| Option              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -n   --noinet       | <p>Use this option when you don't want <code>mapr-setup.sh</code> to fetch packages from the Internet. Instead of taking the files as an argument like <code>-a</code>, this option prompts you for a complete set of archive files (the order of the files is important):</p> <ul style="list-style-type: none"> <li>• Installer archive</li> <li>• Ezmeral Ecosystem Pack (EEP) archive</li> <li>• Core archive for the current release</li> </ul> <p> <b>Note:</b> Configure this option when the Installer node does not have access to the Internet or is behind a restricted VPN or firewall. If you use this option together with <code>-a</code>, <code>mapr-setup.sh</code> will ignore <code>-n</code>.</p> <p><b>Example:</b></p> <pre>./mapr-setup.sh -n</pre>  |
| -p   --port         | <p>This option specifies the <code>hostname:port</code> to use for installation-related communication between the Installer node and other nodes in the cluster. The Installer also adds the hostname provided as a default entry for the list of cluster nodes on the <i>Configure Nodes</i> page. Both the <code>hostname</code> and the <code>port</code> are not required when configuring this option; you can choose to configure one or both values.</p> <p> <b>Note:</b> Configure this option when the Installer node has multiple interfaces or hostnames and the result of <code>hostname</code> is not a value that other nodes in the cluster are able to communicate with.</p> <p><b>Example:</b></p> <pre>./mapr-setup.sh -p perfnode131.perf.lab:9441</pre> |
| -r   --repo         | <p>When the Installer packages are not located in the default repository, specify the top-level URL of the repository in which the Installer packages are located. The default URL is <a href="https://package.mapr.hpe.com/">https://package.mapr.hpe.com/</a>.</p> <p><b>Example:</b></p> <pre>./mapr-setup.sh -r http://myrepo.download.pkgs/mapr/releases/</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| -R   --new_repo_url | <p>Specify a new repository URL for both ecosystem and core components. Use this option only with the <code>reload</code> command:</p> <p><b>Example:</b></p> <pre>./mapr-setup.sh -R &lt;new_url&gt; reload</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| -v   --verbose      | <p>Use this option when you want additional information about the setup process.</p> <p><b>Example:</b></p> <pre>./mapr-setup.sh -v</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Option     | Description                                                                                                                                                                                                                                                                                                                                               |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -y   --yes | <p>Use this option to bypass the Installer's usual prompts and immediately proceed with the default options. This option produces the same installation result as going through the <code>mapr-setup.sh</code> script prompts and choosing all of the default options, but with increased speed.</p> <p><b>Example:</b></p> <pre>./mapr-setup.sh -y</pre> |

### Stopping mapr-setup.sh

If you need to stop `mapr-setup.sh` while it is running, press **Ctrl + C**. Depending on when you issue the **Ctrl + C** command, the script either stops or continues to execute until it is able to stop gracefully. You can run the script again or use the `remove` option, described earlier on this page, to remove the Installer and definition files and then rerun the script.

Another way to exit the script is to answer NO when the script prompts for a YES or NO reply. For example, when the script asks if you want to upgrade dependent packages, if you reply NO, the script exits.

### After Running mapr-setup.sh

To validate that the Installer started correctly, do one of the following:

- Log in to the Installer web interface using the cluster admin user name and password.
- Run the Installer Stanza `exportcommand` using the cluster admin user name and password.

If the Installer does not start up correctly, check the logs. See [Logs for the Installer](#) on page 5656.

If you want to change any parameter that you provided to `mapr-setup.sh` on a previous run (for example, the repository URL, the cluster admin user name, or another parameter), you can safely rerun `mapr-setup.sh` with the new parameters. Doing so updates the Installer configuration to use the new parameters. However, do not rerun `mapr-setup.sh` while an installation or a `probe` command is in progress.

### Installer Web Interface

When you run the Installer web interface, it performs the following tasks:

1. Displays the services and ecosystem components that you can install based on the software version that you select.
2. Provides the option to install Monitoring.
3. Guides you through node and cluster configuration.
4. Verifies that each node meets the node requirements.
5. Sets a default, configurable service layout across the nodes in the cluster based on the requirements of each service.
6. Installs or upgrades the software and associated operating-system dependencies.
7. If you chose to install a trial or community license, it will attempt to apply the license to your cluster.

## Installer Stanzas

Running `mapr-setup.sh` also installs Installer Stanzas. Stanzas give you a script-based tool to perform all the installation tasks you can perform using the Installer web interface. See [Installer Stanzas](#) on page 5706. In addition, Stanza commands make it possible to probe a cluster that was installed without using the Installer and use the `import` command to set up the installer database. See [Using probe and import to Generate the Installer Database](#) on page 5717.

## Installer Components

The Installer uses the following components to set up the installation environment:

| Name                          | Filename                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Configuration Script          | <code>mapr-setup.sh</code>                              | Script that configures a node to run the Installer. This includes setting up an Internet or local repository. The <code>mapr-setup.sh</code> script can also be used to create a Persistent Application Client Container (PACC) or a Installer Container. For more information, see <ul style="list-style-type: none"> <li>• <a href="#">Creating a PACC Image Using mapr-setup.sh</a> on page 361</li> </ul>                                                                                                                                                              |
| Installer Package             | <code>mapr-installer-&lt;version&gt;</code>             | Package that contains the Installer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Installer Definitions Package | <code>mapr-installer-definitions-&lt;version&gt;</code> | Package that contains the list of software versions, services, and ecosystem components that you can install with the Installer.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Service Packages              | various                                                 | If you use a remote repository, the Installer accesses the installation packages from <a href="https://package.mapr.hpe.com/">https://package.mapr.hpe.com/</a> .<br>If you use a local repository, the Installer accesses the installation packages from the local repository. The <code>mapr-setup.sh</code> script creates the local repository with the packages available in the archive files that you provide to the <code>mapr-setup.sh</code> script. For more information, see <a href="#">Using a Local, Shared Repository With the Installer</a> on page 5622. |

## Updating the Installer

Update the Installer to include the latest ecosystem packages and installer fixes. Once you update the Installer, you can install ecosystem components and software versions that were made available after you first configured the Installer.

To check the version of the Installer, see [Checking the Installer Version](#) on page 5617.

## Update the Installer Using an Internet Repository

If the node that runs the Installer uses an Internet repository that points to <https://package.mapr.hpe.com/>, use **one** of the following options to gain access to the latest packages:

- **Option 1:**

1. Rename the `mapr-setup.sh` script for the current version of the Installer.
2. Download the `mapr-setup.sh` script for the version of the Installer to which you want to update. For example, if your current version of the script is 1.11 and you want to update to 1.14, download version 1.14 of the script using the steps in [Installer](#) on page 5599.

3. Run the following command:

```
bash /opt/mapr/installer/bin/mapr-setup.sh update
```

- **Option 2:** Use a package manager to update the packages:

**On RHEL/CentOS**

```
yum update mapr-installer
mapr-installer-definitions
```

**On Ubuntu**

```
apt-get install mapr-installer
mapr-installer-definitions
```

**On SLES**

```
zypper update mapr-installer
mapr-installer-definitions
```

Once the update is complete, open the Installer URL (<https://<hostname/IPaddress>:9443>) to update the cluster.

### Update the Installer Using a Local Repository

If the node that runs the Installer uses a local repository, perform the following manual steps to get the latest packages for the cluster version that you are updating or upgrading to:

1. Download the latest versions of the following archive files.

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

2. Run the following command:

```
bash /opt/mapr/installer/bin/mapr-setup.sh -a <full path to each archive file> update
```

For more information about `mapr-setup.sh` options, see [Using mapr-setup.sh](#) on page 5609.

3. Once the update is complete, open the Installer URL (`https://<hostname/IPaddress>:9443`) to update the cluster.

**Related concepts**

[Using mapr-setup.sh](#) on page 5609

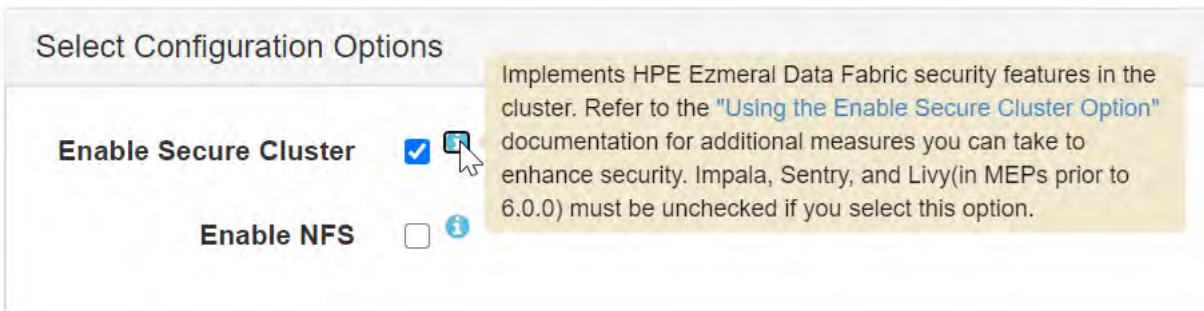

This topic describes how you can use and run the Installer setup script.

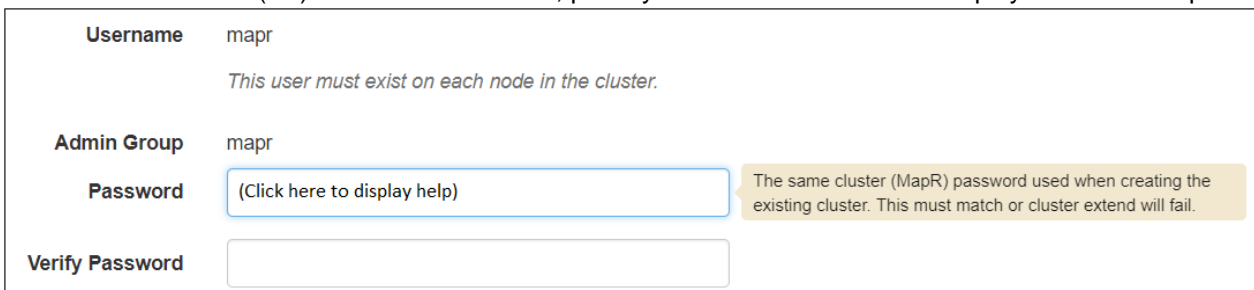

### Online Help for Installer Fields

This page describes how to use field-level help for the Installer.

To get more out of using the Installer, hold your cursor over the information icon (  ) next to each field or option. The help text can make it easier for you to use Installer options and fill in required information. For example:

If no information icon (  ) is visible near a field, place your cursor in the field to display the online help:

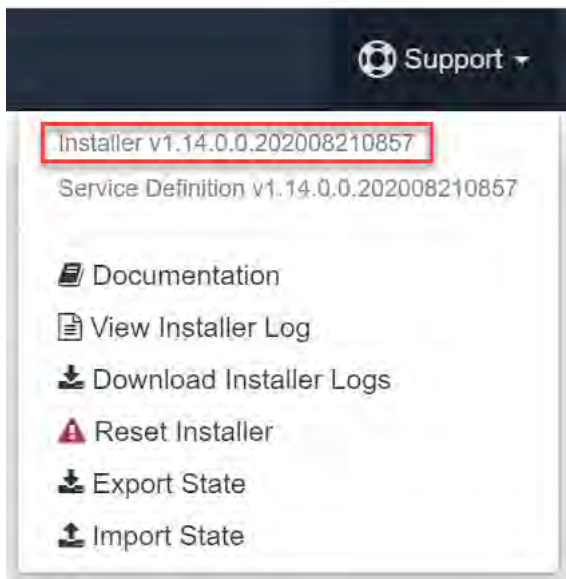

### Checking the Installer Version

Some Installer features require you to use the latest version of the Installer. You can check the Installer version easily from within the user interface.

To check the version of the currently installed Installer:

1. From the Installer web-based interface, click **Support**. The drop-down menu shows the Installer version:

2. **Optional:** Check your version against the recently released [versions](#) to see if a newer version is available. To update the Installer, see [Updating the MapR Installer](#).

### Related concepts

[Selecting an Installer Version to Use](#) on page 5607

Beginning with the EEP 6.2.0 release, several Installer versions are available for use. The version that you use depends on your current core version and whether or not you need to upgrade using the Installer or Stanzas.

[Checking the EEP Version](#) on page 5618

Some Installer operations require you to know the version of the currently installed Ezmeral Ecosystem Pack (EEP). You can check the EEP version easily from within the Installer user interface or derive the EEP version from your repository information.

### Checking the EEP Version

Some Installer operations require you to know the version of the currently installed Ezmeral Ecosystem Pack (EEP). You can check the EEP version easily from within the Installer user interface or derive the EEP version from your repository information.

### Checking the EEP Version Using the Installer

The Control System does not indicate the version of the currently installed EEP. However, if you used the Installer to install the cluster, you can view the EEP version on the home page:

**Installer**

Cluster    my.cluster.com

Version    6.2.0

MEP        7.0.0

An existing cluster has been detected. Select one of the following:

- Extend cluster to add nodes dynamically online
- Incremental install to make changes to services online (unless you change security model or control groups)
- Update core services with a software patch or maintenance release offline
- Shutdown all cluster services
- Uninstall existing cluster before proceeding with a new installation

### Checking the EEP Version in the Repository

If you installed the cluster manually, you can learn the EEP version by checking the `/etc/yum.repos.d/mapr_ecosystem.repo` file:

```
cd /etc/yum.repos.d/
ls -l
total 52
-rw-r--r-- 1 root root 1664 Apr 28 2018 CentOS-Base.repo
-rw-r--r-- 1 root root 1309 Apr 28 2018 CentOS-CR.repo
-rw-r--r-- 1 root root 649 Apr 28 2018 CentOS-Debuginfo.repo
-rw-r--r-- 1 root root 314 Apr 28 2018 CentOS-fasttrack.repo
-rw-r--r-- 1 root root 630 Apr 28 2018 CentOS-Media.repo
-rw-r--r-- 1 root root 1331 Apr 28 2018 CentOS-Sources.repo
-rw-r--r-- 1 root root 4768 Apr 28 2018 CentOS-Vault.repo
-rw-r--r-- 1 root root 957 Dec 27 2016 epel.repo
```

```

-rw-r--r-- 1 root root 1056 Dec 27 2016 epel-testing.repo
-rw-r--r-- 1 root root 169 May 14 10:04 mapr_core.repo
-rw-r--r-- 1 root root 186 May 14 10:04 mapr_ecosystem.repo
-rw-r--r-- 1 root root 171 May 13 11:25 mapr_installer.repo
more mapr_ecosystem.repo

[MapR_Ecosystem]
name = MapR Ecosystem Components
baseurl = https://package.mapr.hpe.com/releases/MEP/MEP-6.2.0/redhat
gpgcheck = 1
enabled = 1
protected = 1

```

## Checking the EEP Version Using the Installed Packages

If the `/etc/yum.repos.d/mapr_ecosystem.repo` file is not available for any reason, another way to learn the currently installed EEP version is to check the versions of the installed packages. Use one of the following commands to display the package versions:

| OS               | Command                                       |
|------------------|-----------------------------------------------|
| On CentOS / RHEL | <code>yum list installed</code>               |
| On SLES          | <code>zypper packages --installed-only</code> |
| On Ubuntu        | <code>apt list --installed</code>             |

For example:

```

yum list installed
Installed Packages
...
mapr-cldb.x86_64 6.2.0.0.20200618050710.GA-1
@MapR_Core
mapr-client.x86_64 6.2.0.0.20200618050710.GA-1
@MapR_Core
mapr-core.x86_64 6.2.0.0.20200618050710.GA-1
@MapR_Core
mapr-core-internal.x86_64 6.2.0.0.20200618050710.GA-1
@MapR_Core
mapr-fileserver.x86_64 6.2.0.0.20200618050710.GA-1
@MapR_Core
mapr-hadoop-util.x86_64 2.7.4.0.202006180214-1
@MapR_Ecosystem
mapr-librdkafka.x86_64 0.11.3.202006031114-1
@MapR_Core
mapr-zk-internal.x86_64 6.2.0.0.20200618050710.GA-1
@MapR_Core
mapr-zookeeper.x86_64 6.2.0.0.20200618050710.GA-1
@MapR_Core
...

```

Then compare the package versions against the component versions in the [repository](#). Some package versions can be the same for multiple EEPs, so it is best to compare multiple packages to confirm the installed EEP.

### Related concepts

[Ezmeral Ecosystem Packs](#) on page 3378

[Installer](#) on page 5599

You must download and run the Installer setup script before you can start the Installer web interface or issue Installer Stanza commands.

### Related tasks

[Checking the Installer Version](#) on page 5617

Some Installer features require you to use the latest version of the Installer. You can check the Installer version easily from within the user interface.

### Related reference

[EEP Support and Lifecycle Status](#) on page 5734

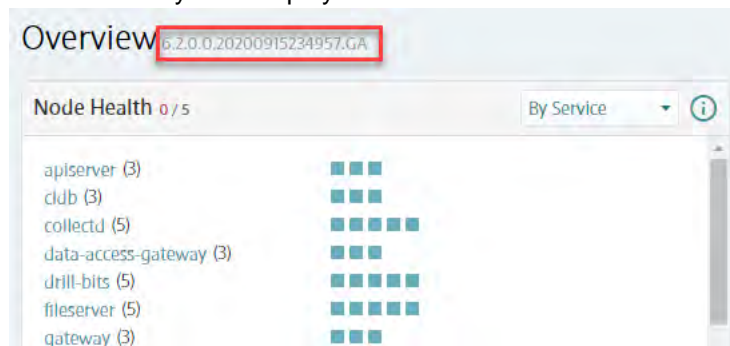

This page shows the EEPs that are supported for different core releases and the current lifecycle status for each EEP.

### Checking the Core Version

Some maintenance operations require you to know the version of the currently installed HPE Ezmeral Data Fabric release (sometimes referred to as the "core version"). You can check the core version easily from within the Control System or Installer user interface or identify the version from your installed packages.

#### Checking the Core Version Using the Control System

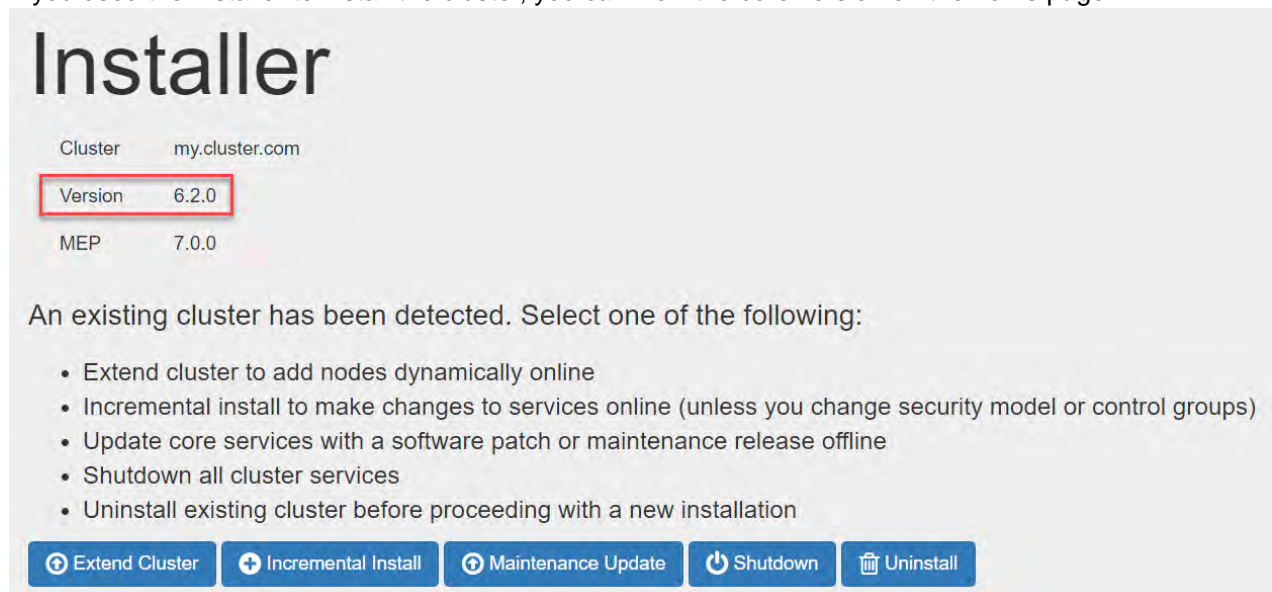

The Control System displays the core version on the **Overview** page:

To connect to the Control System, see [Setting Up the Control System](#) on page 376.

#### Checking the Core Version Using the Installer

If you used the Installer to install the cluster, you can view the core version on the home page:

To set up the Installer, see [Installer](#) on page 5599.

## Checking the Core Version Using maprcli

Another way to view the currently installed core version is to use the `maprcli dashboard info` command:

```
cd /opt/mapr/bin
maprcli dashboard info -json
{
 "timestamp":1586880602331,
 "timeofday":"2020-04-14 09:10:02.331 GMT-0700 AM",
 "status":"OK",
 "total":1,
 "data":[
 {
 "version":"6.1.0.20180926230239.GA",
 "cluster":{
 "name":"bridget.cluster.com",
 "secure":true,
 "dare":false,
 "ip":"10.10.82.24",
 "id":"6083111376716482211",
 "nodesUsed":1,
 "totalNodesAllowed":-1
 },
 "volumes":{
 "mounted":{
 "total":16,
 "size":1543
 },
 "unmounted":{
 "total":3,
 "size":1
 }
 },
 "utilization":{
 "cpu":{
 "util":38,
 "total":8,
 "active":3
 }
 }
 }
],
 ...
}
```

## Checking the Core Version Using the Installed Packages

Another way to view the currently installed core version is to check the versions of the installed `mapr-core.x86_64` or `mapr-core-internal.x86_64` packages. Use one of the following commands to display the package versions:

|                     |                                               |
|---------------------|-----------------------------------------------|
| On CentOS / Red Hat | <code>yum list installed</code>               |
| On SLES             | <code>zypper packages --installed-only</code> |
| On Ubuntu           | <code>apt list --installed</code>             |

For example:

```
yum list installed
Installed Packages
...
mapr-cldb.x86_64 6.2.0.0.20200618050710.GA-1
@MapR_Core
mapr-client.x86_64 6.2.0.0.20200618050710.GA-1
```

```

@MapR_Core
 mapr-core.x86_64 6.2.0.0.20200618050710.GA-1
@MapR_Core
 mapr-core-internal.x86_64 6.2.0.0.20200618050710.GA-1
@MapR_Core
 mapr-fileserver.x86_64 6.2.0.0.20200618050710.GA-1
@MapR_Core
 mapr-hadoop-util.x86_64 2.7.4.0.202006180214-1
@MapR_Ecos
 system
 mapr-librdkafka.x86_64 0.11.3.202006031114-1
@MapR_Core
 mapr-zk-internal.x86_64 6.2.0.0.20200618050710.GA-1
@MapR_Core
 mapr-zookeeper.x86_64 6.2.0.0.20200618050710.GA-1
@MapR_Core
 ...

```

### Related concepts

[Checking the EEP Version](#) on page 5618

Some Installer operations require you to know the version of the currently installed Ezmeral Ecosystem Pack (EEP). You can check the EEP version easily from within the Installer user interface or derive the EEP version from your repository information.

### Using a Local, Shared Repository With the Installer

The Installer can use a local repository instead of an Internet repository.

When you run the `mapr-setup.sh` script, it attempts to connect to <https://package.mapr.hpe.com/> and configures an Internet repository. If there is no Internet connectivity, the script asks for archive files so that it can create a local repository.

**Note:** Passing `-a <full path each archive file>` to the `mapr-setup.sh` script bypasses the Internet connectivity check and automatically creates a local repository with the provided archive files.

To install with a local, shared repository, the node that runs `mapr-setup.sh` needs the following:

- **Any OS dependencies or Java Development Kit (JDK) packages that are required.**
- **A webserver.** The script will attempt to install a webserver on the node if a webserver is not available. The webserver is needed to provide the package files to each node in the cluster. Note that this webserver is not configured to start automatically after a server restart. However, you can start the webserver manually by using the `systemctl start httpd` command.
- **Archive file(s).** To install release 5.2 and later, you need to download multiple archive files. To install release 5.1 or 5.0, you need to download a single archive file.

For release 5.2 and later

- **The Core archive file.** Download the archive file `mapr-<version>GA.<dep|rpm>.tgz` from one of the following locations, based on the operating system of the node:

- <https://package.mapr.hpe.com/releases/v.<version>/redhat/>
- <https://package.mapr.hpe.com/releases/v.<version>/ubuntu/>
- <https://package.mapr.hpe.com/releases/v.<version>/suse/>

**Note:** The package `mapr-v<version>GA-upgrade.<rpm/deb>.tgz` is not for use with theInstaller.

- **The Installer archive file.** Based on the operating system of the node, download `mapr-installer-<version>.<yyyymmdd>.<dep|rpm>.tgz` from one of the following locations:

- <https://package.mapr.hpe.com/releases/installer/redhat/>
- <https://package.mapr.hpe.com/releases/installer/ubuntu/>

- **The Ezmeral Ecosystem Pack (EEP) archive file.** Based on the operating system of the node, download `mapr-mep-<version>.<yyyymmdd>.<dep|rpm>.tgz` from one of the following locations:

- <https://package.mapr.hpe.com/releases/MEP/MEP-<version>/redhat>
- <https://package.mapr.hpe.com/releases/MEP/MEP-<version>/ubuntu>
- <https://package.mapr.hpe.com/releases/MEP/MEP-<version>/suse>

The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number. The 3-digit directory contains a fixed MEP version, including patches, and is not continuously updated. The 2-digit EEP directory points to the latest MEP and patches and is continuously updated. See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

For releases 5.0 and 5.1

- **The MapR archive file.** Download the `mapr-5.0-5.1.<yyyymmdd><dep|rpm>.tgz` archive file from one of the following locations, based on the operating system of the node:
    - <https://package.mapr.hpe.com/releases/installer/ubuntu/>
    - <https://package.mapr.hpe.com/releases/installer/redhat/>
  - **The Core archive file.** Download the archive file `mapr-<version>GA.<dep|rpm>.tgz` from one of the following locations, based on the operating system of the node:
    - <https://package.mapr.hpe.com/releases/v.<version>/redhat/>
    - <https://package.mapr.hpe.com/releases/v.<version>/ubuntu/>
    - <https://package.mapr.hpe.com/releases/v.<version>/suse/>
-  **Note:** The package `mapr-v<version>GA-upgrade.<rpm/deb>.tgz` is not for use with the Installer.

- **The `mapr-setup.sh` script.**

**Note:** Red Hat clusters must have access to a local EPEL repository, as described in [Set Up the Internet Repository: RHEL/CentOS](#) on page 259. The EPEL repository enables installation of these packages:

- clustershell
- pdsh
- pdsh-rcmd-ssh
- sshpass\*

\*Before installing a cluster on a SLES image, you must install `sshpass`, as described in [Adding the Internet Repository on SUSE](#) on page 130.

After downloading the `mapr-setup.sh` script and the archive files to the node that will run the Installer, run the following command from the directory that contains the `mapr-setup.sh` script:

```
bash ./mapr-setup.sh -a <full path to the archive files>
```

## Installer FAQ

Review frequently asked questions about the Installer.

## General

### What is the difference between the Installer and the Quick Installer?

The Installer is a robust, user-friendly replacement for the Quick Installer. You can use the Installer to install a cluster with HPE Ezmeral Data Fabric services and ecosystem components. You can also use the Installer

to update an existing cluster with additional nodes, HPE Ezmeral Data Fabric services, and ecosystem components. However, the Installer does not install the client.

**Which versions of software can I install?**

You can use the Installer to install releases 4.1, 5.0, 5.1, 5.2.x, and 6.x.

**Can I use the Installer to upgrade my cluster?**

Yes. The Installer can be used to upgrade a cluster that was installed using the Installer or an Installer Stanza. See [Upgrading Core With the Installer](#) on page 257 for information about how to upgrade with the Installer.

If the cluster was manually installed, you can install the Installer and enable it to be used with subsequent installations or upgrades by following the steps in [Using probe and import to Generate the Installer Database](#) on page 5717.

**Can I use the Installer to install a patch?**

Yes. See [Applying a Patch](#) on page 393.

**Does the Installer support adding a "compute-only" node?**

A compute-only node is a node that is capable of performing computational tasks but is not expected to perform long-term data storage. The Installer does not explicitly support adding a compute-only node to a cluster. However, you can effectively work around the issue by adding a node that has the filesystem and sufficient associated disk space. The disk space must be equal to or greater than the amount of physical memory on the node.

## Preparing to Install

**What are the Installer requirements?**

See the [Prerequisites](#).

**What information should I have before I start?**

The `mapr-setup.sh` script requests the following information:

- The fully-qualified domain name for each host and the port number that other nodes in the cluster can use to connect to the Installer node.
- A user for the cluster admin user account. If the user account doesn't exist, the `mapr-setup.sh` script prompts for the UID, GID, group name, and password so that it can create the account.

The Installer requests the following information:

- The EEP that you want to install on a 5.2.x or later cluster
- The services that you want to install on the cluster
- Hostnames of the nodes that you want to include in the cluster (specify fully-qualified domain names as described in [Connectivity](#) on page 119)
- Credentials for the `root` user or a user with `sudo` privileges on each node in the cluster

**What are the node requirements?**

See the [Prerequisites](#).

**What are my options if I don't want to use an Internet repository?**

See [Using a Local, Shared Repository With the Installer](#).

## Using the Installer

**Which license edition applies to my installation?**

As of release 5.1, licenses are categorized by new editions and modules that further define the features supported by an edition.

See the following table for descriptions of the license options. For more information about licensing, see [HPE Ezmeral Data Fabric Software Licensing](#).

| License Edition    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Community Edition  | An unlimited, free, community-supported edition with one free NFS Gateway. This edition includes Hadoop, HPE Ezmeral Data Fabric Database, and HPE Ezmeral Data Fabric Event Streams. However, real-time global replication of HPE Ezmeral Data Fabric Database tables or HPE Ezmeral Data Fabric Event Streams is not included.                                                                                                                                                                |
| Enterprise Edition | <p>Edition that enables enterprise-class features such as high availability, multi-tenancy, and disaster recovery. Each of the following modules for the Enterprise Edition unlocks a portion of the total platform capabilities:</p> <p><b>Analytics</b> Enables enterprise-class features for analytic use cases, such as highly-available NFS and support for services like YARN and MapReduce.</p> <p><b>Database</b> Enables enterprise-class features for operational NoSQL database,</p> |

| License Edition | Description                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | <p>with HPE Ezmeral Data Fabric Database JSON and binary tables, and real-time global database replication.</p> <p><b>Streams</b> Enables enterprise-class features for publish/subscribe event streaming, with HPE Ezmeral Data Fabric Event Streams and real-time global stream replication.</p> <p>For more information about editions, see <a href="#">What's Included</a>.</p> |

**What happened to the M3, M5, M7, or Enterprise Edition licenses?**

With the release of 5.1 and Streams, the licensing model has been simplified, allowing more choice in which specific features are licensed on a cluster.

See the following table to understand how the new licenses correspond to the legacy license editions that you are familiar with. For more information about licensing, see [HPE Ezmeral Data Fabric Software Licensing](#). For more information about editions, see [What's Included](#).

| Legacy Edition                    | New Edition & Module(s)                                                               |
|-----------------------------------|---------------------------------------------------------------------------------------|
| M3 or Community Edition           | Community Edition. Starting in 5.1, the Converged Community Edition includes Streams. |
| M5 or Enterprise Edition          | Enterprise Edition with Hadoop Module                                                 |
| M7 or Enterprise Database Edition | Enterprise Edition with Hadoop and Database modules                                   |

**What expressions can I use to specify multiple nodes?**

You can enter the following types of expressions to specify nodes:

- `[0-99]` => Expands hostnames to 0, 1, 2, ...99. The second delimiter allows one or more digits.
- `[00-99]` => Expands hostnames to 00,01,02,...99. Allows two or more digits of the same length
- `[a-z]` or `[A-Z]` => Expands hostnames to a,b,c,...z or A,B,C,...Z

To group hosts based on racks for performance or reliability, append ":" followed by the rack name to each expression.

**Examples:**

- `host1, host2, host3`
- `host[A-Z][0-99]` => `hostA0, hostA1, hostA2 ,...hostZ99`
- `host[000-333]` => `host000, host001, host002, ... host333`
- `host[0-3], otherhost[00-05]` => `host0, host1, host2,...host3` and `otherhost00,...otherhost05`
- `host[0-5]:rack1, host[6-10]:rack2` => `host1, host2, host3,...host5` on rack1. `host6, host7, host8,...host10` on rack2

**How do I change the service layout?**

The Installer uses groups to organize nodes and services. A group is a set of services that you can run on one or more nodes. A service can only be assigned to one group.

On the **Configure Service Layout** page, you can use the **Advanced Configuration** option to drag and drop services between existing groups to specify where the services are to be installed. You can also create new groups or change the list of nodes assigned to a group.

**Note:** Some services can only be assigned to one node.

**Can I install a single-master service, such as Hive, on multiple nodes?**

When you use the Installer, single-master services are added to the default MASTER group. By design, only one node can be assigned to the MASTER group.

To install a single-master service on more than one node:

1. On the Configure Service Layout page, create a new group.
2. Assign multiple nodes to the new group.
3. Drag the single-master service to the new group.

**Can I install a secure cluster with the Installer?**

Yes. Installer [versions](#) 1.10 and later support [security by default](#).

**Are there limitations to what you can do when you update an existing cluster?**

See the restrictions documented in [Using the Incremental Install Function](#) on page 5646.

**How do I uninstall the Installer?**

See [Uninstalling Software Using the Installer Uninstall Button](#) on page 5655. If the installer node is part of the cluster, the Installer packages can remain on the installer node after the cluster is uninstalled.

If you have uninstalled the cluster, you can also run one of the following commands to uninstall the Installer packages from the installer node:

- On CentOS / Red Hat:

```
yum remove 'mapr-installer*'
```

- On Ubuntu:

```
apt-get remove 'mapr-installer*'
```

- On SLES

```
zypper remove 'mapr-installer*'
```

## Troubleshooting

**What can I do if I need to rerun `mapr-setup.sh` with a new repository URL and the script still points to the old URL?**

The `/opt/mapr/installer/data/properties.json` file stores information such as the user ID of the cluster administrator, the user ID of the Installer, the OS type, Internet access information, and the repository URLs for Core and the ecosystem components. Once a repository URL has been stored in `properties.json`, the Installer assumes that the URL will not change. Rerunning the setup script does not update the URL. Even upgrading the installer packages does not update the repository URL in `properties.json`. To pass a new repository value into `properties.json`, you have two options:

### Option 1

You can remove the installer files and rerun the setup script:

```
mapr-setup.sh remove
```

Using the `remove` command removes `properties.json`, the installer database, and the installer packages, but not the setup script. After the files are removed, you can rerun the setup script to specify the new repository URL. For more information about options you can use with `mapr-setup.sh`, see [Using `mapr-setup.sh`](#).

### Option 2

If you need to retain the installer database and the cluster state information (for example, because you need to do an upgrade), you can:

1. Edit the `properties.json` file manually to change the `repo_core_url` and the `repo_eco_url` entries to the correct values.
2. Restart the Installer:

```
systemctl restart mapr-installer
```

#### What can I do if drop-down menus aren't working?

Try any or all of the following to correct the problem:

- Refresh the browser page.
- Clear the browser cache.
- Close and restart the browser or browser tab.

#### Why does the Installer URL not work?

Check that the URL you are trying to access is external. For example, if you install on a cluster that is in the cloud, the URL that the Installer lists may not work if it is an internal URL. Try accessing the external URL that is associated with the internal URL.

#### Why doesn't the Installer list the ecosystem component that I want to install?

The Installer Definitions package contains the versions and services that you can install. Once you update the Installer Definitions, you can install ecosystem components that were made available after you first configured the Installer. See [Updating the Installer](#) on page 5614.

#### On the Verify Nodes page, how can I get more information about a warning or error?

Hold your cursor over the warning or error in the right pane to see more information about the specific warning or error condition.

#### Why are the nodes listed on the Verify Nodes page different from those that I chose to install on?

If you abort an installation and then install on a different set of nodes, you must use the *Verify Nodes* page to manually remove nodes that were part of the aborted installation but are no longer part of the current installation.

#### I can't log in to Hue. What credentials should I use to log into Hue for the first time?

Log in with the cluster administrator username that you configured while running `mapr-setup.sh` and the password `mapr`.

#### What should I do if rerunning `mapr-setup.sh` generates errors because the `properties.json` file has incorrect information?

See [Troubleshooting Repository URL Errors](#) on page 5662.

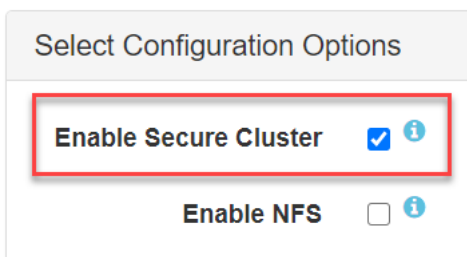

## Installer Operations

This section describes operations you can perform using the Installer.

### Using the Enable Secure Cluster Option

You use the Enable Secure Cluster option to control whether or not the cluster is configured as a secure cluster.

This option appears on the **Version & Services** page of the web-based Installer.

### About the Enable Secure Cluster Option

Using this option controls [platform and ecosystem security](#) in a cluster. When you select the option, the Installer runs the `configure.sh` script on the primary container location database (CLDB) to generate security keys and then distributes the keys to all the other CLDBs. The installer also distributes certificates to all the other nodes and activates security for the ecosystem components that support security.

Certain ecosystem components either do not support security or cannot be secured by the Installer. If you enable security, you will not be allowed to select services such as Impala or Sentry.

Beginning with Release 6.1, data-on-wire encryption is enabled by default for newly created volumes when the **Enable Secure Cluster** option is selected. Data-on-wire encryption encrypts data in a volume during transmission over the wire. In a secure cluster, you can enable or disable data-on-wire encryption for individual volumes using the Control System, the `maprcli`, or the REST API commands.

### Using the Option With New and Already Installed Clusters

You can select or deselect the **Enable Secure Cluster** option during a new installation or during an [Incremental Install](#).

- For new installations:
  - The option is selected by default, meaning that new installations are configured with security unless you deselect the option.
  - Deselecting the option causes the cluster to be installed as a nonsecure cluster.
- For clusters that are already installed with EEP 4.0.0 or later:
  - You can select or deselect the option during an [Incremental Install](#):
    - If security is not currently configured and you select the option, the cluster will be configured with security.
    - If security is already configured, you can remove security by deselecting the option.

**Note:** If Drill is installed, be sure to review the limitations described in [Securing Drill](#) on page 3487 before removing security. Additional steps must be taken so that Drill in a nonsecured cluster can access all Drill znodes.

### Using the Option During an Incremental Install

Normally, **Incremental Install** operations are conducted online. However, selecting or deselecting the **Enable Secure Cluster** option during an **Incremental Install** requires the Installer to stop the Warden and Zookeeper services, bringing the cluster offline temporarily.

In some instances, the **Enable Secure Cluster** option is unavailable. For example, you cannot select this option during an upgrade of a nonsecured Release 5.x cluster to Release 6.0 or later. You must complete the upgrade to Release 6.0 or later first and then use the **Incremental Install** function to enable security.

**Using the Enable DARE Option**

You use the Enable DARE option to enable data-at-rest encryption for volumes.

This option appears on the **Version & Services** page of the web-based Installer when the **Enable Secure Cluster** option is selected. The **Enable DARE** option is *deselected* by default.

For more information about data-at-rest encryption, see [Encryption in Data Fabric](#) on page 656.

**Considerations for Enabling DARE Using the Installer**

Before using the **Enable DARE** option, review these considerations:

-  **Important:** Once enabled, the **Enable DARE** option cannot be disabled, since disk encryption cannot be turned off without reformatting the disks.
- The **Enable DARE** option can only be used during the initial installation of a cluster or during an incremental install.
- You cannot select the **Enable DARE** option when:
  - The **Enable Secure Cluster** option is deselected.
  - You perform an upgrade operation using the Installer. Security changes are not allowed during an upgrade using the Installer.
- If you select the **Enable DARE** option, you can no longer deselect the **Enable Secure Cluster** option during an **Incremental Install** operation.

**Installing the S3 Gateway Using the Installer**

Using the web-based Installer, you can install the S3 Gateway on the cluster.

You can install the S3 gateway during a new or incremental installation of Release 6.2 or later. The following option appears on the **Version & Services** page of the Installer:

**Object Store Gateway with S3-Compatible API (2.0.0)**

Note these considerations for installing the S3 gateway using the Installer:

- Installer 1.15 installs S3 gateway 2.0.0 with EEP 7.0.0 and 7.0.1.
- If **Enable NFS** is specified, the Installer configures the S3 gateway to use NFS servers.
- If **Enable NFS** is not specified, by default the Installer installs Loopback NFS (`mapr-loopbacknfs-<version>`) on all nodes in the cluster. If you later perform an incremental install to **Enable NFS**, the Installer uninstalls Loopback NFS and uses NFS servers to interface with the S3 gateway.
- The S3 gateway:
  - Accesses the MapR file system through `/mapr`
  - Uses port 9000
  - Uses either the http or https protocol
- You cannot upgrade S3 gateway 1.0.x to S3 gateway 2.0.0 manually or by using the Installer. Upgrades are not supported.

To install the S3 gateway manually, see [Installing S3 Gateway](#) on page 196. To learn more about managing and using the S3 gateway, see [S3 Gateway](#) on page 4186.

## Installing NFS Using the Installer

Using the web-based Installer, you can install version 3 or version 4 of the Network File System (NFS) on the cluster.

You can install NFS during a new or incremental installation of Release 6.1 or later. The **Enable NFS** option appears on the **Version & Services** page of the Installer.

Note these considerations for installing NFS using the Installer:

- Previous versions of the Installer installed NFS (version 3) by default. Installer 1.10 and later do NOT install NFS by default. You must select the **Enable NFS** option to instruct the installer to install NFS. When you select the **Enable NFS** option, the **NFS Version** option appears. NFSv3 is always selected by default. NFSv4 is available as an option for 6.1.0 or later releases.

**CAUTION:** The Installer installs but does not secure NFS. Neither NFSv3 nor NFSv4 provides security by default. You can configure NFSv4 server to work with Active Directory and Kerberos servers, but you must first install Active Directory and Kerberos servers. For more information, see [Configuring NFSv4 Server for Kerberos](#) on page 1328. NFSv3 does not support security.

- With the 1.10 installer, if you specify a pre-6.1.0 release, you must select the **Enable NFS** option to install NFS. Selecting the option causes the installer to install NFSv3 by default. The **NFS Version** option is not available for pre-6.1.0 releases.
- When upgrading to Release 6.1 or later, the Installer keeps the NFS version at version 3. After a new installation of Release 6.1 in which you specified NFSv3, or an upgrade to Release 6.1 using the Installer, you can switch to NFSv4 by using the [Incremental Install](#) function of the installer.
- The software supports mixed-mode NFS configurations in which some nodes of a cluster use NFSv3 and other nodes use NFSv4, but mixed-mode configurations cannot be installed using the Installer. The Installer installs all nodes as NFSv3 or all nodes as NFSv4.
- NFSv3 and NFSv4 cannot be used on the same node concurrently.
- A new installation using a Installer Stanza installs NFS only if you set `enable_nfs: true` in the config section of the stanza.

To install NFS manually, see [Installing NFS for the HPE Ezmeral Data Fabric](#) on page 337. To learn more about managing and using NFS, see [Managing the HPE Ezmeral Data Fabric NFS Service](#) on page 1295.

## Using Custom Playbooks

Installer 1.12.0.0 and later enable you to use custom playbooks that can run a set of predefined tasks during or after operations using the Installer or Installer Stanzas.

Using custom playbooks, you can inject specific commands into the Installer 1.12.0.0 and later workflows to make configuration changes and ensure that those changes persist even after incremental installations or upgrades. For example, suppose you want to install a specific software package on all nodes before starting an installation. Custom playbooks enable you to check for and install the software as needed.

Or suppose you want to change a configuration setting before starting Core. Custom playbooks enable you to change the setting as part of an installation or upgrade.

## Restrictions to Using Custom Playbooks

Note these restrictions:

- You can use custom playbooks with any cluster as long as the Installer version is 1.12.0.0 or later. However, Installer 1.12.0.0 and later have limited functionality when used with older releases. See [Selecting an Installer Version to Use](#) on page 5607.

- Custom playbooks are not supported for manual installations. Custom playbooks are supported only for use with the Installer and [Installer Stanzas](#) on page 5706.

### Prerequisite for Using Custom Playbooks

To create a custom playbook file, you must be familiar with Ansible. Ansible is a simple automation language that uses plain-text YAML files to describe the desired state of the cluster. You do not have to install Ansible. Ansible 2.7 is installed whenever you load the Installer using `mapr-setup.sh`. To begin learning Ansible, see these resources:

- [Quick Start Video](#)
- [Getting Started with Ansible](#)
- [Introduction to Playbooks](#)

### Creating and Running a Custom Playbook

Follow these steps to use a custom playbook with the Installer or Installer Stanzas:

| No. | Step                                                                                                               | See for more information                                                                                                                                                                                         |
|-----|--------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.  | Prepare the roles structure and YAML files for the custom playbook.                                                | <ul style="list-style-type: none"> <li>• <a href="#">Predefined Roles for Custom Playbooks</a> on page 5634</li> <li>• <a href="#">Example Playbook Files</a> on page 5635</li> </ul>                            |
| 2.  | Test the roles using standalone Ansible.                                                                           | <ul style="list-style-type: none"> <li>• <a href="#">Testing the Roles</a> on page 5636</li> <li>• <a href="#">Playbook Debugger</a></li> </ul>                                                                  |
| 3.  | Convert the YAML files to a zipped archive file that has a <code>tgz</code> or <code>tar.gz</code> file extension. | <ul style="list-style-type: none"> <li>• <a href="#">Creating the Zipped Archive</a> on page 5636</li> </ul>                                                                                                     |
| 4.  | In the Installer or a Installer Stanza, specify the option to upload the zipped archive file.                      | <ul style="list-style-type: none"> <li>• <a href="#">Installer Options for Custom Playbooks</a> on page 5636</li> <li>• <a href="#">Installer Stanza Parameters for Custom Playbooks</a> on page 5638</li> </ul> |
| 5.  | Run the Installer or Installer Stanza to invoke the playbook.                                                      | <ul style="list-style-type: none"> <li>• <a href="#">Installer</a> on page 5599</li> <li>• <a href="#">Installer Stanzas</a> on page 5706</li> </ul>                                                             |
| 6.  | If the operation returns a syntax error, fix the error and retry the operation.                                    | <ul style="list-style-type: none"> <li>• <a href="#">Troubleshooting Custom Playbook Errors</a> on page 5638</li> </ul>                                                                                          |

### Predefined Roles for Custom Playbooks

The role structure is an important part of your custom playbook. Your custom playbook must contain one or more of the following roles, and each role must be a directory in the zipped archive. The roles do not need to follow a specific order.

| Role              | Tasks in this role are run <i>after</i> . . .                                       |
|-------------------|-------------------------------------------------------------------------------------|
| preinstall        | The Installer has verified the nodes but before the installation workflow has begun |
| postcoreconfigure | <code>configure.sh</code> has run for Core but before Core has been started         |

| Role             | Tasks in this role are run <i>after</i> . . .                                                 |
|------------------|-----------------------------------------------------------------------------------------------|
| postecoconfigure | Ecosystem components are configured and started                                               |
| postinstall      | The cluster is completely installed and running (at the end of the Installer Stage2 playbook) |

Here is an example role structure:

```
preinstall
 tasks
 main.yml
postcoreconfigure
 tasks
 main.yml
 vars
 main.yml
```

The uploaded tarball must contain relative path names with just the top-level role directories, and the tarball structure must adhere to the [Ansible role-structure rules](#). If you need to configure your own roles in the tarball, you must include them as sub-roles to be run from within the pre-defined roles. For more information, see [Ansible Roles](#).

**Note:** Because Installer [maintenance updates](#) only update Core and do not change any configuration settings on the cluster, the Installer handles them differently from other operations. This means that whenever you perform a maintenance update, the Installer does *not* run the postecoconfigure and postinstall playbooks during the maintenance update.

### Example Playbook Files

This example shows a preinstall task that installs the Midnight Commander application on all nodes in the cluster before the Installer workflow is initiated. The example is contained in the `preinstall/tasks/main.yml` file:

```

- name: Install misc stuff - Midnight commander
 vars:
 packages_Suse: ['mc']
 packages_RedHat: ['mc', 'lsof']
 # syslinux-utils is for gethostip, libpython is required for collectd
 packages_Debian: ['mc']

 package: name={{ item }} state=present
 with_items: "{{ vars['packages_' + ansible_os_family] }}"
```

The following example shows the `postcoreconfigure/tasks/main.yml` file for the previous role structure. This example sets the number of RPC threads in `mfs.conf` from the current setting to 4 threads. The variable used to point to the file is defined in `postcoreconfigure/vars/main.yml`:

```

- debug: var=mapr_home

- name: Bump MFS RPC threads
 lineinfile:
 path: "{{ mapr_conf_dir }}/mfs.conf"
 regexp: '^(?P<threads>mfs.numrpcthreads=).*\$$'
 line: '\g<threads>4'
 backrefs: yes
```

This example shows the contents of the variables file (`postcoreconfigure/vars/main.yml`):

```

mapr_conf_dir: "{{ mapr_home }}/conf"
```

### Testing the Roles

Before uploading your zipped archive, develop and test your role files outside the installer using the standalone Ansible 2.7 debugger. You cannot use the [Ansible debugger](#) from within the Installer. For more information, see [Playbook Debugger](#).

Testing the roles by running them using the Installer can be time-consuming. If a role contains logic errors, these errors won't be visible until the playbook is initiated. For example, a `postinstall` playbook that you run during a new installation does not generate an error until the installation is completed. A new installation can take 20 minutes or more, depending on the cluster size. Therefore, you can avoid having to re-run the Installer and playbook by testing the roles for logic errors before using them.

You can run the playbook debugger from the Installer node by using the `virt_runner` program in the `/opt/mapr/installer/bin/` directory. Use this command:

```
virt_runner ansible-playbook -i, -k <Playbook-file-name>
```

When you run the playbook in this fashion, you do not have access to the variables (for example, `mapr_home`) that the Installer defines. So you must set those up manually.

### Creating the Zipped Archive

To create the zipped archive, you can use a tool such as [7-Zip](#) or Linux commands. The following example uses the Linux `tar` command to create an archive of the directory structure and the `gzip` command to zip the archive.

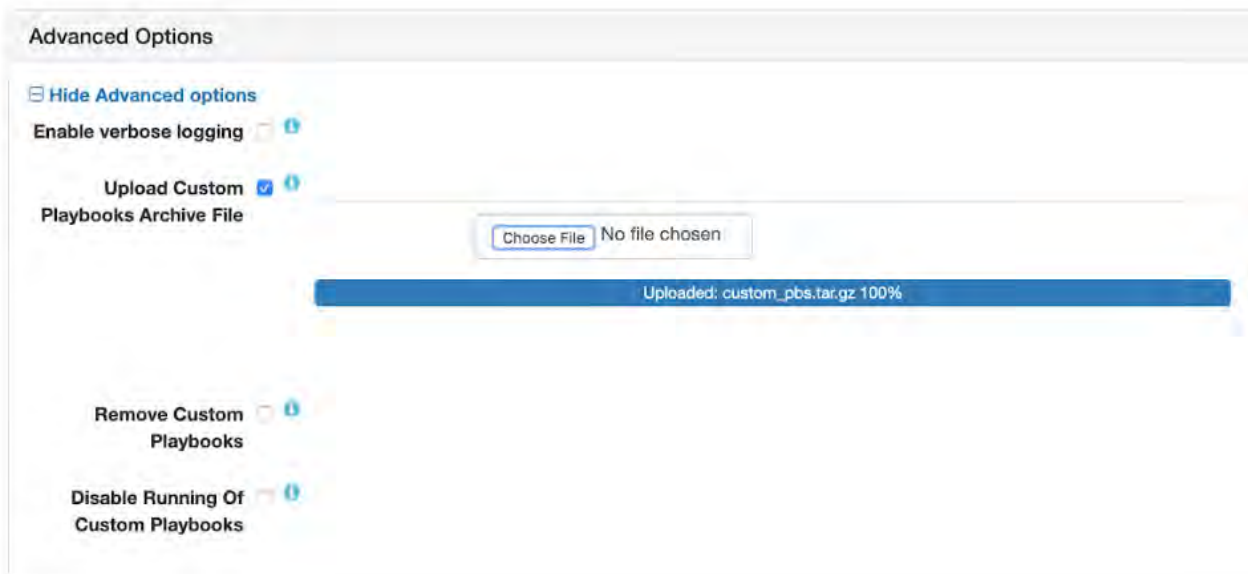

Before using the `tar` command, change the directory to the directory in which you created the role structure. For example, if you created the role structure in the `/tmp` directory, you must issue the `tar` command from the `/tmp` directory:

```
tar -cvf /tmp/custom_pbs.tar .
./
./preinstall/
./preinstall/tasks/
./preinstall/tasks/main.yml
./postcoreconfigure/
./postcoreconfigure/tasks/
./postcoreconfigure/tasks/main.yml
./postcoreconfigure/vars/
./postcoreconfigure/vars/main.yml
gzip /tmp/custom_pbs.tar
```

The `gzip` command creates a `custom_pbs.tar.gz` file in the `/tmp` directory. If you are using the Installer, move the zipped file to the node hosting your browser so that you can upload it using the Installer upload option.

### Installer Options for Custom Playbooks

In the Installer, the custom playbook options appear on the **Version & Services** page under **Advanced Options**. The following screen shows the options that are visible when a playbooks archive file has been uploaded:

To use the options, you select an option and then advance through the Installer menus to complete the Installer task. You can access these options from the following Installer tasks:

- Install
- Incremental Install
- Upgrade Version
- Maintenance Update

Whichever option you select, the Installer obeys the option *every time* you use the Installer for any operation. Therefore, if you select the option to upload a custom playbook, the Installer will run the playbook every time you use the Installer. If you select the option to disable playbooks, playbooks will be disabled until you select a different option. If a value has been set by a custom playbook and you run the same playbook again, the value is left unchanged.

| Option                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Upload Custom Playbooks Archive File | Uploads a zipped TAR file for your custom playbook to <code>/opt/mapr/installer/data/tmp/custom_playbooks/</code> . The Installer displays the file name of the uploaded archive. An error is displayed if you upload a file that does not have a <code>tgz</code> or <code>tar.gz</code> file extension.<br><br>The Installer allows you to upload one playbook at a time. If you upload a new playbook when another playbook is already loaded, the previously loaded playbook and its archive are removed, and the new playbook is loaded. |
| Remove Custom Playbooks              | Removes the installed custom playbook and its archive from <code>/opt/mapr/installer/data/tmp/custom_playbooks/</code> . Both the playbook and the directory structure are removed.                                                                                                                                                                                                                                                                                                                                                           |
| Disable Running of Custom Playbooks  | Enables you to run the Installer or <a href="#">Installer Stanzas</a> on page 5706 <i>without</i> executing the uploaded custom playbook.                                                                                                                                                                                                                                                                                                                                                                                                     |

## Installer Stanza Parameters for Custom Playbooks

To upload a custom playbook using a Stanza, specify the `cpbs_location` parameter followed by the path to the playbook in quotations. For example:

```
environment:
 mapr_core_version:6.1.0
 #DOC path to tar.gz archive of custom playbooks to be installed
 #DOC to remove the custom playbooks, provide an empty string
 #DOC for the filename, or remove cpbs_location all together
 cpbs_location: "/tmp/custom_plays.tar.gz"
```

To remove a custom playbook using a Stanza, specify an empty string for the file name:

```
environment:
 cpbs_location: ""
 ...
```

Or remove `cpbs_location` from the environment section.

To disable a custom playbook without removing it, set the `custom_pbs_disable` parameter to `true`

```
config:
 #DOC flag to indicate if you want to skip running of installed custom
 playbooks
 custom_pbs_disable: true
```

## Troubleshooting Custom Playbook Errors

The Installer loads the custom roles and reports any syntax errors at execution time. The failure of a custom role causes a failure in the Installer operation. If a role has a syntax error, the Installer can show an error like this:

The screenshot shows the 'Installing MapR' interface. At the top, a red progress bar indicates 'install error: 100%'. Below it, a message states '0 nodes installed out of 2' and '2 nodes did not install correctly. Examine the logs to view warning and error messages.' There are 'Retry' and 'Abort Installation' buttons. A list of nodes is shown below, with 'mfs73.qa.lab' and 'qa-node91.qa.lab' marked with red error icons. On the right, a sidebar titled 'mfs73.qa.lab' shows a 'Cannot install' error for 'Custom Preinstall playbook hook' at 0% completion. A list of services is also visible in the sidebar. At the bottom, a progress bar shows the installation process: Incremental, Databases, Monitoring, Nodes, Verification, Layout, Installation (active), and Complete.

**Tip:** To view node details in the right pane of the **Installing MapR** screen, you need to select a red node icon on the left.

If the node detail indicates a custom playbook hook error, refer to the Installer Log for more information. Click **Support > View Installer Log**. For example:

## Installer Logs

```

=====
Version: 1.12.0.0.2272

2019-04-16 15:54:54.472: * 15:54:54,469: running play Stop all services for Retry/Upgrade
2019-04-16 15:54:58.893: * 15:54:58,890: running play Custom Preinstall playbook hookERROR! Syntax Error wh:
mapping values are not allowed here

The error appears to have been in '/opt/mapr/installer/data/tmp/custom_playbooks/preinstall/tasks/main.yml':
be elsewhere in the file depending on the exact syntax problem.

The offending line appears to be:

 name: Install misc stuff - Midnight commander
 vars:
 ^ here
Syntax Error
Exiting with 1
install: python script exited with 1

```

[Close](#)

(Clicking the node log provides limited information for syntax errors.) For more information about the Installer logs, see [Logs for the Installer](#) on page 5656.

### Using the Retry Button

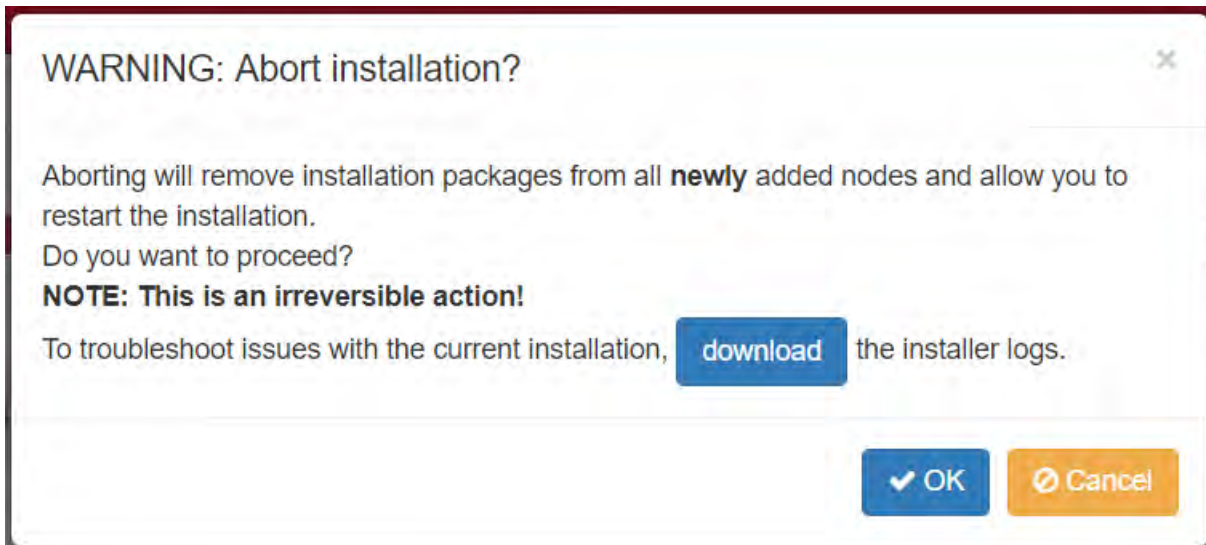

You have several options for fixing the issue. You can fix any problems by logging on to the Installer node and making changes directly in the playbook files located at `/opt/mapr/installer/data/custom_playbooks`. Then click the **Retry** button in the Installer GUI interface. If you use this method, note that you must eventually propagate any fixes to your original tarball if you want to reuse the tarball.

### Using the Abort Installation Button

Another option is to abort the installation and repeat the operation after fixing the error and uploading a corrected playbook. Before using this option, it is important to know that using **Abort Installation** does not remove changes made to the Installer database during the operation that you aborted. After an abort, the Installer can display the desired state rather than the actual state of the nodes.

For example, if you attempted to upgrade a EEP from EEP 6.1.0 to EEP 6.2.0 and then aborted the operation, the Installer can display the currently installed EEP as EEP 6.2.0 even though EEP 6.2.0 has not been installed on the cluster nodes. This condition persists until you rerun the upgrade operation successfully or revert to the last known cluster state by using **Support > Import State**. See [Importing or Exporting the Cluster State](#).

To abort the operation and start over, click **Abort Installation**. A confirmation dialog appears:

Click **OK** to return to the Installer home page. Fix the playbook error and retry the operation.

### Extending a Cluster by Adding Nodes

This section describes how to add capacity to a cluster by adding nodes.

You add nodes to a cluster by using the web-based Installer (version 1.6 or later) or Installer Stanzas. The nodes are added to a pre-existing group *online* without disturbing the running cluster. You can add nodes to on-premise clusters or to cloud-based clusters.

**!** **Important:** After completing these steps, if you added a node to a group containing a CLDB or ZooKeeper, you must also perform the [Post-Expansion Steps for Extending a Cluster](#) on page 5645.

You can add multiple nodes to a group in the same operation, and you can add nodes to custom groups. You can also add the same node to multiple groups. The Installer installs the new nodes with the same patch level as the existing nodes.

**📄** **Note:** Before adding nodes, use the Installer to ensure that your cluster uses three-digit EEPs. If your cluster uses two-digit EEPs, adding a node can result in a version mismatch between the cluster and the newly added node. To change from two-digit to three-digit EEPs you can perform an **Incremental Install** using the Installer. For more information, see [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

### Restrictions

Note these restrictions for using the **Extend Cluster** operation. When adding nodes:

- The cluster must already be installed before nodes can be added.
- You cannot add a node to a MASTER group, since these services can run only on one node.
- If you add a node to a CONTROL group that has a CLDB, you must do a manual, rolling restart of the entire cluster.
- If you add a node to a group that has OpenTSDB, you must add the same node to the group that contains AsyncHBase (currently, the Installer does not check to ensure that this dependency is met).
- You cannot add services.
- You cannot change the EEP version or Core version.
- You cannot add new service groups.

- New nodes are added automatically to the DEFAULT group.
- A node added to a secure cluster will be configured for security automatically. If the cluster is custom secure, you cannot use the Installer. See [Customizing Security in HPE Ezmeral Data Fabric](#) on page 1648.

### Before Adding Nodes

1. Determine the group(s) to which new nodes will be added.

You can add nodes to the following types of groups:

- CLIENT
- DATA
- CONTROL
- MULTI\_MASTER
- MONITORING\_MASTER

**Note:** If you add a node to a group containing a CLDB, you must restart all the nodes except for the new node. If you add a node to a group containing Zookeeper (but not CLDB), you must restart Zookeeper on all the Zookeeper nodes except for the new node. And you must restart the lead Zookeeper last.

To gather information about groups, see [Getting Information About Services and Groups](#) on page 5715.

2. Ensure that the node(s) to be added meet the installation prerequisites described in the [Installer Prerequisites and Guidelines](#) on page 5601.

### Adding Nodes Using the Installer Web Interface

1. Use a browser to connect to the cluster using the Installer URL:

```
https://<Installer Node hostname/IPaddress>:9443
```

2. On the status screen, click the **Extend Cluster** button. The Installer displays the **Extend Cluster** screen showing the currently configured groups and services.

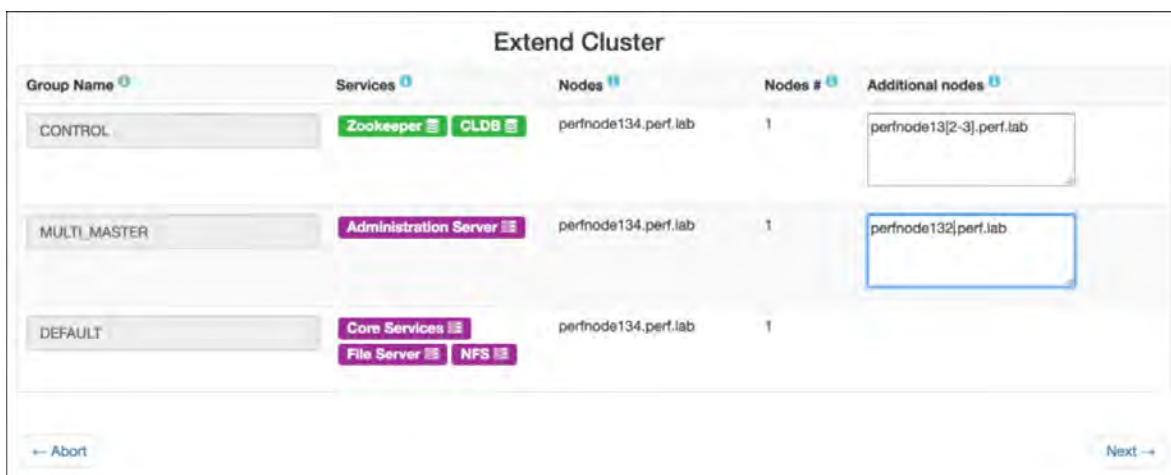

**Note:** If the **Extend Cluster** button is not visible, you might need to clear your browser cache and refresh the browser page.

3. Specify the nodes to be added:

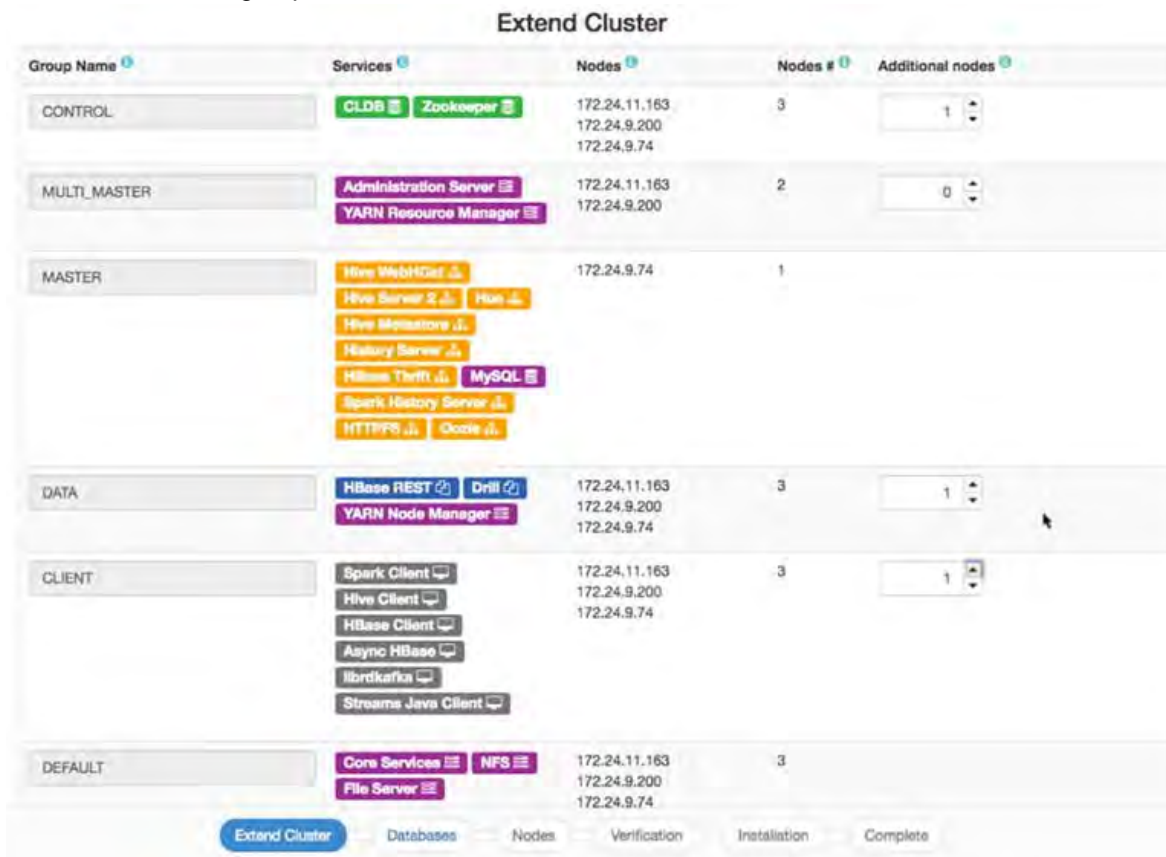

- **On-Premise Cluster**

In the **Additional Nodes** column, specify the host name(s) or IP address(es) of the nodes to be added. If you are adding multiple nodes, you can specify an array. The following example adds *perfnode132.perf.lab* and *perfnode133.perf.lab* to the CONTROL group and *perfnode132.perf.lab* to the MULTI\_MASTER group:

- **Cloud-Based Cluster**

In the **Additional Nodes** column, specify the number of nodes to be added. You do not need to specify the host name or IP address. The following example adds a node to each of the CONTROL, DATA, and CLIENT groups:

4. Click **Next**. The Installer checks the nodes to ensure that they are ready for installation and displays the **Authentication** screen.

5. Enter your SSH password and other authentication information as needed, and click **Next**. The installer displays the **Verify Nodes** screen.

**Note:** For a cloud-based cluster, the **Authentication** screen requests information that is specific to the type of cluster (AWS or Azure). Use the tooltips to learn more about the authentication information needed for your cluster.

6. Click a node icon to check the node status and see warnings or error information in the right pane. The node-icon color reflects the installation readiness for each node:

- Green (ready to install)
- Yellow (warning)
- Red (cannot install)

**Note:** If there are warnings or errors, hold your cursor over the warning or error in the right pane to see more information.

**Important:** If node verification fails, try removing the node and retrying the operation. If node verification fails and you abort the installation, you must use the **Import State** command to reset the cluster to the last known state. Otherwise, you will not be able to perform subsequent Installer operations. See [Importing or Exporting the Cluster State](#) on page 5649.

7. When you are satisfied that the nodes are ready to be installed, click **Next**. The Installer adds the nodes. After the nodes are added, you can use the control system to view the nodes in the cluster.
8. Perform any post-expansion steps. Post-expansion steps are necessary only if you added a node to a group containing a CLDB or Zookeeper.

| If you added a node to a group containing . . . | Do this                                                                                                                                                                                                                                                                                    |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Zookeeper only                                  | One node at a time, stop and restart the Zookeeper service on all Zookeeper nodes, restarting the master Zookeeper node last. You do not need to restart the Zookeeper node that was added. See <a href="#">Post-Expansion Steps for Extending a Cluster</a> on page 5645.                 |
| Zookeeper and CLDB<br>or<br>CLDB only           | One node at a time, restart all services on all nodes following the order prescribed in <a href="#">Manual Rolling Upgrade Description</a> on page 268. You do not need to restart the node that was added. See <a href="#">Post-Expansion Steps for Extending a Cluster</a> on page 5645. |

### Adding Nodes Using a Installer Stanza

To add nodes using a Installer Stanza, you add the `scaled_hosts2:` parameter (on-premise clusters) or the `scaled_count:` parameter (cloud-based clusters) to the Stanza file for the group that you want to scale. Then you run the Stanza using the `install` command. The services contained in the group are configured for the added node.

**Note:** If the group you are trying to scale does not contain the `mapr-core-5.2.x` service, the first group containing `mapr-core-5.2.x` will automatically get scaled.

1. In the Stanza file, add the `scaled_hosts2:` or `scaled_count:` parameter:

- **On-Premise Cluster**

Add the `scaled_hosts2` parameter to the group that you want to scale, specifying the host name(s) or IP address(s) of the nodes to be added. In the following example, the `perfnode132.perf.lab` node is added to the CLIENT group:

| Stanza Before Scaling                                                                                                                                                                                   | Modified Stanza with <code>scaled_hosts2</code> Parameter (On-Premise Cluster)                                                                                                                                                                                  |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>groups: - hosts:   - perfnode131.perf.lab   label: CLIENT - services:   - mapr-spark-client-2.0.1   - mapr-hive-client-1.2   - mapr-hbase-1.1   - mapr-asynchbase-1.7.0   - mapr-kafka-0.9.0</pre> | <pre>groups: - hosts:   - perfnode131.perf.lab   label: CLIENT   <b>scaled_hosts2:</b>   - <b>perfnode132.perf.lab</b> - services:   - mapr-spark-client-2.0.1   - mapr-hive-client-1.2   - mapr-hbase-1.1   - mapr-asynchbase-1.7.0   - mapr-kafka-0.9.0</pre> |

- **Cloud-Based Cluster**

Add the `scaled_count` parameter to the group that you want to scale. Include a number after the parameter to indicate the number of additional nodes to be added to the group. You do not need to specify the host names or IP addresses of the nodes to be added. In the following example, one additional node is added to the CLIENT group:

| Stanza Before Scaling                                                                                                                                                                                   | Modified Stanza with <code>scaled_count</code> Parameter (Cloud-Based Cluster)                                                                                                                                                   |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>groups: - hosts:   - perfnode131.perf.lab   label: CLIENT - services:   - mapr-spark-client-2.0.1   - mapr-hive-client-1.2   - mapr-hbase-1.1   - mapr-asynchbase-1.7.0   - mapr-kafka-0.9.0</pre> | <pre>groups: - hosts:   - perfnode131.perf.lab   label: CLIENT   <b>scaled_count: 1</b> - services:   - mapr-spark-client-2.0.1   - mapr-hive-client-1.2   - mapr-hbase-1.1   - mapr-asynchbase-1.7.0   - mapr-kafka-0.9.0</pre> |

2. Run the Stanza file using the `install` command. See [Installing or Upgrading Core Using an Installer Stanza](#) on page 5712. The Installer SDK detects the new `scaled_host(s)` and gives you the option to proceed with the installation or cancel.

3. Perform any post-expansion steps. Post-expansion steps are necessary only if you added a node to group containing a CLDB or Zookeeper.

| If you added a node to a group containing . . . | Do this                                                                                                                                                                                                                                                                                    |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Zookeeper only                                  | One node at a time, stop and restart the Zookeeper service on all Zookeeper nodes, restarting the master Zookeeper node last. You do not need to restart the Zookeeper node that was added. See <a href="#">Post-Expansion Steps for Extending a Cluster</a> on page 5645.                 |
| Zookeeper and CLDB<br>or<br>CLDB only           | One node at a time, restart all services on all nodes following the order prescribed in <a href="#">Manual Rolling Upgrade Description</a> on page 268. You do not need to restart the node that was added. See <a href="#">Post-Expansion Steps for Extending a Cluster</a> on page 5645. |

### Post-Expansion Steps for Extending a Cluster

You must perform post-expansion steps if you added a node to a group containing the CLDB or Zookeeper.

For more information about extending a cluster, see [Extending a Cluster by Adding Nodes](#) on page 5640.  
*Restarting Zookeeper Nodes*

If you used the Installer **Extend Cluster** function to add a node to a group containing Zookeeper only, you must restart Zookeeper on all Zookeeper nodes except for the added node.

One node at a time, stop and restart the Zookeeper service on all Zookeeper nodes, restarting the primary Zookeeper node last. Use the following restart steps.

#### *Restarting All Services for Zookeeper and CLDB*

If you used the Installer **Extend Cluster** function to add a node to a group containing Zookeeper and CLDB, or CLDB only, you must restart all services on all nodes.

One node at a time, restart all services on all nodes following the group upgrade order prescribed in [Manual Rolling Upgrade Description](#) on page 268. You do not need to restart the node that was added. Use the restart steps below.

#### *Restart Steps*

1. Change to the `root` user (or use `sudo` for the following commands).
2. Stop Warden.

```
sudo service mapr-warden stop
```

3. Stop Zookeeper.

```
service mapr-zookeeper stop
```

4. Start the ZooKeeper on nodes where it is installed.

```
service mapr-zookeeper start
```

5. On all nodes, start Warden. Example:

```
service mapr-warden start
```

- Over a period of time (depending on the cluster size and other factors) the cluster comes up automatically. After the CLDB restarts, there is a 15-minute delay before replication resumes, in order to allow all nodes to register and heartbeat. This delay can be configured using the `config save` command to set the `cldb.replication.manager.start.mins` parameter.

### Using the Incremental Install Function

Use the Incremental Install function of the web-based Installer to control security, add or upgrade services, upgrade Ezmeral Ecosystem Packs (EEPs), and perform other maintenance functions.

#### Things You Can Do Using the Incremental Install

Using the Incremental Install function, you can:

- Enable or disable security by using the **Enable MapR Secure Cluster** option
- Add services that are supported for your current EEP
- Apply a patch
- Delete a service from a cluster by deselecting the service
- Upgrade the Ezmeral Ecosystem Pack (EEP) to upgrade your services
- Change a 2-digit EEP to the equivalent 3-digit EEP (see [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653)

**Note:** Before enabling security using the Incremental Install function, be sure to review the known issue (IN-1084) related to custom certificates. See [MapR Installer Known Issues](#).

You cannot perform the following functions using an Incremental Install:

- Add a node to a cluster
- Delete a node from a cluster
- Upgrade the Core version

### Online Versus Offline Operations

Most **Incremental Install** operations are performed online. However, applying a patch or selecting or deselecting the **Enable MapR Secure Cluster** option are offline operations. See [Using the Enable Secure Cluster Option](#) on page 5630. Making a change to security requires the Installer to stop the Warden and Zookeeper services, bringing the cluster offline temporarily.

#### Using Incremental Install

- Using a browser, log in to the Installer:

```
https://<Installer Node hostname/Ipaddress>:9443
```

- Click the **Incremental Install** button. The **Version & Services** page appears.
- Make the desired changes to add or remove security, add or delete services, apply a patch, or upgrade the EEP. Then click **Next**.
- Advance through the Installer screens, providing the admin password or other information as needed.
- After the **Incremental Install** finishes, if you added services, use the Control System **Services** tab or the `maprcli service list -node` command to ensure that the services are running. If the services are not running, you might need to restart the nodes. For more information, see IN-1332 in [Installer Known Issues](#) on page 5663.

## Enabling or Disabling Metrics Collection or Logging

You can use the Installer to enable or disable metrics collection and logging during a new or incremental installation.

During installation using the Installer, you can configure metrics and logging using settings on the **Monitoring** page of the Installer user interface. Installing the metrics collection infrastructure is selected by default because the control system relies on these metrics to provide graphs and charts. Logging is deselected by default.

If you did not install metrics collection or logging during your initial installation, you can add it later by selecting the feature during an [Incremental Install](#).

If you installed metrics collection or logging during your initial installation but you want to disable it, you can do so by deselecting the feature during an [Incremental Install](#).

**Note:** If you do not install (or choose to uninstall) the metrics collection infrastructure, the control system cannot display graphs and charts.

## Using the MapR Subnet and MapR External Advanced Options

Using the Installer advanced options available under Node Configuration, you can restrict the cluster to a subset of network interface cards (NICs) or specify public IP addresses that can be used with the cluster nodes.

Using these options in the Installer has the same effect as manually inserting the MAPR\_SUBNETS and MAPR\_EXTERNAL environment variables into the [env\\_override.sh](#) file on all nodes.

**Attention:** The Installer does not validate the functionality of the subnets or IP addresses that you provide. If you provide incorrect values, it is possible for the installation to succeed initially and later develop connectivity issues. For this reason, it is critical that you supply accurate values for the Installer **MapR Subnet** and **MapR External** advanced options.

### MapR Subnet

Allows you to set a subnet mask to restrict cluster services to certain interfaces. The values specified in this field are used to populate the MAPR\_SUBNETS environment variable.

Specify one or more comma-separated subnet masks. For example:

```
10.10.15.0/24,10.10.16.0/24
```

The information on this page is specific to the web-based Installer. To configure the MAPR\_SUBNETS environment variable for a manual installation, see [Designating NICs for HPE Ezmeral Data Fabric](#) on page 921.

### MapR External

Allows you to specify external IP addresses for the CLDB, filesystem, and MAST Gateway nodes.

Do NOT use DNS names. Specify a comma-separated list of tuples of host names and external IP addresses. For example:

```
node1:1.1.1.1,node2:1.1.1.2,node3:1.1.1.3
```

The specified node names need to match the host name you specified for the host earlier in Node Configuration. The information on this page is specific to the web-based Installer. To configure the MAPR\_SUBNETS environment variable for a manual

installation, see [Designating NICs for HPE Ezmeral Data Fabric](#) on page 921.

### Related reference

[Environment Variables](#) on page 2576

Describes the environment variables specific to the HPE Ezmeral Data Fabric.

### Related information

[Designating NICs for HPE Ezmeral Data Fabric](#) on page 921

Explains how to assign IP address blocks for HPE Ezmeral Data Fabric.

### Online vs. Offline Operations

Most Installer operations are offline operations, meaning that the cluster must be brought down in order to perform the operation. But there are some exceptions.

The following table shows which Installer operations are offline and online:

| Offline Operations                                                  | Online Operations                                                    |
|---------------------------------------------------------------------|----------------------------------------------------------------------|
| <a href="#">Upgrading Core With the Installer</a> on page 257       | <a href="#">Using the Incremental Install Function</a> on page 5646* |
| <a href="#">Performing a Maintenance Update</a> on page 5650        | <a href="#">Extending a Cluster by Adding Nodes</a> on page 5640**   |
| <a href="#">Applying a Patch Using the Installer</a> on page 394    |                                                                      |
| <a href="#">Using the Enable Secure Cluster Option</a> on page 5630 |                                                                      |

\*Using the **Incremental Install** function to apply a patch or change security settings is an offline operation.

\*\*Adding a node to a CONTROL group requires a manual, rolling restart of the entire cluster.

### Starting Up a Cluster Using the Installer Startup Button

You can use a single button to start software on a cluster.

The **Startup** button is a feature of Installer 1.8 or later. The **Startup** button appears on the status page of the Installer web interface when the cluster is in the shutdown state. The **Startup** button starts Warden and Zookeeper, which in turn start other running services that are part of a cluster.

**Note:** If the **Startup** button is not visible and the **Shutdown** button is present, the cluster is still running and is not in the shutdown state

The **Startup** button works differently depending on your cluster deployment:

| Deployment   | Startup Button Behavior                                                                      |
|--------------|----------------------------------------------------------------------------------------------|
| On premise   | Starts the Zookeeper and Warden services on all nodes.                                       |
| In the cloud | Starts the virtual machine nodes and then starts Zookeeper and Warden services on all nodes. |

To use the **Startup** button:

1. For a cluster deployed in the cloud, use the AWS console or the Azure portal to ensure that the nodes are shut down before you try to start them.
2. Use a browser to connect to the cluster using the Installer URL:

```
https://<Installer Node hostname/IPaddress>:9443
```

3. On the status screen, click the **Startup** button. The Installer displays the **Authentication** screen.

4. Enter your authentication information if requested, and click **Startup**. The installer begins the startup process.
5. To shut down software on the cluster, see [Shutting Down a Cluster Using the Installer Shutdown Button](#) on page 5649.

### Shutting Down a Cluster Using the Installer Shutdown Button

You can use a single button to shut down software on a cluster.

The **Shutdown** button appears on the status page of the Installer web interface when you connect to an installed cluster using Installer 1.6 or later. The **Shutdown** button shuts down Warden and Zookeeper, which in turn shut down other running services that are part of a cluster. When you use the **Shutdown** button, the Installer implements the same orderly shutdown used to perform software upgrades.

The **Shutdown** button works differently depending on where the cluster is deployed:

| Deployment   | Shutdown Button Behavior                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| On premise   | Does not stop non-HPE software and does not power off the nodes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| In the cloud | <p>Shuts down (but does not remove) all the nodes in the cluster:</p> <ul style="list-style-type: none"> <li>• If the installer node is part of the cluster, the installer node is not shut down, but Warden shuts down the services on the installer node.</li> <li>• To shut down the installer node, use AWS-console or Azure-portal commands to stop the instance.</li> </ul> <p> <b>CAUTION:</b> If a shutdown is initiated on an AWS cluster using an instance store, all data will be lost.</p> |

To use the **Shutdown** button:

1. Review [Shutting Down a Cluster](#) on page 872 for some pre-shutdown steps you may want to perform before shutting down Warden and Zookeeper.
2. Use a browser to connect to the cluster using the Installer URL:

```
https://<Installer Node hostname/IPaddress>:9443
```

3. On the status screen, click the **Shutdown** button. The Installer asks you if you want to continue.
4. Click **OK**. The Installer displays the **Authentication** screen.
5. Enter your authentication information if requested, and click **Shutdown**. The installer begins the shutdown process.
6. To restart software on the cluster, see [Starting Up a Cluster Using the Installer Startup Button](#) on page 5648.

**Note:** Do not attempt to restart the cluster until you have confirmed that it is shut down. For an on-premise cluster, the presence of the **Startup** button on the Installer status page indicates that the cluster is shut down and ready to be started. For a cluster deployed in the cloud, the **Startup** button must be present, *and* you must use the AWS or Azure console to verify that the servers are down before restarting.

### Importing or Exporting the Cluster State

You can use the Import State and Export State commands to upload or download a YAML configuration file (a "Stanza") that describes the state of the cluster.

In the web-based Installer, the **Import State** and **Export State** commands can be useful if you encounter a failure while using the installer and you want to revert to a previous cluster state. You can access these commands from the **Support** menu at the top of the Installer user interface.

|                     |                                                                                                                                                                                                                                                  |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Import State</b> | Opens the <b>Cluster State</b> dialog box, which enables you to reset the cluster to the last known state or to a desired state recorded in a YAML configuration file that you specify. You can use the <b>Import State</b> command at any time. |
| <b>Export State</b> | Downloads a YAML file capturing the current state of the cluster. You can use the <b>Export State</b> command at any time.                                                                                                                       |

For more information about using Installer Stanza files, see [Installer Stanzas](#).

To import the cluster state, follow these steps:

1. Using a browser, log in to the Installer:

```
https://<Installer Node hostname/IpAddress>:9443
```

For more information about the Installer, see [Installer](#) on page 5599.

2. Click **Support > Import State**. The **Cluster State** dialog box appears.
3. Chose *one* of the following options:
  - Click **Reset** to revert the cluster to the last known state. (After a successful installation or Incremental Install using the Installer or Stanzas, the last known state of the cluster is saved to `/opt/mapr/installer/data/last_known_state.yaml`.)
  - Click **Choose File**, select a YAML file, and then click **Reset** to load the YAML file.

To export the cluster state, follow these steps:

1. Using a browser, log in to the Installer:

```
https://<Installer Node hostname/IpAddress>:9443
```

For more information about the Installer, see [Installer](#) on page 5599.

2. Click **Support > Export State**.

The cluster state is downloaded as `stanza.yaml`.

### Performing a Maintenance Update

Perform a maintenance update when you want to upgrade to a new patch version of core or apply a patch.

A maintenance update is an update to your installed software that does not require configuration-file changes. Performing a maintenance update has no effect on the ecosystem packages (EEP components). You perform a maintenance update when you want to do either or both of the following:

- **Update to a new patch version of core.** For example, you can perform a maintenance update to change your core version from release 6.1.0 to release 6.1.1. You cannot use a maintenance update to change your core version from a minor version, such as 6.1, to another minor version, such as 6.2. Use the **Version Upgrade** button for minor-version upgrades. The **Version Upgrade** button also permits an upgrade to a patch version of core.
- **Apply a patch.** The **Maintenance Update** page is one of several installer screens that offer the **Patch file** option. See [Applying a Patch Using the Installer](#) on page 394.

You cannot perform a maintenance update if your current EEP version is incompatible with the selected MapR core version. For example, you cannot do a maintenance update from release 6.1.0 and EEP 6.3.0

to release 6.1.1 because EEP 6.3.0 is not compatible with release 6.1.1. For EEP and core compatibility information, see [EEP Support and Lifecycle Status](#) on page 5734.

**Note:** The maintenance update is an offline update (not a rolling update).

You perform a maintenance update using the Installer. To perform a maintenance update:

1. Verify that your installed EEP is supported by the core version you plan to select for the maintenance update. To check your EEP version, see [Checking the EEP Version](#) on page 5618. For EEP and core compatibility information, see [EEP Support and Lifecycle Status](#) on page 5734.
2. Update the Installer to the latest supported version. See [Updating the Installer](#) on page 5614.
3. Prepare the cluster for a maintenance update by referring to one or both of these topics:
  - [Preparing to Upgrade Core](#) on page 252
  - [Verify Cluster Readiness for a Patch](#)
4. Start the Installer. For more information, see [Installer](#) on page 5599.
5. Click the **Maintenance Update** button.
6. Change the core version, or install a core patch, or both.

**Important:** During patch-file installation, do not refresh the browser page while the patch file is being uploaded. Doing so can interrupt the upload process.

7. Click **Next** to complete the update.

### Related concepts

[Checking the EEP Version](#) on page 5618

Some Installer operations require you to know the version of the currently installed Ezmeral Ecosystem Pack (EEP). You can check the EEP version easily from within the Installer user interface or derive the EEP version from your repository information.

[Installer Updates](#) on page 5684

Installer updates provide new features or bug fixes.

### Auto-Provisioning Templates

Describes the Installer auto-provisioning templates.

Auto-provisioning templates let you select from different provisioning options to address a range of computing requirements. Each template provides a different mix of services and capabilities. You can select the template you need when installing using the Installer web-based interface or Installer Stanzas.

Installer 1.14 provided the following auto-provisioning templates:

| Template Names in Installer                | Template Name for Stanzas | Description                                                                                              |
|--------------------------------------------|---------------------------|----------------------------------------------------------------------------------------------------------|
| Batch, interactive and real-time analytics | template-05-converged     | Deploys YARN, HPE Ezmeral Data Fabric Database, HPE Ezmeral Data Fabric Event Streams, Drill, and Spark. |
| Data Lake: Common Hadoop Services          | template-10-hadoop        | Provides the most common services deployed in an Apache Hadoop cluster for getting started with          |

| Template Names in Installer                                                                             | Template Name for Stanzas | Description                                                                                                                                                                                                                                                  |
|---------------------------------------------------------------------------------------------------------|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                         |                           | a Hadoop data lake. Includes YARN, MapReduce, Spark, and Hive on top of the HPE Ezmeral Data Fabric.                                                                                                                                                         |
| Data Exploration: Interactive SQL with Apache Drill                                                     | template-20-drill         | Provides services needed for users to perform schema-free interactive exploration of their data, including the Apache Drill SQL engine and the Hive Metastore.                                                                                               |
| Database for Analytics                                                                                  | template-30-maprdb        | Deploys the HPE Ezmeral Data Fabric Database, providing both JSON and binary data models to enable analytic applications to perform in-situ data processing.                                                                                                 |
| Database for Operational Applications                                                                   | template-30-maprdb2       | Deploys the HPE Ezmeral Data Fabric Database, providing both JSON and binary data models to enable operational applications to read and write data at high rates.                                                                                            |
| Database and Distributed Query Service for Operational Applications                                     | template-30-maprdb3       | Deploys the HPE Ezmeral Data Fabric Database, providing both JSON and binary data models to enable operational applications to read and write data at high rates. It also deploys Drill as distributed query service performant distributed query execution. |
| Real-time Analytics: Apache Spark Streaming including SparkML and GraphX                                | template-40-maprstreams   | Deploys Spark Streaming and HPE Ezmeral Data Fabric Event Streams for real-time streaming applications.                                                                                                                                                      |
| HPE Ezmeral Data Fabric File Store                                                                      | template-60-maprxd        | Provides common services for HPE Ezmeral Data Fabric File Store (core, filesystem, NFS).                                                                                                                                                                     |
| Real-time and batch analytics with Apache Spark on HPE Ezmeral Data Fabric including SparkML and GraphX | template-60-spark         | Deploys real-time and batch analytics with Apache Spark on data-fabric, including SparkML and GraphX.                                                                                                                                                        |
| Custom Services                                                                                         | N/A                       | Selecting this template allows you to customize the services that are installed. No services are selected by default.                                                                                                                                        |

### MapR Installer 1.10 Updates to the Auto-Provisioning Templates

The following templates were renamed in MapR Installer 1.10:

| Old Name (MapR Installer 1.9)                                             | New Name (MapR Installer 1.10)                                           |
|---------------------------------------------------------------------------|--------------------------------------------------------------------------|
| MapR Converged Cluster: Batch, interactive and real-time analytics        | MapR Data Platform: Batch, interactive and real-time analytics           |
| Analytics with MapR Database                                              | MapR Database (MapR-DB) for Analytics                                    |
| Operational Applications with MapR Database                               | MapR Database for Operational Applications                               |
| Operational Applications with MapR Database and Distributed Query Service | MapR Database and Distributed Query Service for Operational Applications |
| File Store: Cloud Scale Data Platform                                     | MapR File System and Object Store (File Store)                           |

For MapR Installer 1.10, these features were added to the MapR File System and Object Store (File Store) template:

- MAST Gateway

- NSFv4

### MapR Installer 1.9 Updates to the Auto-Provisioning Templates

For MapR Installer 1.9, the following changes to the auto-provisioning templates were implemented:

- A new auto-provisioning template was added. The **Operational Applications with HPE Ezmeral Data Fabric Database and Distributed Query Service** template includes the MapR DataBase and the OJAI Distributed Query services.
- Other templates were changed to enable the use of Drill as an optional selection with the OJAI Distributed Query Service. The following table compares the contents of the various HPE Ezmeral Data Fabric Database templates:

| Template                                                                                     | MapR-DataBase | OJAI Distributed Query Service* | Drill |
|----------------------------------------------------------------------------------------------|---------------|---------------------------------|-------|
| MapR Converged Cluster: Batch, interactive and real-time analytics                           | Y             | Y                               | Y     |
| Analytics with HPE Ezmeral Data Fabric Database                                              | Y             | Y                               | Y     |
| Operational Applications with HPE Ezmeral Data Fabric Database                               | Y             | N                               | N     |
| Operational Applications with HPE Ezmeral Data Fabric Database and Distributed Query Service | Y             | Y                               | N     |

\*Prior to MapR Installer 1.9, this service was called the OJAI Query Service.

### Understanding Two-Digit and Three-Digit EEPs

Understanding the differences between the EEP directories on <https://package.mapr.hpe.com/releases/MEP/> can help you prevent versioning issues.

To install or update a Ezmeral Ecosystem Pack (EEP), either manually or by using the Installer, you must first choose a EEP version. The EEP version that you choose has a corresponding subdirectory on <https://package.mapr.hpe.com/releases/MEP/> from which the ecosystem packages are retrieved.

For each released EEP, the <https://package.mapr.hpe.com/releases/MEP/> directory includes both two-digit and three-digit subdirectories:

# Index of /releases/MEP

| <u>Name</u>                                                                                                        | <u>Last modified</u> | <u>Size</u> | <u>Description</u> |
|--------------------------------------------------------------------------------------------------------------------|----------------------|-------------|--------------------|
|  <a href="#">Parent Directory</a> |                      | -           |                    |

|  <a href="#">MEP-6.3.3/</a>     | 23-Mar-2021 20:49    | -           |                    |
|  <a href="#">MEP-6.3.4/</a>     | 01-Jun-2021 16:04    | -           |                    |
|  <a href="#">MEP-6.3/</a>       | 01-Jun-2021 16:04    | -           |                    |
|  <a href="#">MEP-7.0.0/</a>     | 17-Sep-2020 07:51    | -           |                    |
|  <a href="#">MEP-7.0.1/</a>     | 02-Feb-2021 05:37    | -           |                    |
|  <a href="#">MEP-7.0/</a>       | 02-Feb-2021 05:37    | -           |                    |
|  <a href="#">MEP-7.1.0/</a>     | 01-Jun-2021 16:08    | -           |                    |
|  <a href="#">MEP-7.1/</a>       | 01-Jun-2021 16:08    | -           |                    |

The following table compares the two-digit and three-digit subdirectories and describes how they are used:

| EEP Subdirectory | Example    | Continuously Updated? | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------|------------|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Two-digit        | MEP-3.0/   | Yes                   | <p>Subdirectories using two digits (for example, MEP-3.0) contain the latest EEP and patches and are continuously updated. For example, if you select EEP 3.0 when using the Installer, the installer installs or upgrades your cluster with the packages from the most current version of EEP 3.0.x. If the most current version is EEP 3.0.1, EEP 3.0.1 is installed. If the most current version is EEP 3.0.2, EEP 3.0.2 is installed, and so on.</p> <p>If you later decide to make changes to the cluster, the Installer applies the packages from the most current version, which can be different from the version you installed originally.</p> <p>Two-digit EEP version numbers make new patches available automatically without the need for system reconfiguration.</p> |
| Three-digit      | MEP-3.0.0/ | No                    | <p>Subdirectories using three digits contain a fixed EEP version, including patches, and are not continuously updated. For example, if you select EEP 3.0.0 when using the Installer, the installer uses the packages from the MEP-3.0.0 subdirectory and continues to use the MEP-3.0.0 subdirectory until you change the specified EEP version.</p> <p>Three-digit EEP version numbers ensure that your cluster uses only the specified EEP version. They are best for users who install software manually and do not require automatic updates.</p>                                                                                                                                                                                                                             |

### MapR Installer Use of Two-Digit and Three-Digit EEPs

Installer version 1.5 automatically uses two-digit EEPs. Installer versions 1.6 and later use three-digit EEP versions and do not allow you to select two-digit EEPs.

### Upgrades from Installer 1.5 to 1.6 or later

If you upgrade the Installer from version 1.5 to a later version, you see both two-digit and three-digit EEPs in the EEP drop-down list for an Incremental Install. The two-digit EEPs continue to operate as they did previously, installing the latest three-digit EEP with the same first two digits. The three-digit EEPs operate as described earlier on this page. Installer version 1.7 displays and supports only three-digit EEPs.

**Note:** If your cluster uses two-digit EEPs, recommends that you upgrade to three-digit EEPs as soon as it is convenient to do so. Doing so enables you to use new features such as the "Extend Cluster" feature without introducing EEP version inconsistencies. You can upgrade by [performing an Incremental Install](#) and selecting a three-digit EEP.

### Related concepts

[Installer Updates](#) on page 5684

Installer updates provide new features or bug fixes.

### Related tasks

[Checking the Installer Version](#) on page 5617

Some Installer features require you to use the latest version of the Installer. You can check the Installer version easily from within the user interface.

### Uninstalling Software Using the Installer Uninstall Button

You can use a single button to uninstall data-fabric software on all nodes in the cluster.

The **Uninstall** button appears on the status page of the Installer web interface when you connect to an installed cluster. The **Uninstall** button removes data-fabric software (but does not remove the Installer) from all nodes in the cluster.

**Note:** You can also use Installer Stanzas to uninstall software. See [Uninstalling Core Using an Installer Stanza](#) on page 5714.

To use the **Uninstall** button:

1. Use a browser to connect to the cluster using the Installer URL:

```
https://<Installer Node hostname/IPaddress>:9443
```

2. On the status screen, click the **Uninstall** button. The Installer displays the **Uninstall** screen.
3. Enter your SSH password and other authentication information as needed, and click **Next**. The installer begins the uninstall process.

## Installer Troubleshooting

This section describes how to identify and solve problems when you use the Installer.

### Logs for the Installer

This topic describes the logs generated by the Installer and Installer Stanzas.

Installer logs are written to the following folder: `/opt/mapr/installer/logs`.

The following list describes each log:

`<nodename>.log[.x]`

Shows installation activities associated with a particular node. Every time you run the Installer or a Installer Stanza, a new copy of this log is created for each node in the cluster. When you encounter errors, you should check this log first, and then check the `mapr-installer.log`.

The node log is created only if the software was able to run Ansible successfully on the node. If incorrect credentials were provided for the root user, or if there was an issue and Ansible quit before issuing the first logging callback, no log file is created for the node. If this happens, you must consult `mapr-installer.log`.

`installer.log[.x]`

Logs the REST calls sent to the installer and the database events that the installer runs. Every time you run the Installer or a Installer Stanza, a new copy of this log is created. If the log is not present, you might need to restart the installer (`service mapr-installer restart`).

`installer-cli.log[.x]`

Shows the progress of installation for a Installer Stanza. Every time you run a Installer Stanza, a new copy of this log is created.

`installer-process.log`

Serves as the top-level log file for the Ansible part of the installer. This log is created by the main Python script that runs the installer backend. This log typically shows the same information as `mapr-installer.log`.

`mapr-installer.log[.x]`

Shows the progress of Ansible scripts performed by the installer server. This log is useful if back-end issues prevent the creation of `<nodename>.log`.

Every time you run the Installer or a Installer Stanza, a new copy of this log is created.

### Creating an Archive of Installer Logs

This topic describes how you can create a .zip archive of the logs generated by the Installer and Installer Stanzas. The .zip archive is a handy way to share log information with HPE support personnel.

To create a .zip archive of all the installer logs, use one of these commands:

- From the Installer web-based interface, click **Support > Download Installer Logs**.
- From a browser, specify the following URL. When prompted, supply the user name and password for the Installer:

```
https://<host_name>:9443/api/process/installer.zip
```

- From a terminal, specify the following syntax:

```
wget --no-check-certificate
https://mapr:mapr@<host_name>:9443/api/process/installer.zip
```

For information about Installer logs, see [Logs for the MapR Installer](#).

### Using Service Verification

The service verification feature provides an easy way to verify that services on all nodes in the cluster are running and functional.

-  **Important:** Service verification is not currently implemented for all services. Support for additional services will be added in subsequent releases.

For secure or non-secure clusters, you can run the service verification feature from the Installer user interface. Service verification is useful after a new installation. For example, service verification can detect whether all services have successfully joined a cluster. You can run a service verification any time after the cluster is installed to check the general health of services on all nodes.

### Before Using Service Verification

Before you can use the service verification feature:

- The cluster must be installed, and you must have installed it by using the Installer or Installer Stanzas.
- Ensure that the Installer is up to date. Service verification is supported only on Installer [versions](#) 1.15.0.0 and later.
- Service verification can only be performed from the Installer node. The Installer node is the node where you run the Installer.
- Running service verification requires `root`-user access (or `sudoer` access to `root`) for remote authentication. (When you perform service verification, the Installer node must ssh into each of the cluster nodes.)

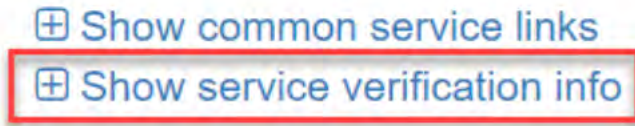

### Performing Service Verification Using the Installer User Interface

To perform service verification from the Installer user interface:

1. On the Installer node, use a browser to navigate to the Installer home page, and log on as the cluster admin:

```
https://<Installer Node hostname/IPaddress>:9443
```

2. Scroll down until you see the following links:

3. Click the **Show service verification info** link to display the list of services and nodes.
4. Click **Run Service Verification** to start the verification. The Installer prompts for the `root` user password:

**Run Service Verification**

Configure Remote Authentication

|                     |                                        |                                                                                                                                 |
|---------------------|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| Login Method        | SSH - Password <sup>i</sup>            |                                                                                                                                 |
| SSH Username        | <input type="text" value="root"/>      | The username used to SSH into each node to perform installation. This user must either be root, or a user with sudo privileges. |
| SSH Password        | <input type="password" value="*****"/> |                                                                                                                                 |
| Verify SSH Password | <input type="password" value="*****"/> |                                                                                                                                 |
| SSH Port            | <input type="text" value="22"/>        |                                                                                                                                 |

5. Enter the `root` user credentials, and click **Run Service Verification**. Verification can take anywhere from a few seconds to several minutes, depending on the size of the cluster, the network, and other attributes that affect performance. When the verification activity is complete, the Installer shows a list of

services with the verification output for each service. For example:

| Service Name             | ❏                      | ❏                      | ❏                      |
|--------------------------|------------------------|------------------------|------------------------|
| Apiserver                | NOT_IMPLEMENTED        | NOT_IMPLEMENTED        | NOT_INSTALLED          |
| CLDB                     | NOT_IMPLEMENTED        | NOT_IMPLEMENTED        | NOT_IMPLEMENTED        |
| Collectd                 | VERIFIED               | VERIFIED               | VERIFIED               |
| Data Access Gateway      | NOT_IMPLEMENTED        | NOT_IMPLEMENTED        | NOT_INSTALLED          |
| File Server              | NOT_IMPLEMENTED        | NOT_IMPLEMENTED        | NOT_IMPLEMENTED        |
| Gateway                  | NOT_IMPLEMENTED        | NOT_IMPLEMENTED        | NOT_INSTALLED          |
| Grafana                  | RUNNING_NOT_RESPONDING | RUNNING_NOT_RESPONDING | NOT_INSTALLED          |
| HBase Client             | RUNNING_NOT_RESPONDING | RUNNING_NOT_RESPONDING | RUNNING_NOT_RESPONDING |
| HBase Thrift             | NOT_INSTALLED          | NOT_INSTALLED          | NOT_IMPLEMENTED        |
| History Server           | NOT_INSTALLED          | NOT_INSTALLED          | NOT_IMPLEMENTED        |
| Apache Kafka Java Client | RUNNING_NOT_RESPONDING | RUNNING_NOT_RESPONDING | RUNNING_NOT_RESPONDING |
| Apache Kafka REST API    | NOT_RUNNING            | NOT_RUNNING            | NOT_RUNNING            |
| Mastgateway              | NOT_IMPLEMENTED        | NOT_IMPLEMENTED        | NOT_IMPLEMENTED        |
| YARN Node Manager        | NOT_IMPLEMENTED        | NOT_IMPLEMENTED        | NOT_IMPLEMENTED        |
| Oozie                    | NOT_INSTALLED          | NOT_INSTALLED          | NOT_RUNNING            |
| OpenTSDB                 | VERIFIED               | VERIFIED               | VERIFIED               |
| YARN Resource Manager    | NOT_IMPLEMENTED        | NOT_IMPLEMENTED        | NOT_INSTALLED          |
| Spark History Server     | NOT_INSTALLED          | NOT_INSTALLED          | NOT_IMPLEMENTED        |
| Spark Thrift Server      | NOT_INSTALLED          | NOT_INSTALLED          | NOT_IMPLEMENTED        |
| Zookeeper                | NOT_IMPLEMENTED        | NOT_IMPLEMENTED        | NOT_IMPLEMENTED        |

Possible values are:

- FAILED\_TO\_EXECUTE
- NOT\_IMPLEMENTED
- NOT\_INSTALLED
- NOT\_RUNNING
- NOT\_STARTED
- RUNNING\_NOT\_RESPONDING
- VERIFIED

6. To rerun service verification – for example, after running it once and discovering some services are not responding – click **Run Service Verification** again.

### Service Verification Logs

On each node where a service is installed, logged output from the service verification feature is saved to:

```
$MAPR_HOME/<service>/<service>-<version>/var/log/<service>/
verify_service.<date>
```

For example, service verification output for OpenTSDB might be found here:

```
pwd
/opt/mapr/opentsdb/opentsdb-2.4.0/var/log/opentsdb
```

```

Possible return codes for the log output are:

- 0 – running and responding to a simple interaction test
- 1 – not running

- 2 – running but not responding to a simple interaction test
- 3 – not started\*

\*From Warden's point of view, the service is enabled, but Warden has not started it yet.

### Related concepts

[Updating the Installer](#) on page 5614

Update the Installer to include the latest ecosystem packages and installer fixes. Once you update the Installer, you can install ecosystem components and software versions that were made available after you first configured the Installer.

[Installer Prerequisites and Guidelines](#) on page 5601

The node on which you run the installer and the nodes you plan to include in your cluster must meet certain user, connectivity, and security requirements.

### Starting and Stopping the Installer

Describes how and when you need to shut down and restart the Installer.

It is seldom necessary to shut down and restart the Installer, but you might need to do so in the following scenarios:

- You are troubleshooting an Installer issue, and stopping and restarting the Installer might resolve the issue.
- You need to upgrade the OS for a node. See [When Upgrading Core with the Installer Requires an OS Upgrade](#) on page 250.
- You want to run the Installer node in FIPS-compliant mode, and you cannot leave the Installer running because the Installer is not FIPS compliant.

### Checking the Installer Status

When you are not sure if the Installer is running, use the following command to check the status:

```
systemctl status mapr-installer
```

### Starting and Restarting the Installer

To start or restart the Installer (requires `root` authentication):

```
systemctl start mapr-installer
```

### Stopping the Installer

Note that if you stop the Installer while an installation is in progress, any passwords that you provided to the Installer user interface are lost. The Installer retains password information in memory and not in the Installer database. If you then restart the Installer to continue the installation, the installation fails. In this scenario, you must restart the Installer and the Installer user interface and re-enter the password information to resume the installation.

To stop the Installer (requires `root` authentication):

```
systemctl stop mapr-installer
```

### Related concepts

[Resetting the Installer Database](#) on page 5662

The `reset` command uninstalls the metadata from the Installer database. `reset` is for advanced users.

**Related tasks**

[Starting Up a Cluster Using the Installer Startup Button](#) on page 5648

You can use a single button to start software on a cluster.

[Shutting Down a Cluster Using the Installer Shutdown Button](#) on page 5649

You can use a single button to shut down software on a cluster.

**Resetting the Installer Database**

The `reset` command uninstalls the metadata from the Installer database. `reset` is for advanced users.

You can reset the Installer database by using the CLI `reset` command or by using the Installer web interface (**Support > Reset Installer**).

The reset function can be useful for testing purposes, but use reset with caution. If you reset the installer database while packages are installed on the nodes, you will need to remove the packages manually.

**Note:** If you experience a failure while installing or uninstalling, the installer prompts you to retry the operation or uninstall and then reinstall from scratch. You should always retry or uninstall before considering using `reset`.

This example resets the Installer database. The `-nv` option specifies that certificates will not be checked and the output mode is verbose:

```
./bin/mapr-installer-cli reset -nv
```

**Troubleshooting Repository URL Errors**

This page describes how to troubleshoot an issue in which an incorrect repository URL is stored in the Installer `properties.json` file.

**How Repository URL Errors Can Occur**

The `properties.json` file stores information such as the user ID of the cluster administrator, the user ID of the Installer, the OS type, Internet access information, and the repository URL. Once the repository URL has been stored in `properties.json`, the Installer assumes that the URL will not change.

If you run `mapr-setup.sh -r <url>` and you make a mistake when typing the URL, the incorrect URL is added into the Installer `properties.json` file. If you later run `mapr-setup.sh -r <url>` again but with the correct URL, the `properties.json` is not updated. Even upgrading the installer packages does not update the repository URL in `properties.json`.

Some versions of the Installer generate a warning if you try to correct the URL by running `mapr-setup.sh -r <url>` again, but older versions of the Installer do not generate a warning. Whether or not a warning is generated, you can correct the issue, but how you do so depends on the version of the Installer that is installed.

**Fix Using Installer 1.10 or Later**

Installer 1.10 and later versions generate a warning if you run `mapr-setup.sh -r <url>` and provide a new URL. The warning describes two ways to change the URL currently stored in the `properties.json` file:

- You can use the `reload` or `remove` command, and then specify a new URL:

1. Use *one* of the following commands:

```
bash /tmp/mapr-setup.sh -R <new_url> reload
```

or

```
bash /tmp/mapr-setup.sh remove
```

Using the `remove` command removes `properties.json`, the installer database, and the installer packages, but not the setup script.

2. Specify the new URL:

```
bash /tmp/mapr-setup.sh -r <new_url>
```

- You can manually edit the `properties.json` file:

1. Edit the `properties.json` file to specify the new URL:

```
edit /opt/mapr/installer/data/properties.json
```

2. Reload the MapR Installer:

```
systemctl restart mapr-installer
```

### Fix Using Installer 1.9 or Earlier

Installer 1.9 and earlier do NOT generate a warning if you run `mapr-setup.sh -r <url>` and provide a new URL. To pass a new repository value into `properties.json` for Installer versions 1.9 or earlier, you must first remove the installer files:

```
mapr-setup.sh remove
```

Using the `remove` command removes `properties.json`, the installer database, and the installer packages, but not the setup script. After the files are removed, you can rerun `mapr-setup.sh` to specify the new repository URL:

```
bash /tmp/mapr-setup.sh -r <new_url>
```

To run `mapr-setup.sh`, see [MapR Installer](#). For information about options you can use with `mapr-setup.sh`, see [Using mapr-setup.sh](#).

### Installer Known Issues

This topic describes some Installer known issues that you should be aware of while troubleshooting.

If you are viewing this page from within the Installer application, click [here](#) to display the information in a browser.

#### IN-3016

On Installer 1.16 and earlier, clicking **Abort** during the **Extend Cluster** operation returns you to the verification page and does not reset the Installer database back to its initial state.

(Note that on Installer 1.17 and later, clicking **Abort** resets the Installer database automatically so that you can retry the operation.)

**Workaround:** On Installer 1.16 and earlier, use these steps to reset the Installer database manually and retry the **Extend Cluster** operation:

1. Click **Support > Reset Installer**. This command uninstalls the metadata from the Installer database. For more information, see [Resetting the Installer Database](#) on page 5662.
2. Click **Support > Import State**. The **Cluster State** dialog box appears, enabling you to reset the cluster to the last known state. For more information, see [Importing or Exporting the Cluster State](#) on page 5649.
3. Click **Reset** to recover the Installer to the last known state and return to the Installer home page.
4. If necessary, retry the **Extend Cluster** operation.

**IN-3007**

During a multinode installation of core 6.2 on SLES 15 SP2, the Installer returns the following error:

```
"msg": "user {{ ssh_id }} does
not have the ability to elevate
privileges - check for correct
sudoers config for example"
```

This issue can occur when Python is not installed on all cluster nodes.

**Workaround:** Check to ensure that Python is installed on all cluster nodes. Install Python, if it is not already installed.

**IN-2924**

Upon restart, cluster nodes running Loopback NFS do not remount `/mapr`. This issue can occur when using Installer 1.16.0.0 to perform a new or incremental installation. The issue is caused by a missing symlink.

**Workaround:** Manually create a symlink from `/usr/local/mapr-loopbacknfs/conf/mapr_fstab` to `/opt/mapr/conf/mapr_fstab`, and use the following commands to restart NFS and mount `/mapr`:

1. Restart the Loopback NFS service:

```
maprcli node services -nodes <node
names> -nfs restart
```

2. Run the `mount_local_fs.pl` script to mount `/mapr`:

```
/opt/mapr/bin/mount_local_fs.pl
```

**IN-2397**

The Verify phase of the Installer can fail if the `authorized_keys` file contains a command such as the following:

```
no-port-forwarding,no-agent-forwarding
,no-X11-forwarding,command="echo"
```

```
'Please login as the user \"admin\"
rather than the user
\"root\".';echo;sleep 10" ssh-rsa ...
```

Any command in the `authorized_keys` file prevents the Installer from authenticating with remote nodes.

**Workaround:** Verify that the `authorized_keys` file does not contain commands that prevent the Installer from authenticating with remote nodes. In addition, if you are using keys for remote authentication, you must ensure that you can ssh into all nodes in the cluster using the user and password that you specified when you configured remote authentication.

#### IN-2500

After a new installation, the Installer home page displays two YARN ResourceManager links, but one of the links does not work.

**Workaround:** This is normal. Click the YARN ResourceManager links until you find the link that works. Even if the ResourceManager is installed on multiple nodes, the YARN ResourceManager only has one server running at a time, . If the running ResourceManager fails, a new ResourceManager is started on one of the other nodes.

#### IN-2705

If you used the Installer to install Sentry on an insecure cluster, you must manually add Sentry to the list of services that Warden monitors. To add Sentry to the list of services that Warden monitors, copy `/opt/mapr/sentry/sentry-<version>/conf.d/warden.sentry.conf` to `/opt/mapr/conf/conf.d`.

Neither Hive nor Impala is configured to use Sentry by default; however, you can configure Hive and Impala to use Sentry, as described in [Configure Hive to use Sentry Authorization](#) on page 4036 and [Configure Impala to Use Sentry Authorization](#) on page 4034

#### SPYG-1136

During a manual installation or upgrade, Collectd provided in core 6.1.0 won't start on RHEL / CentOS 8.2 because it expects the Python 2 libraries to be installed, and RHEL / CentOS 8.2 provides the Python 3 libraries instead. This issue does not affect installations or upgrades performed using the Installer.

**Workaround:** Before installing the monitoring components, check to see if Python 2 is installed. If the following error is generated, try installing Python 2 on RHEL / CentOS 8.2:

```
failed: libpython2.7.so.1.0: cannot
open shared object file
```

#### IN-2637

After a manual installation, Oozie and Hive services can fail to connect to a MySQL or MariaDB database because the server time-zone value is unrecognized or represents more than one time zone. The issue affects your installation if you applied the `mapr-patch` released on or after February 21, 2021 (including the latest `mapr-patch`). This issue affects manual installations but is fixed in Installer 1.14.0.0.

**IN-2935**

**Workaround:** For manual installations, you must configure either the server or JDBC driver (using the `serverTimezone` configuration property) to use a more specific time-zone value if you want to utilize time-zone support. After running `configure.sh` but before starting the Oozie or Hive services, update the `serverTimezone` parameter in the `hive-site.xml` or `oozie-site.xml`. For more information, see MySQL Bug #[95036](#).

On RHEL or CentOS 8.3, new installations using the Installer can fail with the following error message:

```
mount.nfs: access denied by server
while mounting localhost:/mapr
```

This happens when the Installer cannot start the `mapr-loopbacknfs` service because the RHEL or CentOS NFS/NFS4 service is running.

**Workaround:** Edit the `/etc/systemd/system/mapr-loopbacknfs.service` file to add the following `Conflicts` directive to the `nfs-mountd.service`:

```
[Unit]
Description=MapR Technologies, Inc.
loopbacknfs service
After=rc-local.service
After=network.target syslog.target
Conflicts=nfs-mountd.service
```

The `Conflicts` command stops `nfs-mountd` before installation so it cannot interfere with starting `mapr-loopbacknfs`. After editing the `loopbacknfs.service` file, perform a daemon reload using the following command, and then retry the installation:

```
systemctl daemon-reload
```

**IN-2947**

For Installer 1.16.0 on Ubuntu 18.04, the **Extend Cluster** operation fails for clusters larger than three nodes. The operation fails on nodes where ZooKeeper is not installed. The failure occurs because the Installer attempts to update the ZooKeeper service file on a node that has no roles file for ZooKeeper.

**Workaround:** Make sure ZooKeeper is running on every node in the cluster, and retry the **Extend Cluster** operation.

**ES-77, FLUD-55**

During an upgrade from EEP 6.x to EEP 7.0.0 or EEP 7.0.1, some monitoring components do not get updated because of an error in the fourth digit of the package version. This issue can occur during manual upgrades or upgrades performed using the Installer. The affected components can include any or all of the following:

- Elasticsearch

- Fluentd
- Grafana
- Kibana

**Workaround:** See [Reinstalling Monitoring Components After an Upgrade](#) in the data-fabric documentation.

#### IN-1976

During a version upgrade from core 6.0.1 and EEP 5.0.x to a later version of core, the upgrade succeeds, but the following error message is generated:

```
This version of Kibana requires
Elasticsearch v6.2.3 on all
nodes. I found the following
incompatible nodes in your
cluster: v5.4.1 @ 10.10.103.231:9200
(10.10.103.231), v5.4.1 @
10.10.102.21:9200 (10.10.102.21), v5.4.1
@ 10.10.103.230:9200 (10.10.103.230)
```

This happens because the Elasticsearch package script does not remove Elasticsearch completely and does not shut it down. Even though a new version of Elasticsearch is installed, the old version is still running and using the port needed by the new version.

#### Workaround:

1. Use the `jps` command to find the process for the old Elasticsearch.
2. Use `kill -9` to shut down the old Elasticsearch process. Warden will restart the newly installed Elasticsearch.

#### IN-2742

A `configure.sh` operation can hang because of a system control hang if you try to install on top of a "minimal" operating system installation and the RDMA RPM or service is not present. This issue can occur during manual installations or during installations using the Installer.

**Workaround:** Before running `configure.sh`, use one of the following workarounds:

- Workaround #1 - Install the missing RDMA Dependencies**
- **RHEL / CentOS**

1. Install `libibverbs`:

```
yum
install
libibverbs
```

2. Enable and start the RDMA service:

```
systemctl
enable
rdma &&
systemctl
start rdma
```

3. Retry the HPE Ezmeral Data Fabric installation.

- **Ubuntu 18**

1. Install the rdma-core package:

```
apt-get
install
rdma-core
```

2. Install libibverbs1:

```
apt-get
install
libibverbs1
```

3. Enable and start the RDMA service:

```
systemctl
enable
iwpmc &&
systemctl
start iwpmc
```

4. Retry the installation.

- **Ubuntu 16**

Release 6.2 does not provide RDMA support for Ubuntu 16 because Ubuntu 16 does not have the rdma-core package.

**Workaround #2 - Disable RDMA Support**

1. Rename `/opt/mapr/lib/libibverbs.so`.  
For example:

```
mv /opt/mapr/lib/libibverbs.so /opt/mapr/libibverbs.so.sv
```

2. Restart the ZooKeeper and Warden nodes.

**Workaround #3 - Install the Latest Core Patch**

The latest patch contains the `export MAPR_RDMA_SUPPORT=false` environment variable, which removes RDMA support. For patch information, see "Downloading a Patch" in the data-fabric documentation.

**IN-2784 & MFS-11853**

Stopping a cluster by stopping ZooKeeper and Warden can cause clients that are accessing the file system through POSIX (for example, the S3 gateway) to hang if Loopback NFS is installed on a cluster node and is not stopped first. Note that beginning with Installer 1.15, the Installer installs Loopback NFS on all cluster nodes unless NFS is enabled.

**Workaround:** If Loopback NFS is running and you need to stop the cluster, you must first unmount `/mapr` and stop Loopback NFS on all nodes. Then, you can stop ZooKeeper and Warden. For more information, see "Managing the mapr-loopbacknfs Service" in the data-fabric documentation.

**IN-1343**

In a new installation of six nodes or more using the Installer, if only data nodes fail to install, retrying the installation can fail.

**Workaround:** Use the Installer uninstall feature, and retry the installation from scratch. See "Uninstalling Software Using the Installer Uninstall Button" in the data-fabric documentation.

**IN-2132**

On a SLES cluster, using Installer version 1.10 or earlier of the `mapr-setup.sh` script can complete successfully even if `sshpass` is not installed.

**Workaround:** Upgrade to the latest Installer. You must use version 1.11 or later of the `mapr-setup.sh` script. If you cannot use Installer version 1.11 or later of the `mapr-setup.sh` script, install `sshpass` before running the `mapr-setup.sh` script on a SLES cluster.

**IN-2008**

When you upgrade from a secure 6.0.0 cluster to 6.0.1 using Installer 1.9, a security certificate for log

monitoring is overwritten. As a result, Elasticsearch can fail to start after the upgrade. This issue is not present during a new installation of 6.0.0 or 6.0.1 or during an upgrade to 6.1.0. This issue is fixed in Installer 1.10 and later.

**Workaround:** To resolve the issue, you must remove the `.keystore_password` file, re-run the command to generate new Elasticsearch certificates, and then re-distribute the certificates. Use these steps:

1. Remove or rename the `.keystore_password` file. For example:

```
rm /opt/mapr/elasticsearch/
elasticsearch-x.x.x/etc/
elasticsearch/.keystore_password
```

2. Perform steps 3 through 7 of "Step 9: Install Log Monitoring" in the data-fabric documentation. Completing steps 3 through 7 regenerates the Elasticsearch certificates and copies them to the other nodes.

#### IN-2443

An internal server error that includes a `NullPointerException` can be generated if you install a cluster on Ubuntu 16 using a Installer Stanza. The error appears if Hive is installed but no password for Hive is included in the `.yaml` installation file.

**Workaround:** Add the Hive password to the `.yaml` installation file and re-run the Stanza.

#### IN-18

When using the `-v` or `--verbose` options with Installer Stanzas, detailed error information is not provided on the command line. For example, if a `mapr` user or group is not present on a host during a new installation, the `mapr-installer-cli` reports "Verification Error" on the command line.

**Workaround:** To view more detailed error information when using the `-v` or `--verbose` options, check the `installer-cli.log[.x]` file after running the Stanza. For information about the Installer logs, see "Logs for the Installer" in the data-fabric documentation.

#### IN-2200

Deploying a release 6.0.1 cluster on AWS fails when the following parameters are specified:

- `diskType: io1`
- `installerOnitsOwn: false`

**Workaround:** Try using a `diskType` of `gp2` (general-purpose SSD) instead of `io1` (provisioned IOPs SSD), or set `InstallerOnitsOwn` to `false` instead of `true`. Then retry the deployment.

#### IN-2152

During a Installer upgrade from any release to 6.0.1, core files can be generated for ecosystem components, which can cause alarms in the Control System following the upgrade. This happens because the upgrade sequence shuts down the cluster, then upgrades Core packages, and then restarts Core.

Restarting Core is necessary to upgrade some ecosystem components. When the old ecosystem components are started, version incompatibilities with the new version of Core can cause core dumps. This is a temporary issue. Upgrading the ecosystem component, which happens later in the upgrade process, resolves the issue. The issue does not exist in 6.1 and later releases, which have the ability to prevent services from restarting during an upgrade.

**Workaround:** Ignore the Control System alarms, or upgrade to 6.1 or later, which should not generate core alarms.

**IN-1940**

In Installer versions 1.9 and earlier, the `probe` command can fail because of a runtime error if you have installed the Operational Applications with HPE Ezmeral Data Fabric Database template. The error is caused by the presence of the `mapr-drill-internal` package. Any node running the Data Access Gateway requires the `mapr-drill-internal` package to be installed even though Drill is not installed as a service. The `mapr-drill-internal` package provides a set of client libraries used by the Data Access Gateway.

**Workaround:** Before using the `probe` command, update the Installer. The `probe` command is fixed in versions 1.10 and later.

**IN-1635**

In Installer Stanza versions 1.9 and earlier, the `probe` command was hard coded with a cluster admin user of `mapr`. If you configured a cluster admin user other than `mapr`, the `probe`-generated YAML file could not be imported using the `import` command.

**Workaround:** Before using the `probe` command, update the Installer to version 1.10 or later. Or, if you must use version 1.9 or earlier, edit the `probe`-generated YAML file to specify the correct cluster admin user.

**IN-2123**

In a secure cluster, the **Extend Cluster** operation fails if you try to extend the control group. The new control node cannot join the cluster because it inadvertently receives a new set of keys. This issue affects versions 1.7 through 1.10 of the Installer and is fixed in Installer 1.10.0.201812181130 and later versions.

**Workaround:** You can resolve the issue by manually copying `mapruserticket` into the `/opt/mapr/conf` directory of the node to be added to the cluster.

**IN-2141**

The following issue applies to Installer versions 1.7 through 1.10, but not all 1.10 versions. The issue is fixed in Installer 1.10.0.201812181130 and later versions.

An extend cluster (add node) operation can fail when you:

1. Install a 6.x cluster manually with security enabled.

2. Run the Installer Stanza `probe` command on the cluster or on a node to be added to the cluster.
3. Use the `import` command to import the `probe` `.yaml` file into the Installer.
4. Perform an extend cluster operation immediately after the `import` operation.

The extend cluster operation fails because keystore, truststore, and server ticket (`maprserverticket`) files are not present on the installer node.

**Workaround:**

Before attempting the extend cluster operation, copy the keystore, truststore, and server ticket (`maprserverticket`) files from any CLDB node to `/opt/mapr/installer/data/tmp` on the installer node. The files that need to be copied are:

- `cldb.key`
- `dare.master.key*`
- `maprserverticket`
- `ssl_keystore`
- `ssl_keystore.p12`
- `ssl_keystore.pem`
- `ssl_truststore`
- `ssl_truststore.p12`
- `ssl_truststore.pem`

\*The DARE primary key is required only if DARE is enabled.

If metrics monitoring is configured on the cluster, you must also copy the tickets related to Fluentd, Kibana, and Elasticsearch to the same location.

**IN-2217**

During an upgrade to EEP 6.1.0 using the Installer, the Installer does not back up the Drill `conf`, `log`, and `jar` directories into `${MAPR_HOME}/drill/OLD_DRILL_VERSIONS`. This can happen when you upgrade Drill from an old version (for example, Drill 1.10 in EEP 3.0) to Drill 1.15.0.0 in EEP 6.1.0.

Recent packaging changes in Drill contribute to this issue. Drill 1.10 consists only of `mapr-drill-1.10` (role and binaries), whereas Drill 1.15.0.0 consists of `mapr-drill-1.15` (roles) and `mapr-drill-internal-1.15` (binaries). During the upgrade, the `mapr-drill-1.10` binaries are successfully uninstalled, but the `OLD_DRILL_VERSIONS` directory that is needed to back up Drill 1.10 is not created.

**Workaround:**

Before upgrading, perform the following steps:

1. Shut down the `mapr-drill-1.10` Drillbits.

```
maprcli node services -name
drill-bits -action stop -nodes
<node hostnames separated by a
space>
```

2. Create `${MAPR_HOME}/drill/OLD_DRILL_VERSIONS/drill-1.10`.
3. Copy the following directories of `mapr-drill-1.10` into the `OLD_DRILL_VERSIONS` directory:
  - a. Copy the `conf` directory to `${MAPR_HOME}/drill/OLD_DRILL_VERSIONS/drill-1.10.0/conf`.
  - b. Copy the `logs` directory to `${MAPR_HOME}/drill/OLD_DRILL_VERSIONS/drill-1.10.0/logs`.
  - c. Copy the `jars/3rdparty` directory to `${MAPR_HOME}/drill/OLD_DRILL_VERSIONS/drill-1.10.0/jars`.
4. Proceed with the upgrade.
5. After successfully upgrading and starting `mapr-drill-1.15.0.0`, you may remove the `${MAPR_HOME}/drill/drill-1.10.0` directory.

#### IN-1915

During an upgrade using the Installer, refreshing the browser page can cause the Installer to forget upgrade parameters that were specified before the refresh.

**Workaround:** Avoid refreshing the browser page during an upgrade operation. If you must refresh the page, go back to the first page of the upgrade operation and start over again to ensure that the Installer has the correct parameters before it begins the Verify phase of the upgrade.

#### IN-2035

During a version upgrade using the Installer, if you select the **Advanced Configuration** button and then click **Previous** (one or more times) followed by **Abort**, the Installer can indicate that the upgrade completed even though the upgrade was aborted.

**Workaround:**

If this happens, you must reset the installer and reload the last known state. Follow these steps to reset the cluster state:

1. Click **Support > Reset Installer**. A warning screen appears.
2. Click **OK**.

3. Click **Support > Import State**.
4. Click **Reset** to recover the cluster to the last known state. It is safe to retry the upgrade at this point.

For more information about the **Reset Installer** and **Import State** commands, see "Resetting the Installer Database" and "Importing or Exporting the Cluster State" in the data-fabric documentation.

## IN-2065

`/mapr` sometimes does not get mounted after you enable NFS (v3 or v4) using the Installer Incremental Install function. The Incremental Install function is an online operation. Enabling NFS using an Incremental Install can create a race condition between when the `mapr_fstab` file gets created and NFS is started by Warden. If NFS is started by Warden before the `mapr_fstab` file is created, `/mapr` does not get mounted.

### Workaround:

If `/mapr` is not mounted, check the time stamp of the `/opt/mapr/conf/mapr_fstab` file to see if it is older than the time stamp in the `warden.log` file for starting NFS. For example:

```
[root@atsqa4-61 logs]# ls -ld /opt/
mapr/conf/fstab
rw-rr- 1 mapr mapr 39 Sep 26
11:31 /opt/mapr/conf/mapr_fstab

[root@atsqa4-61 logs]# fgrep starting
warden.log | fgrep nfs
2018-09-26 11:29:33,407 INFO
com.mapr.warden.service.baseservice.Ser
vice
[Thread-34]: -----Service is
starting for: nfs4
```

If the time stamp of the `mapr_fstab` file is older than the Warden time stamp:

1. Restart the NFS service:

```
maprcli node services -nodes <node
names> -nfs4 start
```

2. Run the `mount_local_fs.pl` script to mount `/mapr`:

```
/opt/mapr/bin/mount_local_fs.pl
```

## INFO-420

The procedure for configuring storage using `disksetup` does not work for new installations of DARE-enabled 6.1 clusters. With DARE enabled, `disksetup` fails on any node that is not a CLDB node because there is no local copy of the `dare.master.key` file. When you use `disksetup`, non-CLDB nodes try to contact the CLDB, which must be running when the nodes attempt contact.

**Workaround:**

After running `configure.sh`, you must:

1. Format the disks on the CLDB nodes.
2. Start ZooKeeper on the ZooKeeper nodes.
3. Start Warden on the CLDB nodes.
4. Format the remaining node disks using `disksetup`.
5. Start Warden on the remaining nodes.

**IN-2057**

A fresh install of 6.0.0 using the `sample_advanced.yaml` file for Installer Stanzas (Installer version 1.9) can fail with the following error message:

```
ERROR: install command failed
Service mapr-data-access-gateway must
be a member of a template group.
Configured services require it:
['mapr-data-access-gateway']
```

The error is generated because the `.yaml` file is missing an entry for the `mapr-data-access-gateway` in the **MASTER services** section. The `mapr-data-access-gateway` service is needed for HPE Ezmeral Data Fabric Database installations.

**Workaround:**

In the **MASTER services** section of the `sample_advanced.yaml` file, add `mapr-data-access-gateway` to at least one of the host groups, and retry the installation.

**IN-1272**

During an upgrade to 6.0 or later (Drill 1.11), `configure.sh` sometimes fails to disable the storage plugin for HBase. The HBase server is not supported in Core 6.0 or later, so the HBase storage plugin should be disabled before a cluster is upgraded to 6.0 or later. Otherwise, Drill queries against HBase will hang.

**Workaround:**

Before upgrading to Drill 1.11 or later, manually disable the HBase storage plug-in. To manually disable the plug-in, you can use the Drill Web Console or Drill REST API commands. You can disable the HBase storage plugin on the **Storage** page of the Drill Web Console at `http(s)://<drill-hostname>:8047`. For more information, see this page:

```
https://drill.apache.org/docs/
rest-api-introduction/#delete-/
storage/{name}.json
```

**IN-1747**

If you use the Installer 1.10 **Uninstall** button to uninstall software and a node is unreachable, you will

not be able to uninstall the node later when the node is reachable.

**Workaround:**

Uninstall the software on the node manually. See "Decommissioning a Node and Uninstalling Data Fabric Software from the Command-line" in the data-fabric documentation.

**IN-2015**

A fresh install of 6.0.0 with EEP 4.1.1 using Installer 1.9 can fail with the following error message:

```
file not found: /opt/mapr/
elasticsearch/elasticsearch-5.4.1/etc/
elasticsearch/sg/
admin-usr-clientCombo.pem
```

**Workaround:** Update the Installer to version 1.10 or later, and retry the operation.

**IN-2018**

Logging on to Kibana results in an authentication failure. This can happen on a CentOS cluster if you use Installer 1.10 to install 6.0.1 EEP 5.0.0, and then upgrade to 6.1.0 and EEP 6.0.0.

**Workaround:** Try using Installer 1.9 to install the 6.0.1 cluster and Installer 1.10 to upgrade the cluster. See "Updating the Installer" in the data-fabric documentation.

**CORE-150**

After using the **Incremental Install** function of the Installer to apply security to an Azure-based 6.1.0 cluster, the Hue and Spark-thrift server links are not accessible in the Installer interface. This issue can occur on an Azure-provisioned cluster whose internal DNS suffix starts with a number rather than a letter.

**Workaround:** Re-create the cluster in Azure so that the internal DNS suffix starts with a letter and not a number.

**IN-2025**

The **Extend Cluster** operation can fail during the **Verify Nodes** phase with an error indicating `Unscalable host groups found`. This error can occur when the MASTER group is missing or a single-instance service (for example, Grafana) has been moved out of the MASTER group. The `mapr-installer.log` reveals which cluster services are supposed to be in the MASTER group.

**Workaround:** Move any original MASTER services that caused the error back to the MASTER group. The `mapr-installer.log` indicates the services that need to be moved along with the `Unscalable host groups found` error.

**IN-2006**

On a cluster with `mapr-drill` installed, the `probe` command can return the wrong database type value.

**Workaround:**

After using the `probe` command, check to see if the resulting YAML file has the correct `mapr_db` setting. Possible settings are:

- QS
- DRILL
- DRILLQS

If necessary, change the setting in the YAML file to match the value from the probed cluster.

**IN-1955**

If you install cluster software using the Installer in a browser and then upgrade the installer in the same browser tab and attempt an upgrade without starting a new browser, the stale browser cache can cause upgrade errors.

**Workaround:** Clear your browser cache or open a new browser tab whenever you need to update the Installer and perform a new installer operation.

**IN-1983**

After an upgrade from release 5.x to release 6.1 and EEP 6.0.0 using the Installer, the `kafka-connect` service fails to start. This issue has been noticed on platforms that use `systemd`.

**Workaround:** Stop the `kafka-connect` service manually, and restart the service.

**IN-1972**

During an upgrade from release 5.x to release 6.1, the Installer prompts you for the MySQL user ID and password. If you enter a password that is different from the password you provided when you originally configured MySQL through the Installer, the upgrade fails with this error: "Unable to connect to database...."

**Workaround:** When the Installer prompts you for the MySQL user ID and password, enter the password that you specified when you first installed the cluster. If you did not specify a password for MySQL when you installed release 5.x, leave the password field blank.

**IN-1904**

If you initiate a system startup by clicking the **Startup** button on the Installer web interface, the **Authentication** screen is displayed. If you subsequently click the **Previous** button, the following buttons are shown as active even though they are not usable during system startup:

- Extend Cluster
- Incremental Install
- Maintenance Update
- Shutdown
- Uninstall

**Workaround:** Do not use the **Previous** button during startup.

**IN-1657**

After updating the Installer 1.7 or later, the Installer can lose awareness that a cluster was previously installed. For example, the Installer might indicate the need for a fresh install.

**Workaround:** If this happens, do NOT proceed with installation or upgrade operations. Follow these steps to reset the cluster state:

1. Click **Support > Reset Installer**. A warning screen appears.
2. Click **OK**.
3. Click **Support > Import State**.
4. Click **Reset** to recover the cluster to the last known state. It is safe to use the Installer at this point.

#### IN-1804

For release 6.0 or later clusters, enabling security by using the Incremental Install function can overwrite custom certificates in the `ssl_truststore` and `ssl_keystore` files. When you turn on security, the Installer runs the `configure.sh` script on the CLDB primary node to generate security keys and then distributes the keys to all the other CLDB nodes. The installer also distributes certificates to all the other nodes. This process can cause custom certificates to be overwritten. However, before enabling security, the Installer makes a backup of the existing `ssl_keystore` and `ssl_truststore` files.

**Workaround:**

After enabling security, locate the backup of the `ssl_keystore` and `ssl_truststore` files. The backup uses this format:

```
/opt/mapr/conf/
ssl_keystore.sv.<timestamp>
```

Extract any custom certificates from the backup files, and manually merge or add them into the new `ssl_keystore` and `ssl_truststore` files.

To merge the files, you can use the `/opt/mapr/server/manageSSLKeys.sh` utility, as shown in "Configuring Secure Clusters for Running Commands Remotely" in the data-fabric documentation.

#### IN-997

When using Installer 1.9 with Ubuntu distributions, an upgrade of the Installer definitions requires a restart of the installer service. The restart is needed because the Installer services version is not updated properly when you use either of the following commands:

- `mapr-setup.sh reload`
- `apt-get install mapr-installer-definitions`

**Workaround:** After installing or reloading the Installer definitions, issue one of these commands to fix the services version:

- `service mapr-installer restart`
- `systemctl restart mapr-installer`

**IN-1671**

For Installer 1.8 and earlier, installation on Ubuntu 16.04 can fail if Python 2 is not available or if the default is set to Python 3. The installer requires `python` and `python-yaml` to be installed on all nodes.

**Workaround:** To install the Python packages manually:

```
sudo apt-get install python
python-yaml -y
```

**IN-1336**

The Installer **Retry** function can be affected if the installer operation fails. Suppose you deselect a service during an **Incremental Install** operation. If the **Incremental Install** fails and you need to **Retry**, it's possible that the service will not be deselected (uninstalled).

**Workaround:** Manually remove (uninstall) the service by using one of these commands:

- **Red Hat / CentOS:** `yum remove`
- **Ubuntu:** `apt-get remove`
- **SLES:** `zypper remove`

**IN-1392**

During an **Extend Cluster** (add node) operation using the Installer, if installation of the added node fails and you abort the operation, the installer can display the added node even though it did not get installed.

**Workaround:** When the Installer indicates that a node did not get added correctly (typically during the Installation phase), select the node and click **Remove Node**. Then retry adding the node.

**IN-1396**

An installation using the Installer fails with the following Ansible module error:

```
nValueError: need more than 1 value
to unpack
```

**Workaround:** Check for syntax errors in the `/etc/sysctl.conf` file, which can cause an Ansible error when the Installer is attempting to set various kernel parameters.

**IN-1398**

In the Installer **Verify Nodes** page, if you click a host, the **Disks Selected for MapR** box in the right pane displays the disks that were specified for the host either manually or automatically. If you deselect a disk in the right pane and click **Retry**, the deselection is not always implemented.

**Workaround:** Click **Previous** to go back to the **Node Configuration** page, and re-specify the disks that you want. Then continue with the operation.

**IN-1386**

On a secure cluster, YARN jobs can fail if you specify IP addresses rather than host names when you configure nodes using the Installer.

**Workaround:**

Do not use an IP address for node configuration with the Installer. If you already used an IP address, change the IP address in the `yarn-site.xml` file on all nodes. In the following example, the 10.10.10.7 IP address must be changed to a host name, such as `bld73.qa.lab`:

```
<property>
<name>yarn.timeline-service.hostname</name>
<value>10.10.10.73</value>
</property>
```

**IN-1333**

On Ubuntu clusters, the `mapr-setup.sh` script fails to reload the Installer definitions during an update of the installer and definitions.

**Workaround:** After updating, restart the installer to load the definitions:

```
service mapr-installer restart
```

**IN-907**

The Installer service fails if the `mapr` user or `root` user already exist and they are configured to use a shell other than `bash`. For more information about user requirements, see "Installer Prerequisites and Guidelines" in the `data-fabric` documentation.

**Workaround:** Configure the users to use `bash`. For more information about user requirements, see "Installer Prerequisites and Guidelines" in the `data-fabric` documentation.

**IN-1079**

Verification fails when the installed language pack is for a language other than English.

**Workaround:** Remove the non-English language pack and install the English language pack. In the following example, the non-English language pack is shown as German. Also, make sure your system locale is set to `en_us`, as described in "Infrastructure" in the `data-fabric` documentation.

```
sudo apt-get install language-pack-en
language-pack-en-base manpages
sudo apt-get remove language-pack-de
language-pack-de-base manpages-de
```

**IN-804**

Using the Incremental Install operation to add a third node to a CONTROL group generates an error: `ERROR: configure_refresh.sh failed. This issue applies to Installer versions 1.6 and earlier.`

**Workaround:** Update the Installer to version 1.7 or later, and retry the operation. See "Updating the Installer" in the `data-fabric` documentation.

**IN-1314**

When you use the Installer to install ecosystem components that require a MySQL component such as Hive, Oozie, or Hue, the passwords you provide to install the MySQL database are displayed in the `mapr-installer.log` and `<nodename>.log` files. Beginning with Installer 1.7, the permissions for the

`mapr-installer.log` and `<nodename>.log` files are changed so that these passwords are not world readable. However, the passwords are still present in log files created with earlier versions of the Installer.

**Workaround:** For increased security, remove the earlier logs or change the user permissions for them.

**IN-1042**

Installation of the 5.2.x `mapr-metrics` package on SLES 12 SP2 fails because the `libmysqlclient16` package is not present. This can happen when `mapr-metrics` is installed manually or using the Installer. This issue was detected during installations of release 5.2.x with EEP 3.0.0.

**Workaround:** None.

**IN-870**

If your cluster uses 2-digit EEPs, and you use the Installer **Extend Cluster** button to add a node, the node can be added with a patch version that is different from the patch version of other nodes in the cluster. See "Understanding Two-Digit and Three-Digit MEPs" in the data-fabric documentation.

**Workaround:** A one-time change can prevent this issue. After updating the Installer from version 1.5 to version 1.6 or later, but before performing any Installer operations, use an Incremental Install function to change your 2-digit EEP version to the equivalent 3-digit EEP version. See "Updating the Installer" in the data-fabric documentation.

**ES-27, IN-1387**

On a new installation of a secure cluster using the Installer, Elasticsearch fails to start, and logs indicate that Elasticsearch key generation failed. When this happens, Kibana and Fluentd also do not start. The Installer allows the installation to complete.

**Workaround:** Check the installer log for a message indicating that Elasticsearch could not be secured. Use the **Incremental Install** feature of the Installer to retry installation of the Monitoring logging components. Alternatively, you can configure security for the logging components manually. See "Step 9: Install Log Monitoring" in the data-fabric documentation.

**IN-1332**

On clusters with less than the recommended memory configuration (16 GB per node), services added during an Incremental Install operation might fail to start because Warden allocated available memory to the filesystem. The Installer might not indicate a problem with the newly added services. If this issue occurs, the filesystem cannot relinquish memory without restarting Warden.

**Note:** This issue can also occur on clusters with more than 16 GB of memory per node if the installed services require more memory than is currently installed.

**Workaround:**

Use the Control System or the `maprcli service list -node` command to determine if the added services are running. If not, perform a rolling restart of the nodes to which the new services were added.

The rolling restart will rebalance memory across the filesystem and services. One node at a time, restart Warden on each node following the group upgrade order prescribed in "Manual Rolling Upgrade Description" in the data-fabric documentation. Use the following steps:

1. Change to the `root` user (or use `sudo` for the following commands).
2. Stop Warden.

```
sudo service mapr-warden stop
```

3. Restart Warden.

```
service mapr-warden start
```

### IN-1339

Installation fails with the Installer reporting an **Unexpected failure during module execution**, and the following entry is present in the "Logs for the Installer" described in the data-fabric documentation:

```
os.write(self.sshpass_pipe[1],
to_bytes(self._play_context.password)
+ b'\n')
OSError: [Errno 9] Bad file descriptor
```

**Workaround:** Change the ssh settings as described in known issue IN-405 later on this page, and retry the installation.

### IN-553

New installations on Ubuntu 14.04 using Installer 1.6 or 1.7 can fail because of a JDK 1.8 issue.

**Workaround:**

If you are installing on Ubuntu 14.04, you must install Java JDK 1.8 before running the Installer. For more information, see [this website](#). If you are installing on RHEL/CentOS or SLES, the Installer installs Java JDK 1.8 for you.

### IN-405

Installation or cluster import using the probe command fails with the error message: "Failed to resolve remote temporary directory from ansible-tmp- ...."

**Workaround:**

To proceed using the Installer, disable SSH connection reuse by including this entry underneath the `[ssh_connection]` property of `/opt/mapr/installer/etc/ansible.cfg`:

```
ssh_args=-o ControlMaster=no -o
ControlPath=none -o ControlPersist=no
```

This workaround can lead to longer install times. We recommend that you resolve any network connectivity issues in your environment.

IN-250

An upgrade to a new core version and a new EEP using the Installer can fail if the cluster being upgraded was initially installed with Hive Metastore but not with Hive. The Hive Metastore package has an installation dependency on Hive, but the Hive Metastore definitions do not enforce the dependency, resulting in inconsistencies in the installer database. This issue has been observed on Ubuntu platforms.

**Workaround:**

Before upgrading, if you have Hive Metastore installed by itself, use the **Incremental Install** feature of the Installer to install Hive. Then proceed with the upgrade.

Performing an upgrade without doing the **Incremental Install** of Hive will cause the upgrade to fail. In this scenario, you will have to reinstall or rebuild the database by using Stanza commands. You can use the `reset` command, followed by `probe`, and then edit the versions in the resulting YAML file. The last step is to import the edited YAML using the `import` command. See "Using probe and import to Generate the Installer Database" in the data-fabric documentation.

N/A

The Installer Web Interface can inadvertently deselect services that you have selected, preventing them from being installed. For example, if you select an auto-provisioning template on the **Select Services** page, and you also select additional services (for example, Streams Tools), and go to the next page, when you return to the **Select Services** page, Streams Tools will be deselected, and you will need to reselect it to ensure that it is installed.

**Workaround:** Reselect any services that are deselected.

MAPR-20606

The Configure Service Layout page may assign services to a group with the name "Unprovisioned Services."

**Workaround:** In the Installer Web Interface, click **Restore Default**.

N/A

You cannot use the Installer after you upgrade the cluster using the command line.

After you use the command line to upgrade a cluster that you installed with the Installer, the Installer is not aware that the cluster runs the upgraded version. Therefore, Installer does not install nodes and ecosystem components that apply to the upgraded version.

**Workaround:** Use the Installer Stanzas `probe` and `import` commands to update the installer database. See "Using probe and import to Generate the Installer Database" in the data-fabric documentation.

**Changing Timeout Values to Resolve Installer Errors**

Change timeout values to reduce errors when using the Installer.

Sometimes the Installer can return errors because the `maprccli` or `filesystem` commands that it uses time out because of network latency. For example, if logs indicate that the installer could not obtain the nodelist,

or a filesystem operation timed out, changing a timeout value can enable the same Installer operation to succeed.

You can change the following timeout parameters to improve the success of Installer operations:

| Timeout   | Description                                                              | Default Value (minutes) |
|-----------|--------------------------------------------------------------------------|-------------------------|
| standard  | The timeout used for maprccli commands and Hadoop filesystem operations. | 2                       |
| configure | The timeout used for <code>configure.sh</code> operations.               | 10                      |

You must specify timeout values as an integer greater than or equal to 0.

To change the `standard` or `configure` timeout values:

1. On the Installer node, navigate to the following directory:

```
/opt/mapr/installer/ansible/playbooks/group_vars/
```

2. Edit the `all` file to change one or both timeout values to a number greater than or equal to 0. In this example, the timeouts are set to 7 minutes and 15 minutes respectively:

```
timeout:
 standard: 7
 configure: 15
```

3. If a Installer error prompted you to change the timeout, retry the operation that failed.

## Installer Release Notes

This release of the Installer works with RedHat/CentOS, Ubuntu, and SLES.

The Installer consists of the following packages along with the `mapr-setup.sh` script:

- **Installer** - Package that contains the Installer.
- **Installer Definitions** - Package that contains the list of versions, services, and ecosystem components that you can install with the Installer.

The release notes include the following sections:

### Installer Updates

Installer updates provide new features or bug fixes.

The following table shows the Installer new-feature updates by version:

| Version                 | Updates                                                                                                                                                                                                            |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.17.0.1.202201201546-1 | This version: <ul style="list-style-type: none"> <li>• Provides Log4j fixes. For more information, see <a href="#">advisory 4916</a>.</li> <li>• Fixes <a href="#">CVE-2021-42392</a> in the Installer.</li> </ul> |

| Version                 | Updates                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.17.0.0.202110261002-1 | <p>This version:</p> <ul style="list-style-type: none"> <li>• Adds support for EEP 8.0.0, EEP 7.1.1, EEP 6.3.5, and version updates to many ecosystem components. For a list, see <a href="#">What's New in EEP 8.0.0</a> on page 6706.</li> <li>• Is built on Ubuntu 18.04 and is not supported on Ubuntu 16.04. Note that core 6.2.0 is supported on Ubuntu 16.04. You can use Installer 1.17.0.0 to install core 6.2.0 on Ubuntu 16.04 as long as the Installer node is running an OS that Installer 1.17.0.0 supports. For details, see <a href="#">Selecting an Installer Version to Use</a> on page 5607. For supported OS versions, see the <a href="#">Installer Support Matrix</a> on page 5802.</li> <li>• Includes some terminology updates. References to the <i>ecosystem pack (MEP)</i> have been changed to <i>Ezmeral Ecosystem Pack (EEP)</i>. For more information, see <a href="#">What's New in EEP 8.0.0</a> on page 6706.</li> <li>• Includes numerous fixes, the most significant of which are: <ul style="list-style-type: none"> <li>• IN-2264: Probe does not detect hive database settings like it does for hue and oozie</li> <li>• IN-2490: Change ansible source module to mapr_ansible</li> <li>• IN-2560: Releases installer-v1.11.0 and installer-v1.12.0 - mapr-setup.sh by default installs the most current version of the Installer</li> <li>• IN-2848: correctly detect and report ansible syntax errors</li> <li>• IN-2856: Installer Failing when doing incremental upgrade</li> <li>• IN-2924: need to create symlink for mapr_fstab when using mapr-loopbacknfs</li> <li>• IN-2934: Ubuntu16 - mapr-setup.sh gpgkeys: protocol `https` not supported</li> <li>• IN-2935: Centos83 - fresh install failing with "mount.nfs: access denied by server while mounting localhost:/mapr"</li> <li>• IN-2947: extend cluster on ubuntu fails on nodes that do not have zookeeper installed</li> </ul> </li> </ul> |
| 1.16.0.3.202201072207-1 | <p>This version:</p> <ul style="list-style-type: none"> <li>• Provides Log4j fixes. For more information, see <a href="#">advisory 4916</a>.</li> <li>• Fixes <a href="#">CVE-2021-42392</a> in the Installer.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Version                 | Updates                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| 1.13.0.0.201912130933-1 | <p>This version includes the following new functionality or characteristics:</p> <ul style="list-style-type: none"> <li>• Installer 1.13.0.0 supports EEP 6.3.0.</li> <li>• Installer 1.13.0.0 supports Red Hat / CentOS 7.6 and 7.7 but does not support Ubuntu 18.04, as indicated in <a href="#">Operating System Support Matrix</a> on page 5726.</li> <li>• Installer 1.13.0.0 supports HBase 1.13.0.</li> <li>• Unlike Installer 1.12.0, Installer 1.13.0.0 requires Java 8 and cannot run on Java 7.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 1.12.0.0.201905241518-1 | <p>This version includes the following new functionality or characteristics:</p> <ul style="list-style-type: none"> <li>• Installer 1.12.0.0 and later support the upload of a zipped tarball containing custom Ansible roles. These instructions can be executed in the installer workflow to customize the installation. For more information, see <a href="#">Using Custom Playbooks</a> on page 5633.</li> <li>• You cannot use Installer 1.12.0.0 or later to perform basic installer operations with 5.2.x releases. You must use Installer 1.11.0.0 instead. See <a href="#">Selecting an Installer Version to Use</a> on page 5607.</li> <li>• For data disks, Installer versions 1.12.0.0 and later require a minimum disk size that is equal to the physical memory on the node. If a data disk does not meet the minimum disk size requirement, a verification error is generated.</li> <li>• If you click a link in a Installer tooltip, the link is displayed in a new browser tab. Previously, clicking a tooltip link caused the browser to display the link in the same browser tab, and any changes made in the user interface were lost. This behavior has been corrected.</li> <li>• IN-2389 &amp; INFO-1120: Sqoop2 cannot be installed using Installer 1.12.</li> <li>• IN-2417: Extending a secure cluster no longer fails with a <code>mapruserticket</code> error when you add a CONTROL node and DATA node at the same time.</li> </ul> |

| Version                 | Updates                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| 1.11.0.0.201902141709-1 | <p>No new features. This version includes the following fixes:</p> <ul style="list-style-type: none"> <li>• IN-2254: Ran out of memory on 1.10 installer - bump memory limits.</li> <li>• IN-2171: Unable to install Installer from packages on SLES.</li> <li>• IN-2155: Restrict expanding cluster groups based on service type not on group name.</li> <li>• IN-2154: Installer verification phase fails with error "ValueError: zero length field name in format."</li> <li>• IN-2123: Unable to extend secure cluster, mapruserticket not copied into new node.</li> <li>• IN-2108: Adding node with Extend Cluster fails at "get list of the ECO warden config files."</li> <li>• IN-2094: Installer verification fails for LUKS encrypted disks.</li> <li>• IN-2078: AttributeError in prereq check about OS.</li> <li>• IN-2025: Installer Error "Unscalable Host Groups" during 'extend cluster' or 'incremental install'.</li> </ul>                                                                                                                                                                                                                                                                                                          |
| 1.11.0.0.201901301400-1 | <p>This version includes the following new functionality or characteristics:</p> <ul style="list-style-type: none"> <li>• Support for EEP 6.1.0. For more information about EEP 6.1.0, see <a href="#">What's New in EEP 6.1.0</a> on page 6726.</li> <li>• The Installer provides a new advanced option that allows you to restrict the software to a subset of network interface cards (NICs) or to specify public IP addresses that can be used with the cluster nodes. See <a href="#">Using the MapR Subnet and MapR External Advanced Options</a> on page 5647.</li> <li>• The Installer warns you if you specify a host name using an IP address rather than a fully qualified domain name (FQDN). See <a href="#">Connectivity</a> on page 119.</li> <li>• The Installer warns you if you run <code>mapr-setup.sh -r &lt;url&gt;</code> and specify a URL that is different from the URL currently stored in the <code>properties.json</code> file. See <a href="#">Troubleshooting Repository URL Errors</a> on page 5662.</li> <li>• The installer version (1.11.0.0) now uses four digits rather than three or two digits. For more information about 4-digit versions, see <a href="#">What's New in EEP 6.1.0</a> on page 6726.</li> </ul> |

| Version               | Updates                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| 1.10.0.201809200839-1 | <p>This version includes the following new functionality:</p> <ul style="list-style-type: none"> <li>• The installer provides a new option for setting Data-at-Rest Encryption (DARE). See <a href="#">Using the Enable DARE Option</a> on page 5632.</li> <li>• The installer provides a new option for setting the NSF version. See <a href="#">Installing NFS Using the Installer</a> on page 5633.</li> <li>• Changes have been made to the auto-provisioning templates. See <a href="#">Auto-Provisioning Templates</a> on page 5651.</li> <li>• With Installer 1.10, metrics collection is enabled by default on 6.1 or later and cannot be disabled. Metrics collection is required for metering. To support metrics collection, collectd is installed on all nodes in the cluster. Users can specify the full collection configuration for collectd or a minimum configuration to support only metering for billing purposes. If the minimum configuration is selected, HPE Ezmeral Data Fabric Database table metrics are disabled.</li> <li>• With Installer 1.10, the installer no longer includes an option to support off-cluster Elasticsearch and OpenTDSDB when security is turned on.</li> <li>• When installing Oozie 4.3.0, MapR Installer 1.10 leverages the Hadoop credential provider API to encrypt the Oozie database user password.</li> </ul> |

| Version                                       | Updates                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |          |          |                    |                                |                                               |               |

| 1.7.201711082221-1 | <p>This version includes the following new features:</p> <ul style="list-style-type: none"> <li>• Support for <a href="#">Version 6.2.0 Release Notes</a> on page 34 and <a href="#">Ezmeral Ecosystem Pack (EEP) Reference</a> on page 6701 4.0.0, 3.0.2, 2.0.3, and 1.1.4.</li> <li>• A new option for enabling or disabling security for the cluster. See <a href="#">Using the Enable Secure Cluster Option</a> on page 5630.</li> <li>• <b>Import State</b> and <b>Export State</b> commands that allow you to recover more easily from Installer failures. See <a href="#">Importing or Exporting the Cluster State</a> on page 5649.</li> <li>• The ability to change <a href="#">timeout parameters</a> to improve the success of Installer operations.</li> <li>• The ability to uninstall a service by deselecting it during an <a href="#">Incremental Install</a> operation.</li> <li>• Support for the <code>scaled_hosts2:</code> parameter for Installer Stanzas. Installer 1.7 (which includes Installer Stanzas) no longer supports the <code>scaled_hosts:</code> parameter for adding nodes to an on-premise cluster. Instead, you need to use the <code>scaled_hosts2:</code> parameter. See <a href="#">Extending a Cluster by Adding Nodes</a>.</li> </ul> |
| 1.6.201708241301-1 | <p>This version includes the following new features:</p> <ul style="list-style-type: none"> <li>• Support for Installing MapR in the cloud.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 1.6.201708012220-1 | <p>This version includes the following new features:</p> <ul style="list-style-type: none"> <li>• Support for adding nodes. See <a href="#">Extending a Cluster by Adding Nodes</a> on page 5640.</li> <li>• A new one-click <b>Shutdown</b> command. ## Installer Containers

This section describes how you can obtain the Installer as a Docker container.

A Installer container is a Docker container that contains the Installer. You can use a Installer container to perform basic installer operations from a node that is not necessarily a part of a cluster. For example, from a Installer container, you can perform the following actions:

- Start and run the web-based Installer to install a new cluster, apply a patch, or perform an update.
- Run [Installer Stanza commands](#) to probe an installed cluster.

You can create your own Installer container by using the `mapr-setup.sh` script. Or you can download a pre-built container image for the Installer.

### Creating an Installer Container Using `mapr-setup.sh`

This section describes how to create an Installer Container image by using the `mapr-setup.sh` script.

#### Creating the Image

To create an Installer image using `mapr-setup.sh`:

1. Download the `mapr-setup.sh` script to a Linux or Mac OS X platform where Docker 1.12.5 or later is installed and the Docker daemon is up and running. Choose *one* of the following download options:

**Note:** Running `mapr-setup.sh` on Windows is not supported.

- Download the setup script directly from [package.mapr.hpe.com](https://package.mapr.hpe.com) to the node that will run the Installer:

```
wget https://package.mapr.hpe.com/releases/installer/
mapr-setup.sh -P /tmp
```

- Download to your local workstation, and copy to the node that will run the Installer:
  - a. On the [Download Page](#), click **Download**, and save the setup script to a location on your workstation.
  - b. Use a tool such as `SCP` to copy the file to the node that will run the Installer:

```
scp mapr-setup.sh user@server /tmp
```

2. Run the `mapr-setup.sh` script with the `docker installer` command to create the Docker image:

```
./mapr-setup.sh docker installer
```

3. Respond to the command-line prompts to provide the information to configure the image. The following table describes each prompt. If you press **Enter** without specifying a value, `mapr-setup.sh` uses the default value shown in the square brackets ( [] ):
 

| Prompt                                 | Default Value                   |
|----------------------------------------|---------------------------------|
| <code>docker image name</code>         | <code>mapr-installer</code>     |
| <code>docker image tag</code>          | <code>6.2</code>                |

| <code>docker image license</code>      | <code>MapR</code>               |

| Prompt                                                        | Notes                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Build MapR UI Installer image? (y/n) [y]                      | Type <b>y</b> to continue or <b>n</b> to exit the script.                                                                                                                                                                                                                                                                                                                |
| Image OS class (centos7, ubuntu16) [<local OS>]:              | Specify the base operating system on which to build the image.<br><br> <b>Note:</b> SLES is not currently supported.                                                                                                                                                                    |
| Docker FROM base image name:tag [centos:centos7]:             | Specify the starting image used to create the new image. If necessary, you can enter your own tag and image name to choose a base image already created for your installation. If you do not enter a name, the script provides one for you.                                                                                                                              |
| MapR installer image tag name [<name>]                        | Accept the software-provided name for the container image, or provide your own name. This is the name you will use to run the image to create the Installer container.                                                                                                                                                                                                   |
| Container memory: specify host XX[kmg] or 0 for no limit [0]: | Specify the maximum amount of memory (in kilobytes, megabytes, or gigabytes) that Docker allows the container to access. For example: <ul style="list-style-type: none"> <li>• 2g</li> <li>• 4096m</li> <li>• 0</li> </ul> Accepting the default (0), means there is no restriction on memory, and the container can use as much memory as the platform makes available. |

4. After the last prompt, press **Enter**. The script:

- Prepares the installer
- Installs or verifies installer package dependencies
- Installs installer packages
- Cleans up unneeded files
- Creates the `mapr-docker-installer.sh` sample-run file and displays the location of the file:

```
Edit '/root/docker_images/installer/mapr-docker-installer.sh' to
configure settings and then execute it to start the container
```

`mapr-docker-installer.sh` contains environment variables for the image and makes it easy for you to start the container.

5. (Optional) Edit the `mapr-docker-installer.sh` script file if you want to change any environmental variables. For more information about the environmental variables, see [Environmental Variables for the Installer Container](#) on page 5704.

## 6. Run the `mapr-docker-installer.sh` file to start `mapr-installer` services:

```
./docker_images/installer/mapr-docker-installer.sh
```

After the installer service is started, you can issue [Stanza commands](#) or open the web-based Installer in a browser:

```
installer (380) started with log /opt/mapr/installer/logs/installer.log
Started service mapr-installer
```

```
...Success
```

To continue installing MapR software, open the following URL in a web browser

If the address '172.17.0.2' is internal and not accessible from your browser, use the external address mapped to it instead

```
https://172.17.0.2:9443
```

**Note:** The Installer maintains the state of the cluster. When the installer is run from a container, the installer database is only as persistent as the container itself. If you need the installer data to be persistent, here are some options:

- If you shut down a Installer container, use the `docker start` command (not the `docker run` command) to restart the same instance of the container. If you create a new instance of the container, the database will have no information.
- Mount the `/opt/mapr/` data directory outside the container to persistent storage to maintain the cluster state.
- Use the Stanza `export` command to export the state of the cluster before you shut down the container. See [Exporting a Cluster Configuration](#).

### Running the Installer Container Using Stanza Commands

You can also use the `sample-run` file to execute a Installer Stanza command. In this scenario, the command creates the installer container, runs a Stanza command, and then shuts down the container. For example, the following command runs the Stanza `probe` command on node 10.10.88.53:

```
./docker_images/installer/mapr-docker-installer.sh probe -o
config.ssh_id=root config.ssh_password=mapr
config.hosts='["10.10.88.53"]' -nv
```

For a list of the Stanza commands, see [Installer Stanza Commands](#) on page 5718.

### Using the Pre-Built Installer Container Images

This section describes how to obtain and run the pre-built Installer container images.

Pre-built Installer container images are available on Docker hub. Images are available for:

- Ubuntu 16.04
- Ubuntu 14.04
- CentOS 7

- CentOS 6

The pre-built images are about 200 MB. A sample-run script that you can use to start the container is available on GitHub.

To use a pre-built image:

1. Download the pre-built Installer container image and the sample-run script to a Linux or Mac OS X platform where Docker 1.12.5 or later is installed and the Docker daemon is up and running.
  - You can download the pre-built image from the [data-fabric public repository](#).
  - You can download the sample-run script (`mapr-docker-installer.sh`) from this [GitHub location](#).
2. *(Optional)* Edit the `mapr-docker-installer.sh` script file if you want to change any environmental variables. For more information about the environmental variables, see [Environmental Variables for the Installer Container](#) on page 5704.
3. Run the `mapr-docker-installer.sh` file to start `mapr-installer` services:

```
$./docker_images/installer/mapr-docker-installer.sh
```

After the installer service is started, you can issue [Stanza commands](#) or open the web-based Installer in a browser:

```
installer (380) started with log /opt/mapr/installer/logs/installer.log
Started service mapr-installer

...Success

 To continue installing MapR software, open the following URL in a
 web browser

 If the address '172.17.0.2' is internal and not accessible
 from your browser, use the external address mapped to it
 instead

 https://172.17.0.2:9443
```

The Installer maintains the state of the cluster. When the installer is run from a container, the installer database is only as persistent as the container itself. If you need the installer data to be persistent, here are some options:

- If you shut down a Installer container, use the `docker start` command (not the `docker run` command) to restart the same instance of the container. If you create a new instance of the container, the database will have no information.
- Mount the `/opt/mapr/` data directory outside the container to persistent storage to maintain the cluster state.
- Use the Stanza `export` command to export the state of the cluster before you shut down the container. See [Exporting a Cluster Configuration](#).

### Environmental Variables for the Installer Container

This section describes environmental variables that you can modify to customize the sample-run script for the Installer container.

## About `mapr-docker-installer.sh`

`mapr-docker-installer.sh` is the sample-run script for the Installer container. The script contains the `docker run` command that runs the container and environmental variables that can be passed into the container at run time. Modifying the variables is optional; the script can run without any changes to the environmental variables.

The following environmental variables can be changed in `mapr-docker-installer.sh`:

### Environmental Variables in `mapr-docker-installer.sh`

| Key                     | Variable        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAPR_CONTAINER_USER     | <user-name>     | <p>The user that the user application inside the Docker container will run as. This configuration is functionally equivalent to the Docker native <code>-u</code> or <code>--user</code>. Do not use Docker <code>-u</code> or <code>--user</code>, as the container needs to start as the <code>root</code> user to bring up FUSE before switching to the <code>MAPR_CONTAINER_USER</code>.</p> <p>The user specified here is the user that all storage operations on the cluster will be performed as. Therefore, HPE recommends not using <code>root</code> or <code>mapr</code>.</p> <p>This user also owns the <code>/opt/mapr</code> directory tree.</p> |
| MAPR_CONTAINER_UID      | <uid>           | <p>The UID that the application inside the Docker container will run as. This is a companion to the <code>MAPR_CONTAINER_USER</code> option. If a UID is not provided, the default is UID 1000. Providing a UID is strongly recommended.</p>                                                                                                                                                                                                                                                                                                                                                                                                                   |
| MAPR_CONTAINER_GROUP    | <group-name>    | <p>The group that the application inside the Docker container will run as. This is a companion to the <code>MAPR_CONTAINER_USER</code> option. If a group name is not provided, the default is <code>users</code>. Providing a group name is strongly recommended.</p>                                                                                                                                                                                                                                                                                                                                                                                         |
| MAPR_CONTAINER_GID      | <gid>           | <p>The GID that the application inside the Docker container will run as. This is a companion to the <code>MAPR_CONTAINER_USER</code> option. If a GID is not provided, the default is GID 1000. Providing a GID is strongly recommended.</p>                                                                                                                                                                                                                                                                                                                                                                                                                   |
| MAPR_PKG_URL            | <mapr-pkg-url>  | <p>The URL of the repository that hosts the packages (typically <a href="https://package.mapr.hpe.com/">https://package.mapr.hpe.com/</a>). If you change <code>MAPR_PKG_URL</code>, use the full URL to your repository (for example, <code>&lt;hostname&gt;/releases</code>).</p>                                                                                                                                                                                                                                                                                                                                                                            |
| MAPR_CONTAINER_PASSWORD | <mapr-password> | <p>The password for the <code>mapr</code> user. This password must be set if the</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Key              | Variable      | Description                                                                                                                                                                                                                                                                                                                                                              |
|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  |               | container will remaining running. The password defaults to <code>mapr</code> .                                                                                                                                                                                                                                                                                           |
| MAPR_STANZA_FILE | <stanza-file> | The path to a Installer Stanza file that needs to be mounted from the host. You must specify this field if you issue the Stanza <code>install</code> command as an argument to the script. For example:<br><pre>mapr-docker-installer.sh install -nv</pre>                                                                                                               |
| MAPR_MEMORY      | <mapr-memory> | Specify the maximum amount of memory (in kilobytes, megabytes, or gigabytes) that Docker allows the container to access. For example: <ul style="list-style-type: none"> <li>• 2g</li> <li>• 4096m</li> <li>• 0</li> </ul> Accepting the default (0), means there is no restriction on memory, and the container can use as much memory as the platform makes available. |
| MAPR_TZ          | <time-zone>   | The time zone inside the container. For a list of time-zone settings, see <a href="#">this website</a> . The default is UTC.                                                                                                                                                                                                                                             |

## Installer Stanzas

This section describes how to prepare for and use Installer Stanzas to install, upgrade, or uninstall software.

Installer Stanzas enable API-driven installation of data-fabric clusters. An extension of the [Spyglass Initiative](#), Installer Stanzas enable the creation of a YAML configuration file (a "Stanza") that describes a cluster. A command-line addition to the web-based Installer allows you to execute the configuration file programmatically to automate new deployments.

You can use Installer Stanzas when you need a script-based tool to install MapR software and you do not want to click through the menus and options provided by the Installer. Installer Stanzas provide less visual feedback than the Installer, but they can be faster and more efficient at installing software on clusters with many nodes.

To use Installer Stanzas:

1. **Review the [Installer Stanza Prerequisites](#).**
2. **Use the steps in [Installer](#) to download and run the `mapr-setup.sh` script.** Performing these steps installs both the web-based Installer and the Installer Stanzas feature.
3. **Review or edit the Stanza file.** The Stanza file specifies the installation parameters for your cluster. See [Working with Installer Stanza Files](#) on page 5707.
4. **Run the Installer Stanza file.** See [Running Installer Stanza Files](#).

### Installer Stanza Prerequisites

This topic describes some limitations and guidelines that you must understand before using Installer Stanzas.

Most prerequisites that apply to the Installer also apply to Installer Stanzas. To review the Installer prerequisites, see [Installer Prerequisites and Guidelines](#) on page 5601.

Some additional prerequisites are unique to Installer Stanzas:

- To install Installer Stanza features, you must download version 1.4 or later of the Installer. For more information, see [Installer Updates](#) on page 5684 and [Updating the Installer](#) on page 5614.
- You can use Installer Stanzas to install, upgrade, or uninstall only Release 5.1 and later releases.
- You can use Installer Stanzas to upgrade or uninstall only clusters that were previously installed using the Installer or a Installer Stanza. If your MapR software was installed manually, you cannot use Installer Stanzas on the cluster because the cluster does not have the installer database.

### Working with Installer Stanza Files

This topic describes how to use the sample Stanza files that are provided with the Installer.

The Installer Stanza file specifies how the cluster should be configured, including the configuration of nodes, disks, software versions, and services. You must configure a Stanza file before using Installer Stanzas to install or upgrade a cluster. Sample Stanza files (basic and advanced) are located in this directory:

```
/opt/mapr/installer/examples
```

To create your Stanza file:

1. Make a copy of one of the sample files. For example, make a copy of the `sample_basic` or `sample_advanced` Stanza file, and rename the copy to a name of your choosing.
2. Using any text editor, edit the Stanza file to address the needs of your installation. Comment out any instructions that you don't need.

This table describes how to complete the fields in the Stanza file:

| Section     | Parameter         | Required/Optional | Directions                                                                                                                                                                                                                                                           |
|-------------|-------------------|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| environment | mapr_core_version | Required          | Specify 5.1.0 or later. Be sure to include the third digit (for example, 5.1.0 or 5.2.0).                                                                                                                                                                            |
|             | patch_location    | Optional          | Specify the location of a core patch file. The file name must use the format <code>mapr-patch-\$[mapr_core_version]</code> . For example:<br><pre>mapr-patch-5.2.0.3<br/>9122.GA-4198.x86_6<br/>4.rpm</pre> Use an absolute path to specify the patch file location. |

|        |       |          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|-------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| config | hosts | Required | <p>Specify the list of hosts on which you want to install packages. You can list the hosts on a single line as follows:</p> <pre>-   exampleneode[1-3].example.com</pre> <p>Or you can use multiple lines:</p> <pre>-   exampleneode1.example.com -   exampleneode2.example.com -   exampleneode3.example.com</pre> <p><b>Note:</b></p> <ul style="list-style-type: none"> <li>• The installer host must be one of the hosts in this list.</li> <li>• A comma-separated list of hosts is not supported.</li> <li>• You can override hosts and disks from the command line. The following example specifies installing only on hosts 01 through 04. To pass an array into an override, use single quotes, double quotes, and brackets as follows:</li> </ul> <pre>cli install -nv -t sample_adv.yaml -o config.hosts='[" lab[01-04].yourlab.com"]'</pre> <p> <b>Note:</b> In a command with an override, the key=value pair or pairs that follow -o must not contain a blank space. For more information about key=value pairs, see <a href="#">Installer Stanza Commands</a> on page 5718.</p> |

|  |              |                                   |                                                                                                                                                                                                                                                                                                                                                                                                               |
|--|--------------|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | ssh_id       | Required                          | Specify the user ID that the installer will run under when it installs the packages. This user must have root access and must be present on every host defined in the hosts section.                                                                                                                                                                                                                          |
|  | ssh_password | Optional                          | Specify the password (for use with the password-based login). This is the password that the installer uses to log into the node using ssh. Comment this line if you want to use a private-key-based login.                                                                                                                                                                                                    |
|  | ssh_key_file | Optional                          | Specify the path to a file that contains the private key (for use only with the private key-based login). Uncomment this line if you want to use a private-key-based login. If both the ssh_password and ssh_key_file lines are uncommented, the installer will default to the ssh_key_file.                                                                                                                  |
|  | ssh_port     | Optional                          | Uncomment this line if you need to specify a port other than the default, which is 22.                                                                                                                                                                                                                                                                                                                        |
|  | license_type | Required                          | Specify M3 for the community edition or M5 for the enterprise edition.                                                                                                                                                                                                                                                                                                                                        |
|  | mep_version  | Required for MapR 5.2.0 and later | Specify a currently supported EEP, such as 2.0. For EEP information, see <a href="#">EEP Components and OS Support</a> on page 5739.                                                                                                                                                                                                                                                                          |
|  | disks        | Required                          | <p>List the disks on which the packages will be installed. The disk names should be the same on every node. This field is required, and you must use the following notation:</p> <pre>- /&lt;diskname&gt; - /&lt;diskname&gt; - /&lt;diskname&gt;</pre> <p>A comma-separated list of disks is not supported. Not all of the disks need to be present, but at least one disk on each node must be present.</p> |

|  |                    |          |                                                                                                    |
|--|--------------------|----------|----------------------------------------------------------------------------------------------------|
|  | disk_stripe        | Optional | Uncomment this line if you need to specify a disk stripe value other than the default, which is 3. |
|  | elasticsearch_path | Optional | Uncomment this line if you need to specify a path where Elasticsearch data will be stored.         |

|  |          |          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--|----------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | services | Optional | <p>Specify a predefined template of services. Services are the core or ecosystem components (or tools) that run on each group. The installer configures default services automatically unless you specify a "groups" section in the Stanza file. To view the predefined templates, use the <code>list</code> command with the <code>--type TEMPLATE</code> argument.</p> <p> <b>Note:</b></p> <ul style="list-style-type: none"> <li>• Metrics are provided by default. The metrics services apply only to MapR 5.2 and later.</li> <li>• Logging services, if specified, apply only to 5.2 and later.</li> <li>• If you do not specify any services, the Installer will install only core services.</li> <li>• For an incremental install or upgrade, the Installer discovers any services already installed. Additional services are installed only if you request specific services, a EEP upgrade, or a core upgrade.</li> <li>• You can override services using a command such as the following:</li> </ul> <pre data-bbox="1252 1688 1458 2095">-o config.serv ices='{"map r-oozie": { } , "mapr-hivem etastore": {"database" : {"name": "hive", "user": "hive", "password": "mapr"} } }'</pre> |
|--|----------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                               |          |                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------|----------|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| groups (advanced layout only) |          | Optional                                    | <p>To provision the cluster manually, add services in groups. A group is a collection of hosts (nodes) that runs a specific set of services. The installer creates groups automatically unless you specify the groups manually (manual provisioning).</p> <p>To specify the groups manually, you must include a groups section and define the hosts, labels, and services that your cluster needs. For an example, see the sample_advanced Stanza file.</p> <p>The services you specify must not be of type GROUP. To view the type for a given service, use the <code>list services</code> command with the <code>--name &lt;name-of-service&gt;</code> argument.</p> <p>Also, when provisioning manually, you must ensure that the <code>mapr-core</code> service is present on every node.</p> |
|                               | hosts    | Required (if a groups section is specified) | Hosts are nodes that run a specific set of services.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|                               | label    | Optional                                    | The label is a descriptor for each group. Use the label to describe the group function or some other aspect of the group that is meaningful to your installation. If a label is not specified, the installer will auto-generate a label based on the service names.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|                               | services | Required (if a groups section is specified) | See the "Services" section earlier in this table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### Running Installer Stanza Files

This section describes how to install, upgrade, and uninstall MapR software and check the progress of these operations by using Installer Stanza commands.

**Note:** To run Installer Stanza commands, you must navigate to the installer directory. This applies to all the examples in this section:

```
cd /opt/mapr/installer
```

### Installing or Upgrading Core Using an Installer Stanza

Use the Stanza `install` command to install Release 5.1 or later, install additional features, upgrade a cluster, perform a maintenance update, or apply a patch.

You can use the `install` command of the Installer Stanza command suite to:

- Perform a fresh install of Release 5.1 or later.
- Perform an incremental install (add or upgrade services that are already installed on the cluster).
- Upgrade a cluster to a newer data-fabric software version or a newer EEP version.
- Perform a [maintenance update](#).
- Apply a patch (see [Applying a Patch Using an Installer Stanza](#) on page 400).
- Extend the cluster by adding nodes (see [Extending a Cluster by Adding Nodes](#) on page 5640).

For the `install` command syntax and options, see [Installer Stanza Commands](#) on page 5718 later in this section.

This example installs data-fabric software using the parameters specified in the `sample_basic.yaml` Stanza file. To run this command, you should be logged in as the `mapr` user. The `-nv` option specifies that certificates will not be checked and the output mode is verbose. The `-t` option, which is required, specifies the use of a template file:

```
./bin/mapr-installer-cli install -nv -t ./examples/sample_basic.yaml
```

If you are using a Installer Stanza to install data-fabric software on a cluster that has never had data-fabric software installed (a fresh installation), it is recommended to create the `mapr` user on all nodes. You can create the `mapr` user by using the `config.cluster_admin_password` override. For example:

```
./bin/mapr-installer-cli install -nv -t ./examples/sample_basic.yaml -o
config.cluster_admin_password=mapr
```

If you use the `install` command and an existing cluster is detected, the installer attempts an incremental install or upgrade using the parameters in the specified Stanza file:

- For incremental installs, the installer does not check or verify the configuration.
- You cannot add nodes or services during a version upgrade.

**Note:** If the password in the Stanza file or in the command contains a special character, such as an exclamation point (!), you might need to escape the character with a backslash (\). For example:

```
./bin/mapr-installer-cli install -u mapr:mapr\!@localhost -nv -t ../
examples/sample_basic.yaml
```

If you do not want to include a password in the Stanza file, you can specify a value contained in a secured file. This example uses a Stanza file (`sample_nopwd.yaml`) in which the `ssh_password` line has been removed. The secured file (`installer.cfg`) stores the value of `ssh_password` as `config.ssh_password=mapr`. The contents of `installer.cfg` are piped to the `install` command via an override (`-o -`). You must include the `-` after the `-o`; otherwise, the file contents are not read.

```
cat examples/installer.cfg | ./bin/mapr-installer-cli install -nv -t
examples/sample_nopwd.yaml -o -
```

To check the progress of the installation or upgrade, see [Checking the Progress of Operations](#). For another example of using the `install` command, see [How to Build Stanzas \(blog\)](#).

### New Installation of Release 6.0 Secure Cluster Using Stanzas

To install a Release 6.0 secure cluster using Stanzas, you must add two parameters to the Stanza:

- `config.security: "true"`

- `config.cluster_admin_password: "<mapr_user_password>"`

For example:

```
config:
 security: "true"
 cluster_admin_password: "mapr"
```

After the installation completes, `secure=true` should be set in the `/opt/mapr/conf/mapr-clusters.conf` file. This command should print the ticket details:

```
maprlogin print -ticketfile /opt/mapr/conf/mapruserticket
```

Note these considerations for installing a Release 6.0 secure cluster:

- If you use a Stanza to perform a secure install, you must log out and then log in one time for the `bashrc` to take effect.
- For non-bash environments, you must manually add the above `export` to your login profile.
- You can use the `probe` command to detect whether a cluster is secure or not.

### Uninstalling Core Using an Installer Stanza

Specifies how to uninstall Core from the command line.

You can use the `uninstall` command to uninstall the current data-fabric software version. The `uninstall` command requires that you specify two overrides:

- `config.ssh_id`
- `config.ssh_password` or `config.ssh_key_file`

**Note:** Using the `uninstall` command requires `root` privileges. You can provide the `root` ID and password or the `root` ID and `ssh_key_file`.

This example uninstalls the currently installed data-fabric software. The command uses an override to provide the `ssh_id` and `ssh_password` and includes `-nv` so that certificates will not be checked, and the output mode is verbose.

```
./bin/mapr-installer-cli uninstall -nv -o config.ssh_id=root -o
config.ssh_password=mapr
```

This example uninstalls the currently installed data-fabric software. The command uses an override to provide the `ssh_id` and `ssh_key_file` and includes `-nv` so that certificates will not be checked, and the output mode is verbose. The `ssh_key_file` for `root` normally resides in `/root/.ssh`. In this example, the file has been copied to `/home/mapr/root` so that the `mapr` user can access the key file.

```
./bin/mapr-installer-cli uninstall -nv -o config.ssh_id=root -o
config.ssh_key_file=/home/mapr/root_user_id_rsa
```

### Exporting a Cluster Configuration

If a cluster was installed using the Installer or a Installer Stanza, you can use the `export` command to generate a Stanza that captures the state of the cluster. You can then modify the Stanza to perform incremental installs or upgrades.

This example uses the `export` command to generate the `tt.yaml` Stanza file. The command includes `-n` so that certificates will not be checked:

```
./bin/mapr-installer-cli export -n --file /tmp/tt.yaml
```

**Note:** The `export` command does not export the `config.ssh_password` field. When using the exported YAML file, you need to provide the password manually, pass it as an override, or specify a value contained in a secured file, as described in [Installing or Upgrading Core Using an Installer Stanza](#) on page 5712.

For another example of using the `export` command, see [MapR Stanzas \(blog\)](#).

### Getting Information About Services and Groups

Use the Stanza `list` command to get additional information about your cluster.

You can use the `list` command and its arguments to get information about the configuration, services, groups, hosts, and services in the cluster. While the `list` command provides the state of the cluster, `list` output is not suitable for incremental installs and upgrades. You must use the `export` command if you want to generate a Stanza file that can be used for upgrading.

This example displays a listing of all the services, groups, and hosts that were installed:

```
./bin/mapr-installer-cli list installed -n
```

This example lists all the groups:

```
./bin/mapr-installer-cli list groups -n
```

This example lists all the hosts:

```
./bin/mapr-installer-cli list hosts -n
```

This example lists the installation status for all the hosts:

```
./bin/mapr-installer-cli list hosts_install_status -n -u https://
mapr:<password>@<installer_ip_addr>:9443
```

This example lists the services by template:

```
./bin/mapr-installer-cli list services -n --type TEMPLATE|more
```

You can use the `list services` command to learn about different kinds of services. For example:

| Group Type   | Example Command                                                                   |
|--------------|-----------------------------------------------------------------------------------|
| CONTROL      | <pre>./bin/mapr-installer-cli list services -n --type CONTROL</pre>               |
| MULTI_MASTER | <pre>./bin/mapr-installer-cli list services -n --type MULTI_MASTER</pre>          |
|              | <pre>./bin/mapr-installer-cli list services -n --type<br/>MONITORING_MASTER</pre> |

| Group Type    | Example Command                                                       |
|---------------|-----------------------------------------------------------------------|
| DATA          | <code>./bin/mapr-installer-cli list services -n --type DATA</code>    |
|               | <code>./bin/mapr-installer-cli list services -n --type DEFAULT</code> |
|               | <code>./bin/mapr-installer-cli list services -n --type CLIENT</code>  |
| SINGLE MASTER | <code>./bin/mapr-installer-cli list services -n --type MASTER</code>  |

### Verifying the Nodes

You can use the `check` command to verify that the nodes specified in the Stanza file are ready to be installed. The `check` command does not check the Stanza file and does not do any provisioning or installation. The `check` command runs the same checks that the Installer runs during its Verification phase. For example, it checks that the nodes have the right OS version, that they have enough disk space, and that they have enough memory to support installation or other Installer operations.

This example verifies the nodes specified in the `sample_advanced_demo.yaml` file. The `-nv` option specifies that certificates will not be checked and the output mode is verbose. The `-t` option, which is required, specifies the use of a template file:

```
./bin/mapr-installer-cli check -nv -t sample_advanced_demo.yaml
```

### Resetting the Installer Database

The `reset` command uninstalls the metadata from the Installer database. `reset` is for advanced users.

You can reset the Installer database by using the CLI `reset` command or by using the Installer web interface (**Support > Reset Installer**).

The `reset` function can be useful for testing purposes, but use `reset` with caution. If you reset the installer database while packages are installed on the nodes, you will need to remove the packages manually.

**Note:** If you experience a failure while installing or uninstalling, the installer prompts you to retry the operation or uninstall and then reinstall from scratch. You should always retry or uninstall before considering using `reset`.

This example resets the Installer database. The `-nv` option specifies that certificates will not be checked and the output mode is verbose:

```
./bin/mapr-installer-cli reset -nv
```

### Adding a License Using Stanzas

Explains how to add a license using Installer Stanzas.

In addition to using `maprcli`, REST commands, or the Control System to add a license, you can add a license using Installer Stanzas. After obtaining a valid license file from your sales representative, copy the license file to a cluster node (for example, to `/tmp/license.txt`). You can then use the `license` command to apply the license to the cluster. For example:

```
mapr-installer-cli license -n -l <path-to-license-file>
```

### Checking the Progress of Operations

This topic describes how to use the Installer web interface and installer logs to check the status of Installer Stanza operations.

## Using the Installer to Check Status

The installer provides messages and progress bars to indicate the status of Installer Stanza operations. However, you can also use the [Installer](#) interface to check the current status of your cluster. The Installer provides a quick visual summary of the currently installed software versions and services.

To view the Installer web interface:

```
https://<Installer Node hostname/IPaddress>:9443
```

## Viewing the Installer Logs

To view or understand the logs generated by the Installer or Installer Stanza operations, see [Installer Log Descriptions](#).

## Shutting Down a Cluster Using an Installer Stanza Command

Use the Stanza `shutdown` command to shut down an on-premise or cloud-based cluster.

The Stanza `shutdown` command is available with Installer 1.6 or later. The command shuts down Warden and Zookeeper, which in turn shut down other running services that are part of a data-fabric cluster. When you use the `shutdown` command, the Installer implements the same orderly shutdown that it uses to perform software upgrades.

You must supply the ssh ID and password or the ssh ID and `ssh_key_file`.

The `shutdown` command works differently for cloud-based clusters. Note these considerations for the behavior of the `shutdown` command:

| Cluster Location | Shutdown Command Behavior                                                                                                                                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| On premise       | Does not stop non-data-fabric software and does not power off the nodes.                                                                                                                                                                          |
| In the cloud     | Shuts down (but does not remove) all the nodes in the cluster. If the installer node is part of the cluster, the installer node is not shut down. To shut down the installer node, use AWS-console or Azure-portal commands to stop the instance. |

This example shuts down a cluster. The command uses an override to provide the `ssh_id` and `ssh_password` and includes `-nv` so that certificates will not be checked, and the output mode is verbose.

```
./bin/mapr-installer-cli shutdown -nv -o config.ssh-id=root -o config.ssh_password=mapr
```

This example shuts down a cluster. The command uses an override to provide the `ssh_id` and `ssh_key_file` and includes `-nv` so that certificates will not be checked, and the output mode is verbose. The `ssh_key_file` for root normally resides in `/root/.ssh`. In this example, the file has been copied to `/home/mapr/root` so that the `mapr` user can access the key file.

```
./bin/mapr-installer-cli shutdown -nv -o config.ssh_id=root -o config.ssh_key_file=/home/mapr/root_user_id_rsa
```

## Using probe and import to Generate the Installer Database

If a cluster has data-fabric software installed but has no installer database, you cannot install or upgrade the cluster using Installer Stanza commands. And you cannot use the web-based Installer on the cluster. However, you can generate an installer database on a cluster by using the `probe` and `import` commands. Once the installer database is generated, you can use the web-based installer and all Installer Stanza commands on the cluster.

 **Note:** Using `probe` and `import` to generate the installer database is supported only on release 5.2 and later. If you need to use this feature on an earlier data-fabric software version, please contact your support representative.

 **Note:** If you are not sure if your cluster has an installer database, you can use the `export` command to generate a YAML file that describes the cluster configuration. See [Exporting a Cluster Configuration](#) on page 5714.

### Using probe

Before using the `probe` command, you must know the host names or IP addresses of the cluster nodes and the `root` user, which must be the same on all nodes. The `probe` command generates a template that will be used by the `import` command.

 **Note:** Do not make changes to the `probe`-generated template file. After the installer database is created, you can use the `export` command to export a YAML for making changes.

In this example, the probing user, `mapr1`, probes an array of hosts (`config.hosts`) and generates a template file `/tmp/location.yaml`. The `-u` option provides login credentials for the Installer. Note that the probing user must be able to do `rpm` and `pkg` queries and have permission to read certain files and directories within `/opt/mapr`.

```
mapr-installer-cli probe -n -o config.ssh_id=mapr1
config.ssh_password=xyz config.hosts='["hostname[1-3]","hostname7"]' -u
mapr1:xyz@<installer_hostname>:9443 > /tmp/location.yaml
```

 **Note:** The `probe` command can use various methods to determine the EEP version of a node. One method checks the EEP repo URL defined on the node. If multiple EEP repos are defined on the same node, the `probe` command ignores all of them and tries to determine the EEP version based on the packages that are present.

### Using import

The `import` command prepares the installer database based on the probed template file. This example imports the probed YAML template file from the previous example. `-t` specifies the location of the template file:

```
mapr-installer-cli import -n -t /tmp/location.yaml
```

After you use the `import` command, the installer database should be operational. You can then use the web-based Installer or Stanzas to perform additional operations on the cluster. See [Installer](#) on page 5599.

### Installer Stanza Commands

This topic provides the syntax and options for Installer Stanza commands.

#### Command Usage

To use Installer Stanza commands, you must log in as the cluster administrator user that you configured while running the `mapr-setup.sh` script. For more information, see [Managing Users and Groups](#).

`check`

Use the `check` command to verify that the nodes specified in the Stanza file are ready to be installed. For more information, see [Verifying the Stanza File](#).

```
check [-h]
 [--overrides [OVERRIDES [OVERRIDES ...]]]
```

```
[--no_check_certificate][--url URL]
[--force][--verbose] --template TEMPLATE
```

export

You can use the `export` command to discover a currently installed cluster and generate a Stanza file that captures the configuration, the groups, and the hosts for the cluster. You can then modify the Stanza file to install other clusters. For more information, see [Exporting a Cluster Configuration](#).

**Note:** The Stanza file generated by the `export` command does not contain the `ssh_password` or `ssh_key_file` values. You need to add those values manually or provide them on the command line by using an override.

```
export [-h]
 [--overrides [OVERRIDES [OVERRIDES ...]]]
 [--no_check_certificate] [--url URL]
 [--file FILE]
```

import

The `import` command prepares the installer database using the template generated by the `probe` command. You must specify a template (YAML file) to use the import command. For more information, see [Using probe and import to Generate the Installer Database](#) on page 5717.

```
import [-h][--no_check_certificate][--url URL][--verbose]
 --template TEMPLATE
```

install

You can use the `install` command to perform a fresh install, an incremental install, or an upgrade. For more information, see [Installing or Upgrading Core Using an Installer Stanza](#) on page 5712.

```
install [-h]
 [--overrides [OVERRIDES [OVERRIDES ...]]]
 [--no_check_certificate][--url URL]
 [--force][--verbose] --template TEMPLATE
```

license

Use the `license` command to add a license from a license file. For more information, see [Adding a License Using Stanzas](#) on page 5716.

```
license [-h]
 [--no_check_certificate][--url URL]
 --license LICENSE <license-file>
```

list

You can use the `list` command to display information about the configuration, services, groups, and hosts that are present in the Installer database. For more information, see [Getting Information About Services and Groups](#).

```
list [-h]
 {config,groups,hosts,hosts_install_status,installed,services} ...
```

probe

The `probe` command generates a template file that can be used to create an installer database on a cluster that doesn't have one. A cluster must have an installer database in order for you to use Installer Stanzas on the cluster. If the installer database is not present, you can use the `probe` command followed

by the `import` command to generate one. For more information, see [Using probe and import to Generate the Installer Database](#) on page 5717.

```
probe [-h]
 [--no_check_certificate][--url URL]
 [--force][--verbose] --template TEMPLATE
 [--overrides [OVERRIDES [OVERRIDES ...]]][--verbose]
```

`reset`

The `reset` command uninstalls the metadata from the installer database. For more information, see [Resetting the Installer Database](#).

```
reset [-h] [--overrides [OVERRIDES [OVERRIDES ...]]]
 [--no_check_certificate] [--url URL]
 [--force] [--verbose]
```

`shutdown`

The `shutdown` command shuts down the cluster. For more information, see [Shutting Down a Cluster Using an Installer Stanza Command](#) on page 5717.

```
shutdown [-h] [--overrides [OVERRIDES [OVERRIDES ...]]]
 [--no_check_certificate] [--url URL]
 [--force] [--verbose]
```

`uninstall`

The `uninstall` command removes MapR software. For more information, see [Uninstalling Core Using an Installer Stanza](#).

```
uninstall [-h]
 [--overrides [OVERRIDES [OVERRIDES ...]]]
 [--no_check_certificate] [--url URL]
 [--force] [--verbose]
```

## Command Options

All of the following command options are optional except for the `TEMPLATE` option:

| Option                                                                                                                                                                 | Description                                                                                                                                                                                                        |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-h</code> or <code>--help</code>                                                                                                                                 | Show this help message and exit.                                                                                                                                                                                   |
| <code>-o [OVERRIDES[OVERRIDES ...]]</code><br>or <code>--overrides[OVERRIDES[OVERRIDES ...]]x</code><br><code>= y</code> list of overrides or <code>-</code> for stdin | Use the specification provided on the command line instead of the Stanza file instructions. Overrides are typically used when you want to specify a host name, user ID, password, or key file on the command line. |

|                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                    | <p> <b>Note:</b></p> <p>The key=value pair or pairs specified in a Stanza override must not include blank spaces. For example, do not use this command:</p> <pre>./mapr-installer-cli probe -o config.hosts='["host1", "host2", "host3"]' .....</pre> <p>Use this command instead:</p> <pre>./mapr-installer-cli probe -o config.hosts='["host1","host2","hos t3"]' .....</pre> <p>In the second command, <code>config.hosts</code> is the key, and <code>'["host1","host2","host3"]'</code> is the value. An override can specify multiple key=value pairs with each pair separated by a space:</p> <pre>-o &lt;key1=value1&gt; &lt;key2=value2&gt; &lt;key3=value3&gt;</pre> |
| -n or --no_check_certificate       | Do not verify SSL certifications.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| -u URL or --url URL                | Installer URL (user:password@host:port)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| --file FILE                        | The <code>export</code> file path.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| -f or --force                      | Force action. This option eliminates user input and answers yes to all questions returned by the software.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| -v or --verbose                    | Verbose output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| -t TEMPLATE or --template TEMPLATE | The specified Stanza template file (required for the <code>install</code> and <code>import</code> commands). The template file can be a local file on the installer node, or it can be a remotely accessible URL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Command Line Help**

You can access online help at the command line using any of these commands:

| Command                                                                                                                                                                                                    | This command displays...         |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|
| ./bin/mapr-installer-cli -h                                                                                                                                                                                | Top-level help for the installer |

|-----------------------------------------------------------------------------------------------------------------|--|

## Interoperability Matrices

This section provides tables that show the operating system (OS), JDK, ecosystem, and data-fabric client support for the HPE Ezmeral Data Fabric. Check these tables for information about software compatibility.

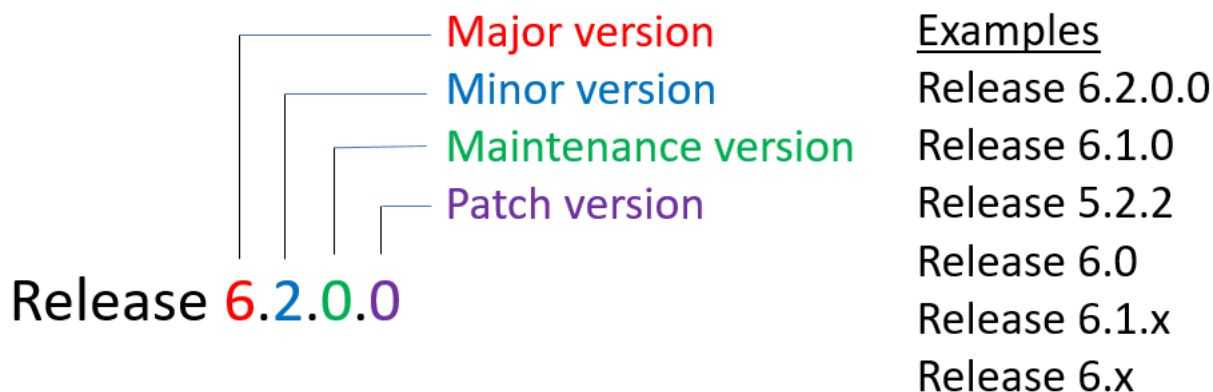

## Understand Software Versions

Understanding the version numbers used by core, Ezmeral Ecosystem Packs (EEPs), EEP components, and patches can help you keep your software up to date and plan for upgrades.

HPE Ezmeral Data Fabric release versions generally follow the industry-standard **<major>.<minor>.<maintenance>** format, with a number representing each version. However, some data-fabric software products use different versioning formats. The following sections describe the characteristics of the various data-fabric versioning formats.

### Core Versions

In HPE Ezmeral Data Fabric interfaces and documentation, core versions are expressed as a dot-separated string of numbers having two, three, or four places. For example:

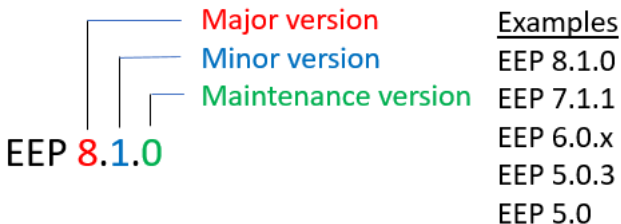

| A Change to This Version | Typically Includes                                                                                       | For Example                                                                                                                                                                                                                                                                                               |
|--------------------------|----------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Core major version       | Significant new features and API changes that can introduce incompatibilities with the previous version. | Release 6.x followed Release 5.2.x and added built-in security features, database features (secondary indexes), new APIs (Apache OJAI and Change Data Capture), a new EEP series (EEP 4.x), filesystem enhancements, a new installer version, and a redesigned control system for monitoring the cluster. |
| Core minor version       | New features, bug fixes, and API changes that are sometimes incompatible with the previous version.      | Release 6.1 followed Release 6.0.1 and added security by default, a new ZooKeeper version, several new                                                                                                                                                                                                    |

| A Change to This Version | Typically Includes                                                                                                         | For Example                                                                                                                                                                                                                                                                                                      |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          |                                                                                                                            | database features (Node.js and Python OJAI clients, complex type support, table metrics, support for the OJAI 3.0 API), a new installer version, a new EEP series (EEP 6.x), and storage tiers for the file system.                                                                                              |
| Core maintenance version | Bug fixes only. This version typically does <i>not</i> introduce incompatibilities with the previous version. <sup>1</sup> | Release 5.2.2 followed maintenance releaseRelease 5.2.1 and introduced new EEPs, improvements to the disk space balancer tool, and a new Installer version, but did not include new features or API changes.                                                                                                     |
| Core patch version       | An emergency bug fix (EBF) patch update, which provides bug fixes and does not introduce new features.                     | Release 6.2.0.1 represents a patch, or EBF, on top of core release 6.2.0.0. Releases 6.2 and later add the fourth place as a patch version. Even though a core version is a string having two, three, or four places, most references to core versions in the data-fabric documentation use two or three places. |

<sup>1</sup>Release 6.0.1 was an exception to this rule, adding REST API access to HPE Ezmeral Data Fabric Database JSON tables, event timestamp support for stream processing, streaming audit logs for the HPE Ezmeral Data Fabric File Store, and a new EEP series (EEP 5.x).

### EEP Versions

In HPE Ezmeral Data Fabric interfaces and documentation, Ezmeral Ecosystem Pack (EEP) versions are expressed as a dot-separated string of numbers having two or three places. For example:

| A Change to This EEP Version | Typically Includes                                                                              | For Example                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------|-------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Major version                | A new EEP series that supports a new major, minor, or maintenance version of core.              | <a href="#">EEP Support and Lifecycle Status</a> on page 5734 shows how EEP major versions change when new versions of core are introduced.                                                                                                                                                                                                                                                                       |
| Minor version                | A significant change in features or APIs but no change in support for the current core version. | EEPs 6.0.1 and 6.1.0 both support Release 6.1.0, but EEP 6.1.0 introduced new HPE Ezmeral Data Fabric Database features, such as the C# and Go OJAI clients, as well as new features for ecosystem components (Flume, Oozie, Tez, and Apache Kafka). EEP 6.2.0, which also supports Release 6.1.0, introduced new ecosystem component versions (Hue, Impala, Spark) and updated some components (Oozie and Hive). |

| A Change to This EEP Version | Typically Includes                                                                                                                  | For Example                                                                                                           |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Maintenance version          | Bug fixes only. EEP maintenance versions do not add new features or API changes and are backward compatible in the same EEP series. | EEPs 5.0.3, 5.0.2, and 5.0.1 added bug fixes to the EEP 5.0.x line while preserving compatibility with Release 6.0.1. |

### About the Patch Version

Beginning with EEP 6.1.0, version numbers for some ecosystem components and data-fabric tools use a dot-separated string having four places instead of two or three places. For example:

- Oozie 5.1.0.0
- Installer 1.11.0.0

The fourth numeral represents the patch version. The patch version adds a unique descriptor for patches that can occur between releases. In future releases, as new versions of components are released, more components and tools will transition to a version string that includes the patch version.

### How the Patch Version Increments

Beginning with EEP 6.2.0, the patch version can be a number in the range 0 through 999. For a newly released component, the patch version starts at 0 and increments by 1 when there is an EBF update. For example, if the EEP 6.1.0 general availability (GA) package version for Oozie is 5.1.0.0, the first bug-fix (EBF) package version will be Oozie 5.1.0.1. The next bug fix package version will be Oozie 5.1.0.2, and so on.

If the same version of a component is present in multiple EEPs, the patch version increments by 100 to provide a range of usable version numbers for future patches. This numbering scheme ensures that all patches have a unique version. The following table shows how the Oozie patch version increments for EEPs 6.1.0, 6.1.1, and 6.2.0:

| EEP   | Oozie GA Version | 1st Oozie Patch Version | 2nd Oozie Patch Version |
|-------|------------------|-------------------------|-------------------------|
| 6.1.0 | 5.1.0.0          | 5.1.0.1                 | 5.1.0.2                 |
| 6.1.1 | 5.1.0.100        | 5.1.0.101               | 5.1.0.102               |
| 6.2.0 | 5.1.0.200        | 5.1.0.201               | 5.1.0.202               |

To obtain EBF patches, you must contact HPE Support. HPE Support makes EBF patch versions available for specific known issues. See [Patches for Known Issues](#).

### Maven Version Format

Beginning with EEP 6.2, the patch version also is present in Maven artifacts for components that use the four-place versioning. In addition, the Maven version format changes to include the associated EEP instead of the YYMM timestamp:

**Old Maven format with YYMM timestamp:** `maprdb-spark-2.2.1-mapr-1803.jar`

**New Maven format with EEP number:** `maprdb-spark-2.3.3.0-mapr-602.jar`

The Maven version increments in the same way that the patch version increments. This table shows how the Spark package version and Maven versions increment when new EBF patch versions become available:

| EEP                           | EEP 6.0.2                      | EEP 6.1.1                        | EEP 6.0.3*                       | EEP 6.1.2*                       |
|-------------------------------|--------------------------------|----------------------------------|----------------------------------|----------------------------------|
| Spark Package Version         | mapr-spark-2.3.3.0.<timestamp> | mapr-spark-2.3.3.100.<timestamp> | mapr-spark-2.3.3.200.<timestamp> | mapr-spark-2.3.3.300.<timestamp> |
| Spark 1st EBF Package Version | mapr-spark-2.3.3.1.<timestamp> | mapr-spark-2.3.3.101.<timestamp> | mapr-spark-2.3.3.201.<timestamp> | mapr-spark-2.3.3.301.<timestamp> |
| Spark Maven Version           | 2.3.3.0-mapr-602               | 2.3.3.100-mapr-611               | 2.3.3.200-mapr-603               | 2.3.3.300-mapr-612               |
| Spark 1st EBF Maven Version   | 2.3.3.1-mapr-602               | 2.3.3.101-mapr-611               | 2.3.3.201-mapr-603               | 2.3.3.301-mapr-612               |

\*This release is not currently available and is included only for illustration purposes.

A patch release can trigger periodic updates to the Maven repository. You may notice patches in the [sftp.mapr.com](https://sftp.mapr.com) repository that are not updated in the Maven repository. This is normal. The Maven repository will be updated eventually. The latest patch versions are always propagated first to [sftp.mapr.com](https://sftp.mapr.com). If you have questions about patches, contact your HPE support representative.

|                                      | 7.8    | No                | No                    | No  | Yes <sup>1</sup> | No               | No  |
|                                      | 7.4    | No                | No                    | No  | Yes              | Yes              | Yes |
|                                      | 7.3    | No                | No                    | No  | Yes              | Yes              | Yes |

<sup>1</sup>Requires a patch. See [this support advisory](#). To install patches, see [Applying a Patch](#) on page 393.

<sup>2</sup>Use Installer 1.10 or later with this release. Before upgrading your operating system to Red Hat Enterprise Linux 7.5, CentOS 7.5, or SLES12 SP3 or later, be sure to update the Installer to version 1.10 or later. See [Updating the Installer](#) on page 5614.

<sup>3</sup>Releases 7.0.0 and 6.2.0, including core and ecosystem components (EEP 7.x.x and later), can be used on the supported versions of Oracle Enterprise Linux. Releases 6.1 and 6.0 support Oracle Enterprise Linux for core installations only (ecosystem components are not supported).

<sup>4</sup>Supported only for EEPs 6.3.0 and later.

<sup>5</sup>NFSv4 is not supported for core 6.1.0 on Red Hat Enterprise Linux / CentOS 8.x.

<sup>6</sup>Requires a patch. Certified only for EEP 5.0.4. Other EEPs supported by release 6.0.x might work but have not been certified.

<sup>7</sup>Hue 4.3.0 in EEP 6.3.0 and 6.3.1 is not supported for Red Hat Enterprise Linux (RHEL) or CentOS 8.x. However, Hue 4.3.0.300 in EEP 6.3.2 can be used with RHEL or CentOS 8.x.

<sup>8</sup>RDMA is not supported with release 6.2 on Ubuntu 16.04.

<sup>9</sup>Installing release 6.1.0 on RHEL or CentOS 8.x requires you to enable the EPEL repository. Starting in RHEL 8.x, a `mapr-core-internal` package dependency (`sdparm`) is deprecated and moved to EPEL, and installation cannot complete without enabling it. For information about adding repositories, see [Adding the Internet Repository on RHEL, CentOS, or Oracle Linux](#) on page 128.

<sup>10</sup>CentOS Linux 8 has reached End of Life (EOL) status. For more information, see [this page](#). See also the [HPE Ezmeral Data Fabric Advisory in response to CentOS 8 Discontinuance](#).

<sup>11</sup>NFS v4 is not supported for releases 7.0.0 and 6.2.0 on SLES 15.

<sup>12</sup>Requires a patch (core 6.2.0.7 or later). The <https://package.mapr.hpe.com/> repository automatically provides the right patch version.

## Operating System Support Matrix (MapR 5.x)

This matrix shows the operating systems and versions supported by each MapR 5.x release.

| OS Version / MapR Version | MapR 5.2.2 | MapR 5.2.0, 5.2.1 | MapR 5.1.0 | MapR 5.0.0 | MapR 4.0.2 | MapR 4.0.1 |
|---------------------------|------------|-------------------|------------|------------|------------|------------|
|                           |            |                   |            |            |            |            |

|                                      |                        |                  |     |                  |                  |                  |                  |
|--------------------------------------|------------------------|------------------|-----|------------------|------------------|------------------|------------------|
| Red Hat (64bit) <sup>6</sup>         | 7.6 <sup>8</sup>       | Yes              | No  | No               | No               | No               | No               |
|                                      | 7.5 <sup>1</sup>       | Yes <sup>2</sup> | No  | No               | No               | No               | No               |
|                                      | 7.4 <sup>1</sup>       | Yes              | No  | No               | No               | No               | No               |
|                                      | 7.3 <sup>1</sup>       | Yes              | Yes | Yes              | No               | No               | No               |
|                                      | 7.2 <sup>1</sup>       | Yes              | Yes | Yes              | No               | No               | No               |
|                                      | 7.1 <sup>1</sup>       | No               | No  | Yes              | No               | No               | No               |
|                                      | 7.0 <sup>1</sup>       | No               | No  | Yes              | Yes              | Yes              | Yes              |

|                                      | 11 SP1, 11 SP2         | No               | No  | No               | No               | No               | No               |
| Oracle Enterprise Linux <sup>5</sup> | 7.2                    | Yes              | Yes | Yes              | No               | No               | No               |
|                                      | 7.0, 7.1               | No               | No  | Yes              | No               | No               | No               |
|                                      | 6.5, 6.6, 6.7, 6.8     | Yes              | Yes | Yes              | No               | No               | No               |
|                                      | 6.4                    | No               | No  | Yes              | No               | No               | No               |

<sup>1</sup>MapReduce (MRv1) metrics are supported only on Red Hat/CentOS 6. MapReduce (MRv1) metrics are not installable on SLES or RedHat / CentOS 7.

<sup>2</sup>MapR Installer 1.9 and earlier are not supported on Red Hat 7.5 or CentOS 7.5 with MapR 5.2.2. Before upgrading your operating system to Red Hat 7.5 or CentOS 7.5, be sure to update the MapR Installer to version 1.10 or later. See [Updating the Installer](#) on page 5614.

<sup>3</sup>If you are installing MapR on CentOS Version 6.3 or earlier, see the Known Issues section in the [Release Notes](#).

<sup>4</sup>Secure MapR clusters are not supported on SLES 11 platforms.

<sup>5</sup>MapR 5.2 and 5.1 support Oracle Enterprise Linux for Core installations only. Ecosystem components are *not* supported.

<sup>6</sup>MapR 5.0 supports RHEL/CentOS 7.0, but service management with `systemd` is not supported. Starting in RHEL/CentOS 7.0, `systemd` was included alongside the legacy process manager, `initd`, but was not enabled by default. In RHEL/CentOS 7.1, `systemd` became the default. Some RHEL/CentOS 7.0 ISOs may have a different default for `systemd` (on), but these will not work with MapR 5.0. Service management integration with `systemd` is only supported if you install MapR 5.1 or 5.2 on RHEL/CentOS 7.1. Customers who encounter issues with `systemd` support may choose to disable `systemd` on RHEL/CentOS 7.0 nodes, downgrade to RHEL/CentOS 6.x, or upgrade to MapR 5.1 or 5.2.

<sup>7</sup>MapR does not support RedHat when its kernel patch level is below kernel-2.6.32-504.16.2.el6. Patch levels below kernel-2.6.32-504.16.2.el6 include Linux kernel 3.14-3.17, which has a [bug](#) that may cause the following issues:

- Lost wake-ups between process threads.
- MapR processes hang.

For more information, see <https://rhn.redhat.com/errata/RHSA-2015-0864.html>.

**Tip:** You can run the following command to determine the kernel patch level of your operating system:  
`uname -r`

<sup>8</sup>The MapR Installer and MapR Installer Stanzas are currently not supported for use with this OS version.

## Understand the Core Lifecycle

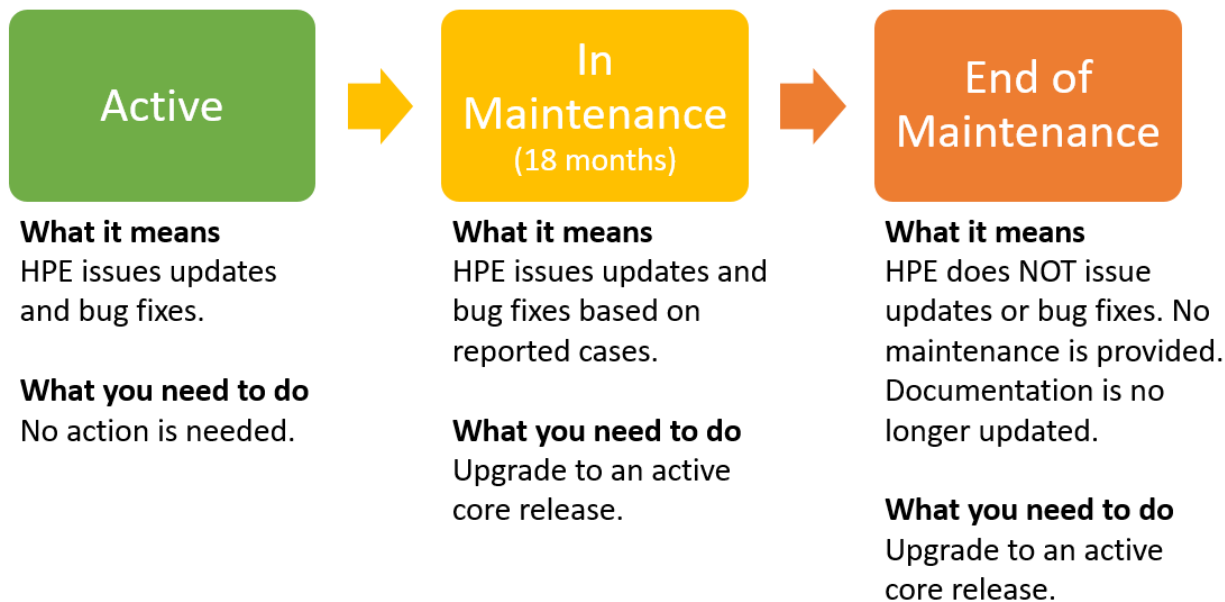

Describes the HPE Ezmeral Data Fabric core lifecycle and defines the lifecycle stages, which are Active, In Maintenance, and End of Maintenance.

### Core Lifecycle Stages

Hewlett Packard Enterprise periodically releases new core software. Each core release is supported for an amount of time that can vary depending on the new releases that follow it. When new core versions are released, older core versions are deprecated or discontinued. Each core version therefore has its own lifecycle. As shown in the diagram, a core release can transition through three lifecycle stages:

- Active
- In Maintenance (18 months)
- End of Maintenance

## Core Lifecycle

Typically, within six months after a new release, Hewlett Packard Enterprise issues an advisory to indicate the end of maintenance for older versions of core. Eighteen months after the advisory is issued, the In-Maintenance core version reaches the End-of-Maintenance stage and is discontinued.

To view the current lifecycle status for every core release, see [Core Support and Lifecycle Status](#) on page 5733. The following table describes the lifecycle stages:

### Support and the Lifecycle Stages

| Support Activity                                  | Notes                                                                                                         | Lifecycle Stage |                  |                    |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------|-----------------|------------------|--------------------|
|                                                   |                                                                                                               | Active          | In Maintenance   | End of Maintenance |
| Proactive Maintenance (Minor, Maintenance, Patch) | Includes proactive fixes for security vulnerabilities, critical bugs, and other issues.                       | Yes             | No               | No                 |
| Reactive Maintenance (Escalation Support + Patch) | Requires the user to open cases resulting in tactical fixes for critical bugs, where backporting is feasible. | Yes             | Yes <sup>1</sup> | No                 |
| Assisted Support (Usage / Debug Support)          | Does not include patch fixes.                                                                                 | Yes             | Yes              | No                 |

<sup>1</sup>Includes fixes for critical bugs and CVEs reported to Support. Does not include documentation updates.

### Core Versions

In HPE Ezmeral Data Fabric interfaces and documentation, core versions are expressed as a dot-separated string of numbers having two, three, or four places. Updates and bug

fixes result in changes to the major, minor, maintenance, and patch versions of a core

release:

### Notification of Changes in Support for Released Core Versions

To notify users about changes in EEP support, Hewlett Packard Enterprise issues periodic support advisories. When core releases are deprecated or discontinued, users of those releases are encouraged to upgrade to newer versions.

For service advisories, see:

- [All Advisories](#)
- [Security Vulnerability Advisories](#)
- [Critical Issue or Bug Advisories](#)
- [Product Discontinuance \(EOL\) Advisories](#)

## Understand the EEP Lifecycle

This page describes the EEP lifecycle and defines the lifecycle stages, which are Active, Deprecated, and Discontinued.

### EEP Lifecycle Stages

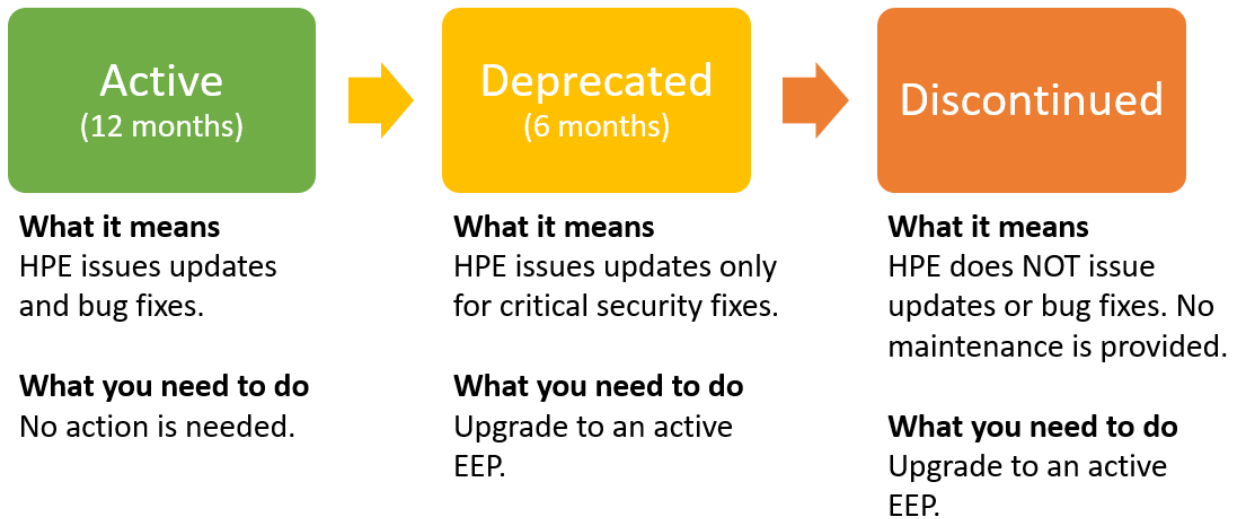

HPE periodically releases new ecosystem components as ecosystem packs (EEPs). Each EEP is supported for 18 months. When new EEPs are released, older EEPs are deprecated or discontinued. Each EEP therefore has its own lifecycle.

As shown in the diagram, an EEP can transition through three lifecycle stages:

- Active (12 months)
- Deprecated (6 months)
- Discontinued

The lifecycle stage determines if HPE issues updates and bug fixes for the EEP, which are reflected in changes to the major, minor, and maintenance versions of the EEP:

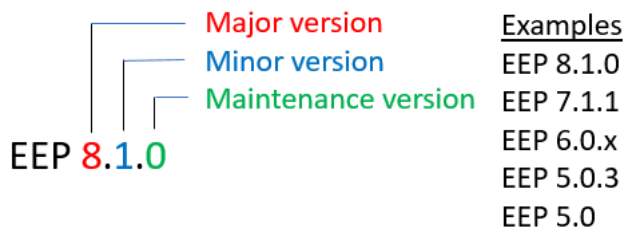

## EEP Lifecycle

To view the current lifecycle status for every EEP, see [EEP Support and Lifecycle Status](#) on page 5734.

### EEP Versions

In HPE Ezmeral Data Fabric interfaces and documentation, Ezmeral Ecosystem Pack (EEP) versions are expressed as a dot-separated string of numbers having two or three places. For example:

| A Change to This EEP Version | Typically Includes                                                                              | For Example                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------|-------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Major version                | A new EEP series that supports a new major, minor, or maintenance version of core.              | <a href="#">EEP Support and Lifecycle Status</a> on page 5734 shows how EEP major versions change when new versions of core are introduced.                                                                                                                                                                                                                                                                       |
| Minor version                | A significant change in features or APIs but no change in support for the current core version. | EEPs 6.0.1 and 6.1.0 both support Release 6.1.0, but EEP 6.1.0 introduced new HPE Ezmeral Data Fabric Database features, such as the C# and Go OJAI clients, as well as new features for ecosystem components (Flume, Oozie, Tez, and Apache Kafka). EEP 6.2.0, which also supports Release 6.1.0, introduced new ecosystem component versions (Hue, Impala, Spark) and updated some components (Oozie and Hive). |
| Maintenance version          | Bug fixes only. EEP maintenance versions do not add new features or API                         | EEPs 5.0.3, 5.0.2, and 5.0.1 added bug fixes to the EEP 5.0.x line while                                                                                                                                                                                                                                                                                                                                          |

| A Change to This EEP Version | Typically Includes                                          | For Example                                  |
|------------------------------|-------------------------------------------------------------|----------------------------------------------|
|                              | changes and are backward compatible in the same EEP series. | preserving compatibility with Release 6.0.1. |

### Notification of Changes in Support for Released EEPs

To notify users about changes in EEP support, HPE issues periodic support advisories. When EEPs are deprecated or discontinued, users of those EEPs are encouraged to upgrade to newer EEPs.

For service advisories, see:

- [All Advisories](#)
- [Security Vulnerability Advisories](#)
- [Critical Issue or Bug Advisories](#)
- [Product Discontinuance \(EOL\) Advisories](#)

### Core Support and Lifecycle Status

This page shows the support and lifecycle status for all versions of HPE Ezmeral Data Fabric core software.

Whenever possible, upgrade to the latest version of data-fabric core so that you can take advantage of new features, usability enhancements, and defect repair. If your installed version of core is "in maintenance," you have a limited amount of time to plan and execute a core upgrade.

For information about the core lifecycle, see [Understand the Core Lifecycle](#) on page 5729. For core compatibility with the leading Linux operating systems, see [Operating System Support Matrix](#) on page 5726.

### Core Lifecycle and Maintenance Dates

| Core Release | Release Date       | Lifecycle Status   | In Maintenance    | End of Maintenance |
|--------------|--------------------|--------------------|-------------------|--------------------|
| 7.0.0        | March 7, 2022      | Active             | N/A               | N/A                |
| 6.2.0        | September 18, 2020 | Active             | January 2023      | June 2024          |
| 6.1.1        | March 29, 2021     | Active             | January 2023      | June 2024          |
| 6.1.0        | September 28, 2018 | Active             | January 2023      | June 2024          |
| 6.0.1        | April 6, 2018      | In Maintenance     | March 2022        | September 2023     |
| 6.0.0        | November 21, 2017  | In Maintenance     | March 2022        | September 2023     |
| 5.2.2        | August 2, 2017     | End of Maintenance | December 13, 2017 | April 30, 2019     |
| 5.2.1        | April 6, 2017      | End of Maintenance | N/A               | April 30, 2019     |
| 5.2.0        | August 19, 2016    | End of Maintenance | N/A               | April 30, 2019     |
| 5.1.0        | February 29, 2016  | End of Maintenance | N/A               | April 30, 2019     |
| 5.0.0        | July 20, 2015      | End of Maintenance | N/A               | April 30, 2019     |
| 4.1.0        | April 30, 2015     | End of Maintenance | N/A               | January 20, 2017   |
| 4.0.2        | January 30, 2015   | End of Maintenance | N/A               | January 20, 2017   |
| 4.0.1        | September 16, 2014 | End of Maintenance | N/A               | January 20, 2017   |

| Core Release | Release Date      | Lifecycle Status   | In Maintenance | End of Maintenance |
|--------------|-------------------|--------------------|----------------|--------------------|
| 4.0.0        | June 23, 2014     | End of Maintenance | N/A            | January 20, 2017   |
| 3.1.1        | June 13, 2014     | End of Maintenance | N/A            | February 29, 2016  |
| 3.1.0        | March 11, 2014    | End of Maintenance | N/A            | February 29, 2016  |
| 3.0.3        | May 5, 2014       | End of Maintenance | N/A            | February 29, 2016  |
| 3.0.2        | October 28, 2013  | End of Maintenance | N/A            | February 29, 2016  |
| 3.0.1        | September 6, 2013 | End of Maintenance | N/A            | February 29, 2016  |
| 3.0.0        | May 1, 2013       | End of Maintenance | N/A            | February 29, 2016  |

### Related concepts

[Understand Software Versions](#) on page 5722

Understanding the version numbers used by core, Ezmeral Ecosystem Packs (EEPs), EEP components, and patches can help you keep your software up to date and plan for upgrades.

[Checking the Core Version](#) on page 5620

Some maintenance operations require you to know the version of the currently installed HPE Ezmeral Data Fabric release (sometimes referred to as the "core version"). You can check the core version easily from within the Control System or Installer user interface or identify the version from your installed packages.

[Upgrading Ezmeral Ecosystem Packs](#) on page 285

Describes how to upgrade Ezmeral Ecosystem Packs (EEPs), either as part of a core upgrade or to take advantage of a new EEP for the current version of core.

### Related reference

[Understand the Core Lifecycle](#) on page 5729

Describes the HPE Ezmeral Data Fabric core lifecycle and defines the lifecycle stages, which are Active, In Maintenance, and End of Maintenance.

[Understand the EEP Lifecycle](#) on page 5731

This page describes the EEP lifecycle and defines the lifecycle stages, which are Active, Deprecated, and Discontinued.

## EEP Support and Lifecycle Status

This page shows the EEPs that are supported for different core releases and the current lifecycle status for each EEP.

Whenever possible, upgrade to the latest EEP supported by your core version so that you can take advantage of bug fixes and usability enhancements. If your installed EEP is deprecated or discontinued, see the corresponding upgrade recommendation and support advisory to understand your options.

To learn more about the EEP lifecycle, see [Understand the EEP Lifecycle](#) on page 5731. For core lifecycle information, see [Core Support and Lifecycle Status](#) on page 5733.

### Core Release 7.0.0

| EEP   | EEP Lifecycle Status | EEP Is Deprecated | EEP Is Discontinued | EEP Upgrade Recommendation | Support Advisory |
|-------|----------------------|-------------------|---------------------|----------------------------|------------------|
| 8.1.0 | Active               | March 6, 2023     | September 30, 2023  | N/A                        | N/A              |

**Core Release 6.2.0**

| EEP   | EEP Lifecycle Status  | EEP Is Deprecated  | EEP Is Discontinued | EEP Upgrade Recommendation  | Support Advisory |
|-------|-----------------------|--------------------|---------------------|-----------------------------|------------------|
| 8.1.0 | Active                | March 6, 2023      | September 30, 2023  | N/A                         | N/A              |
| 8.0.0 | Replaced by EEP 8.1.0 |                    |                     |                             |                  |
| 7.1.1 | Active                | October 31, 2022   | April 30, 2023      | N/A                         |                  |
| 7.1.0 | Active                | June 30, 2022      | December 31, 2022   | N/A                         |                  |
| 7.0.1 | Deprecated            | January 31, 2022   | July 31, 2022       | Upgrade to latest EEP 7.1.x |                  |
| 7.0.0 | Deprecated            | September 18, 2021 | March 31, 2022      | Upgrade to latest EEP 7.1.x |                  |

**Core Release 6.1.1**

**Core Release 6.0.0**

| EEP   | EEP Lifecycle Status | EEP Is Deprecated | EEP Is Discontinued | EEP Upgrade Recommendation  | Support Advisory |
|-------|----------------------|-------------------|---------------------|-----------------------------|------------------|
| 4.1.4 | Discontinued         | October 31, 2018  | April 30, 2019      | Upgrade to latest EEP 5.0.x | Advisory Issued  |
| 4.1.3 | Discontinued         | October 31, 2018  | April 30, 2019      | Upgrade to latest EEP 5.0.x |                  |
| 4.1.2 | Discontinued         | October 31, 2018  | April 30, 2019      | Upgrade to latest EEP 5.0.x |                  |
| 4.1.1 | Discontinued         | October 31, 2018  | April 30, 2019      | Upgrade to latest EEP 5.0.x |                  |
| 4.1.0 | Discontinued         | October 31, 2018  | April 30, 2019      | Upgrade to latest EEP 5.0.x |                  |
| 4.0.0 | Discontinued         | October 31, 2018  | April 30, 2019      | Upgrade to latest EEP 5.0.x |                  |

**Core Release 5.2.x**

| EEP   | EEP Lifecycle Status | EEP Is Deprecated | EEP Is Discontinued | EEP Upgrade Recommendation                              | Support Advisory                                      |
|-------|----------------------|-------------------|---------------------|---------------------------------------------------------|-------------------------------------------------------|
| 3.0.5 | Discontinued         | October 31, 2018  | April 30, 2019      | Upgrade to EEP 6.3.x or later (requires a core upgrade) | Prepare for MapR 5.x End of Maintenance by April 2019 |
| 3.0.4 | Discontinued         | October 31, 2018  | April 30, 2019      | Upgrade to EEP 6.3.x or later (requires a core upgrade) |                                                       |
| 3.0.3 | Discontinued         | October 31, 2018  | April 30, 2019      | Upgrade to EEP 6.3.x or later (requires a core upgrade) |                                                       |
| 3.0.2 | Discontinued         | October 31, 2018  | April 30, 2019      | Upgrade to EEP 6.3.x or later (requires a core upgrade) |                                                       |
| 3.0.1 | Discontinued         | October 31, 2018  | April 30, 2019      | Upgrade to EEP 6.3.x or later (requires a core upgrade) |                                                       |
| 3.0   | Discontinued         | October 31, 2018  | April 30, 2019      | Upgrade to EEP 6.3.x or later (requires a core upgrade) |                                                       |
| 2.0.3 | Discontinued         | October 31, 2018  | April 30, 2019      | Upgrade to EEP 6.3.x or later (requires a core upgrade) |                                                       |
| 2.0.2 | Discontinued         | October 31, 2018  | April 30, 2019      | Upgrade to EEP 6.3.x or later (requires a core upgrade) |                                                       |
| 2.0.1 | Discontinued         | October 31, 2018  | April 30, 2019      | Upgrade to EEP 6.3.x or later (requires a core upgrade) |                                                       |
| 2.0   | Discontinued         | October 31, 2018  | April 30, 2019      | Upgrade to EEP 6.3.x or later (requires a core upgrade) |                                                       |
| 1.1.4 | Discontinued         | October 31, 2018  | April 30, 2019      | Upgrade to EEP 6.3.x or later (requires a core upgrade) |                                                       |
| 1.1.3 | Discontinued         | October 31, 2018  | April 30, 2019      | Upgrade to EEP 6.3.x or later (requires a core upgrade) |                                                       |
| 1.1.2 | Discontinued         | October 31, 2018  | April 30, 2019      | Upgrade to EEP 6.3.x or later (requires a core upgrade) |                                                       |
| 1.1.1 | Discontinued         | October 31, 2018  | April 30, 2019      | Upgrade to EEP 6.3.x or later (requires a core upgrade) |                                                       |
| 1.1.0 | Discontinued         | October 31, 2018  | April 30, 2019      | Upgrade to EEP 6.3.x or later (requires a core upgrade) |                                                       |

\*Before using this EEP with the specified core version, you must apply the latest core patch. See [Downloading a Patch](#) on page 393.

\*\*EEP 5.0.7 is supported on core 6.0.1 until core 6.0.1 is discontinued or a newer EEP 5.0.x (with x > 7) becomes available.

### Related concepts

[Understand Software Versions](#) on page 5722

Understanding the version numbers used by core, Ezmeral Ecosystem Packs (EEPs), EEP components, and patches can help you keep your software up to date and plan for upgrades.

[Checking the EEP Version](#) on page 5618

Some Installer operations require you to know the version of the currently installed Ezmeral Ecosystem Pack (EEP). You can check the EEP version easily from within the Installer user interface or derive the EEP version from your repository information.

[Upgrading Ezmeral Ecosystem Packs](#) on page 285

Describes how to upgrade Ezmeral Ecosystem Packs (EEPs), either as part of a core upgrade or to take advantage of a new EEP for the current version of core.

[Ezmeral Ecosystem Pack \(EEP\) Reference](#) on page 6701

This section contains links to information that is specific to a given EEP.

### Related reference

[Understand the EEP Lifecycle](#) on page 5731

This page describes the EEP lifecycle and defines the lifecycle stages, which are Active, Deprecated, and Discontinued.

## EEP Components and OS Support

Ezmeral Ecosystem Packs consist of ecosystem components and monitoring components that can run on a variety of operating systems.

Release 6.0 and later support multiple Ezmeral Ecosystem Packs (EEPs). For information about the EEPs supported by various core versions, see [EEP Support and Lifecycle Status](#) on page 5734. For more information about the components in each EEP, see the [EEP Release Notes](#) on page 5854.

### EEP 8.1.0 Components and OS Support

This topic lists the ecosystem and monitoring components that are included in EEP 8.1.0 and shows the operating system support for each component.

To understand which core versions can use this EEP, see [EEP Support and Lifecycle Status](#) on page 5734.

For the Linux operating-system versions supported by data-fabric software, see [Operating System Support Matrix](#) on page 5726.

<sup>1</sup>Airflow is not supported on SLES 15 SP2.

<sup>2</sup>The Spark Notebook UI in Hue is a beta feature.

<sup>3</sup>Monitoring components are not supported as standalone products. They are only supported for data-fabric monitoring use cases.

### EEP 8.0.0 Components and OS Support

This topic lists the ecosystem and monitoring components that are included in EEP 8.0.0 and shows the operating system support for each component.

To understand which core versions can use this EEP, see [EEP Support and Lifecycle Status](#) on page 5734.

For the Linux operating-system versions supported by data-fabric software, see [Operating System Support Matrix](#) on page 5726.

| Ecosystem Components        | SLES   |        | RHEL / CentOS |     |     |     | Ubuntu |       |

<sup>1</sup>The Spark Notebook UI in Hue is a beta feature.

<sup>2</sup>Support for Sentry is limited to Impala users.

<sup>3</sup>Monitoring components are not supported as standalone products. They are only supported for data-fabric monitoring use cases.

### EEP 7.1.0 Components and OS Support

This topic lists the ecosystem and monitoring components that are included in EEP 7.1.0 and shows the operating system support for each component.

To understand which core versions can use this EEP, see [EEP Support and Lifecycle Status](#) on page 5734.

For the Linux operating-system versions supported by data-fabric software, see [Operating System Support Matrix](#) on page 5726.

| Ecosystem Components                     | SLES   |        | RHEL / CentOS          | Ubuntu |       | OEL |
|------------------------------------------|--------|--------|------------------------|--------|-------|-----|
|                                          | 15 SP2 | 12 SPx | 8.4, 8.3, 8.2, and 8.1 | 18.04  | 16.04 | 8.2 |

<sup>1</sup>The Spark Notebook UI in Hue is a beta feature.

<sup>2</sup>Support for Sentry is limited to Impala users.

<sup>3</sup>Monitoring components are not supported as standalone products. They are only supported for data-fabric monitoring use cases.

### EEP 6.3.5 Components and OS Support

This topic lists the ecosystem and monitoring components that are included in EEP 6.3.5 and shows the operating system support for each component.

To understand which core versions can use this EEP, see [EEP Support and Lifecycle Status](#) on page 5734.

For the Linux operating-system versions supported by data-fabric software, see [Operating System Support Matrix](#) on page 5726.

| Ecosystem Components                     | SUSE   | RHEL / CentOS |     |     |     |     |     | Ubuntu |       |

| OpenTSDB 2.4.0                           | Y | Y | Y |

<sup>1</sup>The Spark Notebook UI in Hue is a beta feature.

<sup>2</sup>Support for Sentry is limited to Impala users.

<sup>3</sup>Monitoring components are not supported as standalone products. They are only supported for data-fabric monitoring use cases.

### EEP 6.3.2 Components and OS Support

This topic lists the ecosystem and monitoring components that are included in EEP 6.3.2 and shows the operating system support for each component.

To understand which core versions can use this EEP, see [EEP Support and Lifecycle Status](#) on page 5734.

For the Linux operating-system versions supported by data-fabric software, see [Operating System Support Matrix](#) on page 5726.

| Ecosystem Components         | SUSE          | RHEL / CentOS | Ubuntu |
|------------------------------|---------------|---------------|--------|
| AsyncHBase 1.7.0             | Y             | Y             | Y      |

<sup>1</sup>Supported for use only with HPE Ezmeral Data Fabric Database binary tables.

<sup>2</sup>The Spark Notebook UI in Hue is a beta feature.

<sup>3</sup>MapR support for Sentry is limited to Impala users.

<sup>4</sup>Supported for monitoring use cases only.

### EEP 6.1.0 Components and OS Support

This topic lists the ecosystem and MapR-monitoring components that are included in EEP 6.1.0 and shows the operating system support for each component.

To understand which MapR Core versions can use this EEP, see [EEP Support and Lifecycle Status](#) on page 5734.

For the Linux operating-system versions supported by MapR software, see [Operating System Support Matrix](#) on page 5726.

| Ecosystem Components              | SUSE          | RHEL / CentOS | Ubuntu |
|-----------------------------------|---------------|---------------|--------|
| AsyncHBase 1.7 <sup>1</sup>       | Y             | Y             | Y      |
| Drill 1.15.0.0                    | Y             | Y             | Y      |
| Flume 1.8                         | Y             | Y             | Y      |
| HBase-compatible API <sup>1</sup> | Y             | Y             | Y      |
| Hive 2.3.3 <sup>2</sup>           | Y             | Y             | Y      |
| HttpFS 1.0                        | Y             | Y             | Y      |
| Hue 4.2 <sup>3</sup>              | Y             | Y             | Y      |
| Impala 2.10                       | Y<br>(12 SP1) | Y             | N      |
| KSQL 4.1.1                        | Y             | Y             | Y      |
| MapR Data Access Gateway 2.0      | Y             | Y             | Y      |

|-----------------------------------------------|---|---|---|
| MapR Object Store 1.0.1                       | Y | Y | Y |
| Myriad 0.2                                    | Y | Y | Y |
| Oozie 5.1.0.0                                 | Y | Y | Y |
| Pig 0.16                                      | Y | Y | Y |
| Sentry 1.7.0 <sup>4</sup>                     | Y | Y | Y |
| Spark 2.3.2.0                                 | Y | Y | Y |
| Sqoop 1.4.7                                   | Y | Y | Y |
| Sqoop2 1.99.7                                 | Y | Y | Y |
| <b>MapR Monitoring Components<sup>5</sup></b> |   |   |   |
| Collectd 5.8.1.0                              | Y | Y | Y |
| Elasticsearch 6.5.3.0                         | Y | Y | Y |
| Fluentd 1.3.2.0                               | Y | Y | Y |
| Grafana 5.4.2.0                               | Y | Y | Y |
| Kibana 6.5.3.0                                | Y | Y | Y |
| OpenTSDB 2.4.0                                | Y | Y | Y |

<sup>1</sup>Supported for use only with HPE Ezmeral Data Fabric Database binary tables.

<sup>2</sup>Equivalent to Apache Hive 2.3.4.

<sup>3</sup>The Spark Notebook UI in Hue is a beta feature.

<sup>4</sup>MapR support for Sentry is limited to Impala users.

<sup>5</sup>Supported for monitoring use cases only.

### EEP 6.0.2 Components and OS Support

This topic lists the ecosystem and MapR-monitoring components that are included in EEP 6.0.2 and shows the operating system support for each component.

To understand which MapR Core versions can use this EEP, see [EEP Support and Lifecycle Status](#) on page 5734.

For the Linux operating-system versions supported by MapR software, see [Operating System Support Matrix](#) on page 5726.

| Ecosystem Components              | SUSE          | RHEL / CentOS | Ubuntu |
|-----------------------------------|---------------|---------------|--------|
| AsyncHBase 1.7 <sup>1</sup>       | Y             | Y             | Y      |
| Drill 1.14                        | Y             | Y             | Y      |
| Flume 1.8                         | Y             | Y             | Y      |
| HBase-compatible API <sup>1</sup> | Y             | Y             | Y      |

<sup>1</sup>Supported for use only with HPE Ezmeral Data Fabric Database binary tables.

<sup>2</sup>Supported with Open JDK 1.8 and Oracle JDK 1.8.

<sup>3</sup>The Spark Notebook UI in Hue is a beta feature.

<sup>4</sup>Support for Sentry is limited to Impala users.

<sup>5</sup>Monitoring components are not supported as standalone products. They are only supported for data-fabric monitoring use cases.

### EEP 5.0.6 Components and OS Support

This topic lists the ecosystem and monitoring components that are included in EEP 5.0.6 and shows the operating system support for each component.

To understand which core versions can use this EEP, see [EEP Support and Lifecycle Status](#) on page 5734.

For the Linux operating-system versions supported by data-fabric software, see [Operating System Support Matrix](#) on page 5726.

| Ecosystem Components              | SUSE           | RHEL / CentOS | Ubuntu |
|-----------------------------------|----------------|---------------|--------|
| AsyncHBase 1.7.0 <sup>1</sup>     | Y              | Y             | Y      |

| Kibana 5.4.1                                  | Y | Y | Y |
| OpenTSDB 2.4.0                                | Y | Y | Y |

<sup>1</sup>Supported for use only with HPE Ezmeral Data Fabric Database binary tables.

<sup>2</sup>Supported with Open JDK 1.8 and Oracle JDK 1.8.

<sup>3</sup>The Spark Notebook UI in Hue is a beta feature.

<sup>4</sup>MapR support for Sentry is limited to Impala users.

<sup>5</sup>Supported for monitoring use cases only.

### EEP 5.0.1 Components and OS Support

This topic lists the ecosystem and MapR-monitoring components that are included in EEP 5.0.1 and shows the operating system support for each component.

To understand which MapR Core versions can use this EEP, see [EEP Support and Lifecycle Status](#) on page 5734.

For the Linux operating-system versions supported by MapR software, see [Operating System Support Matrix](#) on page 5726.

| Ecosystem Components              | SUSE           | RHEL / CentOS | Ubuntu |
|-----------------------------------|----------------|---------------|--------|
| AsyncHBase 1.7 <sup>1</sup>       | Y              | Y             | Y      |

<sup>1</sup>Supported for use only with HPE Ezmeral Data Fabric Database binary tables.

<sup>2</sup>Supported with Open JDK 1.8 and Oracle JDK 1.8.

<sup>3</sup>The Spark Notebook UI in Hue is a beta feature.

<sup>4</sup>MapR support for Sentry is limited to Impala users.

<sup>5</sup>Supported for monitoring use cases only.

### EEP 4.1.1 Components and OS Support

This topic lists the ecosystem and MapR-monitoring components that are included in EEP 4.1.1 and shows the operating system support for each component.

To understand which MapR Core versions can use this EEP, see [EEP Support and Lifecycle Status](#) on page 5734.

For the Linux operating-system versions supported by MapR software, see [Operating System Support Matrix](#) on page 5726.

| Ecosystem Components                          | SUSE           | RHEL / CentOS | Ubuntu |
|-----------------------------------------------|----------------|---------------|--------|
| AsyncHBase 1.7 <sup>1</sup>                   | Y              | Y             | Y      |

<sup>1</sup>Supported with Open JDK 1.8 and Oracle JDK 1.7 or 1.8.

<sup>2</sup>The Spark Notebook UI in Hue is a beta feature.

<sup>3</sup>MapR support for Sentry is limited to Impala users.

<sup>4</sup>Supported for monitoring use cases only.

### EEP 3.0.4 Components and OS Support

This topic lists the ecosystem and MapR-monitoring components that are included in EEP 3.0.4 and shows the operating system support for each component.

To understand which MapR Core versions can use this EEP, see [EEP Support and Lifecycle Status](#) on page 5734.

For the Linux operating-system versions supported by MapR software, see [Operating System Support Matrix \(MapR 5.x\)](#) on page 5727.

| Ecosystem Components                          | SUSE           | RHEL / CentOS                                | Ubuntu |

<sup>1</sup>Supported with Open JDK 1.8 and Oracle JDK 1.7 or 1.8.

<sup>2</sup>The Spark Notebook UI in Hue is a beta feature.

<sup>3</sup>MapR support for Sentry is limited to Impala users.

<sup>4</sup>Supported for monitoring use cases only.

### EEP 3.0.1 Components and OS Support

This topic lists the ecosystem and MapR-monitoring components that are included in EEP 3.0.1 and shows the operating system support for each component.

To understand which MapR Core versions can use this EEP, see [EEP Support and Lifecycle Status](#) on page 5734.

For the Linux operating-system versions supported by MapR software, see [Operating System Support Matrix \(MapR 5.x\)](#) on page 5727.

<sup>1</sup>Supported with Open JDK 1.8 and Oracle JDK 1.7 or 1.8.

<sup>2</sup>The Spark Notebook UI in Hue is a beta feature.

<sup>3</sup>MapR support for Sentry is limited to Impala users.

<sup>4</sup>Supported for monitoring use cases only.

### EEP 2.0.3 Components and OS Support

This topic lists the ecosystem and MapR-monitoring components that are included in EEP 2.0.3 and shows the operating system support for each component.

To understand which MapR Core versions can use this EEP, see [EEP Support and Lifecycle Status](#) on page 5734.

| Ecosystem Components                          | SUSE           | RHEL / CentOS                           | Ubuntu |
|-----------------------------------------------|----------------|-----------------------------------------|--------|
| AsynchBase 1.7                                | Y              | Y                                       | Y      |

<sup>1</sup>The Spark Notebook UI in Hue is a beta feature.

<sup>2</sup>Supported for monitoring use cases only.

<sup>3</sup>Supported with Open JDK 1.8 and Oracle JDK 1.7 or 1.8.

### EEP 2.0 Components and OS Support

This topic lists the ecosystem and MapR-monitoring components that are included in EEP 2.0 and shows the operating system support for each component.

To understand which MapR Core versions can use this EEP, see [EEP Support and Lifecycle Status](#) on page 5734.

| Ecosystem Components | SUSE | RHEL / CentOS | Ubuntu |
|----------------------|------|---------------|--------|
|----------------------|------|---------------|--------|

|                                               |   |                                         |   |
|-----------------------------------------------|---|-----------------------------------------|---|
| AsyncHBase 1.7                                | Y | Y                                       | Y |

### EEP 1.1.1 Components and OS Support

This topic lists the ecosystem and MapR-monitoring components that are included in EEP 1.1.1 and shows the operating system support for each component.

To understand which MapR Core versions can use this EEP, see [EEP Support and Lifecycle Status](#) on page 5734.

| Ecosystem Components | SUSE | RHEL / CentOS                           | Ubuntu |
|----------------------|------|-----------------------------------------|--------|
| AsyncHBase 1.7       | Y    | Y                                       | Y      |
| Drill 1.8            | N    | Y                                       | Y      |
| Flume 1.6            | Y    | Y                                       | Y      |
| HBase 1.1            | Y    | Y                                       | Y      |
| Hive 1.2             | Y    | Y                                       | Y      |
| HttpFS 1.0           | Y    | Y                                       | Y      |
| Hue 3.9              | Y    | Y                                       | Y      |

## Discontinued Ecosystem Components

Provides information about discontinued ecosystem components.

Ecosystem components can be discontinued when either of the following is true:

- Newer components are available that serve the same function but provide better features and performance.
- The Open Source community decides to retire a product.

To understand what *discontinued* and *deprecated* mean when these terms are applied to a component or EEP, see [Understand the EEP Lifecycle](#) on page 5731.

HPE uses the support advisory process to notify users in advance that a component will be discontinued. The last EEP version to support a deprecated component is the EEP version that is released at the time of the deprecation announcement. The following table lists the components that are either already discontinued or scheduled to be discontinued:

| Component                               | Deprecated       | Discontinued     | Last EEP Version Supporting Component*                                                                                                      | Suggested Replacement                                | Announcement  |

\*Later EEPs in the same series can include a discontinued component. For example, if the last EEP version supporting a discontinued component is x.y.0, the component might be present in x.y.1, x.y.2, x.y.3, and so on. This is to ensure that upgrades complete successfully. But HPE does not support using the component in later EEPs (x.y.1, x.y.2, x.y.3, and so on), and the last supported EEP version remains x.y.0.

\*\*Discontinued for EEP 7.0.0 and later in September 2020. To be discontinued for EEP 5.0.x and EEP 6.3.x when those EEPs reach end of life.

This page shows the EEPs that are supported for different core releases and the current lifecycle status for each EEP.

[Understand the EEP Lifecycle](#) on page 5731

This page describes the EEP lifecycle and defines the lifecycle stages, which are Active, Deprecated, and Discontinued.

## Component Versions for Released EEPs

The published Ezmeral Ecosystem Packs (EEPs) contain different component versions with different features. Comparing the component versions can help you make decisions about installing or upgrading data-fabric software.

### Components Supported by EEPs 1.x - 8.x

The following tables show the latest supported versions of each component in a EEP series. The tables reflect the component versions at release time and do not include patch versions issued between releases.

#### Core 7.0.0 with EEP 8.x

| Ecosystem Component          | EEP Series Versions |
|------------------------------|---------------------|
|                              | EEP-8.1.0           |
| AsynchHBase                  | 1.8.2               |

\*Kafka Schema Registry 5.1.2.0 and later are provided as *general availability* software. Kafka Schema Registry 4.1.1 is *developer preview* software. Developer previews are not tested for production environments, and should be used with caution. Kafka Schema Registry packages are included in EEP 7.0.0 and later but not included in EEP 6.x.

\*\*Beginning with EEP 4.0.0, Livy is included as its own package in MapR EEP repositories. Before EEP 4.0.0, Livy was included as mapr-hue-livy and released only as a part of Hue. For more information, see [Livy](#) on page 4045.

\*\*\*Tez is supported only for use with Hive. Therefore, MapR documentation for Tez is limited when compared to the documentation for other ecosystem components. For release note information, see [Tez Release Notes](#).

\*\*\*\*Before using EEP 6.3.3 with release 6.1.0, you must apply the latest 6.1.0 patch.

**Related concepts**

[Understand Software Versions](#) on page 5722

Understanding the version numbers used by core, Ezmeral Ecosystem Packs (EEPs), EEP components, and patches can help you keep your software up to date and plan for upgrades.

**Related reference**

[EEP Support and Lifecycle Status](#) on page 5734

This page shows the EEPs that are supported for different core releases and the current lifecycle status for each EEP.

**CSI Version Compatibility**

This matrix shows the released versions of the Container Storage Interface (CSI) storage plugin and their compatibility with other components in a Kubernetes environment.

| CSI Storage Plugin | Version Compatibility |                             |          |                                      |                                                                                        |                                                                |                                |

<sup>1</sup>Supports [Raw Block Volumes](#) on page 632.

<sup>2</sup>If your environment uses Kubernetes 1.20+ and OpenShift 4.7+, you must use FUSE 1.2.1+ and Loopback NFS 1.0.1+.

<sup>3</sup>In a release 7.0.0 environment, you must use Fuse 1.2.7+ and Loopback NFS 1.0.7+.

## JDK Support Matrix

This matrix shows the Java Development Kit versions supported by different HPE Ezmeral Data Fabric releases.

Only the Oracle, OpenJDK, and Amazon Corretto Java engines are supported.

| JDK/Data Fabric Release | Release 6.2.0 | Release 6.1.x | Release 6.0.x | Release 5.2.x |
|-------------------------|---------------|---------------|---------------|---------------|
| JDK 11 <sup>1</sup>     | Yes           | No            | No            | No            |
| JDK 8 <sup>2</sup>      | No            | Yes           | Yes           | Yes           |
| JDK 7 <sup>2</sup>      | No            | No            | No            | Yes           |
| JDK 6 <sup>2</sup>      | No            | No            | No            | No            |

<sup>1</sup>Oracle, OpenJDK, and Amazon Corretto engines are supported.

<sup>2</sup>Only the Oracle and OpenJDK Java engines are supported.

Summarizes JDK and JRE build and run information for EEP 7.x.y data-fabric ecosystem components.

### JDK / JRE Support

This page shows the JDK and JRE versions for which data-fabric releases provide build-time and run-time support.

### JDK Build-Time Support

| JDK Version        | Release |       |       |
|--------------------|---------|-------|-------|
|                    | 7.0.0   | 6.2.0 | 6.1.0 |
| JDK 11             | Yes     | Yes   | No    |
| Amazon Corretto 11 | Yes     | Yes   | No    |
| JDK Azul           | No      | No    | No    |
| JDK 8              | No      | No    | Yes   |
| JDK 7              | No      | No    | No    |
| JDK 6              | No      | No    | No    |

### JRE Support (Run-Time Support)

| JRE Version          | Release 7.0.0 | Release 6.2.0 | Release 6.1.x | Release 6.0.x | Release 5.2.x |
|----------------------|---------------|---------------|---------------|---------------|---------------|
| Open JRE 11          | Yes           | Yes           | No            | Yes           | No            |
| (Oracle Sun) JRE 11  | Yes (implied) | Yes (implied) | No            | No            | No            |
| Amazon Corretto (11) | Yes           | Yes           | No            | No            | No            |
| JRE Azul             | No            | No            | No            | No            | No            |
| JRE 8                | No            | No            | Yes           | Yes           | Yes           |

| JRE Version | Release 7.0.0 | Release 6.2.0 | Release 6.1.x | Release 6.0.x | Release 5.2.x |
|-------------|---------------|---------------|---------------|---------------|---------------|
| JRE 7       | No            | No            | No            | No            | Yes           |
| JRE 6       | No            | No            | No            | No            | No            |

## Hadoop Protocol Versions

Shows the Hadoop RPC protocol version and compatible data-fabric client versions for each release.

Each core release version is associated with a Hadoop RPC protocol version. The JobTrackers or ResourceManagers in a given cluster accept only the jobs submitted from clients with a compatible protocol version.

The following table shows the Hadoop version, Hadoop RPC protocol version, and compatible data-fabric client versions for each core release:

| Core Version | EEP                | Hadoop Version | RPC Protocol   | Compatible with Data Fabric Client Version                   |
|--------------|--------------------|----------------|----------------|--------------------------------------------------------------|
| 7.0.0        | 8.1.0              | 2.7.6.200      | 9              | 7.0.0.0                                                      |
|              | 8.0.0              | 2.7.6.100      | 9              | 7.0.0.0                                                      |
| 6.2.x        | 8.1.0              | 2.7.6.200      | 9              | 6.2.x, 6.1.x <sup>3</sup>                                    |
|              | 8.0.0              | 2.7.6.100      | 9              | 6.2.x, 6.1.x <sup>3</sup>                                    |
|              | 7.1.1 <sup>1</sup> | 2.7.5.0        | 9              | 6.2.x, 6.1.x <sup>3</sup>                                    |
|              | 7.1.0 <sup>1</sup> | 2.7.5.0        | 9              | 6.2.x, 6.1.x <sup>3</sup>                                    |
|              | 7.0.1              | 2.7.4.100      | 9              | 6.2.x, 6.1.x <sup>3</sup>                                    |
|              | 7.0.0              | 2.7.4.0        | 9              | 6.2.x, 6.1.x <sup>3</sup>                                    |
| 6.1.x        | N/A                | 2.7.0          | 9              | 6.1.0, 6.0.x, 5.2.x                                          |
| 6.0.x        | N/A                | 2.7.0          | 9              | 6.0.0, 5.2.0, 5.1.0, 5.0.0, 4.1.0, 4.0.2, 4.0.1 <sup>4</sup> |
| 5.2.x        | N/A                | 2.7.0          | 9 <sup>2</sup> | 5.2.0, 5.1.0, 5.0.0, 4.1.0, 4.0.2, 4.0.1 <sup>4</sup>        |
| 5.1.0        | N/A                | N/A            | 9 <sup>2</sup> | 5.1.0, 5.0.0, 4.1.0, 4.0.2, 4.0.1 <sup>4</sup>               |
| 5.0.0        | N/A                | N/A            | 9 <sup>2</sup> | 5.0.0, 4.1.0, 4.0.2, 4.0.1 <sup>4</sup>                      |
| 4.1.0        | N/A                | N/A            | 9 <sup>2</sup> | 4.1, 4.0.2, 4.0.1 <sup>4</sup>                               |
| 4.0.x        | N/A                | N/A            | 9 <sup>2</sup> | 4.0.x <sup>5</sup>                                           |
| 3.1.x        | N/A                | N/A            | 4              | 3.1.x                                                        |
| 3.0.x        | N/A                | N/A            | 5              | 3.0.x, 2.1.x                                                 |
| 2.1.x        | N/A                | N/A            | 5              | 3.0.x, 2.1.x                                                 |
| 2.0.x        | N/A                | N/A            | 4              | 3.1.x, 2.0.x                                                 |

<sup>1</sup>Release 6.2.0.5 and later.

<sup>2</sup>MapReduce version 1 and version 2 use the same protocol version.

<sup>3</sup>Release 6.1 client support is limited if applications submitting jobs to release 6.2 clusters are developed in JDK 1.8. Jars used by the client application should not use features made obsolete in JDK 11.

<sup>4</sup>A release 4.0.2 client can submit MRv2 jobs to a release 4.1, 5.0, or 5.1 cluster configured with zero-configuration ResourceManager failover (RM HA) as long as the client is also configured with zero-configuration RM HA.

<sup>5</sup>If you want to submit MapReduce v2 jobs to a release 4.0.x cluster configured with zero-configuration RMHA, you must use a release 4.0.2 client on a release 4.0.2 cluster.

## Client Support Matrix

This matrix shows which HPE Ezmeral Data Fabric releases are compatible with different data-fabric client OS versions.

For a list of the client versions that are compatible with each release, see [Hadoop Protocol Versions](#) on page 5801.

| Client OS      | Version                                                          | Release 6.2.x | Release 6.1.x | Release 6.0.x | Release 5.2.x | Release 5.1.0 | Release 5.0.0 | Release 4.1.0 | Release 4.0.x |
|----------------|------------------------------------------------------------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|
| Windows 64-bit | 10                                                               | Yes           | Yes           | Yes           | Yes           | Yes           | Yes           | Yes           | Yes           |
|                | 7                                                                | No            | Yes           | Yes           | Yes           | Yes           | Yes           | Yes           | Yes           |
|                | 2012                                                             | No            | Yes           | Yes           | Yes           | Yes           | Yes           | Yes           | Yes           |

### Change Control Notes

Updated January 8, 2021 (changed "N/A" entries to "No" entries).

Updated August 11, 2020 (added column for MapR 6.2.x).

Updated June 27, 2018 (added column for MapR 6.1.x).

## Installer Support Matrix

This matrix shows the operating systems that are supported by the Installer.

### OS Version Support

| Release Version/<br>Installer Version | Installer 1.17.0.0<br>Supported | Installer 1.16.0.x<br>Supported | Installer 1.15.0.x<br>Supported | Installer 1.14.0.x<br>Supported | Installer 1.13.0.0<br>Supported | Installer 1.12.0.0<br>Supported | Installer 1.11.0.0<br>Supported |
|---------------------------------------|---------------------------------|---------------------------------|---------------------------------|---------------------------------|---------------------------------|---------------------------------|---------------------------------|
|                                       |                                 |                                 |                                 |                                 |                                 |                                 |                                 |

<sup>1</sup>Supported on RHEL but not on CentOS.

<sup>2</sup>The Installer only supports upgrades for this OS version. See [Selecting an Installer Version to Use](#) on page 5607.

<sup>3</sup>Before using Installer 1.14 on Ubuntu 16.04 nodes, you must manually install Java JDK 11. If you are using Installer 1.14 on RHEL/CentOS or SLES, the Installer installs Java JDK11 for you.

<sup>4</sup>Before using the Installer to install Release 6.0 or later on Ubuntu 14.04, you must upgrade to Java 1.8 on the cluster nodes. See IN-553 in [Installer Known Issues](#).

<sup>5</sup>Requires Installer 1.14.0.1 or later. Installer 1.14.0.1 supports Oracle Enterprise Linux 7.8 only on release 6.1.0 and does not support ecosystem components for release 6.1.0.

### Version Support

\*The Installer does not support new installations of release 6.1.0 on RHEL / CentOS 8.1.

\*\*New installations of release 6.1.0 are no longer supported. Install release 6.1.1 or release 6.2.0 instead.

\*\*\*The Installer only supports upgrades for this OS version. See [Selecting an Installer Version to Use](#) on page 5607.

### Change Control Notes

- Updated October 15, 2021 (added Installer 1.17.0.0 information).
- Updated October 1, 2021 (added RHEL 8.4 support).
- Updated August 29, 2021 (added Installer 1.16.0.x information).
- Updated April 16, 2020 (added Installer 1.16.0.0 information).
- Updated February 20, 2020 (added Installer 1.15.0.1 and release 6.1.1 information).
- Updated January 16, 2020 (added Installer 1.15.0.0 information and support for Oracle Enterprise Linux 8.2).
- Updated October 28, 2020 (added support for RHEL 7.9 and removed column for Installer 1.8.0).
- Updated October 16, 2020 (added support for RHEL / CentOS 8.2 and Oracle Enterprise Linux 7.8).
- Updated September. 8, 2020 (Installer 1.14.0.0 added).
- Updated June 17, 2020 (rows added for RHEL / CentOS 7.8). Changed RHEL / CentOS 6.x values from Yes to No where only upgrades are supported.

- Updated November 30, 2019 (Installer 1.13.0.0 added, rows for RHEL / CentOS 7.7 and Ubuntu 18.04 added).
- Updated May 1, 2019 (Installer 1.12.0.0 added, rows for RHEL / CentOS 7.0, 7.1, and 7.2 removed).
- Updated January 2, 2019 (Installer 1.11.0.0 added).
- Updated Jul 27, 2018 (Installer 1.10.0 added).
- Updated March 30, 2018 (Installer 1.9.0 added). Corrected support for Ubuntu 11.04.
- Updated January 7, 2018 (Installer 1.8.0 added).
- Updated September 8, 2017 (Installer 1.7 added, release 6.0.x added).
- Updated July 31, 2017 (Installer 1.6 added, SLES 12 SP2 support added, older installer information removed).
- Updated April 6, 2017 (Installer 1.5 added, RHEL / CentOS 7.3 added, SLES 12 SP1 added, releases 2.x, 3.x, and 4.x removed).
- Updated December 8, 2016 (Installer 1.4 added).
- Updated August 19, 2016 (Installer 1.3 and release 5.2 added).
- Updated February 5, 2016 (Installer 1.2 and release 5.1 added).

## Installer EEP Support

This matrix shows which Installer versions support each Ezmeral Ecosystem Pack (EEP) version.

### Installer EEP Support

To understand which EEP versions are supported with different versions of data-fabric core, see [EEP Support and Lifecycle Status](#) on page 5734.

| EEP   | Installer 1.17.0.x | Installer 1.16.0.x | Installer 1.15.0.x | Installer 1.14.0.0 | Installer 1.13.0.0 | Installer 1.12.0.0 | Installer 1.11.0.0 | Installer 1.10.0 | Installer 1.9.0 |
|-------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|------------------|-----------------|
| 8.x.y | Yes                | No                 | No                 | No                 | No                 | No                 | No                 | No               | No              |
| 7.x.y | Yes                | Yes                | Yes                | Yes                | No                 | No                 | No                 | No               | No              |
| 6.x.y | Yes                | Yes                | Yes                | Yes                | Yes                | Yes                | Yes                | Yes              | No              |
| 5.x.y | Yes                | Yes                | Yes                | Yes                | Yes                | Yes                | Yes                | Yes              | Yes             |
| 4.x.y | Yes                | Yes                | Yes                | Yes                | Yes                | Yes                | Yes                | Yes              | Yes             |
| 3.x.y | No                 | No                 | No                 | No                 | No                 | No                 | Yes                | Yes              | Yes             |
| 2.x.y | No                 | No                 | No                 | No                 | No                 | No                 | Yes                | Yes              | Yes             |
| 1.x.y | No                 | No                 | No                 | No                 | No                 | No                 | Yes                | Yes              | Yes             |

For a list of released Installer versions, see [Installer Updates](#) on page 5684.

## Security Support Matrix

The tables in this section show component support for authentication, impersonation, and wire-level encryption.

Information is provided for the 6.2 release. See these sections:

- Table 1 - [Authentication in Release 6.2](#) on page 5806

- Table 2 - [Impersonation and Wire-Level Encryption in Release 6.2](#) on page 5813

Table 1 shows component support for authentication using data-fabric SASL, Kerberos, and PAM.

Table 2 shows component support for impersonation and wire-level encryption.

### Table Symbols

The tables in this section use dashes to indicate non-support and directional arrows to convey inbound and outbound communication:

- A dash (—) indicates that the feature is currently not supported, not needed, or not applicable.
- A right arrow (A → B) means OUTBOUND from A and INBOUND to B.
- A double arrow (A ↔ B) means OUTBOUND from A and INBOUND to B, and vice versa.
- No arrow indicates OUTBOUND communication from the subcomponent to all components with which it communicates.

### Authentication in Release 6.2

Table

| Main Component                | Subcomponent                       | Authentication   |                  |                  |
|-------------------------------|------------------------------------|------------------|------------------|------------------|
|                               |                                    | Data-Fabric SASL | Kerberos         | PAM <sup>1</sup> |
| <b>CORE COMPONENTS</b>        |                                    |                  |                  |                  |
| Data Fabric for Kubernetes    | N/A                                | —                | —                | —                |
| FUSE POSIX Client             | N/A                                | —                | —                | —                |
| JobClient to Resource Manager | N/A                                | Yes              | Yes              | —                |
| Installer                     | N/A                                | —                | —                | Yes              |
| filesystem                    | FileClient C filesystem            | Yes              | —                | —                |
|                               | FileClient Java filesystem         | Yes              | Yes <sup>2</sup> | —                |
|                               | filesystem filesystem <sup>3</sup> | Yes              | —                | —                |
|                               | CLDB filesystem <sup>4</sup>       | Yes              | —                | —                |
|                               | FileClient CLDB <sup>4</sup>       | Yes              | Yes <sup>2</sup> | —                |
|                               | NFSv3 filesystem                   | Yes              | —                | —                |
|                               | NFSv3 CLDB <sup>5</sup>            | Yes              | —                | —                |

Table (Continued)

<sup>1</sup>If LDAP is required, LDAP can be supported through PAM.

<sup>2</sup>Kerberos support is provided by implicit conversion of Kerberos tickets to data-fabric tickets.

<sup>3</sup>Payload not encrypted by default.

<sup>4</sup>All data exchanged with CLDB is in protobufs only and hence encrypted in secure clusters.

<sup>5</sup>Only admin ops to CLDB are audited. NFSv3 communication with CLDB is usually not admin-related.

<sup>6</sup>Accessed through the data-fabric client, which reads security settings from `/opt/mapr/conf/mapr-clusters.conf`; hence, this interface follows the secure-by-default model.

<sup>7</sup>Data-fabric SASL is supported but not enabled during installation.

<sup>8</sup>The Control System is secure between client and webserver (API Server). The server may invoke other commands through the `maprcli` interface that themselves do not use secure communication.

<sup>9</sup>HPE Ezmeral Data Fabric uses data-fabric SASL for communication with ZooKeeper.

<sup>10</sup>Includes a FUSE POSIX client, YARN client, and other client components.

<sup>11</sup>Support for Kerberos has not been verified, but SPNEGO can be used in conjunction with HTTPS.

<sup>12</sup>Flume agents can't be started automatically after installation. Manual configuration is required.

<sup>13</sup>Auditing user administration operations with Hue.

<sup>14</sup>A custom authentication filter can be configured.

<sup>15</sup>Oozie orchestrates Spark/Sqoop jobs using the Spark/Sqoop native client, so security is the same as Spark/Sqoop.

<sup>16</sup>SSL added to Sqoop 1.99.7. Basic access authentication is enabled by default.

<sup>17</sup>The Airflow-to-S3 connection is authenticated using access and secret keys generated by the `mapcli s3keys generate` command.

## Impersonation and Wire-Level Encryption in Release 6.2

Table

| Main Component                | Subcomponent               | Impersonation | Wire-Level Encryption |          |         |

<sup>1</sup>Includes a FUSE POSIX client, YARN client, and other client components.

<sup>2</sup>Airflow supports impersonation but requires a specific cluster configuration to do so. See [this page](#).

## Release History for EEPs

This section shows the original release dates for all Ezmeral Ecosystem Packs (EEP).

For EEP and core compatibility information, see [EEP Support and Lifecycle Status](#) on page 5734. For detailed EEP information, see [EEP Release Notes](#) on page 5854.

| EEP   | Release Date Identifier* | Release Date  |
|-------|--------------------------|---------------|
| 8.1.0 | 2201                     | March 7, 2022 |

| <b>EEP</b> | <b>Release Date Identifier*</b> | <b>Release Date</b> |
|------------|---------------------------------|---------------------|
| 8.0.0      | 2110                            | November 1, 2021    |

| EEP   | Release Date Identifier* | Release Date       |
|-------|--------------------------|--------------------|
| 3.0.2 | 1710                     | November 21, 2017  |
| 3.0.1 | 1707                     | August 2, 2017     |
| 3.0   | 1703                     | April 6, 2017      |
| 2.0.3 | 1710                     | November 21, 2017  |
| 2.0.2 | 1707                     | August 2, 2017     |
| 2.0.1 | 1703                     | April 6, 2017      |
| 2.0   | 1611                     | December 21, 2016  |
| 1.1.4 | 1710                     | November 21, 2017  |
| 1.1.3 | 1707                     | August 2, 2017     |
| 1.1.2 | 1703                     | April 6, 2017      |
| 1.1.1 | 1611                     | December 9, 2016   |
| 1.1.0 | 1609                     | September 29, 2016 |
| 1.0   | 1608                     | September 2, 2016  |

\*The release date identifier is a four-digit number that appears in release notes and provides an approximate indication of the release date for a component. For example, in the string Hive 2.3.3 - 1808, 2.3.3 refers to the Hive version number, and 1808 indicates an August 2018 release. Note that last-minute changes in the release date can result in a slight mismatch between the release date identifier and the actual month of the release.

## Ecosystem Support Matrix (Pre-5.2 releases)

This section provides support matrices for key ecosystem components for pre-5.2 releases.

The following table shows the compatibility of ecosystem products with MapR Converged Data Platform version 5.1 and below. For more recent versions of MapR, see the [EEP Components and OS Support](#) on page 5739.

**Note:** In the MapR Version column, JT stands for JobTracker.

| Ecosystem Component/<br>MapR Version |       | Map R<br>3.0.x | Map R<br>3.1.x | Map R<br>4.0.1<br>(JT) | MapR<br>4.0.1<br>(YAR<br>N) | Map R<br>4.0.2<br>(JT) | MapR<br>4.0.2<br>(YAR<br>N) | Map R<br>4.1.0<br>(JT) | MapR<br>4.1.0<br>(YAR<br>N) | Map R<br>5.0.0<br>(JT) | MapR<br>5.0.0<br>(YAR<br>N) | Map R<br>5.1.0<br>(JT) | MapR<br>5.1.0<br>(YAR<br>N) |
|--------------------------------------|-------|----------------|----------------|------------------------|-----------------------------|------------------------|-----------------------------|------------------------|-----------------------------|------------------------|-----------------------------|------------------------|-----------------------------|

<sup>1</sup> Hue 3.7 with MapR 3.1.x does not work with MapR Security. Only CentOS 6.x and 7.x are supported.

<sup>2</sup> Please make sure to pick the latest patched Oozie 4.0.1 version from monthly release 1502 or later ([Oozie Release Notes](#) on page 6464).

<sup>3</sup> Drill 0.9 and later versions do not work with HPE Ezmeral Data Fabric Database in Version 3.1.x.

<sup>4</sup> The Tez development preview has been withdrawn.

<sup>5</sup> Impala does not use the JobTracker service, but can run in a cluster running JobTracker.

<sup>6</sup> You cannot run Impala as a YARN application, however Impala can run in a YARN cluster.

## Change Control Notes

- This matrix was updated on February 8, 2017 (Apache MapReduce API correction).
- This matrix was updated on September 12, 2016 (Drill 1.8.0).
- This matrix was updated on April 4, 2016 (AsyncHBase 1.7 ).
- This matrix was updated on March 18, 2016 (Impala updates).
- This matrix was updated on February 29, 2016 (MapR 5.1 updates).
- This matrix was updated on Jan 20, 2016 (Drill 0.9 removed).
- This matrix was updated on Jan 12, 2016 (Drill 1.3, 1.4).
- This matrix was updated on Dec 21, 2015 (Spark 1.5.2).
- This matrix was updated on Oct 28, 2015 (Tez 0.5.3).
- This matrix was updated on Oct 4, 2015 ( Flume 1.6 and Mahout 0.11).
- This matrix was updated on September 25, 2015 (Hive 1.2.1 and Oozie 4.2.0).
- This matrix was updated on September 9, 2015 (Pig 15 and Spark 1.4.1).
- This matrix was updated on August 4, 2015 (Hue 3.8.1 and Sqoop 2 1.99.6).
- This matrix was updated on July 24, 2015 (Sqoop and Sqoop2).

For interoperability among specific groups of ecosystem products, see the following subsections.

## Drill Support Matrix

This matrix shows the interoperability between Drill and other ecosystem products.

For MapR Converged Data Platform releases beyond 5.1, you may also want to view [EEP Components and OS Support](#) on page 5739.

| Compatible Product | Version | Drill 1.0  | Drill 1.1       | Drill 1.2       | Drill 1.3 dev preview | Drill 1.4       | Drill 1.5 dev preview | Drill 1.6       | Drill 1.7 dev preview | Drill 1.8        | Drill 1.9        | Drill 1.10       |

|       | 1.1                                     | No  | No  | No  | Yes | Yes | Yes | Yes | Yes | Yes | Yes | Yes |

 **Note:** As of the 1703 release of Drill 1.9 and 1.10, you can install Drill on RHEL, CentOS, Ubuntu, and SLES (with Open JDK 1.8 and Oracle JDK 1.7 or 1.8). Previous releases of Drill supported RHEL, CentOS, and Ubuntu platforms only.

<sup>1</sup> Drill running under YARN is supported on the MapR Converged Data Platform version 5.1 and 5.2 only.

### Change Control Notes

- This matrix was updated April, 2017 (Drill 1.10-1703)
- This matrix was updated on December 7, 2016 (Drill 1.9-1611)
- This matrix was updated on September 29, 2016 (Drill 1.8-1609)
- This matrix was updated on September 12, 2016 (Drill 1.8)
- This matrix was updated on April 1, 2016 (Drill 1.6)
- This matrix was updated on February 28, 2016 (Drill 1.5)
- This matrix was updated on Jan 20, 2016 (Drill 0.x removed).
- This matrix was updated on Jan 12, 2016 (Drill 1.3, 1.4).

### HBase Support Matrix

This matrix shows the interoperability between HBase and other ecosystem products for MapR versions 5.1 and below.

For more recent versions of MapR, see the [EEP Components and OS Support](#) on page 5739. Note that MapR 6.0.x and MapR 6.1 provide Apache HBase-compatible APIs and client interfaces but do not support HBase as a standalone ecosystem component.

| Compatible Product | Product Version      | HBase 0.92.2 | HBase 0.94.17 | HBase 0.94.21 | HBase 0.94.24 | HBase 0.98.4 | HBase 0.98.7 | HBase 0.98.9 | HBase 0.98.12 | HBase 1.1 |

### Change Control Notes

- This matrix was updated April, 2017 (Drill 1.10-1703)
- This matrix was updated on April 4, 2016 (AsynchHBase 1.7).
- This matrix was updated on Feb 28, 2016 (Drill 1.5).
- This matrix was updated on Jan 20, 2016 (Drill 0.x removed).
- This matrix was updated on Jan 12, 2016 (Drill 1.3, 1.4).

### Hive and HCatalog Support Matrix

This matrix shows the interoperability between Hive and HCatalog and other ecosystem products.

This page shows the compatibility of Hive and HCatalog with other ecosystem components and it applies to MapR versions 5.1 and below. For more recent versions of MapR, see the [EEP Components and OS Support](#) on page 5739.

| Compatible Product | Product Version | Hive 0.09 | Hive 0.10 | Hive 0.11 | Hive 0.12 | Hive 0.13 | Hive 1.0 | Hive 1.2.1 |
|--------------------|-----------------|-----------|-----------|-----------|-----------|-----------|----------|------------|
|--------------------|-----------------|-----------|-----------|-----------|-----------|-----------|----------|------------|

<sup>1</sup> By default, Oozie 4.2.0 includes Hive 1.2.1 shared libraries. To use Oozie with other compatible versions of Hive, see MapR's Oozie documentation.

<sup>2</sup> When you use Spark 1.5.2 with Hive 0.13 or Hive 1.0, Spark SQL insert overwrite operations on Hive tables are not supported for the ORC, RC, and AVRO formats. For more information, see the Spark documentation.

<sup>3</sup> By default, Oozie 4.1.0 includes Hive 0.13 shared libraries. To use Oozie with other compatible versions of Hive, see MapR's Oozie documentation.

### Change Control Notes

- This matrix was last updated on April, 2017 (Drill 1.10 added)
- This matrix was last updated on February 29, 2016 (HBase 1.1, Drill 1.5, Impala 2.2, Sentry 1.6 added).
- This matrix was last updated on February 5, 2016 (Tez removed; Flume 1.6 added).

- This matrix was last updated on Jan 20, 2016 (Drill 0.9 removed).
- This matrix was last updated on Jan 12, 2016 (Drill 1.3, 1.4).
- This matrix was last updated on Dec 21, 2015 (Spark 1.5.2).
- This matrix was last updated on Sept 25, 2015 (Hive 1.2.1 and Oozie 4.2.0).
- This matrix was updated on Sept 9, 2015 (Spark 1.4.1 and Pig 15).
- This matrix was updated on August 4, 2015 (Hue 3.8.1 and Sqoop2 1.99.6).
- This matrix was updated on November 20, 2015 (Hue 3.9.0).

### Hue Support Matrix

This matrix shows the interoperability between Hue and other ecosystem products.

This page shows the versions of Hue that work other ecosystem components and it applies to MapR versions 5.1 and below. For more recent versions of MapR, see the [EEP Components and OS Support](#) on page 5739.

<sup>1</sup> Loading examples with HBase 94.x do not work (because of the difference in Thrift version between HBase 94 and Hue).

<sup>2</sup> Not supported on CentOS 5.x.

<sup>3</sup> Pig jobs in Hue are run through Oozie. Oozie 4.0.1 and 4.1.0 bundle Pig 0.12 by default.

<sup>4</sup> On MapR 4.1, Hue 3.8.1 does not work with Sqoop2. To use Sqoop2 and Hue on MapR 4.1, consider using Hue 3.7.

<sup>5</sup> The Spark Notebook UI in Hue is a Beta feature.

<sup>6</sup>Hue 3.8/3.9 and Hive 1.0 require MapR 5.0.0. (This combination is not supported on MapR 5.1.0.)

### Change Control Notes

- This matrix was last updated on February 29, 2016 (MapR 5.1 updates).
- This matrix was last updated on September 25, 2015 (Hue 3.8.1).
- This matrix was updated on August 4, 2015 (Hue 3.8.1).

### Impala Support Matrix

This matrix shows the interoperability between Impala and other ecosystem products.

This page shows the versions of Impala that work with various versions of other ecosystem products and it applies to MapR versions 5.1 and below. For more recent versions of MapR, see the [EEP Components and OS Support](#) on page 5739.

**Note:** Impala 2.2.0 is supported on MapR 5.x. Impala 2.5.0 is supported on MapR 5.1 and later.

| Product | Product Version | Impala 1.1.1                   | Impala 1.2.3                   | Impala 1.4.1                   | Impala 2.2.0                                            | Impala 2.5.0                                                       |

- This matrix was last updated on February 29, 2016 (Impala 2.2.0).

- This matrix was last updated on September 25, 2015 (Hive 1.2.1).
- This matrix was updated on August 4, 2015 (Hue 3.8.1).

### Oozie Support Matrix

This matrix shows the interoperability between Oozie and other ecosystem products.

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

This page shows the versions of Oozie that work with other ecosystem components and it applies to Release versions 5.1 and below. For more recent versions, see the [EEP Components and OS Support](#) on page 5739.

| Compatible Product | Oozie 4.1.0  | Oozie 4.2.0                                  |
|--------------------|--------------|----------------------------------------------|
| Hive               |              | 0.13 <sup>1</sup> , 1.0 <sup>1</sup> , 1.2.1 |
| Hue                | 3.8.1, 3.9.0 | 3.8.1, 3.9.0                                 |
| Pig                |              | 0.14, 0.15                                   |
| Spark              | 1.5.2, 1.6.1 | 1.3.1, 1.4.1, 1.5.2, 1.6.1                   |
| Sqoop              |              | 1.4.6                                        |

<sup>1</sup> By default, Oozie 4.2 includes Hive 1.2.1 shared libraries. To use Oozie with other compatible versions of Hive, see the [MapR Oozie documentation](#).

### Change Control Notes

- This matrix was last updated on February 5, 2016 (Oozie 4.1.0 column added).

### Spark Support Matrix

This matrix shows the interoperability between Spark and other ecosystem products.

This page shows the version of Spark that works with other ecosystem components, and it applies to MapR versions 5.1 and below. See also [Hive and HCatalog Support Matrix](#) on page 5827. For more recent versions of MapR, see the [EEP Components and OS Support](#) on page 5739.

| Compatible Product | Product Version                                                    | Spark 0.9.2 | Spark 1.0.2 | Spark 1.1 | Spark 1.2.1      | Spark 1.3.1      | Spark 1.4.1    | Spark 1.5.2    | Spark 1.6.1 |
|--------------------|--------------------------------------------------------------------|-------------|-------------|-----------|------------------|------------------|----------------|----------------|-------------|
| HBase              | 0.92.2                                                             | No          | No          | No        | No               | No               | No             | No             | No          |
|                    | 0.94.17                                                            | Yes         | Yes         | Yes       | No               | No               | No             | No             | No          |
|                    | 0.94.21                                                            | Yes         | Yes         | Yes       | No               | No               | No             | No             | No          |
|                    | 0.94.24                                                            | Yes         | Yes         | Yes       | Yes (4.0.1 only) | Yes (4.0.1 only) | No             | No             | No          |

<sup>1</sup> The Spark Notebook UI in Hue is a beta feature.

<sup>2</sup> When you use Spark 1.5.2 with Hive 0.13 or Hive 1.0, Spark SQL insert overwrite operations on Hive tables are not supported for the ORC, RC, and AVRO formats. For more information, see the Spark documentation.

<sup>3</sup>This combination is supported as of Mahout 0.11.0-1601.

<sup>4</sup>Livy version is a snapshot.

<sup>5</sup>EOP 2.0 only.

### Change Control Notes

- This matrix was last updated on December 8, 2016 (Mahout 0.12).

## MapR Data Science Refinery Release Notes

This section contains release notes for the MapR Data Science Refinery.

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

 **Important:** If you downloaded a copy of the MapR Data Science Refinery prior to **May 30, 2018**, you may need to update your Docker image. Read the following section to learn more.

### Older Releases of the MapR Data Science Refinery

Version 1.0 and earlier instances of the 1.1 and 1.2 versions of the Data Science Refinery have a security vulnerability. The vulnerability allows users, other than the one you have configured, to access the Zeppelin UI. To determine if you are using an image that has this vulnerability, check the id of your Docker image by running the following command:

```
docker images
```

The following is sample output from the command. The third column corresponds to the image id:

| REPOSITORY<br>ID | CREATED | TAG<br>SIZE | IMAGE |
|------------------|---------|-------------|-------|
|------------------|---------|-------------|-------|

```
maprtech/data-science-refinery v1.2_6.0.1_5.0.0_centos7
fb10d575b45f 5 days ago 3.94GB
```

If your image id matches any of the ids shown in the following table, then you must pull a newer version of the Docker image.

| Data Science Refinery Version Number | Operating System      | Vulnerable Image Id |
|--------------------------------------|-----------------------|---------------------|
| 1.2                                  | Ubuntu 16             | fab3fc7a719e        |
|                                      | CentOS 7              | 0e746a584940        |
| 1.1                                  | Ubuntu 16             | 310a209f8089        |
|                                      | CentOS 7              | 2caf2307bb0b        |
| 1.0                                  | All operating systems | All ids             |

See "Accessing the Zeppelin Docker Image" for instructions on how to download the latest image.

For more information about this security vulnerability, see [Zeppelin Authentication: Passwords in Shiro are overwritten](#).

## Data Science Refinery Support by Core Version

This topic provides general guidance about the core versions you can use with various versions of Data Science Refinery. It also lists features that are exceptions to the general rule.

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

Each Data Science Refinery release has a corresponding Ezmeral Ecosystem Pack (EEP) release:

| Data Science Refinery Version Number | Corresponding EEP Version |
|--------------------------------------|---------------------------|
| 1.4.1                                | 6.3.0                     |
| 1.4                                  | 6.2.0                     |
| 1.3.2                                | 6.1.0                     |
| 1.3                                  | 6.0.0                     |
| 1.2                                  | 5.0.0                     |
| 1.1                                  | 4.1.0                     |
| 1.0                                  | 4.0.0                     |

In addition, each core version supports a set of EEP releases. [EEP Support and Lifecycle Status](#) on page 5734 shows the support matrix.

In general, you can use Data Science Refinery with the core version supported by the corresponding EEP release, as well as newer core versions. For example, because Data Science Refinery 1.3 corresponds with EEP 6.0, which supports core 6.1, unless otherwise noted, you can use Data Science Refinery 1.3 to access a core 6.1 (or later) cluster.

However, there are some exceptions to this general guidance. Some Zeppelin interpreters do not support certain features when using specific core versions. The following table highlights those exceptions. It includes the version combinations, which are supported for those exception features, to show which core version you need to use.

| Zeppelin Interpreter Feature                                                | Data Science Refinery Version | Core Version |       |     |
|-----------------------------------------------------------------------------|-------------------------------|--------------|-------|-----|
|                                                                             |                               | 6.0.0        | 6.0.1 | 6.1 |
| Hive interpreter accessing a secure cluster                                 | 1.0                           | Y            | Y     | N   |
|                                                                             | 1.1                           | Y            | Y     | N   |
|                                                                             | 1.2                           | N            | Y     | N   |
|                                                                             | 1.3                           | N            | N     | Y   |
|                                                                             | 1.4                           | N            | N     | Y   |
| Livy and Spark interpreters accessing HPE Ezmeral Data Fabric Event Streams | 1.0 *                         | Y            | Y     | N   |
|                                                                             | 1.1                           | Y            | Y     | N   |
|                                                                             | 1.2                           | N            | Y     | N   |
|                                                                             | 1.3                           | N            | N     | Y   |
|                                                                             | 1.4                           | N            | N     | Y   |

\* Not applicable for the Spark interpreter since it was introduced in Data Science Refinery 1.1

### What's New in Data Science Refinery 1.4.1

Provides a summary of the new functionality in Data Science Refinery 1.4.1.

Data Science Refinery 1.4.1 includes the following new features:

- Zeppelin is updated to 0.8.2 patch release.
- Zeppelin is now compatible with Spark 2.4.4.
- Updated list of available Helium plugins to most recent version.
- Updated joda-time library to 2.10.3.

### What's New in Data Science Refinery 1.4

Provides a summary of the new functionality in Data Science Refinery 1.4.

Data Science Refinery 1.4 includes the following new features:

- Zeppelin has been updated to 0.8.1 patch release.
- Zeppelin is now compatible with Spark 2.4.
- Zeppelin can now be built from Data Science Refinery Docker files that use Docker multi-stage build, rather than downloading Zeppelin RPM/DEB packages from corresponding repositories on <https://package.mapr.hpe.com/>.

### What's New in Data Science Refinery 1.3

Data Science Refinery 1.3 introduces new features and some changes in behavior for existing features from prior releases. This release requires that you connect to a 6.1.0 (or later) cluster.

#### New Features

The following are new features in this release:

##### Interpreter Lifecycle Management

Prior to the 1.3 release, if a Zeppelin interpreter is idle and using excessive resources, you must either restart or kill the interpreter to reclaim resources.

|                                                                 |                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                 | Starting in 1.3, Data Science Refinery terminates interpreters that have been idle for an hour. You can configure this timeout threshold. For details, see the Idle Interpreter Timeout Threshold in <a href="#">Zeppelin Docker Run Parameters (MapR 6.1.0)</a> .                                              |
| <b>Helium Repository Browser</b>                                | Starting with the 1.3 release, Data Science Refinery supports the Helium repository browser for enabling Zeppelin visualization packages. This provides a simpler procedure for enabling these packages. See <a href="#">Using Visualization Packages in Zeppelin (MapR 6.1.0)</a> for detailed instructions.   |
| <b>Configuration Storage</b>                                    | Starting with the Data Science Refinery 1.3 release, you can store certain Zeppelin configuration files in filesystem, which enables you to share them across multiple containers. For details, see Configuration Storage in <a href="#">Zeppelin Docker Run Parameters (MapR 6.1.0)</a> .                      |
| <b>Default Drill JDBC Connection String</b>                     | Starting with Data Science Refinery 1.3, you can configure the default Drill JDBC connection URL. For more information, see Default Drill JDBC Connection URL in <a href="#">Zeppelin Docker Run Parameters (MapR 6.1.0)</a> .                                                                                  |
| <b>Building your own Docker Image</b>                           | Starting with the 1.3 release, you can build your own custom Docker image of Data Science Refinery. See <a href="#">Building your own MapR Data Science Refinery Docker Image (MapR 6.1.0)</a> for more information.                                                                                            |
| <b>Changes in Existing Features</b>                             |                                                                                                                                                                                                                                                                                                                 |
| The following describe changes in behavior from prior releases: |                                                                                                                                                                                                                                                                                                                 |
| <b>YARN Cluster Mode for Spark Interpreter Jobs</b>             | Prior to the 1.3 release, Spark interpreter jobs run in YARN client mode. The interpreter now runs in cluster mode. This mode reduces Spark resource utilization on the host machine of your Data Science Refinery container. See <a href="#">Understanding Zeppelin Interpreters (MapR 6.1.0)</a> for details. |
| <b>Shared Livy Sessions</b>                                     | In prior releases, the Livy interpreter uses separate Livy sessions for Spark, PySpark, and SparkR jobs. Starting in the 1.3 release, it uses a shared Livy session to run all Spark variations. This reduces resource utilization in your cluster.                                                             |
| <b>Sequential Execution of Notebook Paragraphs</b>              | Starting with the 1.3 release, Data Science Refinery runs paragraphs in a notebook sequentially rather than in parallel. This allows paragraphs to run properly when they have dependencies on earlier paragraphs in the same notebook.                                                                         |
| <b>Hive JDBC Interpreter and Secure Clusters</b>                | Starting with the 1.3 release, you must specify <code>ssl=true</code> in your Hive JDBC URL when connecting to a secure cluster. See <a href="#">Installing Custom Packages for PySpark Using Conda (MapR 6.1.0)</a> for an example.                                                                            |
| <b>Python Versions with the Livy Interpreter</b>                | Starting with the 1.3 release, you no longer can run both Python 2 and Python 3 with the Livy interpreter. You can run only one or the other. By default, the                                                                                                                                                   |

interpreter runs Python 2. To switch to Python 3, see [Python Version in Zeppelin Docker Run Parameters \(MapR 6.1.0\)](#).

The limitation also applies if you are installing custom Python packages. See [Installing Custom Packages for PySpark Using Conda \(MapR 6.1.0\)](#) for instructions on how to install Python 2 vs Python 3 custom packages.

### Running Zeppelin as a Kubernetes Service

The `DEPLOY_MODE` parameter in your Kubernetes pod manifest file has been renamed to `ZEPPELIN_DEPLOY_MODE`. You can still use `DEPLOY_MODE`, but Data Science Refinery 1.3 returns a warning, indicating the parameter is deprecated. See [Running MapR Data Science Refinery as a Kubernetes Service \(MapR 6.1.0\)](#) for an example of a pod manifest file.

### Notebook Storage Using filesystem

Starting with the 1.3 release, to store your notebooks in filesystem, you no longer need to use the FUSE-based POSIX client. See [Zeppelin Docker Run Parameters \(MapR 6.1.0\)](#) for details.

### Related concepts

[Zeppelin 0.8.0-1808 Release Notes](#) on page 5843

## What's New in MapR Data Science Refinery 1.2

Provides a summary of the new functionality in MapR Data Science Refinery 1.2

Data Science Refinery 1.2 includes the following new features:

- Support for the MapR Database Shell interpreter that allows you to run MapR Database Shell commands in Zeppelin
- Support for deploying the Data Science Refinery on a MapR cluster node

## What's New in MapR Data Science Refinery 1.1

Provides a summary of the new functionality in MapR Data Science Refinery 1.1

Data Science Refinery 1.1 includes the following new features in Zeppelin on MapR:

- Support for the Spark interpreter, configured to launch Spark jobs in YARN client mode
- Enhancements in installing custom Python environments for the Livy and Spark interpreters
- Improvements in launching multiple Zeppelin containers on the same host

## Zeppelin Release Notes

The release notes for the Zeppelin component (included in the MapR Data Science Refinery) contain notes specific to the MapR release of Zeppelin.

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

The following table shows the mapping between the Zeppelin and Data Science Refinery version numbers:

| Zeppelin Version Number | MapR Data Science Refinery Version Number |
|-------------------------|-------------------------------------------|
| 0.8.2-1912              | 1.4.1                                     |
| 0.8.1-1904              | 1.4.0                                     |

| Zeppelin Version Number | MapR Data Science Refinery Version Number |
|-------------------------|-------------------------------------------|
| 0.8.0-1901              | 1.3.2                                     |
| 0.8.0-1808              | 1.3                                       |
| 0.7.2-1803              | 1.2                                       |
| 0.7.2-1801              | 1.1                                       |
| 0.7.2-1710              | 1.0                                       |

### Zeppelin 0.8.2-1912 Release Notes

The notes below relate specifically to the MapR distribution of Apache Zeppelin. You may also be interested in the [Apache Zeppelin project homepage](#) and the following Apache Zeppelin 0.8.x changelogs:

Zeppelin on MapR is a component of the Data Science Refinery. This release of Zeppelin is in version 1.4.1 of the Data Science Refinery.

The Data Science Refinery is packaged as a Docker container. MapR ecosystem components included in the Docker image are the same as those in the EEP 6.3.0 release. For product version details, see [EEP 6.3.0 Components and OS Support](#) on page 5752.

You can run the Docker image on the following operating systems:

- Linux (CentOS 7.x, Ubuntu 14, Ubuntu 16)
- Windows 10 Pro (64-bit)
- Mac OS X 10.11

The following are the verified browsers:

- Chrome 57

- Firefox 56.0
- Microsoft Edge 40
- Safari 9.0

The MapR product documentation is available at [Zeppelin on MapR \(MapR 6.1.0\)](#).

### New in this Release

Zeppelin in Data Science Refinery 1.4.1 has updated dependencies to be compatible with EEP 6.3.0. Specifically:

- Zeppelin is updated to 0.8.2 patch release.
- Zeppelin is now compatible with Spark 2.4.4.
- Updated list of available Helium plugins to most recent version.
- Updated joda-time library to 2.10.3.

### Fixes

This release of MapR includes the following fixes on the base Apache release. For complete details, refer to the commit log for this project in GitHub.

| Commit  | Date (YYYY-MM-DD) | Comment                                                           |

### Known Issues and Limitations

- MZEP-17: The HBase interpreter cannot be used to query MapR Database Binary tables
- MZEP-79: Legends in plots do not display correctly when running the Matplotlib (Python/PySpark) example from the Zeppelin Tutorial
- MD-2397: Zeppelin cannot connect to Drill through the JDBC driver on a secure MapR cluster when Zeppelin has Kerberos authentication enabled
- MZEP-86: You cannot run Zeppelin as user 'root'
- MZEP-110: You cannot use a custom R environment with Zeppelin
- DSR-27: You cannot access MapR Event Store For Apache Kafka using either the Livy or Spark interpreters with Data Science Refinery 1.2, if you are connecting to a MapR cluster older than version 6.0.1.
- DSR-62: You cannot access MapR Event Store For Apache Kafka using either the Livy or Spark interpreters with Data Science Refinery 1.1 and 1.2, if you are connecting to a MapR 6.1.0 cluster.

- ZEPPELIN-1904 - Pandas `dataframe.plot` does not work in the Python and PySpark interpreters

For issues that apply to running MapR Docker images, see [Data Fabric PACC Known Issues](#) on page 370.

### Zeppelin 0.8.1-1904 Release Notes

The notes below relate specifically to the MapR distribution of Apache Zeppelin. You may also be interested in the [Apache Zeppelin 0.8. changelog](#) and the [Apache Zeppelin project homepage](#).

Zeppelin on MapR is a component of the Data Science Refinery. This release of Zeppelin is in version 1.4.0 of the Data Science Refinery.

The Data Science Refinery is packaged as a Docker container. MapR ecosystem components included in the Docker image are the same as those in the EEP 6.2 release. See [EEP 6.2.0 Components and OS Support](#) on page 5753 for details on product version numbers.

You can run the Docker image on the following operating systems:

- Linux (CentOS 7.x, Ubuntu 14, Ubuntu 16)
- Windows 10 Pro (64-bit)
- Mac OS X 10.11

The following are the verified browsers:

- Chrome 57
- Firefox 56.0
- Microsoft Edge 40
- Safari 9.0

The MapR product documentation is available at [Zeppelin on MapR \(MapR 6.1.0\)](#).

### New in this Release

Zeppelin in Data Science Refinery 1.4.0 has updated dependencies to be compatible with MEP-6.2.0. Specifically:

- Zeppelin is updated to 0.8.1 patch release.
- Zeppelin is now compatible with Spark 2.4.

- Zeppelin can be built from Data Science Refinery Docker files that use Docker multi-stage build instead of downloading Zeppelin RPM/DEB packages from corresponding repositories on <https://package.mapr.hpe.com/>.

### Fixes

This release by MapR includes the following fixes on the base Apache release. For complete details, refer to the commit log for this project in GitHub.

| Commit  | Date (YYYY-MM-DD) | Comment                                                                               |
|---------|-------------------|---------------------------------------------------------------------------------------|
| 706f3c3 | 2019-03-14        | DSR-84: Switched to Docker multi-stage build                                          |
| 2a6ed4f | 2019-04-09        | DSR-88: Refactored Spark MapR-DB Binary tutorials notebook according to ZEPPELIN-3587 |

### Known Issues and Limitations

- MZEP-17: The HBase interpreter cannot be used to query MapR Database Binary tables
- MZEP-79: Legends in plots do not display correctly when running the Matplotlib (Python/PySpark) example from the Zeppelin Tutorial
- MD-2397: Zeppelin cannot connect to Drill through the JDBC driver on a secure MapR cluster when Zeppelin has Kerberos authentication enabled
- MZEP-86: You cannot run Zeppelin as user 'root'
- MZEP-110: You cannot use a custom R environment with Zeppelin
- DSR-27: You cannot access MapR Event Store using either the Livy or Spark interpreters with Data Science Refinery 1.2, if you are connecting to a MapR cluster older than version 6.0.1.
- DSR-62: You cannot access MapR Event Store using either the Livy or Spark interpreters with Data Science Refinery 1.1 and 1.2, if you are connecting to a MapR 6.1.0 cluster.
- MZEP-154: You cannot log into the Zeppelin UI using Firefox on Ubuntu 18.04.
- ZEPPELIN-1904 - `Pandas dataframe.plot` does not work in the Python and PySpark interpreters

See [Data Fabric PACC Known Issues](#) on page 370 for issues that apply to running MapR Docker images.

### Zeppelin 0.8.0-1901 Release Notes

The notes below relate specifically to the MapR distribution of Apache Zeppelin. You may also be interested in the [Apache Zeppelin 0.8.0 changelog](#) and the [Apache Zeppelin project homepage](#).

Zeppelin on MapR is a component of the Data Science Refinery. This release of Zeppelin is in version 1.3.2 of the Data Science Refinery.

The Data Science Refinery is packaged as a Docker container. MapR ecosystem components included in the Docker image are the same as those in the EEP 6.1 release. See [EEP 6.1.0 Components and OS Support](#) on page 5755 for details on product version numbers.

You can run the Docker image on the following operating systems:

- Linux (CentOS 7.x, Ubuntu 14, Ubuntu 16)
- Windows 10 Pro (64-bit)
- Mac OS X 10.11

The following are the verified browsers:

- Chrome 57
- Firefox 56.0
- Microsoft Edge 40
- Safari 9.0

The MapR product documentation is available at [.Zeppelin on MapR \(MapR 6.1.0\)](#)

### New in this Release

- Zeppelin in Data Science Refinery 1.3.2 has updated dependencies to be compatible with MEP-6.1.0.
- Cron Scheduler feature is now enabled by default in Zeppelin UI.

See [What's New in Data Science Refinery 1.3](#) on page 5835 for the list of new Zeppelin features in 1.3 release.

### Fixes

Zeppelin on MapR is a component of the MapR Data Science Refinery. This release of Zeppelin is in version 1.3 of the Data Science Refinery.

The Data Science Refinery is packaged as a Docker container. MapR ecosystem components included in the Docker image are the same as those in the EEP 6.0 release. See [EEP 6.0.0 Components and OS Support](#) on page 5758 for details on product version numbers.

You can run the Docker image on the following operating systems:

- Linux (CentOS 7.x, Ubuntu 14, Ubuntu 16)
- Windows 10 Pro (64-bit)
- Mac OS X 10.11

The following are the verified browsers:

- Chrome 57
- Firefox 56.0
- Microsoft Edge 40
- Safari 9.0

The MapR product documentation is available at [Zeppelin on MapR \(MapR 6.1.0\)](#).

**New in this Release**

See [What's New in Data Science Refinery 1.3](#) on page 5835 for the list of new Zeppelin features in this release.

**Fixes**

This release by MapR includes the following fixes on the base Apache release. For complete details, refer to the commit log for this project in GitHub.

The following table lists the fixes for Zeppelin:

| Commit  | Date (YYYY-MM-DD) | Comment                                                                                                      |

### Known Issues and Limitations

- MZEP-17: The HBase interpreter cannot be used to query MapR Database Binary tables
- MZEP-79: Legends in plots do not display correctly when running the Matplotlib (Python/PySpark) example from the Zeppelin Tutorial
- MD-2397: Zeppelin cannot connect to Drill through the JDBC driver on a secure MapR cluster when Zeppelin has Kerberos authentication enabled
- MZEP-86: You cannot run Zeppelin as user 'root'
- MZEP-110: You cannot use a custom R environment with Zeppelin
- DSR-27: You cannot access MapR Event Store using either the Livy or Spark interpreters with Data Science Refinery 1.2, if you are connecting to a MapR cluster older than version 6.0.1.
- DSR-62: You cannot access MapR Event Store using either the Livy or Spark interpreters with Data Science Refinery 1.1 and 1.2, if you are connecting to a MapR 6.1.0 cluster.
- MZEP-154: You cannot log into the Zeppelin UI using Firefox on Ubuntu 18.04.
- ZEPPELIN-1904 - Pandas `dataframe.plot` does not work in the Python and PySpark interpreters
- See [Data Fabric PACC Known Issues](#) on page 370 for issues that apply to running data-fabric Docker images.

### Zeppelin 0.7.2-1803 Release Notes

The notes below relate specifically to the MapR distribution of Apache Zeppelin. You may also be interested in the [Apache Zeppelin 0.7.2 changelog](#) and the [Apache Zeppelin project homepage](#).

Zeppelin on MapR is a component of the MapR Data Science Refinery. This release of Zeppelin is in version 1.2 of the Data Science Refinery.

The Data Science Refinery is packaged as a Docker container. MapR ecosystem components included in the Docker image are the same as those in the EEP 5.0 release. See [EEP 5.0.0 Components and OS Support](#) on page 5766 for details on product version numbers.

You can run the Docker image on the following operating systems:

- Linux (CentOS 7.x, Ubuntu 14, Ubuntu 16)
- Windows 10 Pro (64-bit)
- Mac OS X 10.11

The following are the verified browsers:

- Chrome 57
- Firefox 56.0
- Microsoft Edge 40
- Safari 9.0

The MapR product documentation is available at [Zeppelin on MapR \(MapR 6.1.0\)](#).

### New in this Release

- Support for the MapR Database Shell Interpreter that allows you to run MapR Database Shell commands in Zeppelin
- Support for deploying the Data Science Refinery on a MapR cluster node

### Fixes

This release by MapR includes the following fixes on the base Apache release. For complete details, refer to the commit log for this project in GitHub.

The following table lists the fixes for Zeppelin:

| Commit  | Date (YYYY-MM-DD) | Comment                                                                                                                                    |
|---------|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| 6ad375f | 2018-03-26        | MZEP-124: Fix Livy and Spark R interpreters so they work with 'googleVis' package                                                          |
| ef817af | 2018-03-23        | MZEP-124: Fix package and namespace load failures for 'googleVis' when using <code>livy.spark</code> and <code>spark.r</code> interpreters |
| 20c571c | 2018-03-16        | DSR-21: Fix Spark interpreter so it does not fail when <code>zeppelin.spark.useHiveContext</code> is set to true                           |
| 552b84b | 2018-03-13        | ZEPPELIN-2377: Fix Hive support so it can be enabled in Spark master                                                                       |
| 8d02402 | 2018-03-07        | DSR-20: Fix <code>NullPointerException</code> when starting Spark shell inside PACC                                                        |
| 45973ee | 2018-03-05        | DSR-18: Update DSR image with the latest Drill JDBC 1.13 driver                                                                            |
| a87ebdb | 2018-02-27        | MZEP-121: Fix Zeppelin so it can launch Spark jobs with Spark 2.2.1                                                                        |
| eee0429 | 2018-02-27        | DSR-17: Create maven profile for MEP-5.0.0                                                                                                 |
| 93563b7 | 2018-02-27        | DSR-17: Update version to <code>v1.2_6.0.1_5.0.0</code>                                                                                    |
| dad374e | 2018-02-22        | DSR-15: Move <code>spark-defaults</code> modification to Livy                                                                              |
| 06bc368 | 2018-02-21        | MZEP-11: Support MapR Database shell in Zeppelin                                                                                           |
| 21a3343 | 2018-02-08        | DSR-12: Fix Spark interpreter so it works with bridge networking                                                                           |
| 223945b | 2018-02-02        | MZEP-116: Add MapR Database Binary RDD example                                                                                             |
| 4cf60c8 | 2018-01-29        | MZEP-116: Add Spark MapR Database examples                                                                                                 |
| cd11f79 | 2018-01-29        | DSR-2: Fix DSR so it does not exit immediately in Kubernetes                                                                               |
| 8d0e8d9 | 2018-01-24        | MZEP-110: Include R interpreter in DSR container                                                                                           |

The following table lists fixes for Livy:

| Commit  | Date (YYYY-MM-DD) | Comment                                         |
|---------|-------------------|-------------------------------------------------|
| a556425 | 2018-03-16        | MLIVY-21: Fix errors in Livy after installation |
| 2f51b41 | 2018-03-15        | MLIVY-20: Fix failure to start after upgrade    |

| Commit  | Date (YYYY-MM-DD) | Comment                                                                                      |
|---------|-------------------|----------------------------------------------------------------------------------------------|
| d8463f2 | 2018-03-14        | MZEP-127: Fixes to allow Livy to work correctly when DSR is installed on a MapR cluster node |
| add85   | 2018-03-09        | DSR-9: Fix spelling error in console output                                                  |
| 4141b70 | 2018-03-02        | IN-1317: Implement packaging improvements for restart and security                           |
| d778404 | 2018-02-27        | MLIVY-19: Fix file path to <code>warden.livy.conf</code>                                     |
| f41ff88 | 2018-02-26        | DSR-15: Log an error message when Python archive setup fails                                 |
| 73f2e22 | 2018-02-22        | Clean up <code>configure.sh</code>                                                           |
| df7a030 | 2018-02-22        | DSR-15: Propagate <code>spark-defaults</code> modifications to Livy                          |
| 7f690bf | 2018-02-22        | LIVY-19: Fix Livy so it can start with spark 2.2.1                                           |

### Known Issues and Limitations

- MZEP-17: The HBase interpreter cannot be used to query MapR Database Binary tables
- MZEP-79: Legends in plots do not display correctly when running the Matplotlib (Python/PySpark) example from the Zeppelin Tutorial
- MD-2397: Zeppelin cannot connect to Drill through the JDBC driver on a secure MapR cluster when Zeppelin has Kerberos authentication enabled
- MZEP-86: You cannot run Zeppelin as user 'root'
- MZEP-110: You cannot use a custom R environment with Zeppelin
- DSR-27: You cannot access MapR Event Store using either the Livy or Spark interpreters with Data Science Refinery 1.2, if you are connecting to a MapR cluster older than version 6.0.1.
- See [Data Fabric PACC Known Issues](#) on page 370 for issues that apply to running MapR Docker images.

### Zeppelin 0.7.2-1801 Release Notes

The notes below relate specifically to the MapR distribution of Apache Zeppelin. You may also be interested in the [Apache Zeppelin 0.7.2 changelog](#) and the [Apache Zeppelin project homepage](#).

|                    |                                                                                                                                                           |

Zeppelin on MapR is a component of the MapR Data Science Refinery. This release of Zeppelin is in version 1.1 of the Data Science Refinery.

The Data Science Refinery is packaged as a Docker container. MapR ecosystem components included in the Docker image are the same as those in the EEP 4.1 release. See [EEP 4.1.0 Components and OS Support](#) on page 5771 for details on product version numbers.

You can run the Docker image on the following operating systems:

- Linux (CentOS 7.x, Ubuntu 14, Ubuntu 16)
- Windows 10 Pro (64-bit)
- Mac OS X 10.11

The following are the verified browsers:

- Chrome 57
- Firefox 56.0
- Microsoft Edge 40
- Safari 9.0

The MapR product documentation is available at [Zeppelin on MapR \(MapR 6.1.0\)](#).

### New in this Release

This release of Zeppelin on MapR includes the following new features:

- Support for the Spark interpreter, configured to launch Spark jobs in YARN client mode
- Enhancements in installing custom Python environments for the Livy and Spark interpreters
- Improvements in launching multiple Zeppelin containers on the same host

### Fixes

This release by MapR includes the following fixes on the base Apache release. For complete details, refer to the commit log for this project in GitHub.

The following table lists the fixes for Zeppelin:

| Commit  | Date (YYYY-MM-DD) | Comment                                                                     |
|---------|-------------------|-----------------------------------------------------------------------------|
| 625acf6 | 2018-01-11        | MZEP-94: Support for different versions of Python for the Spark interpreter |
| aaa8e92 | 2018-01-11        | PACC-18: Fix regression for PACC-12                                         |

| Commit  | Date (YYYY-MM-DD) | Comment                                                                                              |
|---------|-------------------|------------------------------------------------------------------------------------------------------|
| dc9cb61 | 2018-01-09        | PACC-18: Fix incorrect home directory after <code>docker exec</code> run on Ubuntu                   |
| 8297a9e | 2017-12-25        | PACC-12: Remove obsolete fix for MZEP-66                                                             |
| 3698203 | 2017-12-25        | MZEP-97: Enable Spark interpreter to run in YARN client mode                                         |
| 1e6ccc0 | 2017-12-14        | Restore Core 6.0.0 version in Dockerfile                                                             |
| 0418ced | 2017-12-13        | Update EEP and MapR core versions in Dockerfiles                                                     |
| c6538ab | 2017-12-12        | MZEP-99: Fix no graphs being displayed the first time the Spark Pyspark Tutorial examples are opened |
| ee11e2f | 2017-12-07        | MZEP-98: Restore default examples in the Zeppelin Tutorial                                           |
| 7d15fd9 | 2017-12-05        | MZEP-63: Explicitly set Zeppelin working directory                                                   |
| 0fc3079 | 2017-12-01        | Fix <code>mapr-setup.sh</code> URL in PACC build scripts                                             |
| b8152f2 | 2017-11-30        | MZEP-63: Enable Spark interpreter                                                                    |
| b8e6693 | 2017-11-27        | Refactor the script that builds Docker images                                                        |

The following table lists fixes for Livy:

| Commit  | Date (YYYY-MM-DD) | Comment                                                                                             |
|---------|-------------------|-----------------------------------------------------------------------------------------------------|
| bbf0155 | 2018-01-15        | MZEP-102: Fix issue when no <code>LIVY_RSC_PORT_RANGE</code> is specified                           |
| 90bd035 | 2018-01-12        | MZEP-102: Provide ability to specify custom port range in <code>livy.rsc.launcher.port.range</code> |
| 528e2b7 | 2018-01-11        | MZEP-94: Support different versions of Python for the Spark interpreter                             |
| bef6778 | 2017-12-07        | MZEP-65: Minor fix in <code>start-in-container.sh</code>                                            |
| ccaed0f | 2017-12-05        | MZEP-63: Explicitly set Livy working directory                                                      |
| c2ddf74 | 2017-11-24        | Fixes needed to set up a Conda environment for PySpark                                              |

### Known Issues and Limitations

- MZEP-17: The HBase interpreter cannot be used to query MapR Database Binary tables
- MZEP-79: Legends in plots do not display correctly when running the Matplotlib (Python/PySpark) example from the Zeppelin Tutorial

- MD-2397: Zeppelin cannot connect to Drill through the JDBC driver on a secure MapR cluster when Zeppelin has Kerberos authentication enabled
- MZEP-86: You cannot run Zeppelin as user 'root'
- MZEP-110: You cannot use a custom R environment with Zeppelin
- See [Data Fabric PACC Known Issues](#) on page 370 for issues that apply to running MapR Docker images.

### Zeppelin 0.7.2-1710 Release Notes

### New in this Release

This is the first MapR release of Apache Zeppelin. The following are important product notes:

- Apache Zeppelin on MapR is packaged as a Docker container.
- The Docker container includes the following preconfigured interpreters:
  - Livy
  - JDBC (Drill and Hive)
  - Pig
  - Shell
- MapR does not support the HBase and Spark interpreters. Support for Spark is available through the Livy interpreter.
- MapR ecosystem components included in the Docker image are the same as those in the EEP 4.0 release. See [EEP 4.0.0 Components and OS Support](#) on page 5772 for details on product version numbers.
- You can run the Zeppelin Docker image on the following operating systems:
  - Linux (CentOS 7.x, Ubuntu 14, Ubuntu 16)
  - Windows 10 Pro (64-bit)

- Mac OS X 10.11
- Verified browsers:
  - Chrome 57
  - Firefox 56.0
  - Microsoft Edge 40
  - Safari 9.0

The MapR product documentation is available at [Zeppelin on MapR \(MapR 6.1.0\)](#).

### Fixes

This release by MapR includes the following fixes on the base Apache release. For complete details, refer to the commit log for this project in GitHub.

| Commit  | Date (YYYY-MM-DD) | Comment                                                                                                              |

| 2e15609 | 2017-10-10        | MZEP-38: Add Hive and Drill as separate interpreters to interpreters list                                |
| 4babf22 | 2017-10-04        | MZEP-30: Enable HTTPS by default for Zeppelin UI                                                         |
| 4af55cc | 2017-10-02        | MZEP-31: Move maven arguments to profile                                                                 |
| 9cfc4bd | 2017-10-02        | MZEP-31: Move maven arguments to profile                                                                 |
| 2eefc6d | 2017-09-21        | Fix <code>shiro.ini</code> to allow users to log in to Docker environment                                |
| 462889f | 2017-09-01        | MZEP-18: Add PID for Zeppelin service                                                                    |
| 733a624 | 2017-08-28        | MZEP-13: Fix Zeppelin service so it starts with MapR core 6.0                                            |
| 3ccf3ee | 2017-08-18        | MZEP-4: Add MapR classpath to interpreter classpath                                                      |
| 4e26f4b | 2017-08-18        | MZEP-4 : Implement impersonation in the interpreters using <code>sudo</code> instead of <code>ssh</code> |
| 5d6384c | 2017-08-18        | MZEP-4: Use PAM by default                                                                               |
| 6432602 | 2017-08-17        | MZEP-4: Add <code>configure.sh</code> and Warden configuration                                           |
| 6e69cc4 | 2017-08-17        | MZEP-4: Allow root user to build Zeppelin                                                                |
| 1a36f87 | 2017-08-17        | MZEP-4: Add MapR repository to <code>pom.xml</code>                                                      |
| 3ccf3ee | 2017-08-17        | MZEP-4: Package Zeppelin to run against MapR clusters                                                    |

| Commit   | Date (YYYY-MM-DD) | Comment                               |
|----------|-------------------|---------------------------------------|
| 462889ff | 2017-09-01        | MZEP-18: Add PID for Zeppelin service |

### Known Issues and Limitations

- MZEP-17: The HBase interpreter cannot be used to query MapR Database Binary tables.
- MZEP-79: Legends in plots do not display correctly when running the Matplotlib (Python/PySpark) example from the Zeppelin Tutorial.
- MD-2397: Zeppelin cannot connect to Drill through the JDBC driver on a secure MapR cluster when Zeppelin has Kerberos authentication enabled.
- MZEP-86: You cannot run Zeppelin as user 'root'.
- See [Data Fabric PACC Known Issues](#) on page 370 for issues that apply to running MapR Docker images.

## Ecosystem Component Release Notes

The following release notes contain information for the components included in the HPE Ezmeral Data Fabric.

Note that the *MapR Ecosystem Pack (MEP)* has been renamed as the *Ezmeral Ecosystem Pack (EEP)*. For more information about HPE Ezmeral Data Fabric terminology, see Documentation Enhancements in [What's New in Release 6.2.0](#) on page 34.

Be sure to review these considerations for using ecosystem component release notes:

- Ecosystem component release notes contain HPE-specific information; they do not duplicate release note information on open-source websites.
- Ecosystem component release notes are not necessarily cumulative in nature. For example, if you need to upgrade from version 1.x of a data-fabric product to version 4.x, be sure to review the release notes for versions 2.x, 3.x, and 4.x to become familiar with new features and known issues that might be relevant to version 4.x.
- To view individual product versions organized by EEP and core version, see [Component Versions for Released MEPs](#).

### EEP Release Notes

Provides release-note information for Ezmeral Ecosystem Packs (EEPs).

#### Ezmeral Ecosystem Pack 8.1.0 Release Notes

This topic contains information about the components included in Ezmeral Ecosystem Pack 8.1.0.

|                     |                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| Release Date        | January 2022                                                                                                     |
| Repository Location | <a href="https://package.mapr.hpe.com/releases/MEP/">https://package.mapr.hpe.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>EEPs are contained in the MEP-<version> directory. The MEP-version directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-6.0 or MEP-6.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

EEP 8.1.0 can be used with core 7.0.0 and core 6.2.0. For more information about EEP and core version support, see [EEP Support and Lifecycle Status](#) on page 5734.

## Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.8-2104, 2.3.8 refers to the Hive version number, and 2104 typically indicates an April 2021 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

## Backward Compatibility

EEP 8.1.0 did not introduce any changes that affect application backward compatibility.

## EEP 8.1.0 Components

The EEP 8.1.0 repository contains the following ecosystem components that are fully supported:

| Component                     | Release Notes                                                                                                                                                                                                                                                                                                                    |

<sup>1</sup>Support for this component is subject to your license agreement.

<sup>2</sup>The Spark Notebook UI in Hue is a beta feature.

The EEP 8.1.0 repository contains the following ecosystem components that are supported for internal data-fabric monitoring use cases only:

- Collectd 5.12.0.400
- Elasticsearch 6.8.8.500
- Fluentd 1.10.3.400
- Grafana 7.5.10.400
- Kibana 6.8.8.500
- OpenTSDB 2.4.1.400

### Ezmeral Ecosystem Pack 8.0.0 Release Notes

This topic contains information about the components included in Ezmeral Ecosystem Pack 8.0.0.

**Notice:** HPE recommends using EEP 8.1.0 instead of EEP 8.0.0. For more information about EEP 8.1.0, see [EEP 8.1.0 Reference Information](#) on page 6701.

|                     |                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| Release Date        | October 2021                                                                                                     |
| Repository Location | <a href="https://package.mapr.hpe.com/releases/MEP/">https://package.mapr.hpe.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>EEPs are contained in the MEP-<version> directory. The MEP-version directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-6.0 or MEP-6.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

EEP 8.0.0 can be used with core 6.2.0. For more information about EEP and core version support, see [EEP Support and Lifecycle Status](#) on page 5734.

## Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.8-2104, 2.3.8 refers to the Hive version number, and 2104 typically indicates an April 2021 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

## Backward Compatibility

EEP 8.0.0 did not introduce any changes that affect application backward compatibility.

## EEP 8.0.0 Components

The EEP 8.0.0 repository contains the following ecosystem components that are fully supported:

| Component                     | Release Notes                                                                    |

<sup>1</sup>Support for this component is subject to your license agreement.

<sup>2</sup>The Spark Notebook UI in Hue is a beta feature.

The EEP 8.0.0 repository contains the following ecosystem components that are supported for internal data-fabric monitoring use cases only:

- Collectd 5.12.0.300
- Elasticsearch 6.8.8.400
- Fluentd 1.10.3.300
- Grafana 7.5.10.300
- Kibana 6.8.8.400
- OpenTSDB 2.4.1.300

### Ezmeral Ecosystem Pack 7.1.1 Release Notes

This topic contains information about the components included in Ezmeral Ecosystem Pack 7.1.1.

|                     |                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| Release Date        | October 2021                                                                                                     |
| Repository Location | <a href="https://package.mapr.hpe.com/releases/MEP/">https://package.mapr.hpe.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>EEPs are contained in the MEP-<version> directory. The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-6.0 or MEP-6.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

EEP 7.1.1 can be used with core 6.2.0. For more information about EEP and core version support, see [EEP Support and Lifecycle Status](#) on page 5734.

EEP 7.1.1 is identical to EEP 7.1.0 except for changes to the monitoring (Spyglass) components. For a list of monitoring fixes in EEP 7.1.1, see [Monitoring Components - EEP 7.1.1 Release Notes](#) on page 6434.

### Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.8-2104, 2.3.8 refers to the Hive version number, and 2104 typically indicates an April 2021 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### Backward Compatibility

EEP 7.1.1 did not introduce any changes that affect application backward compatibility.

### Impala SLES 15 Support

Though there are no code changes for Impala in this release, new Impala packages are available. These new Impala packages include support for SLES 15.

### EEP 7.1.1 Components

The EEP 7.1.1 repository contains the following ecosystem components that are fully supported:

| Component                     | Release Notes                                                                                |

<sup>1</sup>Support for this component is subject to your license agreement.

<sup>2</sup>The Spark Notebook UI in Hue is a beta feature.

<sup>3</sup>Support for Sentry is limited to Impala users.

The EEP 7.1.1 repository contains the following ecosystem components that are supported for internal data-fabric monitoring use cases only:

- Collectd 5.10.0.0
- Elasticsearch 6.8.8.300
- Fluentd 1.10.3.200
- Grafana 7.5.2.200
- Kibana 6.8.8.300
- OpenTSDB 2.4.0

### Ezmeral Ecosystem Pack 7.1.0 Release Notes

This topic contains information about the components included in Ezmeral Ecosystem Pack 7.1.0.

|                     |                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| Release Date        | April 2021                                                                                                       |
| Repository Location | <a href="https://package.mapr.hpe.com/releases/MEP/">https://package.mapr.hpe.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-6.0 or MEP-6.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

EEP 7.1.0 can be used with core 6.2.0. For more information about EEP and core version support, see [EEP Support and Lifecycle Status](#) on page 5734.

## Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.8-2104, 2.3.8 refers to the Hive version number, and 2104 typically indicates an April 2021 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

## Backward Compatibility

EEP 7.1.0 did not introduce any changes that affect application backward compatibility.

## Impala SLES 15 Support

Though there are no code changes for Impala in this release, new Impala packages are available. These new Impala packages include support for SLES 15.

## EEP 7.1.0 Components

The EEP 7.1.0 repository contains the following ecosystem components that are fully supported:

| Component                     | Release Notes                                                                                |

<sup>1</sup>Support for this component is subject to your license agreement.

<sup>2</sup>The Spark Notebook UI in Hue is a beta feature.

<sup>3</sup>Support for Sentry is limited to Impala users.

The EEP 7.1.0 repository contains the following ecosystem components that are supported for internal data-fabric monitoring use cases only:

- Collectd 5.10.0.0
- Elasticsearch 6.8.8.300
- Fluentd 1.10.3.0
- Grafana 7.5.2.200
- Kibana 6.8.8.300
- OpenTSDB 2.4.0

### Ezmeral Ecosystem Pack 7.0.1 Release Notes

This topic contains information about the components included in Ezmeral Ecosystem Pack 7.0.1.

|                     |                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| Release Date        | January 2021                                                                                                     |
| Repository Location | <a href="https://package.mapr.hpe.com/releases/MEP/">https://package.mapr.hpe.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-6.0 or MEP-6.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

EEP 7.0.1 can be used with core 6.2.0. For more information about EEP and core version support, see [EEP Support and Lifecycle Status](#) on page 5734.

## Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

## Backward Compatibility

EEP 7.0.1 did not introduce any changes that affect application backward compatibility.

## EEP 7.0.1 Components

The EEP 7.0.1 repository contains the following ecosystem components that are fully supported:

| Component                     | Release Notes                                                                    |

<sup>1</sup>Support for this component is subject to your license agreement.

<sup>2</sup>The Spark Notebook UI in Hue is a beta feature.

<sup>3</sup>Support for Sentry is limited to Impala users.

The EEP 7.0.1 repository contains the following ecosystem components that are supported for internal data-fabric monitoring use cases only:

- Collectd 5.10.0.0
- Elasticsearch 6.8.8.0
- Fluentd 1.10.3.0
- Grafana 6.7.4.0
- Kibana 6.8.8.0
- OpenTSDB 2.4.0

### Ezmeral Ecosystem Pack 7.0.0 Release Notes

This topic contains information about the components included in Ezmeral Ecosystem Pack 7.0.0.

|                     |                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| Release Date        | September 2020                                                                                                   |
| Repository Location | <a href="https://package.mapr.hpe.com/releases/MEP/">https://package.mapr.hpe.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-6.0 or MEP-6.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

EEP 7.0.0 can be used with core 6.2.0. For more information about EEP and core version support, see [EEP Support and Lifecycle Status](#) on page 5734.

## Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

## Backward Compatibility

EEP 7.0.0 did not introduce any changes that affect application backward compatibility.

## EEP 7.0.0 Components

The EEP 7.0.0 repository contains the following ecosystem components that are fully supported:

| Component                   | Release Notes                                                                                                                                                                                                                                                                                                                     |

<sup>1</sup>Support for this component is subject to your license agreement.

<sup>2</sup>The Spark Notebook UI in Hue is a beta feature.

<sup>3</sup>Support for Sentry is limited to Impala users.

The EEP 7.0.0 repository contains the following ecosystem components that are supported for internal data-fabric monitoring use cases only:

- Collectd 5.10.0.0
- Elasticsearch 6.8.8.0
- Fluentd 1.10.3.0
- Grafana 6.7.4.0
- Kibana 6.8.8.0
- OpenTSDB 2.4.0

### Ezmeral Ecosystem Pack 6.3.6 Release Notes

This topic contains information about the components included in Ezmeral Ecosystem Pack 6.3.6.

**CAUTION:** EEP 6.3.6 requires a core patch to resolve a Warden defect. The defect is fixed in `mapr-patch-6.1.1.0.20180926230239.GA-20210512163609.x86_64` and later. Before upgrading to EEP 6.3.6, you must apply the patch. See [Patches and Documentation](#) on page 58.

**Notice:** Currently, no version of the Installer supports installing or upgrading to EEP 6.3.6. Manual installations and upgrades are required until a new version of the Installer is released.

|                     |                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| Release Date        | January 2022                                                                                                     |
| Repository Location | <a href="https://package.mapr.hpe.com/releases/MEP/">https://package.mapr.hpe.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>EEPs are contained in the MEP-<version> directory. The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-6.0 or MEP-6.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

EEP 6.x can be used with MapR Core 6.1.x. For more information about EEP and MapR Core version support, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### Backward Compatibility

EEP 6.3.6 did not introduce any changes that affect application backward compatibility.

### EEP 6.3.6 Components

The EEP 6.3.6 repository contains the following ecosystem components that are fully supported:

| Component                          | Release Notes                                                                   |

<sup>1</sup>Support for this component is subject to your license agreement.

<sup>2</sup>The Spark Notebook UI in Hue is a beta feature.

<sup>3</sup>MapR support for Sentry is limited to Impala users.

The EEP 6.3.6 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.8.1.210
- Elasticsearch 6.8.8.110
- Fluentd 1.10.3.110
- Grafana 7.5.2.110
- Kibana 6.8.8.110
- OpenTSDB 2.4.0

## Ezmeral Ecosystem Pack 6.3.5 Release Notes

This topic contains information about the components included in Ezmeral Ecosystem Pack 6.3.5.

**CAUTION:** EEP 6.3.5 requires a core patch to resolve a Warden defect. The defect is fixed in `mapr-patch-6.1.0.20180926230239.GA-20210512163609.x86_64` and later. Before upgrading to EEP 6.3.5, you must apply the patch. See [Patches and Documentation](#) on page 58.

|                     |                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| Release Date        | October 2021                                                                                                     |
| Repository Location | <a href="https://package.mapr.hpe.com/releases/MEP/">https://package.mapr.hpe.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>EEPs are contained in the `MEP-<version>` directory. The `MEP-<version>` directory can be represented by a 2-digit number or a 3-digit number (for example, `MEP-6.0` or `MEP-6.0.0`). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

EEP 6.x can be used with MapR Core 6.1.x. For more information about EEP and MapR Core version support, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### Backward Compatibility

EEP 6.3.5 did not introduce any changes that affect application backward compatibility.

### EEP 6.3.5 Components

The EEP 6.3.5 repository contains the following ecosystem components that are fully supported:

| Component                          | Release Notes                                                                   |

<sup>1</sup>Support for this component is subject to your license agreement.

<sup>2</sup>The Spark Notebook UI in Hue is a beta feature.

<sup>3</sup>MapR support for Sentry is limited to Impala users.

The EEP 6.3.5 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.8.1.201
- Elasticsearch 6.8.8.100
- Fluentd 1.10.3.100
- Grafana 7.5.2.100

- Kibana 6.8.8.100
- OpenTSDB 2.4.0

### Ezmeral Ecosystem Pack 6.3.4 Release Notes

This topic contains information about the components included in Ezmeral Ecosystem Pack 6.3.4.

**CAUTION:** EEP 6.3.4 requires a core patch to resolve a Warden defect. The defect is fixed in `mapr-patch-6.1.0.20180926230239.GA-20210512163609.x86_64` and later. Before upgrading to EEP 6.3.4, you must apply the patch. See [Patches and Documentation](#) on page 58.

|                     |                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| Release Date        | April 2021                                                                                                       |
| Repository Location | <a href="https://package.mapr.hpe.com/releases/MEP/">https://package.mapr.hpe.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The `MEP-<version>` directory can be represented by a 2-digit number or a 3-digit number (for example, `MEP-6.0` or `MEP-6.0.0`). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

EEP 6.x can be used with MapR Core 6.1.x. For more information about EEP and MapR Core version support, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### Backward Compatibility

EEP 6.3.4 did not introduce any changes that affect application backward compatibility.

### EEP 6.3.4 Components

The EEP 6.3.4 repository contains the following ecosystem components that are fully supported:

| Component                          | Release Notes                                                                   |

<sup>1</sup>Support for this component is subject to your license agreement.

<sup>2</sup>The Spark Notebook UI in Hue is a beta feature.

<sup>3</sup>MapR support for Sentry is limited to Impala users.

The EEP 6.3.4 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.8.1.201
- Elasticsearch 6.8.8.100
- Fluentd 1.10.3.100

- Grafana 7.5.2.100
- Kibana 6.8.8.100
- OpenTSDB 2.4.0

### Ezmeral Ecosystem Pack 6.3.3 Release Notes

This topic contains information about the components included in Ezmeral Ecosystem Pack 6.3.3.

|                     |                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| Release Date        | March 2021                                                                                                       |
| Repository Location | <a href="https://package.mapr.hpe.com/releases/MEP/">https://package.mapr.hpe.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-6.0 or MEP-6.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

EEP 6.x can be used with MapR Core 6.1.x. For more information about EEP and MapR Core version support, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### Backward Compatibility

EEP 6.3.3 did not introduce any changes that affect application backward compatibility.

### EEP 6.3.3 Components

The EEP 6.3.3 repository contains the following ecosystem components that are fully supported:

| Component                          | Release Notes                                                                   |

## Ezmeral Ecosystem Pack 6.3.2 Release Notes

This topic contains information about the components included in Ezmeral Ecosystem Pack 6.3.2.

|                     |                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| Release Date        | January 2021                                                                                                     |
| Repository Location | <a href="https://package.mapr.hpe.com/releases/MEP/">https://package.mapr.hpe.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-6.0 or MEP-6.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

EEP 6.x can be used with MapR Core 6.1.0. For more information about EEP and MapR Core version support, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### Backward Compatibility

EEP 6.3.2 did not introduce any changes that affect application backward compatibility.

### EEP 6.3.2 Components

The EEP 6.3.2 repository contains the following ecosystem components that are fully supported:

| Component                          | Release Notes                                                                              |
|------------------------------------|--------------------------------------------------------------------------------------------|
| AsyncHBase 1.7.0                   | <a href="#">AsyncHBase 1.7.0-1808 Release Notes</a> on page 5935                           |
| Data Access Gateway 2.0            | <a href="#">MapR Data Access Gateway 2.0 Release Notes</a> on page 5941                    |
| Drill 1.16.0.100 <sup>1</sup>      | <a href="#">Drill 1.16.0.100-2101 (EEP 6.3.2) Release Notes</a> on page 5955               |

| Tez 0.9.1                 | <a href="#">Tez 0.9.1 - 2101 (EEP 6.3.2) Release Notes</a> on page 6689                                                                                                                                                                                                                                                                                                                                               |

<sup>1</sup>Support for this component is subject to your license agreement.

<sup>2</sup>The Spark Notebook UI in Hue is a beta feature.

<sup>3</sup>MapR support for Sentry is limited to Impala users.

The EEP 6.3.2 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.8.1.201
- Elasticsearch 6.8.8.100
- Fluentd 1.10.3.100
- Grafana 6.7.4.100
- Kibana 6.8.8.100
- OpenTSDB 2.4.0

## Ezmeral Ecosystem Pack 6.3.1 Release Notes

This topic contains information about the components included in Ezmeral Ecosystem Pack 6.3.1.

|                     |                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| Release Date        | September 2020                                                                                                   |
| Repository Location | <a href="https://package.mapr.hpe.com/releases/MEP/">https://package.mapr.hpe.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-6.0 or MEP-6.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

EEP 6.x can be used with MapR Core 6.1.0. For more information about EEP and MapR Core version support, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### Backward Compatibility

EEP 6.3.1 did not introduce any changes that affect application backward compatibility.

### EEP 6.3.1 Components

The EEP 6.3.1 repository contains the following ecosystem components that are fully supported:

| Component                          | Release Notes                                                                              |

<sup>1</sup>Support for this component is subject to your license agreement.

<sup>2</sup>The Spark Notebook UI in Hue is a beta feature.

<sup>3</sup>MapR support for Sentry is limited to Impala users.

The EEP 6.3.1 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.8.1.200
- Elasticsearch 6.8.8.100
- Fluentd 1.10.3.100
- Grafana 6.0.2.200
- Kibana 6.8.8.100
- OpenTSDB 2.4.0

## Ezmeral Ecosystem Pack 6.3.0 Release Notes

This topic contains information about the components included in Ezmeral Ecosystem Pack 6.3.0.

|                     |                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| Release Date        | December 2019                                                                                                    |
| Repository Location | <a href="https://package.mapr.hpe.com/releases/MEP/">https://package.mapr.hpe.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The `MEP-<version>` directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-6.0 or MEP-6.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

EEP 6.x can be used with MapR Core 6.1.0. For more information about EEP and MapR Core version support, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### Backward Compatibility

EEP 6.3.0 did not introduce any changes that affect application backward compatibility.

### EEP 6.3.0 Components

The EEP 6.3.0 repository contains the following ecosystem components that are fully supported:

| Component                      | Release Notes                                                                              |

<sup>1</sup>Support for this component is subject to your license agreement.

<sup>2</sup>The Spark Notebook UI in Hue is a beta feature.

<sup>3</sup>MapR support for Sentry is limited to Impala users.

The EEP 6.3.0 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.8.1.200
- Elasticsearch 6.5.3.200
- Fluentd 1.4.0.100
- Grafana 6.0.2.100
- Kibana 6.5.3.200
- OpenTSDB 2.4.0

### **Ezmeral Ecosystem Pack 6.2.0 Release Notes**

This topic contains information about the components included with the Ezmeral Ecosystem Pack 6.2.0.

|                     |                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| Release Date        | May 2019                                                                                                         |
| Repository Location | <a href="https://package.mapr.hpe.com/releases/MEP/">https://package.mapr.hpe.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The `MEP-<version>` directory can be represented by a 2-digit number or a 3-digit number (for example, `MEP-6.0` or `MEP-6.0.0`). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

EEP 6.x can be used with MapR Core 6.1.0. For more information about EEP and MapR Core version support, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### Backward Compatibility

EEP 6.2.0 did not introduce any changes that would impact application backward compatibility.

### EEP 6.2.0 Components

The EEP 6.2.0 repository contains the following ecosystem components that are fully supported:

| Component                         | Release Notes                                                                                                                                                                                                                                                                                                                     |

<sup>1</sup>Support for this component is subject to your license agreement.

<sup>2</sup>For use only with HPE Ezmeral Data Fabric Database binary tables.

<sup>3</sup>The Spark Notebook UI in Hue is a beta feature.

<sup>4</sup>MapR support for Sentry is limited to Impala users.

The EEP 6.2.0 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.8.1.100
- Elasticsearch 6.5.3.100
- Fluentd 1.4.0.0
- Grafana 6.0.2.0
- Kibana 6.5.3.100
- OpenTSDB 2.4.0

### Ezmeral Ecosystem Pack 6.1.1 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 6.1.1.

|                     |                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| Release Date        | May 2019                                                                                                         |
| Repository Location | <a href="https://package.mapr.hpe.com/releases/MEP/">https://package.mapr.hpe.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-6.0 or MEP-6.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

EEP 6.x can be used with MapR Core 6.1.0. For more information about EEP and MapR Core version support, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### Backward Compatibility

EEP 6.1.1 did not introduce any changes that would impact application backward compatibility.

### EEP 6.1.1 Components

The EEP 6.1.1 repository contains the following ecosystem components that are fully supported:

| Component                         | Release Notes                                                                                                                                                                                                                                                                                                                     |

<sup>1</sup>For use only with HPE Ezmeral Data Fabric Database binary tables.

<sup>2</sup>MapR support for Sentry is limited to Impala users.

The EEP 6.1.0 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.8.1.1
- Elasticsearch 6.5.3.1
- Fluentd 1.3.2.1
- Grafana 5.4.2.1
- Kibana 6.5.3.1
- OpenTSDB 2.4.0

### Ezmeral Ecosystem Pack 6.1.0 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 6.1.0.

|                     |                                                                                                                  |

| Release Date        | February 2019                                                                                                    |
| Repository Location | <a href="https://package.mapr.hpe.com/releases/MEP/">https://package.mapr.hpe.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

EEP 6.x can be used with MapR Core 6.1.0. For more information about EEP and MapR Core version support, see [EEP Support and Lifecycle Status](#) on page 5734.

## Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

## EEP 6.1.0 Components

The EEP 6.1.0 repository contains the following ecosystem components that are fully supported:

| Component                         | Release Notes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

<sup>1</sup>Support for this component is subject to your license agreement.

<sup>2</sup>For use only with HPE Ezmeral Data Fabric Database binary tables.

<sup>3</sup>MapR Hive 2.3.3 is equivalent to Apache Hive 2.3.4.

<sup>4</sup>MapR support for Sentry is limited to Impala users.

The EEP 6.1.0 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.8.1.0
- Elasticsearch 6.5.3.0
- Fluentd 1.3.2.0
- Grafana 5.4.2.0
- Kibana 6.5.3.0
- OpenTSDB 2.4.0

### Ezmeral Ecosystem Pack 6.0.2 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 6.0.2.

|                     |                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| Release Date        | May 2019                                                                                                         |
| Repository Location | <a href="https://package.mapr.hpe.com/releases/MEP/">https://package.mapr.hpe.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-6.0 or MEP-6.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

EEP 6.x can be used with MapR Core 6.1.0. For more information about EEP and MapR Core version support, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### Backward Compatibility

EEP 6.0.2 did not introduce any changes that would impact application backward compatibility.

**EEP 6.0.2 Components**

The EEP 6.0.2 repository contains the following ecosystem components that are fully supported:

| Component                         | Release Notes                                                                                                                                                                                                                                                                                                                                                                                                                      |

<sup>1</sup>For use only with HPE Ezmeral Data Fabric Database binary tables.

<sup>2</sup>MapR support for Sentry is limited to Impala users.

The EEP 6.0.1 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.8.0
- Elasticsearch 6.2.3
- Fluentd 1.1.2
- Grafana 4.6.5
- Kibana 6.2.3
- OpenTSDB 2.4.0

### Ezmeral Ecosystem Pack 6.0.1 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 6.0.1.

|                     |                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| Release Date        | February 2019                                                                                                    |
| Repository Location | <a href="https://package.mapr.hpe.com/releases/MEP/">https://package.mapr.hpe.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

EEP 6.x can be used with MapR Core 6.1.0. For more information about EEP and MapR Core version support, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### EEP 6.0.1 Components

The EEP 6.0.1 repository contains the following ecosystem components that are fully supported:

| Component                         | Release Notes                                                                        |

<sup>1</sup>Support for this component is subject to your license agreement.

<sup>2</sup>For use only with HPE Ezmeral Data Fabric Database binary tables.

<sup>3</sup>MapR Hive 2.3.0 is equivalent to Apache Hive 2.3.3.

<sup>4</sup>MapR support for Sentry is limited to Impala users.

The EEP 6.0.1 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.8.0
- Elasticsearch 6.2.3
- Fluentd 1.1.2
- Grafana 4.6.1
- Kibana 6.2.3

- OpenTSDB 2.4.0

### Ezmeral Ecosystem Pack 6.0.0 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 6.0.0.

|                     |                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| Release Date        | September 2018                                                                                                   |
| Repository Location | <a href="https://package.mapr.hpe.com/releases/MEP/">https://package.mapr.hpe.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

EEP 6.x can be used with MapR Core 6.1.0. For more information about EEP and MapR Core version support, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### EEP 6.0.0 Components

The EEP 6.0.0 repository contains the following ecosystem components that are fully supported:

| Component                         | Release Notes                                                                                                                                                                                                                                                                                                                     |

<sup>1</sup>Support for this component is subject to your license agreement.

<sup>2</sup>For use only with HPE Ezmeral Data Fabric Database binary tables.

<sup>3</sup>MapR Hive 2.3.0 is equivalent to Apache Hive 2.3.3.

<sup>4</sup>MapR support for Sentry is limited to Impala users.

The EEP 6.0.0 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.8.0
- Elasticsearch 6.2.3
- Fluentd 1.1.2
- Grafana 4.6.1
- Kibana 6.2.3
- OpenTSDB 2.4.0

### Ezmeral Ecosystem Pack 5.0.7 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 5.0.7.

|                     |                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| Release Date        | May 2021                                                                                                         |
| Repository Location | <a href="https://package.mapr.hpe.com/releases/MEP/">https://package.mapr.hpe.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-5.0 or MEP-5.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

To understand which core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### Backward Compatibility

MEP 5.0.7 did not introduce any changes that would impact application backward compatibility.

### EEP 5.0.7 Components

The EEP 5.0.7 repository contains the following ecosystem components that are fully supported:

| Component                         | Release Notes                                                                                     |

<sup>1</sup>For use only with HPE Ezmeral Data Fabric Database binary tables.

<sup>2</sup>Support for Sentry is limited to Impala users.

The EEP 5.0.7 repository contains the following ecosystem components that are supported for internal Monitoring use cases only:

- Collectd 5.7.2
- Elasticsearch 5.4.1
- Fluentd 0.14.20
- Grafana 7.5.2.0
- Kibana 5.4.1
- OpenTSDB 2.4.0

### Ezmeral Ecosystem Pack 5.0.6 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 5.0.6.

|                     |                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| Release Date        | January 2021                                                                                                     |
| Repository Location | <a href="https://package.mapr.hpe.com/releases/MEP/">https://package.mapr.hpe.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-5.0 or MEP-5.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

To understand which core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### Backward Compatibility

MEP 5.0.6 did not introduce any changes that would impact application backward compatibility.

**EEP 5.0.6 Components**

The EEP 5.0.6 repository contains the following ecosystem components that are fully supported:

| Component                         | Release Notes                                                                                                                                                                                                                                                                                                                     |

<sup>1</sup>For use only with HPE Ezmeral Data Fabric Database binary tables.

<sup>2</sup>Support for Sentry is limited to Impala users.

The EEP 5.0.6 repository contains the following ecosystem components that are supported for internal Monitoring use cases only:

- Collectd 5.7.2
- Elasticsearch 5.4.1
- Fluentd 0.14.20
- Grafana 4.6.5
- Kibana 5.4.1
- OpenTSDB 2.4.0

### Ezmeral Ecosystem Pack 5.0.5 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 5.0.5.

|                     |                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| Release Date        | September 2020                                                                                                   |
| Repository Location | <a href="https://package.mapr.hpe.com/releases/MEP/">https://package.mapr.hpe.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-5.0 or MEP-5.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

To understand which core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### Backward Compatibility

MEP 5.0.5 did not introduce any changes that would impact application backward compatibility.

### EEP 5.0.5 Components

The EEP 5.0.5 repository contains the following ecosystem components that are fully supported:

| Component                         | Release Notes                                                            |

<sup>1</sup>For use only with HPE Ezmeral Data Fabric Database binary tables.

<sup>2</sup>Support for Sentry is limited to Impala users.

The EEP 5.0.5 repository contains the following ecosystem components that are supported for internal Monitoring use cases only:

- Collectd 5.7.2
- Elasticsearch 5.4.1
- Fluentd 0.14.20
- Grafana 4.6.5
- Kibana 5.4.1
- OpenTSDB 2.4.0

#### **Ezmeral Ecosystem Pack 5.0.4 Release Notes**

This topic contains information about the components included with the Ezmeral Ecosystem Pack 5.0.4.

|              |               |
|--------------|---------------|
| Release Date | December 2019 |
|--------------|---------------|

|                     |                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| Repository Location | <a href="https://package.mapr.hpe.com/releases/MEP/">https://package.mapr.hpe.com/releases/MEP/</a> <sup>1</sup> |
|---------------------|------------------------------------------------------------------------------------------------------------------|

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-5.0 or MEP-5.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### Backward Compatibility

MEP 5.0.4 did not introduce any changes that would impact application backward compatibility.

### EEP 5.0.4 Components

The EEP 5.0.4 repository contains the following ecosystem components that are fully supported:

| Component                         | Release Notes                                                                                                                                                                                                                                                                                                                    |

<sup>1</sup>For use only with HPE Ezmeral Data Fabric Database binary tables.

<sup>2</sup>MapR support for Sentry is limited to Impala users.

The EEP 5.0.4 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.2
- Elasticsearch 5.4.1
- Fluentd 0.14.20
- Grafana 4.6.5
- Kibana 5.4.1
- OpenTSDB 2.4.0

### Ezmeral Ecosystem Pack 5.0.3 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 5.0.3.

|                     |                                                                                                       |
|---------------------|-------------------------------------------------------------------------------------------------------|
| Release Date        | May 2019                                                                                              |
| Repository Location | <a href="https://package.mapr.hpe.com/releases/MEP/1">https://package.mapr.hpe.com/releases/MEP/1</a> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-5.0 or MEP-5.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### Backward Compatibility

MEP 5.0.3 did not introduce any changes that would impact application backward compatibility.

### EEP 5.0.3 Components

The EEP 5.0.3 repository contains the following ecosystem components that are fully supported:

| Component                         | Release Notes                                                                                                                                                                                                                                                                                                                     |

<sup>1</sup>For use only with HPE Ezmeral Data Fabric Database binary tables.

<sup>2</sup>MapR support for Sentry is limited to Impala users.

The EEP 5.0.3 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.2

- Elasticsearch 5.4.1
- Fluentd 0.14.20
- Grafana 4.6.5
- Kibana 5.4.1
- OpenTSDB 2.4.0

### Ezmeral Ecosystem Pack 5.0.2 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 5.0.2.

|                     |                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| Release Date        | February 2019                                                                                                    |
| Repository Location | <a href="https://package.mapr.hpe.com/releases/MEP/">https://package.mapr.hpe.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### EEP 5.0.2 Components

The EEP 5.0.2 repository contains the following ecosystem components that are fully supported:

| Component                         | Release Notes                                                                        |

<sup>1</sup>For use only with HPE Ezmeral Data Fabric Database binary tables.

<sup>2</sup>MapR support for Sentry is limited to Impala users.

The EEP 5.0.2 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.2
- Elasticsearch 5.4.1
- Fluentd 0.14.20
- Grafana 4.6.1
- Kibana 5.4.1
- OpenTSDB 2.4.0

### Ezmeral Ecosystem Pack 5.0.1 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 5.0.1.

|                     |                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| Release Date        | September 2018                                                                                                   |
| Repository Location | <a href="https://package.mapr.hpe.com/releases/MEP/">https://package.mapr.hpe.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### EEP 5.0.1 Components

The EEP 5.0.1 repository contains the following ecosystem components that are fully supported:

| Component                         | Release Notes                                                                                                                                                                                                                                                                                                                       |

<sup>1</sup>For use only with HPE Ezmeral Data Fabric Database binary tables.

<sup>2</sup>MapR support for Sentry is limited to Impala users.

The EEP 5.0.1 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.2
- Elasticsearch 5.4.1
- Fluentd 0.14.20
- Grafana 4.6.1
- Kibana 5.4.1
- OpenTSDB 2.4.0

### Ezmeral Ecosystem Pack 5.0.0 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 5.0.0.

|                     |                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| Release Date        | March 2018                                                                                                       |
| Repository Location | <a href="https://package.mapr.hpe.com/releases/MEP/">https://package.mapr.hpe.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The `MEP-<version>` directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### EEP 5.0.0 Components

The EEP 5.0.0 repository contains the following ecosystem components that are fully supported:

| Component                         | Release Notes                                                                        |

<sup>1</sup>For use only with HPE Ezmeral Data Fabric Database binary tables.

<sup>2</sup>MapR support for Sentry is limited to Impala users.

The EEP 5.0.0 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.2
- Elasticsearch 5.4.1
- Fluentd 0.14.20
- Grafana 4.6.1
- Kibana 5.4.1
- OpenTSDB 2.4.0

#### **Ezmeral Ecosystem Pack 4.1.4 Release Notes**

This topic contains information about the components included with the Ezmeral Ecosystem Pack 4.1.4.

|                     |                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------|
| Release Date        | May 2019                                                                                                 |
| Repository Location | <a href="https://package.mapr.com/releases/MEP/">https://package.mapr.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-4.0 or MEP-4.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 5734.

#### **Release Note Naming Convention**

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release,

but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### Backward Compatibility

MEP 4.1.4 did not introduce any changes that would impact application backward compatibility.

### EEP 4.1.4 Components

The EEP 4.1.4 repository contains the following ecosystem components that are fully supported:

| Component                         | Release Notes                                                                                                                                                                                                       |

<sup>1</sup>For use only with HPE Ezmeral Data Fabric Database binary tables.

<sup>2</sup>MapR support for Sentry is limited to Impala users.

The EEP 4.1.4 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.2
- Elasticsearch 5.4.1
- Fluentd 0.14.20
- Grafana 4.6.5
- Kibana 5.4.1
- OpenTSDB 2.4.0

### Ezmeral Ecosystem Pack 4.1.3 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 4.1.3.

|                     |                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------|
| Release Date        | February 2019                                                                                            |
| Repository Location | <a href="https://package.mapr.com/releases/MEP/">https://package.mapr.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### EEP 4.1.3 Components

The EEP 4.1.3 repository contains the following ecosystem components that are fully supported:

| Component                         | Release Notes                                                                        |

<sup>1</sup>For use only with HPE Ezmeral Data Fabric Database binary tables.

<sup>2</sup>MapR support for Sentry is limited to Impala users.

The EEP 4.1.3 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.2
- Elasticsearch 5.4.1
- Fluentd 0.14.20
- Grafana 4.4.2
- Kibana 5.4.1
- OpenTSDB 2.4.0

### Ezmeral Ecosystem Pack 4.1.2 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 4.1.2.

|                     |                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------|
| Release Date        | September 2018                                                                                           |
| Repository Location | <a href="https://package.mapr.com/releases/MEP/">https://package.mapr.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but

last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### EEP 4.1.2 Components

The EEP 4.1.2 repository contains the following ecosystem components that are fully supported:

| Component                         | Release Notes                                                                                                                                                                                                        |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

<sup>1</sup>For use only with HPE Ezmeral Data Fabric Database binary tables.

<sup>2</sup>MapR support for Sentry is limited to Impala users.

The EEP 4.1.2 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.2
- Elasticsearch 5.4.1
- Fluentd 0.14.20

- Grafana 4.4.2
- Kibana 5.4.1
- OpenTSDB 2.4.0

### Ezmeral Ecosystem Pack 4.1.1 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 4.1.1.

|                     |                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------|
| Release Date        | March 2018                                                                                               |
| Repository Location | <a href="https://package.mapr.com/releases/MEP/">https://package.mapr.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### EEP 4.1.1 Components

The EEP 4.1.1 repository contains the following ecosystem components that are fully supported:

| Component                         | Release Notes                                                                                                                            |

<sup>1</sup>For use only with HPE Ezmeral Data Fabric Database binary tables.

<sup>2</sup>MapR support for Sentry is limited to Impala users.

The EEP 4.1.1 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.2
- Elasticsearch 5.4.1
- Fluentd 0.14.20
- Grafana 4.4.2
- Kibana 5.4.1
- OpenTSDB 2.4.0

### Ezmeral Ecosystem Pack 4.1.0 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 4.1.0.

|                     |                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------|
| Release Date        | February 2018                                                                                            |
| Repository Location | <a href="https://package.mapr.com/releases/MEP/">https://package.mapr.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### EEP 4.1.0 Components

The EEP 4.1.0 repository contains the following ecosystem components that are fully supported:

| Component      | Release Notes                                                    |
|----------------|------------------------------------------------------------------|
| AsyncHBase 1.7 | <a href="#">AsyncHBase 1.7.0-1607 Release Notes</a> on page 5936 |
| Drill 1.12     | <a href="#">Drill 1.12.0-1801 Release Notes</a> on page 5986     |
| Flume 1.7      | <a href="#">Flume 1.7.0-1703 Release Notes</a> on page 6024      |

| Component                         | Release Notes                                                                                                                                                                                                        |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HBase-compatible API <sup>1</sup> | <a href="#">HBase 1.1.8-1710 Release Notes</a> on page 6074                                                                                                                                                          |
| Hive 2.1                          | <a href="#">Hive 2.1.1-1710 Release Notes</a> on page 6182                                                                                                                                                           |
| HttpFS 1.0                        | <a href="#">HttpFS-1.0-1710 Release Notes</a> on page 6263                                                                                                                                                           |

| Spark 2.1                         | <a href="#">Spark 2.1.0-1801 Release Notes</a> on page 6600                                                                                                                                                          |
| Sqoop 1.4.6                       | <a href="#">Sqoop 1.4.6-1710 Release Notes</a> on page 6659                                                                                                                                                          |
| Sqoop2 1.99.7                     | <a href="#">Sqoop2 1.99.7-1710 Release Notes</a> on page 6667                                                                                                                                                        |
| MapR Streams Clients              | <a href="#">HPE Ezmeral Data Fabric Event Streams C Client 0.9.1 - 1703 Release Notes</a> on page 6366 and <a href="#">HPE Ezmeral Data Fabric Event Streams Python Client 0.9.2-1707 Release Notes</a> on page 6367 |

<sup>1</sup>For use only with HPE Ezmeral Data Fabric Database binary tables.

<sup>2</sup>MapR support for Sentry is limited to Impala users.

The EEP 4.1.0 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.2
- Elasticsearch 5.4.1
- Fluentd 0.14.20
- Grafana 4.4.2
- Kibana 5.4.1
- OpenTSDB 2.4.0

### Ezmeral Ecosystem Pack 4.0.0 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 4.0.0.

|                     |                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------|
| Release Date        | November 2017                                                                                            |
| Repository Location | <a href="https://package.mapr.com/releases/MEP/">https://package.mapr.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### EEP 4.0.0 Components

The EEP 4.0.0 repository contains the following ecosystem components that are fully supported:

| Component                         | Release Notes                                                                                                                                                                                                        |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AsyncHBase 1.7                    | <a href="#">AsyncHBase 1.7.0-1607 Release Notes</a> on page 5936                                                                                                                                                     |

<sup>1</sup>For use only with HPE Ezmeral Data Fabric Database binary tables.

<sup>2</sup>MapR support for Sentry is limited to Impala users.

The EEP 4.0.0 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.2
- Elasticsearch 5.4.1

- Fluentd 0.14.20
- Grafana 4.4.2
- Kibana 5.4.1
- OpenTSDB 2.4.0

### Ezmeral Ecosystem Pack 3.0.5 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 3.0.5.

|                     |                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------|
| Release Date        | February 2019                                                                                            |
| Repository Location | <a href="https://package.mapr.com/releases/MEP/">https://package.mapr.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### EEP 3.0.5 Components

The EEP 3.0.5 repository contains the following ecosystem components that are fully supported:

| Component                  | Release Notes                                                                                                                                                                                                       |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

<sup>2</sup>Mahout 0.12.0 includes backports of all the patches included in Apache Mahout 0.12.1 and 0.12.2.

<sup>3</sup>MapR support for Sentry is limited to Impala users.

<sup>4</sup>Storm 0.10.0 includes backports of all the patches included in Apache Storm 0.10.2.

The EEP 3.0.5 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.1
- Elasticsearch 2.3.3
- Fluentd 0.14.00
- Grafana 4.1.2
- Kibana 4.5.4
- OpenTSDB 2.3.0

### Ezmeral Ecosystem Pack 3.0.4 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 3.0.4.

|                     |                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------|
| Release Date        | September 2017                                                                                           |
| Repository Location | <a href="https://package.mapr.com/releases/MEP/">https://package.mapr.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The `MEP-<version>` directory can be represented by a 2-digit number or a 3-digit number (for example, `MEP-2.0` or `MEP-2.0.0`). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

**EEP 3.0.4 Components**

The EEP 3.0.4 repository contains the following ecosystem components that are fully supported:

| Component                  | Release Notes                                                                                                                                                                                                        |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

<sup>2</sup>Mahout 0.12.0 includes backports of all the patches included in Apache Mahout 0.12.1 and 0.12.2.

<sup>3</sup>MapR support for Sentry is limited to Impala users.

<sup>4</sup>Storm 0.10.0 includes backports of all the patches included in Apache Storm 0.10.2.

The EEP 3.0.4 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.1
- Elasticsearch 2.3.3

- Fluentd 0.14.00
- Grafana 4.1.2
- Kibana 4.5.4
- OpenTSDB 2.3.0

### Ezmeral Ecosystem Pack 3.0.3 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 3.0.3.

|                     |                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------|
| Release Date        | March 2017                                                                                               |
| Repository Location | <a href="https://package.mapr.com/releases/MEP/">https://package.mapr.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### EEP 3.0.3 Components

The EEP 3.0.3 repository contains the following ecosystem components that are fully supported:

| Component                  | Release Notes                                                                                                                            |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------|

<sup>2</sup>Mahout 0.12.0 includes backports of all the patches included in Apache Mahout 0.12.1 and 0.12.2.

<sup>3</sup>MapR support for Sentry is limited to Impala users.

<sup>4</sup>Storm 0.10.0 includes backports of all the patches included in Apache Storm 0.10.2.

The EEP 3.0.2 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.1
- Elasticsearch 2.3.3
- Fluentd 0.14.00
- Grafana 4.1.2
- Kibana 4.5.4
- OpenTSDB 2.3.0

## Ezmeral Ecosystem Pack 3.0.1 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 3.0.1.

|                     |                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------|
| Release Date        | August 2017                                                                                              |
| Repository Location | <a href="https://package.mapr.com/releases/MEP/">https://package.mapr.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### EEP 3.0.1 Components

The EEP 3.0.1 repository contains the following ecosystem components that are fully supported:

| Component                  | Release Notes                                                                                                                            |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------|

<sup>2</sup>Mahout 0.12.0 includes backports of all the patches included in Apache Mahout 0.12.1 and 0.12.2.

<sup>3</sup>MapR support for Sentry is limited to Impala users.

<sup>4</sup>Storm 0.10.0 includes backports of all the patches included in Apache Storm 0.10.2.

The EEP 3.0.1 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.1
- Elasticsearch 2.3.3
- Fluentd 0.14.00
- Grafana 4.1.2
- Kibana 4.5.4
- OpenTSDB 2.3.0

### Ezmeral Ecosystem Pack 3.0 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 3.0.

|                     |                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------|
| Release Date        | April 2017                                                                                               |
| Repository Location | <a href="https://package.mapr.com/releases/MEP/">https://package.mapr.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). The three-digit EEP directory contains a fixed EEP version with patches. Use this EEP version if you prefer to do manual installs and do not require patch updates.

The two-digit EEP directory contains the latest EEP and patches and is continuously updated. The MapR installer uses the two-digit EEP directory to make new patches available automatically without the need for system reconfiguration.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### EEP 3.0 Components

The EEP 3.0 repository contains the following ecosystem components that are fully supported:

| Component      | Release Notes                                                    |
|----------------|------------------------------------------------------------------|
| AsyncHBase 1.7 | <a href="#">AsyncHBase 1.7.0-1607 Release Notes</a> on page 5936 |
| Drill 1.10     | <a href="#">Drill 1.10.0-1703 Release Notes</a> on page 5998     |

| Component                                     | Release Notes                                                                                                                                                                                                          |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

<sup>2</sup>Mahout 0.12.0 includes backports of all the patches included in Apache Mahout 0.12.1 and 0.12.2.

<sup>3</sup>MapR support for Sentry is limited to Impala users.

<sup>4</sup>Storm 0.10.0 includes backports of all the patches included in Apache Storm 0.10.2.

The EEP 3.0 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.1
- Elasticsearch 2.3.3
- Fluentd 0.14.00
- Grafana 4.1.2
- Kibana 4.5.4
- OpenTSDB 2.3.0

### **Ezmeral Ecosystem Pack 2.0.3 Release Notes**

This topic contains information about the components included with the Ezmeral Ecosystem Pack 2.0.3.

|              |               |
|--------------|---------------|
| Release Date | November 2017 |
|--------------|---------------|

|                     |                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------|
| Repository Location | <a href="https://package.mapr.com/releases/MEP/">https://package.mapr.com/releases/MEP/</a> <sup>1</sup> |
|---------------------|----------------------------------------------------------------------------------------------------------|

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.1.1-1803, 2.1.1 refers to the Hive version number and 1803 typically indicates a March 2018 release but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### EEP 2.0.3 Components

The EEP 2.0.3 repository contains the following ecosystem components that are fully supported:

| Component                  | Release Notes                                                                                                                            |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| AsyncHBase 1.7             | <a href="#">AsyncHBase 1.7.0-1607 Release Notes</a> on page 5936                                                                         |
| Drill 1.9                  | <a href="#">Drill 1.9.0-1703 Release Notes</a> on page 5999                                                                              |

| Sqoop2 1.99.7              | <a href="#">Sqoop2 1.99.7-1611 Release Notes</a> on page 6668                                                                            |
| Storm 0.10.0 <sup>5</sup>  | <a href="#">Storm 0.10.0-1611 Release Notes</a> on page 6673                                                                             |

<sup>2</sup>Hive 1.2.1 includes backports of specific patches contained in Apache Hive 1.2.2. For details see the [Hive 1.2.1-1703 Release Notes](#) on page 6197.

<sup>3</sup>Mahout 0.12.0 includes backports of all the patches included in Apache Mahout 0.12.1 and 0.12.2.

<sup>4</sup>Spark 2.0.1-1703 includes backports of all the patches contained in Apache Spark 2.0.2.

<sup>5</sup>Storm 0.10.0 includes backports of all the patches included in Apache Storm 0.10.2.

The EEP 2.0.2 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.1
- Elasticsearch 2.3.3
- Fluentd 0.14.00
- Grafana 4.1.2
- Kibana 4.5.4
- OpenTSDB 2.3.0

### Ezmeral Ecosystem Pack 2.0.2 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 2.0.2.

|                     |                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------|
| Release Date        | August 2017                                                                                              |
| Repository Location | <a href="https://package.mapr.com/releases/MEP/">https://package.mapr.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-`<version>` directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.1.1-1803, 2.1.1 refers to the Hive version number and 1803 typically indicates a March 2018 release but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### EEP 2.0.2 Components

The EEP 2.0.2 repository contains the following ecosystem components that are fully supported:

| Component                  | Release Notes                                                                                                                            |

<sup>2</sup>Hive 1.2.1 includes backports of specific patches contained in Apache Hive 1.2.2. For details see the [Hive 1.2.1-1703 Release Notes](#) on page 6197.

<sup>3</sup>Mahout 0.12.0 includes backports of all the patches included in Apache Mahout 0.12.1 and 0.12.2.

<sup>4</sup>Spark 2.0.1-1703 includes backports of all the patches contained in Apache Spark 2.0.2.

<sup>5</sup>Storm 0.10.0 includes backports of all the patches included in Apache Storm 0.10.2.

The EEP 2.0.2 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.1
- Elasticsearch 2.3.3
- Fluentd 0.14.00
- Grafana 4.1.2
- Kibana 4.5.4
- OpenTSDB 2.3.0

### Ezmeral Ecosystem Pack 2.0.1 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 2.0.1.

|                     |                                                                                               |
|---------------------|-----------------------------------------------------------------------------------------------|
| Release Date        | April 2017                                                                                    |
| Repository Location | <a href="https://package.mapr.com/releases/MEP/1">https://package.mapr.com/releases/MEP/1</a> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). The three-digit EEP directory contains a fixed EEP version with patches. Use this EEP version if you prefer to do manual installs and do not require patch updates.

The two-digit EEP directory contains the latest EEP and patches and is continuously updated. The MapR installer uses the two-digit EEP directory to make new patches available automatically without the need for system reconfiguration.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.1.1-1803, 2.1.1 refers to the Hive version number and 1803 typically indicates a March 2018 release but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

## EEP 2.0.1 Components

The EEP 2.0.1 repository contains the following ecosystem components that are fully supported:

| Component                                   | Release Notes                                                                                                                                      |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| AsyncHBase 1.7                              | <a href="#">AsyncHBase 1.7.0-1607 Release Notes</a> on page 5936                                                                                   |
| Drill 1.9                                   | <a href="#">Drill 1.9.0-1703 Release Notes</a> on page 5999                                                                                        |
| Flume 1.6                                   | <a href="#">Flume 1.6.0-1602 Release Notes</a> on page 6025                                                                                        |

<sup>2</sup>Hive 1.2.1 includes backports of specific patches contained in Apache Hive 1.2.2. For details see the [Hive 1.2.1-1703 Release Notes](#) on page 6197.

<sup>3</sup>Mahout 0.12.0 includes backports of all the patches included in Apache Mahout 0.12.1 and 0.12.2.

<sup>4</sup>Spark 2.0.1-1703 includes backports of all the patches contained in Apache Spark 2.0.2.

<sup>5</sup>Storm 0.10.0 includes backports of all the patches included in Apache Storm 0.10.2.

The EEP 2.0.1 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.5.1
- Elasticsearch 2.3.3
- Fluentd 0.14.00
- Grafana 4.1.2
- Kibana 4.5.4
- OpenTSDB 2.3.0

### Ezmeral Ecosystem Pack 2.0 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 2.0.

|                     |                                                                                               |
|---------------------|-----------------------------------------------------------------------------------------------|
| Release Date        | December 8, 2016                                                                              |
| Repository Location | <a href="https://package.mapr.com/releases/MEP/1">https://package.mapr.com/releases/MEP/1</a> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). The three-digit EEP directory contains a fixed EEP version with patches. Use this EEP version if you prefer to do manual installs and do not require patch updates.

The two-digit EEP directory contains the latest EEP and patches and is continuously updated. The MapR installer uses the two-digit EEP directory to make new patches available automatically without the need for system reconfiguration.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.1.1-1803, 2.1.1 refers to the Hive version number and 1803 typically indicates a March 2018 release but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### EEP 2.0 Components

The EEP 2.0 repository contains the following ecosystem components that are fully supported:

| Component                                   | Release Notes                                                                                                                           |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|

<sup>2</sup>Mahout 0.12.0 includes backports of all the patches included in Apache Mahout 0.12.1 and 0.12.2.

<sup>3</sup>Storm 0.10.0 includes backports of all the patches included in Apache Storm 0.10.2.

The EEP 2.x repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.5.1
- Elasticsearch 2.3.3
- Fluentd 0.14.60
- Grafana 3.1.1
- Kibana 4.5.1
- OpenTSDB 2.2.1

### Ezmeral Ecosystem Pack 1.1.4 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 1.1.4.

|                     |                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------|
| Release Date        | November 2017                                                                                            |
| Repository Location | <a href="https://package.mapr.com/releases/MEP/">https://package.mapr.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.1.1-1803, 2.1.1 refers to the Hive version number and 1803 typically indicates a March 2018 release but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### EEP 1.1.4 Components

The EEP 1.1.3 repository contains the following ecosystem components that are fully supported:

| Component                  | Release Notes                                                         |
|----------------------------|-----------------------------------------------------------------------|
| AsyncHBase 1.7             | <a href="#">AsyncHBase 1.7.0-1607 Release Notes</a> on page 5936      |

| Sqoop2 1.99.6             | <a href="#">Sqoop2 1.99.6-1607 Release Notes</a> on page 6669 |
| Storm 0.10.0 <sup>4</sup> | <a href="#">Storm 0.10.0-1611 Release Notes</a> on page 6673  |

<sup>2</sup>Hive 1.2.1 includes backports of specific patches contained in Apache Hive 1.2.2. For details see the [Hive 1.2.1-1703 Release Notes](#) on page 6197.

<sup>3</sup>Mahout 0.12.0 includes backports of all the patches included in Apache Mahout 0.12.1 and 0.12.2.

<sup>4</sup>Storm 0.10.0 includes backports of all the patches included in Apache Storm 0.10.2.

The EEP 1.1.3 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.1
- Elasticsearch 2.3.3
- Fluentd 0.14.00
- Grafana 4.1.2
- Kibana 4.5.4
- OpenTSDB 2.3.0

### Ezmeral Ecosystem Pack 1.1.3 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 1.1.3.

|                     |                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------|
| Release Date        | August 2017                                                                                              |
| Repository Location | <a href="https://package.mapr.com/releases/MEP/">https://package.mapr.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 5653.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.1.1-1803, 2.1.1 refers to the Hive version number and 1803 typically indicates a March 2018 release but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### EEP 1.1.3 Components

The EEP 1.1.3 repository contains the following ecosystem components that are fully supported:

| Component      | Release Notes                                                    |
|----------------|------------------------------------------------------------------|
| AsynchBase 1.7 | <a href="#">AsynchBase 1.7.0-1607 Release Notes</a> on page 5936 |
| Drill 1.8      | <a href="#">Drill 1.8.0-1703 Release Notes</a> on page 6002      |

| Component                  | Release Notes                                                         |
|----------------------------|-----------------------------------------------------------------------|
| Flume 1.6                  | <a href="#">Flume 1.6.0-1602 Release Notes</a> on page 6025           |

<sup>2</sup>Hive 1.2.1 includes backports of specific patches contained in Apache Hive 1.2.2. For details see the [Hive 1.2.1-1703 Release Notes](#) on page 6197.

<sup>3</sup>Mahout 0.12.0 includes backports of all the patches included in Apache Mahout 0.12.1 and 0.12.2.

<sup>4</sup>Storm 0.10.0 includes backports of all the patches included in Apache Storm 0.10.2.

The EEP 1.1.3 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.1
- Elasticsearch 2.3.3
- Fluentd 0.14.00
- Grafana 4.1.2
- Kibana 4.5.4
- OpenTSDB 2.3.0

### Ezmeral Ecosystem Pack 1.1.2 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 1.1.2.

|                     |                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------|
| Release Date        | April 2017                                                                                               |
| Repository Location | <a href="https://package.mapr.com/releases/MEP/">https://package.mapr.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). The three-digit EEP directory contains a fixed EEP version with patches. Use this EEP version if you prefer to do manual installs and do not require patch updates.

The two-digit EEP directory contains the latest EEP and patches and is continuously updated. The MapR installer uses the two-digit EEP directory to make new patches available automatically without the need for system reconfiguration.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.1.1-1803, 2.1.1 refers to the Hive version number and 1803 typically indicates a March 2018 release but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### EEP 1.1.2 Components

The EEP 1.1.2 repository contains the following ecosystem components that are fully supported:

| Component                  | Release Notes                                                         |
|----------------------------|-----------------------------------------------------------------------|

- OpenTSDB 2.3.0

### Ezmeral Ecosystem Pack 1.1.1 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 1.1.1.

|                     |                                                                                               |
|---------------------|-----------------------------------------------------------------------------------------------|
| Release Date        | December 9, 2016                                                                              |
| Repository Location | <a href="https://package.mapr.com/releases/MEP/1">https://package.mapr.com/releases/MEP/1</a> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-1.1 or MEP-1.1.0). The three-digit EEP directory contains a fixed EEP version with patches. Use this EEP version if you prefer to do manual installs and do not require patch updates.

The two-digit EEP directory contains the latest EEP and patches and is continuously updated. The MapR installer uses the two-digit EEP directory to make new patches available automatically without the need for system reconfiguration.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.1.1-1803, 2.1.1 refers to the Hive version number and 1803 typically indicates a March 2018 release but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### EEP 1.1.1 Components

The EEP 1.1.1 repository contains the following ecosystem components that are fully supported:

| Component                  | Release Notes                                                                                                                                                     |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AsyncHBase 1.7             | <a href="#">AsyncHBase 1.7.0-1607 Release Notes</a> on page 5936                                                                                                  |
| Drill 1.8                  | <a href="#">Drill 1.8.0-1609 Release Notes</a>                                                                                                                    |

| Storm 0.10.0 <sup>3</sup> | <a href="#">Storm 0.10.0-1611 Release Notes</a> on page 6673                                                                                                      |

<sup>2</sup>Mahout 0.12.0 includes backports of all the patches included in Apache Mahout 0.12.1 and 0.12.2.

<sup>3</sup>Storm 0.10.0 includes backports of all the patches included in Apache Storm 0.10.2.

The EEP 1.1 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.5.1
- Elasticsearch 2.3.3
- Fluentd 0.14.00
- Grafana 3.1.1
- Kibana 4.5.1
- OpenTSDB 2.2.1

### Ezmeral Ecosystem Pack 1.1.0 Release Notes

This topic contains information about the components included with the Ezmeral Ecosystem Pack 1.1.0.

|                     |                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------|
| Release Date        | September 30, 2016                                                                                       |
| Repository Location | <a href="https://package.mapr.com/releases/MEP/">https://package.mapr.com/releases/MEP/</a> <sup>1</sup> |

<sup>1</sup>The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-1.1 or MEP-1.1.0). The three-digit EEP directory contains a fixed EEP version with patches. Use this EEP version if you prefer to do manual installs and do not require patch updates.

The two-digit EEP directory contains the latest EEP and patches and is continuously updated. The MapR installer uses the two-digit EEP directory to make new patches available automatically without the need for system reconfiguration.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 5734.

### Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.1.1-1803, 2.1.1 refers to the Hive version number and 1803 typically indicates a March 2018 release but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

### EEP 1.1.0 Components

The EEP 1.1.0 repository contains the following ecosystem components that are fully supported:

| Component      | Release Notes                                                    |

| Storm 0.10.0  | <a href="#">Storm 0.10.0-1609 Release Notes</a> on page 6673                                                                                                      |

The EEP 1.1 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.5.1
- Elasticsearch 2.3.3
- Fluentd 0.14.00
- Grafana 3.1.1
- Kibana 4.5.1
- OpenTSDB 2.2.0

### Package Names for Ezmeral Ecosystem Packs (EEPs)

This page describes how to view the the package names for each Ezmeral Ecosystem Pack (EEP) release.

To view the package names for an EEP:

1. Use a browser to navigate to <https://package.mapr.hpe.com/releases/MEP/>. A list of EEP links is displayed.
2. Click the link for your EEP. A list of operating system links is displayed.
3. Click the link for your operating system. The list of package names is displayed.

For more information about the supported EEPs, see [EEP Components and OS Support](#) on page 5739.

For information about packages and dependencies, see [Packages and Dependencies for Data Fabric Software](#) on page 57.

## Airflow Release Notes

The release notes for the Airflow component included in the HPE Ezmeral Data Fabric contain notes specific to data-fabric only.

**Note:** To identify the EEP to which a specific release note belongs, see [EEP Release Notes](#) on page 5854. To see which operating systems support the ecosystem components in a specific EEP, see [EEP Components and OS Support](#) on page 5739 or [EEP Support and Lifecycle Status](#) on page 5734. To view release notes for prior data-fabric releases, see [Previous Versions](#) on page 6776.

### Airflow 2.2.1.0 - 2201 (EEP 6.2.0-8.1.0) Release Notes

The following notes relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Airflow. You may also be interested in the Apache Airflow [home page](#).

|                              |                                                                                                                                                                                    |

### New in This Release

This is the first release of the Airflow component. Starting from EEP 8.1.0, the HPE Ezmeral Data Fabric supports Apache Airflow in core releases 7.0.0 and 6.2.0. You can use Airflow to:

- Define, schedule, and monitor workflows.
- Orchestrate third-party systems to execute tasks.
- Analyze and manage workflows using the Airflow web interface.

A variety of operators and sensors are provided to integrate Airflow with the HPE Ezmeral Data Fabric Database. In addition, release 7.0.0 includes operators, sensors, and transfers that enable Airflow to create and interact with S3 buckets. For more information, see [Airflow Providers](#).

### Fixes

None.

### Known Issues and Limitations

- Airflow is not supported with FIPS-enabled nodes.

- The Installer can install Airflow, but cannot set up MySQL as the backend database for Airflow. The default Airflow database is SQLite.
- S3 operators can be used with Airflow in release 7.0.0 but not in release 6.2.0 because native S3 support is not implemented in release 6.2.0.
- Airflow Amazon S3 providers might work with Minio S3 API, but HPE does not guarantee this functionality.
- Airflow requires a patch to operate in a release 6.2.0 cluster with security enabled.

#### Resolved Issues

- None.

## AsyncHBase Release Notes

The release notes for AsyncHBase component contains notes specific to MapR only.

**Note:** To identify the EEP to which a specific release note belongs, see [EEP Release Notes](#) on page 5854. To see which operating systems support the ecosystem components in a specific EEP, see [EEP Components and OS Support](#) on page 5739. To view release notes for prior MapR releases, see [Previous Versions](#) on page 6776.

#### AsyncHBase 1.8.2-2009 Release Notes

The notes below relate to the HPE Ezmeral Data Fabric. You may also be interested in the [AsyncHBase Github](#) page.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 5854.

| Package Names                 | The following packages are associated with this release: <ul style="list-style-type: none"> <li>mapr-asynchbase-1.7.0.201603301412-1.noarch.rpm</li> <li>mapr-asynchbase_1.7.0.201603301412_all.deb</li> </ul> |

### New Features

This release of AsyncHBase includes the following behavior change that is specific to MapR:

**Ability to define the default database that AsyncHBase connects to.**

A new parameter `mapr.hbase.default.db` can be added to the `asynchbase.conf` file. You can configure this parameter to specify if AsyncHBase accesses HBase tables or HPE Ezmeral Data Fabric Database tables by default. If this value is not configured, AsyncHBase will determine which type of table is being accessed based on the table name.

### Fixes

This release by MapR includes the following fixes on the base release. For complete details, refer to the commit log for this project in GitHub.

| Commit  | Date (YYYY-MM-DD) | Comment                                                                                                                                                                                                                  |
|---------|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| f1d9c46 | 2016-03-18        | MapR-22861: <code>mapr.hbase.default.db</code> parameter can now be set to indicate whether AsyncHBase connects to HPE Ezmeral Data Fabric Database tables or HBase tables by default.                                   |
| 7f563c4 | 2016-03-15        | MapR-22797: Implemented the <code>locateRegions</code> functionality for HPE Ezmeral Data Fabric Database tables                                                                                                         |
| f2b0a70 | 2016-03-09        | MapR 22778: The <code>AppendRequest</code> behavior against HBase tables was modified so that it returns <code>ArrayList&lt;KeyValue&gt;</code> whenever it is used to return the new values after the append operation. |

### Known Issue

- 22911: In MapR 5.1, when the `DeleteRequest` API calls `setDeleteAtTimestampOnly` for a HPE Ezmeral Data Fabric Database table, the delete occurs for timestamps less than or equal to the given timestamp.

### AsyncHBase 1.6.0-1504 Release Notes

**New in this Release**

- Comparison filters for HBase and HPE Ezmeral Data Fabric Database are now supported.

**Data Access Gateway Release Notes**

This section includes the release notes for the Data Access Gateway.

**Data Access Gateway 4.0 Release Notes**

These notes describe the 4.0 release of the Data Access Gateway.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 5854.

\*The latest core 6.2.0 EBF patch must be applied before you can use Data Access Gateway 4.0 on release 6.2.0.

**New in This Release**

Only Data Access Gateway 4.0 can be used with release 7.0.0 in FIPS mode. This is the only significant difference between Data Access Gateway 3.0 and 4.0. Both versions 3.0 and 4.0 can be used in non-FIPS mode.

The HPE Ezmeral Data Fabric Data Access Gateway is included in EEP repositories beginning with EEP 5.0.0. The Data Access Gateway is a service that acts as a proxy and gateway for translating requests between lightweight client applications and the data-fabric cluster.

| Client                      | Supported EEPs      |
|-----------------------------|---------------------|
| MapR Database JSON REST API | EEP 5.0.0 and later |
| Python OJAI client          | EEP 6.0.0 and later |
| Node.js OJAI client         | EEP 6.0.0 and later |
| C# OJAI client              | EEP 6.0.0 and later |
| Go OJAI client              | EEP 6.0.0 and later |
| Java OJAI Thin Client       | EEP 6.3.0 and later |

**Configuring the Maximum Message Size for the gRPC Service**

EEP 7.1.0 and later support a new configuration option (`grpc.service.max-message-size`) that allows you to change the maximum message size that the gRPC service accepts. For details, see [Administering the Data Access Gateway](#) on page 1669.

In EEP 7.1.0 and later, the Java OJAI Thin Client supports an OJAI Connection String option (`maxmsgsize`) to change the maximum message size that the gRPC client accepts. For details, see [Using the Java OJAI Thin Client](#) on page 2946.

### Fixes

### New in This Release

The MapR Data Access Gateway is included in EEP repositories beginning with EEP 5.0.0. The MapR Data Access Gateway is a service that acts as a proxy and gateway for translating requests between lightweight client applications and the MapR cluster. The version of the MapR Data Access Gateway remains unchanged for EEP 6.3.0, but the Java OJAI Thin Client is now supported:

| Client                      | Supported EEPs      |
|-----------------------------|---------------------|
| MapR Database JSON REST API | EEP 5.0.0 and later |
| Python OJAI client          | EEP 6.0.0 and later |
| Node.js OJAI client         | EEP 6.0.0 and later |
| C# OJAI client              | EEP 6.0.0 and later |
| Go OJAI client              | EEP 6.0.0 and later |
| Java OJAI Thin Client       | EEP 6.3.0 and later |

### Configuring the Maximum Message Size for the gRPC Service

EEP 6.3.4 and later support a new configuration option (`grpc.service.max-message-size`) that allows you to change the maximum message size that the gRPC service accepts. For details, see [Administering the Data Access Gateway](#) on page 1669.

In EEP 6.3.4 and later, the Java OJAI Thin Client supports an OJAI Connection String option (`maxmsgsize`) to change the maximum message size that the gRPC client accepts. For details, see [Using the Java OJAI Thin Client](#) on page 2946.

### Fixes

None.

### Known Issues and Limitations

### New in This Release

This is the first release of the MapR Data Access Gateway. The MapR Data Access Gateway is included in EEP repositories beginning with EEP 5.0.0. The MapR Data Access Gateway is a service that acts as a proxy and gateway for translating requests between lightweight client applications and the MapR cluster. For the EEP 5.0.0 release, the HPE Ezmeral Data Fabric Database JSON REST API uses this service.

**New in This Release**

Drill 1.16.1.400-2201 introduces the following enhancements or HPE platform-specific behavior changes:

- None

**Fixes**

This HPE release includes the following fixes on the base release:

| Commit     | Date (YYYY-MM-DD) | Comment                                                               |
|------------|-------------------|-----------------------------------------------------------------------|
| 33a7d24ea2 | 2022-01-10        | MD-6251: Secondary index error when reading from mapr-db json (#575)  |
| 8365703194 | 2021-12-30        | MD-5516: Add https support for Drill-on-YARN (#566)                   |
| d492882d29 | 2021-12-30        | MD-6191: Allow partition pruning with dynamic CURRENT_DATE operator.  |
| a6ab48aede | 2021-12-20        | MD-6196: Medial CVE fixes (jquery, bootstrap, data tables)            |
| 5ee9b79204 | 2021-12-20        | MD-6196: Medial CVE fixes (junit, bcpkix-jdk15on)                     |
| 4f92206395 | 2021-12-08        | MD-6202: Excluding transitive netty dependency from zookeeper         |
| aeb91d399c | 2021-12-07        | MD-6161: fix skipping of types written not in uppercase (#565)        |
| cbbceb728b | 2021-11-26        | DRILL-8009: DrillConnectionImpl#isValid() doesn't correspond JDBC API |
| a5b79c9e67 | 2021-11-21        | MD-6196: Fix the CVEs with the high severity                          |
| bddeab869d | 2021-11-16        | DRILL-7586: Fix loading incorrect version of commons-lang3            |
| ec1051c0ec | 2021-11-09        | MD-6182: Fixed problem with starting drill on the fips cluster (#564) |

**Known Issues**

- You cannot connect to Drill from SQLLine with the `auth` argument set to `maprsasl`, as shown:

```
/opt/mapr/drill/drill-1.16.0/bin/sqlline -u
jdbc:drill:zk=localhost:5181;auth=maprsasl
```

- Due to Drill version changes (3-digit to 4-digit), you cannot upgrade from Drill in EEP 7.0.0 (Drill 1.16.1) to Drill in EEP 7.0.1 (Drill 1.16.1.5) or later. You must perform a new installation of Drill. Alternatively, if you are running Drill on CentOS or RHEL, you can issue the following command as a workaround to upgrade Drill:

```
rpm -Uv --<old-package> <path/to/packages>/*.rpm
```

See [Upgrading Drill](#) on page 302.

### Limitations

- Older versions of Drill, such as Drill 1.10.0, supported the HBase plug-in, but Drill versions 1.11.0 through 1.16.0.x do not support queries on HBase tables.

### Drill 1.16.1.300-2110 (EEP 8.0.0) Release Notes

## Known Issues and Limitations

- You cannot connect to Drill from SQLLine with the `auth` argument set to `maprsasl`, as shown:

```
/opt/mapr/drill/drill-1.16.0/bin/sqlline -u
jdbc:drill:zk=localhost:5181;auth=maprsasl
```

- Due to Drill version changes (3-digit to 4-digit), you cannot upgrade from Drill in MEP 7.0.0 (Drill 1.16.1) to Drill in MEP 7.0.1 (Drill 1.16.1.5) or later. You must perform a new installation of Drill. Alternatively, if you are running Drill on CentOS or RHEL, you can issue the following command as a workaround to upgrade Drill:

```
rpm -Uv --<old-package> <path/to/packages>/*.rpm
```

See [Upgrading Drill](#) on page 302.

- Older versions of Drill, such as Drill 1.10.0, supported the HBase plug-in, but Drill versions 1.11.0 through 1.16.0.x do not support queries on HBase tables.

### New in This Release

Drill 1.16.1.100-2101 introduces the following enhancements or HPE platform-specific behavior changes:

- None.

### Fixes

This HPE release includes the following fixes on the base release:

| Commit             | Date (YYYY-MM-DD)        | Comment                                                                                                 |

### Known Issues

| MapR Tracking Number | Description                                                                                                                                                                                                                                          |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-6052              | Prtnn_Prng_TC1.sql.explain test failed.                                                                                                                                                                                                              |
| MD-6028              | Property 'MAPR_JMXSSL' in 'env_override.sh' by default set as "false"                                                                                                                                                                                |
| MD-6020              | Error while using Drill                                                                                                                                                                                                                              |
| MD-5792              | TPCH query 5 runs 10-20% slower at sf100/sf1000, possibly due to hash join ordering                                                                                                                                                                  |
| MD-5786              | TPCDS query 98 is 2x slower with Statistics enabled due to hash join order for sf100 and sf1000                                                                                                                                                      |
| MD-5770              | TPCH query 9 runs 18% slower at sf 100/sf1000, possibly due to hash join                                                                                                                                                                             |
| MD-5758              | TPCDS query 78 runs 30x slower with Statistics enabled at sf100                                                                                                                                                                                      |
| MD-5694              | select query takes too long after metadata refresh                                                                                                                                                                                                   |
| MD-5684              | Drill timeout when querying a large number of files                                                                                                                                                                                                  |
| MD-5646              | Modification needed in Drill dependencies/scripts to support hadoop decoupling                                                                                                                                                                       |
| MD-5518              | Semi-Join performance is slower with default settings for TPCH 16                                                                                                                                                                                    |
| MD-5309              | Query on complex data fails with SYSTEM ERROR: SchemaChangeException: Failure while materializing expression. Error in expression at index -1. Error: Missing function implementation: [min(MAP-REPEATED)]. Full expression: --UNKNOWN EXPRESSION--. |
| MD-4906              | SI Selectivity Queries hit ForemanException: One more more nodes lost connectivity during query                                                                                                                                                      |
| MD-4738              | Incorrect parallelism determination for index plans (SI and Complex SI)                                                                                                                                                                              |

|         |                                                                                                |
|---------|------------------------------------------------------------------------------------------------|
| MD-4504 | DRILL-6465: Transitive closure is not working in Drill for Join with multiple local conditions |
| MD-2294 | DRILL-1162: 25 way join ended up with OOM                                                      |

### Known Issues and Limitations

- Due to Drill version changes (3-digit to 4-digit), you cannot upgrade from Drill in MEP 7.0.0 (Drill 1.16.1) to Drill in MEP 7.0.1 (Drill 1.16.1.5) or later. You must perform a new installation of Drill. Alternatively, if you are running Drill on CentOS or RHEL, you can issue the following command as a workaround to upgrade Drill:

```
rpm -Uv --<old-package> <path/to/packages>/*.rpm
```

See [Upgrading Drill](#) on page 302.

- Older versions of Drill, such as Drill 1.10.0, supported the HBase plug-in, but Drill versions 1.11.0 through 1.16.0.x do not support queries on HBase tables.

### Drill 1.16.1.0-2009 (EEP 7.0.0) Release Notes

This section provides reference information, including new features, fixes, known issues, and limitations for Drill 1.16.1.0-2009 in EEP 7.0.0.

Below are release notes for the Drill component included in the MapR Converged Data Platform. You may also be interested in the [Apache Drill homepage](#) and the [Apache Drill release notes](#):

### Known Issues

The following table lists the known issues for Drill 1.16.1.0:

| MapR Tracking Number | Description                                                                                                                                                                                                                                          |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-6052              | Prttt_Prnng_TC1.sql.explain test failed.                                                                                                                                                                                                             |
| MD-6028              | Property 'MAPR_JMXSSL' in 'env_override.sh' by default set as "false"                                                                                                                                                                                |
| MD-6027              | Cannot change value of "MAPR_JMXSSL=" in "env_override.sh"                                                                                                                                                                                           |
| MD-6020              | Error while using Drill                                                                                                                                                                                                                              |
| MD-5792              | TPCH query 5 runs 10-20% slower at sf100/sf1000, possibly due to hash join ordering                                                                                                                                                                  |
| MD-5786              | TPCDS query 98 is 2x slower with Statistics enabled due to hash join order for sf100 and sf1000                                                                                                                                                      |
| MD-5770              | TPCH query 9 runs 18% slower at sf 100/sf1000, possibly due to hash join                                                                                                                                                                             |
| MD-5758              | TPCDS query 78 runs 30x slower with Statistics enabled at sf100                                                                                                                                                                                      |
| MD-5694              | select query takes too long after metadata refresh                                                                                                                                                                                                   |
| MD-5684              | Drill timeout when querying a large number of files                                                                                                                                                                                                  |
| MD-5646              | Modification needed in Drill dependencies/scripts to support hadoop decoupling                                                                                                                                                                       |
| MD-5518              | Semi-Join performance is slower with default settings for TPCH 16                                                                                                                                                                                    |
| MD-5309              | Query on complex data fails with SYSTEM ERROR: SchemaChangeException: Failure while materializing expression. Error in expression at index -1. Error: Missing function implementation: [min(MAP-REPEATED)]. Full expression: --UNKNOWN EXPRESSION--. |
| MD-4906              | SI Selectivity Queries hit ForemanException: One more more nodes lost connectivity during query                                                                                                                                                      |
| MD-4738              | Incorrect parallelism determination for index plans (SI and Complex SI)                                                                                                                                                                              |
| MD-4504              | DRILL-6465: Transitive closure is not working in Drill for Join with multiple local conditions                                                                                                                                                       |
| MD-2294              | DRILL-1162: 25 way join ended up with OOM                                                                                                                                                                                                            |

### Limitations

Older versions of Drill, such as Drill 1.10.0, supported the HBase plug-in, but Drill versions 1.11.0 through 1.16.0.x do not support querying HBase tables.

### Drill 1.16.0.400-2201 (EEP 6.3.6) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Drill. You may also be interested in the [Apache Drill homepage](#) and the [Apache Drill release notes](#).

### New in This Release

Drill 1.16.0.400-2201 introduces the following enhancements or HPE platform-specific behavior changes:

- None.

### Fixes

This HPE release includes the following fixes on the base release:

| GitHub Commit Number | Date (YYYY-MM-DD) | HPE Fix Number and Description                                                 |
|----------------------|-------------------|--------------------------------------------------------------------------------|
| bf345798f7           | 2022-02-10        | MD-6277: Remove mapr-log4j-slf4j-impl module introduced in Hive                |
| da06a2908d           | 2022-01-10        | MD-6251: Secondary index error at reading from mapr-db json (#575)             |
| 4faf5f4870           | 2021-12-30        | MD-6191: Change to allow partition pruning with dynamic CURRENT_DATE operator. |
| 14840a0f91           | 2021-12-20        | MD-6196: Medial CVE fixes (jquery, bootstrap, data tables)                     |
| 6573c1a091           | 2021-12-20        | DRILL-7705: Updated jQuery and Bootstrap libraries                             |

### Known Issues

- You cannot connect to Drill from SQLLine with the auth argument set to maprsasl, as shown:

```
/opt/mapr/drill/drill-1.16.0/bin/sqlline -u
jdbc:drill:zk=localhost:5181;auth=maprsasl
```

### Limitations

- Older versions of Drill, such as Drill 1.10.0, supported the HBase plug-in, but Drill versions 1.11.0 through 1.16.0.x do not support queries on HBase tables.

### Drill 1.16.0.300-2110 (EEP 6.3.5) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Drill. You may also be interested in the [Apache Drill homepage](#) and the [Apache Drill release notes](#).

**Known Issues**

None.

## Limitation

Older versions of Drill, such as Drill 1.10.0, supported the HBase plug-in, but Drill versions 1.11.0 through 1.16.0.x do not support queries on HBase tables.

## Drill 1.16.0.22-2009 (EEP 6.3.1) Release Notes

This section provides reference information, including new features, fixes, known issues, and limitations for Drill 1.16.0.22-2009 in EEP 6.3.1.

Below are release notes for the Drill component included in the MapR Converged Data Platform. You may also be interested in the [Apache Drill homepage](#) and the [Apache Drill release notes](#):

## New Features

- None.

## Resolved Issues

Drill 1.16.0.22-2009 provides the following resolved issues and improvements:

| Commit  | Date (YYYY-MM-DD) | Comment                                                                                                        |
|---------|-------------------|----------------------------------------------------------------------------------------------------------------|
| dade023 | 2020-03-24        | DRILL-7405: Avoiding download of TPC-H data                                                                    |
| 892d164 | 2020-03-24        | DRILL-7650: Add option to enable Jetty's dump for troubleshooting                                              |
| 493e65e | 2020-03-19        | DRILL-7351: Added tokens to Web forms to prevent CSRF attacks                                                  |
| 97c1d22 | 2020-03-18        | DRILL-7644: Log SSL protocol version at Drill start up                                                         |
| 3b0c61f | 2020-03-18        | DRILL-7626: Add ability to set HTTP response headers                                                           |
| f46e0c9 | 2020-03-13        | DRILL-7637: Add an option to retrieve MapR SSL truststore/keystore credentials using MapR Web Security Manager |
| d0daa60 | 2020-03-13        | DRILL-7367: Remove Server details from response headers                                                        |

Drill 1.16.0.22-2009 also includes the following resolved issues and improvements:

| MapR Tracking Number | Description                                                                                                 |
|----------------------|-------------------------------------------------------------------------------------------------------------|
| MD-6048              | DRILL-7774: NPE during planning phase of query in 1.16.0.21                                                 |
| MD-6035              | DRILL-7761: Drill 1.16.0 fails with OOM in PLANNING and drillbit hung                                       |
| MD-6034              | Janino compiler 3.0.8 causing drill query throwing exception org.codehaus.commons.compiler.CompileException |
| MD-6018              | Querying empty Parquet files throws error after upgrade to 1.16                                             |
| MD-6004              | UNION query returns "VALIDATION ERROR" if try union varchar output and decimals/integer/date                |
| MD-5998              | DRILL-7649: Replace maprfs.version property usage by mapr.release.version                                   |
| MD-5996              | Script j_security_check works without security headers                                                      |

| MapR Tracking Number | Description                                                                      |
|----------------------|----------------------------------------------------------------------------------|
| MD-5990              | Drill Java JMX Server Insecure Configuration Remote Code Execution Vulnerability |
| MD-5950              | Drill-on-Yarn: NPE while querying a column in Hive table                         |
| MD-5920              | drill.exec.ssl.protocol option is not honored by Webserver                       |
| MD-5839              | DRILL-7615: UNION ALL query returns the wrong result for the decimal value       |

### Known Issues

- None.

### Limitations

Older versions of Drill, such as Drill 1.10.0, supported the HBase plug-in, but Drill versions 1.11.0 through 1.16.0.x do not support querying HBase tables.

### Drill 1.16.0.10-1912 (EEP 6.3.0) Release Notes

This section provides reference information for fixes in Drill 1.16.0.10-1912.

The following release note applies to the 1.16.0.10-1912 version of the Drill component:

-  **Important:** This release note describes only the issues resolved since the 1.16.0.0 release note. For a listing of 1.16.0.0 resolved issues, see [Drill 1.16.0.0-1904 \(EEP 6.2.0\) Release Notes](#) on page 5959.

### Limitations

Older versions of Drill, such as Drill 1.10.0, supported the HBase plug-in, but Drill versions 1.11.0 through 1.16.0.x do not support querying HBase tables.

### Drill 1.16.0.0-1904 (EEP 6.2.0) Release Notes

This section provides reference information, including new features, improvements, resolved issues, known issues, and limitations for Drill 1.16.0.0-1904.

These release notes contain MapR-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 5854.

The following release notes apply to the 1.16.0.0 version of the Drill component:

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                |

### New in this Release

Drill 1.16.0.0 includes the following new features and improvements in the following areas:

#### SQL

- [ANALYZE TABLE COMPUTE STATISTICS](#) generates table statistics for more efficient query plans. ([DRILL-1328](#))
- [ANALYZE TABLE REFRESH METADATA](#) generates metadata cache files for specific columns instead of an entire table or directory. ([DRILL-7058](#))
- [CREATE OR REPLACE SCHEMA](#) command defines schema for text files. (MD-5202, [DRILL-6964](#))

- [NEARESTDATE](#) function for time series analysis.
  - [NEAREST DATE function](#) to facilitate time series analysis ([DRILL-7077](#))
  - By default, Drill no longer writes the profiles for SET queries to the persistent store. Setting the `exec.query_profile.alter_session.skip` option to false reverts this behavior.
- Storage**
- [SYSLOG \(RFC-5424\) Format Plugin \(DRILL-6582\)](#)
  - [Format plugin for LTSV files \(DRILL-7014\)](#)
  - A new `maprdb` format plugin option, `readTimestampWithZoneOffset`, converts timestamp values from UTC to local time zone when values are read from MapR Database. This option is disabled by default. ([MD-5272](#))
  - Drill can query views defined in Hive similarly to querying Hive tables in a hive schema, for example:
 

```
SELECT * FROM hive.`hive_view`;
```

([DRILL-540](#))
- Configuration Options**
- A new Drill configuration option, `store.hive.maprdb_json.read_timestamp_with_timezone_offset`, enables Drill to read timestamp values with a timezone offset when using the hive plugin with the Drill native MapRDB JSON reader enabled. This option is disabled by default. ([MD-5272](#))
- Web UI**
- Several Web UI improvements, including:
- [Storage plugin management improvements \(DRILL-6562\)](#)
  - [Query progress indicators and warnings \(DRILL-6879\)](#)
  - Ability to [limit the result size for better UI response \(DRILL-6050\)](#)
  - Ability to [sort the list of profiles in the Drill Web UI \(DRILL-6942\)](#)
  - [Display query state in query result page \(DRILL-6939\)](#)
  - [Button to reset the options filter \(DRILL-6921\)](#)
- SQLLine (Drill shell)**
- Upgrade to [SQLLine 1.7. \(DRILL-6989\)](#)
- Calcite**
- Upgrade to Calcite 1.18.0. ([MD-5050](#))

For a list of additional features and improvements, see the [Apache Drill 1.16 release notes](#).

## Resolved Issues

Drill 1.16.0.0 includes the following resolved issues and improvements:

| MapR Tracking Number | Resolved Issue                                                                                                                                                                                                                                       |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-5673              | DRILL-7150: Drill timestamp timezone conversion uses current daylight savings time instead of the one active during timestamp date                                                                                                                   |
| MD-5647              | DRILL-7118: Filter not getting pushed down on MapR-DB tables.                                                                                                                                                                                        |
| MD-5638              | DRILL-7130: IllegalStateException: Read batch count [0] should be greater than zero                                                                                                                                                                  |
| MD-5630              | DRILL-7113: Drill on MapRDB can not understand null value                                                                                                                                                                                            |
| MD-5624              | DRILL-7125: REFRESH TABLE METADATA fails after upgrade from Drill 1.13.0 to Drill 1.15.0                                                                                                                                                             |
| MD-5623              | Unable to connect to Drill 1.15 through ZK                                                                                                                                                                                                           |
| MD-5609              | DRILL-7079: Drill can't query views from the S3 storage when plain authentication is enabled                                                                                                                                                         |
| MD-5606              | DRILL-7100: parquet RecordBatchSizerManager : IllegalArgumentException: the requested size must be non-negative                                                                                                                                      |
| MD-5561              | DRILL-7060: Query on audit logs fails by DATA_READ ERROR Error Parsing JSON - Unrecognized character escape 'S' (code 83)                                                                                                                            |
| MD-5552              | DRILL-7119: Modify selectivity calculations to use histograms                                                                                                                                                                                        |
| MD-5550              | DRILL-7048: Implement JDBC Statement.setMaxRows() with System Option                                                                                                                                                                                 |
| MD-5523              | Physical plan generation failure after upgrade from 1.10 to 1.14                                                                                                                                                                                     |
| MD-5490              | DRILL-7117: Support creation of column Histograms for numeric data types                                                                                                                                                                             |
| MD-5428              | Include links to pre and post procedures in Drill upgrade documentation                                                                                                                                                                              |
| MD-5379              | DRILL-7018: Drill Query (when store.parquet.reader.int96_as_timestamp=true) on Parquet File fails with Error: SYSTEM ERROR: IndexOutOfBoundsException: readerIndex: 0, writerIndex: 372 (expected: 0 <= readerIndex <= writerIndex <= capacity(256)) |
| MD-5374              | DRILL-6971: Display query state in query result page of Web UI                                                                                                                                                                                       |
| MD-5369              | DRILL-7115: Improve Hive schema show tables performance                                                                                                                                                                                              |
| MD-5368              | DRILL-4858: repeated_count on JSON array of objects (maps) implementation is <b>missing</b> in Drill 1.14                                                                                                                                            |
| MD-5363              | DRILL-4858: Missing function implementation: [repeated_count(LIST-REPEATED)]                                                                                                                                                                         |

| MD-1008 | DRILL-7038: Performance - Queries on partitioned columns currently scan the entire datasets                                                                                                                                         |
| MD-880  | HashJoin's not fully parallelized in query plan                                                                                                                                                                                     |
| MD-680  | DRILL-7069: Planning time unaccounted for query with longer planning time                                                                                                                                                           |

### Known Issues

Drill 1.16.0.0 has the following known issues:

| MapR Tracking Number | Known Issue                                                                                     |
|----------------------|-------------------------------------------------------------------------------------------------|
| MD-5792              | TPCH query 5 runs 10-20% slower at sf100/sf1000, possibly due to hash join ordering             |
| MD-5786              | TPCDS query 98 is 2x slower with Statistics enabled due to hash join order for sf100 and sf1000 |

|         |                                                                                                                                                 |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-5782 | Need better error message when analyze command fails due to schema change                                                                       |
| MD-5770 | TPCH query 9 runs 18% slower at sf 100/sf1000, possibly due to hash join                                                                        |
| MD-5758 | TPCDS query 78 runs 30x slower with Statistics enabled at sf100                                                                                 |
| MD-5755 | DirectScan lists all partitions in explain plan, even for full table scan                                                                       |
| MD-5744 | [DRILL-7216] Auto limit is happening on the Drill Web-UI while the limit check box is unchecked                                                 |
| MD-5740 | REFRESH TABLE METADATA does not count null values for decimal, varchar, and interval data types.                                                |
| MD-5694 | The first query to use a new metadata cache file may take a while to run because the first query triggers a refresh of the metadata cache file. |
| MD-5684 | Drill timeout when querying a large number of files                                                                                             |
| MD-5676 | Drill parquet file may not have statistics for decimal and varchar data types.                                                                  |
| MD-5608 | Running analyze command on a view fails correctly but the error is confusing                                                                    |
| MD-5528 | Compute stats on non existent columns fails with exception                                                                                      |
| MD-5388 | Running analyze cmd on duplicate column names is resulting in IndexOutOfBoundsException                                                         |
| MD-5371 | Error msg not clear when analyze cmd is run on table with complex types                                                                         |
| MD-5342 | DRILL-6839 : regarding aggs in cross join queries                                                                                               |

**Fixes**

None.

**Limitations**

None.

**Drill 1.15.0.7-1904 (EEP 6.1.1) Release Notes**

This section provides reference information for fixes in Drill 1.15.0.7-1904.

The following release notes apply to the 1.15.0.7-1904 version of the Drill component:

|                               |                                                                        |
|-------------------------------|------------------------------------------------------------------------|
| Version                       | 1.15.0.7-1904                                                          |
| Release Date                  | May 2019                                                               |

### Fixes

Drill 1.15.0.7-1904 provides the following fixes:

| Fix Tracking Number | Description                                                                             |
|---------------------|-----------------------------------------------------------------------------------------|
| MD-5523             | Physical plan generation failure after upgrade from 1.10 to 1.14.                       |
| DRILL-7100          | Fixed IllegalArgumentException when reading Parquet data.                               |
| MD-4166             | Fix creation of filter conditions for IS NULL and IS NOT NULL.                          |
| DRILL-7118          | Filter not getting pushed down on MapR-DB tables.                                       |
| DRILL-7125          | REFRESH TABLE METADATA fails after upgrade from Drill 1.13 to 1.15.0.0.                 |
| DRILL-7130          | Fixed IllegalStateException while reading Parquet data.                                 |
| DRILL-7150          | Fix timezone conversion for timestamp from MaprDB after the transition from PDT to PST. |
| DRILL-7050          | RexNode convert exception in sub-query.                                                 |
| MD-5623             | Unable to connect to Drill 1.15 through ZK.                                             |
| MD-5771             | Username / password authentication for JDBC is not working anymore in Drill 1.15.       |
| DRILL-7237          | Fix single_value aggregate function for variable length types.                          |

### Known Issues and Limitations

None.

### Drill 1.15.0.0-1901 (EEP 6.1.0) Release Notes

This section provides reference information, including new features, improvements, resolved issues, known issues, and limitations for Drill 1.15.0.0-1901.

These release notes contain MapR-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 5854.

The following release notes apply to the 1.15.0.0 version of the Drill component:

|                               |                                                                                                                                                                                 |

## New in this Release

Drill 1.15.0.0 includes the following new features and improvements in the following areas:

### Storage

- Ability to query data in S3 via the new cloud [storage plugin for S3](#). (MD-4541)
- Credential Provider API support in the [S3 storage plugin](#). (MD-4543, DRILL-6662)
- The INFORMATION\_SCHEMA [FILES](#) table provides information about directories and files stored in [workspaces](#) configured within [S3](#) and [filesystem](#) storage plugin configurations. (MD-4544, DRILL-6680)

### SQL

- [TIMESTAMPADD](#) and [TIMESTAMPDIFF](#) datetime functions. (MD-342, DRILL-3610)
- [CROSS JOIN](#) in the FROM clause. (MD-4359, DRILL-786)
- Support for column aliases and positional aliases in the [GROUP BY](#), [HAVING](#), and [ORDER BY](#) clauses. (MD-4825, DRILL-1248)
- [Lateral join](#) functionality is enabled by default. (DRILL-6729)
- [Storage plugin names are case-insensitive](#). (MD-4589, MD-4663, DRILL-6492, DRILL-6768)
- All [cast and data type conversion functions](#) return null for an empty string ("") when the `drill.exec.functions.cast_empty_string_to_null` option is enabled. (DRILL-6817)
- A new option, `exec.query.return_result_set_for_ddl`, [prevents Drill from returning a result set for DDL statements](#) when set to "false." Useful for clients tools that connect to Drill (via JDBC) if they do not expect a result set. (MD-4757, DRILL-6834)

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Query optimization</b>    | <ul style="list-style-type: none"> <li>• MapR Database <a href="#">secondary index support</a> in Apache Drill. (DRILL-6381)</li> <li>• Improved query performance with <a href="#">semi-join functionality</a> inside the Hash-Join operator. (MD-4877, DRILL-6735)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Parquet</b>               | <ul style="list-style-type: none"> <li>• Parquet filter pushdown supports <a href="#">VARCHAR and DECIMAL data types</a> (MD-1266, DRILL-6744)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Security</b>              | <ul style="list-style-type: none"> <li>• <a href="#">Secure znodes with custom Access Control Lists</a>. (MD-4476, DRILL-5671)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Web UI</b>                | <p>Multiple <a href="#">Web UI improvements</a> that simplify use and administrative tasks, including:</p> <ul style="list-style-type: none"> <li>• The ability to cancel multiple queries at once via a check box next to executing queries.</li> <li>• The auto prompt in the Web UI SQL box now works on UDFs.</li> <li>• An enhanced Options page that includes detailed descriptions of each option.</li> <li>• Categorized options via Quick Filters on the Options page. (DRILL-5735)</li> <li>• Default button (DRILL-6668)</li> <li>• <a href="#">Web display options</a> and updated option names (MD-4835, DRILL-6544, DRILL-6715)</li> <li>• <a href="#">Meta+Enter key combination to submit queries</a> (DRILL-6611)</li> </ul> |
| <b>SQLLine (Drill shell)</b> | <ul style="list-style-type: none"> <li>• <a href="#">Upgrade to SQLLine 1.6</a>, includes the ability to add a custom configuration. (MD-2682, MD-5151, DRILL-3853)</li> <li>• Additional <a href="#">SQLLine connection parameters</a>. (DRILL-3933)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>System tables</b>         | <ul style="list-style-type: none"> <li>• <a href="#">System options table</a> includes option descriptions. (DRILL-6684)</li> <li>• <a href="#">System functions table</a> exposes the available SQL functions in Drill and also detects UDFs that have been dynamically loaded into Drill. (MD-4941, DRILL-3988)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                  |

For a list of additional features and improvements, see the [Apache Drill 1.15 Release Notes](#).

For additional information, read the [MapR Drill 1.15 blog post](#).

### Default Configuration Changes

Starting in MEP 6.1.0, certain ecosystem components, including Drill, have four digit version numbers. For example, when you install Drill, the Drill version appears as 1.15.0.0.

## Resolved Issues

Drill 1.15.0.0 includes the following resolved issues:

| MapR Tracking Number | Resolved Issue                                                                                                                                                                                                                                                                                                                                                          |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-5253              | The TO_TIMESTAMP function no longer loses precision for milliseconds.                                                                                                                                                                                                                                                                                                   |
| MD-5226              | DRILL-6918: Querying empty topics no longer fails with a "NumberFormatException."                                                                                                                                                                                                                                                                                       |
| MD-5208              | Semi-join queries on sf1 data no longer return an UNSUPPORTED_OPERATION error.                                                                                                                                                                                                                                                                                          |
| MD-5149              | DRILL-6869: Drill no longer allows views created outside of workspaces.                                                                                                                                                                                                                                                                                                 |
| MD-5147              | DRILL-6865: Queries no longer return the wrong results when filter pruning occurs.                                                                                                                                                                                                                                                                                      |
| MD-5142              | DRILL-6857: Limit is pushed into the scan when selecting from a Parquet file with multiple row groups.                                                                                                                                                                                                                                                                  |
| MD-5138              | DRILL-6863: Drop table works when the path is within a workspace that starts with '/.                                                                                                                                                                                                                                                                                   |
| MD-5105              | DRILL-6818: Secondary index options have descriptions.                                                                                                                                                                                                                                                                                                                  |
| MD-5076              | DRILL-6811: Type inference returns the correct data mode for boolean functions.                                                                                                                                                                                                                                                                                         |
| MD-5062              | DRILL-6664: Drill returns the same results for queries on the same column of a Parquet table with the same predicate.                                                                                                                                                                                                                                                   |
| MD-5057              | Queries against new files created on a volume that has reached the name container data threshold no longer fail with I/O exceptions.                                                                                                                                                                                                                                    |
| MD-5023              | DRILL-6810: Drill does not support nullable complex types (maps, arrays); therefore, UDFs cannot return null if @Output is of a complex type. Null handling of complex types is disabled by default. NullHandling.INTERNAL should be used instead of NullHandling.NULL_IF_NULL in UDFs. When using NullHandling.INTERNAL, the UDF must handle null input(s) on its own. |
| MD-5019              | DRILL-6797: Drill aggregation queries that use custom UDF to split column data in a Parquet file no longer fail with a compilation error if the filter criteria results in no rows.                                                                                                                                                                                     |
| MD-5014              | DRILL-6776: The Drill Web UI page source no longer has links to external sites.                                                                                                                                                                                                                                                                                         |
| MD-5008              | Drill can leverage indexes for queries with ORDER BY DESC on indexed columns; for example, if a secondary index is defined on column a, Drill leverages the index for the query:<br><br>SELECT a FROM t ORDER BY a DESC;                                                                                                                                                |
| MD-5002              | DRILL-6764: Queries no longer fail with IOB exception when UNNEST references a deep nested field, like t.c_orders.o_lineitems.                                                                                                                                                                                                                                          |
| MD-5001              | DRILL-6766 : Queries with LATERAL UNNEST no longer return the following system error when one batch of streaming aggregates is split across multiple output batches :<br><br>IllegalStateException: Unexpected case where rowId [] in right batch of lateral is smaller than rowId [] in left batch being processed.                                                    |
| MD-4968              | DRILL-6762: Dynamic UDFs registered on one Drillbit are now visible on other Drillbits.                                                                                                                                                                                                                                                                                 |
| MD-4956              | DRILL-6755: Hash-Join does not build hash tables when the probe side is empty.                                                                                                                                                                                                                                                                                          |

|         |                                                                                                                                                     |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-4938 | The option <code>planner.index.covering_selectivity_threshold</code> takes effect in execution plan when set to values < 1.0 for complex data.      |
| MD-4936 | DRILL-6773: Queries, with column aliases, that returned inconsistent results after a Drill patch was applied no longer return inconsistent results. |
| MD-4867 | DRILL-6726: Drill can query views created before DRILL-6492 when impersonation is enabled.                                                          |
| MD-4852 | DRILL-6819: The invisible "back" link on the query results page in the Drill WebUI has been removed.                                                |
| MD-4851 | Drill queries on MapRDB JSON tables no longer fail on schema change when the only distinct values are null and text.                                |
| MD-4801 | DRILL-6724: Operator context is dumped to logs when errors occur during query execution.                                                            |
| MD-4780 | DRILL-6746: Queries no longer hang when one of the nodes encounters a connection error.                                                             |
| MD-4755 | DRILL-6709: The batch statistics logging utility has been extended to mid-stream operators.                                                         |
| MD-4643 | DRILL-6732: Disabled plugins no longer work as enabled.                                                                                             |
| MD-4617 | "direct.used" metrics( <code>jvm_direct_current</code> ) catches the direct memory usage.                                                           |
| MD-4585 | The <code>drillbit.log</code> file includes query user information.                                                                                 |
| MD-4567 | DRILL-6517 : Hash-Join no longer accesses batches after query cancellation.                                                                         |
| MD-4499 | DRILL-5365: File not found exception no longer results from reading a Parquet file.                                                                 |
| MD-4362 | Drill no longer fails to generate a non-covering index plan for queries on data with the reserved word 'date' as a column name.                     |
| MD-3879 | DRILL-6039: Graceful shutdown waits for fragments to complete before stopping the Drillbit.                                                         |
| MD-2979 | DRILL-6410: The Parquet reader no longer leaks memory during query cancellation.                                                                    |

### Known Issues

Drill 1.15.0.0 has the following known issues:

| MapR Tracking Number | Known Issue                                                                                                                                  |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| MD-5390              | Drill does not return an error message when impersonation prevents access to a directory.                                                    |
| MD-5376              | DRILL-6991: The Kerberos ticket is being dumped in the log if the log level is "debug" for stdout.                                           |
| MD-5348              | TPCDS queries 56, 60, 83 are slower with plan change.                                                                                        |
| MD-5319              | TPCDS query 95 slower with plan change.                                                                                                      |
| MD-5250              | TPCDS queries 56 and 60 have regressed.                                                                                                      |
| MD-5232              | TPCH query 4 has regressed for scale factor 1000.                                                                                            |
| MD-5231              | DRILL-6896: TPCH 13 has "regressed".                                                                                                         |
| MD-5204              | DRILL-6845: TPCDS query 95 slower with semi-join enabled. You can disable semi-join through the <code>planner.enable_semijoin</code> option. |

|         |                                                                                                        |

### Fixes

Drill 1.14.0-1901 provides the following fixes:

| Fix Tracking Number | Description                                                                                                                                                                                                                                                                                                                   |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-5379             | DRILL-7018: Fixed Parquet buffer overflow when reading timestamp column.                                                                                                                                                                                                                                                      |
| MD-5272             | DRILL-6969: Drill no longer returns inconsistent results when reading MapR Database JSON tables using hive plugin when the native reader is enabled.                                                                                                                                                                          |
| MD-5257             | DRILL-6942: Sort query profiles by duration in the Drill Web UI under Profiles tab.                                                                                                                                                                                                                                           |
| MD-5062             | DRILL-6664: Drill returns the same results for queries on the same column of a Parquet table with the same predicate.                                                                                                                                                                                                         |
| MD-5019             | DRILL-6797: Drill aggregation queries that use custom UDF to split column data in a Parquet file no longer fail with a compilation error if the filter criteria results in no rows.                                                                                                                                           |
| MD-5014             | DRILL-6776: The Drill Web UI page source no longer has links to external sites.                                                                                                                                                                                                                                               |
| MD-5008             | <p>Drill can leverage indexes for queries with ORDER BY DESC on indexed columns; for example, if a secondary index is defined on column a, Drill leverages the index for the query:</p> <pre>SELECT a FROM t ORDER BY a DESC;</pre>                                                                                           |
| MD-5002             | DRILL-6764: Queries no longer fail with IndexOutOfBoundsException when UNNEST references a deep nested field, like t.c_orders.o_lineitems.                                                                                                                                                                                    |
| MD-5001             | <p>DRILL-6766: Queries with LATERAL UNNEST no longer return the following system error when one batch of streaming aggregates is split across multiple output batches:</p> <pre>IllegalStateException: Unexpected case where rowId [] in right batch of lateral is smaller than rowId [] in left batch being processed.</pre> |

|         |                                                                                                                                                     |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-4938 | The option <code>planner.index.covering_selectivity_threshold</code> takes effect in execution plan when set to values < 1.0 for complex data.      |
| MD-4936 | DRILL-6773: Queries, with column aliases, that returned inconsistent results after a Drill patch was applied no longer return inconsistent results. |
| MD-4902 | Complex secondary index plans are parallelized when queries have AND conditions.                                                                    |
| MD-4851 | Drill queries on MapRDB JSON tables no longer fail on schema change when the only distinct values are null and text.                                |
| MD-4780 | DRILL-6746: Queries no longer hang when one of the nodes encounters a connection error.                                                             |

### Known Issues and Limitations

None.

### Drill 1.14.0-1808 (EEP 6.0.0) Release Notes

This section provides reference information, including new features, improvements, resolved issues, known issues, and limitations for Drill 1.14.0-1808.

These release notes contain MapR-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 5854.

The following release notes apply to the 1.14.0 version of the Drill component:

|                               |                                                                                                                                                                                 |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Version                       | 1.14.0                                                                                                                                                                          |
| Release Date                  | September 2018                                                                                                                                                                  |

### New in this Release

Drill 1.14.0 includes the following new features and improvements:

#### Query Planning

The query planner in Drill can leverage indexes created on MapR Database JSON document fields with array fields. See [Writing Drill Queries that Leverage Indexes on Array Fields](#). (MD-3742)

When you query a view created on a MapR Database table, the query planner in Drill creates the same query plan it would create if you ran the underlying query directly against the MapR Database table. (MD-3360, MD-3313)

#### SQL

Drill supports lateral joins. You must enable the lateral join functionality in Drill. See [Lateral Join](#).

The DECIMAL data type is enabled by default and has [enhanced support](#). (MD-3522, MD-1138, MD-640)

Hive schema and table names are case-insensitive. See [Case-Sensitivity](#). (MD-948)

Support for the ANY\_VALUE function; based on [CALCITE-2366](#). (MD-4498)

|                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                      | Drill allows comparisons between date and timestamp values. (MD-4220)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Resource management</b>                           | Drill can directly manage the CPU resources through the Drill start-up script, <code>drill-env.sh</code> . See <a href="#">Configuring cgroups to Control CPU Usage</a> . (MD-3862)                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Storage plugin management</b>                     | Ability to <a href="#">export and save your storage plugin configurations</a> to a JSON file for reuse. (MD-4621)<br>Ability to manage storage plugin configurations in the Drill configuration file <code>storage-plugins-override.conf</code> . (MD-2732)                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Integration with Hive and Hue</b>                 | Hue integration with Drill is officially supported. See <a href="#">Integrate Hue with Drill</a> . (MD-2382)<br>Ability to specify Hive properties at the session level through the <code>store.hive.conf.properties</code> option. See <a href="#">Setting Hive Properties</a> . (MD-4370)<br>A new option, <code>store.hive.maprdb_json.optimize_scan_with_native_reader</code> , enables Drill to use the native Drill reader to read Hive MapR Database JSON tables. When you enable this option, Drill typically performs faster reads of data and applies filter pushdown optimizations. See <a href="#">SET maprdb Format Plugin Options</a> . (MD-3662) |
| <b>Parquet filter pushdown and partition pruning</b> | Drill can <a href="#">infer filter conditions</a> for join queries and push the filter conditions down to the data source. (MD-3542, MD-2181, MD-1399, MD-1272)<br><a href="#">Parquet filter pushdown</a> pushes filters past the ITEM operator; useful for queries on complex fields. (MD-1271)<br>Parquet performance improvements. (MD-2518, MD-1582)<br>Drill uses a native reader to read Hive tables when the <a href="#">store.hive.optimize_scan_with_native_readers</a> option is enabled; Drill reads data faster and applies filter pushdown optimizations. (MD-1267)<br>Drill can pushdown filters into the Systems table. (MD-4055)               |
| <b>Query profiles</b>                                | Profiles in Drill show the amount of memory used by the Unordered Receiver operator. (MD-4260)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Drivers</b>                                       | Drill 1.14 requires new versions of the ODBC and JDBC drivers. You can download the MapR <a href="#">ODBC</a> and <a href="#">JDBC</a> drivers for Drill 1.14. Earlier versions of the drivers do not work with Apache Drill 1.14.                                                                                                                                                                                                                                                                                                                                                                                                                              |

For a list of additional features and improvements, see the [Apache Drill 1.14 Release Notes](#).

### Default Configuration Changes

Note the following changes to default configurations in Drill 1.14.0:

- Warden manages memory as a percentage of total system memory. See [Configuring Drill Memory](#). (MD-2850)
- [Spillable operators](#) spill data to the `/tmp/drill/spill` directory on the MapR Filesystem. You can override this setting in `drill-override.conf`. Refer to the examples in `drill-override-example.conf`. (MD-4775)
- Query profile data is stored in `maprfs:///apps/drill/profiles`. The `drill-override.conf` file includes the `sys.store.provider.zk.blobroot` property that you can use to override the default location. See [Configuring the ZooKeeper PStore Location](#). (MD-3527)

## Resolved Issues

Drill 1.14.0 includes the following resolved issues:

| MapR Tracking Numbers | Resolved Issues                                                                                                                                                                                                             |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-4871               | When querying a target MapR stream, the query stops running, and Drill prints a message stating "Failed to fetch messages within 200 milliseconds."                                                                         |
| MD-4831               | The Drill-on-Yarn package has inconsistent libMapRClient.so versions.                                                                                                                                                       |
| MD-4721               | The following error should be logged as a warning instead of an error:<br>"ERROR o.a.d.e.p.index.IndexDiscoverBase - No index returned from Admin.getTableIndexes"                                                          |
| MD-4666               | DRILL-6612: Drill logs an assertion error when a query joins on a temporary table.                                                                                                                                          |
| MD-4643               | DRILL-6732: Disabled storage plugins work as if they are enabled.                                                                                                                                                           |
| MD-4607               | DRILL-6557: Scanning input splits in Hive table causes an exceptionally long planning phase.                                                                                                                                |
| MD-4535               | DRILL-6513: Drill should only allow valid values when users set planner.memory.max_query_memory_per_node. This option should be limited by direct memory; otherwise, there can be memory pressure and out-of-memory errors. |
| MD-4422               | DRILL-6468: The Drillbit stays in QUIESCENT mode after an out-of-memory condition.                                                                                                                                          |
| MD-4371               | A specific query returns an exception when using the "equals" operator to filter on a boolean column.                                                                                                                       |
| MD-4251               | DRILL-6474: Queries with ORDER BY and OFFSET (without LIMIT) do not return any rows.                                                                                                                                        |
| MD-4156               | When selecting a column from a Parquet file, a query may stop running and return an error stating "ArrayIndexOutOfBoundsException,"                                                                                         |
| MD-4133               | The INFO log level provides excessive logging information.                                                                                                                                                                  |
| MD-4107               | Queries on Hive data sources may stop running and return an error stating "UnsupportedOperationException: org.apache.hadoop.hive ql.io.parquet.convert.ETypeConverter\$8\$1."                                               |
| MD-4102               | UNION ALL queries return a UNION-ALLNumberFormatException                                                                                                                                                                   |
| MD-4065               | The Hash Aggregate operator uses ~2X memory.                                                                                                                                                                                |
| MD-4048               | DRILL-6282: Update Drill's metric dependencies.                                                                                                                                                                             |
| MD-4033               | Drill does not return results for some queries with an inner join.                                                                                                                                                          |

| MD-1487 | DRILL-3855: Predicate pushdown does not occur for the UNION ALL operator.                                                        |

### Known Issues

Drill 1.14.0 has the following known issues:

| MapR Tracking Numbers | Known Issues                                                                                                                                                                                                           |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-4938               | The planner.index.covering_selectivity_threshold does not take effect in the execution plan when the option is set to values less than 1.0 for complex data.                                                           |
| MD-4906               | For selectivity queries on secondary indexes, Drill may return an exception that states "ForemanException: One more more nodes lost connectivity during query."                                                        |
| MD-4902               | Queries with AND conditions on indexed complex type fields are not parallelized.                                                                                                                                       |
| MD-4894               | Queries with nested FLATTEN functions may stop running and return an error that states "Error: UNSUPPORTED_OPERATION ERROR: Hash aggregate does not support schema change."                                            |
| MD-4890               | The query planner in Drill does not create an index-based query plan for queries with multi-level flattens or queries with intermediate filters that reference multi-level flattens.                                   |
| MD-4865               | Certain queries with AND conditions on alphanumeric data, such as keys, stop running, and Drill returns an error that states "UNSUPPORTED_OPERATION ERROR: In a list of type BIT, encountered a value of type FLOAT4." |
| MD-4860               | Simple select star queries return a NullPointerException when the data is highly complex.                                                                                                                              |
| MD-4846               | When operators hit the maximum buffer size, Drill returns an OversizedAllocationException that states "Unable to expand the buffer. Max allowed buffer size is reached."                                               |
| MD-4827               | The ODBC driver returns INFINITY in capital letters instead of mixed case.                                                                                                                                             |
| MD-4821               | DRILL-6707: A query with a 10-way merge join fails with an IllegalArgumentException.                                                                                                                                   |
| MD-4799               | Data batches for the Project operator exceed the specified maximum.                                                                                                                                                    |
| MD-4773               | A data verification failure in Functional/tpch/sf0dot01/smoke/parquet/join10-hash.q needs to be resolved.                                                                                                              |
| MD-4759               | An orderby on a field with [[]] throws a NullPointerException.                                                                                                                                                         |
| MD-4739               | Parallelism for complex secondary index plans are unrestricted.                                                                                                                                                        |
| MD-4738               | The query planner incorrectly determines parallelism for secondary index plans.                                                                                                                                        |
| MD-4736               | Queries with multiple flatten functions may hang.                                                                                                                                                                      |

|         |                                                                                                                                                                                                                                                                             |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-4730 | Drill may log the following exception during index planning:<br>java.lang.ClassCastException: org.apache.drill.common.expression.FunctionCall cannot be cast to org.apache.drill.common.expression.SchemaPath                                                               |
| MD-4709 | Queries pick non-covering index plans if the Streaming Aggregate operator is disabled.                                                                                                                                                                                      |
| MD-4704 | Queries that have an exact equality filter with a map JSON literal stop running and return an error that states "SchemaChangeException - Error: Missing function implementation: [equal(MAP-REQUIRED, VARBINARY-REQUIRED)]."                                                |
| MD-4577 | The HashJoin operator allocates too much memory and slows down queries (TPCH 16) when spill to disk is enabled.                                                                                                                                                             |
| MD-4574 | MapR Database cannot push filters on non-rowkey columns down to the data source when using a convert function with the byte_substr manipulation function; for example:<br><br>... where<br>convert_from(byte_substr(t.cf1.ADDR_WORK_OPT_OUT_DATE_DM,1,8),'UTF8')='20130402' |
| MD-4531 | The total batches for the Project operator are not properly split and exceed the maximum specified.                                                                                                                                                                         |
| MD-4518 | The total batch size for the Project operator exceeds the maximum specified.                                                                                                                                                                                                |
| MD-4504 | [DRILL-6465] Transitive closure is not working for joins with multiple local conditions.                                                                                                                                                                                    |
| MD-4479 | The error message for group by queries on a complex type needs to be updated to state that they are unsupported.                                                                                                                                                            |
| MD-4404 | The Datediff function returns the wrong result if Drill uses a timezone with DST.                                                                                                                                                                                           |
| MD-4377 | Queries on complex data may stop running and return a NumberFormatException.                                                                                                                                                                                                |
| MD-4376 | Queries on complex data may return a NullPointerException.                                                                                                                                                                                                                  |
| MD-4375 | Queries with invalid filters on fields with complex types hang during the planning phase.                                                                                                                                                                                   |
| MD-4264 | HashAgg Batch throws an IllegalStateException when asserts are enabled for a non-covering index plan.                                                                                                                                                                       |
| MD-4229 | DRILL-6329 : TPC-DS Query 66 failed due to out-of-memory errors.                                                                                                                                                                                                            |

### New Features

- None.

### Resolved Issues

Drill 1.13.0-2009 provides the following resolved issues and improvements:

| Commit  | Date (YYYY-MM-DD) | Comment                                               |
|---------|-------------------|-------------------------------------------------------|
| 9d1841f | 2020-06-05        | DEVOPS-4070: Fix repository.mapr.com/nexus repository |
| 8857248 | 2020-06-03        | DRILL-7405: Avoiding download of TPC-H data           |
| 628933e | 2020-06-04        | DRILL-6470: Remove defunct repository                 |

Drill 1.13.0-2009 also includes the following resolved issues and improvements:

| MapR Tracking Number | Description                                |
|----------------------|--------------------------------------------|
| MD-6000              | Query hung after upgrade from 1.10 to 1.13 |

### Known Issues

- None.

### Limitations

Older versions of Drill, such as Drill 1.10.0, supported the HBase plug-in, but Drill versions 1.11.0 through 1.16.0.x do not support querying HBase tables.

### Drill 1.13.0-1912 (EEP 5.0.4) Release Notes

This section provides reference information for fixes in Drill 1.13.0-1912.

The following release notes apply to the 1.13.0-1912 version of the Drill component:

|                               |                                                                        |
|-------------------------------|------------------------------------------------------------------------|
| Version                       | 1.13.0-1912                                                            |
| Release Date                  | December 2019                                                          |
| MapR Version Interoperability | See <a href="#">Component Versions for Released EEPs</a> on page 5789. |

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Package Names | <p>Navigate to <a href="https://package.mapr.com/releases/MEP/">https://package.mapr.com/releases/MEP/</a>, and select your MEP and OS to view the list of package names. |---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Fixes

Drill 1.13.0-1904 provides the following fixes:

| Fix Tracking Number | Description                                                                       |
|---------------------|-----------------------------------------------------------------------------------|
| MD-4166             | Fix creation of filter conditions for IS NULL and IS NOT NULL.                    |
| DRILL-6721          | Fix SchemalessScan plan serialization / deserialization.                          |
| MD-5771             | Username / password authentication for JDBC is not working anymore in Drill 1.15. |

### Known Issues and Limitations

None.

### Drill 1.13.0-1901 (EEP 5.0.2) Release Notes

This section provides reference information for fixes in Drill 1.13.0-1901.

The following release notes apply to the 1.13.0-1901 version of the Drill component:

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Version                       | 1.13.0-1901                                                                                                                                                                                                                                                                                                                                                                                                      |
| Release Date                  | February 2019                                                                                                                                                                                                                                                                                                                                                                                                    |
| MapR Version Interoperability | See <a href="#">Component Versions for Released EEPs</a> on page 5789.                                                                                                                                                                                                                                                                                                                                           |

### Fixes

Drill 1.13.0-1901 provides the following fixes:

| Fix Tracking Number | Description                                                                                                                                                                         |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-5379             | DRILL-7018: Fixed Parquet buffer overflow when reading timestamp column.                                                                                                            |
| MD-5062             | DRILL-6664: Drill returns the same results for queries on the same column of a Parquet table with the same predicate.                                                               |
| MD-5019             | DRILL-6797: Drill aggregation queries that use custom UDF to split column data in a Parquet file no longer fail with a compilation error if the filter criteria results in no rows. |

|         |                                                                                                                                                                                                                          |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-5014 | DRILL-6776: The Drill Web UI page source no longer has links to external sites.                                                                                                                                          |
| MD-5008 | Drill can leverage indexes for queries with ORDER BY DESC on indexed columns; for example, if a secondary index is defined on column a, Drill leverages the index for the query:<br><br>SELECT a FROM t ORDER BY a DESC; |
| MD-4936 | DRILL-6773: Queries, with column aliases, that returned inconsistent results after a Drill patch was applied no longer return inconsistent results.                                                                      |
| MD-4851 | Drill queries on MapRDB JSON tables no longer fail on schema change when the only distinct values are null and text.                                                                                                     |
| MD-4780 | DRILL-6746: Queries no longer hang when one of the nodes encounters a connection error.                                                                                                                                  |

### Known Issues

### Drill 1.13.0-1808 Release Notes

This section provides reference information for fixes in Drill 1.13.0-1808.

The following release notes apply to the 1.13.0-1808 version of the Drill component:

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Version                       | 1.13.0-1808                                                                                                                                                                                                                                                                                                                                                                                                              |
| Release Date                  | September 2018                                                                                                                                                                                                                                                                                                                                                                                                           |

### Fixes

Drill 1.13.0-1808 provides the following fixes:

| Fix Tracking Numbers | Description                                                                                                                                                               |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-4156              | Queries on a single Parquet column no longer fail with an ArrayIndexOutOfBoundsException.                                                                                 |
| MD-4248              | (DRILL-6442) Hbase disk cost and row count estimates are adjusted when filter push down is applied; also, includes fixes for issues in the HBaseTestsSuite's init method. |
| MD-4259              | LIMIT queries on MapR Database JSON tables with indexes now return the correct results.                                                                                   |
| MD-4403              | The compiler no longer returns an 'inline' specifier error when compiling the Drill native client on CentOS 7, Ubuntu 14, and Windows.                                    |
| MD-4444              | Issuing the CTAS command against a MapR Database table no longer returns a NullPointerException.                                                                          |

| Fix Tracking Numbers | Description                                                                       |
|----------------------|-----------------------------------------------------------------------------------|
| MD-4509              | Query plans with CAST indexes are generated for LIKE filters with CAST functions. |
| MD-4969              | The client POM file now includes the org.apache.drill.contrib dependency.         |

### Known Issues and Limitations

### Drill 1.13-1803 Release Notes

This section provides reference information, including new features, improvements, resolved issues, known issues, and limitations for Drill 1.13.0-1803.

The following release notes apply to the 1.13.0 version of the Apache Drill component included in the MapR Converged Data Platform.

|                               |                                                                                                                             |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| Version                       | 1.13.0                                                                                                                      |
| Release Date                  | April 2018                                                                                                                  |

### New in this Release

This release of Drill includes a fix for [CVE-2017-12197](#) and the following new features:

- [Parquet planning](#) improvements, including:
  - (MD-3445, MD-1312) Performance improvements with support for project push down, filter push down, and partition pruning on star queries in common table expressions (CTEs), views, and subqueries.
- [Parquet filter pushdown](#) improvements, including:
  - (MD-1264) Filtering on the IS [NOT] NULL and IS [NOT] TRUE|FALSE operators.
  - (MD-3821) Filtering on boolean values.
  - (MD-1270) Casting between date, time, and timestamp values.
  - (MD-1269) Support for files with multiple row groups.
- [Runtime filter pushdown support](#) for queries with join conditions on rowkeys.
  - (MD-1293) Drill can push down rowkey join filters to HPE Ezmeral Data Fabric Database at runtime.
- (MD-1947) Upgrade to [Calcite version 1.15](#).
- (MD-1086) Ability to [configure cgroups to control Drill CPU usage](#) when Drill runs under YARN.
- (MD-2234) Ability to [gracefully shut down](#) a Drillbit.
- (MD-2404) Support for [SPNEGO](#) to extend the Kerberos-based single sign-on authentication mechanism to HTTP.
- SQL [syntax highlighting for queries and snippets](#) (SQL templates).

- Ability to [define the maximum amount of cumulative memory](#) allocated to the Drill process during startup.

For a list of additional features and improvements, see the [Apache Drill 1.13 Release Notes](#).

## Improvements

This release of Drill includes the following improvements:

| MapR Tracking Numbers | Improvements                                                                                                                                                                                                                                                                                   |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-3836               | DRILL-6174 Parquet pushdown planning improvements                                                                                                                                                                                                                                              |
| MD-3711               | Batch Sizing for Operators in EEP 5.0                                                                                                                                                                                                                                                          |
| MD-3657               | DRILL-6071 Limit batch size for flatten operator                                                                                                                                                                                                                                               |
| MD-3611               | DRILL-6145 Implement Hive HPE Ezmeral Data Fabric Database JSON handler                                                                                                                                                                                                                        |
| MD-3428               | DRILL-6115 SingleMergeExchange is not scaling up when many minor fragments are allocated for a query                                                                                                                                                                                           |
| MD-3340               | DRILL-6147: Limit batch size for Flat Parquet Reader                                                                                                                                                                                                                                           |
| MD-3312               | Proposal Auto Mem Allocation                                                                                                                                                                                                                                                                   |
| MD-3265               | Query with union on empty directory on any side fails                                                                                                                                                                                                                                          |
| MD-2920               | Drill contains updated Hive libraries with Hive version 2.1.1-mapr-1710. With the update, Drill supports queries on transactional (ACID) and non-transactional Hive bucketed ORC tables. The updated libraries are backward compatible with earlier versions of the Hive server and metastore. |

## Resolved Issues

This release of Drill includes the following resolved issues:

| MapR Tracking Numbers | Resolved Issues                                                                                                                                                                                                            |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-4026               | Drillbit failed to start after v6.0.0 -> v6.0.1 core upgrade.                                                                                                                                                              |
| MD-3997               | DRILL-6250: Ssqline start command with password appears in the ssqline.log.                                                                                                                                                |
| MD-4110               | OJAI query through Drill fails due to impersonation.                                                                                                                                                                       |
| MD-4099               | Fix protocol incompatibility between 1.12.0-mapr and 1.13.0-mapr client and bit.                                                                                                                                           |
| MD-4049               | Query with runtime filter pushdown returns incorrect results.                                                                                                                                                              |
| MD-4074               | HashAggBatch.innerNext() OOM error.                                                                                                                                                                                        |
| MD-4108               | Queries on wide column parquet dataset return incorrect results.                                                                                                                                                           |
| MD-4101               | Queries going to Drill fail with java.lang.IllegalArgumentException: org.apache.zookeeper KeeperException\$NoAuthException: KeeperErrorCode = NoAuth for /drill/cluster114-drillbits/2ffc1e3c-0ff7-490c-bf23-98365cc7eaf2. |
| MD-4100               | Update the default Heap for Drill to 4GB.                                                                                                                                                                                  |
| MD-4098               | Drillbit crashes when canceling a hash agg query.                                                                                                                                                                          |
| MD-4082               | Query fails with IndexOutOfBoundsException: Index: 0, Size: 0.                                                                                                                                                             |
| MD-4077               | OJAI is unable to query QueryService (Drill) as root.                                                                                                                                                                      |

|         |                                                                                                                                                       |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-4071 | Update the Hadoop and MapR versions in the pom.xml file.                                                                                              |
| MD-4056 | Drillbit startup fails with "No configuration setting found for key 'drill.exec.options.store.parquet.reader.enableFSRetry'".                         |
| MD-4054 | Queries with runtime filter pushdown fail with NPE when subquery contains filter on nested fields.                                                    |
| MD-4039 | Query encounters INTERNAL_ERROR ERROR: index: -25614, length: 0 (expected: range(0, 65536)).                                                          |
| MD-4017 | DRILL-6254: IllegalArgumentException: the requested size must be non-negative.                                                                        |
| MD-4013 | DRILL-6275: Drillbit direct_current memory usage is not populated/updated.                                                                            |
| MD-4002 | Query is not honoring the batch size limit.                                                                                                           |
| MD-3986 | Queries are hanging.                                                                                                                                  |
| MD-3984 | DRILL-6241: Saffron properties config file still has the excessive permissions.                                                                       |
| MD-3957 | Error in parquet record reader.                                                                                                                       |
| MD-3956 | Query hangs.                                                                                                                                          |
| MD-3948 | Allocated batch size is larger than requested.                                                                                                        |
| MD-3947 | Record counts are the same but batch sizes are different.                                                                                             |
| MD-3946 | Batch Sizes are inconsistent when record sizes are the same.                                                                                          |
| MD-3945 | MapR Drill does not compile because JDBC driver JAR is too large.                                                                                     |
| MD-3925 | Query using index plan fails with "DrillRuntimeException: Join only supports implicit casts between <types>. Add explicit casts to avoid this error". |
| MD-3886 | DRILL-6199: Filter push down doesn't work with more than one nested subqueries                                                                        |
| MD-3880 | RowKeyJoin caused IndexOutOfBoundsException.                                                                                                          |
| MD-3875 | DRILL-6151 Fragment executors may terminate without sending final batch to a downstream causing query to hang.                                        |
| MD-3865 | DRILL-6217: NaN/Inf: NestedLoopJoin processes NaN values incorrectly.                                                                                 |
| MD-3864 | Error is displaying while accessing query profiles via the Web-UI.                                                                                    |
| MD-3863 | DRILL-6187: Exception in RPC communication between data server and data client.                                                                       |
| MD-3857 | NullPointerException occurs on HiveDrillNativeParquetScan.                                                                                            |
| MD-3824 | dir0 does not work when the directory structure contains Avro files(DRILL-4120).                                                                      |
| MD-3822 | DRILL-6216: Metadata mismatch for sys.options table.                                                                                                  |
| MD-3802 | DRILL-6023 Graceful shutdown hardening.                                                                                                               |
| MD-3784 | DRILL-6189: User credentials appear in the Drill logs if the log level is set to ALL.                                                                 |
| MD-3783 | DRILL-6189: Drill config files have the excessive permissions.                                                                                        |
| MD-3726 | Simple Order by queries (without limit) when an index is used are showing regression.                                                                 |
| MD-3670 | Fix NPE during physical plan submission for various storage plugins.                                                                                  |
| MD-3634 | Find on a table using Dill fails with ClassNotFoundException: org.ojai.store.QueryResult.                                                             |
| MD-3610 | Drill query hanging.                                                                                                                                  |
| MD-3598 | Address bugs related to Nan / Inf w/ MD-2745.                                                                                                         |
| MD-3455 | Queries with GROUP BY w/o WHERE clause using index plans returns rows with possible incorrect precision.                                              |

|         |                                                                                                                   |
|---------|-------------------------------------------------------------------------------------------------------------------|
| MD-3575 | DRILL-6192: Drill is vulnerable to CVE-2017-12197.                                                                |
| MD-3208 | Misleading message when multi-column subquery is projecting within an IN clause.                                  |
| MD-3188 | DRILL-5903: Query encounters "Waited for 15000ms, but tasks for 'Fetch parquet metadata' are not complete."       |
| MD-3187 | DRILL-5902: Regression: Queries encounter random failure due to RPC connection timed out.                         |
| MD-2922 | Predicates joined by AND/OR do not return right results for time and timestamp with millisec or higher precision. |
| MD-2790 | DRILL-5902 Queries encounter random failure due to RPC connection timed out.                                      |
| MD-2684 | DRILL-4708: connection closed unexpectedly.                                                                       |
| MD-2544 | Drillbit JVM dumps core when querying a table with SI.                                                            |
| MD-2041 | Potential wrong result from spillable hash agg.                                                                   |
| MD-1848 | Drill not able to read HPE Ezmeral Data Fabric Database when FQDN is longer than 64 characters.                   |
| MD-1575 | Not able to set exec.impersonation.inbound_policies from web interface.                                           |

### Known Issues

This release of Drill includes the following known issues:

| MapR Tracking Numbers | Known Issues                                                                                                                                          |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-4106               | DRILL-6293: Unable to read Apache Hive(2.1.1) tables using Drill 1.13.0.                                                                              |
| MD-3988               | Query runs out of memory.                                                                                                                             |
| MD-4153               | Add support for runtime filter pushdown when _id occurs on the right side of the join.                                                                |
| MD-4133               | Excessive logging at INFO level.                                                                                                                      |
| MD-4109               | Drillbit crashed when concurrency is high (48 clients ) and -Dio.netty.buffer.bytebuf.checkAccessible=true not in the Drillbit start-up command line. |
| MD-4107               | Queries on Hive datasource fail with UnsupportedOperationException: org.apache.hadoop.hive.ql.io.parquet.convert.ETypeConverter\$8\$1.                |
| MD-4102               | NumberFormatException from UNION-ALL query.                                                                                                           |
| MD-4086               | Clean up messages going into drillbit.out.                                                                                                            |
| MD-4065               | HashAgg uses ~2X memory.                                                                                                                              |
| MD-4048               | DRILL-6283: Excluding io.dropwizard.metrics dependencies.                                                                                             |
| MD-4047               | Queries frequently fail with scan errors when performing runtime filter pushdown.                                                                     |
| MD-4046               | Drill returns different query plans across runs for queries performing runtime filter pushdown.                                                       |
| MD-4031               | Drill does not pushdown runtime filters for queries with IN subquery unless threshold is over 10%.                                                    |
| MD-4001               | select count(*) the Count from sys.drillbits works fine from sqlline but fails from drillSession.executeStatement().                                  |
| MD-3981               | Runtime filter pushdown does not happen for equality join with scalar subquery.                                                                       |
| MD-3929               | DRILL-6219: Filter pushdown does not work with star operator if there is a subquery with its own filter.                                              |
| MD-3924               | Query with a nested sub-query having a filter on a non-existent field fails with NPE.                                                                 |
| MD-3138               | Invalid expected results for Functional/table_function/positive/drill-3149_10.q.                                                                      |

**Fixes**

Drill 1.12.0-1808 provides the following fixes:

| Fix Tracking Numbers | Descriptions                                                                                                                                                |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-4509              | Query plans with CAST indexes are generated for LIKE filters with CAST functions.                                                                           |
| MD-4444              | Issuing the CTAS command against a MapR Database table no longer returns a NullPointerException.                                                            |
| MD-4156              | Queries on a single Parquet column no longer fail with an ArrayIndexOutOfBoundsException.                                                                   |
| MD-4048              | The io.dropwizard.metrics have been removed from Drill.                                                                                                     |
| MD-3979              | Queries that use CAST index plans no longer fail with a NullPointerException.                                                                               |
| MD-3716              | (DRILL-6223) Queries on complex nested data in Parquet files no longer fail when selecting on all columns.                                                  |
| MD-3544              | Queries on complex nested data in Parquet files no longer fail.                                                                                             |
| DRILL-6557           | Drill no longer fetches all the input splits when Hive statistics provide the number of bytes, which improves query planning time for queries on Hive data. |

| Fix Tracking Numbers | Descriptions                                                                                                                                                                                                                                                                                                                     |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DRILL-6204           | When the <code>store.hive.optimize_scan_with_native_readers</code> option is enabled, Drill separates the partitioned columns from the non-partition columns when reading Hive data directly from the filesystem. This prevents Drill from returning an error if the reader cannot find partitioned columns in the table schema. |
| DRILL-6195           | Drill can query Hive partitioned bucketed tables.                                                                                                                                                                                                                                                                                |
| DRILL-6164           | Drill no longer returns out-of-memory errors due to memory leaks caused by the buildup of Parquet reader references that the scanner does not remove.                                                                                                                                                                            |
| DRILL-5978           | Hive libraries are updated to version 2.1.2-mapr-1710.                                                                                                                                                                                                                                                                           |
| DRILL-4185           | Drill supports queries with JOIN and UNION [ALL] operators on empty directories.                                                                                                                                                                                                                                                 |

### Known Issues and Limitations

See the [Drill 1.12.0-1801 release notes](#).

### Drill 1.12.0-1801 Release Notes

This section provides reference information, including new features, default configuration changes, improvements, resolved issues, known issues, and limitations for Drill 1.12.0-1801.

The following release notes apply to the 1.12.0 version of the Apache Drill component included in the MapR Converged Data Platform.

|                               |                                                                                                                                                      |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| Version                       | 1.12.0                                                                                                                                               |
| Release Date                  | February 2018                                                                                                                                        |

### New in this Release

- (MD-1649) Index-based query plans for queries without filters, including queries with GROUP BY, JOIN, and DISTINCT projections. See [Index Planning in Drill](#).
- (MD-2301) Ability to submit queries from the REST API when impersonation is enabled and authentication is disabled. See [Submitting Queries](#).
- (MD-2745) Support for NaN (Not-a-Number) and Infinity (both POSITIVE and NEGATIVE) as numeric values. See [JSON Data Model](#).
- (MD-2490, DRILL-5723) System options improvements, including a new internal system options table.

### Default Configuration Changes

The default size for the `store.parquet.block-size` parameter is now 268435456 (256 MB), the same size as MapR filesystem chunk sizes. Previously, the default size was 536870912 (512 MB). See [Configuring the Parquet Block Size](#) for more information.

### Improvements

In addition to the features mentioned above, Drill 1.12 includes the following improvements:

| MapR Tracking Numbers | Improvements                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-3365               | Bounds checking for direct memory is now disabled by default. You can enable bounds checking, as explained in <a href="#">Configuring Drill Memory</a> .                                                                                                                                                                                                                                                                                                                                                                                                        |
| MD-3314               | Unable to re-run queries from Profiles tab with impersonation and without authentication                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| MD-3086               | Improve the row count estimates for LIMIT queries to avoid over-parallelization                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| MD-3053               | HPE Ezmeral Data Fabric Database Statistics Improvements                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| MD-2867               | DRILL-5855 Provide a useful error message when the SystemOptionManager is queried for a non-existent option                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| MD-1649, MD-3267      | Support Index Planning for Queries with GROUP BY w/o WHERE clause                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| MD-1431               | Improve Performance of Drill's Parquet Scan Operator (Amadeus)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| MD-1247, MD-1810      | Drill only initializes enabled storage plugins and registers schemas for workspaces that relate directly to a query, which improves query time for small queries that run concurrently. The Foreman in Drill caches the root schema of the JSON document for use in subsequent queries. Previously, Drill initialized all enabled storage plugins and registered workspace schemas for each query without caching the root schema, which caused an increase in query time if a storage plugin was misconfigured or the underlying data source was down or slow. |
| MD-580                | Improve performance of Parquet scan operator                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

For a list of additional features and improvements, see [Apache Drill 1.12 Release Notes](#).

### Resolved Issues

This release of Drill includes the following resolved issues:

| MapR Tracking Numbers | Resolved Issues                                                                                                                                                              |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-3471               | Intermittent permission denied errors with Drill queries on Views                                                                                                            |
| MD-3423               | DRILL-5880 : Advanced tests fail with error:<br>"UNSUPPORTED_OPERATION ERROR: This query cannot be planned possibly due to either a cartesian join or an inequality join"    |
| MD-3322               | You no longer need to enable the <code>planner.index.force_sort_noncovering</code> option for Drill to correctly return the results of a non-covering query in sorted order. |
| MD-3249               | Query with union on 520 columns failing with compilation exception                                                                                                           |
| MD-3246               | Investigate jackson-databind vulnerabilities CVE-2017-15095 & CVE-2017-7525                                                                                                  |
| MD-3196               | Query hangs when we concat many items                                                                                                                                        |
| MD-3155               | Simba JDBC driver dependency issues with third party applications                                                                                                            |
| MD-3131               | DRILL-5967 Memory leak by HashPartitionSender                                                                                                                                |
| MD-3071               | Queries (intermittently) fail with SYSTEM ERROR: RpcException: Data not accepted downstream.                                                                                 |
| MD-3066               | Queries with join on two or more tables fail to pick hash index plans for all eligible tables                                                                                |
| MD-3062               | DRILL-5822: The query with "SELECT *" with "ORDER BY" clause and <code>planner.slice_target=1</code> doesn't preserve column order                                           |
| MD-3055               | Remove hbase and hbase_describe plugin templates from 1.11.0-mapr branch                                                                                                     |
| MD-3031               | Duplicate columns projected from HPE Ezmeral Data Fabric Database Scan for large IN condition                                                                                |
| MD-2987               | DRILL-5771: Fix serDe errors when format plugin is used with table function                                                                                                  |
| MD-2983               | Using option <code>planner.index.use_hashjoin_noncovering=true</code> is causing NPE                                                                                         |
| MD-2979               | Memory leak by ParquetRowGroupScan                                                                                                                                           |
| MD-2978               | Drill isn't honoring option not to save query profiles                                                                                                                       |
| MD-2894               | Order by doesn't sort columns when window function is involved in the query                                                                                                  |
| MD-2843               | MIN MAX DIR tests fail and return incorrect results                                                                                                                          |
| MD-2807               | DRILL-5922 Intermittent Memory Leaks in the ROOT allocator                                                                                                                   |
| MD-2771               | <code>skip.header.line.count</code> does not work for Hive table with data file size > chunk size                                                                            |
| MD-2770               | <code>java.lang.NoClassDefFoundError</code> exception not handled in <code>org.apache.drill.exec.rpc.security.ClientAuthenticatorProvider</code>                             |

### Known Issues

This release of Drill includes the following known issues:

| MapR Tracking Numbers | Known Issues                                                                                                                                                                            |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-3564               | Min/Max functions logic should be improved                                                                                                                                              |
| MD-3563               | Order by clause works inconsistently when sorting columns with NaN                                                                                                                      |
| MD-3534               | Query runs out of memory when using SI indices                                                                                                                                          |
| MD-3521               | Nan/Inf data types: strange query result with INNER JOIN operator when selecting 1 column                                                                                               |
| MD-3497               | NaN/Infinity: some functions don't work as expected                                                                                                                                     |
| MD-3449               | Queries using non-covering index plans with larger rowkey join batch size fail with "CONNECTION ERROR: Exceeded timeout while waiting send intermediate work fragments to remote nodes" |
| MD-3345               | Query using index plans (intermittently) fails with IllegalStateException: #Scan ranges should be greater than 0 since estimated rowcount=[non-zero]                                    |
| MD-3344               | TPC-H Query 1 returns rows with incorrect precision on Parquet SF100 dataset                                                                                                            |
| MD-3201               | Multiple occurrences of "AnalyzerException: Error at instruction 98: Expected an object reference, but found ." seen in drillbit.out                                                    |
| MD-2455               | Query with INTERVAL in predicate does not return any rows                                                                                                                               |

### Fixes

None

### Limitation

(Ubuntu systems only) If you uninstall Drill 1.11 or upgrade from Drill 1.11 to Drill 1.12, you must manually backup log files, third-party JAR files, and configuration files and settings prior to performing the uninstall or upgrade procedure. Failure to do so results in the loss of the files and configurations.

### Drill 1.11.0-1710 Release Notes

This section provides reference information, including new features, fixes, known issues, and limitations for Drill 1.11.0-1710.

The following release notes apply to the 1.11.0 version of the Apache Drill component included in the MapR Converged Data Platform.

|         |        |
|---------|--------|
| Version | 1.11.0 |
|---------|--------|

|                               |                                                                                                                                                      |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|

### New in this Release

- [Secondary index](#) support on HPE Ezmeral Data Fabric Database for JSON tables.
- [MapR default security](#) configuration that secures the cluster and ecosystem components using MapR security (mapr tickets) to provide authentication, authorization, and encryption.
- Client to Drillbit Encryption using [SSL/TLS](#).
- [Spill to disk](#) for the Hash Aggregate operator (in addition to the Sort operator).
- [Throttle-based resource assignment](#) (queuing feature).
- Drill integration with Zeppelin.

In addition to the features mentioned above, Drill 1.11 also includes the following features and improvements:

| MapR Tracking Numbers | Features                                                                  |
|-----------------------|---------------------------------------------------------------------------|
| MD-2490               | Addition of an internal options table.                                    |
| MD-1813               | Multiplexing session over a connection.                                   |
| MD-1655               | Provide an option to persist Query Profiles in a Drillbit server's memory |
| MD-1245               | MapR-SASL Plugin for ODBC/Drill (Authentication & Encryption)             |
| MD-536                | SASL support between Drillclient and Drillbit                             |

| MapR Tracking Numbers | Improvements                                                                                                                 |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------|
| MD-2962               | Add a UDF to decode encoded fieldpath                                                                                        |
| MD-2871               | Restricted scan (for non-covering) gets over-parallelized due to scan range size                                             |
| MD-2799               | DRILL-5811 Large number of "Failure finding Drillbit" messages when using filesystem                                         |
| MD-2789               | Fix correct batch size for merge back during non-covering query.                                                             |
| MD-2693               | Drill should use <code>`com.mapr.db.index.IndexDesc.getNullOrdering()`</code> to decide if an index can be used for order by |
| MD-2656               | Drill needs to return more specific error for DB                                                                             |
| MD-2647               | Enable UTF-8 support in query string by default                                                                              |
| MD-2506               | Standardize on JDBC driver that gets shipped with Drill and sqlline                                                          |
| MD-2422               | Drill performance - doing less than 40 queries/sec                                                                           |
| MD-2416               | RestrictedJsonTableGroupScan should support projection pushdown                                                              |
| MD-2403               | Drillbit fails to start when only keystore path is provided without keystore password.                                       |
| MD-2339               | Additional log events for debugging index selection                                                                          |

|         |                                                                                |
|---------|--------------------------------------------------------------------------------|
| MD-2319 | Query Containing Wildcard in String Matching Filter Runs 4x Slower Than Impala |
| MD-2301 | Support Impersonation without authentication for REST API                      |
| MD-2278 | Include flags controlling secure Drill ZK ACLs in the secure installer         |
| MD-2225 | Review the names of index planning config options                              |
| MD-2196 | DRILL-4264: Allow field names to include dots                                  |
| MD-2192 | Provide log tracing of a query submitted by an OJAI client for user debugging  |
| MD-2074 | Memory Fragmentation Fundamentals Completion                                   |
| MD-2067 | Handle the case of order-by with no filter conditions                          |
| MD-2002 | Operator Specific Handle for Empty Batches                                     |
| MD-1987 | Drill should read HPE Ezmeral Data Fabric Database tablets in parallel         |
| MD-1962 | Create configuration file for distribution specific configuration              |
| MD-1836 | Leverage hash index when doing secondary index planning                        |
| MD-1823 | Add logging information for listing candidate indexes for a given query        |
| MD-1815 | Leverage HPE Ezmeral Data Fabric Database batch gets for better performance.   |
| MD-1789 | Cast function support pull request and code review process                     |
| MD-1786 | Push down limit on HPE Ezmeral Data Fabric Database table scan                 |
| MD-1752 | Throttling-based per-query memory assignment                                   |
| MD-1673 | Add Statistics support for HPE Ezmeral Data Fabric Database                    |
| MD-1665 | Provide query level option to pick specific indexes                            |
| MD-1643 | Disable table caching by default                                               |
| MD-1498 | Plan queries against HPE Ezmeral Data Fabric Database JSON faster              |
| MD-1318 | Improve Low Latency Performance of Drill                                       |
| MD-1209 | Configuring ZooKeeper Access Controls for Drill on a Secure Cluster            |

**Fixes**

| MD-1776               | Issue with column alias for nested table calculated column when using sum ()                             |

|         |                                                                                                                                    |
|---------|------------------------------------------------------------------------------------------------------------------------------------|
| MD-1671 | Have to restart drillbits whenever hive metastore is restarted.                                                                    |
| MD-1661 | A query with limit 0 on HPE Ezmeral Data Fabric Database binary table not allowing filter to push past project                     |
| MD-1657 | Random Error : Flatten does not support inputs of non-list values                                                                  |
| MD-1640 | Drill fails to compare multi-byte characters from hive table(DRILL-3250)                                                           |
| MD-1633 | Query remains in CANCELLATION_REQUESTED state after "java.io.IOException: Broken pipe"                                             |
| MD-1618 | Moving a directory which contains a cache file causes subsequent queries to fail                                                   |
| MD-1607 | Reverse a String: IndexOutOfBoundsException                                                                                        |
| MD-1597 | simba and mapr jdbc driver differ in implementation                                                                                |
| MD-1586 | Pam authentication with Centrify doesn't work by JPam restriction                                                                  |
| MD-1576 | JBOSS Drill Connectivity - NullPointerException                                                                                    |
| MD-1524 | linux ODBC is ALWAYS returning 64K as the length of a varchar or char                                                              |
| MD-1515 | Drill planner/optimizer pushes down the Filter columns into Scan even after Filter is eliminated                                   |
| MD-1473 | Query failed with error Statement "break OrOP2" is not enclosed by a breakable statement with label "OrOP2"                        |
| MD-1455 | Hash aggregate does not support schema changes                                                                                     |
| MD-1382 | Use simple optimizer for low latency operational queries                                                                           |
| MD-1361 | Out of heap running CTAS against text delimited                                                                                    |
| MD-1359 | Wrong results after set planner.enable_njoin_for_scalar_only=false                                                                 |
| MD-1339 | Query text show as empty string in profile when queries are executed using PreparedStatements                                      |
| MD-1256 | unset MAPR_TICKETFILE_LOCATION for sqlline                                                                                         |
| MD-1238 | Wrong result with Drill displaying date fields with parquet files generated by spark                                               |
| MD-1237 | Cancelled query stuck into CANCELLATION_REQUESTED forever                                                                          |
| MD-1205 | Simple query with only one join condition failed with "Hash join does not support schema changes"                                  |
| MD-1168 | Drill Web UI Page Source Has Links To External Sites                                                                               |
| MD-1115 | DRILL-5464: HashAgg throws a SchemaChangeException when atleast 1 scan fragment reads 0 rows                                       |
| MD-965  | UnsupportedOperationException: Unable to get holder type for minor type [LATE] and mode [OPTIONAL].                                |
| MD-853  | Query on TPC-H SF100 dataset fails with "Hash join does not support schema changes" [HPE Ezmeral Data Fabric Database JSON Tables] |
| MD-752  | Remove mapr jars from Drill packages and source them from \$MAPR_HOME/lib                                                          |

### Drill 1.10.0-1808 Release Notes

This section provides reference information for fixes in Drill 1.10.0-1808.

The following release notes apply to the 1.10.0-1808 version of the Drill component:

|              |                |
|--------------|----------------|
| Version      | 1.10.0-1808    |
| Release Date | September 2018 |

|                               |                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Fixes

Drill 1.10.0-1808 provides the following fixes:

| Fix Tracking Numbers | Description                                                                                                                              |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| MD-3943              | The io.dropwizard.metrics have been removed from Drill.                                                                                  |
| MD-3716              | Queries on complex nested data in Parquet files no longer fail when selecting on all columns.                                            |
| MD-3715              | A Drillbit no longer hangs or loses connectivity.                                                                                        |
| MD-3544              | Queries on complex nested data in Parquet files no longer fail.                                                                          |
| MD-3471              | Queries on views no longer intermittently return permission denied errors.                                                               |
| MD-3409              | Drill returns the correct row count for queries on MapR Database JSON tables.                                                            |
| MD-3214              | Drill reruns queries on Parquet data sources if they fail due to Parquet input stream read errors.                                       |
| MD-3196              | Queries with multiple concatenated items no longer hang.                                                                                 |
| MD-2758              | Performance improvements for queries with the LIKE operator.                                                                             |
| MD-2528              | Drill can read Parquet columns with INT64 types.                                                                                         |
| DRILL-6140           | Drill correctly lists operators in query profiles.                                                                                       |
| DRILL-6028           | Drill splits the generated code in ChainedHashTable into blocks to avoid "code too large" error.                                         |
| DRILL-5978           | Hive libraries are updated to version 2.1.2-mapr-1710.                                                                                   |
| DRILL-5972           | Improved performance for queries with filters on INFORMATION_SCHEMA.                                                                     |
| DRILL-5971           | Drill can read Parquet logical types INT64 and INT32.                                                                                    |
| DRILL-5906           | The Hive version in Drill is upgraded to 1.2.0-mapr-1707 hive.version to avoid NullPointerException when querying Hive ORC tables.       |
| DRILL-5857           | Hive unit tests include a fix for NumberFormatException.                                                                                 |
| DRILL-5757           | Queries with the CONVERT_TO_JSON function no longer fail when using fields that do not exist as a parameter.                             |
| DRILL-5697           | Improved performance for queries with the LIKE operator to filter on pattern matching.                                                   |
| DRILL-5420           | The ParquetAsyncPgReader no longer goes into an infinite loop during cleanup.                                                            |
| DRILL-5083           | To avoid an infinite loop in the Merge Join, the status.getOutcome() method returns a failure if one of the batches has a "stop" status. |
| DRILL-4120           | The Avro storage format allows implicit columns.                                                                                         |

| Fix Tracking Numbers | Description                                                                   |
|----------------------|-------------------------------------------------------------------------------|
| DRILL-4039           | Queries no longer fail when non-ascii characters are used in string literals. |
| DRILL-3250           | Drill no longer fails when comparing multi-byte characters from a Hive table. |

### Drill 1.10.0-1707 Release Notes

This section provides reference information, including new features, fixes, known issues, and limitations for Drill 1.10.0-1707.

The following release notes apply to the 1.10.0 version of the Apache Drill component included in the MapR Converged Data Platform.

|                               |                                                                                                                                                      |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| Version                       | 1.10.0                                                                                                                                               |
| Release Date                  | August 2017                                                                                                                                          |
| MapR Version Interoperability | See <a href="#">EEP Components and OS Support</a> on page 5739, <a href="#">Interoperability Matrix</a> , and <a href="#">Drill Support Matrix</a> . |
| Package Names                 | <a href="#">Package Names for Ezmeral Ecosystem Packs (EEPs)</a> on page 5933                                                                        |

### New in this Release

No new features in this release.

### Fixes

This release of Drill on MapR includes the following fixes. For complete details, refer to the commit log for this project in GitHub.

| MapR Fix   | Description                                                                                                                   |
|------------|-------------------------------------------------------------------------------------------------------------------------------|
| MD-1970    | Querying HPE Ezmeral Data Fabric Database JSON with Drill no longer produces an <code>ArrayIndexOutOfBoundsException</code> . |
| MD-2273    | Drill no longer returns <code>IndexOutOfBoundsException</code> errors when reading CSV files.                                 |
| DRILL-5590 | Drill no longer returns an <code>IndexOutOfBoundsException</code> when a text file contains more than 4,096 rows.             |
| DRILL-5498 | The CSV reader can handle duplicate column header names.                                                                      |
| DRILL-5599 | Queries no longer stay in the <code>CANCELLATION_REQUESTED</code> state after a connection with the client is interrupted.    |
| MD-2050    | Drill correctly calculates the number of rows and creates an optimal query plan.                                              |
| DRILL-5496 | You do not have to restart drillbits when a secure Hive metastore is restarted.                                               |
| DRILL-5399 | Running multiple queries concurrently no longer produces an <code>UNSUPPORTED_OPERATION ERROR</code> .                        |
| DRILL-5516 | Drill optimizes memory usage for the HBase reader.                                                                            |
| DRILL-5419 | Drill now calculates the return string length for literals and certain string functions.                                      |

| MapR Fix                           | Description                                                                                                             |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| MD-1671, MD-1631                   | Drill no longer hangs or reports errors when retrieving schemas as the Hive server restarts.                            |
| DRILL-5424                         | Queries that apply reverse functions on tables with long varchars no longer fail with IndexOutOfBoundsException errors. |
| DRILL-5413, DRILL-4678, DRILL-4347 | Drill is updated with version of 1.4.0-drill-r21 Calcite.                                                               |

### Known Issues and Limitations

No known issues or limitations in this release.

### Resolved Issues

No resolved issues in this release.

### Drill 1.10.0-1703 Release Notes

The following release notes apply to the 1.10.0 version of the Apache Drill component included in the MapR Converged Data Platform.

|                               |                                                                                                                                                      |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| Version                       | 1.10.0                                                                                                                                               |
| Release Date                  | April 2017                                                                                                                                           |
| MapR Version Interoperability | See <a href="#">EEP Components and OS Support</a> on page 5739, <a href="#">Interoperability Matrix</a> , and <a href="#">Drill Support Matrix</a> . |
| Package Names                 | <a href="#">Package Names for Ezmeral Ecosystem Packs (EEPs)</a> on page 5933                                                                        |

### New in this Release

This Apache Drill release includes the following behavior changes that are specific to MapR:

- Support for authentication through MapR-SASL tickets.
- Support for installation on SUSE operating systems with Open JDK 1.8 and Oracle JDK 1.7 or 1.8.

This release also includes the following bug fixes and improvements:

- Tableau native connectivity.
- Support for the CREATE TEMPORARY TABLE AS (CTTAS) command.
- Support for Kerberos authentication between the client and drillbit.
- Support for authentication through MapR-SASL tickets.
- New JDBC connection option that improves fault tolerance when connecting directly to a Drill node from a client.
- Improved diagnostics in Drill Web Console with version and other query profile statistics.
- Improved Parquet compatibility with Hive/Spark generated Parquet files with support for INT96 timestamp datatype
- Configurable list of profiles in Drill web UI

Additional bug fixes and enhancements are listed in the [Apache Drill 1.10.0 Release Notes](#)

## Fixes

| MapR Fix   | Description                                                                                                                                         |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| Drill-5395 | Region to fragment assignment logic no longer causes queries against HPE Ezmeral Data Fabric Database tables to fail with a null pointer exception. |
| MD-1457    | The ODBC driver's DNS Configuration dialog box now supports Cluster IDs that include dots(.).                                                       |
| MD-1433    | The planning stage now has better performance for queries against HPE Ezmeral Data Fabric Database binary tables.                                   |
| MD-1259    | The Apache Drill documentation now includes implicit column name parameters and details.                                                            |
| MD-1244    | Using store.parquet.reader.int96_as_timestamp no longer throws IndexOutOfBoundsException.                                                           |
| MD-832     | Drill verifies that all the running drillbits are in the same version. A warning displays in the Web UI whenever there is a mismatch.               |
| MD-924     | Drill compatibility issues with Parquet Date and Timestamp data types have been resolved.                                                           |

## Known Issues and Limitations

- MD-1588: When Drill is run under Warden on RedHat/CentOS operating systems, drillbits fail to start automatically after an upgrade to Drill 1.10.0.

Workaround: Run the following command to manually start the drillbits:

```
maprcli node services -name drill-bits -action start -nodes <node host names separated by a space>
```

- MD-1340: Select \* query returns incorrect format for nested Date fields.

## Drill 1.9.0-1703 Release Notes

The following release notes apply to the 1.9.0 version of the Apache Drill component included in the MapR Converged Data Platform.

|                               |                                                                                                                                                                                                                                            |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Version                       | 1.9.0                                                                                                                                                                                                                                      |
| Release Date                  | April 2017                                                                                                                                                                                                                                 |
| MapR Version Interoperability | MapR Drill 1.9.0 is certified on the MapR v5.1.0 and v 5.2.0 converged data platform. See <a href="#">EEP Components and OS Support</a> on page 5739, <a href="#">Interoperability Matrix</a> , and <a href="#">Drill Support Matrix</a> . |
| Package Names                 | <a href="#">Package Names for Ezmeral Ecosystem Packs (EEPs)</a> on page 5933                                                                                                                                                              |

## New in This Release

None

## Fixes

This MapR release includes the following fixes on the base release:

| MapR Fix Number | Description                                                                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-1433         | The planning stage now has better performance for queries against HPE Ezmeral Data Fabric Database binary tables.                                   |
| MD-1375         | FileNotFoundException no longer displays when reading a parquet file.                                                                               |
| MD-1314         | The same query no longer produces different results when using the flatten operator.                                                                |
| Drill-5395      | Region to fragment assignment logic no longer causes queries against HPE Ezmeral Data Fabric Database tables to fail with a null pointer exception. |
| Drill-5159      | Drill MergeProjectRule now operates on Calcite logical convention.                                                                                  |
| Drill-5117      | Queries on json files with 1000+ columns no longer fail with a compile error.                                                                       |
| Drill-5056      | UserException now writes more information to the log.                                                                                               |

### Known Issues

The following table lists the known issues in Drill 1.9.0:

| Issue   | Description                                                                                                                                                                         |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-1256 | The MAPR_TICKETFILE_LOCATION variable in drill-env.sh needs to be unset so that a user other than the mapr user can connect to Drill through SQLLine and MapR-SASL.                 |
| MD-1229 | Hive table partition pruning does not prune out all unnecessary partitions in some scenarios.                                                                                       |
| MD-1226 | MapR-SASL plain authentication goes through Kerberos, by default, requiring regular users to have a valid Kerberos ticket when connecting to Drill using SQLLine through ZooKeeper. |
| MD-1208 | Parquet filter pushdown does not prune enough partitions in queries where the predicate contains the TIME data type.                                                                |

### Drill 1.9.0 Release Notes

The following release notes apply to the 1.9.0 version of the Apache Drill component included in the MapR Converged Data Platform.

|                               |                                                                                                                                                                                                        |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Version                       | 1.9.0                                                                                                                                                                                                  |
| Release Date                  | December 9, 2016                                                                                                                                                                                       |
| MapR Version Interoperability | MapR Drill 1.9.0 is certified on the MapR v5.1.0 and v5.2.0 Converged Data Platform. See <a href="#">Interoperability Matrices</a> on page 5722 and <a href="#">Drill Support Matrix</a> on page 5825. |
| Packages                      | See <a href="#">Package Names for Ezmeral Ecosystem Packs (EEPs)</a>                                                                                                                                   |

### Noteworthy New Features in the MapR Distribution of Drill

This release provides enhanced query improvements with the following bug fixes and improvements:

- The [Asynchronous Parquet Reader](#) improves the performance of the Parquet Scan operator by increasing the speed at which the Parquet reader scans, decompresses, and decodes data. This feature is disabled by default.
- [Parquet Filter Pushdown](#) optimizes the performance by pruning extraneous data from a Parquet file to reduce the amount of data that Drill scans and reads when a query on a Parquet file contains a filter expression.
- [Dynamic UDFs](#) enable users to register and unregister UDFs in a multi-tenant environment using the new CREATE FUNCTION USING JAR and DROP FUNCTION USING JAR commands.
- Support for a variety of JOIN syntax generated by Tableau and other BI tools, including joins between tables with NULL column values.
- HTTPD Format Plugin adds the capability to query HTTP web server logs natively and also includes parse\_url() and parse\_query() UDFs that return maps of the URL and the query string.

Additional bug fixes and enhancements listed in the [Apache Drill 1.9.0 Release Notes](#).

### Default Configuration Changes

The default value for the `store.parquet.block-size` parameter is now 268435456 (256MB), the same size as MapR filesystem chunk sizes. Prior to this release, the default value was 536870912 (512 MB).

The `planner.enable_limit0_optimization` parameter is now enabled by default to optimize limit0 queries. Prior to this release, the option was disabled by default.

You can modify parameter values using the [ALTER SYSTEM|SESSION](#) command.

### Resolved Issues

The following table lists resolved issues in Drill 1.9.0:

| Issue   | Description                                                                                                                                                                                                |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-1217 | When you use the JDBC URL format for a direct Drillbit connection, the driver can now shuffle between the Drillbits listed in the connection string instead of always selecting the first Drillbit listed. |
| MD-1163 | The avgwidth stat for the timestamp data type (int64) is now 8 instead of 4 bytes.                                                                                                                         |
| MD-540  | Query profiles now include the session options used for a query.                                                                                                                                           |

### Known Issues

The following table lists the known issues in Drill 1.9.0:

| Issue   | Description                                                                                                                                                                         |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-1256 | The MAPR_TICKETFILE_LOCATION variable in drill-env.sh needs to be unset so that a user other than the mapr user can connect to Drill through SQLLine and MapR-SASL.                 |
| MD-1229 | Hive table partition pruning does not prune out all unnecessary partitions in some scenarios.                                                                                       |
| MD-1226 | MapR-SASL plain authentication goes through Kerberos, by default, requiring regular users to have a valid Kerberos ticket when connecting to Drill using SQLLine through ZooKeeper. |

| Issue   | Description                                                                                                          |
|---------|----------------------------------------------------------------------------------------------------------------------|
| MD-1208 | Parquet filter pushdown does not prune enough partitions in queries where the predicate contains the TIME data type. |

### Limitations

See [Drill-on-YARN Limitations](#).

### Drill 1.8.0-1703 Release Notes

The following release notes apply to the 1.8.0 version of the Apache Drill component included in the MapR Converged Data Platform.

|                               |                                                                                                                                                                      |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Version                       | 1.8.0                                                                                                                                                                |
| Release Date                  | April 2017                                                                                                                                                           |
| MapR Version Interoperability | MapR Drill 1.8.0 is certified on the MapR v5.1.0 converged data platform. See the <a href="#">Interoperability Matrix</a> and <a href="#">Drill Support Matrix</a> . |
| Package Names                 | <a href="#">Package Names for Ezmeral Ecosystem Packs (EEPs)</a> on page 5933                                                                                        |

### New in This Release

No new features.

### Fixes

This MapR release includes the following fixes on the base release:

| MapR Fix Number | Description                                                                                                 |
|-----------------|-------------------------------------------------------------------------------------------------------------|
| MD-1314         | The same query no longer produces different results when using the flatten operator.                        |
| MD-1217         | The JDBC client randomly chooses a Drillbit in the cluster instead of selecting the first one in the list.  |
| MD-1142         | A simple query with a where condition on a particular column is no longer getting an illegalstateexception. |
| MD-1127         | Drill 1.8.0 sandbox is now able to start even when loopback address is detected.                            |
| MD-1117         | Queries for a single row group and single parquet file no longer take 6 seconds.                            |
| MD-1109         | Queries that include the flatten function are no longer cancelled.                                          |
| Drill-5159      | Drill MergeProjectRule now operates on Calcite logical convention.                                          |
| Drill-5094      | Comparator guarantees transitive attribute.                                                                 |
| Drill-5032      | Drill query on hive parquet table no longer fails with OutOfMemoryError: Java heap space                    |
| Drill-4927      | Drill now supports null equality joins.                                                                     |
| Drill-4911      | SimpleParallelizer now avoids plan serialization for logging purpose when debug logging is not enabled.     |

**Known Issues and Limitations**

For known issues, see the [Drill 1.8.0 release notes](#).

For limitations, see [Drill-on-YARN Limitations](#) on page 3449

**Resolved Issues**

None.

**Drill 1.8.0 - 1609 Release Notes**

The following release notes apply to the 1.8.0-1609 version of the Apache Drill component included in the MapR Converged Data Platform.

|                               |                                                                                                                                                                                      |                                                                                                                                        |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| Drill Version                 | 1.8.0-1609                                                                                                                                                                           |                                                                                                                                        |
| Release Date                  | September 30, 2016                                                                                                                                                                   |                                                                                                                                        |

**Known Issues**

See the [Drill 1.8.0 release notes](#).

**Resolved Issues**

Drill 1.8.0-1609 provides the following fixes:

- Drill 1.8.0 is available as part of the Ezmeral Ecosystem Pack (EEP) version 1.1.0.
- You can use the MapR Installer to install or upgrade to Drill 1.8.0.
- You can now install Drill 1.8.0 on MapR v5.2.0, as well as MapR v5.1.0. When you install, you have the option of installing Drill under the MapR Warden service or under YARN.

**Limitations**

See [Drill-on-YARN Limitations](#).

**Drill 1.8.0 Release Notes**

The following release notes apply to the 1.8.0 version of the Apache Drill component included in the MapR Converged Data Platform.

|         |       |
|---------|-------|
| Version | 1.8.0 |
|---------|-------|

|                               |                                                                                                                                                                                                                                                                                                                                                                                                      |                       |                                                                                                                              |                     |                                                                                                                                        |

### Noteworthy New Features in the MapR Distribution of Drill

This release provides enhanced query improvements with the following bug fixes and improvements:

- [Drill-on-YARN](#) (mapr-drill-yarn package)
- Metadata cache pruning - See [Partition Pruning Introduction](#) and [Optimizing Parquet Metadata Reading](#).
- IF EXISTS parameter with the DROP TABLE and DROP VIEW commands - See [DROP TABLE](#) and [DROP VIEW](#).
- DESCRIBE SCHEMA command - See [DESCRIBE](#).
- Multi-byte delimiter support - See [List of Attributes and Definitions](#).
- New parameters for filter selectivity estimates - See [System Options](#).

Additional bug fixes and enhancements listed in the [Apache Drill 1.7.0 Release Notes](#) and the [Apache Drill 1.8.0 Release Notes](#).

**Note:** Currently, you cannot use the MapR Installer to install or upgrade to Drill 1.8. Support for this feature will be available soon.

### Resolved Issues

The following table lists resolved issues in Drill 1.8.0:

| Issue   | Description                                                                                                        |
|---------|--------------------------------------------------------------------------------------------------------------------|
| MD-1047 | Query time is improved for simple queries on INFORMATION_SCHEMA.TABLES when there are many views.                  |
| MD-1044 | Queries no longer get stuck in the CANCELLATION_REQUESTED state.                                                   |
| MD-1042 | CTAS queries that contain an INNER JOIN and UNION no longer produce an inefficient query plan and resource errors. |

|         |                                                                                                                                      |
|---------|--------------------------------------------------------------------------------------------------------------------------------------|
| MD-1030 | Partition pruning now works correctly when optimization is applied to queries that contain an IN list with more multiple lines.      |
| MD-949  | Flatten on CONVERT_FROM no longer fails with a ClassCastException.                                                                   |
| MD-904  | Drill no longer throws an array index out of bound exception when reading a parquet file written by a mapreduce program.             |
| MD-901  | Drill no longer produces a Java compilation error for large queries with many CASE and CAST expressions.                             |
| MD-895  | Drill queries no longer produce memory leaks.                                                                                        |
| MD-888  | Queries no longer fail with a "Connection timed out" error.                                                                          |
| MD-878  | The RANK() window function no longer returns the wrong results for large datasets.                                                   |
| MD-746  | Queries no longer hang when fragment 0 is running.                                                                                   |
| MD-727  | Drill returns null values for non-existent columns in HPE Ezmeral Data Fabric Database JSON tables.                                  |
| MD-603  | Drill now returns the directory structure associated with a workspace.                                                               |
| MD-509  | Drill no longer returns a NumberFormatException error when casting an empty string to int in HBase/HPE Ezmeral Data Fabric Database. |

### Known Issues

| Issue   | Description                                                                                                    |
|---------|----------------------------------------------------------------------------------------------------------------|
| MD-1076 | Drill drops NULL fields when writing to a JSON file.                                                           |
| MD-1073 | Queries on ORC tables no longer take an unusually long time when Drill runs for multiple days without restart. |
| MD-1061 | Queries on Hive ORC tables fail with a "does not have access to maprfs:///" error.                             |
| MD-892  | The drill-env.sh script does not set the file client read ahead throttle environment variable.                 |
| MD-833  | Queries submitted from Tableau produce IndexOutOfBoundsException errors.                                       |

### Limitations

See [Drill-on-YARN Limitations](#).

### Drill 1.7.0 Release Notes (Developer Preview)

The following release notes are for the 1.7.0 developer preview of the MapR distribution of Apache Drill. Release notes for prior releases are posted on the [Apache Drill web site](#).

|                               |                                                                                                                   |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------|
| Version                       | 1.7.0 (developer preview)                                                                                         |
| Release Date                  | July 5, 2016                                                                                                      |
| MapR Version Interoperability | See <a href="#">Interoperability Matrices</a> on page 5722 and <a href="#">Drill Support Matrix</a> on page 5825. |

## Noteworthy New Features

This release introduces the following enhancements:

- Improvements to MaxDir/MinDir functions. See [Query Directory Functions](#).
- Access to Drill logs in the Web UI. See [Log and Debug Introduction](#).
- Addition of JDBC/ODBC client IP in Drill audit logs. See [Query Audit Logging](#).
- Monitoring via JMX. See [Monitoring Metrics](#).
- Hive CHAR data type support. See [Hive-to-Drill Data Type Mapping](#).
- Partition pruning enhancements.
- Improved metadata query performance on Hive tables.
- Ability to return file names as part of queries.

See [Apache Drill 1.7.0 Release Notes](#) for a complete list of JIRAs resolved in the 1.7.0 release.

## Drill 1.6.0 - 1606 Release Notes

The following release notes apply to the 1.6.0 - 1606 version of the Apache Drill component included in the MapR Converged Data Platform.

|                               |                                                                                                                                                                                                                                                                             |               |                                            |             |                                            |               |                                       |

## Resolved Issues

The following table lists resolved issues in Drill 1.6.0 - 1606:

| Issue      | Description                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DRILL-4715 | Queries with multiple, non-trivial expressions no longer cause compilation errors at runtime due to memory limits imposed by the JVM.                                                                                                                                                                                                                                                                                        |
| DRILL-4694 | Drill no longer adds extraneous NULL fields to JSON output files when you issue the CTAS statement to create JSON output from an existing JSON file. A new option, <code>store.json.writer.skip_null_fields</code> , controls this behavior. By default, <code>store.json.writer.skip_null_fields = true</code> and skips NULL fields. Setting <code>store.json.writer.skip_null_fields = false</code> reverts the behavior. |

|            |                                                                                                                                                                                                                                                                                                                                           |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DRILL-4693 | Columns now appear in the correct order when you issue a SELECT list expression with the COVERT_FROM function and the format type is JSON.                                                                                                                                                                                                |
| DRILL-4679 | <p>Queries that contain the CONVERT_FROM function with the JSON format type no longer fail with the following error when the input data has 0 rows due to a filter condition:</p> <pre>Error: SYSTEM ERROR: IllegalStateException: next() returned NONE without first returning OK_NEW_SCHEMA [#16, ProjectRecordBatch]Fragment 0:0</pre> |
| DRILL-4676 | Canceling a query during planning no longer blocks the drillbit from accepting new queries.                                                                                                                                                                                                                                               |
| DRILL-4657 | Running a query with the RANK function no longer produces incorrect results when a frame does not fit into two batches of data.                                                                                                                                                                                                           |
| DRILL-4654 | <p>Drill now uses JMX (<a href="#">Java Management Extensions</a>) to monitor queries at runtime and provide the following new metrics through the Drill Web Console and JConsole:</p> <ul style="list-style-type: none"> <li>• pending/running/completed queries</li> <li>• current memory usage (root allocator)</li> </ul>             |
| DRILL-4647 | In instances when a drillbit is not running or query submission fails, the C++ client correctly propagates failed connection errors back to the application.                                                                                                                                                                              |
| DRILL-4476 | The UNION ALL operator now supports scenarios where the query expression on either side of the UNION ALL operator references an empty source.                                                                                                                                                                                             |
| DRILL-3714 | Queries no longer remain in a CANCELLATION_REQUESTED state until the drillbits are restarted.                                                                                                                                                                                                                                             |
| MD-850     | Queries that contain two numbers CAST as decimals and added together no longer result in a data type mismatch.                                                                                                                                                                                                                            |
| MD-849     | Queries on JSON files that contain two index levels no longer fail with an IndexOutOfBoundsException error.                                                                                                                                                                                                                               |
| MD-815     | <p>Queries on INFORMATION_SCHEMA (hive metadata) are significantly faster due to the use of a bulk load algorithm when the exec.enable_bulk_load_table_list system option is set to true:</p> <pre>ALTER SYSTEM SET `exec.enable_bulk_load_table_list` = true</pre>                                                                       |

### Drill 1.6.0 Release Notes

The following release notes are for the 1.6.0 version of the Apache Drill component included in the MapR distribution for Apache Hadoop. Release notes for prior releases are posted on the [Apache Drill web site](#).

|              |               |
|--------------|---------------|
| Version      | 1.6.0         |
| Release Date | April 4, 2016 |

|                               |                                                                                                                                                                                             |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MapR Version Interoperability | MapR Drill 1.6.0 is certified on the MapR v5.1.0 converged data platform. See <a href="#">Interoperability Matrices</a> on page 5722 and <a href="#">Drill Support Matrix</a> on page 5825. |
| Download Location             | See <a href="#">Installing Drill</a> .                                                                                                                                                      |

### Noteworthy New Features in the MapR Distribution of Drill

This release provides enhanced query improvements with the following bug fixes and improvements:

- JDK 1.8 support.
- JSON and binary table support through the HPE Ezmeral Data Fabric Database format plugin.
- [Inbound impersonation](#) which is useful in a multi-tier architecture where queries must run as the end user instead of the application user.
- More [custom frames](#) in the window function frame clause.
- [Row count based pruning for Limit N queries](#)
- [Lazy reading of parquet metadata caching](#)
- [Early application of partition pruning in query planning](#)

Additional bug fixes and enhancements listed in the [Apache Drill 1.6.0 Release Notes](#).

### Resolved Issues

The following table lists resolved issues in Drill 1.6.0:

| Issue  | Description                                                                                                                                                                         |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-803 | LIMIT 0 optimization applies to the ranking and value window functions.                                                                                                             |
| MD-784 | LIMIT 0 optimization applies to the Hive UDF xpath_double.                                                                                                                          |
| MD-781 | LIMIT 0 optimization applies to the TRIM function.                                                                                                                                  |
| MD-608 | Complex data functions FLATTEN and KVGGEN no longer return null data when you issue queries through the ODBC driver.                                                                |
| MD-604 | EXTRACT function with seconds no longer returns incorrect data when you issue queries through the ODBC driver.                                                                      |
| MD-361 | Drill honors the Hive skip.header.line.count and skip.footer.line.count table properties and skips header and footer lines when querying Hive tables created with these properties. |

### Known Issues

The following table lists known issues in Drill 1.6.0:

| Issue  | Description                                                                                                                                           |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-851 | Pushdown is disabled for columns with TIMESTAMP values which makes these columns case-insensitive. See <a href="#">Limitations</a> .                  |
| MD-845 | LIMIT 0 optimization does not apply when used in a query with a FULL OUTER JOIN and the <code>planner.enable_merge_join</code> option is set to true. |

|        |                                                                                                                                                                                              |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MD-817 | LIMIT 0 optimization does not apply when a query contains math operations between an interval type and a constant.                                                                           |
| MD-802 | LIMIT 0 optimization applies to the AVG window function.                                                                                                                                     |
| MD-794 | LIMIT 0 optimization does not apply when the return type is VARBINARY.                                                                                                                       |
| MD-787 | LIMIT 0 optimization does not apply to the Hive BIN function.                                                                                                                                |
| MD-786 | LIMIT 0 does not apply to the Hive HEX function.                                                                                                                                             |
| MD-747 | SUM function queries with a decimal argument and LIMIT 0 optimization returns the wrong data types and nullability.                                                                          |
| MD-727 | If you query a column that does not exist in the records of the queried table, Drill does not return any rows when it should return rows with null values. See <a href="#">Limitations</a> . |

### Limitations

(MD-851) Pushdown filtering is disabled on columns with TIMESTAMP values, which results in these columns being case-insensitive. For example, if a JSON table is created with the following JSON records where the “access” columns are not of a particular case:

```
{ "_id": "ID1", "name": "Alice", "age": "25", "access": "2013-10-23 11:11:11", "DOB": { "$dateDay": "1988-01-01" }, "salary": "50.00" }
{ "_id": "ID2", "name": "Bob", "age": "21", "access": "2013-10-23 11:11:11", "DOB": { "$dateDay": "1988-01-01" }, "salary": "150.00" }
{ "_id": "ID3", "name": "Frank", "age": "32", "ACCESS": "2013-10-23 11:11:11", "dob": { "$dateDay": "1988-01-01" }, "salary": "250.00" }
```

Running a query on the “access” column returns all values because Drill does not push the filtering process down to HPE Ezmeral Data Fabric Database to get the subset of columns from records where the name is “access” in lowercase. Instead, HPE Ezmeral Data Fabric Database returns every value from each record that has a column named “access”, regardless of the case. If some records include a column named “ACCESS” or “Access,” these values are also returned in the result set.

```
SELECT * FROM dfs.`/tmp/data/student_db` where access = timestamp '2013-10-23 11:11:11';
+-----+-----+-----+-----+-----+-----+
| _id | access | age | dob | name | salary |
+-----+-----+-----+-----+-----+-----+
| ID1 | 2013-10-23 11:11:11 | 25 | 1988-01-01 | Alice | 50.00 |
| ID2 | 2013-10-23 11:11:11 | 21 | 1980-12-12 | Bob | 150.00 |
| ID3 | 2013-10-23 11:11:11 | 32 | 1970-10-12 | Frank | 250.00 |
+-----+-----+-----+-----+-----+-----+
3 rows selected (0.223 seconds)
```

In comparison, you can see that a query on the “dob” column in the same table produces only one result because the column does not contain TIMESTAMP values and is therefore case-sensitive:

```
SELECT * FROM dfs.`/tmp/data/student_db` where dob = date '1988-01-01';
+-----+-----+-----+-----+-----+-----+
| _id | ACCESS | age | dob | name | salary |
+-----+-----+-----+-----+-----+-----+
| ID3 | 2013-10-23 11:11:11 | 32 | 1988-01-01 | Frank | 250.00 |
+-----+-----+-----+-----+-----+-----+
1 row selected (0.359 seconds)
```

Although there are three records with “dob” columns, there is only one record with the column name in lowercase.

(MD-727) If you query one column that is partially or completely non-existent in the records of the queried table, Drill does not return any rows for the records when it should return the rows with null values. For example, if a JSON table is created from the following JSON records where only one record has a "time" column with a value and the other two records do not have time columns:

```
{ "_id": "student1", "name": "Alice", "street": "123 Ballmer Av",
 "zipcode": 12345, "state": "CA" },
{ "_id": "student2", "name": "Bob", "time": "2016-03-08", "street": "1 Infinite
 Loop", "zipcode": 12345, "state": "CA" },
{ "_id": "student3", "name": "Frank", "street": "435 Walker Ct",
 "zipcode": 12345, "state": "CA" }
```

The query returns only one row for the record in which the time column exists with a value instead of returning three rows with two rows having null values in the column.

```
SELECT `time` FROM dfs.`/user/root/students`;
+-----+
| time |
+-----+
| 2016-03-08 |
+-----+
```

In comparison, if you query all of the columns in the table, you can see that the query returns all records and includes null values for records missing a time column.

```
SELECT * FROM dfs.`/user/root/students`;
+-----+-----+-----+-----+-----+-----+
| _id | name | state | street | zipcode | time |
+-----+-----+-----+-----+-----+-----+
| student1 | Alice | CA | 123 Ballmer Av | 12345.0 | null |
| student2 | Bob | CA | 1 Infinite Loop | 12345.0 | 2016-03-08 |
| student3 | Frank | CA | 435 Walker Ct | 12345.0 | null |
+-----+-----+-----+-----+-----+-----+
3 rows selected (0.314 seconds)
```

### Drill 1.5.0 Release Notes (Developer Preview)

The following release notes are for the 1.5.0 developer preview of the MapR distribution of Apache Drill. Release notes for prior releases are posted on the [Apache Drill web site](#).

|                               |                                                                                                                  |
|-------------------------------|------------------------------------------------------------------------------------------------------------------|
| Version                       | 1.5.0 (Developer preview)                                                                                        |
| Release Date                  | February 23, 2016                                                                                                |
| MapR Version Interoperability | See <a href="#">Interoperability Matrices</a> on page 5722 and <a href="#">Drill Support Matrix</a> on page 5825 |

### Noteworthy New Features

This release introduces the following enhancements:

- Improved Memory Allocator - Drill uses a new allocator that improves an operator's use of direct memory and tracks the memory use more accurately. See [Configuring Drill Memory](#).
- Configurable Caching of Hive Metadata - You can now configure the TTL for the Hive metadata client cache depending on how frequently the Hive metadata is updated. See [Hive Metadata Caching](#).

See [Apache Drill 1.5.0 Release Notes](#) for a complete list of JIRAs resolved in the 1.5.0 release.

### Drill 1.4.0 Release Notes

The following release notes are for the 1.4.0 version of the Apache Drill component included in the MapR distribution for Apache Hadoop.

|                               |                             |
|-------------------------------|-----------------------------|
| Version                       | 1.4.0                       |
| Release Date                  | January 12, 2016            |
| MapR Version Interoperability | See Interoperability Matrix |

### Noteworthy New Features in the MapR Distribution of Drill

This release introduces a number of enhancements, including the following ones:

- Improved Tableau experience with faster Limit 0 queries (MD-602)
- Metadata (INFORMATION\_SCHEMA) query performance improvements on Hive schemas/tables (MD-530, MD-504, MD-507, [DRILL-4126](#), [DRILL-4127](#), [DRILL-4161](#))
- Optimized Parquet metadata caching, faster queries on a large number of files  
Metadata caching is new feature introduced in [Drill 1.2](#) to speed up Drill queries involving large number of files. In 1.4, the cache size is considerably reduced using a variety of techniques including efficient storage of information as well reducing the redundant metadata. This significantly boosts performance of the queries. Note however that the depending on the size of data, the cache construction might take longer.
- Partition pruning improvements  
Partition pruning is significantly enhanced in 1.4. The enhancements including support for more datatypes, working better in conjunction with metadata caching as well as a moving the partition pruning evaluation from Hep to Volcano planner. ([DRILL-4126](#), [DRILL-3765](#))
- Improved Window functions resource usage and performance
- Updated 1.2.1 Windows ODBC driver (updates to Mac and Linux versions to follow)
- New and improved [Drill JDBC driver](#).  
This driver is recommended by MapR for production deployments deployments and partner certifications. The new driver offers much more compatibility to the JDBC standard. This driver compliments the currently available open source version of JDBC driver.
- Stability improvements
- 90 bug fixes and additional enhancements listed in [Apache Drill 1.4 Release Notes](#) and [Apache Drill 1.3 Release Notes](#)

### Known Issues

- Drill was upgraded to use a new Parquet reader in the Drill 1.3 dev preview release. Customers moving from Drill 1.2 and prior versions to 1.4 must migrate their data or regenerate their parquet in order to continue working with Drill in optimized way. For more information on how to upgrade the parquet, refer to the [migration tool documentation](#).
- Merge join in 1.4 has known issues related to performance and data correctness in 1.4 ([DRILL-3578](#)). Hence, upgrading to 1.4 is not recommended for performant queries that use merge joins. If you do upgrade to 1.4, you must set the `planner.enable_mergejoin` option to false (that is, use hash join instead); otherwise, merge join queries will not run and/or produce incorrect results.
- Extract function with seconds returns incorrect data when you issue queries from the ODBC driver. (MD-604)

- Complex data functions FLATTEN and KVGGEN return null data when you issue queries from the ODBC driver. (MD-608)
- After upgrading to Release 1.4 or later, any custom function you wrote in Release 1.3 or earlier that is in a package that Drill scans by default will run. However, if you created *your own package* for the custom function, it will *not* run in Release 1.4 and later. You can use one of the following workarounds. The first workaround is quick and easy. The second is recommended for new UDFs you create in Release 1.4 and later.

### Quick Workaround

1. Create a drill-module.conf file in \$DRILL\_HOME/conf/ if one does not already exist.
2. Add the following code to the drill-module.conf, replacing com.yourgroupidentifier.udf with the package name(s) of your UDFs.

```
drill.classpath.scanning.packages += "com.yourgroupidentifier.udf"
```

3. Copy the drill-module.conf file to all Drillbits.
4. Ensure that DRILL\_HOME/conf/drill-override.conf does not contain any information regarding UDF packages.
5. Restart Drill on all the Drillbits.

### Alternative Workaround

1. Add the following code to the drill-module.conf in your UDF project (src/main/resources/drill-module.conf). Replace com.yourgroupidentifier.udf with the package name(s) of your UDFs.

```
drill.classpath.scanning.packages += "com.yourgroupidentifier.udf"
```

2. Recompile the UDFs and place the 2 jar files (source + binary) in Drill's classpath on all the Drillbits.
  3. Recompile the UDFs and place the 2 jar files (source + binary) in Drill's classpath on all the Drillbits.
  4. Restart drill on all the Drillbits.
- If you upgrade from Drill 1.2 or earlier, update Parquet data.

Drill 1.4 is the first production ready release after the Drill upgrade to use the latest version of the Apache Parquet library, which was released in 1.3 dev preview. If you generated Parquet using Drill 1.2 and earlier, take one of the following actions:

- Update data using the [Drill migration utility](#).
- Regenerate data using the new version of Drill.

One of these actions is mandatory to continue to get accurate functionality and to optimize performance.

### Resolved Issues

- Regardless of whether impersonation is enabled or not, this release caches data in the HiveMetaStore to improve performance. (DRILL-4126)

### Drill 1.3.0 Release Notes (Developer Preview)

The following release notes are for the 1.3.0 developer preview of the MapR distribution of Apache Drill. Release notes for prior releases are posted on the Apache Drill web site.

|                               |                                                                                                                  |
|-------------------------------|------------------------------------------------------------------------------------------------------------------|
| Version                       | 1.3.0 Developer Preview                                                                                          |
| Release Date                  | November 23, 2015                                                                                                |
| MapR Version Interoperability | See <a href="#">Interoperability Matrices</a> on page 5722 and <a href="#">Drill Support Matrix</a> on page 5825 |

### Noteworthy New Features

This release introduces the following enhancements:

- Upgrade to the latest version of the Apache Parquet library (See [DRILL-4070](#) and <http://drill.apache.org/docs/partition-by-clause/>)
- Performance improvements for Limit 0 and Limit 1 queries
- Hive table query planning improvements
- Partition pruning enhancements
- Support for CSV header parsing
- Improved query/operators profiles
- Capability to reset the SYSTEM and SESSION settings to their defaults
- Merge Join improvements
- [Additional bug fixes and enhancements](#)

### Known Issue

The MapR 1.3 developer preview of Drill has the following known issue:

- [DRILL-4070](#) - You must change the metadata of Parquet files generated by Drill 1.1 and 1.2 for the files to work optimally with Drill 1.3.0. See <http://drill.apache.org/docs/partition-by-clause/>.

### Drill 1.2.0 Release Notes

|                         |                                                       |
|-------------------------|-------------------------------------------------------|
| Version                 | 1.2.0                                                 |
| Release Date            | November 7, 2015                                      |
| Works with MapR version | See <a href="#">Drill Support Matrix</a> on page 5825 |

### Noteworthy New Features in MapR Distribution of Drill

This release introduces a number of enhancements, including the following ones:

- Partition pruning improvements
- [Optimizes reads](#) of Parquet-backed, Hive tables.
- [Improved Hive support](#)  
Supports Hive 1.2.1 and using multiple Hive versions (same as corresponding MapR platform version).
- [Analytical/Window functions support](#)  
Adds Lead, Lag, First\_Value, Last\_Value, and Ntile support and allows [multiple window functions](#) in the same query.
- [DROP TABLE](#) Command

- [Parquet metadata caching](#)

Improves query performance on a large number of files.

- Security support for the Web Console

- [Row key filter pushdown](#)

Improves performance when querying HPE Ezmeral Data Fabric Database and HBase.

- Improvements in the Drill JDBC driver.

- Read support for the Parquet [INT96](#) data type support

A new `TIMESTAMP_IMPALA` type used with the `CONVERT_FROM` function decodes a timestamp from Hive or Impala.

- Improved correlated subqueries

- Support for UNION DISTINCT syntax

- Improved LIMIT processing

### Known Issues

The MapR 1.2 release of Drill does not include fixes for the following issues that were fixed in the Apache Drill 1.2 release:

| Drill JIRA | Description                                                                                                                                                                                                                                                                                     |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DRILL-1065 | You cannot issue the ALTER SESSION RESET command to reset an option to its default system value.                                                                                                                                                                                                |
| DRILL-2361 | Drill returns the following error message when column aliases for aggregate or group by fields include a dot (.):<br>Field references must be singular names.                                                                                                                                   |
| DRILL-2879 | Drill cannot parse JSON files with the BSON OID data type, a MongoDB extension to the JSON format. Drill may also have issues parsing JSON files with the BSON Binary data type.                                                                                                                |
| DRILL-3791 | Testing of the JDBC storage plugin with MySQL is incomplete.                                                                                                                                                                                                                                    |
| DRILL-3869 | Queries submitted through the Drill Web Console with a trailing semicolon (;) fail, and Drill returns the following error message:<br>org.apache.drill.common.exceptions.UserRemoteException: PARSE ERROR: Encountered ";" at line 1, column 42. Was expecting one of: "OFFSET" ... "FETCH" ... |
| DRILL-3888 | The test JAR file configurations exist in each module's POM file instead of the root POM file.                                                                                                                                                                                                  |
| DRILL-3916 | Drill-bits cannot load the JDBC storage plugin when starting because the plugin does not exist.                                                                                                                                                                                                 |

### Drill 1.1.0 Release Notes

This version of Drill is no longer supported.

### Flume Release Notes

**!** **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

The release notes for Flume contain notes specific to MapR only.

**☰** **Note:** To identify the EEP to which a specific release note belongs, see [EEP Release Notes](#) on page 5854. To see which operating systems support the ecosystem components in a specific EEP, see [EEP Components and OS Support](#) on page 5739. To view release notes for prior MapR releases, see [Previous Versions](#) on page 6776.

### Flume 1.9.0.0 Release Notes

This section provides reference information, including new features, fixes, known issues, and limitations for Flume 1.9.0.0.

**!** **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

The following release notes for the Flume 1.9.0.0 component are included in the MapR distribution for Apache Hadoop:

### Flume 1.9.0.200-2110 (EEP 8.0.0) Release Notes

**!** **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Flume. You may also be interested in the [Apache Flume 1.9.0 changelog](#) or the [Apache Flume homepage](#).

For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 5854.

### New in This Release

No new features were introduced in this release.

### Fixes

This HPE release includes the following fixes on the base release:

| GitHub Commit Number | Date (YYYY-MM-DD) | Fix Number and Description                                                           |
|----------------------|-------------------|--------------------------------------------------------------------------------------|
| cb11414              | 2021-09-07        | MAPR-FLUME-82 Update maven artifact version strings to replace 'mep/mapr' with 'eep' |
| 420b96f              | 2021-09-03        | MAPR-FLUME-81 mapr-security-web jar is taken from the cluster                        |

|         |            |                                                                  |
|---------|------------|------------------------------------------------------------------|
| eb25c7b | 2021-09-03 | MAPR- FLUME-79<br>kafka-eventstreams*.jar was added to classpath |
| d9a47e3 | 2021-07-23 | MAPR- FLUME-71 Kafka version was updated to 2.6.1.0-mapr         |

For complete details, refer to the commit log for this project in GitHub.

#### Known Issues and Limitations

- None.

#### Resolved Issues

- None.

#### Flume 1.9.0.100-2101 (EEP 7.0.1) Release Notes

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Flume. You may also be interested in the [Apache Flume 1.9.0 changelog](#) or the [Apache Flume homepage](#).

#### New in This Release

Flume 1.9.0.100-2101 introduces the following enhancements or HPE platform-specific behavior changes:

- None.

#### Fixes

This HPE release includes the following fixes on the base release:

| GitHub Commit Number | Date (YYYY-MM-DD) | MapR Fix Number and Description                     |
|----------------------|-------------------|-----------------------------------------------------|
| 43bfe16              | 2020-11-12        | MAPR-FLUME-70 Thrift version was updated to v0.13.0 |

For complete details, refer to the commit log for this project in GitHub.

#### Known Issues and Limitations

- None.

## Resolved Issues

- None.

## Flume 1.9.0.0-2009 Release Notes

This section provides reference information, including new features, fixes, known issues, and limitations for Flume 1.9.0.0 for EEP 7.0.0.

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

You may also be interested in the [Apache Flume 1.9.0 changelog](#) or the [Apache Flume homepage](#).

These release notes contain only MapR-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 5854.

|                            |                                                                                                                                                                              |

## New in This Release

- None.

## Fixes

This MapR release includes the following fixes on the base release:

| Commit  | Date (YYYY-MM-DD) | Comment                                                                                                                                                                                                                                            |
|---------|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c9df319 | 2019-03-15        | MAPR-FLUME-27: Flume uses 2.1.1.0-mapr version of Kafka                                                                                                                                                                                            |
| 5343bb7 | 2019-03-20        | MAPR-FLUME-26: KafkaChannel does not avoid duplicates while consumer rebalancing processing. KafkaChannel was extended to consume from multiple topics(listed explicitly or via specifying regex pattern). Sink and Source runner stop were fixed. |
| 5fb966b | 2019-06-05        | MAPR-FLUME-43: Flume 1.9 uses hadoop 2.7.4.0-mapr-1908                                                                                                                                                                                             |
| 6e39679 | 2020-01-21        | MAPR-FLUME-44: Protobuf version was updated to 3.11.1 for Flume 1.9.                                                                                                                                                                               |
| dc9d3dd | 2020-03-31        | MAPR-FLUME-1: Flume uses mapr version of mapr specific components.                                                                                                                                                                                 |
| 27e0ce2 | 2020-04-07        | MAPR-FLUME-50: Mapr-flume is built using java 11.                                                                                                                                                                                                  |

| Commit  | Date (YYYY-MM-DD) | Comment                                                                                                                           |
|---------|-------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| f71421a | 2020-04-16        | MAPR-FLUME-55: XercesImpl version was upgraded to 2.12.0.                                                                         |
| 3af3507 | 2020-04-30        | MAPR-FLUME-1 hive version was changed to 2.3.7-mapr                                                                               |
| 623e77a | 2020-04-30        | MAPR-FLUME-61: Zookeeper version was changed to 3.5.6-mapr.                                                                       |
| 7056d16 | 2020-05-05        | MAPR-FLUME-58: libthrift version was upgraded to 0.12.0. Derby version was upgraded to 10.14.2.0.                                 |
| f06f6b9 | 2020-05-14        | MAPR-FLUME-53: jackson-databind version was upgraded to 2.10.0. Avro version was updated to 1.9.2. jackson-mapr-asl was excluded. |
| 46a7704 | 2020-07-15        | MAPR-FLUME-66: guava version was upgraded to 28.2-jre                                                                             |
| 2da21f7 | 2020-08-11        | MAPR-FLUME-68: HBase version was changed to 1.4.12.0-mapr                                                                         |

**New in This Release**

Flume 1.8.0-2201 is a defect-repair release.

**Fixes**

This HPE release includes the following fixes on the base release:

| GitHub Commit Number | Date (YYYY-MM-DD) | MapR Fix Number and Description                       |
|----------------------|-------------------|-------------------------------------------------------|
| 5d7b40a              | 2022-01-25        | MAPR-FLUME-85 log4j v1 was updated to the 1.3.1-mapr  |
| e9b7914              | 2021-12-16        | MAPR-FLUME-84 Log4j version was updated to 1.3.0-mapr |
| 0229b54              | 2021-01-23        | MAPR-FLUME-77 Upgrade version of rat-plugin           |

For complete details, refer to the commit log for this project in GitHub.

**Known Issues and Limitations**

- None.

**Resolved Issues**

- None.

**Flume 1.8.0-2104 (EEP 6.3.4) Release Notes**

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Flume. You may also be interested in the [Apache Flume 1.8.0 changelog](#) or the [Apache Flume homepage](#).

### New in This Release

Flume 1.8.0-2101 introduces the following enhancements or HPE platform-specific behavior changes:

- None.

### Fixes

This HPE release includes the following fixes on the base release:

| GitHub Commit Number | Date (YYYY-MM-DD) | MapR Fix Number and Description                                          |
|----------------------|-------------------|--------------------------------------------------------------------------|
| 2951e22              | 2020-10-20        | MAPR-FLUME-69 CVE fixes were moved from Mapr Flume 1.9 to Mapr Flume 1.8 |
| a0bd4c2              | 2020-11-12        | MAPR-FLUME-70 Thrift version was updated to v0.13.0                      |

For complete details, refer to the commit log for this project in GitHub.

**Known Issues and Limitations**

- None.

**Resolved Issues**

- None.

**Flume 1.8.0-1904 Release Notes**

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

The notes below relate specifically to the MapR Distribution for Apache Hadoop. You may also be interested in the [Apache Flume 1.8.0 changelog](#) or the [Apache Flume homepage](#).

These release notes contain only MapR-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 5854.

**New in This Release**

Flume 1.8.0-1803 introduces the following enhancement or MapR platform-specific behavior changes:

- Support for MapR-Streams v1.0.

**Fixes**

This MapR release includes the following fixes on the base release:

| GitHub Commit Number | Date (YYYY-MM-DD) | MapR Fix Number and Description           |
|----------------------|-------------------|-------------------------------------------|
| ae218cb              | 2018-01-31        | FLUME-3197: Upgrade Kafka client to 1.0.x |
| 779d6f4              | 2018-02-26        |                                           |

For complete details, refer to the commit log for this project in GitHub.

**Known Issues and Limitations**

- None

**Resolved Issues**

- None

**Flume 1.7.0 Release Notes**

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

The following release notes for the Flume 1.7.0 component are included in the MapR distribution for Apache Hadoop.

**Flume 1.7.0-1703 Release Notes**

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

The notes below relate specifically to the MapR Distribution for Apache Hadoop. You may also be interested in the [Apache Flume 1.7.0 changelog](#) or the [Apache Flume homepage](#)

## New in this Release

This release of Apache Flume includes the following behavior change that is specific to MapR:

### Support for HPE Ezmeral Data Fabric Event Streams through the Kafka 0.9 API.

To read HPE Ezmeral Data Fabric Event Streams topics, you can use a Kafka source or a Kafka channel. To write to a HPE Ezmeral Data Fabric Event Streams topic, you can use a Kafka channel or a Kafka sink.

For details on the features provided in open source version of Flume 1.6, see the [Apache Flume release notes](#).

## Fixes

| GitHub Commit | Date (YYYY-MM-DD) | Comment                                                                                                                      |

### Fixes

This release from MapR includes the following fixes on the base Apache release. These fixes were back-ported from Flume Version 1.5.2. For complete details, refer to the commit log for this project in GitHub.

### Updating Flume for Compatibility with HBase 0.98

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

Flume 1.5 is compatible with HBase 0.94 and 0.98. If you are using MapR Version 4.0.x and have upgraded to HBase 0.98, you need to update the Flume 1.5 jar files as follows:

1. Go to the directory where the Flume scripts are stored:

```
cd /opt/mapr/flume/flume-<version>/bin/
```

- Execute the update script:

```
bash flume-jars.sh
```

During the script execution, you should see the following log messages:

```
POST_YARN=1, HBASE_VERSION=0.98.4 : installing flume*-hbase.98-h2 jars
```

You can now use Flume 1.5 with HBase 0.98.

### Flume 1.5.0-1501 Release Notes

 **Important:** This component is deprecated. HPE recommends using an alternate product. For more information, see [Discontinued Ecosystem Components](#) on page 5787.

**New in This Release**

This is the initial release of Flume 1.5.0 on the MapR Distribution for Hadoop. This release supports MapReduce version 1 and MapReduce version 2 and includes all patches made to Flume version 1.4.0.

**Hadoop Release Notes**

The release notes for the Hadoop and YARN components included in the HPE Ezmeral Data Fabric contain notes specific to data-fabric only.

**Hadoop 2.7.6.200 - 2201 (EEP 8.1.0) Release Notes**

The notes below relate to the HPE Ezmeral Data Fabric distribution of Apache Hadoop.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 5854.

**New in this Release**

Hadoop 2.7.6.100 - 2110 introduces the following enhancements:

- Added FIPS support.
- Added sharding for RM volume across multiple volumes to support stability.

**Fixes**

This HPE release includes the following fixes on the base Apache release:

| GitHub Commit Number | Date (YYYY-MM-DD) | HPE Fix Number and Description |
|----------------------|-------------------|--------------------------------|
|----------------------|-------------------|--------------------------------|

### Known Issues and Limitations

- None.

### Resolved Issues

- None.

### Hadoop 2.7.6.100 - 2110 (EEP 8.0.0) Release Notes

The notes below relate to the HPE Ezmeral Data Fabric distribution of Apache Hadoop.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 5854.

### New in this Release

Hadoop 2.7.6.100 - 2110 introduces the following enhancements or HPE platform-specific behavior changes:

- All fixes from Apache Hadoop 2.7.6 have been backported.

- Support for file exclusion list in DistCp.
- Added a `yarn top` tool.
- Support for BCFKS keystores for Hadoop Credential Provider.

### Fixes

This HPE release includes the following fixes on the base Apache release:

| GitHub Commit Number | Date (YYYY-MM-DD) | HPE Fix Number and Description                                                                                                             |

| a42503a9153          | 2021-07-26        | Update gradle-wrapper.properties                                                                                                           |
| 1d04de14c09          | 2021-07-26        | Backport MAPRYARN-321: Upgraded Avro version to 1.10.1                                                                                     |
| 2b2518f33a8          | 2021-07-23        | Backport HADOOP-17341. Upgrade commons-codec to 1.15 (#2428)                                                                               |
| b6988af1234          | 2021-07-20        | Backport HADOOP-10075. addendum to fix compilation on Windows                                                                              |
| 7d0183ee3bd          | 2021-06-21        | MAPRYARN-320: Kill child process from container-executor                                                                                   |
| ad8e8d08c0b          | 2021-06-18        | Backport YARN-10490. yarn top command not quitting completely with ctrl+c. Contributed by Agshin Kazimli                                   |
| 1c737ee2f90          | 2021-06-18        | MAPRYARN-316: Added disks to "yarn top" command                                                                                            |
| a35adb43f87          | 2021-06-18        | Backport YARN-3348. Add a 'yarn top' tool to help understand cluster usage. Contributed by Varun Vasudev                                   |
| 9f5418a1de5          | 2021-06-07        | Backport HADOOP-17602. Upgrade JUnit to 4.13.1. Contributed by Ahmed Hussein.                                                              |
| f3b647eea98          | 2021-06-04        | Fixed LocatedFileStatusFetcher for work with symlinks                                                                                      |

|             |            |                                                                                                                                                                                       |
|-------------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9b16bf0084b | 2021-06-03 | MAPRHADOOP-177: Fixed mkdir command for non existing parent dir                                                                                                                       |
| e96a8d7e003 | 2021-06-02 | MAPRHADOOP-174: Fixed issue with copying multiple files to directory                                                                                                                  |
| 740035b02f1 | 2021-05-31 | Backport HADOOP-16245. Restrict the effect of LdapGroupsMapping SSL configurations to avoid interfering with other SSL connections. Contributed by Erik Krogen.                       |
| 27e38cbbb28 | 2021-05-31 | Backport HADOOP-12862. LDAP Group Mapping over SSL can not specify trust store. Contributed by Wei-Chiu Chuang and Konstantin Shvachko.                                               |
| 290a908be21 | 2021-05-31 | Backport HADOOP-15345. Backport HADOOP-12185 to branch-2.7: NetworkTopology is not efficient adding/getting/removing nodes. Contributed by He Xiaoqiao.                               |
| 532934140ad | 2021-05-31 | Backport HDFS-13195. DataNode conf page cannot display the current value after reconfig. Contributed by maobaolong.                                                                   |
| f9918ab5550 | 2021-05-31 | Backport HDFS-12884. BlockUnderConstructionFeature.truncateBlock should be of type BlockInfo. Contributed by chencan.                                                                 |
| 1c3f997eb9b | 2021-05-31 | Backport HADOOP-13105. Support timeouts in LDAP queries in LdapGroupsMapping. Contributed by Mingliang Liu.                                                                           |
| 209c93fbe66 | 2021-05-31 | Backport HADOOP-12001. Fixed LdapGroupsMapping to include configurable Posix UID and GID attributes during the search. Contributed by Patrick White.                                  |
| fdb6bf9b675 | 2021-05-31 | Backport HADOOP-15279. increase maven heap size recommendations                                                                                                                       |
| 444cef90d29 | 2021-05-31 | Backport HADOOP-15283. Upgrade from findbugs 3.0.1 to spotbugs 3.1.2 in branch-2 to fix docker image build.                                                                           |
| a156fd13c95 | 2021-05-31 | Backport HDFS-4210. Throw helpful exception when DNS entry for JournalNode cannot be resolved. Contributed by Charles Lamb and John Zhuge.                                            |
| 79158f841e8 | 2021-05-31 | Backport HADOOP-15206. BZip2 drops and duplicates records when input split size is small. Contributed by Aki Tanaka                                                                   |
| 93547c2cb3b | 2021-05-31 | Backport HADOOP-12568. Update core-default.xml to describe posixGroups support. Contributed by Wei-Chiu Chuang.                                                                       |
| 28283d0740c | 2021-05-31 | Backport HADOOP-12793. Write a new group mapping service guide (Wei-Chiu Chuang via iwasakims)                                                                                        |
| a6aef9fa3fa | 2021-05-31 | Backport HADOOP-9477. Add posixGroups support for LDAP groups mapping service. (Dapeng Sun via Yongjun Zhang)                                                                         |
| 2b0f6773337 | 2021-05-31 | Backport MAPREDUCE-7048. Uber AM can crash due to unknown task in statusUpdate. Contributed by Peter Bacsko                                                                           |
| ac06e483c05 | 2021-05-31 | Backport HDFS-10453. ReplicationMonitor thread could stuck for long time due to the race between replication and delete of same file in a large cluster.. Contributed by He Xiaoqiao. |
| 384340b76ed | 2021-05-31 | Backport HDFS-7959. WebHdfs logging is missing on Datanode (Kihwal Lee via sjlee)                                                                                                     |
| 953f75abed0 | 2021-05-31 | Backport HDFS-13120. Snapshot diff could be corrupted after concat. Contributed by Xiaoyu Yao.                                                                                        |
| 8bc1c2ecbaa | 2021-05-31 | Backport HADOOP-15212. Add independent secret manager method for logging expired tokens. Contributed by Daryn Sharp.                                                                  |

|             |            |                                                                                                                                                                          |
|-------------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| f73da507697 | 2021-05-31 | Backport MAPREDUCE-7020. Task timeout in uber mode can crash AM. Contributed by Peter Bacsko                                                                             |
| ef3f06d320b | 2021-05-31 | Backport HDFS-12371. BlockVerificationFailures and BlocksVerified show up as 0 in Datanode JMX. Contributed by Hanisha Koneru.                                           |
| 7570e0e491d | 2021-05-31 | Backport HADOOP-13508. FsPermission string constructor does not recognize sticky bit. Contributed by Atul Sikaria.                                                       |
| 27e4c5fe92e | 2021-05-31 | Backport HDFS-11003. Expose XmitsInProgress through DataNodeMXBean. Contributed By Brahma Reddy Battula                                                                  |
| a537ad3ea2d | 2021-05-31 | Backport HADOOP-13263. Reload cached groups in background after expiry. (Contributed bt Stephen O'Donnell)                                                               |
| 358d2fd6795 | 2021-05-31 | Backport HADOOP-14246. Authentication Tokens should use SecureRandom instead of Random and 256 bit secrets (Contributed by Robert Kanter via Daniel Templeton)           |
| fb29d47034b | 2021-05-31 | Backport HDFS-11384. Balancer disperses getBlocks calls to avoid NameNode's rpc queue saturation. Contributed by Konstantin V Shvachko.                                  |
| 442c573b4e6 | 2021-05-31 | Backport MAPREDUCE-7028. Concurrent task progress updates causing NPE in Application Master. Contributed by Gergo Repas                                                  |
| ead4809bbc1 | 2021-05-31 | Backport HDFS-12881. Output streams closed with IOUtils suppressing write errors. Contributed by Ajay Kumar                                                              |
| f7842437eff | 2021-05-31 | Backport MAPREDUCE-5124. AM lacks flow control for task events. Contributed by Peter Bacsko                                                                              |
| 9316e6866df | 2021-05-31 | Backport YARN-4167. NPE on RMActiveServices#serviceStop when store is null. (Bibin A Chundatt via rohithsharmaks)<br>Backport YARN-6633 by Inigo Goiri.                  |
| 573618f058e | 2021-05-31 | Backport YARN-3425. NPE from RMNodeLabelsManager.serviceStop when NodeLabelsManager.servicelnit failed. (Bibin A Chundatt via wangda) Backport YARN-6632 by Inigo Goiri. |
| 38565378f4f | 2021-05-31 | Backport YARN-7661. NodeManager metrics return wrong value after update node resource. Contributed by Yang Wang                                                          |
| cb027e006c4 | 2021-05-28 | Backport MAPRHADOOP-174: Added wildcard usage for path with symlinks                                                                                                     |
| ffc31a97594 | 2021-05-26 | Backport YARN-4348. ZKRMStateStore.syncInternal shouldn't wait for sync completion for avoiding blocking ZK's event thread. (ozawa)                                      |
| 226dfdeca76 | 2021-05-26 | Backport YARN-3798. ZKRMStateStore shouldn't create new session without occurrence of SESSIONEXPIED. (ozawa and Varun Saxena)                                            |
| 4f4bf8a1446 | 2021-05-20 | MAPRHADOOP-173: Moving cluster from secure to unsecure breaks yarn-site.xml                                                                                              |
| 6a83c9d9918 | 2021-05-19 | COMSECURE-384: Add Bouncy Castle JARs to Hadoop class path - unitTested                                                                                                  |
| fa833c7d5bb | 2021-05-17 | MAPRHADOOP-171: Distcp to S3A does not work                                                                                                                              |
| ff9e411bb5f | 2021-05-13 | MAPRHADOOP-172: configure ssl-client/server.xml as part of hadoop-util configuration                                                                                     |
| da5ef438a37 | 2021-05-11 | Backport HADOOP-15970. Upgrade plexus-utils from 2.0.5 to 3.1.0.                                                                                                         |

|             |            |                                                                                                             |
|-------------|------------|-------------------------------------------------------------------------------------------------------------|
| 4e64e475366 | 2021-05-06 | MAPRYARN-299: change service name identification approach                                                   |
| 6d453dc22df | 2021-04-28 | MAPRHADOOP-169: Updated JQuery to 3.5.1 for SLS                                                             |
| 2ac48dc37c5 | 2021-04-28 | Backport HADOOP-17302. Upgrade to jQuery 3.5.1 in hadoop-sls. (#2379)                                       |
| 32e551d6ae2 | 2021-04-28 | Backport HADOOP-14040. Use shaded aws-sdk uber-JAR 1.11.86. Contributed by Steve Loughran and Sean Mackrory |
| 8394c1d02c1 | 2021-04-28 | Backport HADOOP-12537 S3A to support Amazon STS temporary credentials. Contributed by Sean Mackrory.        |
| 1c36296b9e8 | 2021-04-28 | Backport HADOOP-12723 S3A: Add ability to plug in any AWSCredentialsProvider. Contributed by Steven Wong.   |
| eed76986ecd | 2021-04-26 | Backport HADOOP-1540. Support file exclusion list in distcp. Contributed by Rich Haase                      |
| 912a88cdc84 | 2021-04-20 | MAPRHADOOP-167: jackson-mapper-asl updated to 1.9.13-atlassian-5                                            |

### Known Issues and Limitations

- None.

### Resolved Issues

- None.

### Hadoop 2.7.5.0 - 2104 (EEP 7.1.0) Release Notes

The notes below relate to the HPE Ezmeral Data Fabric distribution of Apache Hadoop.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 5854.

|                          |                                                                                                                                                                               |

### New in this Release

Hadoop 2.7.5.0 - 2104 introduces the following enhancements or HPE platform-specific behavior changes:

- All the fixes from Apache Hadoop 2.7.5 have been backported.
- Symbolic links are supported for all Hadoop operations.
- Hadoop Key Management Server (hadoop-kms) has been removed.
- Log4j APIs have moved to slf4j.
- Jetty version updated to 9.4.39.v2021032.
- [Service verifier](#).

### Fixes

This data-fabric release includes the following fixes on the base Apache release. For details, refer to the commit log for this project in GitHub.

| Commit   | Date (YYYY-MM-DD) | Comment                                                                                  |
|----------|-------------------|------------------------------------------------------------------------------------------|
| 48b8b44e | 2021-04-13        | MAPRHADOOP-165: Jetty updated to 9.4.39.v20210325 due CVE-2021-28165                     |
| 62625863 | 2021-04-06        | MAPRHADOOP-163:fix mapred-site.xml HS_IP new value change                                |
| 7df21655 | 2021-03-25        | MAPRHADOOP-161: ssl-client/server.xml should be updated after Hadoop upgrade             |
| 2c4da9f4 | 2021-03-22        | MAPRYARN-307: Job history server does not delete logs on new nodes with central logging  |
| 4406c09b | 2021-03-17        | MAPRYARN-299: Add service verifier to hadoop packages that contains a startable servicee |
| 961269d8 | 2021-03-15        | MAPRHADOOP-159: Fixed mfs and conf commands for Windows client                           |
| 6b28f579 | 2021-03-09        | MAPRHADOOP-155: CVE-2016-2402 vulnerability in okhttp                                    |
| ceb85f35 | 2021-03-05        | MAPRYARN-306: fix ConcurrentModificationException                                        |
| 705769a6 | 2021-03-03        | MAPRHADOOP-152: Updated Jetty to 9.4.38.v20210224 due CVEs                               |

|          |            |                                                                                                                                              |
|----------|------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| d72447ab | 2021-03-01 | Backport HADOOP-17223. Update org.apache.httpcomponents:httpClient to 4.5.13 and httpcore to 4.4.13                                          |
| 258214e1 | 2021-02-26 | Backport YARN-7590. Improve container-executor validation check. Contributed by Eric Yang.                                                   |
| e189bdf  | 2021-02-26 | MAPRYARN-294: Added missed API for ContainerLocalizer logs                                                                                   |
| e0e5e7ff | 2021-02-26 | Backport YARN-8039. Clean up log dir configuration in TestLinuxContainerExecutorWithMocks.testStartLocalizer. Contributed by Miklos Szegedi. |
| 1cac41e8 | 2021-02-26 | Backport YARN-5277. When localizers fail due to resource timestamps being out, provide more diagnostics. Contributed by Siddharth Ahuja      |
| 9df6eea0 | 2021-02-26 | Backport YARN-7705. Create the container log directory with correct sticky bit in C code. Contributed by Yufei Gu.                           |
| 989909e7 | 2021-02-26 | YARN-7363. ContainerLocalizer don't have a valid log4j config in case of Linux container executor. (Contributed by Yufei Gu)                 |
| 1ace3db4 | 2021-02-26 | Backport YARN-7261. Add debug message for better download latency monitoring. (Yufei Gu)                                                     |
| 7125273e | 2021-02-24 | MAPRHADOOP-147: Fixed __HS_IP__ address at mapred-site.xml after Hadoop update                                                               |
| 7430b2fc | 2021-02-23 | MAPRHADOOP-146: Added information about ACE to cp copy usages                                                                                |
| 1f3ff1a9 | 2021-02-22 | MAPRYARN-125: fix typo in deprecated key replacement                                                                                         |
| c2be584e | 2021-02-16 | MAPRYARN-283: Implement maxContainer queue element at the queue level                                                                        |
| 8c75d4dd | 2021-02-12 | Backported YARN-6752. Display reserved resources in web UI per application                                                                   |
| eaf1f314 | 2021-02-10 | MAPRYARN-292: Nodemanager does not delete the appcache application directories                                                               |
| c5ede6c4 | 2021-02-10 | MAPRHADOOP-120: Fixed symlink path for LocatedFileStatus                                                                                     |
| 897dca05 | 2021-02-08 | MAPRHADOOP-143: CVE-2020-17527 Tomcat 9.0.39 vulnerability. Updated to 9.0.43                                                                |
| 98fe6480 | 2021-02-03 | MAPRYARN-295: NodeManager shutdown with NPE in AsyncDispatcher Thread                                                                        |
| 5cf60bb9 | 2021-02-02 | MAPRHADOOP-142: MapTask checks if output dir exist in MFS ignoring the path schema                                                           |
| 21585148 | 2021-01-06 | MAPRHADOOP-88: Remove hadoop-kms                                                                                                             |
| e5a0ca54 | 2020-12-29 | MAPRYARN-288: Scheduler queue UI doesn't work                                                                                                |
| a1deb43c | 2020-12-24 | MAPRHADOOP-135: Moved ShuffleHandler to Netty 4                                                                                              |
| fa85c3c7 | 2020-12-07 | MAPRHADOOP-121: Added symlink support for LS and Delete operations                                                                           |
| 77b364a2 | 2020-12-07 | MAPRYARN-280: Support for symlinks as input/output for YARN application                                                                      |
| 7dfc54f2 | 2020-12-07 | MAPRHADOOP-121: Support symlinks for CLI                                                                                                     |
| 23ed8d45 | 2020-11-27 | MAPRHADOOP-116 Move log4j APIs over to slf4j                                                                                                 |
| df184cf8 | 2020-11-02 | MAPRHADOOP-79: Update jackson to 2.11.1                                                                                                      |

|          |            |                                                                                |
|----------|------------|--------------------------------------------------------------------------------|
| a3119a41 | 2020-10-08 | Backport some changes from hadoop-13597                                        |
| 641791bf | 2020-10-06 | Backport MFS-11328: Link activation jar under lib to find the class DataSource |
| 3960fa46 | 2020-10-05 | MAPRHADOOP-114: Update jetty dependency to version 9                           |

For complete details, refer to the commit log for this project in GitHub.

### Known Issues and Limitations

- None.

### Resolved Issues

- None.

### Hadoop 2.7.4.100 - 2101 (EEP 7.0.1) Release Notes

The notes below relate to the HPE Ezmeral Data Fabric distribution of Apache Hadoop.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 5854.

### New in this Release

This release includes bug fixes and updates but no significant new features.

### Fixes

This data-fabric release includes the following fixes on the base Apache release. For details, refer to the commit log for this project in GitHub.

| Commit  | Date (YYYY-MM-DD) | Comment                                                                                                                                            |

- None.

### Resolved Issues

- None.

### Hadoop 2.7.4.0-2009 (EEP 7.0.0) Release Notes

The notes below relate to the HPE Ezmeral Data Fabric distribution of Apache Hadoop.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 5854.

### New in this Release

This release:

- Decouples Hadoop from core and splits Hadoop into the following packages:
  - `mapr-hadoop-util`
  - `mapr-hadoop-client`
  - `mapr-hadoop-core`

The `mapr-mapreduce2` package has been removed.

- Decouples the following YARN resources from core and moves them to the MEP repository:
  - `mapr-nodemanager`
  - `mapr-resourcemanager`
  - `mapr-historyserver`
  - `mapr-timelineserver`
- Provides support for YARN CGroups.
- Adds a CLI feature to manage the `node.labels` file that updates and autogenerates the labels file.
- Provides support for JDK 11.
- Adds saving ACE for Hadoop FS commands.

**Fixes**

This data-fabric release includes the following fixes on the base Apache release. For details, refer to the commit log for this project in GitHub.

| e94706b9266 | 2019-07-09 | MAPRHADOOP-54: Add ability to fetch node labels through RM Rest API                                                                                                                                                                                                  |
| bb7d41d794c | 2019-07-04 | MAPRYARN-200: Backport YARN-6797: TimelineWriter does not fully consume the POST response                                                                                                                                                                            |
| 1b02dfa19d0 | 2019-06-27 | MAPRHADOOP-52: update dependency (upgrade version commons-compress and netty)                                                                                                                                                                                        |
| d0315775926 | 2019-06-27 | Backported HADOOP-14597. Native compilation broken with OpenSSL-1.1.0. Contributed by Ravi Prakash.                                                                                                                                                                  |
| bbfad1bdc9f | 2019-06-26 | MAPRYARN-191: Fixed some ClientRMService node/labels related methods.                                                                                                                                                                                                |
| 28e0de41fc3 | 2019-06-21 | MAPRHADOOP-49: Hadoop configuration after installation incomplete                                                                                                                                                                                                    |
| f8560dd218  | 2019-06-20 | MAPRYARN-195: Fixed compare method at DominantResourceFairnessPolicy, change weight calculation for CPU, MEMORY, DISK.                                                                                                                                               |
| ecc0d96cba4 | 2019-06-20 | Backported YARN-8436. FSParentQueue: Comparison method violates its general contract. (Wilfred Spiegelburg via Haibo Chen)                                                                                                                                           |
| 30ab0e70ef3 | 2019-06-18 | MAPRMR-8: Added property for the configuration max number of blocks in the split for CombineFileInputFormat                                                                                                                                                          |
| dd01c093203 | 2019-06-14 | MAPRHADOOP-37: Add copyAce logic on running Map Tasks                                                                                                                                                                                                                |
| 428acd4d377 | 2019-06-07 | MAPRYARN-192: Refactored label wrapper to handle edge conditions                                                                                                                                                                                                     |
| 632659bfa7f | 2019-06-07 | MAPRYARN-191: Edited node labels page to work with MapR specific.                                                                                                                                                                                                    |
| 6bdf170a840 | 2019-06-07 | MAPRYARN-191: Fixed yarn cluster -Inl to properly show label information.                                                                                                                                                                                            |
| 8d95c10257a | 2019-06-06 | MAPRYARN-192: Added AND support to label expression                                                                                                                                                                                                                  |
| 51919781c70 | 2019-06-04 | MAPRYARN-154: Added creation of nm-staging volume to LocalVolumeAuxService.                                                                                                                                                                                          |
| 97028f090e8 | 2019-06-03 | MAPRYARN-168: Added -XX:ErrorFile default location to YARN_OPTS.                                                                                                                                                                                                     |
| a44b8b3c195 | 2019-05-31 | MAPRYARN-182: Added AM/PM flag to last heartbeat report time.                                                                                                                                                                                                        |
| b43cb6a34a8 | 2019-05-30 | MAPRHADOOP-37: added copyAce method to AbstractMapRFileSystem.                                                                                                                                                                                                       |
| 1cd2861e7d2 | 2019-05-29 | MAPRYARN-187: Repair SLS to work with hadoop-2.7.4-mapr.                                                                                                                                                                                                             |
| ab38d390906 | 2019-05-28 | Backported YARN-4579. Allow DefaultContainerExecutor container log directory permissions to be configurable (rchiang via rkanter)                                                                                                                                    |

|             |            |                                                                                                                                                                                                                                                       |
|-------------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a283450c281 | 2019-05-24 | MAPRHADOOP-42: Excluded mapr specific properties from map-reduce unit tests                                                                                                                                                                           |
| 7d3f70347e3 | 2019-05-23 | Backported YARN-6078. Containers stuck in Localizing state. Adapted to 2.7 hadoop. (cherry picked from commit bd1a53c)                                                                                                                                |
| 2e3f1b93ab3 | 2019-05-23 | Backported YARN-6004. Refactor TestResourceLocalizationService#testDownloadingResources OnContainer so that it is less than 150 lines. (Chris Trezzo via mingma) (cherry picked from commit 61424da)                                                  |
| 9c9a8a89d49 | 2019-05-22 | MAPRHADOOP-42: Excluded mapr specific properties from unit tests                                                                                                                                                                                      |
| a043d169aeb | 2019-05-13 | MAPRYARN-183: changed the log levels to WARN from ERROR at LocalVolumeAusService.java                                                                                                                                                                 |
| e18c6c7bf33 | 2019-05-13 | MAPRHADOOP-40: Set default mapr_home in ssl-client/server conf                                                                                                                                                                                        |
| a7489d421c6 | 2019-05-13 | MAPRHADOOP-34: Property mapreduce.shuffle.ssl.enabled was add to the mapred-site.xml for secure clusters                                                                                                                                              |
| 12909327cc6 | 2019-05-07 | MAPRHADOOP-39: Option -R doesn't clean up yarn-site.xml                                                                                                                                                                                               |
| 81af4616c5a | 2019-05-03 | MAPRYARN-173: Fixed wrong constant usage in TestCapacityScheduler. Fixed using maxVcores instead of maxDisks in refreshMinimumAllocation in AbstractYarnScheduler. Created testRefreshMaximumResourceAllocationShouldReturnSameResourcesAsInArgument. |
| 7ffe8be41e  | 2019-04-26 | MAPRYARN-179: Fixed FairSharePolicy comparator.                                                                                                                                                                                                       |
| 0de1dad6d74 | 2019-04-24 | MAPRHADOOP-36: Add condition for getting MaprFS instead of LocalFS for writing logs in case of enabled DFS logging.                                                                                                                                   |
| bebab711a51 | 2019-04-24 | MAPRMR-7: added new variable to FileSystem.Cache.Key                                                                                                                                                                                                  |
| 9c32b7a4296 | 2019-04-23 | Backported HDFS-9612. DistCp worker threads are not terminated after jobs are done. (Wei-Chiu Chuang via Yongjun Zhang)                                                                                                                               |
| 86199b5232f | 2019-04-23 | Backported HDFS-9347. Invariant assumption in TestQuorumJournalManager.shutdown() is wrong. Contributed by Wei-Chiu Chuang.                                                                                                                           |
| 26dbab3311b | 2019-04-23 | MAPRYARN-175: yarn job fails to initialize when output directory is set to target cluster                                                                                                                                                             |
| 32ae1a69d69 | 2019-04-18 | Backported YARN-5969. FairShareComparator: Cache value of getResourceUsage for better performance. Fix using existing Resource.java API in 2.7.0 hadoop.                                                                                              |

| 74a66284ec8 | 2018-09-12 | Backported HADOOP-12292. Make use of DeleteObjects optional. (Thomas Demoor via stevel)                                           |
| a6b4c204373 | 2018-09-12 | Backported HADOOP-12269. Update aws-sdk dependency to 1.10.6 (Thomas Demoor via Lei (Eddy) Xu)                                    |

### Known Issues and Limitations

- None.

### Resolved Issues

- None.

## HBase Release Notes

The release notes for HBase component included in the HPE Ezmeral Data Fabric contains notes specific to data-fabric only.

More details are available on the Apache website under the [Release Notes for Apache HBase](#) page and the [Apache HBase Project](#) page.

### HBase 1.4.13.200 - 2201 (EEP 8.1.0) Release Notes

The notes below relate to the HPE Ezmeral Data Fabric distribution of HBase.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. You may also be interested in the [Ecosystem Component Release Notes](#) on page 5854 and the [Apache HBase homepage](#).

### New in this Release

HBase 1.4.13.200 - 2201 introduces the following enhancements or HPE platform-specific behavior changes:

- Federal Information Processing Standards (FIPS) support
- CVE fixes

- Bug fixes

### Fixes

This HPE release includes the following fixes on the base Apache release. For details, refer to the commit log for this project in GitHub:

| GitHub Commit Number | Date (YYYY-MM-DD) | HPE Fix Number and Description                                                                    |
|----------------------|-------------------|---------------------------------------------------------------------------------------------------|
| 12c2a75dff9          | 2022-02-09        | EEP-HBASE-280: FIPS mode check needs to be done over ssl-client instead of Zookeeper              |
| af61cf17008          | 2022-01-25        | EEP-HBASE-275: Upgrade Log4J version to '1.3.1-mapr'                                              |
| ddba4184c7           | 2022-01-13        | EEP-HBASE-274: HBase REST authentication doesn't work for /jmx and /conf                          |
| 45e13fbfe7           | 2022-01-05        | EEP-HBASE-271: Update log4j v2 to the latest available (to 2.17+)                                 |

|            |            |                                                                         |
|------------|------------|-------------------------------------------------------------------------|
| 21108dde8d | 2021-10-18 | MAPR-HBASE-251: HBase services can't start on cluster with enabled FIPS |
|------------|------------|-------------------------------------------------------------------------|

### Known Issues and Limitations

This release contains the following known issues and limitations:

- For a FIPS-enabled configuration, mixed mode support is not available in this release. For example, a non-FIPS client node cannot communicate with a FIPS server node.

### HBase 1.4.13.100 - 2110 (EEP 8.0.0) Release Notes

The notes below relate to the HPE Ezmeral Data Fabric distribution of HBase.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. You may also be interested in the [Ecosystem Component Release Notes](#) on page 5854 and the [Apache HBase homepage](#).

### New in this Release

HBase 1.4.13.0 - 2104 introduces the following enhancements or HPE platform-specific behavior changes:

- CVEs fixes.
- Extra loggings.
- [Service verifier](#).
- Bug fixes.

### Fixes

This HPE release includes the following fixes on the base Apache release:

| GitHub Commit Number | Date (YYYY-MM-DD) | HPE Fix Number and Description                                                                                                         |
|----------------------|-------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| 451ca18c25           | 2021-04-27        | MAPR-HBASE-233: Couldn't get into HBase shell on client node.                                                                          |
| 05892ab377           | 2021-04-13        | MAPR-HBASE-232: Impersonation doesn't work for hbase-rest. (cherry picking HBASE-21960 Ensure RESTServletContainer used by RESTServer) |
| c517c848b5           | 2021-03-30        | MAPR-HBASE-218: Add service verifier to HBase package (Additional checks on services).                                                 |
| 229e1d69ca           | 2021-03-29        | MAPR-HBASE-217: HBase data loss due to RS crash, extra-logging added for investigation.                                                |
| 3cfa6a2055           | 2021-03-22        | MAPR-HBASE-218: Add service verifier to HBase package.                                                                                 |
| 9b736d6a70           | 2021-03-22        | MAPR-HBASE-167: Upgrade Jackson-Databind (transitive from HTrace) packaged with MapR-HBase.                                            |
| 3aed5b975a           | 2021-03-19        | MAPR-HBASE-230: Update HBase dependencies to the latest artifacts for MEP7.1.0 release.                                                |
| e2c24bb816           | 2021-03-17        | MAPR-HBASE-225: Opentsdb daemon process does not start after setting noexec to /tmp dir in MapR 6.1/MEP-6.2.                           |
| cd81f567e3           | 2021-03-12        | MAPR-HBASE-223: CVE: Security vulnerabilities in bootstrap.js (cherry picking HBASE-24971: updating JQuery).                           |
| 4a3138f81f           | 2021-03-04        | MAPR-HBASE-216: HBase process should start with ErrorFile option.                                                                      |
| 0fe43d8588           | 2021-03-02        | MAPR-HBASE-223: CVE: security vulnerabilities in bootstrap.js (cherry picking HBASE-25079 + HBASE-25261).                              |
| a0d4312e03           | 2021-02-23        | MAPR-HBASE-220: Dependency error for 3.0.1-b06-SNAPSHOT: PKIX path validation failed.                                                  |
| 0b0be18f3b           | 2021-02-11        | MAPR-HBASE-215: CVE-2014-3488, CVE-2019-16869 etc. Netty vulnerabilities.                                                              |

|            |            |                                                                                                  |
|------------|------------|--------------------------------------------------------------------------------------------------|
| 911a5d63db | 2021-02-09 | MAPR-HBASE-214: Vulnerabilities in Tomcat.                                                       |
| 8d43b042c4 | 2021-02-05 | MAPR-HBASE-207: HBase Web UIs display incorrectly when encryption is disabled on secure cluster. |

### New in this Release

- Java 11 Support
- CVEs fixes

### Fixes

This MapR release includes the following fixes on the base Apache release. For details, refer to the commit log for this project in GitHub.

| Commit   | Date (YYYY-MM-DD) | Comment                                                                                                 |
|----------|-------------------|---------------------------------------------------------------------------------------------------------|
| 63a98f35 | 2020-03-05        | MAPR-HBASE-145: Update protobuf version to 3.11.1                                                       |
| 2074692b | 2020-03-30        | MAPR-HBASE-141: Disable TLSv1 and TLSv1.1 protocol for Hbase thrift server                              |
| ceeefb42 | 2020-04-02        | MAPR-HBASE-152: Duplicates of some jars in the hbase lib directory                                      |
| b49b19fa | 2020-04-08        | MAPR-HBASE-151: Bad exception message                                                                   |
| 10e834fc | 2020-04-20        | MAPR-HBASE-164: Unable to modify a column family in a maprdb table using hbase shell                    |
| 177800e6 | 2020-04-23        | MAPR-HBASE-157: Fix io.netty vulnerability                                                              |
| 4a364d2b | 2020-04-03        | MAPR-HBASE-163: Unable to create buffered mutator for maprdb table                                      |
| 985f6ae1 | 2020-04-24        | MAPR-HBASE-154: Unable to start hbase shell with MapR ticket in case Kerberos is enables in the cluster |
| 65e21d86 | 2020-04-27        | MAPR-HBASE-165: ZK version updates to v3.5.6 for MEP 7.0.0                                              |
| ddde8d1b | 2020-04-30        | MAPR-HBASE-166: hbase hbck command incorrectly uses HBASE_REGIONSERVER_OPTS environment variable        |
| 041ca362 | 2020-05-07        | MAPR-HBASE-156: Fix org.codehaus.jackson vulnerability                                                  |
| 520ebadd | 2020-05-12        | MAPR-HBASE-172: Throw UnsupportedOperationException for unsupported maprdb methods                      |
| 11ccd452 | 2020-05-19        | MAPR-HBASE-170: Update Google Guava library version to `28.2-jre` in HBase 1.4.12                       |
| 2c67a1eb | 2020-05-22        | MAPR-HBASE-171: 'list_perm' and 'set_perm' commands are not available                                   |
| 9600575c | 2020-05-26        | MAPR-HBASE-168: HBase web pages don't look right                                                        |
| 2216faab | 2020-06-05        | MAPR-HBASE-173: HBase doesn't start on core 6.2.0 with Java11                                           |
| 58287ba0 | 2020-06-17        | MAPR-HBASE-158: Build and verify HBase and Java 11                                                      |
| 37be28c7 | 2020-07-03        | MAPR-HBASE-180: 404 ERROR for all requests to the hbase-rest                                            |
| f67c7c47 | 2020-07-10        | MAPR-HBASE-179: Warnings in the hbase shell                                                             |
| a466d4af | 2020-07-20        | MAPR-HBASE-181: HBase Rest Throws NoClassDefFoundError: org/apache/logging/log4j/core/Layout            |

|          |            |                                                                                                                                               |
|----------|------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| c9da5fd0 | 2020-07-20 | CORE-262 and CORE-263 Warden hbase memory/svc management add hbmaster and hbregionserver warden conf with the previously used memory settings |
| c726132a | 2020-07-22 | MAPR-HBASE-182: Could not finish disable_all/enable_all commands - 'enter' key does not work correctly in the hbase shell                     |
| 4abed490 | 2020-07-29 | MAPR-HBASE-183: Could not create region server group in the hbase shell                                                                       |
| 706c9461 | 2020-08-10 | MAPR-HBASE-185: Unnecessary string in the output of command 'show_filters'                                                                    |
| 77a95708 | 2020-08-19 | MAPR-HBASE-175: Hbase thrift Java JMX Server Insecure Configuration Remote Code Execution Vulnerability                                       |
| 796757af | 2020-08-19 | MAPR-HBASE-190: Update disruptor dependency to 3.4.2                                                                                          |
| e94abc9b | 2020-08-21 | MAPRDB-2275: [hbase-1.4.12] NPE in BufferedMutatorImpl.setRpcTimeout                                                                          |
| 70068f7a | 2020-08-28 | MAPR-HBASE-189: hbase.rest.client.RemoteAdmin.getRestVersion return 500 error                                                                 |
| b092745b | 2020-08-28 | CORE-468: fix issue causing hbase classpath to break                                                                                          |
| 049614b2 | 2020-09-01 | MAPR-HBASE-174: Hbase services fails with NPE when Credential Provider is configured.                                                         |

### Known Issues and Limitations

This release contains the following known issues and limitations:

- None

### HBase 1.1.13.500-2201 (EEP 6.3.6) Release Notes

The notes below relate to the HPE Ezmeral Data Fabric distribution of Apache HBase.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. You may also be interested in [Ecosystem Component Release Notes](#) on page 5854 and the [Apache HBase homepage](#).

### New in this Release

HBase 1.1.13.500 - 2201 introduces the following enhancements or HPE platform-specific behavior changes:

- CVE fixes
- Bug fixes

### Fixes

This HPE release includes the following fixes on the base Apache release. For details, refer to the commit log for this project in GitHub.

| GitHub Commit Number | Date (YYYY-MM-DD) | HPE Fix Number and Description                                                        |
|----------------------|-------------------|---------------------------------------------------------------------------------------|
| 3f220a0c74           | 2022-01-25        | EEP-HBASE-275: Upgrade Log4J version to '1.3.1-mapr'                                  |
| 7fdeb174ed           | 2022-01-13        | EEP-HBASE-274: HBase REST authentication doesn't work for /jmx and /conf              |
| a5f4e12215           | 2021-12-20        | EEP-HBASE-270: Update disruptor dependency in EEP-6.3.5                               |
| ec24def3de           | 2021-12-20        | EEP-HBASE-263: Log4j Vulnerabilities: CVE-2019-17571 -- Upgrading to 1.3.0-mapr       |
| 69fc348174           | 2021-12-14        | EEP-HBASE-263: Log4j Vulnerabilities: CVE-2019-17571                                  |
| 90584ea4d5           | 2021-11-18        | EEP-HBASE-260: Netty Vulnerabilities: WS-2020-0408, CVE-2021-37137 and CVE-2021-37136 |
| 42b703d124           | 2021-10-25        | MAPR-HBASE-252: [Hbase] CVE-2021-42340 Apache Tomcat DoS                              |

### Known Issues and Limitations

This release contains the following known issues and limitations:

- ASYNC-5: Data-fabric-SASL security is not implemented in AsyncHBase. As a result, an AsyncHBase client connection fails on a secure data-fabric cluster. **Workaround:** Implement AsyncHBase security or disable HBase security.
- Data-fabric client nodes cannot be configured for HBase by using the `configure.sh` script. **Workaround:** To configure an HBase client node, you can use the `configure_client.sh` script. For more information, see [Configuring HBase on a Client Node](#).
- MD-5925: Drill versions 1.11.0 through 1.16.0.x do not support querying HBase tables. **Workaround:** None.

- **ASync-9:** An error is generated when AsyncHBase is used to put data to a cluster with HBase and Kerberos configured. The error occurs when `hbase.rpc.protection` is set to `privacy` or `integrity` in the AsyncHbase client configuration. **Workaround:** To avoid the error, set `hbase.rpc.protection` to `authentication`.

### HBase 1.1.13.400-2110 (EEP 6.3.5) Release Notes

The notes below relate to the HPE Ezmeral Data Fabric distribution of Apache HBase.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. You may also be interested in [Ecosystem Component Release Notes](#) on page 5854 and the [Apache HBase homepage](#).

### Known Issues and Limitations

This release contains the following known issues and limitations:

- ASYNC-5: Data-fabric-SASL security is not implemented in AsyncHBase. As a result, an AsyncHBase client connection fails on a secure data-fabric cluster. **Workaround:** Implement AsyncHBase security or disable HBase security.
- Data-fabric client nodes cannot be configured for HBase by using the `configure.sh` script. **Workaround:** To configure an HBase client node, you can use the `configure_client.sh` script. For more information, see [Configuring HBase on a Client Node](#).
- MD-5925: Drill versions 1.11.0 through 1.16.0.x do not support querying HBase tables. **Workaround:** None.
- ASYNC-9: An error is generated when AsyncHBase is used to put data to a cluster with HBase and Kerberos configured. The error occurs when `hbase.rpc.protection` is set to `privacy` or `integrity` in the AsyncHbase client configuration. **Workaround:** To avoid the error, set `hbase.rpc.protection` to `authentication`.

### HBase 1.1.13.300-2104 (EEP 6.3.4) Release Notes

The notes below relate to the HPE Ezmeral Data Fabric distribution of Apache HBase.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. You may also be interested in [Ecosystem Component Release Notes](#) on page 5854 and the [Apache HBase homepage](#).

### New in this Release

HBase 1.1.13.300 - 2104 introduces the following enhancements or HPE platform-specific behavior changes:

- CVEs fixes.
- Extra loggings.
- Bug fixes.

### Fixes

This HPE release includes the following fixes on the base Apache release. For details, refer to the commit log for this project in GitHub.

| GitHub Commit Number | Date (YYYY-MM-DD) | HPE Fix Number and Description                                |
|----------------------|-------------------|---------------------------------------------------------------|
| 442bf075d7           | 2021-04-27        | MAPR-HBASE-233: Couldn't get into HBase shell on client node. |

|            |            |                                                                                                                       |
|------------|------------|-----------------------------------------------------------------------------------------------------------------------|
| c4b124d200 | 2021-03-29 | MAPR-HBASE-217: HBase data loss due to RS crash, extra-logging added for investigation.                               |
| af92293fe5 | 2021-03-22 | MAPR-HBASE-167: Upgrade Jackson-Databind (transitive from HTrace) packaged with MapR-HBase.                           |
| 2b694bbdd2 | 2021-03-17 | MAPR-HBASE-225: Opentsdb daemon process does not start after setting noexec to /tmp dir in MapR 6.1/MEP-6.2.          |
| 6539a26268 | 2021-03-16 | MAPR-HBASE-228: HBase mapreduce jobs failed with exitCode=1 due to shaded Guava (partially reverting MAPR-HBASE-192). |
| 00b6a7cdfc | 2021-03-12 | MAPR-HBASE-223: CVE: Security vulnerabilities in bootstrap.js (cherry picking HBASE-24971: updating JQuery).          |
| 0290b06632 | 2021-03-10 | MAPR-HBASE-224: HBase Rest threads go in loop while processing TLSv1.3 requests.                                      |
| a832859220 | 2021-03-04 | MAPR-HBASE-216: HBase process should start with ErrorFile option.                                                     |
| b356b53bc2 | 2021-03-02 | MAPR-HBASE-223: CVE: security vulnerabilities in bootstrap.js (cherry picking HBASE-25079 + HBASE-25261).             |
| c03d5db9b5 | 2021-02-11 | MAPR-HBASE-215: CVE-2014-3488,CVE-2019-16869 etc. Netty vulnerabilities.                                              |
| e0ad1f0ea1 | 2021-02-09 | MAPR-HBASE-214: Vulnerabilities in Tomcat.                                                                            |
| 2960be4671 | 2021-02-05 | MAPR-HBASE-207: HBase Web UIs display incorrectly when encryption is disabled on secure cluster.                      |

### Known Issues and Limitations

This release contains the following known issues and limitations:

- ASYNC-5: Data-fabric-SASL security is not implemented in AsyncHBase. As a result, an AsyncHBase client connection fails on a secure data-fabric cluster. Workaround: Implement AsyncHBase security or disable HBase security.
- Data-fabric client nodes cannot be configured for HBase by using the `configure.sh` script. Workaround: To configure an HBase client node, you can use the `configure_client.sh` script. For more information, see [Configuring HBase on a Client Node](#).
- MD-5925: Drill versions 1.11.0 through 1.16.0.x do not support querying HBase tables. Workaround: None.
- ASYNC-9: An error is generated when AsyncHBase is used to put data to a cluster with HBase and Kerberos configured. The error occurs when `hbase.rpc.protection` is set to `privacy` or `integrity` in the AsyncHbase client configuration. Workaround: To avoid the error, set `hbase.rpc.protection` to `authentication`.

### Known Issues and Limitations

This release contains the following known issues and limitations:

- ASYNC-5: MapR-SASL security is not implemented in AsyncHBase. As a result, an AsyncHBase client connection fails on a secure MapR cluster. Workaround: Implement AsyncHBase security or disable HBase security.
- MapR client nodes cannot be configured for HBase by using the configure.sh script. Workaround: To configure an HBase client node, you can use the configure\_client.sh script. For more information, see [Configuring HBase on a Client Node](#).
- MD-5925: Drill versions 1.11.0 through 1.16.0.x do not support querying HBase tables. Workaround: None.
- ASYNC-9: An error is generated when AsyncHBase is used to put data to a cluster with HBase and Kerberos configured. The error occurs when hbase.rpc.protection is set to privacy or integrity in the AsyncHbase client configuration. Workaround: To avoid the error, set hbase.rpc.protection to authentication.

### HBase 1.1.8-2101 (EEP 5.0.6) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache HBase.

|                              |                                                                                     |

**New in this Release**

HBase 1.1.8-2101 introduces the following enhancements or HPE platform-specific behavior changes:

- None.

**Fixes**

This HPE release includes the following fixes on the base release:

| Commit     | Date (YYYY-MM-DD) | Comment                                                                        |
|------------|-------------------|--------------------------------------------------------------------------------|
| e276401226 | 2021-01-12        | MAPR-HBASE-197: port locking of hbase rest and thrift services UI              |
| 312b45d089 | 2020-09-15        | MAPR-HBASE-191 Retrieve max version records using spark hbase binary connector |

For details, refer to the commit log for this project in GitHub.

**Known Issues and Limitations**

- None.

**Resolved Issues**

- None.

**HBase 1.1.8-2009 (EEP 5.0.5) Release Notes**

The notes below relate to the MapR Converged Data Platform.

These release notes contain only MapR-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 5854.

**New in this Release**

- Added HBase Master and RegionServer services.
- Added MaprSasl support for HBase Master, RegionServer, REST, and Thrift.
- Added configurable HTTP Security Headers.
- Added the use of HTTP principal for Kerberos authentication for HBase Thrift.

**Fixes**

This MapR release includes the following fixes on the base Apache release. For details, refer to the commit log for this project in GitHub.

| 438db6a8             | 2019-11-29 | CORE-347: fix handling of defaultdb                                                                                                          |
| 6f864c85             | 2019-11-28 | HBASE-134: fix usage of not_configure_yet and allow multiple configure.sh runs                                                               |

### Known Issues and Limitations

This release contains the following known issues and limitations:

- ASYNC-5: MapR-SASL security is not implemented in AsyncHBase. As a result, an AsyncHBase client connection fails on a secure MapR cluster. **Workaround:** Implement AsyncHBase security, or disable HBase security.
- MapR client nodes cannot be configured for HBase by using the `configure.sh` script. **Workaround:** To configure an HBase client node, you can use the `configure_client.sh` script. For more information, see [Configuring HBase on a Client Node](#) on page 177.
- MD-5925: Drill versions 1.11.0 through 1.16.0.x do not support querying HBase tables. **Workaround:** None.
- ASYNC-9: An error is generated when AsyncHBase is used to put data to a cluster with HBase and Kerberos configured. The error occurs when `hbase.rpc.protection` is set to `privacy` or `integrity` in the AsyncHbase client configuration. **Workaround:** To avoid the error, set `hbase.rpc.protection` to `authentication`.

### Resolved Issues

- None.

### HBase 1.1.8-1904 Release Notes

The notes below relate to the MapR Converged Data Platform.

These release notes contain only MapR-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 5854.

**New in this Release**

- HBase Master and HBase Regionserver are removed for MapR 6.0.0 and EEP 4.0.0. The Thrift and REST server packages are still available to support HPE Ezmeral Data Fabric Database binary tables.
- MapR-SASL authentication, encryption, and impersonation for HBase Thrift Gateway are enabled by default on secure clusters.
- On a secure cluster, by default, HBase REST and HBase Thrift read the `ssl-client.xml` file and configure SSL using this file.
- PAM authentication, encryption, and impersonation for HBase REST are enabled by default on secure clusters.

 **Note:** HBase Master and HBase Regionserver are still available for previous EEP releases.

### Resolved Issues

This MapR release includes the following bug fixes:

| Bug              | Description                                                                                                                                                                            |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bug 28640        | Updated Jersey version to 1.19.4 in the MapR Spark connector. In addition, fixed the build failure for licenses and added a Jersey servlet dependency in the hbase-server/pom.xml file |
| MAPR-HBASE-20    | Changed permissions to hbase-site.xml                                                                                                                                                  |
| MapR [Spark-245] | Fixed Spark integration with HPE Ezmeral Data Fabric Database binary on MapR-SASL                                                                                                      |
| MAPR-HBASE-22    | Adding Impersonation configuration for HBase REST (enabled by default on secure clusters)                                                                                              |
| MAPR-HBASE-24    | The key store and trust store password for hbase-rest and hbase-thrift are taken from ssl-client.xml                                                                                   |
| MAPR-HBASE-25    | Updated zookeeper version in HBase from 3.4.6 to 3.4.11                                                                                                                                |
| MAPR-HBASE-31    | Restart of HBase Rest and HBase Thrift services during configure.sh                                                                                                                    |
| MAPR-HBASE-2     | Enabled secure by default for HBase Rest/Thrift Gateway                                                                                                                                |

### HBase 1.1.8-1710 Release Notes

The notes below relate to the MapR Converged Data Platform.

|                               |                                                                                                                                                                               |

### New in this Release

HBase Master and HBase Regionserver are removed for MapR 6.0/MEP 4.0.0. The Thrift and REST server packages are still available to support HPE Ezmeral Data Fabric Database binary tables.

 **Note:** HBase Master and HBase Regionserver are still available for previous MapR/MEP releases.

### Resolved Issues

This MapR release includes the following bug fixes:

| Bug       | Description                                                                                                                                                                             |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bug 28640 | Updated Jersey version to 1.19.4 in the MapR Spark connector. In addition, fixed the build failure for licenses and added a Jersey servlet dependency in the hbase-server/pom.xml file. |

## HBase 1.1.8-1703 Release Notes

The notes below relate to the MapR Converged Data Platform.

|                            |                                                                                     |

### New in This Release

This is the initial MapR release of HBase 1.1. In addition to HBase 1.1 features, this release includes the following feature that is specific to MapR:

- **Default Database Setting.**

When you run `configure.sh`, a default database for HBase clients is automatically set based on the packages available on the cluster. When `mapr-hbase-regionserver` or `mapr-hbase-master` packages are installed on the cluster, HBase is the default database for all HBase client connections. You can use the `configure.sh -defaultdb` option to change the default database setting for the cluster or you specify a value to override the default in the HBase job configuration or the `hbase-site.xml`. For more information, see MapR's HBase and `configure.sh` documentation.

- **Default Ports**

The following ports for HBase 1.1 are changed:

Table

| Service                      | Port  |
|------------------------------|-------|
| HBase Master                 | 16000 |
| HBase Master (for GUI)       | 16010 |
| HBase RegionServer           | 16020 |
| HBase RegionServer (for GUI) | 16030 |
| HBase Status MultiCast       | 16100 |

**Note:** If you need to use the previous default ports from HBase 0.98.x, change the `hbase-site.xml` by adding the following properties:

```
<property>
 <name>hbase.master.port</name>
 <value>60000</value>
</property>
<property>
 <name>hbase.master.info.port</name>
 <value>60010</value>
</property>
<property>
 <name>hbase.regionserver.port</name>
 <value>60020</value>
</property>
<property>
 <name>hbase.regionserver.info.port</name>
 <value>60030</value>
</property>
```

### Fixes

This release by MapR includes the following fixes on the base Apache release. For complete details, refer to the commit log for this project in GitHub.

| Commit  | Date (YYYY-MM-DD) | Comment                                                                                                                                                       |
|---------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8cc858f | 2016-01-28        | Backported HBASE-14799 to fix potential security vulnerability in the commons-collections library when you accept and process Java object serialization data. |
| ed43aca | 2015-11-11        | <b>MAPR 13750:</b> fs.mapr.readbuffering and fs.mapr.aggregate.writes are now disabled for HBase RegionServers.                                               |

### New in This Release

This is the initial release of HBase 0.98.12.1.

When HBase 0.98.12.1 runs on MapR version 5.0, it includes the following updates for HPE Ezmeral Data Fabric Database:

- HTable.checkAndMutate() API is supported by HPE Ezmeral Data Fabric Database
- Truncate API will retain ACEs for HPE Ezmeral Data Fabric Database binary tables

For more information about HPE Ezmeral Data Fabric Database API compatibility, refer to HPE Ezmeral Data Fabric Database documentation for *Creating HPE Ezmeral Data Fabric Database Applications with Java*.

### Fixes

This release by MapR includes the following fixes on the base Apache release. For complete details, refer to the commit log for this project in GitHub.

### New in This Release

- C APIs for HBase are supported by HPE Ezmeral Data Fabric Database in MapR version 4.1.
- HBase Rest Gateway Server can be deployed as a pluggable service on MapR version 4.0.1 or higher.
- HBase 0.98.9 introduces the HBaseAdmin.truncateTable() API. In this MapR release of HBase, the HBaseAdmin.truncateTable() API is also supported for HPE Ezmeral Data Fabric Database tables with MapR version 4.0.1 or higher.
- The performance test utility for libhbase includes support for Zipfian and uniform random key generation. It also runs a performance test for scans.

**Note:** The HTable.checkAndMutate() API is not supported by HPE Ezmeral Data Fabric Database.

Apply the latest 4.x EBF patch if you want to use HBase replication. Contact Customer Support for details.

## Fixes

This release by MapR includes the following fixes on the base Apache release. For complete details, refer to the commit log for this project in GitHub.

| Commit  | Date (YYYY-MM-DD) | Comment                                                                                                                                                                                                                              |

## Hive Release Notes

The release notes for the Hive component included in the HPE Ezmeral Data Fabric contain notes specific to data-fabric only.

**Note:** To identify the EEP to which a specific release note belongs, see [EEP Release Notes](#) on page 5854. To see which operating systems support the ecosystem components in a specific EEP, see [EEP Components and OS Support](#) on page 5739 or [EEP Support and Lifecycle Status](#) on page 5734. To view release notes for prior data-fabric releases, see [Previous Versions](#) on page 6776.

### Hive 2.3.9 Release Notes

This section provides reference information, including new features, fixes, known issues, and limitations for Hive 2.3.9.

The following release notes for the Hive 2.3.9 component are included in the HPE Ezmeral Data Fabric distribution for Apache Hadoop:

**Hive 2.3.9.0 - 2201 (EEP 8.1.0) Release Notes**

The following notes relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hive. You may also be interested in the [Apache Hive-2.3.9 Release Notes](#) and the [Apache Hive homepage](#).

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Package Names                | Navigate to <a href="http://package.mapr.hpe.com/releases/MEP/">http://package.mapr.hpe.com/releases/MEP/</a> , and select your EEP(MEP) and OS to view the list of package names.                                                                                                                                                                                                                                                                                                                                                                                   |
| ODBC/JDBC Drivers            | <p>Hive 2.3.9 works with the following HPE Hive drivers:</p> <ul style="list-style-type: none"> <li>• ODBC Drivers <ul style="list-style-type: none"> <li>• <a href="#">Mac OS X</a></li> <li>• Linux <ul style="list-style-type: none"> <li>• <a href="#">32-bit</a></li> <li>• <a href="#">64-bit</a></li> </ul> </li> <li>• Windows <ul style="list-style-type: none"> <li>• <a href="#">32-bit</a></li> <li>• <a href="#">64-bit</a></li> </ul> </li> </ul> </li> </ul> <p>For additional driver information, see <a href="#">Connecting to HiveServer2</a>.</p> |

**Feature support**

The following list describes support of various components and functionality with Hive 2.3.9 - 2201:

- Supports Hive-2.3.9 on Tez-0.9.2 For more information, see [Tez 0.9.2 - 2201 \(EEP 8.1.0\) Release Notes](#) on page 6678.
- Does not support Hive on Spark. You cannot use Spark as a query engine for Hive. However, you can run Hive and Spark on the same cluster. You can also use Spark SQL and Drill to query Hive tables.
- Does not support HDFS encryption in Hive tables.
- Does not support LLAP with Hive-2.3.9 because Apache Slider is not an HPE supported ecosystem component.
- Starting from Hive 2.1, Hive must run the `schematool` command as an initialization step.

**Changes in default security configuration**

The following list describes changes in default security for Hive 2.3.9 - 2201:

- Starting from EEP-8.1.0, Hive supports SCRAM token and SCRAM-SHA-256 authentication in HPE Ezmeral Data Fabric.

Table

| # | Property                             | Data Type | Default value | Description                                                               |
|---|--------------------------------------|-----------|---------------|---------------------------------------------------------------------------|
| 1 | hive.delegation.token.authentication | String    | DIGEST        | Delegation token authentication method. Possible values are DIGEST, SCRAM |

To configure SCRAM token and SCRAM-SHA-256 authentication, set the following property on `HIVE_HOME/conf/hive-site.xml` file:

```
<property>
 <name>hive.delegation.token.authentication</name>
 <value>SCRAM</value>
</property>
```

Execute `MAPR_HOME/server/configure.sh -R` script on a newly installed and Data-Fabric SASL or KERBEROS secured cluster to automatically configure the following authentications:

1. For a FIPS enabled cluster, Hive configures `hive.delegation.token.authentication=SCRAM` authentication.
2. For a non-FIPS cluster if you configure Hadoop with `hadoop.security.token.authentication.method=SCRAM` authentication, Hive configures the SCRAM authentication.
3. For other clusters, Hive configures `hive.delegation.token.authentication=DIGEST` authentication.

For non-secure clusters, Hive configures `hive.delegation.token.authentication=DIGEST` authentication.

When you upgrade Hive, the upgrade does not update the value of the set `hive.delegation.token.authentication` property.

Manually set the value of `hive.delegation.token.authentication` property when you change the cluster settings from FIPS to non-FIPS or from non-FIPS to FIPS.

### New in This Release

Hive 2.3.9.0 - 2201 introduces the following enhancements or HPE platform-specific behavior changes:

- Starting from EEP-8.1.0, Hive supports FIPS and SCRAM SASL.
- Beginning with EEP 8.1.0, JAR artifacts for Hive use four digits instead of three digits. For example:

```
hive-service-rpc-2.3.9.0-mapr-SNAPSHOT.jar
hive-llap-ext-client-2.3.9.0-mapr-SNAPSHOT.jar
hive-exec-2.3.9.0-mapr-SNAPSHOT.jar
hive-beeline-2.3.9.0-mapr-SNAPSHOT.jar
```

If your application includes a Hive dependency in the `pom.xml` file, you must update the JAR artifact before using Hive 2.3.9 - 2201.

The Hive package name on [package.mapr.hpe.com](http://package.mapr.hpe.com) continues to use two digits, and the Hive root folder continues to use three digits.

- Improved `Describe` table operator in terms of fetching statistics of partitions. Starting from EEP 8.0.0, you can fetch the partition information using the `describe` command with `formatted` or `extended` statements.

Configure the `hive.describe.partitionedtable.ignore.stats` property to change the behaviour of fetching statistics of partitions. It is set to the default value of `false`.

```
<property>
 <name>hive.describe.partitionedtable.ignore.stats</name>
 <value>>false</value>
 <description>Enables partitioned table stats collection for 'DESCRIBE
FORMATTED' or 'DESCRIBE EXTENDED' commands</description>
</property>
```

```
<property>
 <name>hive.describe.partitionedtable.ignore.stats</name>
 <value>>true</value>
 <description>Disables partitioned table stats collection for
'DESCRIBE FORMATTED' or 'DESCRIBE EXTENDED' commands</description>
</property>
```

- Hive supports symbolic links on filesystem. See [Hive Features in HPE Ezmeral Data Fabric](#) on page 3755.

## Fixes

This HPE release includes the following fixes on the base release:

### Known Issues and Limitations

- [HIVE-1089](#): Hive on MapReduce engine does not support data insertion into Versioned buckets. You must use Unversioned buckets on MapReduce engine in S3 file system.

Hewlett Packard Enterprise recommends using Hive on Tez engine for full S3 file system support.

- [HIVE-19502](#): Unable to insert values into table stored by JdbcStorageHandler
- [HIVE-19286](#): NPE in MERGE operator on MR mode

- [HIVE-760](#): [Hive-2.3] Could not start hive-metastore on Centos 8 MetaException(message:Version information not found in metastore)

Starting in EEP 7.0.0, use the MySQL driver with MariaDB.

```
<property>
 <name>javax.jdo.option.ConnectionURL</name>
 <value>jdbc:mysql://localhost:3306/hive?
createDatabaseIfNotExist=true</value>
</property>
<property>
 <name>javax.jdo.option.ConnectionDriverName</name>
 <value>com.mysql.jdbc.Driver</value>
 <description>Driver class name for a JDBC metastore</description>
</property>
```

Some SELECT queries can be converted to a single FETCH task minimizing latency. Currently, the query should be single sourced and should not have a subquery or any aggregations or distincts (which incurs RS), lateral views and joins:

```
none : disable hive.fetch.task.conversion
minimal : SELECT star, filter on partition columns, LIMIT only
more : SELECT, filter, LIMIT only (support TABLESAMPLE and virtual
columns)
```

### Resolved Issues

- [MAPR-TEZ-172](#) fixes a [HIVE-789](#) known issue from [Hive 2.3.8 - 2104 \(EEP 7.1.0\) Release Notes](#) on page 6094 in this release.

### Hive 2.3.9 - 2110 (EEP 8.0.0) Release Notes

The following notes relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hive. You may also be interested in the [Apache Hive-2.3.9 Release Notes](#) and the [Apache Hive homepage](#).

|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Feature support

The following list describes support of various components and functionality with Hive 2.3.9 - 2110:

- Supports Hive-2.3.9 on Tez-0.9.2 For more information, see [Tez 0.9.2 - 2110 \(EEP 8.0.0\) Release Notes](#) on page 6679.
- Does not support Hive on Spark. You cannot use Spark as a query engine for Hive. However, you can run Hive and Spark on the same cluster. You can also use Spark SQL and Drill to query Hive tables.
- Does not support HDFS encryption in Hive tables.
- Does not support LLAP with Hive-2.3.9 because Apache Slider is not an HPE supported ecosystem component.
- Starting from Hive 2.1, Hive must run the `schematool` command as an initialization step.

### Changes in default security configuration

The following list describes changes in default security for Hive 2.3.9 - 2110:

- None.

### New in This Release

Hive 2.3.9 - 2110 introduces the following enhancements or HPE platform-specific behavior changes:

- Improved `Describe` table operator in terms of fetching statistics of partitions. Starting from EEP 8.0.0, you can fetch the partition information using the `describe` command with `formatted` or `extended` statements.

Configure the `hive.describe.partitionedtable.ignore.stats` property to change the behaviour of fetching statistics of partitions. It is set to the default value of `false`.

```
<property>
 <name>hive.describe.partitionedtable.ignore.stats</name>
 <value>>false</value>
 <description>Enables partitioned table stats collection for 'DESCRIBE FORMATTED' or 'DESCRIBE EXTENDED' commands</description>
</property>
```

```
<property>
 <name>hive.describe.partitionedtable.ignore.stats</name>
 <value>>true</value>
 <description>Disables partitioned table stats collection for 'DESCRIBE FORMATTED' or 'DESCRIBE EXTENDED' commands</description>
</property>
```

- Hive supports symbolic links on filesystem. See [Hive Features in HPE Ezmeral Data Fabric](#) on page 3755.

## Fixes

This HPE release includes the following fixes on the base release:

| GitHub Commit Number | Data (YYYY-MM-DD) | HPE Fix Number and Description                                                                |

| 051002d23a | 2021-05-22 | HIVE-6990 : Direct SQL fails when the explicit schema setting is different from the default on (Bing Li, Sergey Shelukhin via Ashutosh Chauhan)          |

### Known Issues and Limitations

- [HIVE-19502](#) Unable to insert values into table stored by JdbcStorageHandler
- [HIVE-19286](#) NPE in MERGE operator on MR mode
- [HIVE-760](#) [Hive-2.3] Could not start hive-metastore on Centos 8 MetaException(message:Version information not found in metastore)

Starting in MEP 7.0.0, use the MySQL driver with MariaDB.

```
<property>
 <name>javax.jdo.option.ConnectionURL</name>
 <value>jdbc:mysql://localhost:3306/hive?
createDatabaseIfNotExist=true</value>
</property>
<property>
 <name>javax.jdo.option.ConnectionDriverName</name>
 <value>com.mysql.jdbc.Driver</value>
 <description>Driver class name for a JDBC metastore</description>
</property>
```

Some SELECT queries can be converted to a single FETCH task minimizing latency. Currently, the query should be single sourced and should not have a subquery or any aggregations or distincts (which incurs RS), lateral views and joins:

```
none : disable hive.fetch.task.conversion
minimal : SELECT star, filter on partition columns, LIMIT only
more : SELECT, filter, LIMIT only (support TABLESAMPLE and virtual
columns)
```

**Resolved Issues**

- [MAPR-TEZ-172](#) fixes a [HIVE-789](#) known issue from [Hive 2.3.8 - 2104 \(EEP 7.1.0\) Release Notes](#) on page 6094 in this release.

**Hive 2.3.8 Release Notes**

This section provides reference information, including new features, fixes, known issues, and limitations for Hive 2.3.8.

The following release notes for the Hive 2.3.8 component are included in the HPE Ezmeral Data Fabric distribution for Apache Hadoop:

**Hive 2.3.8 - 2104 (EEP 7.1.0) Release Notes**

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hive. You may also be interested in the [Apache Hive-2.3.8 Release Notes](#) and the [Apache Hive homepage](#).

| Package Names                | Navigate to <a href="http://package.mapr.hpe.com/releases/MEP/">http://package.mapr.hpe.com/releases/MEP/</a> , and select your EEP and OS to view the list of package names.                                                                                                                                                                                                                                                                                                                                                                                        |
| ODBC/JDBC Drivers            | <p>Hive 2.3.8 works with the following HPE Hive drivers:</p> <ul style="list-style-type: none"> <li>• ODBC Drivers <ul style="list-style-type: none"> <li>• <a href="#">Mac OS X</a></li> </ul> </li> <li>• Linux <ul style="list-style-type: none"> <li>• <a href="#">32-bit</a></li> <li>• <a href="#">64-bit</a></li> </ul> </li> <li>• Windows <ul style="list-style-type: none"> <li>• <a href="#">32-bit</a></li> <li>• <a href="#">64-bit</a></li> </ul> </li> </ul> <p>For additional driver information, see <a href="#">Connecting to HiveServer2</a>.</p> |

**Feature support**

The following list describes support of various components and functionality with Hive 2.3.8 - 2104:

- Supports Hive-2.3.8 on Tez-0.9.2 For more information, see [Tez 0.9.2-2104 \(MEP 7.1.0\) Release Notes](#).
- Does not support Hive on Spark. You cannot use Spark as a query engine for Hive. However, you can run Hive and Spark on the same cluster. You can also use Spark SQL and Drill to query Hive tables.
- Does not support HDFS encryption in Hive tables.
- Does not support LLAP with Hive-2.3.8 because Apache Slider is not an HPE supported ecosystem component.

- Starting from Hive 2.1, Hive needs to run the `schematool` command as an initialization step.

### Changes in default security configuration

The following list describes changes in default security for Hive 2.3.8 - 2104:

- None.

### New in This Release

Hive 2.3.8 - 2104 introduces the following enhancements or HPE platform-specific behavior changes:

- Added configuration to view audit logs for connected, disconnected, and total connected users in HiveServer2.
- Added [Service verifier](#).

### Fixes

This HPE release includes the following fixes on the base release:

| GitHub Commit Number | Data (YYYY-MM-DD) | HPE Fix Number and Description                                                                                     |

### Known Issues and Limitations

- [HIVE-947](#): If you add `tez.history.logging.service.class` and `tez.tez-ui.history-url.base` properties to `tez-site.xml` file, Hive applications will fail in EEP 7.1.0. To fix this issue, remove these properties from the `tez-site.xml` configuration file.
- [HIVE-19502](#) Unable to insert values into table stored by JdbcStorageHandler
- [HIVE-19286](#) NPE in MERGE operator on MR mode
- [HIVE-789](#) [Hive-Hbase integration] Unable to run queries against hive-hbase tables. `ClassNotFoundException: HiveHBaseTableInputFormat` [MEP-7.0.0]

If you run an HBase + Hive + Tez integration in MEP 7.1.0, you may encounter the following exception:

```
Caused by: java.lang.ClassNotFoundException:
org.apache.hadoop.hbase.client.mapr.BaseTableMappingRules
 at java.base/
jdk.internal.loader.BuiltinClassLoader.loadClass(BuiltinClassLoader.java:581
)
 at java.base/
jdk.internal.loader.ClassLoaders$AppClassLoader.loadClass(ClassLoaders.java:
178)
 at java.base/java.lang.ClassLoader.loadClass(ClassLoader.java:522)
 ... 39 more
```

This exception can occur due to the new Tez classloader implemented in the Tez project. To resolve this issue, put the following additional JAR files in the `/apps/tez/tez-0.9` folder.

Issue the following commands before you run HBase + Hive + Tez integration in MEP 7.1.0:

```
hadoop fs -mkdir /apps/tez/tez-0.9/hbase
hadoop fs -put /opt/mapr/hbase/hbase-1.4.12/lib/* /apps/tez/tez-0.9/hbase/
```

Add the following property to `/opt/mapr/tez/tez-0.9/conf/tez-site.xml`:

```
<property>
<name>tez.lib.uris</name>
<value>${fs.defaultFS}/apps/tez/tez-0.9,${fs.defaultFS}/apps/tez/tez-0.9/
lib,${fs.defaultFS}/apps/tez/tez-0.9/hbase/</value>
</property>
```

It is assumed that the Hive version is 2.3, Hbase version is 1.4.12, Tez version is 0.9, Hadoop version is 2.7.4, Zookeeper version is 3.5.6.0, and ecosystem release is 2009.

[HIVE-760](#) [Hive-2.3] Could not start hive-metastore on Centos 8 `MetaException(message:Version information not found in metastore)`

Starting in MEP 7.0.0, use the MySQL driver with MariaDB.

```
<property>
 <name>javax.jdo.option.ConnectionURL</name>
 <value>jdbc:mysql://localhost:3306/hive?createDatabaseIfNotExist=true</
value>
</property>
<property>
 <name>javax.jdo.option.ConnectionDriverName</name>
 <value>com.mysql.jdbc.Driver</value>
 <description>Driver class name for a JDBC metastore</description>
</property>
```

Some SELECT queries can be converted to a single FETCH task minimizing latency. Currently, the query should be single sourced and should not have a subquery or any aggregations or distincts (which incurs RS), lateral views and joins:

```
none : disable hive.fetch.task.conversion
minimal : SELECT star, filter on partition columns, LIMIT only
more : SELECT, filter, LIMIT only (support TABLESAMPLE and virtual columns)
```

### Resolved Issues

- None.

### Hive 2.3.7 Release Notes

This section provides reference information, including new features, fixes, known issues, and limitations for Hive 2.3.7.

The following release notes for the Hive 2.3.7 component are included in the HPE Ezmeral Data Fabric distribution for Apache Hadoop:

#### Hive 2.3.7 - 2101 (EEP 7.0.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hive. You may also be interested in the [Apache Hive-2.3.7 Release Notes](#) and the [Apache Hive homepage](#).

### Feature support

The following list describes support of various components and functionality with Hive 2.3.7 - 2101:

- Supports Hive-2.3.7 on Tez-0.9.2 For more information, see [Tez 0.9.2-2101 \(MEP 7.0.1\) Release Notes](#).
- Does not support Hive on Spark. You cannot use Spark as an query engine for Hive. However, you can run Hive and Spark on the same cluster. You can also use Spark SQL and Drill to query Hive tables.
- Does not support HDFS encryption in Hive tables.
- Does not support LLAP with Hive-2.3.7 because Apache Slider is not an HPE supported ecosystem component.
- Starting from Hive 2.1, Hive needs to run the `schematool` command as an initialization step.

### Changes in default security configuration

The following list describes changes in default security for Hive 2.3.7 - 2101:

- None.

### New in This Release

Hive 2.3.7 - 2101 introduces the following enhancements or HPE platform-specific behavior changes:

- None.

### Fixes

This HPE release includes the following fixes on the base release:

| Commit  | Date (YYYY-MM-DD) | Comment                                                                                                                                                                                                       |

### Known Issues and Limitations

- [HIVE-19502](#) Unable to insert values into table stored by JdbcStorageHandler
- [HIVE-19286](#) NPE in MERGE operator on MR mode
- [HIVE-789](#) [Hive-Hbase integration] Unable to run queries against hive-hbase tables. ClassNotFoundException: HiveHBaseTableInputFormat [MEP-7.0.0]

If you run an HBase + Hive + Tez integration in MEP 7.0.1, you may encounter the following exception:

```
Caused by: java.lang.ClassNotFoundException:
org.apache.hadoop.hbase.client.mapr.BaseTableMappingRules
 at java.base/
jdk.internal.loader.BuiltinClassLoader.loadClass(BuiltinClassLoader.java:581
)
 at java.base/
jdk.internal.loader.ClassLoaders$AppClassLoader.loadClass(ClassLoaders.java:
178)
 at java.base/java.lang.ClassLoader.loadClass(ClassLoader.java:522)
 ... 39 more
```

This exception can occur due to the new Tez classloader implemented in the Tez project. To resolve this issue, put the following additional JAR files in the `/apps/tez/tez-0.9` folder.

Issue the following commands before you run HBase + Hive + Tez integration in MEP 7.0.1:

```
hadoop fs -mkdir /apps/tez/tez-0.9/hbase
hadoop fs -put /opt/mapr/hbase/hbase-1.4.12/lib/* /apps/tez/tez-0.9/hbase/
```

Add the following property to `/opt/mapr/tez/tez-0.9/conf/tez-site.xml`:

```
<property>
<name>tez.lib.uris</name>
<value>${fs.defaultFS}/apps/tez/tez-0.9,${fs.defaultFS}/apps/tez/tez-0.9/
lib,${fs.defaultFS}/apps/tez/tez-0.9/hbase/</value>
</property>
```

It is assumed that the Hive version is 2.3, Hbase version is 1.4.12, Tez version is 0.9, Hadoop version is 2.7.4, Zookeeper version is 3.5.6.0, and ecosystem release is 2009.

[HIVE-760](#) [Hive-2.3] Could not start hive-metastore on Centos 8 MetaException(message:Version information not found in metastore)

Starting in MEP 7.0.1, use the MySQL driver with MariaDB.

```
<property>
 <name>javax.jdo.option.ConnectionURL</name>
 <value>jdbc:mysql://localhost:3306/hive?createDatabaseIfNotExist=true</
value>
</property>
<property>
 <name>javax.jdo.option.ConnectionDriverName</name>
 <value>com.mysql.jdbc.Driver</value>
 <description>Driver class name for a JDBC metastore</description>
</property>
```

Some SELECT queries can be converted to a single FETCH task minimizing latency. Currently, the query should be single sourced and should not have a subquery or any aggregations or distincts (which incurs RS), lateral views and joins:

```
none : disable hive.fetch.task.conversion
minimal : SELECT star, filter on partition columns, LIMIT only
more : SELECT, filter, LIMIT only (support TABLESAMPLE and virtual columns)
```

### Resolved Issues

- None.

### Hive 2.3.7-2009 (EEP 7.0.0) Release Notes

This section provides reference information, including new features, fixes, known issues, and limitations for Hive 2.3.7-2009 in EEP 7.0.0.

Below are release notes for the Hive component included in the MapR Converged Data Platform. You may also be interested in the [Apache Hive homepage](#) and the following Apache Hive release notes:

- [Apache Hive-2.3.7 Release Notes](#)
- [Apache Hive-2.3.6 Release Notes](#)
- [Apache Hive-2.3.5 Release Notes](#)
- [Apache Hive-2.3.4 Release Notes](#)
- [Apache Hive-2.3.3 Release Notes](#)
- [Apache Hive-2.3.2 Release Notes](#)
- [Apache Hive-2.3.1 Release Notes](#)
- [Apache Hive-2.3.0 Release Notes](#)

These release notes contain MapR-specific information only and are not necessarily cumulative in nature. For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 5854.

| ODBC / JDBC Drivers | <p>Hive 2.3.7 works with the following MapR Hive ODBC drivers:</p> <ul style="list-style-type: none"> <li>• <a href="#">Mac OS X</a></li> <li>• Linux <ul style="list-style-type: none"> <li>• <a href="#">32-bit</a></li> <li>• <a href="#">64-bit</a></li> </ul> </li> <li>• Windows <ul style="list-style-type: none"> <li>• <a href="#">32-bit</a></li> <li>• <a href="#">64-bit</a></li> </ul> </li> </ul> <p>For additional driver information, see <a href="#">Connecting to HiveServer2</a> on page 3730.</p> |

### Feature Support

- Hive-2.3.7 works with Tez-0.9.2. For more information, see [Tez 0.9.2-2009 \(MEP 7.0.0\) Release Notes](#).
- Hive on Spark is not supported; you cannot use Spark as an execution engine for Hive. However, you can run Hive and Spark on the same cluster. You can also use Spark SQL and Drill to query Hive tables.
- HDFS encryption is not supported in Hive tables.
- LLAP is not supported with Hive-2.3.7, as Apache Slider is not a supported ecosystem component.
- In Hive 2.1 and later, Hive must run the `schematool` command as an initialization step.
- In EEPs 6.3.1 and 7.0.0, the default protocol version for TLS (SSL) is `TLSv1.2`, but you can modify the protocol version. For more information, see [Configure the TLS \(SSL\) Protocol Version in Hive](#) on page 3662.

### Default Security Configuration Change

By default, the `hive-site.xml` file now contains the following property on secured clusters:

| Property                                        | Default Value                                                                               |
|-------------------------------------------------|---------------------------------------------------------------------------------------------|
| <code>hive.metastore.pre.event.listeners</code> | <code>org.apache.hadoop.hive.ql.security.authorization.AuthorizationPreEventListener</code> |

This property is added to `hive-site.xml` during Hive updates (no version change) and upgrades (with version change).

### New Features

- None.

## Known Issues

- Some SELECT queries can be converted to a single FETCH task to minimize latency. Currently, a query should be single sourced, without a subquery, and should not have any aggregations or distincts (which incurs RS), lateral views, or joins:
  - none: disable `hive.fetch.task.conversion`
  - minimal: SELECT \*, filter on partition columns, LIMIT only
  - more: SELECT, filter, LIMIT only (support TABLESAMPLE and virtual columns)
- Use MySQL driver with MariaDB. In `hive-site.xml`, set the following properties:

```
<property>
 <name>javax.jdo.option.ConnectionURL</name>
 <value>jdbc:mysql://localhost:3306/hive?
createDatabaseIfNotExist=true</value>
</property>
<property>
 <name>javax.jdo.option.ConnectionDriverName</name>
 <value>com.mysql.jdbc.Driver</value>
 <description>Driver class name for a JDBC metastore</description>
</property>
```

- [HIVE-19502](#) - Unable to insert values into table stored by JdbcStorageHandler.
- [HIVE-19286](#) - NPE in MERGE operator in MR mode.
- [HIVE-760](#) - [Hive-2.3] Could not start hive-metastore on Centos 8 MetaException(message:Version information not found in metastore)
- [HIVE-789](#) - [Hive-Hbase integration] Unable to run queries against hive-hbase tables.

When using HBase with Hive-on-Tez, some queries, such as SELECT COUNT(\*), fail because the new Tez classloader cannot load the MapR-specific classes. When this occurs, the system returns the following exception:

```
org.apache.hadoop.hbase.client.mapr.BaseTableMappingRules
 at java.base/
jdk.internal.loader.BuiltinClassLoader.loadClass(BuiltinClassLoader.java:581)
 at java.base/
jdk.internal.loader.ClassLoaders$AppClassLoader.loadClass(ClassLoaders.java:178)
 at java.base/java.lang.ClassLoader.loadClass(ClassLoader.java:522)
 ... 39 more
```

## Workaround

This workaround resolves the issue when running HBase 1.4.12 with Hive 2.3 on Tez 0.9 in an environment with Hadoop 2.7.4 and ZooKeeper 3.5.6.0 in ecosystem release 2009.

To resolve the issue, complete the following steps before you run HBase with Hive-on-Tez:

1. Create the `/apps/tez/tez-0.9/hbase` directory:

```
hadoop fs -mkdir /apps/tez/tez-0.9/hbase
```

2. Add the HBase JAR files to the `/apps/tez/tez-0.9/hbase` directory:

```
hadoop fs -put /opt/mapr/hbase/hbase-1.4.12/lib/* /apps/tez/tez-0.9/hbase/
```

3. Update `/opt/mapr/tez/tez-0.9/conf/tez-site.xml` with the following property:

```
<property>
 <name>tez.lib.uris</name>
 <value>${fs.defaultFS}/apps/tez/tez-0.9,${fs.defaultFS}/apps/tez/tez-0.9/lib,${fs.defaultFS}/apps/tez/tez-0.9/hbase/</value>
</property>
```

## Fixes

This release by MapR includes the following fixes on the base Apache release. For complete details, refer to the commit log for this project in GitHub.

### Hive 2.3.6 Release Notes

This section provides reference information, including new features, fixes, known issues, and limitations for Hive 2.3.6.

The following release notes for the Hive 2.3.6 component are included in the MapR distribution for Apache Hadoop:

### Hive 2.3.6 - 2201 (EEP 6.3.6) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hive. You may also be interested in the [Apache Hive-2.3.6 Release Notes](#) and the [Apache Hive homepage](#).

|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Feature support

The following list describes support of various components and functionality with Hive 2.3.6 - 2201:

- Supports Hive-2.3.6 on Tez-0.9.1 For more information, see [Tez 0.9.1 - 2201 \(EEP 6.3.6\) Release Notes](#) on page 6686.
- Does not support Hive on Spark, so you cannot use Spark as an execution engine for Hive. However, you can run Hive and Spark on the same cluster. You can also use Spark SQL and Drill to query Hive tables.
- Does not support HDFS encryption in Hive tables.
- Does not support LLAP with Hive-2.3.6 because Apache Slider is not a supported HPE ecosystem component.
- Starting from Hive 2.1, Hive must run the `schematool` command as an initialization step.

### Changes in default security configuration

The following list describes changes in default security for Hive 2.3.6 - 2201:

- None.

### New in This Release

Hive 2.3.6 - 2201 introduces the following enhancements or HPE platform-specific behavior changes:

- Improved `Describe` table operator in terms of fetching statistics of partitions. Starting from EEP 6.3.5, you can fetch the partition information using the `describe` command with `formatted` or `extended` statements.

Configure the `hive.describe.partitionedtable.ignore.stats` property to change the behaviour of fetching statistics of partitions. It is set to the default value of `false`.

```
<property>
 <name>hive.describe.partitionedtable.ignore.stats</name>
 <value>false</value>
 <description>Enables partitioned table stats collection for 'DESCRIBE
 FORMATTED' or 'DESCRIBE EXTENDED' commands</description>
</property>
```

```
<property>
 <name>hive.describe.partitionedtable.ignore.stats</name>
 <value>true</value>
 <description>Disables partitioned table stats collection for
 'DESCRIBE FORMATTED' or 'DESCRIBE EXTENDED' commands</description>
</property>
```

## Fixes

This HPE release includes the following fixes on the base release:

| be8520b3dc           | 2021-10-08        | HIVE-16820 : TezTask may not shut down correctly before submit (Sergey Shelukhin, reviewed by Siddharth Seth) |

### Known Issues and Limitations

- [HIVE-19502](#) Unable to insert values into table stored by JdbcStorageHandler
- [HIVE-19286](#) NPE in MERGE operator on MR mode

Some SELECT queries can be converted to a single FETCH task minimizing latency. Currently, the query should be single sourced, not having any subquery, and should not have any aggregations or distincts (which incurs RS), lateral views or joins:

```
none : disable hive.fetch.task.conversion
minimal : SELECT star, filter on partition columns, LIMIT only
more : SELECT, filter, LIMIT only (support TABLESAMPLE and virtual columns)
```

### Resolved Issues

- None.

### Hive 2.3.6 - 2110 (EEP 6.3.5) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hive.

|              |              |
|--------------|--------------|
| Hive Version | 2.3.6        |
| Release Date | October 2021 |

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| ODBC/JDBC Drivers            | <p>Hive 2.3.6 works with the following HPE Hive drivers:</p> <ul style="list-style-type: none"> <li>• ODBC Drivers <ul style="list-style-type: none"> <li>• <a href="#">Mac OS X</a></li> <li>• Linux <ul style="list-style-type: none"> <li>• <a href="#">32-bit</a></li> <li>• <a href="#">64-bit HIVE-20204</a></li> </ul> </li> <li>• Windows <ul style="list-style-type: none"> <li>• <a href="#">32-bit</a></li> <li>• <a href="#">64-bit</a></li> </ul> </li> </ul> </li> </ul> <p>For additional driver information, see <a href="#">Connecting to HiveServer2</a>.</p> |

### Feature support

The following list describes support of various components and functionality with Hive 2.3.6 - 2110:

- Supports Hive-2.3.6 on Tez-0.9.1 For more information, see [Tez 0.9.1-2104\(MEP 6.3.4\) Release Notes](#).
- Does not support Hive on Spark, so you cannot use Spark as an execution engine for Hive. However, you can run Hive and Spark on the same cluster. You can also use Spark SQL and Drill to query Hive tables.
- Does not support HDFS encryption in Hive tables.
- Does not support LLAP with Hive-2.3.6 because Apache Slider is not a supported HPE ecosystem component.
- Starting from Hive 2.1, Hive must run the `schematool` command as an initialization step.

### Changes in default security configuration

The following list describes changes in default security for Hive 2.3.6 - 2110:

- None.

### New in This Release

Hive 2.3.6 - 2110 introduces the following enhancements or HPE platform-specific behavior changes:

- Improved `Describe` table operator in terms of fetching statistics of partitions. Starting from EEP 6.3.5, you can fetch the partition information using the `describe` command with `formatted` or `extended` statements.

Configure the `hive.describe.partitionedtable.ignore.stats` property to change the behaviour of fetching statistics of partitions. It is set to the default value of `false`.

```
<property>
 <name>hive.describe.partitionedtable.ignore.stats</name>
 <value>>false</value>
 <description>Enables partitioned table stats collection for 'DESCRIBE
 FORMATTED' or 'DESCRIBE EXTENDED' commands</description>
</property>
```

```
<property>
 <name>hive.describe.partitionedtable.ignore.stats</name>
 <value>>true</value>
 <description>Disables partitioned table stats collection for
 'DESCRIBE FORMATTED' or 'DESCRIBE EXTENDED' commands</description>
</property>
```

## Fixes

This HPE release includes the following fixes on the base release:

| GitHub Commit Number | Data (YYYY-MM-DD) | HPE Fix Number and Description                                                                |
|----------------------|-------------------|-----------------------------------------------------------------------------------------------|
| 5cf874c69e           | 2021-09-14        | MAPR-HIVE-1007: Permission denied to hbase temp files while running hcat jobs from other user |
| d40b435ebc           | 2021-08-17        | MAPR-HIVE-977 : Downgrade jackson to v2.11.1 or to 2.11.3 to be consistent with core version  |
| 55471aefc0           | 2021-07-29        | MAPR-HIVE-960 : CVE-2012-5783 vulnerability in commons-httpclient                             |
| 96739404d6           | 2021-07-23        | MAPR-HIVE-965 : Throws exception at INSERT statement with Avro table on MapReduce engine      |
| 864aa58888           | 2021-07-21        | MAPR-HIVE-959 : Update derbyclient and derbynet to most feasible version                      |
| dbc1444cce           | 2021-07-21        | MAPR-HIVE-963 : CVE-2020-13956, WS-2017-3734 vulnerabilities in httpclient                    |
| f1b65a14f4           | 2021-07-21        | MAPR-HIVE-962 : WS-2019-0379: commons-codec vulnerability                                     |
| de8eff00d4           | 2021-06-28        | MAPR-HIVE-896 : CVE-2020-17521 vulnerability in Groovy                                        |
| d6cc638433           | 2021-06-22        | MAPR-HIVE-927 : NPE thrown from XmlUtil by Hive Client                                        |
