known as the "Year 2038 problem" or "Y2K38 problem"). This change affects the `from_unixtime()` and `unix_timestamp()` functions. You might need to change application code that interacts with these functions, change the types of columns that store the return values, or add `CAST()` calls to SQL statements that call these functions.

Analytic Functions

Analytic (window) functions operate on a set of rows and return a single value for each row from the underlying query. The term "window" describes the set of rows on which the function operates. A window function uses values from the rows in a window to calculate the returned values. When you use a window function in a query, you define the window using the `OVER()` clause. The `OVER()` clause (window clause) differentiates window functions from other analytical and reporting functions.

As of Impala 2.2.0, you can use the following analytic functions in queries:

- `MAX()`
- `MIN()`
- `SUM()`
- `COUNT()`
- `AVG()`

- RANK()
- LAG()
- LEAD()
- FIRST_VALUE()

The analytic functions support the following syntax:

```
function(args) OVER([partition_by_clause] [order_by_clause [window_clause]])
partition_by_clause ::= PARTITION BY expr [, expr ...]order_by_clause ::=
ORDER BY expr [ASC | DESC] [NULLS FIRST | NULLS LAST] [, expr [ASC | DESC]
[NULLS FIRST | NULLS LAST] ...]
```

The window clause supports the following syntax:

```
ROWS BETWEEN [ { m | UNBOUNDED } PRECEDING | CURRENT ROW] [ AND [CURRENT
ROW | { UNBOUNDED | n } FOLLOWING] ]
```

```
RANGE BETWEEN [ {m | UNBOUNDED } PRECEDING | CURRENT ROW] [ AND [CURRENT
ROW | { UNBOUNDED | n } FOLLOWING] ]
```

Query Options

You issue query options to Impala using the SET command. SET has been promoted to an SQL statement and can be used in client applications through the JDBC and ODBC APIs.

The following table lists new query options that you can use with the SET statement:

APPX_COUNT_DISTINCT()

Allows multiple COUNT(DISTINCT) operations within a single query. When used in a query, Impala rewrites each COUNT(DISTINCT) to use the NDV() function, resulting in an approximate count rather than precise.

Default is false (shown as 0 in output of SET statement).

Syntax: set APPX_COUNT_DISTINCT=true|false;

SET EXEC_SINGLE_NODE_ROWS_THRESHOLD

This query option controls how many rows constitute a small query providing a guideline for when to turn optimizations on or off which prevents the unnecessary overhead of parallelizing and generating native code. Impala can complete small queries quickly and free-up YARN resources and admission control slots for data-intensive queries.

Default is 100.

Syntax: SET EXEC_SINGLE_NODE_ROWS_THRESHOLD=number_of_rows;

PARQUET_FILE_SIZE

Specifies the maximum size of each Parquet data file produced by Impala INSERT statements. Specify the size in bytes or with a trailing m or g character to indicate megabytes or gigabytes. For example:

```
-- 128 megabytes.set
PARQUET_FILE_SIZE=134217728 \
INSERT OVERWRITE parquet_table SELECT
```

```
* FROM text_table;
-- 512 megabytes.set
PARQUET_FILE_SIZE=512m; \
INSERT OVERWRITE parquet_table SELECT
* FROM text_table;
-- 1 gigabyte.set
PARQUET_FILE_SIZE=1g; \
INSERT OVERWRITE parquet_table SELECT
* FROM text_table;
```

Syntax: set PARQUET_FILE_SIZE=size INSERT OVERWRITE parquet_table SELECT * FROM text_table;

QUERY_TIMEOUT_S

Sets the idle query timeout value, in seconds, for the session. Impala automatically cancels queries that sit idle for longer than the timeout value specified. QUERY_TIMEOUT_S must be smaller than or equal to the --idle_query_timeout value if the --idle_query_timeout_startup option is set.

Syntax: SET QUERY_TIMEOUT_S=seconds;

Functions

The following table lists new functions with their descriptions and syntax:

APPX_MEDIAN()

An aggregate function that uses sampling to produce an estimate for the median value of a column. This function returns a value that is approximately the median (midpoint) of values in the set of input values. The input type must support less-than and greater-than comparison operators.

Return type: Same as the input value, except for CHAR and VARCHAR arguments which produce a STRING result

The return value is always the same as one of the input values, not an "in-between" value produced by averaging.

Syntax: APPX_MEDIAN([DISTINCT | ALL] expression)

CURRENT_DATABASE()

Utility function that returns the database that the session is currently using. Returns default if no database was selected or the database that the session switched to with the USE statement or the

```
impalad-d
```

option. **Return type:** string

Syntax: CURRENT_DATABASE()

DATE_PART()

A new date and time function, similar to EXTRACT(), but with the order of the arguments reversed. You can also call the EXTRACT() function using the SQL-99 syntax, EXTRACT(*unit* FROM *timestamp*). These enhancements simplify the porting process for date-related code from other systems. **Return type:** int

Syntax: DATE_PART(string, timestamp)

DECODE()

A function that compares an expression to one or more possible values and returns a corresponding result when a match is found.

This function works as a shorthand for a CASE() expression and improves compatibility with SQL code containing vendor extensions.

Return type: Same as the initial argument value, except that integer values are promoted to BIGINT and floating-point values are promoted to DOUBLE; use CAST() when inserting into a smaller numeric column.

Syntax: decode(type expression, type search1, type result1 [, type search2, type result2...] [, type default])

isfalse(), isnotfalse(), isnottrue(), istrue(), nonnullvalue(), nullvalue()

These conditional functions provide enhanced compatibility when porting code that uses industry extensions.

mod()

This function returns the modulus of a number. MOD is equivalent to using the % arithmetic operator. It works with any size integer type, any size floating-point type, and DECIMAL with any precision and scale. Return type: Same as the input value.

Syntax: mod(numeric_type a, same_type b)

NDV()

This aggregate function now returns DOUBLE results rather than STRING. Prior to 2.2.0, you had to CAST() the result to a numeric type before using the function in arithmetic operations.

Syntax: NDV([DISTINCT | ALL] expression)

STDDEV(), STDDEV_POP(), STDDEV_SAMP()

These aggregate functions now return DOUBLE results rather than STRING. Prior to 2.2.0, you had to CAST() the result to a numeric type before using the function in arithmetic operations.

Syntax: { STDDEV | STDDEV_SAMP | STDDEV_POP } ([DISTINCT | ALL] expression)

VARIANCE(), VARIANCE_POP(), VARIANCE_SAMP()

These aggregate functions now return DOUBLE results rather than STRING. Prior to 2.2.0, you had to CAST() the result to a numeric type before using the function in arithmetic operations. VAR_SAMP() and VAR_POP() are aliases for the existing VARIANCE_SAMP() and VARIANCE_POP() functions.

Syntax: { VARIANCE | VAR[IAN]_SAMP | VAR[IAN]_POP } ([DISTINCT | ALL] expression)

Statements

The following table lists new or improved statements with their descriptions and syntax:

COMPUTE|DROP INCREMENTAL STATS

This statement collects or drops statistics for individual partitions in a partitioned table instead of processing the entire table for each COMPUTE STATS statement. Use the COMPUTE STATS statement for non-partitioned tables or partitioned tables that are unchanging or have content that is entirely replaced.

Syntax: COMPUTE|DROP INCREMENTAL STATS [db_name.]table_name [PARTITION

CREATE ROLE

```
(partition_spec)] partition_spec ::=
partition_col=constant_value
```

This statement creates a role. You can grant privileges to roles and then assign roles to users. A user can only exercise the privileges associated with a particular role. Only users that have administrative privileges can create/drop roles. By default, the `hive`, `impala` and `hue` users have administrative privileges in Sentry.

Syntax: `CREATEROLE role_name`

DROP ROLE

Removes a role from the metastore database. When you drop a role, the role is revoked from all users to whom it was previously assigned, and all privileges granted to that role are revoked. In progress queries are not affected. Impala verifies the role information approximately every 60 seconds.

Syntax: `DROPROLE role_name`

GRANT

This statement grants roles or privileges on specified objects to groups. The object name is typically an identifier. For URIs, it is a string literal.

Only administrative users (initially, a predefined set of users specified in the Sentry service configuration file) can use this statement.

The `WITH GRANT OPTION` clause allows members of the specified role to issue `GRANT` and `REVOKE` statements for those same privileges. If a role has the `ALL` privilege on a database and the `WITH GRANTOPTION` set, users granted that role can execute `GRANT/REVOKE` statements only for that database or child tables of the database. This means a user could revoke the privileges of the user that provided them the `GRANT OPTION`.

You cannot revoke the `WITH GRANT OPTION` from a privilege that was previously granted to a role. To remove the `WITH GRANT OPTION`, revoke the privilege and grant it again without the `WITHGRANT OPTION` flag.

Syntax:

```
GRANT ROLE role_name TO GROUP
group_name

GRANT privilege ON object_type
object_name
TO [ROLE] roleName
[WITH GRANT OPTION]

privilege ::= SELECT | INSERT | ALL
object_type ::= TABLE | DATABASE |
SERVER | URI
```

REVOKE

This statement revokes roles or privileges on a specified object from groups. The object name is typically an identifier. For URIs, it is a string literal. Only administrative users (those with `ALL` privileges on the server, defined in the Sentry policy file) can use this statement. The revocation has a cascading effect.

For example, revoking the `ALL` privilege on a database also revokes the same privilege for all the tables in that database.

Syntax:

```
REVOKE ROLE role_name FROM GROUP
group_name

REVOKE privilege ON object_type
object_name
FROM [ROLE] role_name
privilege ::= SELECT | INSERT | ALL
object_type ::= TABLE | DATABASE |
SERVER | URI
```

SHOW FILES

This statement displays the files that constitute a specified table or a partition within a partitioned table. Results include the names of the files, file sizes, and the applicable partition for a partitioned table. The size includes a suffix of B for bytes, MB for megabytes, and GB for gigabytes. `SHOW FILES` applies to tables and partitions stored on the filesystem or S3. It does not apply to views or tables mapped to HBase. HBase does not use the same file-based storage layout.

Syntax: `SHOW FILES IN table`

SHOW GRANT ROLE

This statement lists all the grants for the given role name. This statement is only allowed for Sentry administrative users and other users that have been granted the specified role. This syntax is available when you are using the Sentry authorization framework along with the Sentry service. It does not apply when you use the Sentry framework with privileges defined in a policy file. When authorization is enabled, the output of the `SHOW` statement is limited to those objects for which you have some privilege, though there might be other concealed database and tables.

Syntax: `SHOWGRANTROLE role_name`

SHOW ROLES

This statement displays roles. This syntax is available when you are using Sentry authorization with the Sentry service. It does not apply when you use the Sentry framework with privileges defined in a policy file. When authorization is enabled, the output of the `SHOW` statement is limited to those objects for which you have some privilege, though there might be other concealed database and tables.

Syntax: `SHOW ROLES`

SHOW ROLEGRANT GROUP

This statement lists all the grants for the given group. This statement is only allowed for Sentry administrative users and other users that have been granted the specified role. This syntax is available when you are using the Sentry authorization framework along with the Sentry service. It does not apply when you use the Sentry framework with privileges defined in a policy file. When authorization is enabled, the output of the `SHOW` statement is limited to those objects for which you have some privilege, though there might be other concealed database and tables.

Syntax: SHOWROLEGRANT GROUP `group_name`

Data Types

The following table lists new or improved data types with their descriptions:

| Data Type | Description |
|-----------|--|
| Complex | Impala can run queries against Parquet data containing columns with composite or nested data types. |
| CHAR | A fixed-length character type, padded with trailing spaces if necessary to achieve the specified length. If values are longer than the specified length, Impala truncates any trailing characters. The maximum length you can specify is 255. Provides enhanced support for CHAR in the COMPUTE STATS statement. |
| VARCHAR | A variable-length character type, truncated during processing if necessary to fit within the specified length. Short values are padded with spaces on the right. The maximum length you can specify is 65,535. Provides enhanced support for VARCHAR types in the COMPUTE STATS statement. |

Clauses and Operators

The following table lists new or improved clauses and operators with descriptions and syntax:

[NOT] EXISTS

The EXISTS operator checks if a subquery returns any results. The NOT EXISTS operator finds values in a table that do not correspond to values in another table. You can use either of these operators in the WHERE clause of a subquery. Correlated subqueries used in the EXISTS operator cannot include a LIMIT clause.

Syntax: [NOT]EXISTS (subquery)

[NOT] IN

The IN operator compares an argument value to a set of values. If an argument value matches any value in a set, the result is TRUE. The NOT IN operator checks if the argument value is not part of a set of values. Correlated subqueries used in the IN operator cannot include a LIMIT clause.

Syntax: expression [NOT] IN (expression [,expression])

LEFT|RIGHT ANTI JOIN

These clauses return results from one table that has no match in another table. The LEFT ANTI JOIN clause returns those values from the left-hand table that have no matching value in the right-hand table. RIGHT ANTI JOIN reverses the comparison and returns values from the right-hand table.

Syntax:

```
SELECT select_list FROM
table_or_subquery1 {LEFT | RIGHT}
ANTI JOIN table_or_subquery2 |
[ ON col1 = col2 [AND col3 =
col4 ...] |
USING (col1 [, col2 ...]) ]
[other_join_clause ...]
[ WHERE where_clauses ]
```

Hint

The Impala SQL dialect supports query hints to fine-tune the inner workings of queries. You can specify hints as a temporary workaround for expensive queries where missing statistics or other factors cause inefficient performance.

Insert `+` immediately before a hint name to include hints inside comments that use `/* */` or `-` notation.

Example:

```
INSERT insert_clauses
/* +SHUFFLE|NOSHUFFLE */
SELECT remainder_of_query;
INSERT insert_clauses
-- +SHUFFLE|NOSHUFFLE
SELECT remainder_of_query;
```

New Features in Impala 1.4.1

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

Admission Control

A new feature that enforces limits on concurrent SQL queries and statements that run in an Impala cluster with heavy workloads. When admission control is enabled, Impala queues SQL queries and statements that it would otherwise cancel or re-run due to insufficient resources or performance bottlenecks.

You can configure admission control options that Impala uses to enforce limits on the following behaviors:

- Number of concurrent queries that run in the cluster
- Query queue size
- Number of delayed queries that the queue can hold
- Amount of memory that queries use
- Time that queries can exist in queue before Impala cancels them

Refer to [Admission Control](#) for more information.

Partition Pruning

Partition pruning now includes performance improvements that reduce the time spent on query planning for partitioned tables with thousands of partitions. Previously, Impala could query tables with up to approximately 3000 partitions. Now, Impala can comfortably query tables with tens of thousands of partitions.

Impala Daemon Options

The following table lists new Impala daemon start up options that you can add to the `env.sh` configuration file:

| Option | Default | Description |
|---|-------------------|--|
| <code>load_catalog_in_background</code> | <code>true</code> | New start up option to control the parallelism of metadata loading during start up for the catalogd daemon. Makes Impala use background threads after start up to load and cache metadata. |

| | | |
|------------------------------|--------------------------------------|--|
| num_metadata_loading_threads | 16 | New start up option for controlling the parallelism of metadata loading during start up for the catalogd daemon. Determines how much parallelism Impala devotes to loading metadata in the background. You can increase this value for systems with a huge number of databases, tables, or partitions. You can lower this value for busy systems that have CPU-constraints due to jobs from other components running in the cluster. |
| insert_inherit_permissions | Same permissions as parent directory | New start up option that causes Impala INSERT statements to create each new partition with the same filesystem permissions as its parent directory. By default, INSERT statements create directories for new partitions using default filesystem permissions. |

Impala-Shell Command Line Options

The following table lists the new option with its description:

| Option | Description |
|----------------|--|
| strict_unicode | The impala-shell interpreter now supports UTF-8 characters for input and output. You can control whether impala-shell ignores invalid Unicode code points through this option. |

Security

The following table contains new security features and their descriptions:

| Feature | Description |
|----------------------------|--|
| LDAP | LDAP connections can be secured through either SSL or TLS. |
| Sentry-based authorization | Impala can now use Sentry-based authorization based on the original policy file. |

Functions

The following table lists new functions and their descriptions:

| Statement | Description |
|--|---|
| NULLIF() NULLIFZERO() ZEROIFNULL() | New conditional functions that simplify porting SQL containing vendor extensions to Impala. |
| CURRENT DATABASE() | New utility function that returns the database that the session is currently using. |

Built-In Functions

The following table lists new built-in functions and their descriptions:

| Function | Description |
|---|---|
| ADD_MONTHS() | A built-in function that is an alias for the existing MONTHS_ADD() function. |
| EXTRACT() | A new built-in function that returns one date or time field from a TIMESTAMP value. |
| ROUND() | A new built-in function that rounds DECIMAL values to a specified number of fractional digits. |
| TRUNC() | A new built-in function that truncates date/time values to a particular granularity, such as year, month, day, hour, and so on. |
| STDDEV(), STDDEV_SAMP(), STDDEV_POP(), VARIANCE(), VARIANCE_SAMP(), VARIANCE_POP() | Built-in aggregate functions for computing properties for statistical distributions. |
| MAX_INT(), MIN_SMALLINT() | New built-in functions that you can use to check whether data values are in an expected range. You might be able to switch a column to a smaller type to save memory during processing. |
| IS_INF(), IS_NAN() | New built-in functions that check for special values infinity and “not a number”. These values could be specified as inf or nan in text data files. They may also be produced by certain arithmetic expressions. |

Statements

The following table lists new or improved statements and their descriptions:

| Statement | Description |
|-----------|-------------|
|-----------|-------------|

| | |
|--------------------------------|--|
| COMPUTE STATS | <p>Use this statement to collect table and column statistics with a single statement.</p> <p>Useful for query planning, join queries, queries on partitioned tables, and any other data intensive operations.</p> <p>This release includes the following performance improvements for the statement:</p> <ul style="list-style-type: none"> The <ul style="list-style-type: none"> NDV function is sped up through native code generation. Because the NULL count is not currently used by the Impala query planner, in Impala 1.4.0 and higher, <ul style="list-style-type: none"> COMPUTE STATS does not count the NULL values for each column. The #Nulls field of the stats table is left as -1, signifying that the value is unknown. |
| CREATE TABLE | <p>SQL syntax for creating a table.</p> <p>This release includes the following improvements for the statement:</p> <ul style="list-style-type: none"> You can now specify the clause <code>FIELDS TERMINATED BY '\0'</code> to use text data files that use ASCII 0 (nul) characters as a delimiter. For interoperability with Parquet files created through other Hadoop components, such as Pig or MapReduce applications, you can create an Impala table that automatically sets up the column definitions based on the layout of an existing Parquet data file. Has a <code>STORED AS AVRO</code> clause, enabling you to create Avro tables through Impala. |
| EXPLAIN PLAN | <p>When you run <code>EXPLAIN PLAN</code> followed by a <code>SELECT</code> query, it returns the query execution plan. <code>EXPLAIN PLAN</code> now provides more detail in a simpler format with the following verbosity levels:</p> <ul style="list-style-type: none"> 0 – Most concise 1 2 3 – Most verbose |
| INVALIDATE METADATA table_name | <p>Impala loads metadata for a Hive table when you issue the <code>INVALIDATE METADATA table_name</code> statement if a Hive table exists with the same name.</p> |

| | |
|-----------------|--|
| SHOW FUNCTIONS | Shows user-defined functions associated with a particular database. This release includes the following improvements for the statement: <ul style="list-style-type: none"> Now displays the return type and argument type of each function. You can now specify the clause <code>FIELDS TERMINATED BY '\0'</code> with a <code>CREATE TABLE</code> statement to use text data files that use ASCII 0 (nul) characters as a delimiter. |
| SHOW PARTITIONS | Displays information about each partition in a partitioned table. Run the <code>COMPUTE STATS</code> statement after creating all table partitions and then run <code>SHOW PARTITIONS</code> for more informative output. |

Data Types

The following table lists new or improved data types with their descriptions:

| Data Type | Description |
|-----------|--|
| DECIMAL | A numeric data type that you can use in <code>CREATE TABLE</code> and <code>ALTER TABLE</code> statements to store fixed-precision values when working with currency or other fractional values where it is important to represent values exactly and avoid rounding errors. Useful for calculations where the imprecise representation and rounding behavior of <code>FLOAT</code> and <code>DOUBLE</code> make them impractical to use. Includes enhancements to built-in functions, numeric literals, and arithmetic expressions. |
| TIMESTAMP | Accepts more input string formats through the <code>UNIX_TIMESTAMP</code> function, and produces more string formats through the <code>FROM_UNIXTIME</code> function. |

Clauses and Operators

The following table lists new or improved clauses and operators with descriptions:

| Feature | Description |
|-----------------|---|
| ORDER BY | No longer requires a <code>LIMIT</code> clause. If the size of the result set to be sorted exceeds the memory available to Impala, Impala uses a temporary work space on disk to perform the sort operation. |
| REGEXP RLIKE | Improved compatibility with the regular expression support for popular database systems. There is no change to the behavior of the <code>regexp_extract()</code> and <code>regexp_replace()</code> built-in functions. These operators now match a regular expression string that occurs anywhere inside the target string; the same as if the regular expression was enclosed on each side by <code>.*</code> . |

New Features in Impala 1.2.3

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

Join Order Optimizations

A primary new feature of Impala 1.2.3 is join order optimizations that automatically distribute and parallelize the work for a join query to minimize disk I/O and network traffic. Automatic optimization reduces the need to use query hints or to rewrite join queries with the tables in a specific order based on size or importance.

Use the COMPUTE STATS statement when you want to gather critical, statistical information about each table when you enable join optimizations. If a join query is inefficient due to outdated statistics or unexpected data distribution, you can use the STRAIGHT_JOIN keyword immediately after the SELECT statement to prevent Impala from reordering the joined tables.

The STRAIGHT_JOIN keyword turns off the reordering of join clauses that Impala does internally, and produces a plan that relies on optimal ordering of the join clauses in the query text. For example, you rewrite the query so that the largest table is on the left, followed by the next largest, and so on until the smallest table is on the right.

Impala Catalog Service

When Impala changes table data or metadata on one node, the catalog service communicates the new or updated metadata to all the other Impala nodes. You no longer need to use the REFRESH or INVALIDATE METADATA statements after issuing the following statements to Impala:

- CREATE TABLE
- ALTER TABLE
- DROP TABLE
- INSERT
- LOAD DATA

Note:

The catalog service only works on operations performed through Impala. If you perform operations through the Hive shell or through the filesystem, you must issue the REFRESH and INVALIDATE METADATA statements. The catalog service broadcasts the results of the REFRESH and INVALIDATE METADATA results to other Impala nodes so that you only have to issue the statements once.

Impala Daemon Options

The following table lists new Impala daemon startup options that you can add to the env.sh file:

| Option | Description |
|------------------------|--|
| --idle_query_timeout | Impala daemon option that controls how long a query can be idle before Impala cancels the query. |
| --idle_session_timeout | Impala daemon option that controls how long a session can be idle before the session expires. |
| --enable_ldap_auth | Enables LDAP authentication between Impala and the client. Example: -enable_ldap_auth=true \ |

| | |
|-------------------------------------|---|
| --ldap_uri | Sets the URI of the LDAP server to use. Typically, the URI is prefixed with ldap://<hostname>. Optionally, the URI can specify the port. For example, ldap://<hostname>:<port>. Example: -ldap_uri=ldap://10.250.1.5/\ |
| --ldap_manual_configextendingcolumn | Bypasses all the automatic configuration if you need to provide a custom SASL. |
| --ldap_tls | Tells Impala to start a TLS connection to the LDAP server and to fail authentication if Impala cannot start the TLS connection. |

Security

The following table contains new security features and their descriptions:

| Feature | Description |
|-----------------------|---|
| Impersonation support | Allows you to give users the permission to submit requests using the credentials of another user. Only available through the Hue interface. |
| LDAP authentication | You can configure LDAP authentication for client connections with Impala. |

Functions

The following table lists new functions and their descriptions:

| Function | Description |
|-------------------------------|--|
| User-Defined Functions (UDFs) | Reusable SQL functions that you can create to encapsulate code that processes column values during an Impala query. You can run scalar UDFs and UDAs (user-defined aggregate functions). Impala accepts UDFs and UDAFs written in C++ or you can use Hive functions written in Java. For more information about user-defined functions, refer to Impala User-Defined Functions on page 4003. |
| NDV () | An aggregate function that you can use to quickly return an approximate result instead of using COUNT (DISTINCT col). |
| GROUP_CONCAT() | An aggregate function that you can use to concatenate column values across all rows of a result set. |

Built-In Functions

Several built-in functions and operators are now overloaded for more numeric data types to reduce CAST() function use with INSERT statements. Addition, subtraction, and multiplication functions now produce a result that is only one step bigger than their arguments. Numeric and conditional functions can return SMALLINT, FLOAT, and other smaller types instead of BIGINT or DOUBLE.

The following table lists new built-in functions and their descriptions:

| Function | Description |
|----------|-------------|
|----------|-------------|

| | |
|--------------------------|---|
| least () | A mathematical function that returns the smallest value from a list of expressions. The return type is the same as the initial argument value, except that integer values are promoted to BIGINT and floating-point values are promoted to DOUBLE. Use CAST() when inserting into a smaller numeric column. |
| greatest () | A mathematical function that returns the largest value from a list of expressions. The return type is the same as the initial argument value, except that integer values are promoted to BIGINT and floating-point values are promoted to DOUBLE. Use CAST() when inserting into a smaller numeric column. |
| initcap () | Returns the input string with the first letter capitalized. |
| fnv_hash ()extending col | A mathematical function for constructing hashed values that returns a consistent 64-bit value derived from the input argument, for convenience of implementing hashing logic in an application. The return type is BIGINT. |

Statements, Options, and Hints

The following table lists new statements, options, hints and their descriptions:

| Statement | Description |
|------------------------|---|
| COMPUTE STATS | You can use this statement to collect table and column statistics with a single statement. This is useful for query planning, join queries, queries on partitioned tables, and any other data intensive operations. Collect stats for each table involved in a join query. |
| CREATE TABLE AS SELECT | SQL syntax that you can use to create a table and copy data into the table in a single operation. |
| SHOW TABLE STATS | SQL syntax that you can use to verify that statistics are available and to see the values used during query planning. |
| SHOW COLUMN STATS | SQL syntax that you can use to verify that statistics are available and to see the values used during query planning. |
| SHOW CREATE TABLE | Summarizes the effects of the original CREATE TABLE statement and subsequent ALTER TABLE statements to provide a CREATE TABLE statement that recreates the current structure and layout for the table. You can use this statement to create a simplified setup script for a schema. |
| EXPLAIN_LEVEL | A query option that you can enable and use with the EXPLAIN and PROFILES statements to provide more verbose results. The verbose results provide estimated resource requirements and the available table and column statistics. |
| SYNC_DDL | A query option that you can enable before you issue a DDL, INSERT, or LOAD statement which causes the statement to wait and return only after the Catalog service broadcasts changes to all Impala nodes in the cluster. |

| | |
|--------------------------|---|
| [SHUFFLE] [NOSHUFFLE] | You can use these hints in INSERT statements when inserting into Parquet tables to avoid problems due to memory consumption and open files in the filesystem, by collecting new data for each partition on a specific node. |
|--------------------------|---|

Clauses and Operators

The following table lists new clauses, operators, and their descriptions:

| Feature | Description |
|----------------------|--|
| CROSS JOIN | A clause that you can use in the SELECT statement to allow joins without an equality comparison between columns in both tables. |
| NULLS FIRST | A clause that you can use to ensure consistent placement of NULL values in ORDER BY queries. |
| NULLS LAST | A clause that you can use to ensure consistent placement of NULL values in ORDER BY queries. |
| OFFSET | A clause that you can use with the ORDER BY and LIMIT clauses to produce paged result sets, like items 1-10, 11-20... |
| STORED AS PARQUET | You can use this clause instead of STORED AS PARQUETFILE for conciseness in new code. |
| TBLPROPERTIES | A clause that you can use with the CREATE TABLE and ALTER TABLE statements to associate random pieces of metadata with a table as key-value pairs. |
| WITH SERDEPROPERTIES | A clause that you can use with the CREATE TABLE and ALTER TABLE statements to specify the serializer and deserializer (SerDes) classes that read and write data for a table, which may be needed for Hive compatibility with Impala. |
| LIMIT | This clause accepts an arithmetic expression and numeric literals. |
| STRAIGHT_JOIN | You can use this operator to override the reordering of tables in a join query. Uses the original technique of ordering join tables in descending order of size enabling you to fine-tune the join query plan. |

Additional Impala Configuration Options

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

You can modify the `env.sh` file located in `/opt/mapr/impala/impala-<version>/conf/` to set certain Impala start up options.

Modifying Startup Options

The `env.sh` file contains values that the Impala server, statestore, and catalog services use during start up. The file also has information about resources allocated for Impala. Most of the default values in the `env.sh` file should work effectively, however there are some values that you can modify. You can check the current value of all the settings through the Impala web interface, available by default at `http://<impala-node-hostname>:25000/varz`.

You may want to modify the following content in the `env.sh` file:

- Statestore address

- Amount of memory available to Impala
- Core dump enablement
- Session and query idle time

To modify the values, edit the `env.sh` file and then restart the Impala server, Impala statestore, and Impala catalog to implement the changes.

Example of some file content that you may want to modify:

```
HIVE_METASTORE_URI=thrift://localhost:9083
# not needed if /opt/mapr/hive is configured
IMPALA_STATE_STORE_HOST=127.0.0.1
IMPALA_STATE_STORE_PORT=24000
IMPALA_BACKEND_PORT=22000
IMPALA_LOG_DIR=/opt/mapr/impala/impala-1.1.1/log
export IMPALA_STATE_STORE_ARGS=${IMPALA_STATE_STORE_ARGS:- \
-log_dir=${IMPALA_LOG_DIR}} \
-state_store_port=${IMPALA_STATE_STORE_PORT}
export IMPALA_SERVER_ARGS=${IMPALA_SERVER_ARGS:- -log_dir=${IMPALA_LOG_DIR} \
-state_store_port=${IMPALA_STATE_STORE_PORT} \
-use_statestore
-state_store_host=${IMPALA_STATE_STORE_HOST} \
-be_port=${IMPALA_BACKEND_PORT}}
export ENABLE_CORE_DUMPS=false
```

The following table contains a list of settings that you can edit in `/opt/mapr/impala/impala-<version>/conf/env.sh` with descriptions for how to change them:

| Setting | Description |
|--------------------|--|
| Statestore address | <p>You can modify this setting to change the statestore IP address or hostname.</p> <p>Example:</p> <p>If a machine with an IP address of 192.168.0.28 is hosting statestore, you can change</p> <pre>IMPALA_STATE_STORE_HOST=127.0.0.1</pre> <p>to</p> <pre>IMPALA_STATE_STORE_HOST=192.168.0.28.</pre> |

| | |
|-----------------------------|---|
| <p>Memory limits</p> | <p>If you run Impala on nodes that also run MapReduce, both frameworks may compete for memory. Configure memory based on your job requirements and SLAs to ensure that each framework has enough memory to avoid conflicts.</p> <p>You can include the <code>mem_limit</code> parameter in <code>IMPALA_SERVER_ARGS</code> to limit the amount of memory available to Impala. Use absolute notation, such as 500M or 2G, or a percentage of physical memory, such as 50% to specify the memory limit. Impala aborts queries that exceeds the specified memory limit. Percentage limits are based on the physical memory of the machine.</p> <p>You can also include the <code>num_threads_per_disk</code> parameter in <code>IMPALA_SERVER_ARGS</code> to limit the number of threads that each disk processes per impala server daemon. Limiting the number of threads per disk can reduce the overall amount of memory consumed.</p> <p>Example:</p> <p>To limit Impala to 50% of system memory, modify:</p> <pre>export IMPALA_SERVER_ARGS=\$ {IMPALA_SERVER_ARGS:- \ -log_dir=\${IMPALA_LOG_DIR} \ -state_store_port=\$ {IMPALA_STATE_STORE_PORT} \ -use_statestore -state_store_host=\$ {IMPALA_STATE_STORE_HOST} \ -be_port=\${IMPALA_BACKEND_PORT}}</pre> <p>to</p> <pre>export IMPALA_SERVER_ARGS=\$ {IMPALA_SERVER_ARGS:- \ -log_dir=\${IMPALA_LOG_DIR} \ -state_store_port=\$ {IMPALA_STATE_STORE_PORT} \ -use_statestore -state_store_host=\$ {IMPALA_STATE_STORE_HOST} \ -be_port=\${IMPALA_BACKEND_PORT} \ -mem_limit=50% \ -num_threads_per_disk=2}</pre> |
| <p>Core dump enablement</p> | <p>Core dump file locations can vary depending on your operating system configuration. Other security settings may prevent Impala from writing core dumps when you enable this option.</p> <p>To enable core dumps, change export <code>ENABLE_CORE_DUMPS=false</code> to <code>export ENABLE_CORE_DUMPS=true</code>.</p> |

| | |
|---|---|
| Session and query idle time | <p>You can modify the time for which sessions and queries can remain idle by adding the following options to <code>env.sh</code>:</p> <pre>--idle_session_timeout --idle_query_timeout</pre> <p>Example:</p> <pre>IMPALA_SERVER_ARGS=" \ -log_dir=\${IMPALA_LOG_DIR} \ -state_store_port=\${ {IMPALA_STATE_STORE_PORT} \ -idle_query_timeout=<value in seconds> \ -idle_session_timeout=<value in seconds> \ -use_statestore \ -state_store_host=\${ {IMPALA_STATE_STORE_HOST} \ -catalog_service_host=\${ {CATALOG_SERVICE_HOST} \ -be_port=\${IMPALA_BACKEND_PORT}"</pre> |
| Use background threads to load and cache metadata | <p>The following option controls the parallelism of metadata loading during start up for the catalogd daemon and makes Impala use background threads after start up to load and cache metadata.</p> <pre>--load_catalog_in_background</pre> <p>The default setting is <code>true</code>.</p> |
| Determine how much parallelism Impala devotes to loading metadata in background | <p>The following option controls the parallelism of metadata loading during start up for the catalogd daemon and determines how much parallelism Impala devotes to loading metadata in the background:</p> <pre>--num_metadata_loading_threads</pre> <p>The default is 16, but you can increase this value for systems with a huge number of databases, tables, or partitions. You can lower this value for busy systems that have CPU-constraints due to jobs from other components running in the cluster.</p> |
| INSERT to create new partition and inherit permissions | <p>The following option causes Impala INSERT statements to create each new partition with the same filesystem permissions as its parent directory:</p> <pre>--insert_inherit_permissions</pre> <p>By default, INSERT statements create directories for new partitions using default filesystem permissions.</p> |

After you edit `/opt/mapr/impala/impala-<version>/conf/env.sh`, use the following commands to restart the Impala server and services:

- Issue the following command to restart the Impala server:

```
$ sudo maprcli node services -name impalaserver -action restart -nodes
<IP address where impala server is installed>
```

- Issue the following command to restart the Impala statestore:

```
$ sudo maprcli node services -name impalastore -action restart -nodes <IP
address where impala statestore is installed>
```

- Issue the following command to restart the Impala catalog:

```
$ sudo maprcli node services -name impalacatalog -action restart -nodes
<IP address where impala catalog is installed>
```

Admission Control

Important: This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

Admission control enforces limits on concurrent SQL queries and statements that run in an Impala cluster with heavy workloads. When admission control is enabled, Impala queues SQL queries and statements that it would otherwise cancel or re-run due to insufficient resources or performance bottlenecks.

You can configure admission control options that Impala uses to enforce limits on the following behaviors:

- Number of concurrent queries that run in the cluster
- Query queue size
- Number of delayed queries that the queue can hold
- Amount of memory that queries use
- Time that queries can exist in queue before Impala cancels them

Query Queuing

Admission control is embedded within each `impalad` daemon and communicates through the statestore service. The `impalad` daemon determines if a query runs immediately or if the query is queued. The queue can include queries submitted through multiple Impala nodes.

Impala executes queries in the order that they are submitted to allow for dependent statements, such as a `CREATE TABLE` statement followed by an `INSERT INTO` statement. Impala may not execute queries submitted through different nodes in the order that the queries were received. When Impala must execute a sequence of statements in order, you should submit the statements on the same Impala node within a single session. When statement order is not important, you can set up your table structures and submit statements through different Impala nodes.

If a sudden flow of requests causes more queries to run concurrently than expected, the overall Impala memory limit and the Linux `cgroups` mechanism serve as hard limits to prevent over allocation of memory. When queries hit these limits, Impala cancels the queries.

Configuring Admission Control

You can use a combination of Impala start-up options, and optionally edit configuration settings in `fair-scheduler.xml`, to configure admission control. Admission control uses the Fair Scheduler configuration settings to determine how to map users and groups to different resource pools.

Fair Scheduler Settings

You can configure settings in `fair-scheduler.xml` that admission control can use to determine how to map users and groups to different resource pools. The `<aclSubmitApps>` tag in `fair-scheduler.xml` contains users and groups that can submit Impala statements to a corresponding Impala resource pool. The user and group lists are separated by a space, as shown in the following example:

```
<aclSubmitApps>user1,user2,user3 dev,tech,admin</aclSubmitApps>
```

If the `<aclSubmitApps>` tag is empty for a pool, no one can submit directly to that pool, however child pools can have their own `<aclSubmitApps>` values to allow users and groups to submit to the child pools.

Impala does not use the `vcores` and `disks` values, however you must specify them to satisfy YARN requirements for the file content. For more information about Fair Scheduler configuration settings, refer to the [Apache wiki](#).

The following `fair-scheduler.xml` shows examples of the `<aclSubmitApps>` tag and also shows the `vcores` and `disks` values:

```
<allocations>
  <queue name="root">
    <aclSubmitApps> </aclSubmitApps>
    <queue name="default">
      <maxResources>40000 mb, 0 vcores, 0 disks</maxResources>
      <aclSubmitApps>*</aclSubmitApps>
    </queue>
    <queue name="dev">
      <maxResources>100000 mb, 0 vcores, 0 disks</maxResources>
      <aclSubmitApps>user1,user2 dev,tech,admin</aclSubmitApps>
    </queue>
    <queue name="prod">
      <maxResources>2000000 mb, 0 vcores, 0 disks</maxResources>
      <aclSubmitApps> tech,admin</aclSubmitApps>
    </queue>
  </queue>
  <queuePlacementPolicy>
    <rule name="specified" create="false"/>
    <rule name="default" />
  </queuePlacementPolicy>
</allocations>
```

Impala Start-up Options

To configure admission control, modify Impala's start-up options. You can modify the start-up options in

```
/opt/mapr/impala/impala-<version>/conf/env.sh.
```

For more information about how to modify Impala start-up options, refer to [Additional Impala Configuration Options](#).

The following table lists the admission control start-up options that you can configure:

| Option | Type | Default | Description |
|----------------------------|-------|---------|---|
| -default_pool_max_queued | int64 | 0 | The maximum number of requests allowed in the queue. Impala rejects additional requests when the queue reaches this limit. This a "soft" limit that applies cluster-wide. Each Impala node decides independently whether to run queries immediately or to queue them. Impala allows for the overall number of queued queries to be slightly higher than the limit during times of heavy load. A negative value or 0 indicates that requests are always rejected once the maximum concurrent requests are executing. Ignored if fair_scheduler_config_path is set. |
| -default_pool_max_requests | int64 | -1 | The maximum number of concurrent requests allowed to run before incoming requests are queued. This a "soft" limit that applies cluster-wide. Each Impala node decides independently whether to run queries immediately or to queue them. The overall number of concurrent queries might be slightly higher during times of heavy load. A negative value indicates no limit. Ignored if fair_scheduler_config_path is set. |

| Option | Type | Default | Description |
|---------------------------------|---------|-------------------|--|
| -default_pool_mem_limit | string | "" (empty string) | <p>The maximum amount of memory that all outstanding requests in this pool can use before new requests to this pool are queued. Specified in bytes, megabytes, or gigabytes by a number followed by the suffix b (optional), m, or g, either upper- or lowercase. You can specify floating-point values for megabytes and gigabytes, to represent fractional numbers such as 1.5. You can also specify it as a percentage of the physical memory by specifying the suffix %. 0 or no setting indicates no limit. Defaults to bytes if no unit is given. This is a soft limit applied cluster-wide. Each Impala node makes independent decisions to run queries immediately or queue them, so the overall memory used by concurrent queries might be slightly higher during times of heavy load. Ignored if fair_scheduler_config_path is set.</p> <p>Note: Impala relies on the statistics produced by the COMPUTE STATS statement to estimate memory usage for each query.</p> |
| -disable_admission_control | Boolean | false | Turns off the admission control feature entirely, regardless of other configuration option settings. |
| -disable_pool_max_requests | Boolean | false | Disables all per-pool limits on the maximum number of running requests. |
| -disable_pool_mem_limits | Boolean | false | Disables all per-pool memory limits. |
| -fair_scheduler_allocation_path | String | "" (empty string) | <p>Path to the Fair Scheduler allocation file,</p> <pre>fair-scheduler.xml</pre> <p>. Admission control can only use a small subset of the settings that can go in this file.</p> |

| Option | Type | Default | Description |
|------------------------|-------|---------|--|
| -queue_wait_timeout_ms | int64 | 60000 | The maximum amount of time (in milliseconds) that a request waits in queue to be executed before timing out. |

Admission Control with Clients

Admission control works with JDBC and ODBC client interfaces, however you may experience the following scenarios due to limits enforced by this feature:

- The API call blocks SQL statements in the query queue instead of running them immediately. Query execution begins when the statement moves out of the query queue, at which time the client program can request the results, which may also block until they become available.
- If a SQL statement is canceled due to prolonged queue time or because it exceeded the memory limit during execution, an error occurs and the client program receives an error message.

You cannot set the following options from JDBC or ODBC applications:

- You must set the REQUEST_POOL option for a session through the impala-shell interpreter, or through the Impala start-up options if you want the setting to apply cluster-wide.
- You must set the MEM_LIMIT query option through the impala-shell interpreter. It cannot be used directly through JDBC or ODBC applications.

Admission Control Guidelines

The admission control system is not aware of other Hadoop workloads, such as MapReduce applications.

The following table lists some admission control guidelines to follow:

| Guideline | Description |
|---|--|
| Examine query profile output | Examine the profile output for a query to see how admission control works for the query. The profile output provides details about the admission decision, such as whether the query was queued or not and which resource pool it was assigned to. It also includes the estimated and actual memory usage for the query, so you can fine-tune the configuration for the memory limits of the resource pools. In impala-shell, you can also specify which resource pool to direct queries to by setting the REQUEST_POOL query option. You can run the PROFILE statement in the impala-shell right after you run the query to see the query output, or you can review the Impala log file. |
| You cannot use admission control with Hue deployed | Unclosed Hue queries accumulate and exceed the queue size limit. To use admission control, you must explicitly enable it by specifying --disable_admission_control=false in the impalad command-line options safety valve field. |
| Set the MEM_LIMIT query option to override the query estimated memory usage | When a query cannot run due to high estimated memory usage, set the MEM_LIMIT query option in the impala-shell and issue the query through the shell in the same session to override the estimate. Impala treats the MEM_LIMIT value as the estimated amount of memory and overrides the estimate that Impala would generate based on table and column statistics. This value is used only for making admission control decisions, and is not pre-allocated by the query. |

| Guideline | Description |
|--|---|
| Increase memory if needed when inserting into Parquet tables | Admission control affects query statements, as well as INSERT and CTAS. Inserting into a Parquet tables is memory intensive because 1GB of data is buffered before writing out each Parquet data block. When inserting into a partitioned Parquet table, Impala redistributes the data among the nodes to reduce memory consumption. You may need to temporarily increase the memory dedicated to Impala during the insert operation, or break up the load operation into several INSERT statements, or both. |
| Limits on queued queries affect subsequent statements in the same session | If Impala queues a query due to a limit on concurrent queries or memory usage, subsequent statements in the same session are also queued to ensure that the statements are processed in the correct order. |
| Reuse classifications and hierarchy developed for use with Sentry security | If you set up different resource pools for different users and groups, consider reusing any classifications and hierarchy you developed for use with Sentry security. See Enabling Sentry Authorization for Impala for details. For details about all the Fair Scheduler configuration settings, see the Apache wiki , in particular the tags such as <queue> and <aclSubmitApps> to map users and groups to particular resource pools (queues). |
| Use the COMPUTE STATS statement for large tables involved in join queries | Although COMPUTE STATS is an important statement to help optimize query performance, it is especially important when admission control is enabled. Admission control relies on COMPUTE STATS to generate accurate memory usage estimates for complex queries. |

Spill to Disk

Important: This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

Impala 2.2.0 introduces the "spill to disk" feature which prevents queries that use memory-intensive operations, such as large sort, join, aggregation, or analytic function operations, from failing with out-of-memory errors. Impala automatically writes data to disk when queries with memory-intensive operations exceed the set memory limit on an Impala node. You can enable or disable the spill to disk feature in `/opt/mapr/impala/impala-<version>/conf/env.sh`. You can also change the `DISABLE_UNSAFE_SPILLS` setting at the session level to allow or prevent data spills.

Impala reserves a certain amount of memory for memory-intensive operations that reach the set memory threshold. This memory reserve serves as a buffer that slows an operation's use of memory and in some instances prevents operations from exceeding the memory limit on a node. If the amount of memory used exceeds the set memory limit, Impala starts writing data to disk (spilling to disk).

Impala writes data to a temporary work area on disk. The default location of this work area is `/tmp/impala-scratch`. You can start the `impalad` daemon with the `--scratch_dirs="path_to_directory"` configuration option to change the directory location, however the scratch directory must reside on the local filesystem. You can specify a single directory, or a comma-separated list of directories. If there is less than 1 GB of available space on the filesystem where the scratch directory resides, Impala writes a warning message to its log when it runs. When an operation completes, the data is removed from the disk.

Prevent Data from Spilling to Disk

Spilling to disk can have significant performance implications due to the additional I/O required. Ideally, you want to optimize queries, system parameters, and the hardware configurations to prevent data from spilling to disk. The following points describe some techniques that can prevent data from spilling to disk:

- View the query profile after you run queries to determine how often they spill to disk and how much temporary data is written to disk. You can run the PROFILE command from the impala-shell or you can view the Impala debug web user interface to see the profile for the query.
- Increase the number of Impala nodes in the cluster to increase the aggregate memory available.
- Increase the overall memory capacity of each node at the hardware level.
- On a multi-tenant cluster, use resource management features to allocate more memory for Impala.
- If you are running concurrent queries rather than a few memory-intensive ones, use the admission control feature to lower the limit on the number of concurrent queries. You can schedule the most resource-intensive queries to avoid spikes in memory usage and improve overall response times. See [Admission Control](#).
- Use the following techniques to tune the queries with the highest memory requirements:
 - Run the COMPUTE STATS statement for all tables involved in large-scale joins and aggregation queries.
 - Minimize the use of STRING columns in join columns. Use numeric values instead.
 - Evaluate the EXPLAIN plan to see the execution plan used for the most resource-intensive queries.
 - Add hints to the most resource-intensive queries to select the right execution strategy.
 - If your queries experience substantial performance overhead due to spilling, enable the DISABLE_UNSAFE_SPILLS query option to prevent queries from spilling to disk.

DISABLE_UNSAFE_SPILLS

You can categorize queries that spill to disk as safe or unsafe. A spill that results from optimized queries may represent a safe spill, whereas a spill that results from running large ad-hoc queries with unknown performance implications may represent an unsafe spill. For example, if a query does not include a hint to set the most efficient mechanism for a join or an INSERT ... SELECT into a partitioned table, these tables will most likely result in suboptimal execution plans that could cause unnecessary spilling.

When DISABLE_UNSAFE_SPILLS is enabled (set to "true"), you can run the COMPUTE STATS statement on large tables involved in join queries and resource-intensive operations. The COMPUTE STATS statement collects table and column statistics to help estimate memory usage for each query before you allow data to spill to disk.

If you have determined that your queries will spill safely to disk, run the following command to turn the DISABLE_UNSAFE_SPILLS option off:

```
set DISABLE_UNSAFE_SPILLS=false
```

Disable the Spill to Disk Feature

You can disable the spill to disk feature if spilling to disk negatively affects performance or you do not know the performance implications or memory usage of queries in advance.

To disable the spill to disk feature, complete the following steps:

1. On each node running the Impala server, edit `/opt/mapr/impala/impala-<version>/conf/env.sh`, and set the following options to "false":

```
-enable_partitioned_aggregation=false
-enable_partitioned_hash_join=false
```

2. Save the `env.sh` file and then run the following commands to restart the Impala service and instances:

- a. Run the following command to restart the Impala server:

```
$ sudo maprcli node services -name impalaserver -action
restart -nodes <IP address where impala server is installed>
```

- b. Run the following command to restart the Impala statestore:

```
$ sudo maprcli node services -name impalastore -action restart -nodes
<IP address where impala statestore is installed>
```

- c. Run the following command to restart the Impala catalog:

```
$ sudo maprcli node services -name impalacatalog -action
restart -nodes <IP address where impala catalog is installed>
```

Working with Impala

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

After you start Impala, use the `impala-shell` or a JDBC or ODBC client to query data. You can query data stored in files, as well as data stored in HPE Ezmeral Data Fabric Database tables. Impala depends on the Hive metastore to track table metadata. The filesystem tracks the metadata of other files. Impala supports Text and Parquet file formats. If you want to query data using SequenceFile, RCFile, and Avro file formats, use Hive to load the data. Impala supports Snappy, GZIP, Deflate, and BZIP compression codecs.

Impala File Formats

The following table summarizes the supported Impala text formats:

| File Type | Format | Compression Codecs | Can Impala Create? | Can Impala INSERT? |
|--------------|--------------|------------------------------|---|---------------------------------------|
| Text | Unstructured | Snappy, GZIP, BZIP | Yes, for CREATE TABLE with no STORED AS clause; default file format is uncompressed text with values separated by ASCII 0x01 characters, typically represented a Ctrl-A | Yes. CREATE TABLE, INSERT, and query. |
| SequenceFile | Structured | Snappy, GZIP, deflate, BZIP2 | Yes | No. Query only. Load data using Hive. |
| RCFile | Structured | Snappy, GZIP, deflate, BZIP2 | Yes | No. Query only. Load data using Hive. |
| Parquet | Structured | Snappy (default), GZIP | Yes | Yes. CREATE TABLE, INSERT, and query. |
| Avro | Structured | Snappy, GZIP, deflate, BZIP2 | No, create using Hive. | No. Query only. Load data using Hive. |

Impala SQL Dialect

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

Impala uses the SQL query language and is compatible with the Hive query language, HiveQL. You can use other languages, such as Java, to interact with Impala through ODBC and JDBC interfaces. The Impala SQL dialect supports a subset of SQL and HiveQL functions, statements, datatypes, operators, and built-in functions.

The Impala SQL dialect supports DML statements similar to the DML component of HiveQL. The Impala SQL dialect does not support UPDATE and DELETE statements, and does not support the INSERT... VALUES syntax to insert a single row.

Refer to [Supported and Unsupported SQL/HiveQL Language Features](#) for a list of supported and unsupported functions, statements, datatypes, operators, and features.

Example: Running an Impala SQL Query

In this example scenario, download a customer CSV file and use the Hive shell to create a table and import customer data into the table and then run an Impala query on the table.

1. Download the following CSV file to `/root/customers_sample_data.csv`:

[customers_sample_data.csv](#)

2. Issue the following command from the hive-shell to import the CSV file and create a table:

```
hive> create table customers(FirstName string,
LastName string,Company string,Address string,
City string,County string,State string,Zip string,
Phone string,Fax string,Email string,Web string)
row format delimited fields terminated by ',' stored as textfile;
```

3. Issue the following command in the hive-shell to load the customer data into the customers table:

```
Hive> load data local inpath '/root/customers_sample_data.csv' overwrite
into table customers;
```

4. Issue the following command to start the Impala shell:

```
$ impala-shell
```

5. To connect to an instance of Impala, issue the following CONNECT command, replacing `impalad-host` with the host name you have configured on a node running Impala:

```
[Not connected] > connect impalad-host
[impalad-host:21000] >
```

6. Issue the following command to query the data to find the total number of customers:

```
select count(*) from customers
```

The query returns the following result:

```
+-----+
| count(*) |
+-----+
| 6 |
+-----+
```

Query HPE Ezmeral Data Fabric Database Binary Tables with Impala

! **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

You can use Impala to query data in HPE Ezmeral Data Fabric Database binary tables. Create an external table in the Hive shell and then map the Hive table to the corresponding HPE Ezmeral Data Fabric Database binary table. You can map a HPE Ezmeral Data Fabric Database binary table to a Hive table with or without string row keys. When you create an external table in Hive, use the `HBaseStorageHandler` clause in the Hive `CREATE TABLE` statement to allow Hive to access data stored in the HPE Ezmeral Data Fabric Database binary table. The `HBaseStorageHandler` has two important properties:

| | |
|------------------------------------|---|
| <code>hbase.columns.mapping</code> | Specifies the Hive column to column family mapping. |
| <code>hbase.table.name</code> | Absolute path of the table or just the table name, depending on whether the table path is mapped. |

Example:

```
CREATE EXTERNAL TABLE students
(id string,
name string,
street string,
zipcode int,
state string)
STORED BY 'org.apache.hadoop.hive.hbase.HBaseStorageHandler' WITH
SERDEPROPERTIES
('hbase.columns.mapping'=':key,account:name,address:street,address:zipcode,adddress:state')
TBLPROPERTIES ('hbase.table.name'='/user/userA/students');
```

Once you have mapped the HPE Ezmeral Data Fabric Database binary table to Hive, you can query or insert into the table from Impala because Hive and Impala share the metastore database. Impala nodes cache table metadata if a table contains a large amount of data or has many partitions. Caching the metadata reduces runtime for future queries on the table.

If you insert new data into a Hive or HPE Ezmeral Data Fabric Database binary table, use the Impala shell to issue the `REFRESH` statement to refresh the data location cache. The `REFRESH` command only applies to the node that the Impala shell is connected to. If you route all SQL statements to the same node, you do not have to issue regular `REFRESH` statements when table data is updated on other nodes.

If you create, drop, or alter any external tables or databases, use the Impala shell to issue the `INVALIDATE METADATA` statement to refresh table structure metadata.

To ensure Impala is querying HPE Ezmeral Data Fabric Database binary tables and not HBase, add the next property to `$HBASE_HOME/conf/hbase-site.xml`:

```
<property>
  <name>mapr.hbase.default.db</name>
  <value>maprdb</value>
</property>
```

Example: Running an Impala Query on HPE Ezmeral Data Fabric Database Binary Tables

In this example scenario, a professor wants to know how many times a student clicks on Google from his webpage. He wants to use Impala to query the data in HPE Ezmeral Data Fabric Database. One of his students offered to load the data into HPE Ezmeral Data Fabric Database so he can access it. In order to complete the professor's request, the student must use the HBase shell to create two HPE Ezmeral Data Fabric Database binary tables that contain the following schema and then put data in the tables:

- student

- account – id, name
- address – street, zipcode, state
- clicks
 - clickinfo – clickid, studentid, url, time
 - iteminfo – itemid, quantity

Each bullet corresponds to a column family with a list of columns. In order to access the tables using Impala, the student must create external tables in Hive with mapped columns that match the HPE Ezmeral Data Fabric Database columns.

If you would like to be the student, you can perform the following steps to help the professor:

1. Use the HBase shell to create two tables in HPE Ezmeral Data Fabric Database: “student” and “clicks”. To create the tables, issue the following commands:

```
echo "create '/user/userA/students','account','address'" | hbase shell
echo "create '/user/userA/clicks','clickinfo','iteminfo'" | hbase shell
```

2. Issue the `hadoop fs -ls` command on the table location to verify that the tables exist.

```
hadoop fs -ls /user/userA
echo "describe '/user/userA/student'" | hbase shell
echo "describe '/user/userA/clicks'" | hbase shell
```

3. Create external tables in Hive with the appropriate column mapping for the “student” and “clicks” tables using a string row key. Remember the two important properties for `HBaseStorageHandler`:
 - `hbase.columns.mapping`, which specifies Hive column to column family mapping.
 - `hbase.table.name`, which can be the absolute path of the table or just the table name, depending on whether the table path is mapped.

To create the external tables in Hive, run the following commands:

```
CREATE EXTERNAL TABLE students
(id string,
name string,
street string,
zipcode int,
state string)
STORED BY
'org.apache.hadoop.hive.hbase.HBaseStorageHandler' WITH SERDEPROPERTIES
('hbase.columns.mapping'=':key,account:name,address:street,address:zipcod
e,address:state')
TBLPROPERTIES
('hbase.table.name'='/user/userA/students');

CREATE EXTERNAL TABLE clicks
(clickid string,
studentid string,
url string,
time timestamp,
itemtype string,
quantity int)
STORED BY 'org.apache.hadoop.hive.hbase.HBaseStorageHandler'
WITH SERDEPROPERTIES ('hbase.columns.mapping'=':key,clickinfo:studentid,
clickinfo:url,clickinfo:time,iteminfo:itemtype,iteminfo:quantity')
```

```
TBLPROPERTIES  
( 'hbase.table.name' = '/user/userA/clicks' );
```

4. Create a `testdata.txt` file with the following content to add data into the “students” and “clicks” HPE Ezmeral Data Fabric Database binary tables.

```

cat > testdata.txt
put '/user/userA/students','student1','account:name','Alice'
put '/user/userA/students','student1','address:street','123 Ballmer Av'
put '/user/userA/students','student1','address:zipcode','12345'
put '/user/userA/students','student1','address:state','CA'
put '/user/userA/students','student2','account:name','Bob'
put '/user/userA/students','student2','address:street','1 Infinite Loop'
put '/user/userA/students','student2','address:zipcode','12345'
put '/user/userA/students','student2','address:state','CA'
put '/user/userA/students','student3','account:name','Frank'
put '/user/userA/students','student3','address:street','435 Walker Ct'
put '/user/userA/students','student3','address:zipcode','12345'
put '/user/userA/students','student3','address:state','CA'
put '/user/userA/students','student4','account:name','Mary'
put '/user/userA/students','student4','address:street','56 Southern Pkwy'
put '/user/userA/students','student4','address:zipcode','12345'
put '/user/userA/students','student4','address:state','CA'
put '/user/userA/clicks','click1','clickinfo:studentid','student1'
put '/user/userA/clicks','click1','clickinfo:url','http://www.google.com'
put '/user/userA/clicks','click1','clickinfo:time','2014-01-01

put '/user/userA/clicks','click7','iteminfo:itemtype','image'
put '/user/userA/clicks','click7','iteminfo:quantity','10'

```

```

put '/user/userA/clicks','click8','clickinfo:studentid','student4'
put '/user/userA/clicks','click8','clickinfo:url','http://www.amazon.com'
put '/user/userA/clicks','click8','clickinfo:time','2013-02-01
22:01:01.0001'
put '/user/userA/clicks','click8','iteminfo:itemtype','image'
put '/user/userA/clicks','click8','iteminfo:quantity','1'
put '/user/userA/clicks','click9','clickinfo:studentid','student4'
put '/user/userA/clicks','click9','clickinfo:url','http://www.amazon.com'
put '/user/userA/clicks','click9','clickinfo:time','2013-02-01
22:01:01.0001'
put '/user/userA/clicks','click9','iteminfo:itemtype','image'
put '/user/userA/clicks','click9','iteminfo:quantity','10'

```

5. Press Control + Z to finish editing the file and pipe these commands to the HBase shell to insert the test data:

```
cat testdata.txt | hbase shell
```

6. Scan the tables to verify that the data was inserted correctly. Run the following commands to perform the scan:

```
echo "scan '/user/userA/students'" | hbase shell
echo "scan '/user/userA/clicks'" | hbase shell
```

7. Use Hive to verify that the data was inserted into the tables. Issue the SELECT statement against students and clicks to verify the count in each table.

```

hive
hive> select * from students;
OK
student1      Alice   123 Ballmer Av  12345   CA
student2      Bob     1 Infinite Loop 12345   CA
student3      Frank  435 Walker Ct   12345   CA
student4      Mary   56 Southern Pkwy 12345   CA
hive> select * from clicks;
OK
click1 student1      http://www.google.com 2014-01-01
12:01:01.0001 image 1

```

Since the Impala shell was running when you inserted the data, verify that the metadata is refreshed to make sure that Impala is aware of the new tables created.

8. From the Impala shell , issue the INVALIDATE METADATA statement to refresh the metadata.

```

> invalidate metadata;
> select * from students ;
Query: select * from students
Query finished, fetching results ...
+-----+-----+-----+-----+-----+
| id      | name  | state | street          | zipcode |
+-----+-----+-----+-----+-----+
| student1 | Alice | CA    | 123 Ballmer Av  | 12345   |
| student2 | Bob   | CA    | 1 Infinite Loop | 12345   |
| student3 | Frank | CA    | 435 Walker Ct   | 12345   |
| student4 | Mary  | CA    | 56 Southern Pkwy | 12345   |
+-----+-----+-----+-----+-----+
select count(*) from clicks;
> select * from clicks;
Query: select * from clicks
Query finished, fetching results ...
+-----+-----+-----+-----+-----+
| clickid | studentid | time                | url          | itemtype | quantity |
+-----+-----+-----+-----+-----+
| click1  | student1  | 2014-01-01 12:01:01.000100000 | http://www.google.com | image    | 1         |
| click2  | student1  | 2014-01-01 01:01:01.000100000 | http://www.amazon.com | image    | 1         |
| click3  | student2  | 2014-01-01 01:02:01.000100000 | http://www.google.com | text     | 2         |
| click4  | student2  | 2013-02-01 12:01:01.000100000 | http://www.ask.com    | text     | 5         |
| click5  | student2  | 2013-02-01 12:01:01.000100000 | http://www.reuters.com | text     | 100      |
| click6  | student3  | 2013-02-01 12:01:01.000100000 | http://www.google.com | image    | 1         |
| click7  | student3  | 2013-02-01 12:45:01.000100000 | http://www.ask.com    | image    | 10        |
| click8  | student4  | 2013-02-01 22:01:01.000100000 | http://www.amazon.com | image    | 1         |
| click9  | student4  | 2013-02-01 22:01:01.000100000 | http://www.amazon.com | image    | 10        |
+-----+-----+-----+-----+-----+

```

9. To query the tables and to find out which students clicked on google.com, run the following command from the Impala shell:

```
> select * from clicks where url like '%google%';
Query: select * from clicks where url like '%google%'
Query finished, fetching results ...
```

| clickid | studentid | time | itemtype | quantity | url |
|---------|-----------|-------------------------------|----------|----------|-----------------------|
| click1 | student1 | 2014-01-01 12:01:01.000100000 | image | 1 | http://www.google.com |
| click3 | student2 | 2014-01-01 01:02:01.000100000 | text | 2 | http://www.google.com |
| click6 | student3 | 2013-02-01 12:01:01.000100000 | image | 1 | http://www.google.com |

Managing Impala

Important: This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

To manage Impala, you can start and stop the Impala services, modify resource allocation, and use log files to identify and resolve issues.

Starting/Stopping Impala From the Control System

You must start the statestore service before you start the catalog or the Impala service.

To start the Impala statestore and catalog services from the Control System, complete the following steps:

1. In the Navigation pane, expand the Cluster Views pane and click Dashboard.
2. In the Services pane, click Impala statestore. The Nodes screen appears and displays the node configured with the statestore service.
3. Click the hostname of the node with the statestore and catalog services configured to display the Node Properties screen.
4. Use the Stop/Start button in the Impala statestore row under Manage Services to start Impala statestore.
5. Use the Stop/Start button in the Impala catalog row under Manage Services to start Impala catalog.

To start Impala server from the Control System, complete the following steps:

1. In the Navigation pane, expand the Cluster Views pane and click Dashboard.
2. In the Services pane, click Impala server. The Nodes screen appears and displays the nodes configured with the Impala server.
3. Click the hostname of the a node with the Impala server configured to display its Node Properties screen.
4. Use the Stop/Start button in the Impala server row under Manage Services to start the Impala server.
5. Repeat steps 3 and 4 for the remaining nodes configured with the Impala server.

From the CLI

You must start the statestore service before you start the catalog or the Impala service.

To start Impala from the command line, complete the following steps:

1. Issue the following command to start the statestore service on the node with statestored:

```
$ sudo maprcli node services -name impalastore -action start|stop -nodes
<node IP addresses separated by a space>
Example:
$ sudo maprcli node services -name impalastore -action start -nodes
10.10.30.166
```

2. Issue the following command to start the catalog service on the node with catalogd:

```
$ sudo maprcli node services -name impalacatalog -action start|
stop -nodes <node IP addresses separated by a space>
Example:
$ sudo maprcli node services -name impalacatalog -action start -nodes
10.10.30.166
```

3. Issue the following command to start the Impala service on the node(s) with impalad:

```
$ sudo maprcli node services -name impalserver -action start|
stop -nodes < node IP addresses separated by a space >
Example:
$ sudo maprcli node services -name impalserver -action start -nodes
10.10.30.166
```

4. Optionally, you can run the following command to launch the impala-shell if you want to issue queries from the command line:

```
${IMPALA_HOME}/bin/impala-shell.sh
```

Modify Resource Allocation

If you run Impala on nodes that also run MapReduce, both frameworks may suffer poor performance if they have to compete for resources. You can configure memory based on your job requirements and SLAs to ensure that each framework has enough resources to avoid conflicts. For information about modifying memory, refer to [Additional Impala Configuration Options](#).

Impala Logs

Impala logs provide information errors, configuration, and completed jobs. You can review log files on each node. An Impala administrator should review the log files and set log levels.

Impala uses the glog_v logging system to store information. Some messages refer to C++ file names. The GLOG_v environment variable specifies which types of messages Impala logs.

Reviewing Logs

You can locate log files in the Impala installation directory (/opt/mapr/impala/impala-<version>/logs) on each node with Impala. Impala creates a new set of log files on each statestored or impalad restart.

The following table provides a list of the important log files for the impalad and statestored processes with descriptions:

| Log Type | Impalad Filename | Statestored Filename | File Content |
|----------|------------------|----------------------|--------------|
|----------|------------------|----------------------|--------------|

| | | | |
|---------|-----------------|---------------------|--|
| INFO | impalad.INFO | statestored.INFO | Shows configuration settings for the processes. |
| WARNING | impalad.WARNING | statestored.WARNING | Shows problem information, including such things as suboptimal settings and also serious runtime errors. |
| ERROR | impalad.ERROR | statestored.ERROR | Shows the most serious errors, such as process crashes, failed queries. The .WARNING file also shows these messages. |

Setting Log Levels

The GLOG system has three logging levels that you can adjust by exporting variable settings. The logging levels are cumulative. Increasing logging levels may decrease performance and increases log size. Change logging settings before you start impalad.

The following table provides the logging levels and their descriptions:

| Level | Description |
|----------|--|
| GLOG_v=1 | Default. Logs information about each connection and query that is initiated to an impalad instance, including runtime profiles |
| GLOG_v=2 | Logs everything from GLOG_v=1 plus information for each RPC initiated. This level also records query execution progress information, including details on each file read. |
| GLOG_v=3 | Logs everything from GLOG_v=2 plus it logs row read. This level is only applicable for the most serious troubleshooting and tuning scenarios, because it can produce exceptionally large and detailed large log files. |

Use the following command to change logging settings:

```
export GLOG_v=1
```

For more information on how to configure GLOG, including how to set variable logging levels for different system components, see [Fixed in 5.2 r1.0](#).

Log Rotation

Log rotation is the automatic removal of unneeded or old log files. By default, Impala switches out old log files every 5 seconds, based on the default interval specified in the `logbufsecs` setting. The `-max_log_files` configuration option specifies how many log files to keep at each severity level (INFO, WARNING, ERROR, and FATAL). You can configure the `-max_log_files` option for each Impala daemon (impalad, statestored, and catalogd) in the `env.sh` configuration file. By default, Impala preserves the latest 10 log files for each severity level and removes old logs based on the `logbufsecs` setting. Setting `-max_log_files` to 0 preserves all of the log files. This setting requires manual log rotation. Setting `max_log_files` to 1 preserves only the latest log file.

Impala Ports

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

Before you deploy Impala, verify that the TCP ports are open on each system.

Impala uses the following ports:

| Component | Service | Port | Type | Description |
|--------------------------|-----------------------------------|-------|----------|---|
| Impala Daemon | Impala Daemon Frontend Port | 21000 | External | Impala uses this port to communicate commands and receive results through the impala-shell and the ODBC driver. |
| Impala Daemon | Impala Daemon Frontend Port | 21050 | External | Impala uses this port to communicate commands and receive results through applications. |
| Impala Daemon | Impala Daemon Backend Port | 22000 | Internal | The Impala daemons use this port to communicate with each other. |
| Impala Daemon | StateStoreSubscriber Service Port | 23000 | Internal | The Impala daemons listen for updates from the statestore on this port. |
| Impala Daemon | Impala Daemon HTTP Server Port | 25000 | External | The Impala web interface that administrators use for troubleshooting. |
| Impala Statestore Daemon | StateStore Service Port | 24000 | Internal | The statestore listens on this port for registration requests. |
| Impala Statestore Daemon | StateStore HTTP Server Port | 25010 | External | The statestore web interface that administrators use for troubleshooting. |
| Impala Catalog Daemon | Catalog HTTP Server Port | 25020 | External | The catalog service web interface that administrators use for troubleshooting. |
| Impala Catalog Daemon | Catalog Service Port | 26000 | Internal | The catalog service uses this port to communicate with the Impala daemons. |

Programming Interfaces

Important: This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

You can connect to Impala daemons through the impala-shell or through a JDBC or ODBC client. You can use the impala-shell to query data from a Linux environment. In a non-Linux environment, you can query data using JDBC and ODBC applications.

Impala Shell

The Impala-shell is a command line tool that you can use for setting up databases and tables, inserting data, and issuing queries using SQL statements and some shell commands. The impala-shell can reside on any client machine.

You can connect to the same node and issue all SQL statements through that particular node to avoid issuing the REFRESH statement frequently. For load balancing, you can connect to different nodes for each impala-shell session. When you connect to different Impala nodes, you may need to issue the REFRESH and INVALIDATE METADATA statements to update table data and metadata.

When you run commands from within the impala-shell, use a semi-colon to terminate commands. Each command can span multiple lines. Refer to [Impala-Shell Commands and Command Line Options](#) for a list of commands and options that you can issue from within the impala-shell.

Connecting to impalad from impala-shell

You can connect to any node running the Impala daemon process from the impala-shell using the CONNECT command. Once connected, you can send queries to the Impala node from the command line.

To connect to impalad, complete the following steps:

1. Issue the following command to start the impala-shell without a connection:

```
$ impala-shell
```

2. Issue the CONNECT command to connect to an instance of Impala, replacing impalad-host with the hostname of the node that you want to connect to.

Example:

```
[Not connected] > connect impalad-host
[impalad-host:21000] >
```

JDBC and ODBC Clients

You can use a JDBC or ODBC client to connect to Impala and run queries against data stored in filesystem and HPE Ezmeral Data Fabric Database. The client or application issues a query to an Impala daemon through an ODBC or JDBC connection. The ODBC and JDBC driver submits the query to Impala in the form of a SQL statement.

Install a JDBC or ODBC driver on the client machine and then configure the driver to enable communication between the client and Impala. For driver download, installation, and connection information, refer to the following documentation:

JDBC/ODBC

Important: This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

JDBC

The Impala JDBC Driver is available in a JAR file. You can download the driver to access Impala from a Java application or any tool that uses a JDBC connection. You can download the Impala JDBC driver from https://package.mapr.hpe.com/tools/MapR-JDBC/MapR_Impala/. The documentation for the Impala JDBC 1.0.46 driver is available at [Impala JDBC Driver](#).

ODBC

The Impala ODBC Driver is available for Microsoft Windows, Linux, and Mac OS X. The driver complies with the ODBC 3.52 data standard and adds Unicode and 32- and 64-bit support on all platforms. The ODBC driver connects to an Impala server regardless of the server's host operating system. You can download the Impala ODBC driver from https://package.mapr.com/tools/MapR-ODBC/MapR_Impala/. The documentation for the Impala ODBC 1.2.16 driver is available at [Impala ODBC Driver](#).

The following sections provide JDBC and ODBC connection information:

JDBC Connections

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

You can connect to Impala through a JDBC client tool, such as the SquirrelL client. You can also use the driver in a Maven application.

Using the JDBC Driver with a Client Application

You can download the Impala JDBC driver from https://package.mapr.hpe.com/tools/MapR-JDBC/MapR_Impala/MapR_Impala_jdbc_v1.0.46.1057/. After downloading the driver, refer to the documentation at [Impala JDBC Driver](#) to install and configure the JDBC driver.

Before you connect to Impala from a JDBC client tool, complete the following tasks:

1. Configuring the JDBC Port. The default JDBC port that Impala accepts connections through is port 21050. Verify that this port can communicate with other hosts on your network. If your JDBC application connects through a different port, use the `--hs2_port` option when you start `impalad` to specify the port number.
2. Enable the JDBC driver on client machines. The JDBC driver is packaged in JAR files. From a system that has Hive installed, download the following JAR files to each client machine:
 - The JDBC driver is in `/opt/mapr/hive/hive-2.1/lib/hive-jdbc-2.1.1-mapr-1710.jar`.
 - The `hadoop-common-2.7.0` jar file for MRv2 (YARN) is in `/opt/mapr/hadoop/hadoop-2.7.0/share/hadoop/common`.
 - The other required JAR files are in `/opt/mapr/hive/hive-2.1/lib/`.

Download the following JARs:

```
commons-logging-1.1.3.jar
guava-14.0.1.jar
hive-exec-2.1.1-mapr-1710.jar
hive-jdbc-2.1.1-mapr-1710.jar
hive-metastore-2.1.1-mapr-1710.jar
hive-service-2.1.1-mapr-1710.jar
hive-shims-2.1.1-mapr-1710.jar
httpclient-4.4.jar
httpcore-4.4.jar
libfb303-0.9.2.jar
libthrift-0.9.2.jar
```

Note: You may have a different Hive 2.1 version installed. This list pertains to the 1710 version of Hive 2.1. You also need the `slf4j-api-1.7.5.jar` and `slf4j-log4j12-1.7.5.jar` files, which are available in `/opt/mapr/lib`.

3. Update the CLASSPATH. The client application needs to locate the JAR files. Set the CLASSPATH for the client process to include the JARs. Consult the documentation for your JDBC client application for more details on how to install new JDBC drivers.

If the existing CLASSPATH on your client machine refers to an older version of the Hive JARs, verify that the new JARs are listed first. You can put the new JAR files ahead of the older JAR files, or delete the other references to Hive JAR files.

4. Specify a connection string to establish a connection between Impala and JDBC. The JDBC driver classpath is `org.apache.hive.jdbc.HiveDriver`. Use the following connection string to establish the connection:

```
jdbc:hive2://host:port/;auth=noSasl
```

Example:

```
jdbc:hive2://myhost.example.com:21050/;auth=noSasl
```

Using the JDBC Driver in a Maven Application

To use the JDBC driver in a Maven application, complete the following steps:

1. Configure a Maven repository. Refer to [Maven Artifacts for MapR](#) to configure the Maven repository in your Java application.
2. Add the following dependency in the `pom.xml`:

```
<dependency>
  <groupId>org.apache.hive</groupId>
  <artifactId>hive-jdbc</artifactId>
  <version>0.12-mapr[[mapr-version-number]]</version>
</dependency>
```

3. Specify the connection string in the Java application. The following code shows a working example:

```
import java.sql.*;
public class ImpalaJdbcExample
{
    private static String connectionString =
"jdbc:hive2://10.10.80.231:21050/?auth=noSasl";
    private static String driverName =
"org.apache.hive.jdbc.HiveDriver";
    private static String queryString = "select count(*) from
customers";
    private static Connection con;
    private static ResultSet resultSet;
    private static Statement sqlStatement;
    public static void main(String[] args)
    {
        System.out.println("Loaded the driver successfully.
Trying to establish connection");
        try
        {
            Class.forName(driverName);
            con =
DriverManager.getConnection(connectionString);
            System.out.println("Created connection. Preparing
statement");
            sqlStatement = con.createStatement();
            System.out.println("Executing "+queryString);
            resultSet =
sqlStatement.executeQuery(queryString);
            while(resultSet.next())
            {
                System.out.println("Result set
"+resultSet.getString(1));
            }
            con.close();
        }
        catch(SQLException sqle)
        {
            System.out.println("Got sql exception");
            sqle.printStackTrace();
        }
        catch(Exception e)
        {
            System.out.println("Got exception");
            e.printStackTrace();
        }
    }
}
```

ODBC Client Connections on Mac OS X

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

You can use an ODBC client tool to connect to Impala from Mac OS X. Install the driver and configure it to pass a SQL query to Impala. After you install the driver, see [Configure the MapR Impala ODBC Driver for Linux and Mac OS X](#).

Before you install the driver, verify that your system meets the following prerequisites:

- Mac OS X version 10.8 or later

- 100 MB of available disk space
- iODBC 3.52.7 or above

To install and configure the Impala ODBC Driver, complete the following steps:

1. [Download the MapR Impala ODBC Driver.](#)
2. Install the Impala ODBC Driver on the machine from which you connect to the Impala service. The driver supports 32- and 64-bit applications. To install the driver:
 - a. Double-click to mount the `MapRImpalaODBC.dmg` disk image.
 - b. Double-click `MapRImpalaODBC.pkg` to run the Installer.
 - c. Follow the instructions in the installer to complete the installation process.
 - d. When the installation completes, click **Close**.

Impala ODBC Driver files install in the following locations:

- `/opt/mapr/impalaodbc/ErrorMessage`s – Error messages files directory
 - `/opt/mapr/impalaodbc/Setup` – Sample configuration files directory
 - `/opt/mapr/impalaodbc/lib/universal` – Binaries directory
3. Update the `DYLD_LIBRARY_PATH` environment variable. The `DYLD_LIBRARY_PATH` environment variable must include the paths to the:
 - Installed ODBC driver manager libraries
 - Installed Impala ODBC Driver for Impala shared libraries

For example, if the ODBC driver manager libraries are installed in `/usr/local/lib`, then set `DYLD_LIBRARY_PATH` to the following:

```
export DYLD_LIBRARY_PATH=/usr/local/lib:/opt/mapr/impalaodbc/lib/universal
```

Next Step: See [Configure the MapR Impala ODBC Driver for Linux and Mac OS X](#).

ODBC Client Connections on Linux

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

You can use an ODBC client tool to connect to Impala from Linux. Install the driver and configure it to pass a SQL query to Impala. After you install the driver, [Configure the MapR Impala ODBC Driver for Linux and Mac OS X](#).

Before you install the driver, verify that your system meets the following system prerequisites:

- RedHat 6.x or CentOS 6.x
- 50 MB of available disk space
- An installed ODBC driver manager, such as unixODBC 2.3.0/2.3.1 or iODBC 3.52.7

To install and configure the Impala ODBC Driver, complete the following steps:

1. Download the Impala ODBC Driver. You can install the 32- or 64-bit driver on Linux. Download and install the version of the driver that matches the architecture of the client application that you use to access Impala. The 64-bit editions of Linux support 32- and 64-bit applications.

Click on the link to download the driver appropriate for your system:

| Operating System | Version | Drivers |
|------------------|---------|--|
| RedHat | 6.x | MapRImpalaODBC-1.2.1.1001-1.el6.x86_64.rpm |
| | | MapRImpalaODBC-32bit-1.2.1.1001-1.el6.i686.rpm |

2. Install the Impala ODBC Driver on the machine that you connect to the Impala service from.
 - a. Login as **root**.
 - b. Navigate to the folder that contains the driver RPM packages to install.
 - c. Enter the following command where *RPMFileName* is the file name of the RPM package containing the version of the driver that you want to install:

```
yum localinstall --nogpgcheck RPMFileName
```

Impala ODBC Driver files install in the following locations:

- /opt/mapr/impalaodbc/ErrorMessage – Error messages files directory
- /opt/mapr/impalaodbc/Setup – Sample configuration files directory
- /opt/mapr/impalaodbc/lib/32 – 32-bit shared libraries directory
- /opt/mapr/impalaodbc/lib/64 – 64-bit shared libraries directory

The Impala ODBC Driver depends on the following resources:

- cyrus-sasl-2.1.22-7 or above
- cyrus-sasl-gssapi-2.1.22-7 or above
- cyrus-sasl-plain-2.1.22-7 or above

If the package manager in your Linux or Mac OS X distribution cannot resolve the dependencies automatically when installing the driver, download and manually install the packages.

3. Set the shared LD_LIBRARY_PATH environment variable. Update the shared library environment variable to include the paths to the following directories:
 - Installed ODBC driver manager libraries
 - Installed Impala ODBC Driver for Impala shared libraries

Note: You can have both 32- and 64-bit versions of the driver installed at the same time on the same computer, but do not include the paths to both 32- and 64-bit shared libraries in LD_LIBRARY_PATH at the same time. Only include the path to the shared libraries that correspond to the driver matching the architecture of the client application used. For example, if you are using a 64-bit client application and ODBC driver manager libraries are installed in /usr/local/lib, then set LD_LIBRARY_PATH as follows:

```
export LD_LIBRARY_PATH=/usr/local/lib:/opt/mapr/impalaodbc/lib/64
```

Next Step: [Configure the MapR Impala ODBC Driver for Linux and Mac OS X.](#)

ODBC Client Connections on Windows

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

You can connect to Impala through an ODBC client tool, such as Tableau, from a Windows operating system. Use the Impala ODBC Driver for SQL access to files and tables. Install the driver and configure it to pass a SQL query to Impala. You can run 32- and 64-bit applications on 64-bit Windows operating systems. You can install both versions of the driver on the same computer, however you should use the version of the driver that matches the architecture of the client application running the query.

Before you install the driver, verify that your system meets the following system prerequisites:

- Administrator privileges on the machine.
- One of the following operating systems (32- and 64-bit editions are supported):
 - Windows 7
 - Windows Server 2008 R2
 - Windows Server 2012
- 25 MB of available disk space

To install and the configure the Impala ODBC Driver, complete the following steps:

1. Download the Impala ODBC Driver:
 - [MapRImpalaODBC32.msi](#) (32-bit)
 - [MapRImpalaODBC64.msi](#) (64-bit)
2. Install the Impala ODBC Driver on the machine that you connect to the Impala service from. When you install the driver, the driver program updates the system path to include the JVM directory. To install the driver:
 - a. Double-click the file.
 - b. Click **Next**.
 - c. Accept the terms of the License Agreement, and click **Next**.
 - d. Select an installation location and then click **OK**. To accept the installation location, click **Next**.
 - e. Click **Install**.
 - f. When the installation completes, click **Finish**.
3. Configure the Impala ODBC Driver. To configure the driver:
 - a. Click the Windows **Start** button.
 - b. Click **All Programs**.
 - c. Select the Impala ODBC Driver. If you installed both versions of the driver, two options appear. Select the version that matches the architecture of your application. For example, a DSN that is defined for the 32-bit driver will only be accessible from 32-bit applications.
 - d. Click 64-bit ODBC Administrator or 32-bit ODBC Administrator. The ODBC Data Source Administrator window opens.

- e. Click the **Drivers** tab, and verify that the Impala ODBC Driver appears in the list of ODBC drivers that are installed on your system.
- f. Click the **System DSN** tab to create a system DSN or click the User DSN tab to create a user DSN. All users that login to a workstation can see a system DSN. A user DSN is specific to a user on the workstation. Only the user who creates a user DSN can see it.
- g. Click **Add**. The Create New Data Source window opens.
- h. Select **Impala ODBC Driver** and then click **Finish**. The Impala ODBC Driver DSN Setup dialog opens.
- i. Enter the DSN information. Optionally, you can select **Advanced Options**, and enter the following information in the Advanced Options window:

| Option | Description |
|-------------------------------------|--|
| Use Native Query | Select this option to disable translating ODBC SQL to Impala SQL. By default, the driver applies transformations to the queries produced by an application to convert the queries to an equivalent form in Impala SQL. If the application produces Impala SQL, you can turn off the translation to avoid additional overhead of query transformation. |
| Rows Fetched Per Block | Enter the number of rows to fetch per block. You can enter any positive 32-bit integer as a value. |
| Socket Timeout | Enter the number of seconds Impala waits to close an idle connection with the client application. If you want to disable this option, set the value to 0. |
| Allow Common Name Hostname Mismatch | Select this option to allow the common name of a CA-issued SSL certificate to mismatch the hostname of the Impala server. Note: This setting only applies to the User Name and Password (SSL) and No Authentication (SSL) authentication mechanisms. Other authentication mechanisms ignore this setting. |
| Trusted Certificates field | Enter the path to the file that contains the trusted certificates in this field to configure the driver to load trusted certificates (such as the certificate from the Impala server) from a specific file when authenticating the Impala server using SSL. Note: This setting only applies to the User Name and Password (SSL) and No Authentication (SSL) authentication mechanisms. Other authentication mechanisms ignore this setting. SSL certificates in the trusted certificates file must be in PEM format. If this setting is not set, then the driver defaults to using the trusted CA certificates PEM file installed by the driver. |

- j. Click **OK**.
- k. Optionally, if the operations against Impala are to be done on behalf of a user that is different than the authenticated user for the connection, enter the user name of the user to be delegated in the **Delegation UID** text box.
- l. Click **Test** to test the connection.
- m. Review the connection test results, and click **OK** in the Test Results dialog.
- n. In the Impala ODBC Driver DSN Setup dialog, click **OK**.

4. Configure authentication. The Impala server supports multiple authentication mechanisms. You must determine the authentication type your server is using and configure your DSN accordingly. The following table provides the authentication methods available with configuration instructions:

| Method | Configuration |
|-------------------|--|
| Kerberos | <p>Kerberos must be configured before you can use this authentication mechanism. For details, see Configuring Kerberos Authentication for Windows on page 3972. After Kerberos is installed and configured, configure your DSN to use Kerberos authentication.</p> <p>To configure your DSN to use Kerberos authentication, complete the following steps:</p> <ol style="list-style-type: none"> In the Impala ODBC Driver DSN Setup dialog, click the drop-down arrow next to the Mechanism field, and then select Kerberos If your Kerberos setup does not define a default realm or if the realm of your Impala server is not the default, then type the Kerberos realm of the Impala server host in the Realm field. Otherwise, leave the field blank. In the Host FQDN field, type the fully qualified domain name of the Impala host. In the Service Name field, type the service name of the Impala server. <p>For example, if the principle for the Impala server is</p> <pre>impala/ fully.qualified.domain.name@your-realm.com</pre> <p>, then the value in the service name field is <code>impala</code>. If you are unsure of the correct service name to use for your particular Hadoop deployment, contact your Hadoop administrator.</p> <ol style="list-style-type: none"> In the Transport Buffer Size field, type the number of bytes to reserve in memory for buffering unencrypted data from the network. <p>Note: In most circumstances, the default value of 1000 bytes is optimal.</p> |
| No Authentication | <p>For this authentication mechanism, you do not need to configure any additional settings. To configure your DSN for connections that do not require authentication, click the drop-down arrow next to the Mechanism field, and then select No Authentication in the driver DSN Setup dialog.</p> |

| Method | Configuration |
|--------------------------------|---|
| <p>No Authentication (SSL)</p> | <p>This authentication mechanism uses SSL but does not require a user name or a password. The driver accepts self-signed SSL certificates.</p> <p>To configure your DSN to use No Authentication (SSL) authentication, complete the following steps:</p> <ol style="list-style-type: none"> <li data-bbox="818 380 1442 464">a. In the Impala ODBC Driver DSN Setup dialog, click the drop-down arrow next to the Mechanism field, and then select No Authentication (SSL) <li data-bbox="818 485 1458 621">b. Optionally, configure the driver to allow a mismatch between the common name of a CA-issued certificate and the host name of the Impala server by clicking Advanced Options and selecting the Allow Common Name Host Name Mismatch check box. <p>Note: For self-signed certificates, the driver always allows the common name of the certificate to not match the host name.</p> <p>Optionally, configure the driver to load SSL certificates from a specific file by clicking Advanced Options and typing the path to the file in the Trusted Certificates field.</p> <p>Note: By default, the driver uses the trusted CA certificates PEM file that is installed with the driver.</p> |
| <p>User Name</p> | <p>This authentication mechanism requires a user name but does not require a password. The user name labels the session, facilitating database tracking.</p> <p>To configure your DSN to use User Name authentication, complete the following steps:</p> <ol style="list-style-type: none"> <li data-bbox="818 1094 1442 1167">a. In the Impala ODBC Driver DSN Setup dialog, click the drop-down arrow next to the Mechanism field, and then select User Name <li data-bbox="818 1188 1403 1251">b. In the User Name field, type a user name that is recognized by the Impala server. <li data-bbox="818 1272 1458 1356">c. In the Transport Buffer Size field, type the number of bytes to reserve in memory for buffering unencrypted data from the network. <p>Note: In most circumstances, the default value of 1000 bytes is optimal.</p> |

| Method | Configuration |
|------------------------------|---|
| User Name and Password | <p>This authentication mechanism requires a user name and a password.</p> <p>Note: This authentication mechanism should not be used with an Impala configuration that does not have LDAP enabled.</p> <p>To configure your DSN for User Name and Password authentication, complete the following steps:</p> <ol style="list-style-type: none"> a. In the Impala ODBC Driver DSN Setup dialog, click the drop-down arrow next to the Mechanism field, and then select User Name and Password b. In the User Name field, type a user name that is recognized by the Impala server. c. In the Password field, type the password corresponding to the user name you typed in step 2. |
| User Name and Password (SSL) | <p>This authentication mechanism uses SSL and requires a user name and a password. The driver accepts self-signed SSL certificates.</p> <p>Note: This authentication mechanism should not be used with an Impala configuration that does not have LDAP enabled.</p> <p>To configure your DSN to use User Name and Password (SSL) authentication, complete the following steps:</p> <ol style="list-style-type: none"> a. In the Impala ODBC Driver DSN Setup dialog, click the drop-down arrow next to the Mechanism field, and then select User Name and Password (SSL) b. In the User Name field, type a user name that is recognized by the Impala server. c. In the Password field, type the password corresponding to the user name you typed in step 2. d. Optionally, configure the driver to allow a mismatch between the common name of a CA-issued certificate and the host name of the Impala server by clicking Advanced Options and selecting the Allow Common Name Host Name Mismatch check box. <p>Note: For self-signed certificates, the driver always allows the common name of the certificate to not match the host name</p> <p>Optionally, configure the driver to load SSL certificates from a specific file by clicking Advanced Options and typing the path to the file in the Trusted Certificates field.</p> <p>Note: By default, the driver uses the trusted CA certificates PEM file that is installed with the driver.</p> |

Configuring Kerberos Authentication for Windows

Important: This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

You can configure Kerberos Authentication for Windows through Active Directory or MIT Kerberos.

Active Directory

The ODBC Driver for Impala supports Active Directory Kerberos on Windows. Before you can use Active Directory Kerberos on Windows, the following prerequisites must be met:

- MIT Kerberos is not installed on the client Windows machine.
- The MIT Kerberos Hadoop realm has been configured to trust the Active Directory realm, so that users in the Active Directory realm can access services in the MIT Kerberos Hadoop realm.

MIT Kerberos

To use Kerberos, you must download and install MIT Kerberos for Windows 4.0.1.

Complete the following steps to use MIT Kerberos:

1. Download MIT Kerberos for Windows 4.0.1.

- **Download for 64-bit Computers**

To download the Kerberos installer for 64-bit computers, use the following download link from the MIT Kerberos website:

<http://web.mit.edu/kerberos/dist/kfw/4.0/kfw-4.0.1-amd64.msi>

This installer includes both 32-bit and 64-bit libraries.

- **Download for 32-bit Computers**

To download the Kerberos installer for 32-bit computers, use the following download link from the MIT Kerberos website:

<http://web.mit.edu/kerberos/dist/kfw/4.0/kfw-4.0.1-i386.msi>

This installer includes 32-bit libraries only.

2. Run the MIT Kerberos for Windows 4.0.1 installer.

- a. To run the installer, double-click the .msi file that you downloaded.
- b. Follow the instructions in the installer to complete the installation process.
- c. When the installation completes, click **Finish**.

3. Setup the Kerberos configuration file.

Settings for Kerberos are specified through a configuration file. You can set up the configuration file as a .ini file in the default location (the C:\ProgramData\MIT\Kerberos5directory) or as a .conf file in a custom location.

Normally, the C:\ProgramData\MIT\Kerberos5 directory is hidden. Consult your Windows documentation if you want to view and use this hidden directory.

Setup in the Default Location

To set up the Kerberos configuration file in the default location, obtain the krb5.conf configuration file from your Kerberos administrator. Alternatively, you can obtain the /etc/krb5.conf configuration file on the machine that is hosting the Impala server and then complete the following steps:

- a. Rename the configuration file from krb5.conf to krb5.ini.
- b. Copy the krb5.ini file to the C:\ProgramData\MIT\Kerberos5 directory, and overwrite the empty sample file.

Note: For more information on configuring Kerberos, consult the MIT Kerberos documentation.

Setup in a Custom Location

To set up the Kerberos configuration file in a custom location, obtain the krb5.conf configuration file from your Kerberos administrator. Alternatively, you can obtain the /etc/krb5.conf configuration file on the machine that is hosting the Impala server and then complete the following steps:

- a. Place the krb5.conf file in an accessible directory and make note of the full path name.
 - b. Click Start, then right-click Computer, and then click Properties.
 - c. Click Advanced system settings. In the System Properties dialog, click the Advanced tab, and then click Environment Variables.
 - d. In the Environment Variables dialog, under the System variables list, click New.
 - e. In the New System Variable dialog, in the Variable Name field, type KRB5_CONFIG.
 - f. In the Variable Value field, type the absolute path to the krb5.conf file from step 2.
 - g. Click OK to save the new variable.
 - h. Ensure the variable is listed in the System variables list.
 - i. Click OK to close the Environment Variables dialog, and then click OK to close the System Properties dialog.
4. Setup the Kerberos Credential Cache File. Kerberos uses a credential cache to store and manage credentials. To set up the Kerberos credential cache file, complete the following steps:
- a. Create a directory where you want to save the Kerberos credential cache file. For example, create the following directory: **C:\temp**
 - b. Click **Start**, then right-click **Computer**, and then click **Properties**.
 - c. Click **Advanced system settings**.
 - d. In the System Properties dialog, click the **Advanced** tab, and then click **Environment Variables**.
 - e. In the Environment Variables dialog, under the **System variables** list, click **New**.
 - f. In the New System Variable dialog, in the Variable Name field, type **KRB5CCNAME**.
 - g. In the Variable Value field, type the path to the folder you created in step 0, and then append the file name krb5cache. For example, if you created the folder C:\temp in step 0, then type C:\temp\krb5cache.
- Note:** krb5cache is a file (not a directory) that is managed by the Kerberos software, and it should not be created by the user. If you receive a permission error when you first use Kerberos, ensure that krb5cache does not already exist as a file or a directory.
- a. Click **OK** to save the new variable.
 - b. Ensure the variable appears in the **System variables** list.
 - c. Click **OK** to close the Environment Variables dialog, and then click **OK** to close the System Properties dialog.
 - d. To ensure that Kerberos uses the new settings, restart your computer.

5. Obtain a Ticket for a Kerberos Principal. A principal is a user or service that can authenticate to Kerberos. To authenticate to Kerberos, a principal must obtain a ticket by using a password or a keytab file. You can specify a keytab file to use, or use the default keytab file of your Kerberos configuration.

Obtain a Ticket Using a Password

- a. Click the **Start** button, then click **All Programs**, and then click the **Kerberos for Windows (64-bit)** or the **Kerberos for Windows (32-bit)** program group.
- b. Click **MIT Kerberos Ticket Manager**.
- c. In the MIT Kerberos Ticket Manager, click **Get Ticket**.
- d. In the Get Ticket dialog, type your principal name and password, and then click **OK**.

If the authentication succeeds, then your ticket information appears in the MIT Kerberos Ticket Manager.

Obtain a Ticket Using a keytab File

- a. Click the **Start** button > **All Programs** > **Accessories** > **Command Prompt**.
- b. In the Command Prompt, type a command using the following syntax:

```
kinit -k -t keytab_file principal
```

keytab_file is the full path to the keytab file.

For example:

```
C:\mykeytabs\impalaserver.keytab
```

principal is the Kerberos principal to use for authentication.

For example:

```
impala/impalaserver.example.com@EXAMPLE.COM
```

If the cache location KRB5CCNAME is not set or not used, then use the `-c` option of the `kinit` command to specify the credential cache. In the command, the `-c` argument must appear last. For example:

```
kinit -k -t C:\mykeytabs\impalaserver.keytab
      impala/fully.qualified.domain.name@your-realm.com -c
      C:\ProgramData\MIT\krb5ccache
```

Note: `krb5ccache` is the Kerberos cache file, not a directory.

Obtain a Ticket Using the Default keytab File

Note: For instructions on configuring a default keytab file for your Kerberos configuration, consult the MIT Kerberos documentation.

- a. Click the **Start** button > **All Programs** > **Accessories** > **Command Prompt**
- b. In the Command Prompt, type a command using the following syntax:

```
kinit -k principal
```

principal is the principal to use for authentication.

For example:

```
impala/impalaserver.example.com@EXAMPLE.COM
```

If the cache location KRB5CCNAME is not set or not used, then use the `-c` option of the `kinit` command to specify the credential cache. In the command, the

`-c` argument must appear last.

For example:

```
kinit -k impala/fully.qualified.domain.name@your-realm.com -c
C:\ProgramData\MIT\krbcache
```

Note: `krbcache` is the Kerberos cache file, not a directory.

Configure the Impala ODBC Driver for Linux and Mac OS X

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

The configuration files reside in the the home directory. You can use the two environment variables, `ODBCINI` and `ODBCSYSINI`, to specify different locations for the `odbc.ini` and `odbcinst.ini` configuration files. Set `ODBCINI` to point to your `odbc.ini` file. Set `ODBCSYSINI` to point to the directory containing the `odbcinst.ini` file. For example, if your `odbc.ini` file is located in `/etc` and your `odbcinst.ini` file is located in `/usr/local/odbc`, set the environment variables as follows:

- ```
export ODBCINI=/etc/odbc.ini
```
- ```
export ODBCSYSINI=/usr/local/odbc
```

Sample Files

The driver installation contains the following sample configuration files in the `Setup` directory:

- `odbc.ini`
- `odbcinst.ini`
- `mapr.impalaodbc.ini`

The sample files appear in the directory listings by default because the filenames do not begin with a `(.)`. Filenames that begin with a `(.)` are hidden. If the default location is used for `odbc.ini` and `odbcinst.ini`, filenames must begin with a period `(.)`. For `mapr.impalaodbc.ini`, the filename must begin with a `(.)` and must reside in the user's home directory.

If the configuration files do not already exist in the home directory, you can copy the sample configuration files to that directory and rename them. If the configuration files already exist in the home directory, use the sample configuration files as a guide for modifying the existing configuration files.

Step 1: Configure the Environment

By default, the configuration files reside in the user's home directory. However, the `ODBCINI`, `ODBCSYSINI`, and `SIMBAINI` environment variables can be used to specify different locations for the `odbc.ini`, `odbcinst.ini`, and `mapr.impalaodbc.ini` configuration files. Set `ODBCINI` to point to your `odbc.ini` file.

Set ODBC_SYSINI to point to the directory containing the odbcinst.ini file. Set SIMBAINI to point to your mapr.impalaodbc.ini file. For example, if your odbc.ini and mapr.impalaodbc.ini files are located in /etc and your odbcinst.ini file is located in /usr/local/odbc, then set the environment variables as follows:

- `export ODBCINI=/etc/odbc.ini`
- `export ODBC_SYSINI=/usr/local/odbc`
- `export SIMBAINI=/etc/mapr.impalaodbc.ini`

The following search order is used to locate the mapr.impalaodbc.ini file:

1. If the SIMBAINI environment variable is defined, then the driver searches for the file specified by the environment variable.
Important: SIMBAINI must contain the full path, including the filename.
2. The current working directory of the application is searched for a file named mapr.impalaodbc.ini **not** beginning with a period.
3. The directory ~/ (that is, \$HOME) is searched for a hidden file named .mapr.impalaodbc.ini.
4. The directory /etc is searched for a file named mapr.impalaodbc.ini **not** beginning with a period.

Step 2: Configure the odbc.ini File

Define the ODBC data sources in the odbc.ini configuration file. This file is divided into the following optional and required sections:

- (Optional) [ODBC]. Controls global ODBC configuration.
- (Required) [ODBC Data Sources]. Lists DSNs and associates them with a driver.
- (Required) A section with the same name as the data source specified in the [ODBC Data Sources] section. This is required to configure the data source.

Example odbc.ini sample file for Linux

```
[ODBC Data Sources]
Sample MapR Impala DSN 32=MapR Impala ODBC Driver 32-bit

[Sample MapR Impala DSN 32]
Driver=/opt/mapr/impalaodbc/lib/32/libmaprimpalaodbc32.so
HOST=MyImpalaServer
PORT=21050
```

Example odbc.ini file for Mac OS X

```
[ODBC Data Sources]
Sample MapR Impala DSN=MapR Impala ODBC Driver

[Sample MapR Impala DSN]
Driver=/opt/mapr/impalaodbc/lib/universal/libmaprimpalaodbc.dylib
HOST=MyImpalaServer
PORT=21050
```

Create a Data Source

To create a data source, complete the following steps:

1. Open the .odbc.ini configuration file in a text editor.
2. Add a new entry to the [ODBC Data Sources] section. Type the data source name (DSN) and the driver name.
3. To set configuration options, add a new section having a name matching the data source name (DSN) you specified in step 2. Specify configuration options as key-value pairs.
4. Save the .odbc.ini configuration file.

Refer to [Driver Configuration Options for Linux and Mac OS X](#) for available configuration options that control DSN behavior.

Step 3: Configure the odbcinst.ini File

The odbcinst.ini is an optional configuration file that defines the ODBC Drivers. This configuration file is optional because you can specify drivers directly in the odbc.ini configuration file. The odbcinst.ini file is divided into the following sections:

- [ODBC Drivers] lists the names of all the installed ODBC drivers.
- A section having the same name as the driver name specified in the [ODBC Drivers] section lists driver attributes and values.

Example odbcinst.ini sample file for Linux

```
[ODBC Drivers]
MapR Impala ODBC Driver 32-bit=Installed
MapR Impala ODBC Driver 64-bit=Installed

[MapR Impala ODBC Driver 32-bit]
Description= MapR Impala ODBC Driver (32-bit)
Driver=/opt/mapr/impalaodbc/lib/32/libmaprimpalaodbc32.so

[MapR Impala ODBC Driver 64-bit]
Description=MapR Impala ODBC Driver (64-bit)
Driver=/opt/mapr/impalaodbc/lib/64/libmaprimpalaodbc64.so
```

Example odbcinst.ini file for Mac OS X

```
[ODBC Drivers]
MapR Impala ODBC Driver=Installed

[MapR Impala ODBC Driver]
Description=MapR Impala ODBC Driver
Driver=/opt/mapr/impalaodbc/lib/universal/libmaprimpalaodbc.dylib
```

Define a Driver

To define a driver, complete the following steps:

1. Open the .odbcinst.ini configuration file in a text editor.
2. Add a new entry to the [ODBC Drivers] section. Type the driver name, and then type =Installed. Assign the driver name as the value of the Driver attribute in the data source definition instead of the driver shared library name.
3. In .odbcinst.ini, add a new section having a name matching the driver name you typed in step 2, and add configuration options to the section based on the sample odbcinst.ini file provided with MapR Impala ODBC Driver for Impala in the Setup directory. Specify configuration options as key-value pairs.
4. Save the .odbcinst.ini configuration file.

Step 4: Configure the mapr.impalaodbc.ini File

Configure the MapR Impala ODBC Driver to work with your ODBC driver manager.

To configure mapr.impalaodbc.ini, complete the following steps:

1. Open the .mapr.impalaodbc.ini configuration file in a text editor.
2. Edit the DriverManagerEncoding setting. The value is typically UTF-16 or UTF-32, but depends on the driver manager used. iODBC uses UTF-32 and unixODBC uses UTF-16. Review your ODBC Driver Manager documentation for the correct setting.
3. Edit the ODBCInstLib setting. The value is the name of the ODBCInst shared library for the ODBC driver manager you use. The configuration file defaults to the shared library for iODBC. In Linux, the shared library name for iODBC is libiodbcinst.so. In Mac OS X, the shared library name for iODBC is libiodbcinst.dylib.

Note: Review your ODBC Driver Manager documentation for the correct setting. Specify an absolute or relative filename for the library. If you use the relative filename, include the path to the library in the library path environment variable. In Linux, the library path environment variable is LD_LIBRARY_PATH. In Mac OS X, the library path environment variable is DYLD_LIBRARY_PATH.

4. Save the .mapr.impalaodbc.ini configuration file.

Step 5: Configure Authentication

The Impala server supports multiple authentication mechanisms. You must determine the authentication type your server is using and configure your DSN accordingly. The following table provides the authentication methods available with configuration instructions:

Note: For details on the keys involved in configuring authentication, see [Driver Configuration Options for Linux and Mac OS X](#).

| Method | Configuration |
|-------------------|---|
| No Authentication | For this authentication mechanism, you do not need to configure any additional settings. To configure your DSN for connections that do not require authentication, set the AuthMech configuration key for the DSN to 0. |

| | |
|------------------------|---|
| Kerberos | <p>For information on operating Kerberos, refer to the documentation for your operating system.</p> <p>To configure your DSN to use Kerberos authentication, complete the following steps:</p> <ol style="list-style-type: none"> 1. Set the AuthMech configuration key for the DSN to 1 2. If your Kerberos setup does not define a default realm or if the realm of your Impala server is not the default, then set the appropriate realm using the KrbRealm key. 3. Set the KrbFQDN key to the fully qualified domain name of the Impala host. 4. Set the KrbServiceName key to the service name of the Impala server. <p>For example, if the principle for the Impala server is <code>impala/fully.qualified.domain.name@your-realm.com</code>, then the value in the service name field is <code>impala</code>. If you are unsure of the correct service name to use for your particular Hadoop deployment, contact your Hadoop administrator.</p> |
| User Name | <p>This authentication mechanism requires a user name but does not require a password. The user name labels the session, facilitating database tracking.</p> <p>To configure your DSN to use User Name authentication, complete the following steps:</p> <ol style="list-style-type: none"> 1. Set the AuthMech configuration key for the DSN to 2. 2. Set the UID key to a user name that is recognized by the Impala server. |
| User Name and Password | <p>This authentication mechanism requires a user name and a password.</p> <p>Note: This authentication mechanism should not be used with an Impala configuration that does not have LDAP enabled.</p> <p>To configure your DSN to use User Name and Password authentication, complete the following steps:</p> <ol style="list-style-type: none"> 1. Set the AuthMech configuration key for the DSN to 3. 2. Set the UID key to a user name that is recognized by the Impala server. 3. Set the PWD key to the password corresponding to the user name you provided in step 2. |

| | |
|------------------------------|--|
| User Name and Password (SSL) | <p>This authentication mechanism uses SSL and requires a user name and a password. The driver accepts self-signed SSL certificates.</p> <p>Note: This authentication mechanism should not be used with an Impala configuration that does not have LDAP enabled.</p> <p>To configure your DSN to use User Name and Password (SSL) authentication, complete the following steps:</p> <ol style="list-style-type: none"> 1. Set the AuthMech configuration key for the DSN to 4. 2. Set the UID key to a user name that is recognized by the Impala server. 3. Set the PWD key to the password corresponding to the user name you provided in step 2. 4. Optionally, configure the driver to allow a mismatch between the common name of a CA-issued certificate and the host name of the Impala server by setting the CAIssuedCertNamesMismatch key to 1. <p>Note: For self-signed certificates, the driver always allows the common name of the certificate to mismatch the host name. For more details, see Driver Configuration Options for Linux and Mac OS X.</p> <p>Optionally, configure the driver to load SSL certificates from a specific file by setting the TrustedCerts configuration key to the path of the file.</p> <p>Note: By default, the driver uses the trusted CA certificates PEM file that is installed with the driver. For more details, see Driver Configuration Options for Linux and Mac OS X.</p> |
| No Authentication (SSL) | <p>This authentication mechanism uses SSL but does not require a user name or a password. The driver accepts self-signed SSL certificates.</p> <p>To configure your DSN to use No Authentication (SSL) authentication, complete the following steps:</p> <ol style="list-style-type: none"> 1. Set the AuthMech configuration key for the DSN to 5. 2. Optionally, configure the driver to allow a mismatch between the common name of a CA-issued certificate and the host name of the Impala server by setting the CAIssuedCertNamesMismatch key to 1. <p>Note: For self-signed certificates, the driver always allows the common name of the certificate to mismatch the host name. For more details, see Driver Configuration Options for Linux and Mac OS X.</p> <p>Optionally, configure the driver to load SSL certificates from a specific file by setting the TrustedCerts configuration key to the path of the file.</p> <p>Note: By default, the driver uses the trusted CA certificate PEM file that is installed with the driver. For more details, see Driver Configuration Options for Linux and Mac OS X.</p> |

Driver Configuration Options for Linux and Mac OS X

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

The configuration options that you can use to control the behavior of the ODBC Driver for Impala are listed and described in the table below.

Note: You can set configuration options in your `odbc.ini` and `mapr.impalaodbc.ini` files. Configuration options set in the `mapr.impalaodbc.ini` file apply to all connections, whereas configuration options set in an `odbc.ini` file are specific to a connection. Configuration options set in `odbc.ini` take precedence over configuration options set in `mapr.impalaodbc.ini`.

| Key | Default Value | Default |
|---------------------------|---------------|---|
| AuthMech | 0 | You can use the following authentication mechanism values: <ul style="list-style-type: none"> • 0 – No Authentication • 1 – Kerberos • 2 – User Name • 3 – User Name and Password • 4 – User Name and Password (SSL) • 5 – No Authentication (SSL) |
| CAIssuedCertNamesMismatch | 0 | Whether to allow the common name of a CA-issued SSL certificate to mismatch the host name of the Impala server. The following values are possible: <ul style="list-style-type: none"> • 0 – Do not allow the names to mismatch. • 1 – Allow the names to mismatch. <p>Note: This setting is only applicable to the User Name and Password (SSL) and No Authentication (SSL) authentication mechanisms. It is ignored by other authentication mechanisms.</p> |
| Driver | | The location of the ODBC Driver for Impala shared object file. |
| HOST | | The IP address or hostname of the Impala server. |
| KrbFQDN | | The fully qualified domain name of the Impala host used. |
| KrbRealm | | If there is no default realm configured or if the realm of the Impala host is different from the default realm for your Kerberos setup, use this option to define the realm of the Impala host. |
| KrbServiceName | | The Kerberos service principal name of the Impala server. |
| PORT | 10000 | The listening port for the service. |

| | | |
|-----------------------|---|---|
| PWD | | The password of a user account on the host that is running Impala. PWD is required if AuthMech is set to User Name and Password or User Name and Password (SSL). |
| RowsFetchedPerBlock | 10000 | The maximum number of rows that a query returns at a time. Any positive 32-bit integer is a valid value, but testing has shown that performance gains are marginal beyond the default value of 10000 rows. |
| SocketTimeout | 0 | The number of seconds after which Impala closes the connection with the client application if the connection is idle. |
| TrustedCerts | <p>For 32 bit driver:</p> <pre>/opt/mapr/ impalaodbc/lib/32/ cacerts.pem</pre> <p>For 64 bit driver:</p> <pre>/opt/mapr/ impalaodbc/lib/64/ cacerts.pem</pre> | <p>Used to specify the location of the file containing trusted CA certificates for authenticating the Impala server when using SSL.</p> <p>If this setting is not set, then the driver defaults to using the trusted CA certificates file installed by the driver.</p> <p>Note: This setting is only applicable to User Name and Password (SSL) and No Authentication (SSL) authentication mechanisms, and it is ignored by other authentication mechanisms.</p> |
| TSaslTransportBufSize | 1000 | <p>The number of bytes to reserve in memory for buffering unencrypted data from the network.</p> <p>Note: In most circumstances, the default value of 1000 bytes is optimal.</p> |
| UID | anonymous | The user name of an existing account on the host that is running Impala. UID is required if AuthMech is set to User Name and Password or User Name and Password (SSL). UID is optional if AuthMech is set to User Name. |

| | | |
|----------------|---|---|
| UseNativeQuery | 0 | <p>By default, the driver transforms the queries emitted by an application to convert the queries into an equivalent form in Impala SQL. Use this option to specify whether or not the driver transforms queries. The following values are possible:</p> <ul style="list-style-type: none"> • 0 – Transform the queries into Impala SQL. • 1 – Do not transform the queries (use the native query instead). <p>Note: If the application is Impala-aware and already emits Impala SQL, then set this option to 1 to avoid the extra overhead of query transformation.</p> |
|----------------|---|---|

Impala-Shell Commands

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

You can specify `impala-shell` options from the command line or in the `$HOME/.impalarc` configuration file. You can define a set of default options for your `impala-shell` environment in the `$HOME/.impalarc` configuration file. For every command line option, there is an equivalent setting in the `$HOME/.impalarc` configuration file. Options specified from the `impala-shell` command line override corresponding options in the configuration file.

The configuration file must contain the header label `[impala]`, followed by the options specific to the `impala-shell`. This is a standard convention for configuration files that enables a single file to hold configuration options for multiple applications. To specify a different file name or path for the configuration file, specify the argument `--config_file=path_to_config_file` from the command line.

Impala-Shell Commands

After you connect to an instance of `impalad` from the `impala-shell`, you can issue certain commands from within the shell. Enter a command at the prompt or use the `-q` option to pass it as an argument. The `impala-shell` passes most of the commands to `impalad` as SQL statements.

| Command | Description |
|---------------|---|
| alter | Changes table schema in an Impala table, or a table shared between Impala and Hive. |
| compute stats | Gathers critical, statistical information about each table when you enable join optimizations. |
| connect | Connects <code>impala-shell</code> to a specific instance of <code>impalad</code> . The default port is 21000 unless modified. You can connect to any host in your cluster running <code>impalad</code> . If you connect to an instance of <code>impalad</code> that was started with an alternate port specified by the <code>--fe_port</code> flag, provide the alternate port. |
| describe | Shows the columns, column data types, and column comments for the table specified. <code>DESCRIBE FORMATTED</code> shows additional information, such as the filesystem data directory, partitions, and internal table properties. You can use <code>desc</code> as an abbreviated alternative for <code>describe</code> . |

| | |
|---------------------|---|
| drop | Removes a schema object and its associated data files. |
| explain | Provides the query execution plan and represents a query as a series of steps. |
| help | Provides a list of available commands and options. |
| history | Maintains an enumerated cross-session command history. The history is stored in ~/.impalahistory. |
| insert | Writes query results to the table specified. Overwrites table data or appends data to the existing table content. |
| invalidate metadata | Updates impalad metadata. Use this command after creating, dropping, or altering databases, tables, or partitions in Hive. |
| profile | Displays low-level information about the most recent query. Used for performance diagnosis and tuning. |
| quit | Exits the shell. Include the final semicolon to ensure that the shell recognizes the end of the command. |
| refresh | Refreshes impalad metadata. Issue the REFRESH command to refresh metadata after you make database changes, such as adding or removing a table. |
| select | Specifies the data set to complete an action upon. You can send the information returned from select to an output, such as the console or a file. You can also use it to complete another query element. |
| set | Manages query options for an impala-shell session. Issue query options to Impala using the SET command. Issue SET without arguments to see display a current list query options. Use these options for query tuning and troubleshooting. SET has been promoted to an SQL statement and can be used in client applications through the JDBC and ODBC APIs. To modify option values, issue commands with the syntax SET option=value. To restore an option to its default, use the UNSET command. Some options take Boolean values of true and false. Others take numeric arguments, or quoted string values. |
| shell | Executes commands specified in the operating system shell without exiting impala-shell. Use ! as an abbreviation for the shell command. |
| show | Displays metastore data for schema objects created and accessed through Impala and Hive. Use show to gather information about databases or tables. |
| summary | Summarizes the work performed in various stages of a query. It provides a high-level view of the information displayed by the EXPLAIN command. |
| unset | Removes user-specified values for a query option and returns the option to its default value. |
| use | Indicates the database against which to run subsequent commands. Avoid using fully qualified names when referring to tables in databases other than default. Do not use with the -q option. |
| version | Returns Impala version information. |

Impala-Shell Command Line Options

Specify the command-line options to change how shell commands run when you start the `impala-shell`. These options do not apply to `impalad` configuration.

| Option | Configuration File Setting | Description |
|--|--|--|
| <code>-B</code> or <code>--delimited</code> | <code>write_delimited=true</code> | Prints query results in plain text format. Specify the delimiter character with the <code>--output_delimiter</code> option. Store query results in a file instead of printing to the screen with the <code>-B</code> option. |
| <code>--print_header</code> | <code>print_header=true</code> | Prints a header. |
| <code>-o filename</code> or <code>--output_file filename</code> | <code>output_file=filename</code> | Stores all query results in the file specified. |
| <code>--output_delimiter=delimiter_character</code> | <code>output_delimiter=character</code> | Defaults to tab (<code>'\t'</code>), and specifies the character to use as a delimiter between fields when query results are printed in plain text format by the <code>-B</code> option. |
| <code>-p</code> or <code>--show_profiles</code> | <code>show_profiles=true</code> | Displays the query execution plan. Provides the same output as the <code>EXPLAIN</code> statement with a detailed itemization of execution steps, for every query executed by the shell. |
| <code>-h</code> or <code>--help</code> | N/A | Displays help information. |
| <code>-i hostname</code> or <code>--impalad=hostname</code> | <code>impalad=hostname[:portnum]</code> | Connects to <code>impalad</code> on the host specified. The default port of 21000 is assumed unless you provide another value. If you connect to an instance of <code>impalad</code> that was started with an alternate port specified by the <code>--fe_port</code> flag, provide that port. |
| <code>-q query</code> or <code>--query=query</code> | <code>query=query</code> | <p>Passes a query or shell command from the command line. The shell immediately exits after processing the statement. You can use the following statements with the command:</p> <ul style="list-style-type: none"> • <code>SELECT</code> • <code>CREATE TABLE</code> • <code>SHOW TABLES</code> • Any other statement recognized in <code>impala-shell</code> <p>Fully qualify the names for tables outside the default database. You can also issue the <code>-f</code> option to pass a file with a <code>USE</code> statement followed by other queries.</p> |
| <code>-f query_file</code> or <code>--query_file=query_file</code> | <code>query_file=path_to_query_file</code> | Passes a SQL query from a file. The file must be semicolon (<code>;</code>) delimited. |

| | | |
|--|---|---|
| -k or --kerberos | use_kerberos=true | Uses Kerberos authentication when the shell connects to <code>impalad</code> . If Kerberos is not enabled on the <code>impalad</code> instance, an error displays. |
| -s <code>kerberos_service_name</code> or --kerberos_service_name= <code>name</code> | kerberos_service_name= <code>name</code> | Instructs the <code>impala-shell</code> to authenticate to a particular <code>impalad</code> service principal. If a <code>kerberos_service_name</code> is not specified, <code>impala</code> is used by default. Using this option in conjunction with a connection in which Kerberos is not supported returns errors. |
| -V or --verbose | verbose=true | Enables verbose output. |
| --quiet | verbose=false | Disables verbose output. |
| -v or --version | version=true | Displays version information. |
| -c | ignore_query_failure=true | Continues on query failure. |
| -r or --refresh_after_connect | refresh_after_connect=true | Refreshes Impala metadata upon connection. Equivalent to running the REFRESH statement after connecting. |
| -d <code>default_db</code> or --database= <code>default_db</code> | default_db= <code>default_db</code> | Specifies the database to use on startup. Equivalent to running the USE statement after connecting. If you do not specify a name, a database named <code>default</code> is used. |
| -ssl | ssl=true | Enables SSL for <code>impala-shell</code> . Default: <code>ssl=true</code> |
| --ca_cert= <code>path_to_certificate</code> | ca_cert= <code>path_to_certificate</code> | The local pathname that points to the third-party CA certificate or a copy of the server certificate for self-signed server certificates. If <code>--ca_cert</code> is not set, <code>impala-shell</code> enables SSL, but does not validate the server certificate. This is useful for connecting to a known-good Impala that is only running over SSL, when a copy of the certificate is not available (such as when debugging customer installations). |
| -l | use_ldap=true | Enables LDAP authentication. |
| -u | user= <code>user_name</code> | Sets the user. The <code>impala-shell</code> prompts you for the password. Per Active Directory, the user is the short username, not the full LDAP distinguished name. |
| --config_file= <code>path_to_config_file</code> | N/A | Specifies the path to the file that contains the <code>impala-shell</code> configuration settings. The default path is <code>\$HOME/.impalarc</code> . You can only specify this setting on the command line. |

**Note:**

The `--strict_unicode` option no longer exists. To avoid problems with Unicode values in `impala-shell`, define the following setting before running `impala-shell`:

```
export LC_CTYPE=en_US.UTF-8
```

Impala Built-In Functions

Important: This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

You can use built-in functions to transform data directly in `SELECT` statements to avoid post processing in another application. Built-in functions allow an SQL query to return result sets with formatting, calculating, and type conversions already applied.

Impala supports the following categories of functions:

- Aggregation Functions
- Type Conversion Functions
- Mathematical Functions
- Date and Time Functions
- String Functions
- Conditional Functions
- Bit Manipulation Functions
- Analytic Window Functions
- Miscellaneous Functions

The following table provides a few rules that apply to built-in functions:

| Rule | Example |
|---|--|
| <p>Call functions through the <code>SELECT</code> statement.</p> <p>You can omit the <code>FROM</code> clause in most functions.</p> <p>Supply literal values for any required arguments.</p> | <pre>select abs(-1);</pre> <pre>select concat('The sly ', 'brown fox');</pre> <pre>select power(2,5);</pre> |
| <p>When you include a <code>FROM</code> clause and specify a column name as a function argument, the function is applied to each item in the result set.</p> | <pre>select concat('State = ',state_code) from all_states where population > 20000000;</pre> <pre>select round(price) as dollar_value from product_directory where price between 400.0 and 500.0;</pre> |

| | |
|---|--|
| <p>If an argument to a built-in function is NULL, the result value NULL.</p> | <pre>select cos(null);</pre> <pre>select power(2,null);</pre> <pre>select concat('a',null,'b');</pre> |
| <p>Aggregate functions require a FROM clause in the query. They calculate a return value across all items in a result set.</p> <p>Aggregate functions ignore NULL values rather than returning a NULL result.</p> | <pre>select count(customer_id) from customer_directory;</pre> <pre>select max(weight), avg(weight) from census_data where age > 40;</pre> |

The following sections list the available functions:

Aggregation Functions

You can use the following aggregation functions:

- APPX_MEDIAN()
- AVG()
- COUNT()
- MAX()
- MIN()
- NDV()
- STDDEV()
- STDDEV_SAMP()
- STDDEV_POP()
- SUM()
- VARIANCE()
- VARIANCE_SAMP()
- VARIANCE_POP()

Type Conversion Functions

Use conversion functions in combination with other functions to explicitly pass the expected data types.

CAST

Use CAST when passing a column value or literal to a function that expects a parameter with a different type.

Syntax

```
cast(expr as type)
```

TYPEOF

Example

```
select concat('Here are the first
',10,' results. '); -- Fails
select concat('Here are the first
',cast(10 as string),' results. '); --
Succeeds
```

Available as of Impala 2.5.0. Use `typeof` to return the name of the data type corresponding to an expression. For types with extra attributes, such as length for CHAR and VARCHAR, or precision and scale for DECIMAL, includes the full specification of the type.

Syntax

```
typeof(type value)
```

Examples

```
select typeof(2);
select typeof('xyz');
select typeof(5.30001 / 2342.1);
```

The examples above return tinyint, string, and DECIMAL(13,11) respectively.

Mathematical Functions

The following functions were added in Impala 2.5.0:

- `dceil(double a)`, `dceil(decimal(p,s) a)`
- `dexp(double a)`
- `dfloor(double a)`, `dfloor(decimal(p,s) a)`
- `dlog10(double a)`
- `dpow(double a, double p)`, `fpow(double a, double p)`
- `dround(double a)`, `dround(double a, int d)`, `dround(decimal(p,s) a, int_type d)`
- `dsqrt(double a)`
- `dtrunc(double_or_decimal a[, digits_to_leave])`
- `factorial(integer_type a)`
- `radians(double a)`
- `random()`, `random(int seed)`

The following table lists the mathematical functions with their descriptions and return types:

| Function | Description | Return type |
|----------------------------|---|-------------|
| <code>abs(double a)</code> | Ensures all return values are positive. Returns the absolute value of the argument. | double |

| | | |
|--|--|--|
| acos(double a) | Returns the arccosine of the argument. | double |
| asin(double a) | Returns the arcsine of the argument. | double |
| bin(bigint a) | Returns the binary representation of an integer value. | string |
| ceil(double a), ceiling(double a), dceil(double a), dceil(decimal(p,s) a) | Returns the smallest integer > or = to the argument. | int or decimal(p,s) depending on the type of the input argument |
| conv(bigint num, int from_base, int to_base), conv(string num, int from_base, int to_base) | Returns a string representation of an integer value in a particular base. The input value can be a string. To use the return value as a number, use CAST() to convert to the appropriate type. | string |
| cos(double a) | Returns the cosine of the argument. | double |
| cot(double a) | Returns the cotangent of the argument. | double |
| degrees(double a) | Converts the argument value from radians to degrees. | double |
| e() | Returns the mathematical constant e. | double |
| exp(double a), dexp(double a) | Returns the mathematical constant e raised to the power of the argument. | double |
| factorial(integer_type a) | Computes the factorial of an integer value. It works with any integer type. You can use either the factorial() function or the ! operator. The factorial of 0 is 1. Likewise, the factorial() function returns 1 for any negative value. The maximum positive value for the input argument is 20; a value of 21 or greater overflows the range for a BIGINT and causes an error. | bigint |
| floor(double a), dfloor(double a), dfloor(decimal(p,s) a) | Returns the largest integer that is less than or equal to the argument. | int, bigint, or decimal(p,s) depending on the type of the input argument |
| fnv_hash(type v) | Returns a consistent 64-bit value, derived from the input argument. Use for implementing hashing logic in an application. | bigint |
| greatest() | Returns the largest value from a list of expressions. | The return type is the same as the initial argument value. Integer values are promoted to BIGINT. Floating-point values are promoted to DOUBLE. Use CAST() when inserting into a smaller numeric column. |
| hex(bigint a), hex(string a) | Returns the hexadecimal representation of an integer value, or of the characters in a string. | string |
| is_inf(double a) | Tests whether a value is equal to the special value "inf", signifying infinity. | boolean |

| | | |
|--|---|--|
| is_nan(double a) | Tests whether a value is equal to the special value "NaN", signifying "not a number". | boolean |
| least() | Returns the smallest value from a list of expressions. | The return type is the same as the initial argument value. Integer values are promoted to BIGINT. Floating-point values are promoted to DOUBLE. Use CAST() when inserting into a smaller numeric column. |
| ln(double a) | Returns the natural logarithm of the argument. | double |
| log(double base, double a) | Returns the logarithm of the second argument to the specified base. | double |
| log10(double a), dlog10(double a) | Returns the logarithm of the argument to the base 10. | double |
| log2(double a) | Returns the logarithm of the argument to the base 2. | double |
| mod() | This function returns the modulus of a number. MOD is equivalent to using the % arithmetic operator. It works with any size integer type, any size floating-point type, and DECIMAL with any precision and scale. | Same as the input value |
| negative(int a), negative(double a) | Returns the argument with the sign reversed; returns a positive value if the argument was already negative. If return values must be negative, use -abs(a) instead. | int or double |
| max_int(),min_smallint() | Checks whether data values are in an expected range. You might be able to switch a column to a smaller type to save memory during processing. | The same as the integral type being checked. |
| pi() | Returns the constant pi. | double |
| pmod(int a, int b), pmod(double a, double b) | Purpose: Returns the positive modulus of a number. | int or double |
| positive(int a), positive(double a) | Returns the original argument; applies to negative arguments also. If return values must be positive, use abs(). | int or double |
| pow(double a, double p), power(double a, double p), dpow(double a, double p), fpow(double a, double p) | Returns the first argument raised to the power of the second argument. | double |
| quotient(int numerator, int denominator) | Returns the first argument divided by the second argument and discards any fractional part. Avoids promoting arguments to DOUBLE as happens with the / SQL operator. | int |
| radians(double a) | Converts argument value from degrees to radians. | double |

| | | |
|--|--|---|
| rand(), rand(int seed), random(), random(int seed) | Returns a random value between 0 and 1. After rand() is called with a seed argument, produces a consistent random sequence based on the seed value. Currently, the random sequence is reset after each query, and multiple calls to rand() within the same query return the same value each time. For different number sequences that are different for each query, pass a unique seed value to each call to rand(). For example, select rand(unix_timestamp()) from ... | double |
| round(double a), round(double a, int d), dround(double a), dround(double a, int d), dround(decimal(p,s) a, int_type d) | Rounds a floating-point value. By default (with a single argument), rounds to the nearest integer. Values ending in .5 are rounded up for positive numbers, down for negative numbers. The second argument is optional and specifies how many digits to leave after the decimal point. Values greater than zero produce a floating-point return value rounded to the requested number of digits to the right of the decimal point. | bigint for single and double argument; double for two-argument signature when second argument is greater than zero; for DECIMAL values, the smallest DECIMAL(p,s) type with appropriate precision and scale |
| sign(double a) | Returns -1, 0, or 1 to indicate the sign of the argument value. | int |
| sin(double a) | Returns the sine of the argument. | double |
| sqrt(double a), dsqrt(double a) | Returns the square root of the argument. | double |
| tan(double a) | Returns the tangent of the argument. | double |
| truncate(double_or_decimal a[, digits_to_leave]), dtrunc(double_or_decimal a[, digits_to_leave]) | Removes some or all fractional digits from a numeric value. With no argument, removes all fractional digits, leaving an integer value. The optional argument specifies the number of fractional digits to include in the return value, and only applies with the argument type is DECIMAL. truncate() and dtrunc() are aliases for the same function. | decimal for DECIMAL arguments; bigint for DOUBLE arguments |
| unhex(string a) | Returns a string of characters with ASCII values corresponding to pairs of hexadecimal digits in the argument. | string |

Date and Time Functions

TIMESTAMP is the underlying datatype for data and time data. Functions that extract a single field, such as hour() or minute(), typically return an integer value. Functions that format the date portion, such as date_add() or to_date(), typically return a string value.

The following table lists the date and time functions with their descriptions and return types:

| Function | Description | Return Type |
|--------------|---|-------------|
| add_months() | Alias for the existing MONTHS_ADD() function. | timestamp |

| | | |
|--|--|-----------|
| date_add(string startdate, int days) | Adds a specified number of days to a date represented as a string. | string |
| date_part() | A new date and time function, similar to EXTRACT(), but with the order of the arguments reversed. You can also call the EXTRACT() function using the SQL-99 syntax, EXTRACT(<i>unit</i> FROM <i>timestamp</i>). These enhancements simplify the porting process for date-related code from other systems. | int |
| date_sub(string startdate, int days) | Subtracts a specified number of days from a date represented as a string. | string |
| datediff(string enddate, string startdate) | Returns the number of days between two dates represented as strings. | int |
| day(string date), dayofmonth(string date) | Returns the day field from a date represented as a string. | int |
| dayname(string date) | Returns the day field from a date represented as a string, converted to the string corresponding to that day name. The range of return values is 'Sunday' to 'Saturday'. Use in report-generating queries, instead of calling dayofweek() and turning that numeric return value into a string using a CASE expression. | string |
| dayofweek(string date) | Returns the day field from a date represented as a string, corresponding to the day of the week. The range of return values is 1 (Sunday) to 7 (Saturday). | int |
| extract() | Returns one date or time field from a TIMESTAMP value. | timestamp |
| from_unixtime(bigint unixtime[, string format]) | Converts the number of seconds from the Unix epoch to the specified time into a string. | string |
| from_utc_timestamp(timestamp, string timezone) | Converts a specified UTC timestamp value into the appropriate value for a specified time zone. | timestamp |
| hour(string date) | Returns the hour field from a date represented as a string. | int |
| int_months_between(timestamp newer, timestamp older) | Available as of Impala 2.5.0. Returns the number of months between the date portions of two TIMESTAMP values, as an INT representing only the full months that passed. | int |
| minute(string date) | Returns the minute field from a date represented as a string. | int |
| month(string date) | Returns the month field from a date represented as a string. | int |

| | | |
|--|--|--------------------------------|
| months_between(timestamp newer, timestamp older) | Available as of Impala 2.5.0. Returns the number of months between the date portions of two TIMESTAMP values. Can include a fractional part representing extra days in addition to the full months between the dates. The fractional component is computed by dividing the difference in days by 31 (regardless of the month). | double |
| now() | Returns the current date and time (in the UTC time zone) as a timestamp value. | timestamp |
| second(string date) | Returns the second field from a date represented as a string. | int |
| timeofday() | Available as of Impala 2.5.0. Returns a string representation of the current date and time, according to the time of the local system, including any time zone designation. | string |
| timestamp_cmp(timestamp t1, timestamp t2) | Available as of Impala 2.5.0. Tests if one TIMESTAMP value is newer than, older than, or identical to another TIMESTAMP | int (either -1, 0, 1, or NULL) |
| to_date(string timestamp) | Returns the date field from a timestamp represented as a string. | string |
| to_utc_timestamp(timestamp, string timezone) | Converts a specified timestamp value in a specified time zone into the corresponding value for the UTC time zone. | timestamp |
| trunc() | Truncates date/time values to a particular granularity, such as year, month, day, hour, and so on. | |
| unix_timestamp(), unix_timestamp(string date), unix_timestamp(string date, string pattern) | Returns a timestamp representing the current date and time, or converts from a specified date and time value represented as a string. | bigint |
| weekofyear(string date) | Returns the corresponding week (1-53) from a date represented as a string. | int |
| year(string date) | Returns the year field from a date represented as a string. | int |

String Functions

The following table lists the string functions with their descriptions and return types:

| Function | Description | Return Type |
|-------------------|--|-------------|
| ascii(string str) | Returns the numeric ASCII code of the first character of the argument. | int |

| | | |
|---|---|--------|
| <code>btrim(string a), btrim(string a, string chars_to_trim)</code> | Available as of Impala 2.5.0. Removes all instances of one or more characters from the start and end of a STRING value. By default, removes only spaces. If a non-NULL optional second argument is specified, the function removes all occurrences of characters in that second argument from the beginning and end of the string. | string |
| <code>chr(int character_code)</code> | Available as of Impala 2.5.0. Returns a character specified by a decimal code point value. The interpretation and display of the resulting character depends on your system locale. Because consistent processing of Impala string values is only guaranteed for values within the ASCII range, only use this function for values corresponding to ASCII characters. In particular, parameter values greater than 255 return an empty string. | string |
| <code>concat(string a, string b...)</code> | Returns a single string representing all the argument values joined together. | string |
| <code>concat_ws(string sep, string a, string b...)</code> | Returns a single string representing the second and following argument values joined together, delimited by a specified separator. | string |
| <code>find_in_set(string str, string strList)</code> | Returns the position (starting from 1) of the first occurrence of a specified string within a comma-separated string. Returns NULL if either argument is NULL, 0 if the search string is not found, or 0 if the search string contains a comma. | int |
| <code>initcap(string str)</code> | Returns the input string with the first letter capitalized. | string |
| <code>instr(string str, string substr)</code> | Returns the position (starting from 1) of the first occurrence of a substring within a longer string. | int |
| <code>length(string a)</code> | Returns the length in characters of the argument string. | int |
| <code>locate(string substr, string str[, int pos])</code> | Returns the position (starting from 1) of the first occurrence of a substring within a longer string, optionally after a particular position. | int |
| <code>lower(string a), lcase(string a)</code> | Returns the argument string converted to all-lowercase. | string |
| <code>lpad(string str, int len, string pad)</code> | Returns a string of a specified length, based on the first argument string. If the specified string is too short, it is padded on the left with a repeating sequence of the characters from the pad string. If the specified string is too long, it is truncated on the right. | string |

| | | |
|--|---|---------|
| <code>ltrim(string a)</code> | Returns the argument string with any leading spaces removed from the left side. | string |
| <code>parse_url(string urlString, string partToExtract [, string keyToExtract])</code> | Returns the portion of a URL corresponding to a specified part. The part argument can be 'PROTOCOL', 'HOST', 'PATH', 'REF', 'AUTHORITY', 'FILE', 'USERINFO', or 'QUERY'. Literal values must be uppercase. You can specify a key to retrieve only the associated value from the key-value pairs in the query string when you request the query portion of the URL. Useful for importing web logs. | string |
| <code>regexp_extract(string subject, string pattern, int index)</code> | Returns the specified () group from a string based on a regular expression pattern. | string |
| <code>regexp_like(string source, string pattern[, string options])</code> | Available as of Impala 2.5.0. Returns true or false to indicate whether the source string contains anywhere inside it the regular expression given by the pattern. The optional third argument consists of letter flags that change how the match is performed, such as i for case-insensitive matching. | boolean |
| <code>regexp_replace(string initial, string pattern, string replacement)</code> | Returns the initial argument with the regular expression pattern replaced by the final argument string. | string |
| <code>repeat(string str, int n)</code> | Returns the argument string repeated a specified number of times. | string |
| <code>reverse(string a)</code> | Purpose: Returns the argument string with characters in reversed order. | string |
| <code>rpad(string str, int len, string pad)</code> | Returns a string of a specified length, based on the first argument string. If the specified string is too short, it is padded on the right with a repeating sequence of the characters from the pad string. If the specified string is too long, it is truncated on the right. | string |
| <code>rtrim(string a)</code> | Returns the argument string with any trailing spaces removed from the right side. | string |
| <code>space(int n)</code> | Returns a concatenated string of the specified number of spaces. Shorthand for <code>repeat(' ',n)</code> . | string |
| <code>split_part(string source, string delimiter, bigint n)</code> | Available as of Impala 2.5.0. Returns the nth field within a delimited string. The fields are numbered starting from 1. The delimiter can consist of multiple characters, not just a single character. All matching of the delimiter is done exactly, not using any regular expression patterns. | string |

| | | |
|--|--|--------|
| substr(string a, int start [, int len]), substring(string a, int start [, int len]) | Returns the portion of the string starting at a specified point, optionally with a specified maximum length. The characters in the string are indexed starting at 1. | string |
| translate(string input, string from, string to) | Returns the input string with a set of characters replaced by another set of characters. | string |
| trim(string a) | Returns the input string with leading and trailing spaces removed. The same as passing the string through both ltrim() and rtrim(). | string |
| upper(string a), ucase(string a) | Returns the argument string converted to all-uppercase. | string |

Conditional Functions

Use the conditional functions to test equality, comparison operators, and nullity.

The following table lists the conditional functions with their descriptions and return types:

| Function | Description | Return Type |
|---|---|--|
| CASE a WHEN b THEN c [WHEN d THEN e]... [ELSE f] END | Compares an expression to one or more possible values, and returns a corresponding result when a match is found. | Same as the initial argument value |
| CASE WHEN a THEN b [WHEN c THEN d]... [ELSE e] END | Tests whether any of a sequence of expressions is true, and returns a corresponding result for the first true expression. | Same as the initial argument value |
| coalesce(type v1, type v2, ...) | Returns the first specified argument that is not NULL, or NULL if all arguments are NULL. | Same as the initial argument value |
| decode() | Compares an expression to one or more possible values and returns a corresponding result when a match is found. This function works as a shorthand for a CASE() expression and improves compatibility with SQL code containing vendor extensions. | Same as the initial argument value, except that integer values are promoted to BIGINT and floating-point values are promoted to DOUBLE; use CAST() when inserting into a smaller numeric column |
