Integrating the MapR GitHub and Maven Repositories

This topic provides instructions for cloning the GitHub and Maven repositories for a MapR open source project into your Eclipse IDE.

Integrating Git

Procedure

1. Open the Git Repository perspective by selecting **Window>Open Perspective>Other...** then choosing **Git Repository Exploring**.
2. From the Git Repository perspective, click the  button to display the **Clone Git Repository** dialog.

Source Git Repository

Enter the location of the source repository.

Location

URI:

Host:

Repository path:

Connection

Protocol:

Port:

Authentication

User:

Password:

Store in Secure Store

3. From a web browser, navigate to the MapR [repository](#), then select the project you want to clone.

4. Copy the git URI from the project page to your clipboard by clicking the  button.
5. In the **Clone Git Repository** dialog, paste the git URI into the **URI:** field, then click **Next**. Eclipse will connect to github and download the repository metadata, then display a list of branches.
6. Select the branches you wish to clone, then click **Next**.

- Configure the destination directory, then click **Finish**. Eclipse downloads the project from github and adds it to your view.

Integrating Maven

Procedure

- Start a new Maven project, or convert your current project into a Maven project if necessary.
- Select **Window>Show View>Package Explorer** to show your current Maven project.
- Add the following lines to your project's `pom.xml` file:

```
<repositories>
  <repository>
    <id>mapr-releases</id>
    <url>https://repository.mapr.com/maven/</url>
    <snapshots><enabled>false</enabled></snapshots>
    <releases><enabled>true</enabled></releases>
  </repository>
</repositories>
```

- In a browser, navigate to the MapR [Maven Repository](#) and search for the Maven artifact your project depends on. You can also [browse](#) the repository.
- In the Package Explorer, right-click your project and select **Maven>Add Dependency**.

- Enter the `groupId`, `artifactId`, and `version` values for the dependency, then click **OK**.
- Refresh the workspace by pressing F5. Your Maven dependencies download automatically.

Developer's Reference

This section contains in-depth information for the developer.

HPE Ezmeral Data Fabric Database Shell (JSON Tables)

The `mapr dbshell` is a tool that enables you to create and perform basic manipulation of JSON tables and documents. You run `dbshell` by typing `mapr dbshell` on the command line after logging into a node in a HPE Ezmeral Data Fabric cluster.

NOTE: HPE Ezmeral Data Fabric Database Shell does not support HPE Ezmeral Data Fabric Streams streams operations.

Permissions

Before running `dbshell`, your user ID must have both the `readAce` and `writeAce` permissions on the volume. For information about these permissions, see [Managing Whole Volume ACEs](#) on page 1797.

SUSE Linux Error Messages

When you run `dbshell` on SUSE Linux, you might see the following messages:

```
[INFO] Unable to bind key for unsupported operation: backward-delete-word
[INFO] Unable to bind key for unsupported operation: up-history
[INFO] Unable to bind key for unsupported operation: down-history
```

To suppress these messages, edit the `/etc/inputrc` file and rename the keywords as follows:

Original name	New name
backward-delete-word	backward-kill-word
down-history	next-history
up-history	previous-history

Command Descriptions

To get a list of supported `dbshell` commands, run `help` at the shell prompt:

```
* ! - Allows execution of operating system (OS) commands
* // - Inline comment markers (start of line only)
* ; - Inline comment markers (start of line only)
* cat - Print the content of the specified file on the standard output
* cd - Change the current directory to the specified path.
* clear - Clears the console
* cls - Clears the console
* create - Create a json table at the given path.
* date - Displays the local date and time
* debug - Sets/shows the debug mode.
* delete - Delete a document from the table.
* desc - Describes the properties of a table.
* drop - Deletes a MapR-DB json table.
* exists - Returns true if the table exists.
* exit - Exits the shell
* find - Retrieves one or more documents from the table.
* findbyid - Retrieves a single document from the table.
* help - List all commands usage
* indexlist - Retrieves the list of indexes for the specified table.
* indexscan - Scan the index and return the document in their natural order.
* insert - Inserts or replaces a document into the table.
* jsonoptions - Sets/shows the Json output options.
* list - Lists all tables in a folder or matching the specified pattern.
* ls - Lists files and folders.
* mkdir - Create a directory at the specified path.
* pwd - Print the absolute path of the current working directory.
```

```

* quit - Exits the shell
* replace - Replace a document based on condition.
* script - Parses the specified resource file and executes its commands
* system properties - Shows the shell's properties
* tableoptions - Sets/shows the MapR-DB Table access options.
* update - Update field in a single document.
* version - Displays shell version
* whoami - Prints the current MapR-DB Shell user.

```

Parameters

Various components of these commands will be either be in JSON (in case a list of key-value is required) or a single value following a switch identifying the component.

To get a list of parameters for a specific command, run `help <command>` at the prompt. For example: `help find` returns the following:

```

maprdb root:> help find
Command:                find
Description:            Retrieves one or more documents from the table.
Options:
  *, --t, --table       Table path. [required]
  --id                  Document Id.
  --fromid              Document Id to start from (inclusive)
  --toid                Document Id to stop at (exclusive)
  --limit               Maximum number of documents to return.
  --withtags, --withTags Enables/disables printing with extended Type
Tags.
  --pretty              Enables/disables pretty printing of the document.
  --offset              Skip first n number of rows in the result.
  --orderby             Sort result by the given fields.
  --c, --where          Condition in JSON format
  --f, --fields         Projections in JSON documents
  --q, --query          Query in JSON documents
Examples:
  find /tables/users
  find /tables/users --fromid user001 --toid user00a --limit 32

```

Value Types

Extended type values are shown using type tags. The scalar types are represented as follows:

- {"\$binary":"AAAASw=="}
- {"\$numberLong":21491}
- {"\$numeric":47.92}
- {"\$time":"14:35:28.981"}
- {"\$date":"2017-04-24T22:35:28.981Z"}
- {"\$dateDay":"2017-04-23"}

Bulk Operations

Currently, bulk conditional operations are not supported.

dbshell create

Describes how to use HPE Ezmeral Data Fabric Database shell to create a JSON table.

Description

To create JSON tables, run the `create <table path>` command.

When you create a JSON table using `mapr dbshell`, the default column family is created automatically. There are no commands for creating additional column families. To create column families, exit the shell and use the `maprcli table cf create` command.

NOTE: If you are using a 5.2.x dbshell client to connect to a 6.0 (or later) server, you must set the `insertionorder` table option to `false` before creating your table. The `insertionorder` option is not support as of 6.0. See the following example:

```
tableoptions --insertionorder false
```

Run `tableoptions` in `dbshell` to see the current setting of `insertionorder`.

Parameters

create Options	Description
<code>--t, --table <table path></code>	Table path Although the <code>--t</code> and <code>--table</code> qualifiers are optional, you must specify a <code><table path></code> .

Syntax

```
create <table path>
```

Example

In the following example, **data** is the volume name and **movies** is the new table name.

```
create /data/movies
```

dbshell delete

Description

The `dbshell delete` command deletes a single JSON document. To delete a document, specify the path of the table where the document is located, the ID of the document, and an optional condition. If the condition for the specified document evaluates to true, the document is deleted.

Parameters

delete Options	Description
<code>*, --t, --table</code> (Required)	Table path
<code>--id</code> (Required)	ID of the document to delete NOTE: You can specify this parameter only once.

delete Options	Description
--c, --where	OJAI condition, in JSON format The condition must qualify to perform the delete. See OJAI Query Condition Syntax on page 3246 for a description of the syntax.

Syntax

```
delete <table path> --id <row-key> --c <condition>
```

Example: Delete a Document if a Condition is Met

The following example deletes the document with the `_id` `id1`, if the condition `(a.b[0].boolean == false && (a.c.d != 5 || a.b[1].decimal > 1))` is met:

```
delete /tbl --id id1
  --c {
    "$and": [
      {"$eq": {"a.b[0].boolean": false}},
      {"$or": [
        {"$ne": {"a.c.d": 5}},
        {"$gt": {"a.b[1].decimal": 1}}
      ]}
    ]}
  ]}
```

Example: Delete a Document

The following example deletes a document with `_id` `movie0000002` from the `movies` table:

```
delete /data/movies --id movie0000002
```

dbshell drop

Description

To run the `drop` command, specify the path to the HPE Ezmeral Data Fabric Database JSON table.

Parameters

Table

drop Options	Description
*, --t, --table (Required)	Table path

Syntax

```
drop <table path>
```

Example

```
drop /data/movies
```

dbshell find or findbyid

To query JSON documents in HPE Ezmeral Data Fabric Database shell, use either the `find` or `findbyid` command. The `find` command enables you to scan complete tables and retrieve rows that satisfy projection and/or condition clauses. The `findbyid` command enables you to retrieve a single document with a given ID.

When you review the `find` examples, note that they are sometimes shown split across multiple lines for readability. You must enter the commands on a single line when you run them in dbshell.

NOTE: If your `find` query requires the [OJAI Distributed Query Service](#) on page 592, you must install the `mapr-drill-internal` package on the nodes where you run dbshell. The package is available in the MapR repository from which you download Ecosystem Packs. See [Data Fabric Repositories and Packages](#) on page 91 for details.

Syntax

```
find <table path> <options>
```

```
findbyid <table path> --id <key-row ID>
```

Parameters

find Options	findbyid Options	Description
<code>*, --t, --table</code> (Required)	<code>*, --t, --table</code> (Required)	Table path
<code>--id</code>	<code>--id</code> (Required)	Document ID For conditions on a single document ID, you can provide the ID either by using the <code>--id</code> switch or by specifying the ID in a condition payload. For example, <code>--id id1</code> is equivalent to <code>--c {"\$eq": {"_id": "id1"}}</code> . NOTE: You cannot specify multiple IDs using either syntax.
<code>--fromid</code>	n/a	Document ID to start from (inclusive)
<code>--toid</code>	n/a	Document ID to stop at (exclusive)
<code>--limit</code>	n/a	Maximum number of documents to return
<code>--withtags, --withTags</code>	<code>--withtags, --withTags</code>	Enables or disables printing with extended type tags Value: <code>True False</code> Default: <code>True</code>
<code>--pretty</code>	<code>--pretty</code>	Enables or disables pretty printing of documents Value: <code>True False</code> Default: <code>True</code>
<code>--offset</code>	n/a	Omits the first n number of documents in the result

find Options	findbyid Options	Description
--orderby	n/a	<p>Sorts the result by the given fields</p> <p>Specify sort order as either ascending or descending using the keywords, ASC or DESC, respectively.</p> <p>Default: ASC</p> <p> NOTE: The keywords ASC and DESC are case insensitive.</p> <p>Syntax:</p> <pre>find <table path> --orderby <field path>:<sortorder></pre> <p>See Query with --orderby on page 6289 for examples.</p>
--c, --where	--c, --where	<p>Condition, in JSON format</p> <p>See OJAI Query Condition Syntax on page 3246 for a description of the syntax.</p> <p>See Return Documents Using Projection and Conditions on page 6290 for a dbshell example that uses a condition specified in JSON format.</p>
--f, --fields	--f, --fields	<p>Projections in JSON documents</p> <p>See JSON Document Field Paths on page 603 for details about how to specify field paths.</p> <p>See Return Documents Using Projection and Conditions on page 6290 for an example.</p>

find Options	findbyid Options	Description
--q, --query	n/a	<p>Query JSON documents</p> <p>This option accepts a query string in JSON format with predefined keywords that define the behavior of the query.</p> <p>The following examples shows a query that uses three keywords:</p> <pre>find table/test --q { "\$select": "a", "\$limit": 2, "\$offset": 1 }</pre> <p> NOTE: The <code>find</code> command does not allow <code>--query</code> to work with other options, such as <code>--fields</code>, <code>--where</code>, and <code>--orderby</code>. For example, the following command ignores the <code>--f</code> option:</p> <pre>find table/test --f "a" --q {"\$limit": 2}</pre> <p>In addition, you should not enter the same keyword twice:</p> <pre>// Incorrect {"\$select": "a", "\$select": "b"}</pre> <pre>// Correct {"\$select": ["a", "b"]}</pre> <p>See Query with --query on page 6285 for more examples.</p>

Query with --query

When querying JSON documents with the `find` command, you can use OJAI query syntax with the `--query` option. With this option, you can specify keywords that determine the documents and the fields from those documents that the command returns.

Syntax

```
find <table path> --query <keywords>
```

 **NOTE:** The `find` command does not allow `--query` to work in tandem with other options such as `--fields`, `--where`, and `--orderby`.

For example, the following command does not return your desired results:

```
find /tbl --f a --q {"$limit": 2}
```

In addition, repetition of keywords in the `--query` option is not supported. You should not enter the same keyword twice:

```
// Incorrect
{"$select": "a", "$select": "b"}
```

```
// Correct
{"$select":["a","b"]}
```

Keywords for the --query Option

The --query option supports the following keywords:

--query Keywords	Equivalent find Option
<code>\$select</code>	Equivalent to the --f, --fields option
<code>\$where</code>	Equivalent to the --c, --where option
<code>\$limit</code>	Equivalent to the --limit option
<code>\$offset</code>	Equivalent to the --offset option
<code>\$orderby</code>	Equivalent to the --orderby option
<code>\$options</code>	No equivalent option

The following sections provide examples of each keyword. For more details, see [OJAI Query Syntax](#) on page 3243.

Sample JSON Document

The examples in this topic use the following sample JSON document:

```
{
  "_id": "id1",
  "a": {
    "b": [{"boolean":false}, {"decimal": 123.456}],
    "c": {
      "d":10,
      "e": "Hello"
    }
  },
  "m": "MapR wins"
}
```

\$select Syntax and Example

The \$select keyword defines the field path projections to be displayed in the result set.

The following syntax shows single and multiple field path projections:

```
// Single field path projection syntax
find <table path> --q {"$select": "<fieldpath>"}

// Multiple field path projection syntax
find <table path> --q {"$select":
["<fieldpath1>","<fieldpath2>","<fieldpath3>"]}
```

The following examples show single and multiple field path projections:

```
// Single field path projection example
find /tbl --q {"$select": "a.c.d"}

// Multiple field path projection example
find /tbl --q {"$select": ["a.c.d", "a.c.e", "m"]}
```

See [OJAI Query Projection](#) on page 3243 for more information about \$select.

\$where Syntax and Example

When using the `$where` keyword, define the condition using [OJAI Query Condition Syntax](#) on page 3246.

```
find <table path> --q {"$where":<condition>}
```

The following example performs a `find` operation with a projection and a condition:

```
find /tbl --q {"$select":"a.c.e",
              "$where":{"$and":[
                  {"$eq":{"a.b[0].boolean":false}},
                  {"$or":[
                      {"$ne":{"a.c.d":5}},
                      {"$gt":{"a.b[1].decimal":1}},
                      {"$lt":{"a.b[1].decimal":10}}
                    ]}
                ]}
            }
```

The projection is on field `a.c.e`. The condition is the following expression:

```
(a.b[0].boolean == false && (a.c.d != 5 || a.b[1].decimal > 1 ||
a.b[1].decimal < 10))
```

\$limit Syntax and Example

The `$limit` keyword sets the maximum number of documents to return. It only accepts positive integers. It throws an exception for negative or decimal values.

```
find <table path> --q {"$limit":<positive integer>}
```

The following example performs a `find` with a projection on the `a.c.e` and `m` fields and limits the result set to a max of 10 documents:

```
find /tbl --q {"$select":["a.c.e","m"],
              "$limit":10
            }
```

See [OJAI Query Limit](#) on page 3245 for more information about `$limit`.

\$offset Syntax and Example

The `$offset` keyword skips the first `n` number of rows in the result. If `n` is greater than the total number of documents, no documents are returned. It only accepts positive integers.

```
find <table path> --q {"$offset":<positive integer>}
```

The following example performs a `find` operation with projection on the `a.c.e` and `m` fields and offsets the result set to skip first five documents:

```
find /tbl --q {"$select":["a.c.e","m"],
              "$offset":5
            }
```

See [OJAI Query Offset](#) on page 3245 for more information about `$offset`.

\$orderby Syntax and Examples

The \$orderby keyword sorts the result on the specified fields.

The following shows the syntax and example of sorting a single field in the default ascending order:

```
// Syntax for sorting a single field in the default ascending order
find <table path> --q {"$orderby":"<field path>"}

// Example sort on field path a.c.e in the default ascending order
find /tbl --q {"$orderby":"a.c.e"}
```

The following show the syntax and examples of sorting a single field in ascending or descending order where <order> is ASC for ascending and DESC for descending:

```
// Syntax for sorting a single field in ASC/DESC order
find <table path> --q {"$orderby":{"<field path>":"<order>"}}

// Example sort on field path a.c.e in ascending order
find /tbl --q {"$orderby":{"a.c.e":"asc"}}

// Example sort on field path a.c.e in descending order
find /tbl --q {"$orderby":{"a.c.e":"desc"}}
```

NOTE: The keywords ASC and DESC are case insensitive.

The following shows the syntax and an example of sorting multiple fields in ascending and descending order:

```
// Syntax for sorting multiple field paths in ascending/descending order
find <table path> --q {"$orderby":[{"<field path1>":"<order>"},
                                {"<field path2>":"<order>"},
                                {"<field path3>":"<order>"}
                              ]}

// Example sort on field path a.c.d (in the default ascending order)
// and field path a.c.e in descending order
find /tbl --q {"$orderby":["a.c.d",{"a.c.e":"desc"}]}
```

See [OJAI Query Order By](#) on page 3244 for more information about \$orderby.

\$options Syntax and Example

The \$options keyword enables you to influence a query's execution path. The general syntax is as follows:

```
find <table path> --q {"$options":{"<option name>:<option value>"}}
```

When specifying the <option name>, you must separate the components of the option name, replacing the dots with curly braces and colons and enclosing each component in quotes. The following example shows you how to do this for the ojai.mapr.query.hint-using-index option. The example forces the query to use a secondary index named colIndex:

```
find /apps/test --q {
  "$where":{"$eq":{"col":10}},
  "$options":{"ojai":{"mapr":{"query":{"hint-using-index":"colIndex"}}}}
}
```

See [OJAI Query Options](#) on page 3227 for a complete list of available query options.

Query with --orderby

When querying JSON documents with the `find` command, you can use the `--orderby` option to order the data. You can specify either an ascending or descending sort using the keywords, `ASC` and `DESC`.

General Syntax

```
find <table path> --orderby <field path>:<sortorder>
```

The keywords `ASC` and `DESC` are case insensitive. Ascending is the default sort order.

Sample JSON Document

The following sample JSON document is used in examples in this section:

```
{
  "_id": "id1",
  "a": {
    "b": [{"boolean":false}, {"decimal": 123.456}],
    "c":{
      "d":10,
      "e":"Hello"
    }
  },
  "m": "MapR wins"
}
```

Simple Sort

The following syntax and example are a simple sort on a single field path in the default ascending sort order:

```
// Syntax
find <table path> --orderby <field path>

// Example
find /tbl --orderby a.c.d
```

Specific Sort on Single Field

The following syntax and example are a sort with a specified ordering on a single field path:

```
// Syntax
find <table path> --orderby <field path>:<sort order>

// Example
find /tbl --orderby a.c.d:desc
```

Specific Sort on Multiple Fields

The following syntax and example specify a sort ordering on each field path:

```
// Syntax
find <table path> --orderby <field path>:<sort order>,<field path>:<sort order>

// Example
find /tbl --orderby a.c.d:asc,a.c.e:desc
```

Mixed Mode Sort on Multiple Fields

The following syntax and example specify a sort ordering on one field path and use the default sort order (ascending) on another field path.

```
// Syntax
find <table path> --orderby <field path>:<sort order>,<field path>

// Example
find /tbl --orderby a.c.d:DESC,a.c.e
```

Query Examples with Other Options

This section contains examples of `findbyid` and `find` commands using options not used in examples in other sections.

Return all Documents

When you do not specify other options to `find` except the table path, the command returns all documents. The following example returns all documents that are in the `/data/movies` table:

```
find /data/movies
```

Return Limited Number of Documents with Specified Range of IDs

The following example returns at most 32 documents within a range of IDs that includes the specified starting ID and excludes the specified ending ID:

```
find /data/movies --fromid movie0000001 --toid movie0000100 --limit
32
```

Return all Documents with Specified ID

The following example returns the document that has the specified ID:

```
findbyid /data/movies --id movie0000002
```

Return Documents Using Projection and Conditions

The following example performs a `find` operation with a projection and condition and limits the result to 10 documents:

```
find /tbl --c {
  "$and": [
    {"$eq": {"a.b[0].boolean": false}},
    {"$or": [
      {"$ne": {"a.c.d": 5}},
      {"$gt": {"a.b[1].decimal": 1}},
      {"$lt": {"a.b[1].decimal": 10}}
    ]}
  ]}
--fields m,a.c.e --limit 10
```

The projection is on fields on `m` and `a.c.e`. The condition is the following expression:

```
(a.b.[0].boolean == false && (a.c.d != 5 || a.b[1].decimal > 1 ||
a.b[1].decimal < 10))
```

Returns Documents in Specified Order

The following example is identical to the previous one, except it also includes an ordering on the result:

```
find /tbl --c {
  "$and": [
    {"$eq": {"a.b[0].boolean": false}},
    {"$or": [
      {"$ne": {"a.c.d": 5}},
      {"$gt": {"a.b[1].decimal": 1}},
      {"$lt": {"a.b[1].decimal": 10}}
    ]}
  ]}
--fields m,a,c,e
--orderby m,a,c,e:desc
--limit 10
```

dbshell indexscan

Description

The `indexscan` command scans secondary indexes and returns the document ID and the values of the indexed and included fields. This includes displaying information about errors encountered inserting into the index.

Syntax

```
maprdb root:> indexscan
  <table path>
  --indexname <index name>
  --limit
  --withtags
  --pretty
  --mode
  --where
  --fields
  --decodeindexedfields
```

Parameters

Parameters	Description
<code>*</code> , <code>--t</code> , <code>--table</code> (Required)	Path of the JSON table
<code>--indexname</code> , <code>--indexName</code> (Required)	Name of the secondary index
<code>--limit</code>	Maximum number of documents to return
<code>--withtags</code> , <code>--withTags</code>	Enables or disables printing with extended JSON type tags Values: true false
<code>--pretty</code>	Enables or disables pretty printing of documents Values: true false

Parameters	Description
--mode	<p>Enables display of the error information for the index</p> <p>Value: <code>err</code></p> <p>If you specify <code>--mode err</code>, the command scans only rows with errors and prints the <code>_id</code> and <code>\$ERROR</code> fields. If you do not specify <code>--mode</code>, the command prints the <code>_id</code>, <code>indexed</code>, and <code>included</code> fields of rows that do not have errors.</p> <p>The following lists the types of errors:</p> <ul style="list-style-type: none"> • <code>KEY_TOO_LONG</code> • <code>INVALID_CAST</code>
--c, --where	<p>Condition, in JSON format, that filters the rows returned</p> <p>See OJAI Query Condition Syntax on page 3246 for a description of the syntax.</p>
--f, --fields	<p>Fields from the index to return</p> <p>See JSON Document Field Paths on page 603 for details about how to specify field paths.</p>
--decodeindexedfields	<p>Enables display of values for indexed fields that are nested documents or arrays</p> <p>Value: <code>true</code></p> <p> NOTE: This parameter ignores all other values, including specifying no value.</p>

Example: Simple Index

The following example uses a simple index where `index1` is on `table1`, field `a`.

```
// Insert one document
maprdb root:> insert /table1 --id 1 --value '{"a":7}'
Document with id: "1" inserted.

// Create index1 on table1 and index field a
# maprcli table index add -path /table1 -index index1 -indexedfields a

// Perform a normal indexscan; the _id field and the indexed field for the
document is displayed
maprdb root:> indexscan /table1 --indexname index1
{"_id":"1","a":7}
1 document(s) found.

// Insert another document with _id value as 2 with field a as a map
maprdb root:> insert /table1 --id 2 --value '{"a":[1,2,3]}'

// Perform a normal indexscan; the document that does not have the error is
displayed
maprdb root:> indexscan /table1 --indexname index1
{"_id":"2","a":[1,2,3]}
{"_id":"1","a":7}
2 document(s) found.

// Perform an indexscan with error mode; no errors are displayed because
MapR-DB 6.1 allows
```

```
// you to create indexes on array fields
maprdb root:> indexscan /table1 --indexname index1 --mode err
0 document(s) found.
```

Example: Composite Index

The following example uses a composite index with included fields, in which `index2` is on table `table1`, with indexed fields `a` and `b` and included field `c`.

```
// Insert a document with fields 'a', 'b' and 'c'.
maprdb root:> insert /table1 --id 2 --value '{"a":7,"b":"mapr","c":"db"}'
Document with id: "2" inserted.

// Create index2 on table1 with indexed fields a and b, and included field c
# maprcli table index add -path /table1 -index index2 -indexedfields
a,b -includedfields c

// Perform an indexscan
maprdb root:> indexscan /table1 --indexname index2
{"_id":"2","c":"db","a":7,"b":"mapr"}
1 document(s) found.

// Insert a document that has field a as a map
maprdb root:> insert /table1 --id 1 --value '{"a":
{"m":4},"b":"mapr","c":"db"}'
Document with id: "1" inserted.

// Perform a normal indexscan
maprdb root:> indexscan /table1 --indexname index2
{"_id":"1","c":"db","a":{"m":4},"b":"mapr"}
{"_id":"2","c":"db","a":7,"b":"mapr"}
2 document(s) found.

// Perform an indexscan with error mode; no errors are displayed because
MapR-DB 6.1 allows
// you to create indexes on array fields
maprdb root:> indexscan /table1 --indexname index2 --mode err
0 document(s) found.
```

Example: Index on Container Field Paths

Assume you have a table in the path `/apps/indexExample` with the following document:

```
{
  "_id": "10000",
  "FullName": {
    "LastName": "Smith",
    "FirstName": "John"
  },
  "Address": {
    "Street": "123 SE 22nd St.",
    "City": "Oakland",
    "State": "CA",
    "Zipcode": "94601-1001"
  },
  "Gender": "M",
  "AccountBalance": 999.99,
  "Email": "john.smith@company.com",
  "Phones": [
    {"Type": "Home", "Number": "555-555-1234"},
    {"Type": "Mobile", "Number": "555-555-5678"}
  ]
}
```

```

    {"Type": "Work", "Number": "555-555-9012"}
  ],
  "Hobbies": ["Baseball", "Cooking", "Reading"],
  "DateOfBirth": "10/1/1985"
}

```

The following example creates a composite index on the `Type` and `Number` subfields in the nested documents in the `Phones` array:

```

// Create idx3 on the table with indexed fields Phones[].Type and
Phones[].Number
# maprcli table index add -path /apps/indexExample -index idx3 \
  -indexedfields Phones[].Type,Phones[].Number

// Perform an indexscan WITHOUT the decodeindexedfields parameter.
// Three rows are returned, one for each element in the Phones[] array.
// The output contains no values for the indexed fields.
maprdb root:> indexscan /apps/indexExample --indexname idx3
{"_id":"10000"}
{"_id":"10000"}
{"_id":"10000"}
3 document(s) found

// Perform an indexscan WITH the decodeindexedfields parameter set to true.
// The output includes the values in the indexed fields.
maprdb mapr:> indexscan /apps/indexExample --indexname
idx3 --decodeindexedfields true
{"_id":"10000", "$idx":["Home", "555-555-1234"]}
{"_id":"10000", "$idx":["Mobile", "555-555-5678"]}
{"_id":"10000", "$idx":["Work", "555-555-9012"]}
3 document(s) found.

```

Troubleshooting Use Cases

Situations where you can use this command are as follows:

- List the contents of an index.
- Resolve encoding errors encountered inserting into an index.

See [Troubleshooting Secondary Indexes](#) on page 1389 for more information on these use cases.

dbshell insert

Description

The `dbshell insert` command adds documents to JSON tables. Specify the ID of the document in one of two ways:

- As the value of the `_id` field in the document
- As the value of the `--id` parameter in the `insert` command

If a document with the specified ID already exists, the command replaces the document with the new one.

Parameters

insert Options	Description
*, --t, --table (Required)	Table path
--id	ID of the document to insert or replace
--v, --value (Required)	JSON document to insert or replace
--c, --where	OJAI condition, in JSON format The condition must qualify to perform the insert. See OJAI Query Condition Syntax on page 3246 for a description of the syntax.

Syntax

```
insert --table <table path> --value '{"_id": "<row-key", < table field >}'
```

```
insert --table <table path> --id <row-key> --value '{"_id": "<row-key", < table field >}'
```

Example: Insert with _id Field

The following examples insert a document into a table using an `_id` field value:

```
insert /data/movies --value '{"_id": "movie0000002",
                             "title": "Developers on the Edge",
                             "studio": "Command Line Studios"}'
```

```
insert /tables/users --value '{"_id": "user001",
                              "first_name": "John",
                              "last_name": "Doe"}'
```

Example: Insert with --id Parameter

The following examples insert a document into a table using the `--id` parameter in the insert command:

```
insert /data/movies --id movie0000003 --value '{"title": "The Golden
Master",
                                                "studio": "All-Nighter"}'
```

```
insert /tables/users --id user002 --value '{"first_name": "Jane",
                                             "last_name": "Dane"}'
```

dbshell jsonoptions

Description

The `jsonoptions` command sets the JSON output and displays the output appropriately.

Parameters

Table

jsonoptions Options	Description
--pretty	<p>Enables or disables pretty printing mode</p> <p>Value: true false</p> <p>Default: true</p> <p>Pretty print mode displays the content of the documents as an indented hierarchy of field/value pairs. For example, if the value is <code>true</code>, the DATE data type appears as a Map:</p> <pre>"dob" : { "\$dateDay": "2012-10-20" }</pre>
--withtags, --withTags	<p>Enables or disables printing with extended JSON data type tags</p> <p>Value: true false</p> <p>Default: true</p> <p>For example, if the value is <code>false</code>, the DATE data type appears as a simple value:</p> <pre>"dob" : "2012-10-20"</pre>

Syntax

```
jsonoptions --pretty <true|false>
jsonoptions --withTags <true|false>
```

Example

```
jsonoptions --pretty true
jsonoptions --withTags false
```

dbshell list

Description

Lists all JSON tables in a folder or that matches a specific file pattern where the table resides.

Parameters

Table

list Options	Description
*, --p, --patternOrPath	A path and/or a file pattern

Syntax

```
list <path>
```

Example and Output

```
maprdb root:>list /demo
/demo/user
/demo/checkin
/demo/review
/demo/business
/demo/tip
5 table(s) found.
```

dbshell replace

Description

The `dbshell replace` command replaces a document in a JSON table. You can specify a condition with the command.

Parameters

replace Options	Description
<code>*</code> , <code>--t</code> , <code>--table</code> (Required)	Table path
<code>--id</code> (Required)	ID of the document to replace If the specified ID does not exist, the command inserts a new document with the values provided in the command.  NOTE: You can specify this parameter only once.
<code>--v</code> , <code>--value</code> (Required)	JSON document to insert or replace
<code>--c</code> , <code>--where</code>	OJAI condition, in JSON format The condition must qualify to perform the replace. See OJAI Query Condition Syntax on page 3246 for a description of the syntax.

Syntax

```
replace /tbl --id <id> --v {<document to replace>} [--c <condition>]
```

Example

```
replace /tables/users --id user002 --value '{"first_name": "Jane",
"last_name": "Doe"}'
```

dbshell update

Description

The `dbshell update` command updates JSON documents using OJAI mutations. An OJAI mutation allows you to append, decrement, delete, increment, combine, replace, and update fields in a JSON document.

The following table lists the mutations OJAI supports. See [Using OJAI Mutation Syntax](#) on page 3201 for a detailed description of all operations. Each operation in the table links to examples in this topic.

Mutation Operation	Description
Append	Appends values to binary, string, and array fields
Decrement	Decrements field values
Delete	Deletes fields
Increment	Increments field values
Merge	Combines nested documents with existing documents
Put	Replaces field values or adds new fields
Set	Updates field values or adds new fields

Parameters

update Options	Description
<code>*, --t, --table</code> (Required)	Table path
<code>--id</code> (Required)	ID of the document to update  NOTE: You can specify this parameter only once.
<code>--m, --mutation</code> (Required)	OJAI document mutation in JSON format See Using OJAI Mutation Syntax on page 3201 for a description of the syntax.
<code>--c, --where</code>	OJAI condition, in JSON format The condition must qualify to perform the update. See OJAI Query Condition Syntax on page 3246 for a description of the syntax.

Syntax

```
update <table path> --id <id> --m <mutation> [ --c <condition> ]
```

 **NOTE:** If the mutation provided as a part of the `--m` parameter has spaces, then you must enclose it within single quotes.

Sample JSON Document

The dbshell update examples in this topic use the following sample JSON document:

```
{
  "_id": "id1",
  "a": {
    "b": [{"boolean": false}, {"decimal": 123.456}],
    "c": {
      "d": 10,
      "e": "Hello"
    }
  },
  "m": "MapR wins"
}
```

Append Operation

This example performs append operations on fields `a.b` and `a.c.e`:

```
update /tbl --id id1 --m {
  "$append": [{ "a.b": { "appd": 1 } }, { "a.c.e": " MapR" } ]
}
```

When you apply this update command to the sample JSON document, the following is the resulting document:

```
{
  "_id" : "id1",
  "a" : {
    "b" : [ { "boolean" : false }, { "decimal" : 123.456 }, { "appd" : 1 } ],
    "c" : {
      "d" : 10,
      "e" : "Hello MapR"
    }
  },
  "m" : "MapR wins"
}
```

For more details about the `$append` operation, see [OJAI Append Mutations](#) on page 3202.

Decrement Operation

This example performs a decrement operation:

```
update /tbl --id id1 --m {
  "$decrement": { "a.c.d": 5 }
}
```

When you apply this update command to the sample JSON document, the following is the resulting document:

```
{
  "_id" : "id1",
  "a" : {
    "b" : [ { "boolean" : false }, { "decimal" : 123.456 } ],
    "c" : {
      "d" : 5,
      "e" : "Hello"
    }
  },
  "m" : "MapR wins"
}
```

NOTE: To decrement multiple fields, use an array to specify the fields.

For more details about the `$decrement` operation, see [OJAI Decrement Mutations](#) on page 3202.

Delete Operation

With the following example, the operation deletes multiple field paths in the document in a single command:

```
update /tbl --id id1 --m {
  "$delete": [ "a.b[1]", "a.c.e" ]
}
```

When you apply this update command to the sample JSON document, the following is the resulting document:

```
{
  "_id" : "id1",
  "a" : {
    "b" : [ { "boolean" : false } ],
    "c" : {
      "d" : 10
    }
  },
  "m" : "MapR wins"
}
```

The following example shows that if you need to delete only a single field, do not use the array notation:

```
update /tbl --id id1 --m {
  "$delete": "a.b[1]"
}
```

For more details about the `$delete` operation, see [OJAI Delete Mutations](#) on page 3203.

Increment Operation

This example performs an increment operation:

```
update /tbl --id id1 --m {
  "$increment": {"a.c.d":5}
}
```

When you apply this update command to the sample JSON document, the following is the resulting document:

```
{
  "_id" : "id1",
  "a" : {
    "b" : [ { "boolean" : false }, { "decimal" : 123.456 } ],
    "c" : {
      "d" : 15,
      "e" : "Hello"
    }
  },
  "m" : "MapR wins"
}
```

NOTE: To increment multiple fields, use an array to specify the fields.

For more details about the `$insert` operation, see [OJAI Increment Mutations](#) on page 3204.

Merge Operation

This example performs a merge operation:

```
update /tbl --id id1 --m {
  "$merge": {"a.c": {"d":11, "y": "yo"}}
}
```

When you apply this update command to the sample JSON document, the following is the resulting document:

```
{
  "_id" : "id1",
  "a" : {
    "b" : [ { "boolean" : false }, { "decimal" : 123.456 } ],
    "c" : {
      "d" : 11,
      "e" : "Hello",
      "y" : "yo"
    }
  },
  "m" : "MapR wins"
}
```

NOTE: `$merge` does not support the array format for merging two maps at two different field paths in the document.

For example, the following syntax is incorrect:

```
// WRONG Syntax
update /tbl --id id1 --m {"$merge":["a":{"b":1},{a":{"d":"MapR"}}]}
```

The following syntax is correct:

```
// CORRECT Syntax
update /tbl --id id1 --m {"$merge":{"a":{"b":1,"d":"MapR"}}}
```

It results in the following document:

```
{
  "_id" : "id1",
  "a" : {
    "b" : 1,
    "c" : {
      "d" : 10,
      "e" : "Hello"
    }
  },
  "d" : "MapR"
},
"m" : "MapR wins"
}
```

To merge multiple field paths that are non-overlapping, use the syntax described at either [Multiple Mutation Operations](#) on page 6302 or [Updates Without Explicit Mutation Operation Names](#) on page 6304.

For more details about the `$merge` operation, see [OJAI Merge Mutations](#) on page 3204.

Put Operation

This example performs a put operation. Unlike the set operation, the put *replaces* field values. Like the set operation, you do not need an array representation for a single field.

```
update /tbl --id id1 --m {
  "$put":[{"a.b":{"boolean":true},{a.c.d:"eureka"}},{a.x:1}]
}
```

When you apply this update command to the sample JSON document, the following is the resulting document:

```
{
  "_id" : "id1",
  "a" : {
    "b" : { "boolean" : true },
    "c" : {
      "d" : "eureka",
      "e" : "Hello"
    },
    "x" : 1
  },
  "m" : "MapR wins"
}
```

For more details about the `$set` operation, see [OJAI Put Mutations](#) on page 3205.

Set Operation

With this example, the command updates the document fields `a.b[0].boolean`, `a.c.d`, and `a.x`. If the field does not exist, the update command creates and sets it. The update fails if the existing field type does not match the new value. If the field exists and is the same type, the value is updated.

```
update /tbl --id id1 --m {
  "$set": [{"a.b[0].boolean":true}, {"a.c.d":11}, {"a.x":1}]
}
```

When you apply this update command to the sample JSON document, the following is the resulting document:

```
{
  "_id" : "id1",
  "a" : {
    "b" : [ { "boolean" : true }, { "decimal" : 123.456 } ],
    "c" : {
      "d" : 11,
      "e" : "Hello"
    },
    "x" : 1
  },
  "m" : "MapR wins"
}
```

NOTE: If you need to set only a single field, the command looks like the following:

```
update /tbl --id id1 --m {
  "$set": {"a.b[0].boolean":true}
}
```

For more details about the `$set` operation, see [OJAI Set Mutations](#) on page 3206.

Multiple Mutation Operations

You can combine more than one mutation operation in a single OJAI mutation by specifying each operation separated by a comma.

The following is an example that combines multiple operations:

```
update /tbl --id id1 --m
' {
  "$set": { "x": [1, 2, 3] },
  "$put": { "a.c.e": { "$binary": "AAAADg==" } },
  "$increment": "a.b[1].decimal",
  "$delete": "a.b[0]",
  "$merge": { "newDoc": { "k": "MapR DBShell rocks!!" } },
  "$append": { "m": "!!!" }
}'
```

The following is the resulting output:

```
{
  "_id" : "id1",
  "a" : {
    "b" : [ { "decimal" : 124.456 } ],
    "c" : {
      "d" : 10,
      "e" : { "$binary" : "AAAADg==" }
    }
  },
  "m" : "MapR wins!!!",
  "newDoc" : { "k" : "MapR DBShell rocks!!" },
  "x" : [ 1, 2, 3 ]
}
```

The operations behave in the following manner:

- The `$set` operation adds a new array `[1, 2, 3]` with field path `x` into the document.
- The `$put` operation replaces the existing string `"Hello"` with a nested document `{ "$binary": "AAAADg==" }`.
- The `$delete` operation deletes the field path `a.b[0]` from the document.
- The `$merge` operation merges a new nested document `{ "newDoc": { "k": "MapR DBShell rocks!!" } }`.
- The `$append` operates appends the string `"!!!"` to the end of the string `"MapR wins"`.
- The `$increment` and `$delete` operate on different elements of the array `a.b`:
 - The `$increment` operation increments the value `123.456` in the second element of the array `a.b`.
 - The `$delete` operation deletes the field path `a.b[0]`, resulting in a single element array `a.b`.

Conflicting Operations

When you specify a mutation with field paths that are overlapping, HPE Ezmeral Data Fabric Database detects the conflict, discards the previous conflicting operation, and proceeds with the next operation.

For example, suppose you have the following document:

```
{ "_id": "id1", "a": { "b": { "c": 5 } } }
```

The following mutation has two operations with overlapping fields `a.b`:

```
{ "$delete": "a.b", "$set": { "a.b.d": 10 } }
```

You may have intended for the mutation to first delete `a.b` and then to replace it with `a.b.d` as follows:

```
{ "_id": "id1", "a": { "b": { "d": "10" } } }
```

But the *actual* result is the following:

```
{ "_id": "id1", "a": { "b": { "c": 5, "d": "10" } } }
```

In this case, the set operation on `a.b.d` causes the delete operation on `a.b` to be discarded.

NOTE: In the earlier example in this section, the `$increment` and `$delete` operations are not conflicting because one operates on `a.b[1]`, while the other operates on `a.b[0]`. On the other hand, the following are conflicting operations:

```
{ "$increment": "a.b[1].decimal", "$delete": "a.b" }
```

Updates Without Explicit Mutation Operation Names

As part of the update command, you can merge a nested document with a document without specifying a mutation operation name. When applying this type of update, the behavior is the same as the merge operation.

For example, suppose you run the following command:

```
update /tbl --id id1 --m {
  "k": "eureka",
  "a": { "c": { "d": 1234 } }
}
```

If the document with key `id1` exists, the update command merges the nested document with the original document. If the document does not exist, the update creates a new document with the input provided.

Application of the command to the sample document results in the following:

```
{
  "_id" : "id1",
  "a" : {
    "b" : [ { "boolean" : false }, { "decimal" : 123.456 } ],
    "c" : {
      "d" : 1234,
      "e" : "Hello"
    }
  },
  "k" : "eureka",
  "m" : "MapR wins"
}
```

For the following update command:

```
update /tbl --id id1 --m {
  "k": "eureka",
  "a": { "c": { "d": null } }
}
```

This is the resulting document:

```
{
  "_id" : "id1",
  "a" : {
```

```

    "b" : [ { "boolean" : false }, { "decimal" : 123.456 } ],
    "c" : {
      "d" : null,
      "e" : "Hello"
    }
  },
  "k" : "eureka",
  "m" : "MapR wins"
}

```

 **NOTE:** In this example, field `a.c.d` remains in the document and is set to null.

Utilities for HPE Ezmeral Data Fabric Database JSON Tables

HPE Ezmeral Data Fabric Database JSON provides utilities to copy, export, and import data, compare table content, and verify the consistency of secondary indexes.

You can use the following utilities with HPE Ezmeral Data Fabric Database JSON tables:

HPE Ezmeral Data Fabric Database JSON CopyTable

Copies data from one HPE Ezmeral Data Fabric Database JSON table to another HPE Ezmeral Data Fabric Database JSON table.

If the destination table does not exist, `mapr copytable` creates the destination table with the same metadata (column families and access control expressions) as the source table, and then copies data.

If the destination table exists, `mapr copytable` copies data only.

Required Permissions

The user that runs `mapr copytable` must have the following permissions, which you can grant with access-control expressions:

- The permission `readAce` on the volume where the source table is located, and the permission `writeAce` on the volume where the destination table is or will be located.
- The permission `adminperm` on the source table.
- The permission for column-family and column reads (`readperm`) on the data in the source table that you want to copy.
- When `bulkload = false`, the permission for column writes (`writeperm`) on the destination table.
- When `bulkload = true` (default), the permission to load the destination table with bulk loads (`bulkloadperm`).
- If the destination table does not yet exist: `createrenamefamily` on the source table.

For information about how to set permissions on volumes, see [Setting Whole Volume ACEs](#) on page 1294.

For information about how to set permissions on tables, see [Enabling Table and Stream Authorizations with ACEs](#) on page 1292.

 **NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

```

mapr copytable
-src <source table path>
-dst <destination table path>
[-fromID <start key>]
[-toID <end key>]
[-bulkload <true|false> (default: false)]
[-mapreduce <true|false> (default: true)]
[-cmpmeta <true|false> (default: true)]
[-numthreads <number of threads> (default: 16)]
[-maxsplits <integer> (default: 2000)]

```

Parameters

Parameter	Description
src	The path of the table that you want to copy from.
dst	The path of the table that you want to copy to.
fromID	The value of the <code>_id</code> field in the first document of the range of documents to copy. <code>startRow</code> is an alias for this parameter.
toID	The value of the <code>_id</code> field in the last document of the range of documents to copy. <code>stopRow</code> is an alias for this parameter.
bulkload	A Boolean value that specifies whether or not to perform a full bulk load of the table. The default is not to use bulk loading (<code>false</code>). To use bulk load, you must set the <code>-bulkload</code> parameter of the table to <code>true</code> by running the command <code>maprcli table edit -path <path to table> -bulkload true</code> .
mapreduce	A Boolean value that specifies whether or not to use a MapReduce program to perform the copying operation. The default, preferred method is to use a MapReduce program (<code>true</code>). When this parameter is set to <code>false</code> , a client process uses multiple threads to read rows of the source table and write rows to the destination table.
cmpmeta	A Boolean value that specifies whether or not to compare table metadata such as column families and ACEs. The default is to compare metadata (<code>true</code>). Such comparisons are done when the destination table exists before <code>mapr copytable</code> is run and checks that the user ID that runs <code>mapr copytable</code> has the proper permissions on the destination table. Set the value of this parameter to <code>false</code> before copying a table that contains a single column family to a table that contains two or more column families.
numthreads	When <code>-mapreduce</code> is <code>false</code> , this parameter specifies the number of threads allocated to perform the copying of data. The default is 16. If additional CPU resources are available, you might want to increase the number of threads to achieve better performance.

Parameter	Description
maxsplits	Sets the maximum number of destination table presplit tablets. Default is 2000. If <code>copytable</code> fails with an Error NO ENTRY message during table creation, the operation could not complete within the timeout (10 minutes). Reduce the value of <code>-maxsplits</code> . This functionality requires a patch. See Applying a Patch .

Example

The following example copies documents starting from ID `user000001` to ID `user009999`:

```
[user@hostname ~]$ mapr copytable -src /user1/tableA -dst
/mapr/clusterB/vol1/tableB -fromID user000001 -toID user009999
```

Monitoring `mapr copytable` Operations

Use one of the following methods to monitor the progress of the copying of table data:

- If the copy table operation runs as a MapReduce v2 application, monitor the application using the ResourceManager UI.
- If the copy table operation runs as a client process, go to the Tables view of the destination table in the MapR Control System. Then, on the Region tab, monitor the pace at which the number of rows increases.

HPE Ezmeral Data Fabric Database JSON DiffTables

Compares the row keys, column families, and field values in two JSON tables. Then, generates two directories that contain sequence files that you can use to merge the rows from the two JSON tables.

Sequence files are binary flat files. For more detail, see [Sequence File](#). To convert a sequence file into a format that you can read, use the `mapr formatresult` utility.

This utility considers both the source table and the destination table to be a master table. Therefore, it generates two directories with sequence files. These sequence files contain the puts required to update each table so that it contains a superset of the rows defined in both tables at the time at which the utility was run.

This utility generates both of the following output directories in the output directory that you specify:

opsForDst	A directory containing sequence files that correspond to each put and delete required to make the destination table identical to the source table.
opsForSrc	A directory containing sequence files that correspond to each put and delete required to make the source table identical to the destination table.

A user with write permissions on a table can run the `mapr importtable` utility to implement the changes that are specified in the sequence files.

Required Permissions

The user that runs the `mapr difftables` utility must have the following permissions:

- The permission `readAce` on the volumes where the tables are located.
- The permission for column reads (`readperm`) on each table.

For information about how to set permissions on volumes, see [Setting Whole Volume ACEs](#) on page 1294.

For information about how to set permissions on tables, see [Enabling Table and Stream Authorizations with ACEs](#) on page 1292.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

```
mapr difftables
-src <source table path>
-dst <destination table path>
-outdir <output directory>
[-first_exit Exit when first difference is found. ]
[-columns comma-separated list of field paths ]
[-mapreduce] <true|false> (default: true)
[-numthreads <numThreads> (default:16, valid only when -mapreduce is false)]
[-cmpmeta <true|false> (default: true)]
```

Parameters

Parameter	Description
src	The path of the first table to include in the comparison.
dst	The path of the second table to include in the comparison.
first_exit	By default, the utility compares all the table cells in the specified tables. Use this parameter if you want to exit after the first difference is identified between the tables. The parameter takes no value.
outdir	The path to a directory in which to place the generated sequence files. The utility creates the specified directory. If the specified directory already exists, the command fails.
columns	By default, the utility compares all fields in JSON tables. If you do not want to compare all fields, you can specify specific fields to include in the comparison. For example, suppose that want to compare a source table in table replication with a replica of that table. When you set up replication, you chose to replicate the default column family and two additional column families: <code>cf1</code> and <code>cf2</code> . For the <code>-columns</code> parameter, you would specify the value <code>" ,cf1,cf2"</code> , where the default column family is represented by the empty string.
mapreduce	A Boolean value that specifies whether or not to use a MapReduce program to perform the comparison. The default, preferred method is to use a MapReduce program (true). When this parameter is set to false, a client process uses multiple threads to perform the comparison.
numthreads	When <code>-mapreduce</code> is false, this parameter specifies the number of threads allocated to perform the comparison. The default is 16. If additional CPU resources are available, you might want to increase the number of thread to achieve better performance.

Parameter	Description
cmpmeta	A Boolean value that specifies whether or not to compare table metadata such as column families and ACEs. The default is to compare metadata (true).

Example

The following example shows a comparison of two JSON tables

```
[user@hostname ~]$ mapr diffTables -src /source_JSON_table -dst /
destination_JSON_table -outdir output/comparison1 -columns
"dateRange.endYear","contributors.date"
Header: hostName: maprdemo, Time Zone: Pacific Standard Time, processName:

```

HPE Ezmeral Data Fabric Database JSON DiffTablesWithCrc

This utility uses a cyclic redundancy check to detect differences between sets of rows in the specified HPE Ezmeral Data Fabric Database JSON tables. Then, for each set of non-identical rows, it performs a detailed comparison. Finally, it generates one or more directories of sequence files. You can use these files either to merge the rows from two HPE Ezmeral Data Fabric Database JSON tables.

Sequence files are binary flat files. You can learn more about them [here](#). To convert a sequence file into a format that you can read, use the [HPE Ezmeral Data Fabric Database JSON FormatResult](#) on page 6311 utility.

This utility requires less network bandwidth than the `mapr diffTables` utility because it performs a detailed table comparison only on the sets of rows where the CRC algorithm detected a difference. Therefore, consider using this utility when the tables you compare are very similar and you are concerned about the data transfer rate.

This utility considers both the source table and the destination table to be a master table. Therefore, it generates two directories with sequence files. These sequence files contain the puts required to update each table so that each table can contain a superset of the rows in both tables at the time at which the utility was run.

This utility generates the following output directories:

- **opsForDst.** A directory containing sequence files that correspond to each put and delete required to make the destination table identical to the source table.
- **opsForSrc.** A directory containing sequence files that correspond to each put and delete required to make the source table identical to the destination table.

Run the `mapr importtable` command to implement the puts and deletes specified in the sequence files.

A user with write permissions on a table can run the `mapr importtable` utility to implement the changes that are specified in the sequence files.

Requirements

- When the cluster runs YARN, it must use zero configuration failover for the ResourceManager.
- The user that runs the `mapr difftableswithcrc` utility must have the following permissions:
 - The permission `readAce` on the volumes where the tables are located.
 - The permission for column reads (`readperm`) on each table.

For information about how to set permissions on volumes, see [Setting Whole Volume ACEs](#) on page 1294.

For information about how to set permissions on tables, see [Enabling Table and Stream Authorizations with ACEs](#) on page 1292.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

```
mapr difftableswithcrc
-src <source table path>
-dst <destination table path>
-outdir <output directory>
[-first_exit] Exit when first difference is found.
[-columns <comma separated list of field paths> ]
[-exclude_embedded_families <true|false>] (default: false)
  Don't include the other column families with path embedded in specified
columns
[-cmpmeta <true|false> (default: true)]
```

Parameters

Parameter	Description
src	The path of the first table to include in the comparison.
dst	The path of the second table to include in the comparison.
outdir	The path to a directory in which to place the generated sequence files. The utility creates the specified directory. If the specified directory already exists, the command fails.

Parameter	Description
first_exit	By default, the utility compares all the table cells in the specified tables. Use this parameter if you want to exit after the first difference is identified between the tables. The parameter takes no value.
columns	By default, the utility compares all fields in JSON tables. If you do not want to compare all fields, you can specify specific fields to include in the comparison. For example, suppose that want to compare a source table in table replication with a replica of that table. When you set up replication, you chose to replicate the default column family and two additional column families: <code>cf1</code> and <code>cf2</code> . For the <code>-columns</code> parameter, you would specify the value <code>",cf1,cf2"</code> , where the default column family is represented by the empty string.
cmpmeta	A Boolean value that specifies whether or not to compare table metadata such as column families and ACEs. The default is to compare metadata (true).

HPE Ezmeral Data Fabric Database JSON FormatResult

Parses a sequence file generated by the `diffTables` utility for JSON tables and converts the results into a format that makes the results easier to understand.

Required Permissions

The user that runs the `FormatResult` utility must have the `readAce` and `writeAce` permissions on the volumes where the input and output paths are located.

For information about how to set permissions on volumes, see [Setting Whole Volume ACEs](#) on page 1294.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

```
mapr formatresult
-indir <input file path>
-outdir <output file path>
[-mapreduce <true|false> (default: false)]
```

Parameters

Parameter	Description
indir	The path to a file or directory of files that contains the output of the <code>mapr diffTables</code> utility.
outdir	The path to a file or a directory for the output. If the file or directory already exists, the utility fails. When a single sequence file is provided as input, the utility generates a single output file. When a directory of sequence files is provided as input, the utility generates a directory with output files.
mapreduce	A Boolean value that specifies whether or not to use a MapReduce program to perform the copying operation. The default, preferred method is to use a MapReduce program (true).

Example

This example shows the results of the following actions that followed a comparison by difftables of two JSON tables:

1. Formatting the sequence file for the source JSON table.
2. Formatting the sequence file for the destination JSON table.
3. Viewing the content of the first sequence file.
4. Viewing the content of the second sequence file.

This is the command that was used for `maprdb difftables`:

```
mapr difftables -src /src_table -dst /dest_table -outdir
output/diffs -columns dateRange.endYear
```

Here is the command that was used for `mapr formatresult` and the resulting output:

```
[user@hostname ~]$ mapr formatresult -indir output/diffs/
OpsForSrcTable -outdir output/outputForSrcTable5

HPE Ezmeral Data Fabric Database JSON ExportTable and ImportTable

Use these utilities together to export data from JSON tables into binary sequence files, and then import the data from the binary sequence files into other JSON tables. You can also use the `mapr importtable` utility to import changes that are specified in sequence files output by the `mapr difftables` utility.

- [Syntax of `mapr exporttable`](#)
- [Parameters of `mapr exporttable`](#)
- [Syntax of `mapr importtable`](#)
- [Parameters of `mapr importtable`](#)
- [Example of using `mapr exporttable` and `mapr importtable` together](#)

Required Permissions

- The `readAce` permission on the volume where the source table for `mapr exporttable` is located.
- The `writeAce` permission on the volume in which to save the output from `mapr exporttable`.
- The `readAce` permission on the volume where the files output by `mapr exporttable` is located.
- The `writeAce` permission on the volume in which the destination table is located.

For information about how to set permissions on volumes, see [Setting Whole Volume ACEs](#) on page 1294.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run these utilities unless that user is given the relevant permission or permissions with access-control expressions.

Syntax of `mapr exporttable`

```
mapr exporttable
(option)
-src Name of table
-dst Directory path
[-columns Fields to include]
[-mapreduce : <true|false>, default is true]
```

Parameters of `mapr exporttable`

Parameter	Description
src	The path of the JSON table to export from.
dst	The directory within the MapR filesystem to export the files to.

Parameter	Description
columns	<p>A comma-delimited list of fields to include in the exported files.</p> <p>Example</p> <pre>a,b,c</pre> <p>Do not use quotation marks and do not include spaces after commas.</p>
mapreduce	<p>The cluster must have YARN installed and configured for this option to work.</p> <p>A Boolean value that specifies whether or not to use a MapReduce program to perform the operation. The default, preferred method is to use a MapReduce program (true).</p> <p>When this parameter is set to false, a client process uses multiple threads.</p>

Syntax of `mapr importtable`

```
mapr importtable
(option)
-src Input binary file or directory path
-dst Destination table
[-bulkload <true|false>, default is false ]
[-mapreduce : <true|false>, default is true]
```

Parameters of `mapr importtable`

Parameter	Description
src	<p>The path of the binary file or files to import.</p> <p>Examples</p> <pre>-src /temp/part0 -src /temp/*</pre>
dst	The JSON table to import the data into.
bulkload	<p>A Boolean value that specifies whether or not to perform a full bulk load of the table. The default is not to use bulk loading (false). To use bulk load, you must set the <code>-bulkload</code> parameter of the table to <code>true</code> by running the command <code>maprcli table edit -path <path to table> -bulkload true</code>.</p>
mapreduce	<p>The cluster must have YARN installed and configured for this option to work.</p> <p>A Boolean value that specifies whether or not to use a MapReduce program to perform the operation. The default, preferred method is to use a MapReduce program (true).</p> <p>When this parameter is set to false, a client process uses multiple threads.</p>

Example of using `mapr exporttable` and `mapr importtable` together

```
[user@hostname ~]$ mapr exporttable -columns contributors,creditLine -src /
collection/artworks -dst /tempExport
Header: hostName: hostname, Time Zone: Pacific Standard Time, processName:
null, processId: null
2015-10-01 23:02:38,044 INFO org.apache.hadoop.io.compress.zlib.ZlibFactory
<clinit> pool-2-thread-1: Successfully loaded & initialized native-zlib
library
2015-10-01 23:02:38,059 INFO org.apache.hadoop.io.compress.CodecPool

[user@hostname ~]$
```

HPE Ezmeral Data Fabric Database JSON ImportJSON

Imports one or more JSON documents into a HPE Ezmeral Data Fabric Database JSON table. The JSON documents must be flat text files.

Required Permissions

- The `readAce` permission on the volume where the JSON documents to import are located.
- The `writeAce` permission on the volume in which the destination table is located.

For information about how to set permissions on volumes, see [Setting Whole Volume ACEs](#) on page 1294.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

```
mapr importJSON
[-idfield <Name of ID field in JSON Data>]
[-bulkload <true|false>, default is false]
[-mapreduce : <true|false>, default is true]
-src <text file or directory>
-dst <JSON table>
```

Parameters

-

Parameter	Description
idfield	<p>The name of the field that contains the value to use for each document's <code>_id</code> field.</p> <p>An <code>_id</code> field is inserted into each document that is imported into a table, if the document does not already contain one.</p> <p>Documents that do not already contain an <code>_id</code> field must contain a field with a value that can be used for the inserted <code>_id</code> field.</p> <p>For example, each document might have a <code>product_ID</code> field with a value that would be suitable for the <code>_id</code> field.</p> <p>Use quotation marks around the name.</p>
bulkload	<p>A Boolean value that specifies whether or not to perform a full bulk load of the table. The default is not to use bulk loading (<code>false</code>). To use bulk load, you must set the <code>-bulkload</code> parameter of the table to <code>true</code> by running the command <code>maprcli table edit -path <path to table> -bulkload true</code>.</p> <p>This parameter cannot be set to <code>true</code> when the <code>-mapreduce</code> parameter is set to <code>false</code>.</p>
mapreduce	<p>A Boolean value that specifies whether or not to use a MapReduce program to perform the copying operation. The default, preferred method is to use a MapReduce program (<code>true</code>).</p>
src	<p>The path of a JSON document in text format or a directory of such documents.</p> <p>If you specify a directory and that directory contains only the JSON files to import, use an asterisk at the end of the path, as in this example: <code>/user/data/*</code></p> <p>If you specify a directory and that directory contains both the JSON files to import and other files, use a more specific wildcard, such as <code>*.json</code>.</p> <p>The path must be in the MapR filesystem. To move files there from the Linux filesystem, use the command <code>hadoop fs -copyFromLocal</code>.</p>
dst	<p>The path of the destination HPE Ezmeral Data Fabric Database JSON table.</p>

Example

Suppose you have the following three JSON documents in the `/tmp/users` directory in your MapR filesystem:

```
$ hadoop fs -cat /tmp/users/bcumings.json
{"_id": "bcummings", "first_name": "Bettie", "last_name": "Cummings"}

$ hadoop fs -cat /tmp/users/gjones.json
{"_id": "gjones", "first_name": "Gilberto", "last_name": "Jones"}

$ hadoop fs -cat /tmp/users/jdoe.json
{"_id": "jdoe", "first_name": "John", "last_name": "Doe"}
```

The following command imports the three documents into the JSON table in the path `/apps/users`:

```
$ mapr importJSON -idField _id -src /tmp/users/* -dst /apps/users
```

You can run `mapr dbshell` to see the imported documents:

```
maprdb mapr:> find /apps/users
{"_id":"bcummings","first_name":"Bettie","last_name":"Cummings"}
{"_id":"gjones","first_name":"Gilberto","last_name":"Jones"}
{"_id":"jdoe","first_name":"John","last_name":"Doe"}
3 document(s) found.
```

HPE Ezmeral Data Fabric Database JSON verifyindex

Describes how to use the HPE Ezmeral Data Fabric Database JSON `verifyindex` command to verify that the data in a secondary index is consistent with its JSON table.

Syntax

```
mapr verifyindex
  -path < table path >
  -index < index name >
  -first_exit < true | false >
  -numthreads < thread number >
```

Parameters

Parameter	Description
path	(Required) Path to where the table exists.
index	(Required) Name of the secondary index on the table.
first_exit	(Optional) Exit when the first difference is found. Options: true or false. Default: false.
numthreads	(Optional) Number of parallel threads to use for the verification. Default: 16

Example

The following example creates a table, creates a secondary index on the table, inserts some documents, and then runs the `verifyindex` command to verify that there is data consistency between the JSON table and the secondary index. See [Troubleshooting Secondary Indexes](#) on page 1389 for an example where `verifyindex` detects data inconsistency.

```
// Create a table using dbshell add
# mapr dbshell

maprdb root:> create /t1
Table /t1 created.

// Create an index using maprcli table index add
# maprcli table index add -path /t1 -index il -indexedfields a -json
{
  "timestamp":1499788406380,
  "timeofday":"2017-07-11 08:53:26.380 GMT-0700",
  "status":"OK",
  "total":0,
  "data":[ ]
```

```

}

// Insert documents into the table using dbshell insert
# mapr dbshell

maprdb root:> insert /t1 --v {"a":1,"b":2} --id 1
Document with id: "1" inserted.

maprdb root:> insert /t1 --v {"a":"mapr","b":3} --id 2
Document with id: "2" inserted.

maprdb root:> insert /t1 --v {"a":{"$numberLong":3},"b":4} --id 4
Document with id: "4" inserted.

// Run verifyindex to verify indexed data
# mapr verifyindex -path /t1 -index il

Number of rows in table but not in index: 0
Number of rows in index but not in table: 0
Mismatch row count: 0

```

Troubleshooting Use Cases

Situations where you can use this command are as follows:

- Examine details on updates that have not yet propagated from a JSON table to one of its indexes.
- Detect if there are documents that are missing from an index.
- Detect other data consistency issues between an index and its parent JSON table.

See [Troubleshooting Secondary Indexes](#) on page 1389 for more information on these use cases.

HPE Ezmeral Data Fabric Database HBase Shell (Binary Tables)

You can manage HPE Ezmeral Data Fabric Database tables using HBase shell commands and additional HBase shell commands included in the HPE Ezmeral Data Fabric distribution of Hadoop.

The HBase shell command is used on [binary tables](#) only. To run this command, execute the following:

```
hbase shell
```

 **NOTE:** Before running the shell, ensure that your user ID has both the `readAce` and `writeAce` permissions on the volume. For information about these permissions, see [Managing Whole Volume ACEs](#).

When you specify a table in HBase shell, use the following syntax:

- For a table on the local cluster, start the path at the volume mount point. For example, for a table named `test` under a volume with a mount point at `/volume1`, specify the following path as the table name: `"/volume1/test"`
- For a table on a remote cluster, you must also specify the cluster name in the path. For example, for a table named `customer` under `volume1` in the `sanfrancisco` cluster, specify the following path as the table name: `"/mapr/sanfrancisco/volume1/customer"`

 **NOTE:** You can access a table on a remote cluster when the remote cluster has an entry in the [mapr-clusters.conf](#) file on the node where the HBase shell is running.

The following table lists the supported HBase shell commands that you can use to manage HPE Ezmeral Data Fabric Database tables:

Command	Description
alter	<p>Performs the following actions on HPE Ezmeral Data Fabric Database tables:</p> <ul style="list-style-type: none"> • Adds a new table or column family • Modifies the following table-level attributes: <ul style="list-style-type: none"> • BULKLOAD - A Boolean value that specifies whether to perform a full bulk load of the table. The default is false. For more information, see Bulk Loading and HPE Ezmeral Data Fabric Database Tables. • MAX_FILESIZE • AUTOSPLIT - A Boolean value that specifies whether to split the table into regions automatically as the table grows. The average size of each region is determined by the <code>regionsize</code> parameter. The default value is true. If you set the value to false, you can manually split tables into regions by using the <code>maprcli table region split</code> command. • Modifies the following attributes of a column family: <ul style="list-style-type: none"> • TTL • VERSIONS (max or min) • COMPRESSION • IN_MEMORY <p>Aside from the attributes listed above, no other attributes apply to HPE Ezmeral Data Fabric Database tables. Unlike HBase, you do not need to disable a table before altering a table.</p>
alter_async	On HPE Ezmeral Data Fabric Database tables, this has the same behavior as the alter command.
count	Counts the number of rows in a specified table.
create	Creates a table in the specified path.
delete	Deletes a value in a specified table, row, and column. Optionally, you can also specify the timestamp associated with the value that you want to delete.
deleteall	Delete all values in a row based on the table name and row. Optionally, you can also specify the timestamp associated with the values that you want to delete.
describe	Describes a specified table.
disable	Marks a specified table as disabled. This state is recorded only in the client process (HBase shell) memory and does not actually disable any operations on a HPE Ezmeral Data Fabric Database table.

Command	Description
disable_all	Marks tables as disabled if they have names matching the specified regular expression. This state is recorded only in the client process (HBase shell) memory and does not actually disable any operations on the HPE Ezmeral Data Fabric Database tables.
drop	Drops a specified table that is marked as disabled.
drop_all	Drops all tables that are marked as disabled.
enable	Marks a specified table as enabled. This state is recorded only in the client process (HBase shell) memory.
enable_all	Marks tables as enabled if they have a table name that matches the specified regular expression. This state is recorded only in the client process (HBase shell) memory.
exists	Returns boolean value true if the specified table exists.
exit	Exits the HBase shell.
get	Gets the contents of a row or cell.
get_counter	Returns the value of a counter at a specified table, row, and column.
incr	Increments a value at a specified table, row, and column.
is_disabled	Returns a value that indicates if a specified table is disabled. You can perform operations on HPE Ezmeral Data Fabric Database tables that are disabled.
is_enabled	Returns a value that indicates if a specified table is enabled. You can perform operations on HPE Ezmeral Data Fabric Database tables even if they are not enabled.
list	For HBase 1.1 or above, if the <code>mapr.hbase.default.db</code> property is set to <code>maprdb</code> , this command returns the HPE Ezmeral Data Fabric Database tables under the user's home directory.
list_perm	Lists all permissions set by Access Control Expressions for a specified table. This HBase shell command only operates on HPE Ezmeral Data Fabric Database tables. For more information, see list_perm .
put	Puts a value at a specified table, row, and column. Optionally, you can also specify the timestamp for that value.
scan	Scans a specified table. Optionally, you can also specify a dictionary of scanner specifications.
set_perm	Sets permissions with Access Control Expressions on a specified table, column family, or column qualifier. This Hbase shell command only operates on HPE Ezmeral Data Fabric Database tables. For more information, see set_perm .
show_filters	Shows all the filters supported by the Hbase or HPE Ezmeral Data Fabric Database tables. Provide the link to 4.1 supported filters doc
truncate	Disables, drops, and recreates a specified table.
version	Returns the HBase client version.
whoami	Returns the current user.

HPE Ezmeral Data Fabric Database does not support the following HBase shell commands:

- add_peer
- alter_status
- assign
- balance_switch
- balancer
- close_region
- compact
- disable_peer
- enable_peer
- flush
- grant
- hlog_roll
- list_peer
- major_compact
- move
- remove_peer
- start_replication
- stop_replication
- status
- split
- revoke
- unassign
- user_permission
- zk_dump

For more information about the HBase shell commands, see the [Apache HBase documentation](#).

list_perm

Lists all permissions set by Access Control Expressions for a specified HPE Ezmeral Data Fabric Database table

Syntax

```
list_perm "<table path>"
```

Example

```
hbase(main):006:0> list_perm "/table/"
Scope Permission Access Control Expression
defaultappendperm u:jon
createrenamefamilyperm u:jon
deletefamilyperm u:jon
bulkloadperm u:jon
defaultreadperm u:jon
defaultwriteperm u:jon
packperm u:jon
replperm u:jon
defaultmemoryperm u:jon
adminaccessperm u:jon
splitmergeperm u:jon
defaultversionperm u:jon
defaultcompressionperm u:jonr
13 row(s) in 0.0070 seconds
```

set_perm

Set permissions with access control expressions on a MapR Database table, column family, or column qualifier.

Set permissions with [ACE](#) on a HPE Ezmeral Data Fabric Database table, column family, or column qualifier.

Syntax

To set the permission on a table:

```
set_perm "<table path>", "<permission>", "<ACE expression>"
```

To set the permission on a column family or column qualifier:

```
set_perm "<table path>", {COLUMN => "column family[:qualifier]", PERM =>
  "<permission>", EXPR => "<ACE expression>"}
```

Examples

Assigns user jon and user mapr04 the defaultreadperm permission on table /table:

```
hbase(main):004:0> set_perm "/table/","defaultreadperm","u:jon|u:mapr04"
```

Assigns user jon and user mapr05 the compressionperm permission on the cf1 column family in table /table:

```
hbase(main):005:0> set_perm "/table/",{COLUMN => "cf1",PERM =>
  "compressionperm", EXPR =>"u:jon|u:mapr05"}
```

Assigns user jon and user mapr05 the writeperm permission on the col1 column qualifier in cf1 column family in table /table:

```
hbase(main):009:0> set_perm "/table/",{COLUMN => "cf1:col1",PERM =>
  "writeperm", EXPR =>"u:jon|u:mapr05"}
```

Utilities for HPE Ezmeral Data Fabric Database Binary Tables

HPE Ezmeral Data Fabric Database provides utilities to copy and compare data in HPE Ezmeral Data Fabric Database binary tables.

You can use the following utilities with HPE Ezmeral Data Fabric Database binary tables:

HPE Ezmeral Data Fabric Database Binary CopyTable

Copies data from one HPE Ezmeral Data Fabric Database binary table to another HPE Ezmeral Data Fabric Database binary table.

The HPE Ezmeral Data Fabric Database `CopyTable` utility is different from Apache HBase's [CopyTable](#) utility. This utility has the following capability:

- If the destination table does not exist, `CopyTable` creates the target table with the same metadata (column families and access control expressions) as the source table, and then copies data.
- If the destination table exists, `CopyTable` copies data only.
- If you manually set up replication to a HPE Ezmeral Data Fabric Database table, `CopyTable` can be used to perform an initial load of source data to the replica before table replication begins.

NOTE: When copying data to HPE Ezmeral Data Fabric Database tables, it is recommended that you use the HPE Ezmeral Data Fabric Database version of `CopyTable`.

Required Permissions

The user that runs the `CopyTable` utility must have the following permissions:

- The permission `readAce` on the volume where the source table is located, and the permission `writeAce` on the volume where the destination table is or will be located.
- The permission `adminperm` on the source table.
- The permission for column-family and column reads (`readperm`) on the data in the source table that you want to copy.
- When `bulkload = false`, the permission for column writes (`writeperm`) on the destination table.
- When `bulkload = true` (default), the permission to load the destination table with bulk loads (`bulkloadperm`).
- If the destination table does not yet exist: `createrenamefamily` on the source table.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

If `CopyTable` is run between tables on different clusters, the user that runs the command must have the required permissions on each cluster.

For information about how to set permissions on volumes, see [Setting Whole Volume ACEs](#) on page 1294.

For information about how to set permissions on tables, see [Enabling Table and Stream Authorizations with ACEs](#) on page 1292.

Syntax

```
hbase com.mapr.fs.hbase.tools.mapreduce.CopyTable
  -src <source table path> -dst <destination table path>
  [-columns cf1[:col1],...] [-maxversions <max number of versions to
copy>]
  [-starttime <time>]
  [-endtime <time>]
  [-mapreduce <true|false> (default: true)]
```

```
[ -bulkload <true|false> (default: true) ]
[ -numthreads <numThreads> (default:16, valid only when -mapreduce is
false) ]
```

Parameters

Parameters	Description
src	<p>The path to the source table that you want to replicate.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>testsrc</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testsrc</code> For a path on another cluster, you must also specify the cluster name in the path. For example, for a table named <code>customersrc</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customersrc</code>
dst	<p>The path to the replica.</p> <ul style="list-style-type: none"> For a table on the local cluster, start the path at the volume mount point. For example, for a table named <code>testdst</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testdst</code> For a table on another cluster, you must also specify the cluster name in the path. For example, for a table named <code>customerdst</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customerdst</code>
columns	<p>By default, all columns in the source table are copied. If you do not want to copy all columns in the table, you can specify columns to copy. Provide a comma-separated list of column families or columns from a certain column family (column family:qualifier).</p> <p>For example, use the following syntax to copy only the purchases column family and the stars column in the reviews column family: <code>-columns purchases, reviews:stars</code></p>
maxversions	<p>By default, all versions from the source table are copied. If you do not want to copy all versions, use this parameter to specify the number of versions to copy.</p>
starttime	<p>By default, all table values regardless of their associated timestamp are copied. You can specify a timestamp to indicate the table cell version at which to start the copy. The timestamp is a long integer value that is either user-defined or system-defined (epoch in milliseconds). Values with timestamps lower than the specified timestamp will not be copied to the destination.</p>

Parameters	Description
endtime	By default, all table values regardless of their associated timestamp are copied. You can specify a timestamp to indicate the table cell version at which to end the copy. The timestamp is a long integer value that is either user-defined or system-defined (epoch in milliseconds). Values with timestamps greater than or equal to the specified timestamp will not be copied to the destination.
mapreduce	A Boolean value that specifies whether or not to use a MapReduce program to perform the copying operation. The default, preferred method is to use a MapReduce program (<code>true</code>). When this parameter is set to <code>false</code> , a client process uses multiple threads to read rows of the source table and write rows to the destination table.
bulkload	A Boolean value that specifies whether or not to perform a full bulk load of the table. The default is to use bulk loading (<code>true</code>). When you use bulk loading, the utility automatically unsets the bulk load mode on the table to restore normal client operations at the end of the table copy operation. For more information, see Bulk Loading and HPE Ezmeral Data Fabric Database Tables .
numthreads	When <code>-mapreduce</code> is <code>false</code> , this parameter specifies the number of threads allocated to perform the copying of data. The default is 16. If additional CPU resources are available, you might want to increase the number of threads to achieve better performance.

Monitoring the CopyTable Operation

Use one of the following methods to monitor the progress of the copying of table data:

- If the copy table operation runs as a MapReduce v2 application, monitor the application using the ResourceManager UI.
- If the copy table operation runs as a client process, go to the Tables view of the destination table in the MapR Control System. Then, on the Region tab, monitor the pace at which the number of rows increases.

Example

Copies table data with timestamp greater than 1423226300000 (Fri, 06 Feb 2015 12:38:20 GMT) from one HPE Ezmeral Data Fabric Database table to another HPE Ezmeral Data Fabric Database table:

```
[user@hostname ~]$
hbase com.mapr.fs.hbase.tools.mapreduce.CopyTable -src /t1 -dst /
t1_copy7 -starttime 1423226300000
```

HPE Ezmeral Data Fabric Database Binary DiffTables

Compares the row key, column family, timestamp, and value of each table cell in each specified HPE Ezmeral Data Fabric Database table. Then, it generates one or two directories with [sequence files](#) that you can use to either make a HPE Ezmeral Data Fabric Database table identical to its master or merge the rows from two HPE Ezmeral Data Fabric Database tables.

Sequence files are binary flat files. To convert the sequence file into a format that is easier to understand, use the [FormatResults](#) utility.

By default, the DiffTables utility considers both the source table and the destination table to be a master table. Therefore, it generates two directories with sequence files. These sequence files contain the puts required to update each table so that it contains a superset of the rows defined in both tables at the time at which the utility was run.

When you specify a master table, the DiffTables utility generates one of the following output directories:

- **opsForDst.** A directory containing sequence files that correspond to each put and delete required to make the destination table identical to the source table.
- **opsForSrc.** A directory containing sequence files that correspond to each put and delete required to make the source table identical to the destination table.

A user with write permissions on a table can run the `hbase org.apache.hadoop.hbase.mapreduce.Import` command to implement the puts and deletes specified in the sequence files.

Required Permissions

The user that runs the DiffTables utility must have the following permissions:

- The permission `readAce` on the volumes where the tables are located.
- The permission for column reads (`readperm`) on each table.

For information about how to set permissions on volumes, see [Setting Whole Volume ACEs](#) on page 1294.

For information about how to set permissions on tables, see [Enabling Table and Stream Authorizations with ACEs](#) on page 1292.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

```
hbase com.mapr.fs.hbase.tools.mapreduce.DiffTables
  -src <source table path>
  -dst <destination table path>
  -outdir <output directory>
  [-master <src|dst> ] The master table to use for the diff.
  [-first_exit] Exit when first difference is found.
  [-columns <comma separated list of family[:column]> ]
  [-starttime <start diff at timestamp>]
  [-endtime <end diff at timestamp>]
  [-maxversions] <max number of versions to diff>
  [-mapreduce] <true|false> (default: true)
  [-numthreads <numThreads> (default:16, valid only when -mapreduce is
  false)]
  [-cmpmeta <true|false> (default: true)]
```

Parameters

Parameter	Description
src	<p>The path to the source table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>testsrc</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testsrc</code> For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customersrc</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customersrc</code>
dst	<p>The path to the destination table.</p> <ul style="list-style-type: none"> For a table on the local cluster, start the path at the volume mount point. For example, for a table named <code>testdst</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testdst</code> For a table on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customerdst</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customerdst</code>
master	<p>The table that is considered to be the master table. The values are <code>src</code> and <code>dst</code>. By default, both the source table and the destination tables are considered to be a master.</p>
first_exit	<p>By default, the utility compares all the table cells in the specified tables. Use this parameter if you want to exit after the first difference is identified between the tables. The parameter takes no value.</p>
outdir	<p>The path to a directory in which to place the generated sequence files. The utility creates the specified directory. If the specified directory already exists, the command fails.</p>
columns	<p>By default, the utility compares all columns. If you do not want to compare all columns in the table, you can specify specific columns to include in the comparison. Provide a comma-separated list of column families or columns from a certain column family (column family:qualifier). For example, use the following syntax to include the column family <code>purchases</code> and the column <code>stars</code> in the <code>reviews</code> column family: <code>-columns purchases, reviews:stars</code></p>
starttime	<p>By default, the utility compares all table values regardless of their associated timestamp. You can specify a timestamp to indicate the table cell version at which to start the comparison. The timestamp is a long integer value that is either user-defined or system-defined (epoch in milliseconds). Values with timestamps lower than the specified timestamp will not be included in the comparison.</p>

Parameter	Description
endtime	By default, the utility compares all table values regardless of their associated timestamp. Values with timestamps greater than or equal to the specified timestamp will not be included in the comparison.
maxversions	By default, all versions from the master table are included in the comparison. If you do not want to compare all versions, use this parameter to specify the number of recent versions to include in the comparison.
mapreduce	A Boolean value that specifies whether or not to use a MapReduce program to perform the comparison. The default, preferred method is to use a MapReduce program (true). When this parameter is set to false, a client process uses multiple threads.
numthreads	When -mapreduce is false, this parameter specifies the number of threads allocated to perform the comparison. The default is 16. If additional CPU resources are available, you might want to increase the number of thread to achieve better performance.
cmpmeta	A Boolean value that specifies whether or not to compare table metadata such as column families and ACEs. The default is to compare metadata (true).

Examples

The following example compares two HPE Ezmeral Data Fabric Database tables:

```
[user@hostname ~]$ hbase com.mapr.fs.hbase.tools.mapreduce.DiffTables -src /
customerTableA -dst /customerTableB -outdir /customerTableABCompare
2015-03-04 18:04:52,059 INFO [main] Configuration.deprecation:
hadoop.native.lib is deprecated. Instead, use io.native.lib.available
DiffTablesMeta completed. Metadata of the two tables is same.
...
Mapreduce job completed. The tables mismatch.
NUM_ROWS_MISMATCH_IN_SRC:32; NUM_ROWS_MISMATCH_IN_DST:30. Please check diff
in /customerTableABCompare
```

HPE Ezmeral Data Fabric Database Binary DiffTablesWithCrc

This utility uses a cyclic redundancy check to detect differences between sets of rows in the specified HPE Ezmeral Data Fabric Database binary tables. Then, for each set of non-identical rows, it performs a detailed comparison. Finally, it generates one or more directories of sequence files. You can use these files either to make a HPE Ezmeral Data Fabric Database binary table identical to its master or merge the rows from two HPE Ezmeral Data Fabric Database binary tables.

Sequence files are binary flat files. You can learn more about them [here](#). To convert a sequence file into a format that you can read, use the [HPE Ezmeral Data Fabric Database Binary FormatResult](#) on page 6331 utility.

This utility requires less network bandwidth than the `DiffTables` utility because it performs a detailed table comparison only on the sets of rows where the CRC algorithm detected a difference. Therefore, consider using this utility when the tables you compare are very similar and you are concerned about the data transfer rate.

Requirements

- When the cluster runs YARN, it must also use zero configuration failover for the ResourceManager.

By default, the utility considers both the source table and the destination table to be a master table. Therefore, it generates two directories with sequence files. These sequence files contain the puts required to update each table so that it can contain a superset of the rows defined in both tables at the time at which the utility was run.

When you specify a master table, the `mapr difftableswithcrc` utility generates one of the following output directories:

- **opsForDst.** A directory containing sequence files that correspond to each put and delete required to make the destination table identical to the source table.
- **opsForSrc.** A directory containing sequence files that correspond to each put and delete required to make the source table identical to the destination table.

A user with write permissions on a table can run the `hbase org.apache.hadoop.hbase.mapreduce.Import` command to implement the puts and deletes specified in the sequence files.

Required Permissions

The user that runs the `mapr difftableswithcrc` utility must have the following permissions:

- The permission `readAce` on the volumes where the tables are located.
- The permission for column reads (`readperm`) on each table.

For information about how to set permissions on volumes, see [Setting Whole Volume ACEs](#) on page 1294.

For information about how to set permissions on tables, see [Enabling Table and Stream Authorizations with ACEs](#) on page 1292.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

```
hbase com.mapr.fs.hbase.tools.mapreduce.DiffTablesWithCrc
-src <source table path>
-dst <destination table path>
-outdir <output directory>
[-master src|dst ] The master table to use for the diff.
[-first_exit] Exit when first difference is found.
[-cf <comma separated list of column families>]
[-starttime <start diff at timestamp>]
[-endtime <end diff at timestamp>]
[-maxVersions <max number of versions to copy>]
[-cmpmeta <true|false> (default: true)]
```

Parameters

Parameter	Description
src	<p>The path to the source table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>testsrc</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testsrc</code> For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customersrc</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customersrc</code>
dst	<p>The path to the destination table.</p> <ul style="list-style-type: none"> For a table on the local cluster, start the path at the volume mount point. For example, for a table named <code>testdst</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testdst</code> For a table on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customerdst</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customerdst</code>
master	<p>The table that is considered to be the master table. The values are <code>src</code> (the source table) and <code>dst</code> (the destination table). By default, both the source table and the destination table are considered to be the master.</p>
first_exit	<p>By default, the utility compares all the table cells in the specified tables. Set this parameter if you want to exit after the first difference is identified between the tables.</p>
outdir	<p>The path to a directory for the sequence files. The utility will create the specified directory. If the specified directory already exists, the command will fail.</p>
cf	<p>By default, the utility compares all columns from the master table. If you do not want to compare all columns in the table, you can specify specific columns to include in the comparison. Provide a comma-separated list of column families or columns from a certain column family (column family:qualifier). For example, use the following syntax to include the column family <code>purchases</code> and the column <code>stars</code> in the <code>reviews</code> column family: <code>-columns purchases, reviews:stars</code></p>
starttime	<p>By default, the utility compares all table values regardless of their associated timestamp. You can specify a timestamp to indicate the table cell version at which to start the comparison. The timestamp is a long integer value that is either user-defined or system-defined (epoch in milliseconds). Values with timestamps lower than the specified timestamp will not be included in the comparison.</p>

Parameter	Description
endtime	By default, the utility compares all table values regardless of their associated timestamp. You can specify a timestamp to indicate the table cell version at which to end the comparison. The timestamp is a long integer value that is either user-defined or system-defined (epoch in milliseconds). Values with timestamps greater than or equal to the specified timestamp will not be included in the comparison.
maxVersions	By default, the utility compares all versions from the master table. If you do not want to diff all versions, use this parameter to specify the number of recent versions to include in the comparison.
cmpmeta	A Boolean value that specifies whether or not to compare table metadata such as column families and ACEs. The default is to compare metadata (<code>true</code>).

Example

Compares two HPE Ezmeral Data Fabric Database tables:

```
[user@hostname ~]$
hbase com.mapr.fs.hbase.tools.mapreduce.DiffTablesWithCrc -src /
customerTableA -dst /customerTableB -outdir /customerTableCompare
2015-03-04 17:52:40,912 INFO [main] Configuration.deprecation:
hadoop.native.lib is deprecated. Instead, use io.native.lib.available
DiffTablesMeta completed. Metadata of the two tables is same.
....
Mapreduce job completed. The tables mismatch.
NUM_ROWS_MISMATCH_IN_SRC:32; NUM_ROWS_MISMATCH_IN_DST:30. Please check diff
in /customerTableCompare
```

HPE Ezmeral Data Fabric Database Binary FormatResult

Parses a sequence file generated by the `DiffTables` utility or the `DiffTablesWithCrc` utility and converts the results into a format that makes the results easier to understand.

Required Permissions

The user that runs the `FormatResult` utility must have the `readAce` and `writeAce` permissions on the volumes where the input and output paths are located.

For information about how to set permissions on volumes, see [Setting Whole Volume ACEs](#) on page 1294.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

```
hbase com.mapr.fs.hbase.tools.mapreduce.FormatResult
-input <input file path>
-output <output file path>
[-mapreduce <true|false> (default: false)]
```

Parameters

Parameters	Description
input	The path to a file or directory of files that contains the output of either the DiffTables utility or the DiffTablesWithCrc utility.
output	The path to a file or a directory for the output. If the file or directory already exists, the utility fails. When a single sequence file is provided as input, the utility generates a single output file. When a directory of sequence files is provided as input, the utility generates a directory with output files.
mapreduce	A Boolean value that specifies whether or not to use a MapReduce program to perform the FormatResult operation. The default is not to use a MapReduce program (false).

Example

Formats a sequence file:

```
[user@hostname ~]$ hbase
com.mapr.fs.hbase.tools.mapreduce.FormatResult -input /dif1/tf4/opsForDst/
opsForDst-m-00001 -output /dif1/tf4/opsForDst_single/nomr -mapreduce false
2015-03-06 18:58:56,210 INFO [main] Configuration.deprecation:
fs.default.name is deprecated. Instead, use fs.defaultFS
2015-03-06 18:58:57,492 INFO [main] mapreduce.FormatResult: Translated

text files created.
```

HPE Ezmeral Data Fabric Streams Utilities

You can use the following utilities to with HPE Ezmeral Data Fabric Streams streams:

mapr copystream

This utility copies data from one HPE Ezmeral Data Fabric stream to another HPE Ezmeral Data Fabric stream. You can use it, for example, if you want to set up replication manually from one stream to another.

If the destination stream does not exist, `mapr copystream` creates the destination stream with the same metadata as the source stream, and then copies data.

If the destination stream exists, `mapr copystream` copies data only.

Required Permissions

To use this utility, you must have the following permissions:

- The permission `readAce` on the volume where the source stream is located, and the permission `writeAce` on the volume where the destination stream is located.
- On the source stream: either `consumeperm` or `copyperm`.
- On the destination stream: either `copyperm` or all three of the following permissions: `produceperm`, `consumeperm`, `topicperm`

For information about how to set permissions on volumes, see [Setting Whole Volume ACEs](#) on page 1294.

For information about how to set permissions on streams, see [Enabling Table and Stream Authorizations with ACEs](#) on page 1292.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

```
mapr copystream
-src <srcStream>
-dst <dstStream>
[-mapreduce true/false default:false]
[-numthreads <nthreads> default:16]
```

Parameters

Parameter	Description
<code>src</code>	The path and name of the stream to copy messages from.
<code>dst</code>	The path and name of the stream to copy messages to.
<code>mapreduce</code>	A Boolean value that specifies whether or not to use a MapReduce program to perform the copying operation. The default, preferred method is to use a MapReduce program (true). When this parameter is set to false, a client process uses multiple threads to read from the source stream and write to the destination stream. The MapReduce program runs as a MapReduce version 2 application based on the MapReduce mode that is configured on this node.
<code>numthreads</code>	When <code>-mapreduce</code> is false, this parameter specifies the number of threads allocated to perform the copying of data. The default is 16. If additional CPU resources are available, you might want to increase the number of threads to achieve better performance.

`mapr diffstreams`

This utility compares the message IDs, metadata, and data in two HPE Ezmeral Data Fabric streams. Then, generates two directories that contain sequence files that you can use to merge the rows from the two HPE Ezmeral Data Fabric streams.

Sequence files are binary flat files. You can learn more about them [here](#). To convert a sequence file into a format that you can read, use the [HPE Ezmeral Data Fabric Database JSON FormatResult](#) on page 6311 utility.

This utility considers both the source stream and the destination stream to be a master stream. Therefore, it generates two directories with sequence files. These sequence files contain the puts required to update each stream so that it contains a superset of the rows defined in both tables at the time at which the utility was run.

This utility generates both of the following output directories in the output directory that you specify:

`opsForDst`

A directory containing sequence files that correspond to each put and delete required to make the destination stream identical to the source stream.

`opsForSrc`

A directory containing sequence files that correspond to each put and delete required to make the source stream identical to the destination stream.

Required Permissions

To use this utility, you must have the following permissions:

- The permission `readAce` on the volumes where the tables are located.
- On the source stream: either `consumeperm` or `copyperm`.
- On the destination stream: either `consumeperm` or `copyperm`.

For information about how to set permissions on volumes, see [Setting Whole Volume ACEs](#) on page 1294.

For information about how to set permissions on streams, see [Enabling Table and Stream Authorizations with ACEs](#) on page 1292.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

```
mapr diffstreams
-src <srcStream>
-dst <dstStream>
-outdir <output directory>
[-first_exit] Exit when first difference is found
[-mapreduce true/false default:false]
[-numthreads <nthreads> default:16]
```

Parameters

Parameter	Description
<code>src</code>	The path of the first stream to include in the comparison.
<code>dst</code>	The path of the second stream to include in the comparison.
<code>outdir</code>	The path to a directory in which to place the generated sequence files. The utility creates the specified directory. If the specified directory already exists, the command fails.
<code>first_exit</code>	By default, the utility compares all the data in the specified streams. Use this parameter if you want to exit after the first difference is identified between the streams. The parameter takes no value.
<code>mapreduce</code>	A Boolean value that specifies whether or not to use a MapReduce program to perform the comparison. The default, preferred method is to use a MapReduce program (true). When this parameter is set to false, a client process uses multiple threads. The MapReduce program runs as a MapReduce version 2 application based on the MapReduce mode that is configured on this node.
<code>numthreads</code>	When <code>-mapreduce</code> is false, this parameter specifies the number of threads allocated to perform the comparison. The default is 16. If additional CPU resources are available, you might want to increase the number of thread to achieve better performance.

`mapr diffstreamswithcrc`

This utility uses a cyclic redundancy check to detect differences between sets of messages in the specified HPE Ezmeral Data Fabric Streams. Then, for each set of non-identical messages, it performs a detailed comparison. Finally, it generates one or more directories of sequence files.

You can use these files either to make a HPE Ezmeral Data Fabric stream identical to its master or merge the messages from two HPE Ezmeral Data Fabric Streams.

Sequence files are binary flat files. You can learn more about them [here](#). To convert a sequence file into a format that you can read, use the [HPE Ezmeral Data Fabric Database JSON FormatResult](#) on page 6311 utility.

This utility requires less network bandwidth than the `mapr diffstreams` utility because it performs a detailed table comparison only on the sets of messages where the CRC algorithm detected a difference. Therefore, consider using this utility when the streams you compare are very similar and you are concerned about the data transfer rate.

This utility considers both the source stream and the destination stream to be a master stream. Therefore, it generates two directories with sequence files. These sequence files contain the puts required to update each stream so that each stream can contain a superset of the messages in both streams at the time at which the utility was run.

These are the directories that the utility generates:

opsForDst	A directory containing sequence files that correspond to each put and delete required to make the destination stream identical to the source stream.
opsForSrc	A directory containing sequence files that correspond to each put and delete required to make the source stream identical to the destination stream.

Requirements

- When the cluster runs YARN, it must also use zero configuration failover for the ResourceManager.
- To use this utility, you must have the following permissions:
 - The permission `readAce` on the volumes where the tables are located.
 - On the source stream: either `consumeperm` or `copyperm`.
 - On the destination stream: either `consumeperm` or `copyperm`.

For information about how to set permissions on volumes, see [Setting Whole Volume ACEs](#) on page 1294.

For information about how to set permissions on streams, see [Enabling Table and Stream Authorizations with ACEs](#) on page 1292.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

Run the `mapr importstream` command to implement the puts and deletes specified in the sequence files.

Syntax

```
mapr diffstreamswithcrc
-src <srcStream>
-dst <dstStream>
-outdir <output directory>
[-first_exit] Exit when first difference is found
```

Parameters

Parameter	Description
<code>src</code>	The path of the first stream to include in the comparison.
<code>dst</code>	The path of the second stream to include in the comparison.

Parameter	Description
outdir	The path to a directory in which to place the generated sequence files. The utility creates the specified directory. If the specified directory already exists, the command fails.
first_exit	By default, the utility compares all the data in the specified streams. Use this parameter if you want to exit after the first difference is identified between the streams. The parameter takes no value.

mapr exportstream and mapr importstream

Use these utilities together to export data from HPE Ezmeral Data Fabric Streams into binary sequence files, and then import the data from the binary sequence files into other HPE Ezmeral Data Fabric Streams. You can also use the `mapr importstream` utility to import changes that are specified in sequence files output by the `mapr diffstreams` utility.

- [Syntax of `mapr exportstream`](#)
- [Parameters of `mapr exportstream`](#)
- [Syntax of `mapr importstream`](#)
- [Parameters of `mapr importstream`](#)

Required Permissions

To use the `mapr exportstream` utility, you must have the following permissions:

- The `readAce` permission on the volume where the source stream for `mapr exportstream` is located.
- The `writeAce` permission on the volume in which to save the output from `mapr exportstream`.
- On the source stream: either `consumeperm` or `copyperm`
- On the destination directory: write permission

To use the `mapr importstream` utility, you must have the following permissions:

- The `readAce` permission on the volume where the files output by `mapr exportstream` is located.
- The `writeAce` permission on the volume in which the destination stream is located.
- On the source directory: read permission on the directory and all of the files within it
- On the destination stream: either `copyperm` or all three of the following permissions: `produceperm`, `consumeperm`, `topicperm`

For information about how to set permissions on volumes, see [Setting Whole Volume ACEs](#) on page 1294.

For information about how to set permissions on streams, see [Enabling Table and Stream Authorizations with ACEs](#) on page 1292.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run these utilities unless that user is given the relevant permission or permissions with access-control expressions.

Syntax of `mapr exportstream`

```
mapr exportstream
-src <srcStream>
```

```
-dst <dstDir>
[-mapreduce true/false default:false]
```

Parameters of `mapr exportstream`

Description	Parameter
src	The stream to export data from.
dst	The directory within the Data Fabric filesystem to export the files to. This directory must already exist before you run the utility.
mapreduce	A Boolean value that specifies whether or not to use a MapReduce program to perform the operation. The default, preferred method is to use a MapReduce program (true). When this parameter is set to false, a client process uses multiple threads.

Syntax of `mapr importstream`

```
mapr importstream
-src Input binary file or directory path
-dst Destination stream
[-mapreduce true/false default:false]
```

Parameters of `mapr importstream`

Description	Parameter
src	The path of the binary file or files to import. Examples -src /temp/part0 -src /temp/*
dst	The stream to import data into.
mapreduce	A Boolean value that specifies whether or not to use a MapReduce program to perform the operation. The default, preferred method is to use a MapReduce program (true). When this parameter is set to false, a client process uses multiple threads.

`mapr perfconsumer`

This utility runs a consumer reading messages from topics in a HPE Ezmeral Data Fabric stream. Use this utility to run consumers when you want to estimate the performance of consumers for your HPE Ezmeral Data Fabric Streams applications, given your network configuration.

This utility works in conjunction with the `mapr perfproducer` utility. When starting this utility, you can specify how many topics to read from, how many partitions to read from in each topic, and how many messages to read.

The `mapr perfconsumer` utility uses the default values for all of the configuration parameters that apply to consumers. For a list of these parameters, see [HPE Ezmeral Data Fabric Streams Configuration Parameters](#).

The utility uses the default values for all of the configuration parameters that apply to consumers.

Each consumer runs as a single thread. You can run multiple instances of the utility at the same time. However, because consumers can be CPU-intensive, it is recommended to run at most 4 or 5 on a single cluster node.

When you run multiple instances of this utility, you can use the `-group` parameter to create consumer groups.

Monitor the performance of the running instances of the `mapr perfconsumer` utility by following the instructions that are given in [Monitoring Consumers](#).

Prerequisites for running this utility

- Ensure that there is a HPE Ezmeral Data Fabric stream that one or more instances of `mapr perfproducer` have already published messages to or are actively publishing messages to.
- Ensure that the user ID that runs the `mapr perfconsumer` utility has the `consumeperm` permission on the stream.
- Ensure that the user ID that runs the `mapr perfconsumer` utility has the `readAce` and `writeAce` permissions on the volume where the stream is located.

For information about how to set permissions on volumes, see [Setting Whole Volume ACEs](#) on page 1294.

For information about how to set permissions on streams, see [Enabling Table and Stream Authorizations with ACEs](#) on page 1292.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

```
mapr perfconsumer
-path <stream-full-name>
[ -ntopics <num topics> (default: 2) ]
[ -npart <numpartitions per topic> (default: 4)
[ -nmsgs <num messages per topicfeed> (default: 100000) ]
[ -group <consumer group id> (default: null)
[ -topicsubscription <true/false> (default: false) ]
```

Parameters

Parameter	Description
<code>path</code>	The path to the stream.
<code>ntopics</code>	The number of topics for the consumer to subscribe to. The default is 2. If the number that you specify is greater than the number of topics that are in the stream, the utility hangs.

Parameter	Description
npart	<p>The number of partitions to read from in each topic that is subscribed.</p> <p>The default is 4.</p> <p>If the number that you specify is greater than the number of partitions that are in each topic, the utility hangs.</p> <p>If you specify a group ID with the <code>-group</code> parameter, the consumer's committed cursors are saved.</p> <p>If you do not specify a group ID, then the consumer's committed cursors are not saved.</p> <p>If you use the <code>-group</code> parameter to specify a group ID and you set the <code>-topicsubscription</code> parameter to <code>true</code>:</p> <ul style="list-style-type: none"> • If the consumer fails, its partitions can be redistributed among other consumer in the same group. If the consumer is the only consumer within a group, restarting the consumer with the same group ID causes the consumer to begin reading from the offsets of the saved committed cursors. • If the consumer fails and is then restarted, it starts at the oldest message in each partition.
nmsgs	<p>The number of messages to read from each partition.</p> <p>The default is 100,000.</p>
group	<p>The identifier of a consumer group. When two or more consumers belong to a consumer group, they must read from the same number of topics. HPE Ezmeral Data Fabric Streams distributes the partitions for those topics among the consumers in the group.</p> <p>The default is null.</p>
topicsubscription	<p>A value of <code>true</code> subscribes the consumer to topics. A value of <code>false</code> subscribes the consumer to topic partitions.</p> <p>The default is <code>false</code>.</p>

mapr perfproducer

This utility runs a producer, generating messages and publishing them to a HPE Ezmeral Data Fabric stream. Use this utility to run producers when you want to estimate the performance of producers for your HPE Ezmeral Data Fabric Streams applications, given your network configuration.

This utility starts a producer and generates data for the producer to publish in messages to a HPE Ezmeral Data Fabric stream. When starting the utility, you can specify how many topics the producer publishes to, how many partitions to create for each topic, and how many messages to publish to each partition. You can also specify the method for distributing messages among the partitions in each topic.

For example, suppose you run the utility by issuing this command:

```
mapr perfproducer -path /myVolume/myDirectory/stream_a -ntopics
40 -npart -5
-nmsgs 100000 -rr true
```

The producer automatically creates 40 topics in the stream, creating each topic as it writes the first message to that topic. Each topic is created with 5 partitions. The producer writes 100,000 messages to each partition for a total of 20,000,000 messages. After publishing all of the messages, the utility terminates.

The `mapr perfproducer` utility uses the default values for all of the configuration parameters that apply to producers. For a list of these parameters, see [HPE Ezmeral Data Fabric Streams Configuration Parameters](#).

Each producer runs as a single thread. You can run multiple instances of the utility at the same time. However, because producers can be CPU-intensive, it is recommended to run at most 4 or 5 on a single cluster node.

When multiple instances of the `mapr_perfproducer` utility publish to a single stream, the separate instances share topics. For example, if `-ntopics` is set to 40 for each instance that publishes to a single stream, together those instances create no more than 40 topics in the stream and they share those topics.

It is recommended that all producers that publish to a single cluster publish to the same number of topics and partitions within those topics. Therefore, use the same values for `-ntopics` and `-npart` for each instance of the `mapr_perfproducer` utility that shares a stream with other instances.

Monitor the performance of the running instances of the `mapr_perfproducer` utility by issuing the `maprcli` command `stream topic info` at intervals, as described in [Monitoring Producers](#). The command `stream topic info` shows statistics for single topics. Because all of the topics that `mapr_perfproducer` creates have the same number of partitions, and because `mapr_perfproducer` writes the same number of messages to each partition, you can assume that the statistics that the command `stream topic info` displays for any one topic are close to the statistics for any other topic. The naming convention that `mapr_perfproducer` uses when creating topics is simply `topicn`, which produces the names `topic0`, `topic1`, and so on. You can run the command `stream topic info` with any one of these names as the value of the `-topic` parameter.

To simulate consumers to estimate the performance of HPE Ezmeral Data Fabric Streams in your network configuration, run one or more instances of the `mapr_perfconsumer` utility against the stream.

Prerequisites for running this utility

- Create a HPE Ezmeral Data Fabric stream in a Data Fabric cluster for the `mapr_perfproducer` utility to publish messages to. See [stream create](#) on page 2248.

If you plan to replicate the stream for the purposes of the performance estimate, create the replica stream. Then, start replication from the first stream to the replica stream. For instructions on setting up replication between streams, see [Managing Stream Replication](#) on page 1430.

- Ensure that the user ID that runs the `mapr_perfproducer` utility has the `readAce` and `writeAce` permissions on the volume where the stream is located.
- Ensure that the user ID that runs the `mapr_perfproducer` utility has the `produceperm` and `topicperm` permissions on the stream.

For information about how to set permissions on volumes, see [Setting Whole Volume ACEs](#) on page 1294.

For information about how to set permissions on streams, see [Enabling Table and Stream Authorizations with ACEs](#) on page 1292.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

```
mapr_perfproducer
-path <stream-full-name>
[ -ntopics <num topics> (default: 2) ]
[ -npart <numpartitions per topic> (default: 4) ]
[ -nmsgs <num messages per topicfeed> (default: 100000) ]
[ -msgsz <msg value size> (default: 200) ]
[ -rr <round robin true/false> (default: false) ]
[ -hashkey <true/false> (default: false) ]
```

Parameters

Parameter	Description
<code>path</code>	The path to the stream.
<code>ntopics</code>	The number of topics for the producer to publish to in the stream. The default is 2.
<code>npart</code>	The number of partitions to create for each topic. The default is 4.
<code>nmsgs</code>	The number of messages to publish to each partition. The default is 100,000.
<code>msgsz</code>	The size of each message in bytes. The default is 200 bytes.
<code>rr</code>	Specifies to publish messages to partitions within a topic in round-robin fashion. See How Partitions are Chosen for Messages for detail about this method of distributing messages among topic partitions.  NOTE: This parameter is incompatible with the <code>-hashkey</code> parameter. You must set one or the other to true, but not both. The default is <code>false</code> .
<code>hashkey</code>	Specifies to distribute messages among topic partitions according to the hash of each message key. See How Partitions are Chosen for Messages for detail about this method of distributing messages among topic partitions.  NOTE: This parameter is incompatible with the <code>-rr</code> parameter. You must set one or the other to true, but not both. The default is <code>true</code> .

`mapr streamanalyzer`

This light-weight utility, which is a sample application for the `Streams` Java class for analytics on HPE Ezmeral Data Fabric Streams, lets you count the messages in a stream or a subset of the topics in a stream. The utility also lets you print either whole retrieved messages or a subset of the fields in each message.

You can download the source code for this utility here: [StreamAnalyzer.java](#)

For information about the `Streams` Java class and building applications that use it, see [HPE Ezmeral Data Fabric Streams Java API Library](#) on page 3397. See [Logical Schema of Messages](#) on page 727 for information about how messages are structured.

Ensure that the user ID that runs the utility has the `readAce` permission on the volume where the stream is located. For information about how to set permissions on volumes, see [Setting Whole Volume ACEs](#) on page 1294.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

```
mapr streamanalyzer -path <stream-full-name>
[ -topics <comma separated topic names> ]
```

```
[ -regex <regular expression representing topic names> ]
[ -countMessages <true/false> (default: true) ]
[ -printMessages <true/false> (default: false) ]
[ -projectFields <comma separated field names> (default: all fields) ]
```

Parameters

Parameter	Description
path	The path and name of the stream.
topics	A comma-separated list of the names of topics to retrieve. If you do not specify this parameter or the <code>-regex</code> parameter, all of the topics in the stream are retrieved. Do not use this parameter if you use the <code>-regex</code> parameter.
regex	A regular expression that represents the names of the topics to retrieve. If you do not specify this parameter or the <code>-topics</code> parameter, all of the topics in the stream are retrieved. Do not use this parameter if you use the <code>-topics</code> parameter.
countMessages	Prints the number of retrieved messages to the standard output.
printMessages	Prints the contents of retrieved messages to the standard output.
projectFields	If the <code>-printMessages</code> parameter is set to <code>true</code> , this parameter causes only the specified fields to be printed to the standard output for each message. In the list of field names, separate the names with commas. Default: all fields. Valid field names: key, value, topic, offset, partition, and producer. If the <code>-printMessages</code> parameter is set to <code>false</code> , this parameter has no effect.

YARN Commands

This section describes the YARN commands.

Commands

All YARN commands are invoked by the `/usr/bin/yarn` script.

```
Usage: yarn [--config confdir] [COMMAND] [COMMAND_OPTIONS]
```

COMMAND_OPTION	Description
<code>--config confdir</code>	Overrides the default Configuration directory. Default is <code>\${HADOOP_HOME}/conf</code> .
COMMAND	Commands
COMMAND_OPTIONS	Command options

The following `yarn` commands may be run on the HPE Ezmeral Data Fabric distribution of Apache Hadoop:

Command	Description
application	Lists applications, or prints the status or kills the specified application.
classpath	Prints the class path needed to get the Hadoop jar and the required libraries

Command	Description
debugcontrol	Saves additional DEBUG logs for scheduling to a separate file without restarting the RM
daemonlog	Gets and sets the log level for each daemon
jar	Runs jar file
logs	Dumps container logs
node	Prints node report(s)
queue	Prints queue information
rmadmin	Performs administrative tasks for Resource Manager
version	Print the version

The following yarn commands are not supported on the HPE Ezmeral Data Fabric distribution of Apache Hadoop:

- yarn applicationattempt
- yarn cluster
- yarn container
- yarn nodemanager
- yarn proxyserver
- yarn resourcemanager
- yarn sharedcachemanager
- yarn scmadmin
- yarn timelineserver

You can use the maprccli node services command or the Control System to start the services. For more information, see [Managing Services](#) on page 1065.

yarn application

The `yarn application` lists applications, or prints the status or kills the specified application.

Syntax

```
yarn application
  [-list [<-appStates States>] [<-appTypes Types>] ]
  [-status ApplicationId]
  [-kill ApplicationId]
```

Parameters

The following commands parameters are supported for `yarn application`:

Parameter	Description
-list [<appStates States>] [<appTypes Types>]	Lists applications. Optionally, you can filter the applications based on type or state. <ul style="list-style-type: none"> Use <code>-appTypes</code> to filter applications based on a comma-separated list of application types. Use <code>-appStates</code> to filter applications based on a comma-separated list of the following valid application states: ALL, NEW, NEW_SAVING, SUBMITTED, ACCEPTED, RUNNING, FINISHED, FAILED, KILLED
-status ApplicationId	Prints the status of the application.
-kill ApplicationId	Kills the application.

yarn classpath

The `yarn classpath` command prints the class path needed to access the Hadoop jar and the required libraries.

Syntax

```
yarn classpath
```

Output

```
$ yarn classpath
/opt/mapr/hadoop/hadoop-<version>/etc/hadoop:/opt/mapr/hadoop/
hadoop-<version>/etc/hadoop:/opt/mapr/hadoop/hadoop-<version>/etc/
hadoop:/opt/mapr/hadoop/hadoop-<version>/share/hadoop/common/lib/*:
/opt/mapr/hadoop/hadoop-<version>/share/hadoop/common/*:
/opt/mapr/hadoop/hadoop-<version>/share/hadoop/hdfs:
/opt/mapr/hadoop/hadoop-<version>/share/hadoop/hdfs/lib/*:
/opt/mapr/hadoop/hadoop-<version>/share/hadoop/hdfs/*:
/opt/mapr/hadoop/hadoop-<version>/share/hadoop/yarn/lib/*:
/opt/mapr/hadoop/hadoop-<version>/share/hadoop/yarn/*:
/opt/mapr/hadoop/hadoop-<version>/share/hadoop/mapreduce/lib/*:
/opt/mapr/hadoop/hadoop-<version>/share/hadoop/mapreduce/*:
/contrib/capacity-scheduler/*.jar:
/opt/mapr/hadoop/hadoop-<version>/share/hadoop/yarn/*:
/opt/mapr/hadoop/hadoop-<version>/share/hadoop/yarn/lib/*
```

yarn daemonlog

Gets or sets the log level for each daemon.

Syntax

```
yarn daemonlog
```

```
[-getlevel <host:port> <name>] | [-setlevel <host:port> <name> <level>]
```

Parameters

Parameter	Description
-getlevel <host:port> <name>	Prints the log level of the daemon running at <host:port>. This command internally connects to <code>http://<host:port>/logLevel?log=<name></code> .
-setlevel <host:port> <name> <level>	Sets the log level of the daemon running at <host:port>. This command internally connects to <code>http://<host:port>/logLevel?log=<name></code> .

yarn debugcontrol

used to save additional DEBUG logs for scheduling in YARN to a separate file without restarting the RM.

The logs are saved in `/opt/mapr/Hadoop/Hadoop<version>/logs/yarn-mapr-scheduling-debug.log`

Syntax

```
yarn debugcontrol
```

```
[-addapp <application_name>] | [-addqueue <queue_name> ] | [-removeapp  
<application_name> ] | [-removequeue <queue_name> ] | [-getapps ] |  
[-getqueues ]
```

Parameters

Parameter	Description
-addapp <application_name>	enables additional scheduling DEBUG on the application
-addqueue <queue_name>	enables additional scheduling DEBUG on the queue
-removeapp <application_name>	disable addition scheduling DEBUG on the application
-removequeue <queue_name>	disable addition scheduling DEBUG on the queue
-getapps	lists the applications with additional scheduling DEBUG
-getqueues	lists the queues with additional scheduling DEBUG

yarn jar

Runs a jar file that contains YARN code.

Syntax

```
yarn jar <jar> [<mainClass>] [<arguments>]
```

Parameters

The following commands parameters are supported for `yarn jar`:

Parameter	Description
<jar>	The JAR file.
<mainClass>	Sets the applications entry point.
<arguments>	Arguments to the program specified in the JAR file.

yarn logs

Dumps the YARN container logs.

Syntax

```
yarn logs -applicationId <application ID> [OPTIONS]
```

general options are:

```
-appOwner <Application Owner>  AppOwner (assumed to be current user if
                                not specified)
-containerId <Container ID>     ContainerId (must be specified if node
                                address is specified)
-help                           Displays help for all commands.
-nodeAddress <Node Address>     NodeAddress in the format nodename:port
                                (must be specified if container id is
                                specified)
```

Parameters

Parameter	Description
-applicationId	Specifies an application ID.
-appOwner <Application Owner>	Specifies the application owner. Defaults to the current user if this option is not specified.
-containerId <Container ID>	Specifies the container ID. Required when -nodeAddress is specified.
-nodeAddress <Node Address>	Specifies the node address in the following format: nodename:port. Required when -containerId is specified.

yarn node

Prints node report(s)

Syntax

```
yarn node
  [-list [-states <States>] | [-all]]
  [-status NodeId]
```

Parameters

Parameter	Description
-list [-states <states>] [-all]	Lists all running nodes. Optionally, filter nodes based on state or choose to list all the nodes. <ul style="list-style-type: none"> Use -states <states> to filter nodes based on a comma-separate list of node states. Use -all to list all nodes.
-status NodeId	Prints the status report of the node.

yarn queue

Prints queue information

Syntax

```
yarn queue -status <queue name>
```

Parameters

The following command parameter is supported for `yarn queue`:

Parameter	Description
status	The queue name.

yarn radmin

Runs the ResourceManager admin client.

Syntax

```
yarn radmin
  [-refreshQueues]
  [-refreshNodes]
  [-refreshUserToGroupsMapping]
  [-refreshSuperUserGroupsConfiguration]
  [-refreshAdminAcls]
  [-refreshServiceAcl]
  [-getGroups <username>]
  [-help <cmd>]
  [-transitionToActive <serviceId>]
  [-transitionToStandby <serviceId>]
  [-getServiceState <serviceId>]
  [-checkHealth <serviceId>]
```

Parameters

Parameter	Description
-refreshQueues	Reloads the queues' acls, states, and scheduler specific properties. The ResourceManager reloads the mapred-queues configuration file.
-refreshNodes	Refreshes the host information at the ResourceManager.
-refreshUserToGroupsMappings	Refreshes user-to-groups mappings.
-refreshSuperUserGroupsConfiguration	Refreshes superuser proxy groups mappings.
-refreshAdminAcls	Refreshes acls for administration of ResourceManager.
-refreshServiceAcl	Reloads the service-level authorization policy file. The ResourceManager reloads the authorization policy file.
-getGroups <username>	Gets the groups that the user belongs to.
-help <cmd>	Displays help for the given parameter or all parameters if no parameter is specified.
-transitionToActive <serviceId>	Transitions the service into the Active state. You can use this parameter when the ResourceManager is configured to failover manually.
-transitionToStandby <serviceId>	Transitions the service into Standby state. You can use this parameter when the ResourceManager is configured to failover manually.
-getServiceState <serviceId>	Returns the service state. You can use this parameter when the ResourceManager is configured to failover manually or automatically but not with the zero configuration failover option.

Parameter	Description
-checkHealth <serviceId>	Requests a health check for the service. If the health check fails, the RMAAdmin tool exits with a non-zero exit code. You can use this parameter when the ResourceManager is configured to failover manually or automatically but not with the zero configuration failover option.

yarn version

Prints the YARN version.

Syntax

```
yarn version
```

Output

```
$ yarn version
Hadoop 2.7.6.100-eeep-800
Subversion git@github.com:mapr/private-hadoop-common -r
80dc89ae5df3a2cd01089f192c5d8a886e4788c9

Source Code for HPE Ezmeral Data Fabric Software

HPE releases source code to the open-source community for enhancements that HPE has made to the Apache Hadoop project and other ecosystem components.

HPE regularly releases updates to Apache Hadoop ecosystem projects as the projects are released by Apache, after HPE can verify that the changes do not impact product stability. Releases of ecosystem components are independent of the release cycle for the core data-fabric software, so that new updates can be released quickly and efficiently.

Source code developed by HPE can be found on GitHub at <http://github.com/mapr> as of March 2013, coincident with version 2.1.2 of the data-fabric distribution. HPE may also release source code for other data-fabric projects at github.com/mapr. For each release that HPE includes in its distribution, HPE branches and tags the release on GitHub using the underlying project release number appended by `-mapr`.

Component Repositories on GitHub

The following repositories are available on GitHub for components that HPE has enhanced, patched, or created.

- [oozie](#)
- [hcatalog](#)
- [pig](#)
- [hive](#)
- [mahout](#)
- [hbase](#)

- flume
- whirr
- opentsdb

NOTE: Select the [highest MEP version supported by the HPE Ezmeral Data Fabric version](#) that you are using.

- sqoop
- scribe

Finding Source Changes Prior to February 2013

GitHub is the single, central location for tracking changes that HPE applies to components in releases of the data-fabric distribution. Prior to February 2013, HPE included a list of patches in each component directory, as shown below. This information is no longer stored in the installation directory for recent releases, and instead is available at GitHub.

Example: Location of Information about Patches to HBase Prior to February 2012

```
$ ls /opt/mapr/hbase/hbase-0.92.1/
bin                hbase-0.92.1.jar          LICENSE.txt          pom.xml
CHANGES.txt      hbase-0.92.1-tests.jar   logs                README.txt
conf              hbase-webapps            mapr-hbase-patches security
conf.new          lib                      NOTICE.txt         src

$ ls /opt/mapr/hbase/hbase-0.92.1/mapr-hbase-patches/
0000-hbase-with-mapr.patch          0006-hbase-6285-fix.patch
0001-hbase-wait-for-fs+set-chunksize.patch  0007-hbase-6375-fix.patch
0002-hbase-source-env-vars.patch      0008-hbase-6455-fix.patch
0003-hbase-6158-fix.patch             0009-bug-7745-fix.patch
0004-hbase-6018-fix.patch             Readme.txt
0005-hbase-6236-fix.patch
```

Hadoop Commands

This section describes the Hadoop commands.

All Hadoop commands are invoked by the bin/hadoop script.

Hadoop Command Overview

This section contains the following:

Hadoop Syntax Summary

The following syntax summary applies to all commands.

```
hadoop [--config confdir] [COMMAND] [GENERIC_OPTIONS] [COMMAND_OPTIONS]
```

Hadoop has an option parsing framework that employs parsing generic options as well as running classes.

COMMAND_OPTION	Description
-mode	For both the hadoop and hadoop2 commands, setting this option is no longer valid. Both commands default to yarn, the only valid mode for the current Data Fabric version.

COMMAND_OPTION	Description
<code>--config confdir</code>	Overwrites the default Configuration directory. Default is <code>\${HADOOP_HOME}/conf</code> .
COMMAND	Various commands with their options are described in the following sections.
GENERIC_OPTIONS	The common set of options supported by multiple commands.
COMMAND_OPTIONS	Various command options are described in the following sections.

NOTE: Running the `hadoop` script without any arguments prints the help description for all commands.

Supported Commands for Hadoop 2.x

HPE Ezmeral Data Fabric supports the following `hadoop` commands for Hadoop 2.x:

Command	Description
<code>archive -archive Name NAME <src>* <dest></code>	Creates a Hadoop archive, a file that contains other files. A Hadoop archive always has a <code>.har</code> extension.
CLASSNAME	The <code>hadoop</code> script can be used to invoke any class. <code>hadoop CLASSNAME</code> runs the class named CLASSNAME.
<code>classpath</code>	Prints the class path needed to access the Hadoop JAR and the required libraries.
<code>conf</code>	The <code>hadoop conf</code> command prints the configuration information for the current node.
<code>daemonlog</code>	The <code>hadoop daemonlog</code> command may be used to get or set the log level of Hadoop daemons.
<code>distcp <source> <destination></code>	The <code>hadoop distcp</code> command is a tool for large inter- and intra-cluster copying. It uses MapReduce to effect its distribution, error handling and recovery, and reporting. It expands a list of files and directories into input to map tasks, each of which will copy a partition of the files specified in the source list.
<code>fs</code>	The <code>hadoop fs</code> command runs a generic filesystem user client that interacts with the MapR filesystem.
<code>jar <jar></code>	The <code>hadoop jar</code> command runs a JAR file. Users can bundle their MapReduce code in a JAR file and execute it using this command.
<code>mfs</code>	The <code>hadoop mfs</code> command performs operations on directories in the cluster. The main purposes of <code>hadoop mfs</code> are to display directory information and contents, to create symbolic links, and to set compression and chunk size on a directory.
<code>version</code>	The <code>hadoop version</code> command prints the Hadoop software version.

WARNING: For Hadoop2, some `hadoop` commands are deprecated and replaced by the `mapred` command.

For example, if you run the `hadoop job` command, you see this message:

```
# hadoop job
DEPRECATED: Use of this script to execute mapred command is deprecated.
Instead, use the mapred command for it.
```

The syntax for the `mapred` command is:

```
mapred [--config confdir] [--loglevel loglevel] COMMAND
```

Commands used with `mapred` include:

Command	Description
<code>historyserver</code>	Runs job history servers as a standalone daemon
<code>hsadmin</code>	The job history server admin interface
<code>job</code>	Manipulates MapReduce applications
<code>pipes</code>	Runs a pipes job
<code>queue</code>	Gets information regarding JobQueues

Generic Options

Implement the [Tool](#) interface to make the following command-line options available for many of the Hadoop commands.

Generic Option	Description
<code>-conf <filename1 filename2 ...></code>	Add the specified configuration files to the list of resources available in the configuration.
<code>-D <property=value></code>	Set a value for the specified Hadoop configuration property.
<code>-fs <local filesystem URI></code>	Set the URI of the default filesystem.
<code>-jt <local jobtracker:port></code>	Specify a ResourceManager for a given host and port. This command option is a shortcut for <code>-D mapred.job.tracker=host:port</code>
<code>-files <file1,file2,...></code>	Specify files to be copied to the map reduce cluster.
<code>-libjars <jar1,jar2,...></code>	Specify JAR files to be included in the classpath of the mapper and reducer tasks.
<code>-archives <archive1,archive2,...></code>	Specify archive files (JAR, tar, tar.gz, ZIP) to be copied and unarchived on the task node.

hadoop archive

The `hadoop archive` command creates a Hadoop archive, a file that contains other files. A Hadoop archive always has a `*.har` extension.

Syntax

```
hadoop [ Generic Options ] archive
  -archiveName <name>
  [-p <parent>]
```

```
<source>
<destination>
```

Parameters

Parameter	Description
-archiveName <name>	Name of the archive to be created.
-p <parent_path>	The parent argument is to specify the relative path to which the files should be archived to.
<source>	Filesystem pathnames, which work as usual with regular expressions.
<destination>	Destination directory, which would contain the archive.

Examples

Archive within a single directory

```
hadoop archive -archiveName myArchive.har -p /foo/bar /outputdir
```

The above command creates an archive of the directory `/foo/bar` in the directory `/outputdir`.

Archive to another directory

```
hadoop archive -archiveName myArchive.har -p /foo/bar a/b/c e/f/g
```

The above command creates an archive of the directory `/foo/bar/a/b/c` in the directory `/foo/bar/e/f/g`.

hadoop classpath

The `hadoop classpath` command prints the class path needed to access the Hadoop jar and the required libraries.

Syntax

```
hadoop classpath
```

Output Example

```
$hadoop classpath
/opt/mapr/hadoop/hadoop-2.7.0/etc/hadoop:/opt/mapr/hadoop/hadoop-2.7.0/
share/hadoop/common/lib/
*/opt/mapr/hadoop/hadoop-2.7.0/share/hadoop/common/*:/opt/mapr/hadoop/
hadoop-2.7.0/share/hadoo
p/hdfs:/opt/mapr/hadoop/hadoop-2.7.0/share/hadoop/hdfs/lib/*:/opt/mapr/
hadoop/hadoop-2.7.0/shar
e/hadoop/hdfs/*:/opt/mapr/hadoop/hadoop-2.7.0/share/hadoop/yarn/lib/*:/opt/
mapr/hadoop/hadoop-2
.7.0/share/hadoop/yarn/*:/opt/mapr/hadoop/hadoop-2.7.0/share/hadoop/
mapreduce/lib/*:/opt/mapr/h
adoop/hadoop-2.7.0/share/hadoop/mapreduce/*:/contrib/capacity-scheduler/
*.jar:/opt/mapr/lib/kvs
tore*.jar:/opt/mapr/lib/libprotodefs*.jar:/opt/mapr/lib/baseutils*.jar:/opt/
mapr/lib/maprutil*
```

```
jar:/opt/mapr/lib/json-20080701.jar:/opt/mapr/lib/flexjson-2.1.jar
```

hadoop daemonlog

The `hadoop daemonlog` command gets and sets the log level for each daemon.

Hadoop daemons all produce logfiles that you can use to learn about what is happening on the system. You can use the `hadoop daemonlog` command to temporarily change the log level of a component when debugging the system.

Syntax

```
hadoop daemonlog
  -getlevel | -setlevel
  <host>:<port>
  <name>
  [ <level> ]
```

Parameters

The following command options are supported for `hadoop daemonlog` command:

Parameter	Description
<code>-getlevel <host:port><name></code>	<p>Prints the log level of the daemon running at the specified host and port, by querying</p> <pre>http://<host>:<port>/logLevel?log=<name></pre> <ul style="list-style-type: none"> • <code><host></code>: The host on which to get the log level. • <code><port></code>: The port by which to get the log level. • <code><name></code>: The daemon on which to get the log level. Usually the fully qualified classname of the daemon doing the logging. For example, <code>org.apache.hadoop.yarn.server.resourcemanager.resourcemanager</code> for the ResourceManager daemon.
<code>-setlevel <host:port> <name> <level></code>	<p>Sets the log level of the daemon running at the specified host and port, by querying</p> <pre>http://<host>:<port>/logLevel?log=<name></pre> <ul style="list-style-type: none"> • <code><host></code>: The host on which to set the log level. • <code><port></code>: The port by which to set the log level. • <code><name></code>: The daemon on which to set the log level. • <code><level></code>: The log level to set the daemon.

Examples

Getting the log levels of a daemon

To get the log level for each daemon enter a command such as the following:

```
hadoop daemonlog -getlevel 10.250.1.15:50030
org.apache.hadoop.yarn.server.resourcemanager.resourcemanager
Connecting to http://10.250.1.15:50030/logLevel?
log=org.apache.hadoop.yarn.server.resourcemanager.resourcemanager
Submitted Log Name:
org.apache.hadoop.yarn.server.resourcemanager.resourcemanager
Log Class: org.apache.commons.logging.impl.Log4JLogger
Effective level: ALL
```

Setting the log level of a daemon

To temporarily set the log level for a daemon enter a command such as the following:

```
hadoop daemonlog -setlevel 10.250.1.15:50030
org.apache.hadoop.yarn.server.resourcemanager.resourcemanager DEBUG
Connecting to http://10.250.1.15:50030/logLevel?
log=org.apache.hadoop.yarn.server.resourcemanager.resourcemanager&level=DEBU
G
Submitted Log Name:
org.apache.hadoop.yarn.server.resourcemanager.resourcemanager
Log Class: org.apache.commons.logging.impl.Log4JLogger
Submitted Level: DEBUG
Setting Level to DEBUG ...
Effective level: DEBUG
```

Using this method, the log level is automatically reset when the daemon is restarted.

To make the change to log level of a daemon persistent, enter a command such as the following:

```
hadoop daemonlog -setlevel 10.250.1.15:50030
log4j.logger.org.apache.hadoop.yarn.server.resourcemanager.resourcemanager
DEBUG
```

hadoop distcp

The `hadoop distcp` command is a tool used for large inter- and intra-cluster copying.

It uses MapReduce to effect its distribution, error handling and recovery, and reporting. It expands a list of files and directories into input to map tasks, each of which will copy a partition of the files specified in the source list.

Syntax

```
hadoop [ Generic Options ] distcp
  [-p[erbugp] ]
  [-i ]
  [-log ]
  [-m ]
  [-overwrite ]
  [-update ]
  [-f <URI list> ]
  [-filelimit <n> ]
  [-sizelimit <n> ]
  [-delete ]
  <source>
  <destination>
```

Parameters

Command Options

The following command options are supported for the `hadoop distcp` command:

Parameter	Description
<source>	Specify the source URL.
<destination>	Specify the destination URL.
<code>-blocksperchunk</code> <number-of-blocks-per-chunk>	Number of blocks per chunk. When specified, this option splits files into chunks to copy the files in parallel. If the option is set to a positive value, files with more blocks than this value are split into chunks of <number-of-blocks-per-chunk> blocks to be transferred in parallel and reassembled at the destination. By default, <number-of-blocks-per-chunk> is 0 and files are transmitted in their entirety without splitting.
<code>-p[erbugp]</code>	Preserve e: ACE r: replication number b: block size u: user g: group p: permission <code>-p</code> alone is equivalent to <code>-perbugp</code> . Modification times are not preserved. When you specify <code>-update</code> , status updates are not synchronized unless the file sizes also differ.
<code>-i</code>	Ignore failures. As explained in the below, this option will keep more accurate statistics about the copy than the default case. It also preserves logs from failed copies, which can be valuable for debugging. Finally, a failing map will not cause the job to fail before all splits are attempted.
<code>-log <logdir></code>	Write logs to <logdir>. The <code>hadoop distcp</code> command keeps logs of each file it attempts to copy as map output. If a map fails, the log output will not be retained if it is re-executed.
<code>-m <num_maps></code>	Maximum number of simultaneous copies. Specify the number of maps to copy data. Note that more maps may not necessarily improve throughput. See <i>Map Sizing</i> .
<code>-overwrite</code>	Overwrite destination. If a map fails and <code>-i</code> is not specified, all the files in the split, not only those that failed, will be recopied. As discussed in the <i>Overwriting Files Between Clusters</i> , it also changes the semantics for generating destination paths, so users should use this carefully.
<code>-update</code>	Overwrite if <source> size is different from <destination> size. As noted in the preceding, this is not a "sync" operation. The only criterion examined is the source and destination file sizes; if they differ, the source file replaces the destination file. See <i>Updating Files Between Clusters</i> .
<code>-f <URI list></code>	Use list at <URI list> as source list. This is equivalent to listing each source on the command line. The value of <URI list> must be a fully qualified URI.
<code>-filelimit <n></code>	Limit the total number of files to be $\leq n$. See <i>Symbolic Representations</i> .
<code>-sizelimit <n></code>	Limit the total size to be $\leq n$ bytes. See <i>Symbolic Representations</i> .
<code>-delete</code>	Delete the files existing in the <destination> but not in <source>. The deletion is done by FS Shell.

Generic Options

The `hadoop distcp` command supports the following generic options: `-conf <configuration file>`, `-D <property=value>`, `-fs <local|file system URI>`, `-jt <local|jobtracker:port>`, `-files <file1,file2,file3,...>`, `-libjars <libjar1,libjar2,libjar3,...>`, and `-archives <archive1,archive2,archive3,...>`. For more information on generic options, see [Generic Options](#).

Symbolic Representations

The parameter `<n>` in `-filelimit` and `-sizelimit` can be specified with symbolic representation. For example,

- $1230k = 1230 * 1024 = 1259520$
- $891g = 891 * 1024^3 = 956703965184$

Map Sizing

The `hadoop distcp` command attempts to size each map comparably so that each copies roughly the same number of bytes. Note that files are the finest level of granularity, so increasing the number of simultaneous copiers (i.e. maps) may not always increase the number of simultaneous copies nor the overall throughput.

If `-m` is not specified, `distcp` will attempt to schedule work for `min (total_bytes / bytes.per.map, 20 * num_task_trackers)` where `bytes.per.map` defaults to 256MB.

Tuning the number of maps to the size of the source and destination clusters, the size of the copy, and the available bandwidth is recommended for long-running and regularly run jobs.

Examples

For all of the below examples, the cluster name must be specified in the [mapr-clusters.conf](#) on page 2844 configuration file.

Basic inter-cluster copying

The `hadoop distcp` command is most often used to copy files between clusters:

```
hadoop distcp maprfs://cluster1/foo \
maprfs://cluster2/bar
```

The command in the example expands the namespace under `/foo/bar` on cluster1 into a temporary file, partitions its contents among a set of map tasks, and starts a copy on each NodeManager node from cluster1 to cluster2. Note that the `hadoop distcp` command expects absolute paths.

Only those files that do not already exist in the destination are copied over from the source directory.

Updating files between clusters

Use the `hadoop distcp -update` command to synchronize changes between clusters.

```
$ hadoop distcp -update maprfs://cluster1/foo maprfs://cluster2/bar/foo
```

Files in the `/foo` subtree are copied from cluster1 to cluster2 only if the size of the source file is different from that of the size of the destination file. Otherwise, the files are skipped over.

Note that using the `-update` option changes distributed copy interprets the source and destination paths making it necessary to add the trailing `/foo` subdirectory in the second cluster.

Overwriting files between clusters

By default, distributed copy skips files that already exist in the destination directory, but you can overwrite those files using the `-overwrite` option. In this example, multiple source directories are specified:

```
$ hadoop distcp -overwrite maprfs://cluster1/foo/a \
maprfs://cluster1/foo/b \
maprfs://cluster2/bar
```

As with using the `-update` option, using the `-overwrite` changes the way that the source and destination paths are interpreted by distributed copy: the contents of the source directories are compared to the contents of the destination directory. The distributed copy aborts in case of a conflict.

Intra-cluster copying of files and directories

The `hadoop distcp` command can be used to copy files and directories in a cluster to another directory in the same cluster.

- Copy a file into an existing target directory:

```
$ hadoop distcp /test/file.log /test/dir1

#verify the result of the distcp command with the hadoop fs -ls command

$ hadoop fs -ls -R /test
drwxr-xr-x  - username username      1 2022-10-14 10:37 /test/dir1
-rw-r--r--  3 username username    15 2022-10-14 10:37 /test/dir1/
file.log
-rwxr-xr-x  3 username username     15 2022-10-14 10:29 /test/
file.log
```

- Copy a file and a directory to an existing target directory:

```
$ hadoop distcp /test/file.log /test/dir1 /test/dir2

#verify the result of the distcp command with the hadoop fs -ls command

$ hadoop fs -ls -R /test
drwxr-xr-x  - username username      1 2022-10-14 10:37 /test/dir1
-rw-r--r--  3 username username    15 2022-10-14 10:37 /test/dir1/
file.log
drwxr-xr-x  - username username      2 2022-10-14 10:40 /test/dir2
drwxr-xr-x  - username username      1 2022-10-14 10:40 /test/dir2/
dir1
-rw-r--r--  3 username username     15 2022-10-14 10:40 /test/dir2/
dir1/file.log
-rw-r--r--  3 username username     15 2022-10-14 10:40 /test/dir2/
file.log
-rwxr-xr-x  3 username username     15 2022-10-14 10:29 /test/
file.log
```

Migrating Data from HDFS to file system

The `hadoop distcp` command can be used to migrate data from an HDFS cluster to a file system where the HDFS cluster uses the same version of the RPC protocol as that used by MapR. For a discussion, see [Copying Data from Apache Hadoop](#).

```
$ hadoop distcp namenode1:50070/foo maprfs:///bar
```

You must specify the IP address and HTTP port (usually 50070) for the namenode on the HDFS cluster.

hadoop fs

The `hadoop fs` command runs a generic file system user client that interacts with the file system. Starting from EEP 7.1.0, all `hadoop fs` commands support operations on symlinks.

WARNING: On the Windows client, make sure that the `PATH` contains the following directories:

- `C:\Windows\system32`
- `C:\Windows`

If they are not present, the `hadoop fs` command might fail silently.

Syntax

```
hadoop [ Generic Options ] fs
[-cat <src>]
[-chgrp [-R] GROUP PATH...]
[-chmod [-R] <MODE[,MODE]... | OCTALMODE> PATH...]
[-chown [-R] [OWNER][:[GROUP]] PATH...]
[-copyFromLocal <localsrc> ... <dst>]
[-copyToLocal [-ignoreCrc] [-crc] <src> <localdst>]
[-count[-q] <path>]
[-cp <src> <dst> -p[e]]
[-df <path>]
[-du <path>]
[-dus <path>]
[-expunge]
[-get [-ignoreCrc] [-crc] <src> <localdst>]
[-getfattr [-R] {-n name | -d} [-e <encoding>] <path>]
[-getmerge <src> <localdst> [addnl]]
[-help [cmd]]
[-ls <path>]
[-lsr <path>]
[-mkdir <path>]
[-moveFromLocal <localsrc> ... <dst>]
[-moveToLocal <src> <localdst>]
[-mv <src> <dst>]
[-put <localsrc> ... <dst>]
[-rm [-skipTrash] <src>]
[-rmr [-skipTrash] <src>]
[-setfattr -n name [-v value] | -x name <path>]
[-stat [format] <path>]
[-tail [-f] <path>]
[-test -[ezd] <path>]
[-text <path>]
[-touchz <path>]
```

Parameters

Command Options

The following command parameters are supported for `hadoop fs`:

Parameter	Description
<code>-cat <src></code>	Fetch all files that match the file pattern defined by the <code><src></code> parameter and display their contents on <i>stdout</i> .

Parameter	Description
<code>-chmod [-R] <MODE[,MODE]... OCTALMODE> PATH...</code>	Changes permissions of a file. This works similar to shell's <code>chmod</code> with a few exceptions. <code>-R</code> modifies the files recursively. This is the only option currently supported. <code>MODE</code> Mode is same as mode used for <code>chmod</code> shell command. Only letters recognized are <code>rwXt</code> . That is, <code>+t</code> , <code>a+r</code> , <code>g-w</code> , <code>+rwx</code> , <code>o=r</code> <code>OCTALMODE</code> Mode specified in 3 or 4 digits. If 4 digits, the first may be 1 or 0 to turn the sticky bit on or off, respectively. Unlike shell command, it is not possible to specify only part of the mode E.g. <code>754</code> is same as <code>u=rwx,g=rx,o=r</code> If none of 'augo' is specified, 'a' is assumed and unlike shell command, no <code>umask</code> is applied.
<code>-chown [-R] [OWNER] [:[GROUP]] PATH...</code>	Changes owner and group of a file. This is similar to shell's <code>chown</code> with a few exceptions. <code>-R</code> modifies the files recursively. This is the only option currently supported. If only owner or group is specified then only owner or group is modified. The owner and group names may only consists of digits, alphabet, and any of <code>- .@/'</code> i.e. <code>[- .@/a-zA-Z0-9]</code> . The names are case sensitive.  WARNING: Avoid using <code>'</code> to separate user name and group though Linux allows it. If user names have dots in them and you are using local file system, you might see surprising results since shell command <code>chown</code> is used for local files.
<code>-chgrp [-R] GROUP PATH...</code>	This is equivalent to <code>-chown ... :GROUP ...</code>
<code>-copyFromLocal <localsrc> ... <dst></code>	Identical to the <code>-put</code> command.
<code>-copyToLocal [-ignoreCrc] [-crc] <src> <localdst></code>	Identical to the <code>-get</code> command.
<code>-count[-q] <path></code>	Count the number of directories, files and bytes under the paths that match the specified file pattern. The output columns are: <code>DIR_COUNT</code> <code>FILE_COUNT</code> <code>CONTENT_SIZE</code> <code>FILE_NAME</code> or <code>QUOTA</code> <code>REMAINING_QUOTA</code> <code>SPACE_QUOTA</code> <code>REMAINING_SPACE_QUOTA</code> <code>DIR_COUNT</code> <code>FILE_COUNT</code> <code>CONTENT_SIZE</code> <code>FILE_NAME</code>
<code>-cp <src> <dst> [-p[e]]</code>	Copy files that match the file pattern <code><src></code> to a destination. When copying multiple files, the destination must be a directory. Specifying <code>-p</code> with the <code>e</code> option preserves an ACE applied to the file. Specifying <code>-p</code> without an argument preserves the ACE by default.
<code>-df [<path>]</code>	Shows the capacity, free and used space of the file system. If the file system has multiple partitions, and no path to a particular partition is specified, then the status of the root partitions will be shown.
<code>-du <path></code>	Show the amount of space, in bytes, used by the files that match the specified file pattern. Equivalent to the Unix command <code>du -sb <path>/*</code> in case of a directory, and to <code>du -b <path></code> in case of a file. The output is in the form <code>name(full path) size (in bytes)</code> .
<code>-dus <path></code>	Show the amount of space, in bytes, used by the files that match the specified file pattern. Equivalent to the Unix command <code>du -sb</code> . The output is in the form <code>name(full path) size (in bytes)</code> .
<code>-fs [local <filesystem URI>]</code>	Specify the file system to use. If not specified, the current configuration is used, taken from the following, in increasing precedence: <code>core-default.xml</code> inside the hadoop jar file <code>core-site.xml</code> in <code>\$HADOOP_CONF_DIR</code> . The <code>local</code> option means use the local file system as your DFS. <code><filesystem URI></code> specifies a particular file system to contact. This argument is optional but if used must appear first on the command line. Exactly one additional argument must be specified.

Parameter	Description
<code>-get [-ignoreCrc] [-crc] <src> <localdst></code>	Copy files that match the file pattern <src> to the local name. <src> is kept. When copying multiple files, the destination must be a directory.
<code>getfattr [-R] -n <name> -d [-e <encoding>] <path></code>	Retrieve all the extended attribute values (if any) for a file or directory. Here: -R Recursively list the attributes for all files and directories. -n <name> The name of the extended attribute to retrieve. -d Retrieve all extended attributes associated with the pathname. Extended attributes to which the calling process does not have access may be omitted from the list. -e <encoding> Encode values after retrieving them. Valid encodings are text (enclosed in double quotes), hex (prefixed with 0x), and base64 (prefixed with 0s). <path> The file or directory.
<code>-getmerge <src> <localdst></code>	Get all the files in the directories that match the source file pattern and merge and sort them to only one file on local fs. <src> is kept.
<code>-help [cmd]</code>	Displays help for given command or all commands if none is specified.
<code>-ls <path></code>	List the contents that match the specified file pattern. If path is not specified, the contents of /user/<currentUser> will be listed. Directory entries are of the form dirName (full path) <dir> and file entries are of the form fileName(full path) <r n>. size where n is the number of replicas specified for the file and size is the size of the file, in bytes.
<code>-lsr <path></code>	Recursively list the contents that match the specified file pattern. Behaves very similarly to <code>hadoop fs -ls</code> , except that the data is shown for all the entries in the subtree.
<code>-mkdir <path></code>	Create a directory in specified location.
<code>-moveFromLocal <localsrc> ... <dst></code>	Same as <code>-put</code> , except that the source is deleted after it's copied.
<code>-moveToLocal <src> <localdst></code>	Not implemented yet
<code>-mv <src> <dst></code>	Move files that match the specified file pattern <src> to a destination <dst>. When moving multiple files, the destination must be a directory.
<code>-put <localsrc> ... <dst></code>	Copy files from the local file system into fs. To copy files, user must have write permission on the directory or the <code>addchild</code> , <code>deletetchild</code> , and <code>writetfile</code> access set using ACES .
<code>-rm [-skipTrash] <src></code>	Delete all files that match the specified file pattern. Equivalent to the Unix command <code>rm <src></code> . The <code>-skipTrash</code> option bypasses trash, if enabled, and immediately deletes <src>

Parameter	Description								
<code>-rmr [-skipTrash] <src></code>	Remove all directories which match the specified file pattern. Equivalent to the Unix command <code>rm -rf <src></code> . The <code>-skipTrash</code> option bypasses trash, if enabled, and immediately deletes <code><src></code> .								
<code>-setfattr -n <name> [-v <value>] -x <name> <path></code>	Set or remove an extended attribute name and value. Here: <table border="0"> <tr> <td><code>-n <name></code></td> <td>The name of the extended attribute to set.</td> </tr> <tr> <td><code>-v <value></code></td> <td>The value of the extended attribute to set.</td> </tr> <tr> <td><code>-x <name></code></td> <td>The name of the extended attribute to remove.</td> </tr> <tr> <td><code><path></code></td> <td>The file or directory.</td> </tr> </table>	<code>-n <name></code>	The name of the extended attribute to set.	<code>-v <value></code>	The value of the extended attribute to set.	<code>-x <name></code>	The name of the extended attribute to remove.	<code><path></code>	The file or directory.
<code>-n <name></code>	The name of the extended attribute to set.								
<code>-v <value></code>	The value of the extended attribute to set.								
<code>-x <name></code>	The name of the extended attribute to remove.								
<code><path></code>	The file or directory.								
<code>-stat [format] <path></code>	Print statistics about the file/directory at <code><path></code> in the specified format. Format accepts filesize in blocks (%b), filename (%n), block size (%o), replication (%r), modification date (%y, %Y).								
<code>-tail [-f] <file></code>	Show the last 1KB of the file. The <code>-f</code> option shows appended data as the file grows.								
<code>-touchz <path></code>	Write a timestamp in <code>yyyy-MM-dd HH:mm:ss</code> format in a file at <code><path></code> . An error is returned if the file exists with non-zero length.								
<code>-test [-ezd] <path></code>	If file { exists, has zero length, is a directory then return 0, else return 1.								
<code>-text <src></code>	Takes a source file and outputs the file in text format. The allowed formats are zip and TextRecordInputStream.								

Generic Options

The following generic options are supported for the `hadoop fs` command: `-conf <configuration file>`, `-D <property=value>`, `-fs <local|file system URI>`, `-jt <local|jobtracker:port>`, `-files <file1,file2,file3,...>`, `-libjars <libjar1,libjar2,libjar3,...>`, and `-archives <archive1,archive2,archive3,...>`. For more information on generic options, see [Generic Options](#).

Examples

Set an extended attribute on a file, file1.txt:

```
hadoop fs -setfattr -n user.key1 -v val1 /xattrs/m7user1/file1.txt
```

Remove an extended attribute specified by name:

```
hadoop fs -setfattr -x user.key1 /xattrs/m7user1/dir1
```

Retrieve an extended attribute for a file encoded in text:

```
[root@qa-nodell10 ~]# hadoop fs -getfattr -n user.key1 -e text /xattr/file1
# file: /xattr/file1
user.key1="value1"
```

Retrieve an extended attribute for a file encoded in hex:

```
[root@qa-nodell10 ~]# hadoop fs -getfattr -n user.key1 -e hex /xattr/file1
# file: /xattr/file1
user.key1=0x76616c7566531
```

Retrieve an extended attribute for a file encoded in base64:

```
[root@qa-nodell10 ~]# hadoop fs -getfattr -n user.key1 -e base64 /xattr/file1
# file: /xattr/file1
user.key1=0sdmFsdWUx
```

Retrieve an extended attribute specified by name:

```
[root@qa-nodell10 ~]# hadoop fs -getfattr -n user.key1 /xattr/file2
# file: /xattr/file2
user.key1="value1"
```

Retrieve all the extended attributes associated with the given file:

```
[root@qa-nodell10 ~]# hadoop fs -getfattr -d /xattr/file2
# file: /xattr/file2
user.key2="value2"
user.key1="value1"
```

Retrieve extended attributes recursively:

```
[root@qa-nodell10 ~]# hadoop fs -getfattr -R -d /xattr/
# file: /xattr
# file: /xattr/file1
user.key2="value2"
# file: /xattr/file2
user.key2="value2"
user.key1="value1"
```

Retrieve a specific extended attribute recursively on a directory:

```
[root@qa-nodell10 ~]# hadoop fs -getfattr -R -n user.key1 /xattr/
# file: /xattr
user.key1="value1"
# file: /xattr/file1
getfattr: No such attribute
# file: /xattr/file2
user.key1="value1"
```

Suppressing Warning Messages for the hadoop fs Command

After an upgrade to 4.0.x, the `hadoop fs` command returns the following warning message:

```
WARNING: org.apache.hadoop.metrics.jvm.EventCounter is deprecated. Please
use
org.apache.hadoop.log.metrics.EventCounter in all the log4j.properties
files.
```

This message does not cause any problems, but you can suppress it by modifying the following file:

```
/opt/mapr/hadoop/hadoop-0.20.2/conf/log4j.properties
```

In this file, replace the following line:

```
log4j.appender.EventCounter=org.apache.hadoop.log.EventCounter
```

with this line:

```
log4j.appender.EventCounter=org.apache.hadoop.log.metrics.EventCounter
```

hadoop jar

The `hadoop jar` command runs a program contained in a JAR file. Users can bundle their MapReduce code in a JAR file and execute it using this command.

Syntax

```
hadoop jar <jar>
  [<arguments>]
```

Parameters

The following commands parameters are supported for `hadoop jar`:

Parameter	Description
<jar>	The JAR file.
<arguments>	Arguments to the program specified in the JAR file.

Examples

Streaming Application

Hadoop streaming applications are run using the `hadoop jar` command. The Hadoop streaming utility enables you to create and run MapReduce applications with any executable or script as the mapper and/or the reducer.

```
$ hadoop jar $HADOOP_HOME/hadoop-streaming.jar \
  -input myInputDirs \
  -output myOutputDir \
  -mapper org.apache.hadoop.mapred.lib.IdentityMapper \
  -reducer /bin/wc
```

The `-input`, `-output`, `-mapper`, and `-reducer` streaming command options are all required for streaming jobs. Either an executable or a Java class may be used for the mapper and the reducer. For more information about and examples of streaming applications, see [Hadoop Streaming](#) at the Apache project's page.

Running from a JAR file

The simple Word Count program is another example of a program that is run using the `hadoop jar` command. The `wordcount` functionality is built into the `hadoop-0.20.2-dev-examples.jar` program. You pass the file, along with the location, to Hadoop with the `hadoop jar` command and Hadoop reads the JAR file and executes the relevant instructions.

The Word Count program reads files from an input directory, counts the words, and writes the results of the application to files in an output directory.

```
$ hadoop jar /opt/mapr/hadoop/hadoop-0.20.2/hadoop-0.20.2-dev-examples.jar
wordcount /myvolume/in /myvolume/out
```

hadoop job

The `hadoop job` command enables you to manage MapReduce jobs.

WARNING: This command is deprecated.

Syntax

```

hadoop job [Generic Options]
  [-submit <job-file>]
  [-status <job-id>]
  [-counter <job-id> <group-name> <counter-name>]
  [-kill <job-id>]
  [-unblacklist <job-id> <hostname>]
  [-unblacklist-tracker <hostname>]
  [-set-priority <job-id> <priority>]
  [-events <job-id> <from-event-#> <#-of-events>]
  [-history <jobOutputDir>]
  [-list [all]]
  [-list-active-trackers]
  [-list-blacklisted-trackers]
  [-list-attempt-ids <job-id> <task-type> <task-state>]
  [-kill-task <task-id>]
  [-fail-task <task-id>]
  [-blacklist-tasktracker <hostname>]
  [-showlabels]

```

Parameters

Command Options

The following command options are supported for `hadoop job`:

Parameter	Description
<code>-submit <job-file></code>	Submits the job.
<code>-status <job-id></code>	Prints the map and reduce completion percentage and all job counters.
<code>-counter <job-id> <group-name> <counter-name></code>	Prints the counter value.
<code>-kill <job-id></code>	Kills the job.
<code>-unblacklist <job-id> <hostname></code>	Removes a tasktracker job from the jobtracker's blacklist.
<code>-unblacklist-tracker <hostname></code>	Admin only. Removes the TaskTracker at <hostname> from the JobTracker's global blacklist.
<code>-set-priority <job-id> <priority></code>	Changes the priority of the job. Valid priority values are <code>VERY_HIGH</code> , <code>HIGH</code> , <code>NORMAL</code> , <code>LOW</code> , and <code>VERY_LOW</code> . The job scheduler uses this property to determine the order in which jobs are run.
<code>-events <job-id> <from-event-#> <#-of-events></code>	Prints the events' details received by jobtracker for the given range.
<code>-history <jobOutputDir></code>	Prints job details, failed and killed tip details.
<code>-list [all]</code>	The <code>-list all</code> option displays all jobs. The <code>-list</code> command without the <code>all</code> option displays only jobs which are yet to complete.
<code>-list-active-trackers</code>	Prints all active tasktrackers.

Parameter	Description
<code>-list-blackisted-trackers</code>	Prints the TaskTracker nodes that JobTracker blacklisted with the reason for blacklisting.
<code>-list-attempt-ids <job-id><task-type></code>	Lists the IDs of task attempts.
<code>-kill-task <task-id></code>	Kills the task. Killed tasks are <i>not</i> counted against failed attempts.
<code>-fail-task <task-id></code>	Fails the task. Failed tasks are counted against failed attempts.
<code>-blacklist-tasktracker <hostname></code>	Pauses all current tasktracker jobs and prevent additional jobs from being scheduled on the tasktracker.
<code>-showlabels</code>	Dumps label information of all active nodes.

Generic Options

The following generic options are supported for the `hadoop job` command: `-conf <configuration file>`, `-D <property=value>`, `-fs <local|file system URI>`, `-jt <local|jobtracker:port>`, `-files <file1,file2,file3,...>`, `-libjars <libjar1,libjar2,libjar3,...>`, and `-archives <archive1,archive2,archive3,...>`. For more information on generic options, see [Generic Options](#).

Examples

Submitting Jobs

The `hadoop job -submit` command enables you to submit a job to the specified jobtracker.

```
$ hadoop job -jt darwin:50020 -submit job.xml
```

Stopping Jobs Gracefully

Use the `hadoop kill` command to stop a running or queued job.

```
$ hadoop job -kill <job-id>
```

Viewing Job History Logs

Run the `hadoop job -history` command to view the history logs summary in specified directory.

```
$ hadoop job -history output-dir
```

This command will print job details, failed and killed tip details.

Additional details about the job such as successful tasks and task attempts made for each task can be viewed by adding the `-all` option:

```
$ hadoop job -history all output-dir
```

Blacklisting Tasktrackers

The `hadoop job` command when run as root or using `sudo` can be used to manually blacklist tasktrackers:

```
hadoop job -blacklist-tasktracker <hostname>
```

Manually blacklisting a tasktracker pauses any running jobs and prevents additional jobs from being scheduled.

hadoop mfs

The `hadoop mfs` command displays directory information and contents, creates symbolic links and hard links, sets, gets, and removes Access Control Expressions (ACE) on files and directories, and sets compression and chunk size on a directory.

Syntax

```
hadoop mfs
  [ -count <path> ]
  [ -delace [-R] <path> ]
  [ -getace [-R] <path> ]
  [ -help <command> ]
  [ -ln <target> <symlink> ]
  [ -lnh <target> <hardlink> ]
  [ -ls <path> ]
  [ -lsd <path> ]
  [ -lsf <path> ]
  [ -lso <path> ]
  [ -lsor <path> ]
  [ -lsr <path> ]
  [ -Lsr <path> ]
  [ -lsrv <path> ]
  [ -lss <path> ]
  [ -offload <file_path> [-v] ]
  [ -recall <file_path> [-v] ]
  [ -rmr <path> ]
  [ -setace [-R]
    [-readfile <ace>] [-writefile <ace>] [-executefile <ace>]
    [-addchild <ace>] [-deletechild <ace>] [-lookupdir <ace>] [-readdir
    <ace>]
    [-aces "[rf:<ace>],[wf:<ace>],[ef:<ace>],[ac:<ace>],[dc:<ace>],
    [rd:<ace>],[ld:<ace>]" ]
    [-preservemodebits <true|false>] [-setinherit <true|false>] <path> ]
  [ -setaudit on|off <dir|file|table> ]
  [ -setcompression on|off|lzf|lz4|zlib <dir|table> ]
  [ -setchunksize <size> <dir> ]

  [ -setnetworkencryption on|off <target> ]
  [ -stat <path> ]
  [ -tierstatus <file_path> [-v] ]
  [ -addsecuritypolicytag [-R] <comma-separated list of security policy
  tags> <path> ]
  [ -getsecuritypolicytag [-R] <path> ]
  [ -removesecuritypolicytag [-R] <comma-separated list of security policy
  tags> <path> ]
  [ -removeallsecuritypolicytag [-R] <path> ]
  [ -setsecuritypolicytag [-R] <comma-separated list of security policy
  tags> <path> ]
```

Parameters

The normal command syntax is to specify a single option from the following table, along with its corresponding arguments. If you do not set compression and chunk size for a given directory, the values are inherited from the parent directory.

Parameter	Description				
<code>-count <path></code>	Counts and returns the number of directories and (regular, symbolic link, volume link, kvstores, and device) files in the specified path (recursively).				
<code>-delace [-R] <path></code>	<p>Deletes all ACEs associated with the specified file or directory and sets ACEs for the specified file or directory to the default value, which is the empty string. Here:</p> <ul style="list-style-type: none"> <code>[-R]</code> — Enables recursion allowing you to perform the operation in subdirectories as well. <code><path></code> — Specifies the path to the file or directory. <p>You cannot delete specific access types with this parameter. Instead, if necessary, reset the value for the specific access type to an empty string using the <code>-setace</code> parameter. If you use an empty string to deny a specific type of access, then that type of access is denied to all users. To deny specific types of access to specific users only, use the negation operator (!). The mode bits corresponding to the ACEs being deleted, do not change.</p>				
<code>-getace [-R] <path></code>	<p>Returns the permissions -- POSIX mode bits and ACEs -- for the given file or (recursively) for the directory. Recursion is enabled only if -R is specified; if -R is not specified, this parameter returns the permissions only for the given directory. Here:</p> <ul style="list-style-type: none"> <code>[-R]</code> — (Optional) Enables recursion allowing you to perform the operation in subdirectories as well. <code><path></code> — (Required) Specifies the path to the file or directory. <p>If one or more ACEs are available for the file or directory, a plus sign (+), which indicates that both ACEs and POSIX mode bits are set for the given file or directory, is returned. If the ACE on the file or directory is an empty string, the plus sign is not returned.</p>				
<code>-help <command></code>	Displays help for the <code>hadoop mfs</code> command.				
<code>-ln <target> <symlink></code>	Creates a symbolic link <code><symlink></code> that points to the target path <code><target></code> , similar to the standard Linux <code>ln -s</code> command.				
<code>-lnh <target> <hardlink></code>	<p>Creates a hardlink that associates a new name or a file path with an existing file. You must specify the following:</p> <table border="0"> <tr> <td><code><target></code></td> <td>File name, including the full path, of the file to link to.</td> </tr> <tr> <td><code><hardlink></code></td> <td>New name, including the full path, of the file to link with.</td> </tr> </table>	<code><target></code>	File name, including the full path, of the file to link to.	<code><hardlink></code>	New name, including the full path, of the file to link with.
<code><target></code>	File name, including the full path, of the file to link to.				
<code><hardlink></code>	New name, including the full path, of the file to link with.				

Parameter	Description
<code>-ls <path></code>	<p>Lists files in the directory specified by <code><path></code>. The <code>hadoop mfs -ls</code> command corresponds to the standard <code>hadoop fs -ls</code> command, but provides the following additional information:</p> <ul style="list-style-type: none"> • Chunks used for each file • Server where each chunk resides • Whether compression is enabled for each file • Whether encryption is enabled for each file • Whether audit is enabled (A) or disabled (U) for each file
<code>-lsd <path></code>	<p>Lists files in the directory specified by <code><path></code>, and also provides information about the specified directory itself:</p> <ul style="list-style-type: none"> • Whether compression is enabled for the directory (indicated by <code>z</code>) • The configured chunk size (in bytes) for the directory.
<code>-lsf <path></code>	<p>Lists just the file ID (fid) and the file name, for each file present in the specified path. The output is not sorted.</p> <p>Use this option when there are millions of files in a directory. In this scenario, using this option results in the fastest listing of files, as only the fids and the file names are returned. All other file attributes are ignored.</p>
<code>-lso <path></code>	<p>Lists files in the directory specified by <code><path></code>. The <code>hadoop mfs -lso</code> command corresponds to the standard <code>hadoop fs -ls</code> command, but provides the following additional information:</p> <ul style="list-style-type: none"> • Whether compression is enabled for each file • Whether encryption is enabled for each file • Whether audit is enabled (A) or disabled (U) for each file <p>This command is faster than <code>hadoop fs -ls</code> as it uses an optimized printing method to dump data on screen.</p>
<code>-lsor <path></code>	<p>Recursively lists files in the directory specified by <code><path></code>. This command is the recursive variant of the <code>hadoop mfs -lso</code> command.</p>
<code>-lsr <path></code>	<p>Recursively lists files in the directory and subdirectories specified by <code><path></code>. The <code>hadoop mfs -lsr</code> command corresponds to the standard <code>hadoop fs -lsr</code> command, but provides the following additional information:</p> <ul style="list-style-type: none"> • Chunks used for each file • Server where each chunk resides
<code>-Lsr <path></code>	<p>Equivalent to <code>lsr</code>, but additionally dereferences symbolic links</p>

Parameter	Description
<code>-lsrv <path></code>	Lists all paths recursively without crossing volume links.
<code>-lss <path></code>	Lists files in the directory specified by <code><path></code> , with an additional column that displays the number of disk blocks per file. Disk blocks are 8192 bytes.
<code>-offload <file_path> [-v]</code>	The file to offload to the storage tier. This is a blocking operation; the control is not returned until the operation is complete and the file has been offloaded. Use <code>-v</code> (for verbose) to view the status of the ongoing offload operation.
<code>-recall <file_path> [-v]</code>	The file to recall from the storage tier. This is a blocking operation; the control is not returned until the operation is complete and the file has been recalled. Use <code>-v</code> (for verbose) to view the status of the ongoing recall operation.
<code>-rmr <path></code>	Recursively deletes files and directories in the specified path. This is a highly optimized version of the normal generic <code>hadoop fs rmr</code> command and is 10X faster for large directories. This option is useful when one or more directories in the specified path contains many (millions of) files.

Parameter	Description						
<pre>-setace [-R] [-readfile <ace>] [-writefile <ace>] [-executefile <ace>] [-addchild <ace>] [-deletechild <ace>] [-lookupdir <ace>] [-readdir <ace>] [-aces "[rf:<ace>], [wf:<ace>],[ef:<ace>],[ac:<ace>], [dc:<ace>],[rd:<ace>],[ld:<ace>]"] [-preservemodebits <true false>] [-setinherit <true false>] <path></pre>	<p>Sets or modifies the read, write, and execute permissions for files or directories. This argument will:</p> <ul style="list-style-type: none"> • Overwrite existing values with new values, if specified, for access types that were previously set. • Set new values for access types that have not yet been set. • Not set or modify access types that were not passed in with the command, whether they were previously set or unset. <p>Specify the ACEs immediately after the <code>-setace</code> parameter. Specify all the other parameters, after the ACE.</p> <p>Here:</p> <p>-R Enables recursion allowing you to perform the operation in subdirectories as well. Recursion is enabled only if <code>-R</code> is specified; if <code>-R</code> is not specified, sets or modifies the permissions for the given directory only.</p> <p><ace> ACE Syntax on page 1786 defined using boolean expressions and sub-expressions.</p> <p>-readfile -writefile -executefile Specifies permissions (defined using ACEs) for reading, writing, or executing the file.</p> <p>-readdir -lookupdir Specifies permissions (defined using ACEs) for accessing the directory. To permit users to read files in the directory, grant the <code>lookupdir</code> access permission. To permit users to write to or execute files in the directory, grant the <code>readdir</code> and <code>lookupdir</code> access permissions.</p> <p>-addchild -deletechild Specifies permissions (defined using ACEs) for adding or deleting subdirectories.</p> <p>-aces Specifies ACEs as a single string. Specify a comma-separated list of ACEs within quotes, up to 60 KB in length. You can set the following permissions.</p> <table border="1" data-bbox="1149 1892 1455 2100"> <tbody> <tr> <td data-bbox="1149 1892 1198 1965">rf</td> <td data-bbox="1198 1892 1455 1965">Refers to read file access.</td> </tr> <tr> <td data-bbox="1149 1965 1198 2039">wf</td> <td data-bbox="1198 1965 1455 2039">Refers to write file access</td> </tr> <tr> <td data-bbox="1149 2039 1198 2100">ef</td> <td data-bbox="1198 2039 1455 2100">Refers to execute file access</td> </tr> </tbody> </table>	rf	Refers to read file access.	wf	Refers to write file access	ef	Refers to execute file access
rf	Refers to read file access.						
wf	Refers to write file access						
ef	Refers to execute file access						

Parameter	Description
<pre>-setaudit on off <dir file table></pre>	<p>Enables auditing of the specified directory, file, or HPE Ezmeral Data Fabric Database table.</p> <p>Enabling auditing of a directory does not enable auditing of files and subdirectories that exist in the directory. You must enable auditing on those existing files and subdirectories. However, any new files and subdirectories that you create will automatically be enabled for auditing. See How Does Auditing Work? on page 988.</p> <p>For operations on the object to be logged, auditing also needs to be enabled on the cluster and the volume in which the object is located. See Managing Auditing on page 985 for details. If auditing is enabled for a directory, new files and directories created within that directory are also enabled for auditing.</p>
<pre>-setchunksize <size> <dir></pre>	<p>Sets the chunk size in bytes for the directory specified in <code><dir></code>. The <code><size></code> parameter must be a multiple of 65536.</p>
<pre>-setcompression on off lzf lz4 zlib <dirtable></pre>	<p>Turns compression on or off on the directory specified in <code><dir></code> or on the specified table, and sets the compression type to one of the following if compression is not turned off:</p> <ul style="list-style-type: none"> • <code>on</code> — turns on compression using the default algorithm (LZ4) • <code>lzf</code> — turns on compression and sets the algorithm to LZ4 • <code>lz4</code> — turns on compression and sets the algorithm to LZ4 • <code>zlib</code> — turns on compression and sets the algorithm to ZLIB
<pre>-setnetworkencryption on off <target></pre>	<p>Sets network encryption on or off for the filesystem object defined in <code><target></code>. The cluster encrypts network target to or from a file, directory, stream, or data-fabric table with network security enabled.</p>
<pre>-stat <path></pre>	<p>Displays the statistics for the given file. Only the root user and the MAPR_USER user (user name under which data-fabric services run) have permissions to run this command.</p> <p>The path is required and specifies the path (to the file) on which to run the command. The output fields for this command are as follows.</p>

Parameter	Description
tierstatus <file_path> [-v]	<p>The status of the offload or recall of the given file. If <code>-v</code> (for verbose) is also specified, for the given file, the command specifies whether data is local or offloaded as the final output. If the file:</p> <ul style="list-style-type: none"> Contains local data, returns the following final output: <pre>File has local data</pre> Is completely offloaded, returns the following final output: <pre>File does not have local data</pre> <p>See Output on page 6372 for more information.</p>

Output

When used with the `-ls`, `-lsd`, `-lso`, `-lsor`, `-lsr`, or `-lss` options, `hadoop mfs` displays information about files and directories. For each file or directory `hadoop mfs` displays a line of basic information followed by lines listing the chunks that make up the file, in the following format:

```
{mode} {compression} {encryption} {audit} {diskFlush} {replication} {owner}
{group} {size} {date} {chunk size} {name} {chunk} {fid} {host} [{host}...]
{chunk} {fid} {host} [{host}...] ...
```

Volume links are displayed as follows:

```
{mode} {compression} {encryption} {audit} {diskFlush} {replication} {owner}
{group} {size} {date} {chunk size} {name} {chunk} {target volume name}
{writability} {fid} -> {fid} [{host}...]
```

The following table describes the values:

mode	A text string indicating the read, write, and execute permissions for the owner, group, and other permissions. See also Managing Permissions on page 983.
compression	<ul style="list-style-type: none"> U: uncompressed L: LZf Z (Uppercase): LZ4 z (Lowercase): ZLIB
encryption	U: unencrypted; E: encrypted
audit	U: disabled; A: enabled
disk flush	U:disabled; F:enabled
replication	The replication factor of the file (directories display a dash instead)
owner	The owner of the file or directory
group	The group of the file of directory

size	The size of the file or directory
date	The date the file or directory was last modified
chunk size	The chunk size of the file or directory
name	The name of the file or directory
chunk	The chunk number. The first chunk is a primary chunk labeled "p", a 64K chunk containing the root of the file. Subsequent chunks are numbered in order.
fid	The chunk's file ID, which consists of three parts: <ul style="list-style-type: none"> • The ID of the container where the file is stored • The inode of the file within the container • An internal version number For volume links, the first <code>fid</code> is the chunk that stores the volume link itself; the <code>fid</code> after the arrow (<code>-></code>) is the first chunk in the target volume.
host	The host on which the chunk resides. When several hosts are listed, the first host is the first copy of the chunk, while subsequent hosts are replicas.
target volume name	The name of the volume pointed to by a volume link.
writability	Displays whether the volume is writable.

When used with the `-lsf <path>option`, `hadoop mfs` displays only the file ID (fid) and the file name of each file in the path.

When used with the `-stat <path>option`, `hadoop mfs` displays statistics for the given file. For each file, it displays the following:

Output field	Description
uid	The user ID of the owner.
	The last access time. The may not always be updated. For more information, see the <code>UpdateTimeInterval</code> entry in volume create on page 2460.
mtime	The last modified time.
nlink	The number of hard links.

Output field	Description
type	The type of the file. Value can be one of: <ul style="list-style-type: none"> regular directory symlink vollink kvstore device
size	The size of the file or directory. Depending on the type of file, it can be the actual size or the number of entries.
mode	The UNIX style permission mode bits for the file/directory.
networkencryption	The network encryption setting. Determines whether network encryption is enabled for this file.
subtype	The subtype for the specified type. The following subtypes are supported for some of the types: <p>regular</p> <ul style="list-style-type: none"> FSTRegBucket FSTRegCF FSTRegKeyMap <p>kvstore</p> <ul style="list-style-type: none"> FSTKvTable FSTKvTabletMap FSTKvSchema FSTKvTablet FSTKvSegMap FSTKvSpillMap FSTKvKeyMap FSTKvXattr <p>device</p> <ul style="list-style-type: none"> FSTDevPipe FSTDevSocket FSTDevBlock FSTDevChar <p>For all other types, subtypes are not valid.</p>
gid	The group ID.
compression	The compression setting.

When used with [tierstatus](#), the output varies based on whether or not data is local, was offloaded, or was recalled. The output looks similar to the following if:

- Data was completely offloaded:

```
File does not have local data
```

- Data could not be completely offloaded or data was recalled:

```
File has local data
```

Examples

View File Information

The `hadoop mfs` command is used to view file contents. You can use this command to check if compression is turned off in a directory or mounted volume. For example,

```
# hadoop mfs -ls /

physical23.qa.lab:5660
...
```

In the preceding example, the letter `z` indicates LZ4 compression on the directory; the letter `U` indicates that the directory is uncompressed. In the following example, the listed item is both uncompressed (first `U`) and unencrypted (second `U`).

```
[root@node1-302 ~]# hadoop mfs -ls /hbase
Found 10 items
drwxr-xr-x  Z E U U    - root root          1 2018-08-09 19:26 268435456 /
ATS-VOL1533867958/data1533867963
          p 2322.32.131374  physical20.qa.lab:5660 physical19.qa.lab:5660
physical22.qa.lab:5660
...
```

The following example demonstrates the usage of the `-lsf` option:

```
[root@vm5 logs]# hadoop mfs -lsf /tmp/
          2050.33.262504  /tmp/hosts1
          2050.32.262502  /tmp/hosts2
          2050.35.393704  /tmp/hosts3
```

Set ACEs

Example 1: The following command shows how to set separate read, write, and execute permissions (using [ACE](#)) on a file:

```
hadoop mfs -setace -readfile p -writefile 'g:group1&!u:user1' -executefile
p /file
```

When the command shown above runs, the POSIX mode bits for:

- Read access is set for owner, owning group, and others.
- Write access is set for none.
- Execute access is set for owner, owning group, others.

All other POSIX mode bits are set to 0.

Example 2: The following command shows how to set read, write, and execute permissions (using [ACE](#)) as a single string on the specified directory and force all files and subdirectories under the specified directory to inherit the parent [ACE](#). [ACEs](#) that are not specified will be set to the empty string.

```
hadoop mfs -setace -aces "rf:u:root,wf:group1&!
user1,ef:p,rd:u:m7user1" -setinherit true /dir
```

When the command shown above runs, the POSIX mode bits for listing the contents (r) of the directory is set for owner/user and all other POSIX mode bits on the directory are set to 0; all new directories under this directory will inherit the parent POSIX mode bits. Also, new files in the directory will inherit the following POSIX mode bits:

- Read access is set to owner/user.
- Write access is set to none.
- Execute access set for others.

All other POSIX mode bits are set to 0.

Example 3: The following command shows how to set permissions (using [ACE](#)) as a single string on the specified directory and all the files and subdirectories recursively.

```
hadoop mfs -setace -R -aces "rf:p,wf:g:group1&!
u:user1,ef:p" -preservemodebits true /dir
```

When the command shown above runs, the POSIX mode bits are not modified to match the [ACE](#) setting.

Example 4: The following command shows how to deny a specific type of access, `writefile`, which was set in the first example above, without removing all other access types associated with the file. The empty string used in the following example will deny write access to all users, [roles](#), and groups.

```
hadoop mfs -setace -writefile "" -preservemodebits false /file
```

When the command shown above runs, the POSIX mode bit for writing to the file is set to 0.

Get ACEs

The following command shows the [ACEs](#) and POSIX mode bits for the specified file only.

```
hadoop mfs -getace /m7user1/file1.txt
```

Output

```
Path: /m7user1/file1.txt
readfile: !u:m7user1
```

```
writefile: !u:m7user1
executefile: !u:m7user1
mode: -----
```

Delete ACEs

The following command deletes all [ACEs](#) associated with the specified file and sets the ACE for the file to the empty string.

```
hadoop mfs -delace /file
```

The following command deletes all [ACEs](#) associated with the specified directory.

```
hadoop mfs -delace /dir
```

The following command deletes all [ACEs](#) associated with the specified directory and [ACEs](#) associated with the files and directories (recursively) below the specified directory.

```
hadoop mfs -delace -R /dir
```

Create a Hard Link to File

The following command shows how to create a hard link to the file, file1, using a new name, file2.

```
# hadoop mfs -lnh /madvoll/file1 /madvoll/file2
Creating Hardlink: /madvoll/file2 -> /madvoll/file1
```

Retrieve the Number of Hard Links

The following command shows how to retrieve the number of hard links (and other statistics) associated with a given file.

```
# hadoop mfs -stat /voll/file1
Path: /voll/file1
fid: 23185.32.131232
uid: root
gid: root
atime: 2016-06-29 18:49:03
mtime: 2016-07-01 18:01:54
nlink: 2
type: FTRegular
subtype: FSTInval
size: 1024000000
blocksize: 268435456
mode: 644
networkencryption: false
compression: off
```

View the status of the offload or recall operation for the file named file2 in volume named vol1:

```
# hadoop mfs -tierstatus /voll/file2
File has local data.
```

View the status of file named test1 in volume named vol1:

```
# hadoop mfs -tierstatus /voll/test1 -v
      FID                Has Local Data
2154.109.1049824         Yes
2172.143.524906          Yes
2172.153.524926          Yes
2172.166.524952          Yes
```

```
2172.167.524954      Yes
File has local data.
```

Tag a file with a security policy:

The following command tags the file `/user/root/javax.servlet-3.0.jar` with three security policies, namely `pci`, `hippa`, and `new`

```
hadoop mfs -setsecuritypolicytag pci,hippa,new /user/root/
javax.servlet-3.0.jar
```

Retrieve security policy tags from a file:

```
hadoop mfs -getsecuritypolicytag /user/root/javax.servlet-3.0.jar
[hippa, new, pci]
```

Remove all security policy tags from a file:

```
hadoop mfs -removeallsecuritypolicytag /user/root/javax.servlet-3.0.jar
```

hadoop mradmin

The `hadoop mradmin` command runs Map-Reduce administrative commands.

WARNING: This command is deprecated.

Syntax

```
hadoop [ Generic Options ] mradmin
  [-refreshServiceAcl]
  [-refreshQueues]
  [-refreshNodes]
  [-refreshUserToGroupsMappings]
  [-refreshSuperUserGroupsConfiguration]
  [-help [cmd]]
```

Parameters

The following command parameters are supported for `hadoop mradmin`:

Parameter	Description
<code>-refreshServiceAcl</code>	Reload the service-level authorization policy file Job tracker will reload the authorization policy file.
<code>-refreshQueues</code>	Reload the queue acls and state JobTracker will reload the <code>mapred-queues.xml</code> file.
<code>-refreshUserToGroupsMappings</code>	Refresh user-to-groups mappings.
<code>-refreshSuperUserGroupsConfiguration</code>	Refresh superuser proxy groups mappings.
<code>-refreshNodes</code>	Refresh the hosts information at the job tracker.
<code>-help [cmd]</code>	Displays help for the given command or all commands if none is specified.

The following generic options are supported for `hadoop mradmin`:

Generic Option	Description
-conf <configuration file>	Specify an application configuration file.
-D <property=value>	Use value for given property.
-fs <local filesystem URI>	Specify a filesystem.
-jt <local jobtracker:port>	Specify a job tracker.
-files <comma separated list of files>	Specify comma separated files to be copied to the map reduce cluster.
-libjars <comma separated list of jars>	Specify comma separated jar files to include in the classpath.
-archives <comma separated list of archives>	Specify comma separated archives to be unarchived on the computer machines.

hadoop pipes

The `hadoop pipes` command runs a pipes job.

 **WARNING:** This command is deprecated.

Hadoop Pipes is the C++ interface to Hadoop Reduce. Hadoop Pipes uses sockets to enable tasktrackers to communicate processes running the C++ map or reduce functions.

Syntax

```
hadoop [GENERIC OPTIONS ] pipes
  [-output <path>]
  [-jar <jar file>]
  [-inputformat <class>]
  [-map <class>]
  [-partitioner <class>]
  [-reduce <class>]
  [-writer <class>]
  [-program <executable>]
  [-reduces <num>]
```

Parameters

Command Options

The following command parameters are supported for `hadoop pipes`:

Parameter	Description
-output <path>	Specify the output directory.
-jar <jar file>	Specify the jar filename.
-inputformat <class>	InputFormat class.
-map <class>	Specify the Java Map class.
-partitioner <class>	Specify the Java Partitioner.

Parameter	Description
<code>-reduce <class></code>	Specify the Java Reduce class.
<code>-writer <class></code>	Specify the Java RecordWriter.
<code>-program <executable></code>	Specify the URI of the executable.
<code>-reduces <num></code>	Specify the number of reduces.

Generic Options

The following generic options are supported for the `hadoop pipes` command: `-conf <configuration file>`, `-D <property=value>`, `-fs <local|filesystem URI>`, `-jt <local|jobtracker:port>`, `-files <file1,file2,file3,...>`, `-libjars <libjar1,libjar2,libjar3,...>`, and `-archives <archive1,archive2,archive3,...>`. For more information on generic options, see [Generic Options](#).

hadoop queue

The `hadoop queue` command displays job queue information.

WARNING: This command is deprecated.

Syntax

```
hadoop [ Generic Options ] queue
      [-list] | [-info <job-queue-name> [-showJobs]] | [-showacIs]
```

Parameters

Command Options

The `hadoop queue` command supports the following command options:

Parameter	Description
<code>-list</code>	Gets list of job queues configured in the system. Along with scheduling information associated with the job queues.
<code>-info <job-queue-name> [-showJobs]</code>	Displays the job queue information and associated scheduling information of particular job queue. If <code>-showJobs</code> option is present, a list of jobs submitted to the particular job queue is displayed.
<code>-showacIs</code>	Displays the queue name and associated queue operations allowed for the current user. The list consists of only those queues to which the user has access.

Generic Options

The following generic options are supported for the `hadoop queue` command: `-conf <configuration file>`, `-D <property=value>`, `-fs <local|filesystem URI>`, `-jt <local|jobtracker:port>`, `-files <file1,file2,file3,...>`, `-libjars <libjar1,libjar2,libjar3,...>`, and `-archives <archive1,archive2,archive3,...>`. For more information on generic options, see [Generic Options](#).

hadoop version

The `hadoop version` command prints the hadoop software version.

Syntax

```
hadoop version
```

Output

```
$ hadoop version
Hadoop 2.7.6.100-eep-800
Subversion git@github.com:mapr/private-hadoop-common -r
80dc89ae5df3a2cd01089f192c5d8a886e4788c9
Compiled by root on 2021-10-08T11:26Z
Compiled with protoc 3.11.1
From source with checksum 124ac1b54c81145154c71d2be2a66fc
This command was run using /opt/mapr/hadoop/hadoop-2.7.6/share/hadoop/
common/hadoop-common-2.7.6.100-eep-800.jar
```

hadoop conf

The `hadoop conf` command outputs the configuration information for this node to standard output.

Syntax

```
hadoop [ generic options ] conf
```

Examples

Displaying the configured value of a specific parameter

```
[user@hostname ~]$ hadoop conf | grep mapreduce.map.memory.mb
<property><name>mapreduce.map.memory.mb</name><value>1024</
value><source>mapred-site.xml</source></property>
```

The above command returns 1024 as the configured value of the `mapreduce.map.memory.mb` parameter.

Dumping a node's configuration to a text file

```
[user@hostname ~]$ hadoop conf | grep ... >nodeconfiguration.txt
```

The above command creates a text file named `nodeconfiguration.txt` that contains the node's configuration information.

The following information displays when you use the `tail` utility to examine the last few lines of the file:

```
[user@hostname ~]# tail nodeconfiguration.txt
    <property><name>yarn.app.mapreduce.am.resource.mb</
name><value>1536</value><source>mapred-default.xml</source></property>
    <property><name>mapreduce.framework.name</name><value>yarn</
value><source>mapred-default.xml</source></property>
    <property><name>mapreduce.job.reduce.slowstart.completedmaps</
name><value>1.00</value><source>mapred-default.xml</source></property>
    <property><name>yarn.resourcemanager.client.thread-count</
name><value>50</value><source>yarn-default.xml</source></property>

<property><name>mapreduce.cluster.temp.dir</name><value>${hadoop.tmp.dir}/
mapred/temp</value><source>mapred-default.xml</source></property>
```

```

        <property><name>yarn.resourcemanager.staging</name><value>/var/
mapr/cluster/yarn/rm/staging</value></property>
        <property><name>fs.mapr.working.dir</name><value>/user/
$USERNAME/</value></property>
        <property><name>mapreduce.jobhistory.intermediate-done-dir</
name><value>${yarn.app.mapreduce.am.staging-dir}/history/done_intermediate</
value><source>mapred-default.xml</source></property>
        <property><name>fs.s3a.attempts.maximum</name><value>10</
value><source>core-default.xml</source></property>
    </configuration>

```

API Documentation

HPE Ezmeral Data Fabric supports public APIs for file system, HPE Ezmeral Data Fabric Database, and HPE Ezmeral Data Fabric Streams. These APIs are available for application-development purposes.

IMPORTANT: Development using HPE Ezmeral Data Fabric non-public (private or internal) APIs is not supported.

Table

Feature	Language	Link to Location	Description
HPE Ezmeral Data Fabric Streams Administration	Java	For source Java APIs, see: <ul style="list-style-type: none"> Java OJAI Client API Java APIs Apache Kafka 2.1 APIs used with HPE Ezmeral Data Fabric Streams See HPE Ezmeral Data Fabric Streams Java Applications on page 3395 for streams and topics information for application development.	HPE Ezmeral Data Fabric Streams Java API for performing administrative tasks on streams and topics, setting values for the attributes of streams, and accessing streams for analytics purposes. HPE Ezmeral Data Fabric modified Kafka interfaces, classes, and packages used for HPE Ezmeral Data Fabric streams API. This library is a HPE Ezmeral Data Fabric modified version of the open source Kafka library.
HPE Ezmeral Data Fabric Database JSON Client	Java	HPE Ezmeral Data Fabric Database JSON Client API  NOTE: Beginning with core version 6.0, the HPE Ezmeral Data Fabric Database <code>Table</code> interface in the HPE Ezmeral Data Fabric Database JSON Client API is deprecated and replaced by the <code>DocumentStore</code> interface in the OJAI API library. For details, see the next row.	Java API for administration and management of HPE Ezmeral Data Fabric Database JSON tables.
Java OJAI Client	Java	Java OJAI Client API	OJAI is a general-purpose JSON access layer that sits on databases, file systems, and message streams and enables access to structured, semi-structured and unstructured data using a common API. Used for working with HPE Ezmeral Data Fabric Database JSON.
Java OJAI Thin Client	Java	Java OJAI Client API	Allows you to write OJAI applications in Java to access HPE Ezmeral Data Fabric Database JSON. This is the thin client version of the Java OJAI Client.

Table (Continued)

Feature	Language	Link to Location	Description
OJAI REST API	REST	Using the HPE Ezmeral Data Fabric Database JSON REST API on page 3337	Provides an alternative to writing a Java OJAI application. Using HTTP calls, you can perform basic operations on HPE Ezmeral Data Fabric Database JSON tables.
Node.js OJAI Client	Node.js	Node.js OJAI Client API provides the Node.js API documentation.	Allows you to write OJAI applications in Node.js to access HPE Ezmeral Data Fabric Database JSON.
Python OJAI Client	Python	Python OJAI Client API provides the Python API documentation.	Allows you to write OJAI applications in Python to access HPE Ezmeral Data Fabric Database JSON.
C# OJAI Client	C#	C# OJAI Client API provides the C# documentation.	Allows you to write OJAI applications in C# to access HPE Ezmeral Data Fabric Database JSON.
Go OJAI Client	Go	Go OJAI Client API Go OJAI Client API provides the Go documentation.	Allows you to write OJAI applications in Go to access HPE Ezmeral Data Fabric Database JSON.
HPE Ezmeral Data Fabric Database Binary tables	C	Creating C Apps - Binary Tables on page 3098	C API library (<code>libMapRClient</code>) for creating and accessing HPE Ezmeral Data Fabric Database binary tables. This library is a HPE Ezmeral Data Fabric Database-specific version of <code>libhbase</code> .
HPE Ezmeral Data Fabric Database JSON MapReduce	Java	HPE Ezmeral Data Fabric Database	Java API library that extends the Apache Hadoop MapReduce framework. Used to create MapReduce applications that write data from one JSON table to another.
File Access Control Expressions	Java	File ACE APIs	APIs to grant different permissions to multiple users, groups, and roles for files, directories, and whole volume data using boolean expressions and subexpressions.
	C	FileACE C APIs on page 1795	
File System	C	Accessing the File System with C Applications on page 3022	HPE Ezmeral Data Fabric Database <code>libMapRClient</code> library supports access to the HPE Ezmeral Data Fabric Database filesystem. This library is a HPE Ezmeral Data Fabric Database modified version of <code>libhdfs</code> . Used to manage file system files.
	Java	Accessing HPE Ezmeral Data Fabric File Store in Java Applications on page 3079	HPE Ezmeral Data Fabric Database's native <code>maprfs</code> library for accessing the HPE Ezmeral Data Fabric Database filesystem.
Extended Attributes	Java	Extended Attribute Java API	APIs to associate additional metadata with a regular file or directory.

Other Docs

This section contains release-independent information, including: Installer documentation, Ecosystem release notes, interoperability matrices, security vulnerabilities, and links to other data-fabric version documentation.

Products Covered in the HPE Ezmeral Data Fabric Documentation

This section lists the products covered in the HPE Ezmeral Data Fabric documentation portal and provides links to the related product documentation.

The HPE Ezmeral Data Fabric documentation portal provides information and instructions for the following HPE Ezmeral Data Fabric components and features:

HPE Ezmeral Data Fabric File Store

File Store Documentation

Most of the file store conceptual and overview documentation is located in the [HPE Ezmeral Data Fabric File Store](#) on page 441 section of the documentation portal. Additional file store documentation, including installation and upgrade, configuration, and administration is located in the [7.0 Installation](#) on page 70, [7.0 Administration](#) on page 980, and [7.0 Development](#) on page 3003 sections of the documentation portal.

The following list provides some direct links to file store topics:

- [Distributed datastore for files](#) and [persistent storage for containers](#)
- [POSIX Client](#)
- [Platinum POSIX Client](#)
- Container Client including [Flex Volume Plugin](#) and [CSI](#)
- [NFSv4](#) and [NFSv3](#)
- [Multiple file server instances per node](#)
- [Support for HDD and SSD](#)
- [HDFS API](#) and [HttpFS](#)
- [Quotas](#)
- [Snapshots](#)
- [Data Topologies](#)
- [Data Protection Replication](#)
- [Multi-site volume mirroring](#)
- [Data tiering \(Cold\)](#) to 3rd party external stores
- [Data tiering \(Warm\)](#) to erasure coding
- [Global Namespace](#)
- [Compression](#)
- [Unified Security](#) including authentication, authorization, encryption (wire and data-at-rest) and auditing
- [Policy-based security](#)
- [External KMIP Keystore](#)

- [HPE Ezmeral Data Fabric Management](#) using [CLI](#), [REST](#), and [GUI](#)
- [Rolling Upgrades](#)
- [HPE Ezmeral Data Fabric Monitoring](#)
- [HPE Ezmeral Data Fabric Installer](#)
- [Resiliency and self-healing](#)
- [Auto-balancing](#)
- [Disaster recovery](#) - See also [Mirror Volumes](#) on page 454.
- [Multitenancy on File System](#) on page 486

HPE Ezmeral Data Fabric Document Database

Document Database Documentation

Most of the document database conceptual and overview documentation is located in the [HPE Ezmeral Data Fabric Database](#) on page 583 section of the documentation portal. Additional document database documentation, including installation and upgrade, configuration, and administration is located in the [7.0 Installation](#) on page 70, [7.0 Administration](#) on page 980, and [7.0 Development](#) on page 3003 sections of the documentation portal.

The following list provides some direct links to document database topics:

- [Column-Oriented Database](#) using HBase API
- [JSON document database](#) using OJAI API
- [Multi-master table replication](#)
- [Secondary indexes](#)
- [Multiple file server instances per node](#)
- [Change Data Capture \(CDC\)](#)
- [HPE Ezmeral Data Fabric DB Data Access Gateway](#)
- [Strong consistency](#) - See also [Mirroring and Replication](#) and [High Availability](#) on page 589.
- [Resiliency and self-healing](#) - See also [High Availability](#) on page 589.
- [Disaster recovery](#) - See also [Mirroring and Replication](#) and [High Availability](#) on page 589.
- [Automatic compactions](#)
- [Multitenancy](#)
- [Unified Security](#) including authentication, authorization, encryption (wire and data-at-rest) and auditing
- [Policy-based security](#)
- [HPE Ezmeral Data Fabric Administration](#)
- [HPE Ezmeral Data Fabric Monitoring](#)
- [HPE Ezmeral Data Fabric Installer](#)

- [Rolling upgrades](#)
- [Apache HBase](#)

HPE Ezmeral Data Fabric Event Data Streams

Event Data Streams Documentation

Most of the event data streams conceptual and overview documentation is located in the [HPE Ezmeral Data Fabric Streams](#) on page 719 section of the documentation portal. Additional event data streams documentation, including installation and upgrade, configuration, and administration is located in the [7.0 Installation](#) on page 70, [7.0 Administration](#) on page 980, and [7.0 Development](#) on page 3003 sections of the documentation portal..

The following list provides some direct links to event data streams topics:

- [Distributed publish-subscribe messaging infrastructure](#)
- [Support for Kafka API](#)
- [Kafka Connect](#)
- [Kafka REST Proxy](#)
- [KSQL](#)
- [Kafka Streams](#)
- [Kafka Schema Registry](#)
- [Multi-site Stream replication](#)
- [Automatic partition balancing](#)
- [Multi Tenancy](#)
- [Unified Security including authentication, authorization, encryption \(wire and data-at-rest\) and auditing](#)
- [HPE Ezmeral Data Fabric Administration](#)
- [HPE Ezmeral Data Fabric Monitoring](#)
- [HPE Ezmeral Data Fabric Installer](#)
- [Rolling upgrades](#)

HPE Ezmeral Data Fabric Analytics with Hadoop

Analytics with Hadoop Documentation

Most of the documentation related to analytics with Hadoop is located in the [Ecosystem Components](#) on page 3742 section of the documentation portal.

The following list provides some direct links to analytics with Hadoop topics:

- Apache [YARN](#)
- Apache [MapReduce v2](#)
- Apache [Hive](#)

- [Apache Pig](#)
- [Apache Sqoop](#)
- [Apache Flume](#)
- [Apache Oozie](#)
- [Apache Hue](#)
- [HPE Ezmeral Data Fabric DB OJAI Connector for Apache Hive](#)
- [S3 Gateway](#) on page 4440

HPE Ezmeral Data Fabric Advanced Analytics with Spark

Advanced Analytics with Spark Documentation

Most of the documentation related to analytics with Spark is located in the [Apache Spark](#) on page 4501 section of the documentation portal.

The following list provides some direct links to analytics with Spark topics:

- [Apache YARN](#)
- [Apache Spark](#)
- [Apache Spark SQL](#)
- [Apache Spark Streaming](#)
- [Apache Spark MLlib](#)
- [GraphX](#)
- [SparkR](#)
- Support for [Spark Standalone](#) and [Spark on YARN](#)
- [HPE Ezmeral Data Fabric DB OJAI Connector for Apache Spark](#)
- [HPE Ezmeral Data Fabric DB Binary Connector for Apache Spark](#)
- [HPE Ezmeral Data Fabric Streams Integration](#)
- [S3 Gateway](#) on page 4440

HPE Ezmeral Data Fabric Interactive SQL Engine with Drill

Drill Interactive SQL Engine Documentation

Most of the documentation related to the Drill interactive SQL engine is located in the [Apache Drill](#) on page 3766 section of the documentation portal. You may also want to refer to the Apache Drill documentation at <https://drill.apache.org/docs/>.

The following list provides some direct links to Drill topics in the documentation portal and on the [Apache Drill site](#):

- [Schema-less ANSI-compliant distributed SQL query engine](#)
- [Queries on File](#)

- [Queries on HPE Ezmeral Data Fabric Document Database tables and secondary indexes](#)
- [Queries on Hive tables and views](#) - See also [CREATE VIEW](#).
- [File formats \(Text,JSON,Parquet\)](#)
- [Multiple data type support](#)
- [Impersonation](#)
- Support for [Drill standalone](#) and [Drill-on-YARN](#)
- [Drill query and administration UI](#) - See also [Starting the Web UI](#).
- [JDBC/ODBC drivers](#)
- [Drill Explorer](#)
- [SQLLine](#) - See also [Configuring the Drill Shell](#).
- [REST API](#) - See also [REST API Introduction](#).
- [Drill Monitoring](#)
- [S3 Gateway](#) on page 4440- See also [S3 Storage Plugin](#).

HPE Ezmeral Data Fabric Platform Bundle

Platform Bundle Documentation

The following list provides some direct links to platform documentation topics:

- [HPE Ezmeral Data Fabric File Store](#)
- [HPE Ezmeral Data Fabric Analytics with Hadoop](#)
- [HPE Ezmeral Data Fabric Advanced Analytics with Spark](#)
- [HPE Ezmeral Data Fabric Interactive SQL Engine with Drill](#)
- [HPE Ezmeral Data Fabric Document Database](#)
- [HPE Ezmeral Data Fabric Event Data Streams](#)

Installer

You must download and run the Installer setup script before you can start the Installer web interface or issue Installer Stanza commands.

The Installer web interface simplifies the installation of an HPE Ezmeral Data Fabric cluster. After taking you through the process of selecting services and configuring the cluster, the installer installs data-fabric software. You can use the Installer to install:

- New-feature [releases](#), such as 7.5.0 and 7.6.1
- Ecosystem components, such as Spark, Hive, and HBase – or [other components](#) contained in an Ecosystem Pack (EEP)

Before you begin, review the [Installer Prerequisites and Guidelines](#) on page 6390, which describe user, node, and security requirements for using the Installer. For cluster-planning information, see [Planning the Cluster](#) on page 70.

Steps for Setting Up and Running the Installer

To set up and run the installer, complete the following steps:

1. **Select a node from which to run the Installer.** The node from which you run the Installer does not need to be one of the nodes on which you plan to install the cluster.
2. **Download the `mapr-setup.sh` script.** You can download the setup script directly from package.ezmeral.hpe.com to the node that will run the Installer:

IMPORTANT: To access the Data Fabric internet repository, you must specify the email and token of an HPE Passport account. For more information, see [Using the HPE Ezmeral Token-Authenticated Internet Repository](#) on page 92.

```
wget --user=<email> --password=<token> https://package.ezmeral.hpe.com/releases/installer/mapr-setup.sh -P /tmp
```

3. **Change the file permissions so that you can run the file.**

```
chmod +x /tmp/mapr-setup.sh
```

4. **Run the `mapr-setup.sh` script to configure the node to run the Installer.** Run the following command as the `root` user from the directory that contains the script. You must include your HPE Passport email and token and specify the name of the internet repository. The Installer remembers this information for later use. The script prompts you for some information. If you have not used this script before, consider reviewing [Using mapr-setup.sh](#) on page 6398 to be prepared.

```
/tmp/mapr-setup.sh -r https://<email>:<token>@package.ezmeral.hpe.com/releases/
```

5. **Start the Installer.** Open the Installer URL:

```
https://<Installer Node hostname/IPaddress>:9443
```

You are prompted to log in as the cluster administrator user that you configured while running the `mapr-setup.sh` script.

Other Tasks You Can Perform with the Installer

Once the initial installation completes, you can use the same Installer URL to upgrade the cluster, apply a patch, or add nodes and additional services:

Use this option	To
<i>Extend Cluster</i>	Add a host to an existing cluster.
<i>Incremental Install</i>	Add or upgrade services that are already installed on the cluster.
<i>Maintenance Update</i>	Update your cluster to a new patch version of core or apply a patch.
<i>Version Upgrade</i>	Upgrade the cluster to a newer data-fabric release, apply a patch, and upgrade services that are already installed on the cluster.
<i>Shutdown</i>	Stop the data-fabric services on the cluster.

Uninstall

Remove existing data-fabric software before proceeding with a new installation.

NOTE: The Installer definitions are updated frequently. See [Updating the Installer](#) on page 6403 to get the latest ecosystem components and data-fabric software.

HPE Privacy Statement

To learn how HPE uses, shares, transfers, and manages personal information, see the [HPE Privacy Statement](#).

Getting Started with the Installer

This section describes things you need to do to start using the Installer.

Installer Prerequisites and Guidelines

The node on which you run the installer and the nodes you plan to include in your cluster must meet certain user, connectivity, and security requirements.

Installer Requirements

The node that runs the Installer must meet the following requirements:

Installer Node

Beginning with Installer 1.6, the node that runs the Installer does not need to be one of the nodes you plan to install the cluster on. Ensure that the default umask for the root user is set to 0022 on all nodes in the cluster. You can change the umask setting in the `/etc/profile` file, or in the `.cshrc` or `.login` file. The `root` user must have a 0022 umask because the cluster admin user requires access to all files and directories under the `/opt/mapr` directory, even those initially created by `root` services.

Note also that the Installer is not FIPS compliant, and is not supported to run on a FIPS-enabled node.

Package Dependencies

Depending on the operating system, the Installer requires the following packages. If these packages are not found, the Installer attempts to download them from Internet repositories:

Ubuntu Nodes	Red Hat / CentOS Nodes	SLES Nodes
<ul style="list-style-type: none"> ca-certificates curl* debianautils dnstools iputils-arping libnss3 libssl1.0.0 libsystools2 netcat nfs-common ntp ntpd openssl python-dev python-pycurl sdparm sudo syslinux sysstat uuid-runtime wget 	<ul style="list-style-type: none"> curl* device-mapper iputils libsystools lvm2 nc nfs-utils ntp nss openssl python-devel sdparm sudo syslinux sysstat wget which yum-utils compat-openssl10 (required only when running MapR 6.1.x on RHEL version 8 and above) 	<ul style="list-style-type: none"> ca-certificates curl* device-mapper iputils libopenssl1_0_0 systools lvm2 mozilla-nss nfs-client ntp sdparm sudo syslinux sysstat util-linux wget libfreebl3

*The curl version must be greater than 7.51.0.

Repository Connectivity

The Installer requires connectivity to valid repositories for the:

- Linux operating system
- Core
- Ecosystem Pack (EEP)

The Installer can connect to an Internet repository or to a preinstalled local repository, as described in [Using a Local, Shared Repository With the Installer](#) on page 6411. If the Installer dependencies and

packages are present, but there is no connectivity to an OS repository, the Installer fails with the following message:

```
ERROR: Unable to install dependencies
(installer). Ensure that a core
OS repo is enabled and retry
mapr-setup.sh
```

Java

Installer 1.14 and later require Java JDK 11 or an equivalent Java distribution. Before using Installer 1.14 on Ubuntu 16.04 nodes, you must manually install the JDK. If you are using Installer 1.14 on RHEL/CentOS or SLES, the Installer installs OpenJDK 11 for you.

For more information about the supported Java JDK versions, see the [Java Support Matrix](#) on page 6612 and [Java](#) on page 122.

SSH Access

The Installer must have SSH access to all nodes that you want to include in the cluster.

Port Availability

Port 9443 or the non-default port that you configure using `mapr-setup.sh` must be accessible on the Installer node to all nodes that you want to include in the cluster.

Files Extracted into /tmp Require Execute Privileges

Do not mount `/tmp` with the `noexec` option. The HPE Ezmeral Data Fabric extracts certain files into `/tmp` and must run them from `/tmp`. Some processes can fail if `noexec` is set for `/tmp` because some files extracted into `/tmp` require execute privileges. In addition, if you use the `java.io.tmpdir` variable to change the location of the temporary directory used by Java processes, then the newly specified temporary directory must not be mounted with the `noexec` option.

Perform the following steps to change the location of the temporary directory used by Java processes using `java.io.tmpdir` variable:

1. Create a custom `tmp` directory for `mapr` and set its permission similar to `/tmp`.

```
# mkdir /opt/mapr/tmp
# chmod 1777 /opt/mapr/tmp
```

2. Set the custom `tmp` directory as `java.io.tmpdir`.
 - a. For Java version 8 and previous, append the following command to `/opt/mapr/conf/env_override.sh` location.

```
export
JAVA_OPTIONS="-Djava.io.tmpdir=
/opt/mapr/tmp"
```

- b. For Java version 9 and later, run the following command:

```
export
JDK_JAVA_OPTIONS="-Djava.io.tmp
dir=/opt/mapr/tmp"
```

3. Restart `mapr-warden` service on the node.

NOTE: You cannot hide the `Picked up _JAVA_OPTIONS: <...>` message due to Java sources implementation.

Supported Web Browsers

Once the Installer is installed and configured, you can use the following web browsers to access the Installer web interface:

- Safari
- Firefox
- Chrome

Cluster Admin User Requirements

The installation process requires a valid cluster admin user to be present on all nodes in the cluster. The Installer can create a user (the `mapr` user) for you or use a user that you have created. If you choose to create a cluster admin user, make sure the following conditions are met:

- The user must have a home directory and a password.
- The user must be present on all nodes in the cluster.
- The numeric user and group IDs (`MAPR_UID` and `MAPR_GUID`) must be configured for the user, and these values must match on all nodes.
- The `mapr` user and `root` user must be configured to use `bash`. Other shells are not supported.

If the user is not a valid user, installation errors can result. For information about creating the user, see [Managing Users and Groups](#) on page 980.

If you choose to have the Installer create the user, the Installer runs the following command to add a local user to serve as the cluster admin user:

```
useradd -m -u $MAPR_UID -g $MAPR_GID -G $(stat -c '%G' /etc/shadow)
$MAPR_USER
```

In this command:

- `MAPR_USER` defaults to `mapr`.
- `MAPR_UID` defaults to 5000.
- `MAPR_GID` defaults to 5000.
- The home directory is typically `/home/mapr`.

The installer also adds the following to the MAPR_USER `.bashrc` file:

```
[[ -f /opt/mapr/conf/env.sh ]] && . /opt/mapr/conf/env.sh
```

Node Requirements

Nodes that you want to include in the cluster must meet the following criteria:

Fully Qualified Domain Names (FQDNs)

The nodes are expressed as fully-qualified domain names (FQDNs), as described in [Connectivity](#) on page 121. DO NOT specify hostnames as aliases or IP addresses.

OS and Security Updates

Nodes are configured to accept operating system and security updates. They must also be patched with the latest security fixes. See your operating-system vendor documentation for details.

Disk Space Requirements

Nodes meet the requirements listed in [Preparing Each Node](#). The Installer verifies the requirements prior to installation.

OS-partition, disk, and swap-space requirements are the same whether you install the cluster manually or by using the Installer. See [Minimum Disk Space](#) on page 120.

For data disks, Installer versions 1.12.0.0 and later require a minimum disk size that is equal to the physical memory on the node. If a data disk does not meet the minimum disk size requirement, a verification error is generated.

Access to the Installer Node

Nodes have HTTPS access to the Installer node over port 9443.

Proxy Server Requirements

If nodes in the cluster use an HTTP proxy server, the nodes must also meet the following requirements:

- The `no_proxy` environment variable must be set. Nodes in the cluster need to be able to communicate without the use of a proxy. If the `https_proxy` and `http_proxy` environment variable is set for nodes in the cluster, you must also set the `no_proxy` environment variable for the cluster admin user and the `root` user on each node. Configure the `no_proxy` environment variable to the IP range of the nodes or to the sub-domain that contains the nodes.

In addition, you must follow this guideline from the [Python documentation](#): "The `no_proxy` environment variable can be used to specify hosts which shouldn't be reached via proxy; if set, it should be a comma-separated list of hostname suffixes, optionally with `:port` appended, for example `cern.ch,ncsa.uiuc.edu,some.host:8080`."

For cloud-based clusters (Amazon EC2, Google Compute Engine (GCE), and Microsoft Azure), you must include this entry in the no-proxy configuration:

```
169.254.169.254
```

- The global proxy for package repositories must be set. The Installer creates repository files. However, the proxy setting is not configured for each repository. Therefore, configure global proxy settings on each node in the cluster.
 - On CentOS/RedHat, set global proxy settings in `/etc/yum.conf`.
 - On Ubuntu, set global proxy settings in `/etc/apt/apt.conf`.

Enabling Package Repositories for SLES 15

Before using the Installer for a new data-fabric installation on SLES 15 SP2, run the following command on all nodes to enable the Python 2 package repository. You must also run the command on the Installer node if the Installer node is not part of the cluster and is running SLES 15 SP2 (or a later supported service pack):

```
SUSEConnect -p
sle-module-python2/15.<version>/x86_64
```

If you are developing applications on the cluster, run the following command on all nodes:

```
SUSEConnect -p
sle-module-development-tools/
15.<version>/x86_64
```

To view the available SLES modules and learn how to enable or disable them, use the `SUSEConnect -l` command.

Security Requirements

Before installing or upgrading software using the Installer, make sure that you have reviewed the list of known vulnerabilities in [Security Vulnerabilities](#) on page 7683. If a vulnerability applies to your release, contact your support representative for a fix, and apply the fix immediately, if applicable.

Cloud Requirements

When you run the Installer on nodes in the cloud, you must:

- **Verify that port 9443 is open.**

The Installer requires that this port is available.

- **Ensure that the Installer and service UI URLs should refer to an external URL and not an internal URL.**

For example, when you open the Installer URL, replace any internal hostname or IP address with its associated external address. For Amazon EC2 and Google Compute Engine (GCE) clusters, the Installer automatically translates internal addresses to external addresses.

- **On the Configure Nodes page of the Installer web interface, make sure that you do the following:**
 - Define each node using a fully-qualified domain name (FQDN) and internal, resolvable hostnames, as described in [Connectivity](#) on page 121.
 - For the remote authentication, use the same user ID and private key that you use to ssh into your cloud instances. This user must be `root` or a user with `sudo` permissions.

Related concepts

[Installer Updates](#) on page 6482

Installer updates provide new features or bug fixes.

Related tasks

[Checking the Installer Version](#) on page 6406

Some Installer features require you to use the latest version of the Installer. You can check the Installer version easily from within the user interface.

Related reference

[Installer Support Matrix](#) on page 6617

This matrix shows the operating systems that are supported by the Installer.

Selecting an Installer Version to Use

Beginning with the EEP 6.2.0 release, several Installer versions are available for use. The version that you use depends on your current core version and whether or not you need to upgrade using the Installer or Stanzas.

Choosing an Installer Version

In general, you should always use the latest available Installer version. The latest Installer version provides access to the latest Ecosystem Packs (EEPs). To download the latest version, see [Installer Downloads](#) on page 6397 later on this page. For a list of recent Installer versions, see [Installer Updates](#) on page 6482.

However, the newer Installer versions do not support Release 5.x. You must use Installer 1.11.0.0 or 1.12.0.0 if your cluster is on a 5.x release. Installer 1.11.0.0 is the last version of the Installer to support installation for Release 5.x. Installer 1.12.0.0 is the last version of the installer to support upgrades from Release 5.2.x to Release 6.x.

If your cluster runs Release 5.2.x or a lower version of core, you must use Installer 1.11.0.0 to perform the following operations:

- New installs

- Incremental installs
- Patch installs
- Maintenance updates
- Extend-cluster operations

This table describes how to select the Installer version based on your current software and your upgrade plans:

Core Version	Use This Installer Version
6.x and later	Except for Ubuntu 16.04 clusters, you may use the latest Installer version for all operations. See the Special Considerations for Ubuntu 16.04 Clusters on page 6397.
5.2.x	Use Installer 1.11.0.0 until you need to upgrade to Release 6.x. To upgrade to Release 6.x using the Installer, your cluster must have Release 5.2.x with EEP 3.0.1 or later. Before upgrading, update the Installer to 1.12.0.0.
5.1	Use Installer 1.11.0.0 for all operations, including upgrades to Release 5.2.x. Note that you must upgrade to 5.2.x with EEP 3.0.1 or later if you eventually want to upgrade to Release 6.x. After upgrading to 5.2.x, if you need to upgrade to Release 6.x, update the Installer to 1.12.0.0 before upgrading.

Special Considerations for Ubuntu 16.04 Clusters

As indicated in the [Installer Support Matrix](#) on page 6617, Installer 1.17 and later are supported only on Ubuntu 18.04 and 20.04. If your cluster is installed on Ubuntu 16.04:

- The Installer version that you can use depends on whether the Installer node is part of the cluster where you plan to install data-fabric software:

If the Installer node is . . .	Do this
Part of the cluster	Use Installer 1.16.0.x for all Installer operations. You cannot use Installer 1.17 or later unless you upgrade the cluster to Ubuntu 18.04 or 20.04.
Not part of the cluster	Use the latest Installer version on a node that is running any supported version of Ubuntu, RHEL or SLES to perform Installer operations on Ubuntu 16.04 nodes.

- If you need to upgrade from core 6.1.x to core 6.2, you must first upgrade your operating system to Ubuntu 18.04 or 20.04 and then install Installer 1.17 or later to perform the core software upgrade.

Installer Downloads

This table summarizes download information for the Installer:

Installer Version	Download Location	The <code>mapr-setup.sh</code> script provided in this location installs
Latest Installer	package.ezmeral.hpe.com/releases/installer/	The most current version of the Installer
1.18.0.x	package.ezmeral.hpe.com/releases/installer-v1.18.0	Installer 1.18.0.x
1.17.0.x	package.ezmeral.hpe.com/releases/installer-v1.17	Installer 1.17.0.3
Installer 1.16.0.x	package.ezmeral.hpe.com/releases/installer-v1.16	Installer 1.16.0.2

Installer 1.12.0.0	package.ezmeral.hpe.com/releases/installer-v1.12.0	Installer 1.12.0.0
Installer 1.11.0.0	package.ezmeral.hpe.com/releases/installer-v1.11.0	Installer 1.11.0.0

Downloading Older Versions of the Installer

By default, the `mapr-setup.sh` file provided in the `installer-v<version>/` directories in <http://package.ezmeral.hpe.com/releases/> installs the most current version of the Installer – and *not* the version for which the directory is named.

However, you can download older Installer versions by using the latest `mapr-setup.sh`:

1. Download the 1.17 or later version of `mapr-setup.sh`. See [Installer](#) on page 6388.
2. Add the following environmental variable to your current shell:

```
export MAPR_INSTALLER_REPO_DIR=installer-v<version>
```

The `export` command tells `mapr-setup.sh` to install the Installer package from the directory you specify. For example, the following command causes `mapr-setup.sh` to install the v1.11.0 Installer:

```
export MAPR_INSTALLER_REPO_DIR=installer-v1.11.0
```

3. Run `mapr-setup.sh` as described in [Installer](#) on page 6388 to install the Installer version you specified using the `export` command.

Related concepts

[Updating the Installer](#) on page 6403

Update the Installer to include the latest ecosystem packages and installer fixes. Once you update the Installer, you can install ecosystem components and software versions that were made available after you first configured the Installer.

You must download and run the Installer setup script before you can start the Installer web interface or issue Installer Stanza commands.

[Planning Your Core Upgrade](#) on page 266

Describes how to develop a successful plan for your upgrade process.

[Installer Updates](#) on page 6482

Installer updates provide new features or bug fixes.

Related reference

[Installer Support Matrix](#) on page 6617

This matrix shows the operating systems that are supported by the Installer.

[EEP Support and Lifecycle Status](#) on page 6533

This page shows the EEPs that are supported for different core releases and the current lifecycle status for each EEP.

Using `mapr-setup.sh`

This topic describes how you can use and run the Installer setup script.

Before you can run the Installer, you must run the `mapr-setup.sh` script to set up the installation environment on a node that may or may not be part of the cluster. Then, you can run the Installer to perform the installation.

To download and run the `mapr-setup.sh` script, see [Installer](#) on page 6388.

mapr-setup.sh

The `mapr-setup.sh` script performs the following steps to prepare the node to run the Installer:

1. Verifies and installs the operating system dependencies and Java requirements on the current node.
2. Checks for Internet connectivity to the remote repository.
 - If access to <https://package.ezmeral.hpe.com/> is not available, the script prompts for the archive tarballs. Provide the full paths of these tarballs in a space-delimited list.
3. Asks for the hostname and port that cluster nodes can use to connect to the Installer node.
4. Asks for the cluster admin user account and creates the account if it does not exist. This account must exist or be created on each node in the cluster. (The cluster admin is the cluster administrator.)
5. Sets up a custom `yum` or `apt` repository.
 - If no archive file is provided, the script configures access to the <https://package.ezmeral.hpe.com/> repository. For example, on RedHat / CentOS, the script creates the following remote repository: `/etc/yum.repos.d/mapr_installer.repo`
 - If archive files are provided, the script sets up a local repository.
6. Starts the Installer.

Syntax

```

/opt/mapr/installer/bin/mapr-setup.sh
[docker client]
[docker installer]
[-a <full_path_to_archive_file(s)>]
[install]
[reload]
[remove]
[update]
[-h]
[-i <full_path_to_installer_package>]
[-n]
[-p <hostname:port>]
[-r <repository_URL>]
[-y]

```

Options

In general, you should run the `mapr-setup.sh` script without using any additional options. Consider using the following options only if you have a known Internet connectivity issue, your Installer packages are not located in the default repository, or you need help with the installation process.

Option	Description
<code>docker client</code>	Use this option to create a PACC image.
<code>docker installer</code>	Use this option to create a Installer container.
<code>install</code>	Use this option to install the Installer and definition files. If you don't specify an option for <code>mapr-setup.sh</code> , the <code>install</code> option is invoked by default. Example: <pre>./mapr-setup.sh install</pre>

Option	Description
reload	<p>Use this option to reinstall the Installer and definition files. This option is helpful in debugging. No prompt is returned when you use this option.</p> <p>Example:</p> <pre>./mapr-setup.sh reload</pre>
remove	<p>Use this option to remove the Installer and definition files. This option does not remove the <code>mapr-setup.sh</code> script.</p> <p>Example:</p> <pre>./mapr-setup.sh remove</pre>
update	<p>Use this option to update the installer packages. The setup script checks https://package.ezmeral.hpe.com/ for new packages and installs the packages if they are available.</p> <p>Example:</p> <pre>./mapr-setup.sh update</pre>
-a --archives	<p>Use this option to bypass the Internet connectivity check and directly create a local repository. Specify a space-delimited list of the full paths to the following archive files (the order of the files is important) as an argument to the option:</p> <ul style="list-style-type: none"> • Installer archive • Ecosystem Pack (EEP) archive • MapR archive for the current release <p>For more information, see Using a Local, Shared Repository With the Installer on page 6411.</p> <p> NOTE: Use this option when the Installer node does not have access to the Internet or is behind a restricted VPN or firewall.</p> <p>Example for Releases 5.2 and later:</p> <pre>./mapr-setup.sh -a mapr-installer-v1.5.201705041557.deb.tgz mapr-mep-v3.0.0.201704051422.deb.tgz mapr-v5.2.1GA.deb.tgz</pre> <p>Example for Releases 5.0 and 5.1:</p> <pre>./mapr-setup.sh -a mapr-5.0-5.1.201705082100.deb.tar.gz</pre> <p>For Releases 5.0 and 5.1, you only need to provide the core archive file.</p>
-h --help	<p>Use this option to display the command-line help for the Installer.</p> <p> NOTE: If you use this option with other options, the Installer will ignore all options except for <code>-h</code>.</p> <p>Example:</p> <pre>./mapr-setup.sh -h</pre>

Option	Description
-i --install	<p>Use this option to override the Installer packages stored in the remote or local repository. This option take a space-delimited list of the two local packages needed to install the Installer (the order of the files is not important):</p> <ul style="list-style-type: none"> • Installer package • Installer definitions package <p>Example:</p> <pre>./mapr-setup.sh -i mapr-installer-definitions_1.5.201705021610_all.deb mapr-installer_1.5.201705021610_all.deb</pre>
-n --noinet	<p>Use this option when you don't want <code>mapr-setup.sh</code> to fetch packages from the Internet. Instead of taking the files as an argument like <code>-a</code>, this option prompts you for a complete set of archive files (the order of the files is important):</p> <ul style="list-style-type: none"> • Installer archive • Ecosystem Pack (EEP) archive • Core archive for the current release <p> NOTE: Configure this option when the Installer node does not have access to the Internet or is behind a restricted VPN or firewall. If you use this option together with <code>-a</code>, <code>mapr-setup.sh</code> will ignore <code>-n</code>.</p> <p>Example:</p> <pre>./mapr-setup.sh -n</pre>
-p --port	<p>This option specifies the <code>hostname:port</code> to use for installation-related communication between the Installer node and other nodes in the cluster. The Installer also adds the hostname provided as a default entry for the list of cluster nodes on the <i>Configure Nodes</i> page. Both the <code>hostname</code> and the <code>port</code> are not required when configuring this option; you can choose to configure one or both values.</p> <p> NOTE: Configure this option when the Installer node has multiple interfaces or hostnames and the result of <code>hostname</code> is not a value that other nodes in the cluster are able to communicate with.</p> <p>Example:</p> <pre>./mapr-setup.sh -p perfnodel31.perf.lab:9441</pre>
-r --repo	<p>Use the <code>-r</code> option to specify the repo (typically for a new installation). There is no longer a default repo:</p> <p>Example:</p> <pre>./mapr-setup.sh -r http:// <email>:<token>@myrepo.download.pkgs/mapr/releases/</pre>

Option	Description
<code>-R --new_repo_url</code>	<p>Specify a new repository URL for both ecosystem and core components. Use this option only with the <code>reload</code> command, including the required email and token, as indicated in Using the HPE Ezmeral Token-Authenticated Internet Repository on page 92.</p> <p>Example:</p> <pre>./mapr-setup.sh -R http://<email>:<token>@<new_url> reload</pre>
<code>-v --verbose</code>	<p>Use this option when you want additional information about the setup process.</p> <p>Example:</p> <pre>./mapr-setup.sh -v</pre>
<code>-y --yes</code>	<p>Use this option to bypass the Installer's usual prompts and immediately proceed with the default options. This option produces the same installation result as going through the <code>mapr-setup.sh</code> script prompts and choosing all of the default options, but with increased speed.</p> <p>Example:</p> <pre>./mapr-setup.sh -y</pre>

Stopping `mapr-setup.sh`

If you need to stop `mapr-setup.sh` while it is running, press **Ctrl + C**. Depending on when you issue the **Ctrl + C** command, the script either stops or continues to execute until it is able to stop gracefully. You can run the script again or use the `remove` option, described earlier on this page, to remove the Installer and definition files and then rerun the script.

Another way to exit the script is to answer NO when the script prompts for a YES or NO reply. For example, when the script asks if you want to upgrade dependent packages, if you reply NO, the script exits.

After Running `mapr-setup.sh`

To validate that the Installer started correctly, do one of the following:

- Log in to the Installer web interface using the cluster admin user name and password.
- Run the Installer Stanza `exportcommand` using the cluster admin user name and password.

If the Installer does not start up correctly, check the logs. See [Logs for the Installer](#) on page 6473.

If you want to change any parameter that you provided to `mapr-setup.sh` on a previous run (for example, the repository URL, the cluster admin user name, or another parameter), you can safely rerun `mapr-setup.sh` with the new parameters. Doing so updates the Installer configuration to use the new parameters. However, do not rerun `mapr-setup.sh` while an installation or a `probe` command is in progress.

Installer Web Interface

When you run the Installer web interface, it performs the following tasks:

1. Displays the services and ecosystem components that you can install based on the software version that you select.
2. Provides the option to install Monitoring.

3. Guides you through node and cluster configuration.
4. Verifies that each node meets the node requirements.
5. Sets a default, configurable service layout across the nodes in the cluster based on the requirements of each service.
6. Installs or upgrades the software and associated operating-system dependencies.
7. If you chose to install a trial or community license, it will attempt to apply the license to your cluster.

Installer Stanzas

Running `mapr-setup.sh` also installs Installer Stanzas. Stanzas give you a script-based tool to perform all the installation tasks you can perform using the Installer web interface. See [Installer Stanzas](#) on page 6506. In addition, Stanza commands make it possible to probe a cluster that was installed without using the Installer and use the `import` command to set up the installer database. See [Using probe and import to Generate the Installer Database](#) on page 6479.

Installer Components

The Installer uses the following components to set up the installation environment:

Name	Filename	Description
Configuration Script	<code>mapr-setup.sh</code>	Script that configures a node to run the Installer. This includes setting up an Internet or local repository.
Installer Package	<code>mapr-installer-<version></code>	Package that contains the Installer.
Installer Definitions Package	<code>mapr-installer-definitions-<version></code>	Package that contains the list of software versions, services, and ecosystem components that you can install with the Installer.
Service Packages	various	If you use a remote repository, the Installer accesses the installation packages from https://package.ezmeral.hpe.com/ . If you use a local repository, the Installer accesses the installation packages from the local repository. The <code>mapr-setup.sh</code> script creates the local repository with the packages available in the archive files that you provide to the <code>mapr-setup.sh</code> script. For more information, see Using a Local, Shared Repository With the Installer on page 6411.

Updating the Installer

Update the Installer to include the latest ecosystem packages and installer fixes. Once you update the Installer, you can install ecosystem components and software versions that were made available after you first configured the Installer.

To check the version of the Installer, see [Checking the Installer Version](#) on page 6406.

Before Updating the Installer

As a best practice, create a backup of the cluster configuration before updating the Installer. This backup can be useful if there are issues with the Installer update:

1. Using a browser, log on to the installer:

```
https://<Installer Node hostname/IPAddress>:9443
```

2. Click **Support > Export State**. The cluster state is downloaded as `stanza.yaml`.

For more information about importing or exporting the cluster state, see [Importing or Exporting the Cluster State](#) on page 6442.

Update the Installer Using an Internet Repository

Use the following steps to update an Installer that points to the HPE Internet repository:

1. Rename or delete the `mapr-setup.sh` script for the current version of the Installer.
2. Download the latest version of `mapr-setup.sh` using the steps in [Installer](#) on page 6388.
3. Run the `mapr-setup.sh -R reload` command to update the core and ecosystem repos in the `/opt/mapr/installer/data/properties.json` file:

IMPORTANT: To access the Data Fabric internet repository, you must specify the email and token of an HPE Passport account. For more information, see [Using the HPE Ezmeral Token-Authenticated Internet Repository](#) on page 92.

```
bash /tmp/mapr-setup.sh -R https://  
<email>:<token>@package.ezmeral.hpe.com/releases reload
```

4. Run the `mapr-setup.sh -r update` command to update the Installer packages:

```
bash /tmp/mapr-setup.sh -r https://  
<email>:<token>@package.ezmeral.hpe.com/releases update
```

Note the following known issue related to the use of `mapr-setup.sh -r update`: [Upgrading the Ezmeral Data Fabric Installer packages results in Installer GUI losing the cluster](#).

Once the update is complete, open the Installer URL (`https://<hostname/IPAddress>:9443`) to update the cluster.

Update the Installer Using a Local Repository

If the node that runs the Installer uses a local repository, perform the following manual steps to get the latest packages for the cluster version that you are updating or upgrading to:

1. Download the latest versions of the following archive files.

For Releases 5.2 and later

- **The Core archive file.** Download the core archive file `mapr-<version>GA.<dep|rpm>.tgz` from one of the following locations, based on the operating system of the node:
 - <https://package.ezmeral.hpe.com/releases/v<version>/redhat/>
 - <https://package.ezmeral.hpe.com/releases/v<version>/ubuntu/>
-  **NOTE:** The package `mapr-v<version>GA-upgrade.<rpm|deb>.tgz` is not for use with the Installer.
- **The Installer archive file.** Based on the operating system of the node, download `mapr-installer-<version>.<yyyymmdd>.<dep|rpm>.tgz` from one of the following locations:
 - <https://package.ezmeral.hpe.com/releases/installer/redhat/>
 - <https://package.ezmeral.hpe.com/releases/installer/ubuntu/>
- **The Ecosystem Pack (EEP) archive file.** Based on the operating system of the node, download `mapr-mep-<version>.<yyyymmdd>.<dep|rpm>.tgz` from one of the following locations:
 - <https://package.ezmeral.hpe.com/releases/MEP/MEP-<version>/redhat>
 - <https://package.ezmeral.hpe.com/releases/MEP/MEP-<version>/ubuntu>

2. Run the following command:

```
bash /opt/mapr/installer/bin/mapr-setup.sh -a <full path to each archive file> update
```

For more information about `mapr-setup.sh` options, see [Using mapr-setup.sh](#) on page 6398.

3. Once the update is complete, open the Installer URL (`https://<hostname/IPaddress>:9443`) to update the cluster.

Related concepts

[Using mapr-setup.sh](#) on page 6398

This topic describes how you can use and run the Installer setup script.

Online Help for Installer Fields

This page describes field-level help for the Installer.

To get more out of using the Installer, hold your cursor over the information icon () next to each field or option. The help text can make it easier for you to use Installer options and fill in required information. For example:

Select Configuration Options

Enable Secure Cluster ⓘ

Enable NFS ⓘ

Implements HPE Ezmeral Data Fabric security features in the cluster. Refer to the ["Using the Enable Secure Cluster Option"](#) documentation for additional measures you can take to enhance security. Impala, Sentry, and Livy(in MEPs prior to 6.0.0) must be unchecked if you select this option.

If no information icon (ⓘ) is visible near a field, place your cursor in the field to display the online help:

Username	mapr	<i>This user must exist on each node in the cluster.</i>
Admin Group	mapr	
Password	<input type="text" value="(Click here to display help)"/>	The same cluster (MapR) password used when creating the existing cluster. This must match or cluster extend will fail.
Verify Password	<input type="text"/>	

Checking the Installer Version

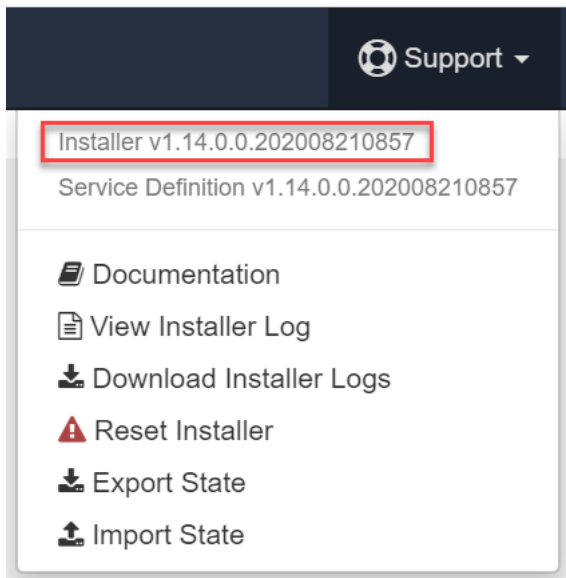

Some Installer features require you to use the latest version of the Installer. You can check the Installer version easily from within the user interface.

About this task

To check the version of the currently installed Installer:

Procedure

1. From the Installer web-based interface, click **Support**. The drop-down menu shows the Installer version:

2. **Optional:** Check your version against the recently released [versions](#) to see if a newer version is available. To update the Installer, see [Updating the Installer](#) on page 6403.

Related concepts

[Selecting an Installer Version to Use](#) on page 6396

Beginning with the EEP 6.2.0 release, several Installer versions are available for use. The version that you use depends on your current core version and whether or not you need to upgrade using the Installer or Stanzas.

[Checking the EEP Version](#) on page 6407

Some Installer operations require you to know the version of the currently installed Ecosystem Pack (EEP). You can check the EEP version easily from within the Installer user interface or derive the EEP version from your repository information.

Checking the EEP Version

Some Installer operations require you to know the version of the currently installed Ecosystem Pack (EEP). You can check the EEP version easily from within the Installer user interface or derive the EEP version from your repository information.

Checking the EEP Version Using the Installer

The Control System does not indicate the version of the currently installed EEP. However, if you used the Installer to install the cluster, you can view the EEP version on the home page:

The screenshot shows the Installer home page. At the top, the word "Installer" is displayed in a large font. Below it, the following information is shown:

Cluster	my.cluster.com
Version	6.2.0
MEP	7.0.0

The "MEP 7.0.0" entry is highlighted with a red box. Below the table, a message states: "An existing cluster has been detected. Select one of the following:"

- Extend cluster to add nodes dynamically online
- Incremental install to make changes to services online (unless you change security model or control groups)
- Update core services with a software patch or maintenance release offline
- Shutdown all cluster services
- Uninstall existing cluster before proceeding with a new installation

At the bottom, there are five action buttons: "Extend Cluster", "Incremental Install", "Maintenance Update", "Shutdown", and "Uninstall".

Checking the EEP Version in the Repository

If you installed the cluster manually, you can learn the EEP version by checking the `/etc/yum.repos.d/mapr_ecosystem.repo` file:

```
cd /etc/yum.repos.d/
ls -l
total 52
-rw-r--r-- 1 root root 1664 Apr 28 2018 CentOS-Base.repo
-rw-r--r-- 1 root root 1309 Apr 28 2018 CentOS-CR.repo
-rw-r--r-- 1 root root 649 Apr 28 2018 CentOS-Debuginfo.repo
-rw-r--r-- 1 root root 314 Apr 28 2018 CentOS-fasttrack.repo
-rw-r--r-- 1 root root 630 Apr 28 2018 CentOS-Media.repo
-rw-r--r-- 1 root root 1331 Apr 28 2018 CentOS-Sources.repo
-rw-r--r-- 1 root root 4768 Apr 28 2018 CentOS-Vault.repo
-rw-r--r-- 1 root root 957 Dec 27 2016 epel.repo
-rw-r--r-- 1 root root 1056 Dec 27 2016 epel-testing.repo
-rw-r--r-- 1 root root 169 May 14 10:04 mapr_core.repo
-rw-r--r-- 1 root root 186 May 14 10:04 mapr_ecosystem.repo
```

```
-rw-r--r-- 1 root root 171 May 13 11:25 mapr_installer.repo
more mapr_ecosystem.repo

[MapR_Ecosystem]
name = MapR Ecosystem Components
baseurl = https://package.ezmeral.hpe.com/releases/MEP/MEP-6.2.0/redhat
gpgcheck = 1
enabled = 1
protected = 1
```

Checking the EEP Version Using the Installed Packages

If the `/etc/yum.repos.d/mapr_ecosystem.repo` file is not available for any reason, another way to learn the currently installed EEP version is to check the versions of the installed packages. Use one of the following commands to display the package versions:

OS	Command
On CentOS / RHEL	<code>yum list installed</code>
On SLES	<code>zypper packages --installed-only</code>
On Ubuntu	<code>apt list --installed</code>

For example:

```
yum list installed
Installed Packages
...
mapr-cldb.x86_64                6.2.0.0.20200618050710.GA-1
@MapR_Core
mapr-client.x86_64             6.2.0.0.20200618050710.GA-1
@MapR_Core
mapr-core.x86_64               6.2.0.0.20200618050710.GA-1
@MapR_Core
mapr-core-internal.x86_64      6.2.0.0.20200618050710.GA-1
@MapR_Core
mapr-fileserver.x86_64         6.2.0.0.20200618050710.GA-1
@MapR_Core
mapr-hadoop-util.x86_64        2.7.4.0.202006180214-1
@MapR_Ecosystem
mapr-librdkafka.x86_64         0.11.3.202006031114-1
@MapR_Core
mapr-zk-internal.x86_64        6.2.0.0.20200618050710.GA-1
@MapR_Core
mapr-zookeeper.x86_64         6.2.0.0.20200618050710.GA-1
@MapR_Core
...
```

Then compare the package versions against the component versions in the [repository](#). Some package versions can be the same for multiple EEPs, so it is best to compare multiple packages to confirm the installed EEP.

Related concepts

[Ecosystem Packs](#) on page 3742

[Installer](#) on page 6388

You must download and run the Installer setup script before you can start the Installer web interface or issue Installer Stanza commands.

Related tasks

[Checking the Installer Version](#) on page 6406

Some Installer features require you to use the latest version of the Installer. You can check the Installer version easily from within the user interface.

Related reference

[EEP Support and Lifecycle Status](#) on page 6533

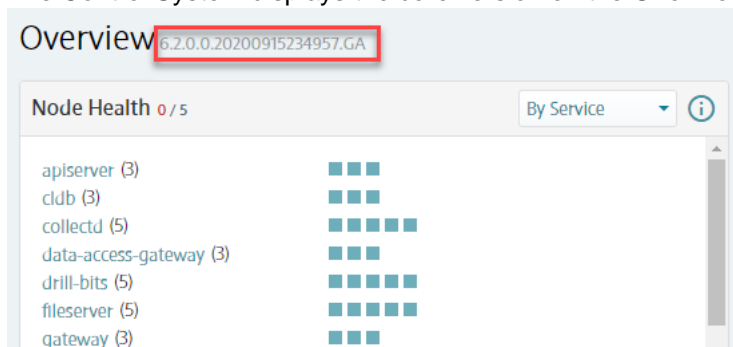

This page shows the EEPs that are supported for different core releases and the current lifecycle status for each EEP.

Checking the Core Version

Some maintenance operations require you to know the version of the currently installed HPE Ezmeral Data Fabric release (sometimes referred to as the "core version"). You can check the core version easily from within the Control System or Installer user interface or identify the version from your installed packages.

Checking the Core Version Using the Control System

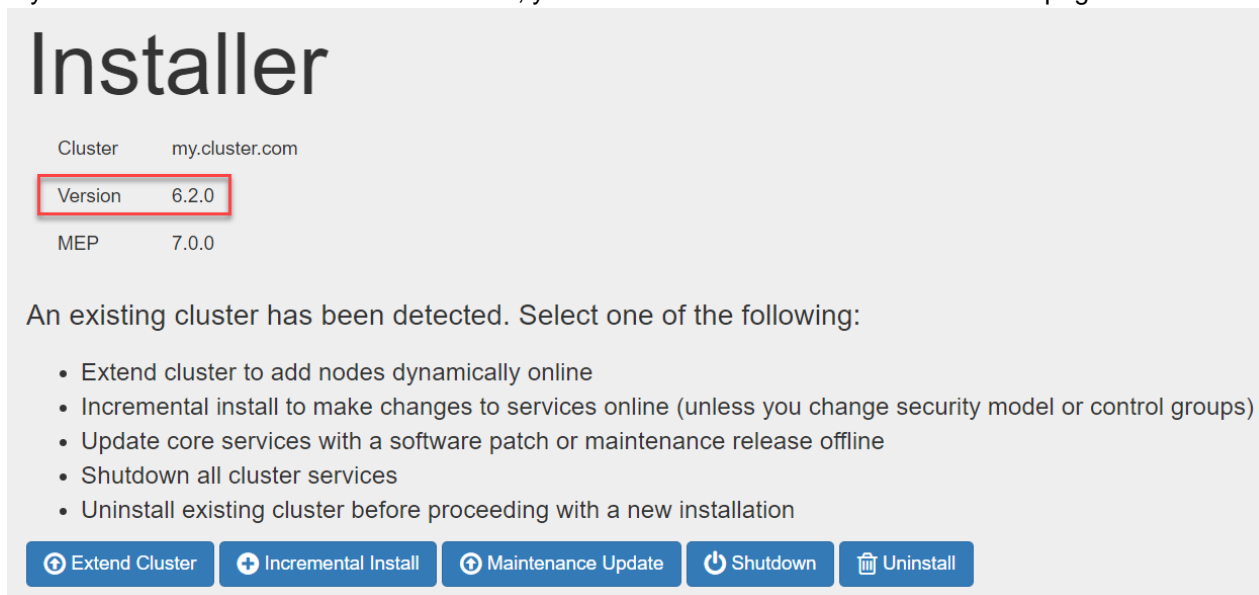

The Control System displays the core version on the **Overview** page:

To connect to the Control System, see [Setting Up the Control System](#) on page 407.

Checking the Core Version Using the Installer

If you used the Installer to install the cluster, you can view the core version on the home page:

To set up the Installer, see [Installer](#) on page 6388.

Checking the Core Version Using maprcli

Another way to view the currently installed core version is to use the `maprcli dashboard info` command:

```
cd /opt/mapr/bin
maprcli dashboard info -json
{
  "timestamp":1586880602331,
  "timeofday":"2020-04-14 09:10:02.331 GMT-0700 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "version":"6.1.0.20180926230239.GA",
      "cluster":{
        "name":"bridget.cluster.com",
        "secure":true,
        "dare":false,
        "ip":"10.10.82.24",
        "id":"6083111376716482211",
        "nodesUsed":1,
        "totalNodesAllowed":-1
      },
      "volumes":{
        "mounted":{
          "total":16,
          "size":1543
        },
        "unmounted":{
          "total":3,
          "size":1
        }
      },
      "utilization":{
        "cpu":{
          "util":38,
          "total":8,
          "active":3
        }
      }
    }
  ],
  ...
}
```

Checking the Core Version Using the Installed Packages

Another way to view the currently installed core version is to check the versions of the installed `mapr-core.x86_64` or `mapr-core-internal.x86_64` packages. Use one of the following commands to display the package versions:

On CentOS / Red Hat	<code>yum list installed</code>
On SLES	<code>zypper packages --installed-only</code>
On Ubuntu	<code>apt list --installed</code>

For example:

```
yum list installed
Installed Packages
...
mapr-cldb.x86_64                6.2.0.0.20200618050710.GA-1
@MapR_Core
mapr-client.x86_64             6.2.0.0.20200618050710.GA-1
```

```

@MapR_Core
  mapr-core.x86_64                               6.2.0.0.20200618050710.GA-1
@MapR_Core
  mapr-core-internal.x86_64                     6.2.0.0.20200618050710.GA-1
@MapR_Core
  mapr-fileserver.x86_64                         6.2.0.0.20200618050710.GA-1
@MapR_Core
  mapr-hadoop-util.x86_64                       2.7.4.0.202006180214-1
@MapR_Ecos
  system
  mapr-librdkafka.x86_64                        0.11.3.202006031114-1
@MapR_Core
  mapr-zk-internal.x86_64                       6.2.0.0.20200618050710.GA-1
@MapR_Core
  mapr-zookeeper.x86_64                        6.2.0.0.20200618050710.GA-1
@MapR_Core
  ...

```

Related concepts

[Checking the EEP Version](#) on page 6407

Some Installer operations require you to know the version of the currently installed Ecosystem Pack (EEP). You can check the EEP version easily from within the Installer user interface or derive the EEP version from your repository information.

Using a Local, Shared Repository With the Installer

The Installer can use a local repository instead of an internet repository.

When you run the `mapr-setup.sh` script, it attempts to connect to <https://package.ezmeral.hpe.com/> and configures an internet repository. If there is no internet connectivity, the script asks for archive files so that it can create a local repository.

NOTE: Passing `-a <full path each archive file>` to the `mapr-setup.sh` script bypasses the internet connectivity check and automatically creates a local repository with the provided archive files.

To install with a local, shared repository, the node that runs `mapr-setup.sh` needs the following:

- **Any OS dependencies or Java Development Kit (JDK) packages that are required.**
- **A webserver.** The script attempts to install a webserver on the node if a webserver is not available. The webserver is needed to provide the package files to each node in the cluster. Note that this webserver is not configured to start automatically after a server restart. However, you can start the webserver manually by using the `systemctl start httpd` command.
- **Archive file(s).** To install release 5.2 and later, you need to download multiple archive files.

For release 5.2 and later

- **The Core archive file.** Download the archive file `mapr-<version>GA.<dep|rpm>.tgz` from one of the following locations, based on the operating system of the node:
 - <https://package.ezmeral.hpe.com/releases/v.<version>/redhat/>
 - <https://package.ezmeral.hpe.com/releases/v.<version>/ubuntu/>
 - <https://package.ezmeral.hpe.com/releases/v.<version>/suse/>
-  **NOTE:** The package `mapr-v<version>GA-upgrade.<rpm|deb>.tgz` is not for use with the Installer.
- **The Installer archive file.** Based on the operating system of the node, download `mapr-installer-<version>.<yyyymmdd>.<dep|rpm>.tgz` from one of the following locations:
 - <https://package.ezmeral.hpe.com/releases/installer/redhat/>
 - <https://package.ezmeral.hpe.com/releases/installer/ubuntu/>
- **The Ecosystem Pack (EEP) archive file.** Based on the operating system of the node, download `mapr-mep-<version>.<yyyymmdd>.<dep|rpm>.tgz` from one of the following locations:
 - <https://package.ezmeral.hpe.com/releases/MEP/MEP-<version>/redhat>
 - <https://package.ezmeral.hpe.com/releases/MEP/MEP-<version>/ubuntu>
 - <https://package.ezmeral.hpe.com/releases/MEP/MEP-<version>/suse>

The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number. The 3-digit directory contains a fixed MEP version, including patches, and is not continuously updated. The 2-digit EEP directory points to the latest MEP and patches and is continuously updated. See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

- **The `mapr-setup.sh` script.**

NOTE: Red Hat clusters must have access to a local EPEL repository, as described in [Adding the Data Fabric Repository on RHEL, CentOS, or Oracle Linux](#) on page 132. The EPEL repository enables installation of these packages:

- clustershell
- pdsh
- pdsh-rcmd-ssh
- sshpass*

*Before installing a cluster on a SLES image, you must install `sshpas`, as described in [Adding the Data Fabric Repository on SUSE](#) on page 134.

After downloading the `mapr-setup.sh` script and the archive files to the node that will run the Installer, run the following command from the directory that contains the `mapr-setup.sh` script:

```
bash ./mapr-setup.sh -a <full path to the archive files>
```

Installer FAQ

Review frequently asked questions about the Installer.

General

What is the difference between the Installer and the Quick Installer?

The Installer is a robust, user-friendly replacement for the Quick Installer. You can use the Installer to install a cluster with HPE Ezmeral Data Fabric services and ecosystem components. You can also use the Installer to update an existing cluster with additional nodes, HPE Ezmeral Data Fabric services, and ecosystem components. However, the Installer does not install the client.

Which versions of software can I install?

You can use the Installer to install core releases 6.x and 7.x. Earlier core releases have reached their "End of Maintenance" status. For more information about the supported versions of HPE Ezmeral Data Fabric core software, see [Core Support and Lifecycle Status](#) on page 6532. To understand which Installer versions can be used with older core versions, see [Selecting an Installer Version to Use](#) on page 6396.

Can I use the Installer to upgrade my cluster?

Yes. The Installer can be used to upgrade a cluster that was installed using the Installer or an Installer Stanza. See [Upgrading Core With the Installer](#) on page 276 for information about how to upgrade with the Installer.

If the cluster was manually installed, you can install the Installer and enable it to be used with subsequent installations or upgrades by following the steps in [Using probe and import to Generate the Installer Database](#) on page 6479.

Can I use the Installer to install a patch?

Yes. See [Applying a Patch](#) on page 425.

Does the Installer support adding a "compute-only" node?

A compute-only node is a node that is capable of performing computational tasks but is not expected to perform long-term data storage. The Installer does not explicitly support adding a compute-only node to a cluster. However, you can effectively work around the issue by adding a node that has the file system and sufficient associated disk space. The disk space must be equal to or greater than the amount of physical memory on the node.

Preparing to Install

What are the Installer requirements?

See the [Prerequisites](#).

What information should I have before I start?

The `mapr-setup.sh` script requests the following information:

- The fully-qualified domain name for each host and the port number that other nodes in the cluster can use to connect to the Installer node.
- A user for the cluster admin user account. If the user account doesn't exist, the `mapr-setup.sh` script prompts for the UID, GID, group name, and password so that it can create the account.

The Installer requests the following information:

- The EEP that you want to install on a 5.2.x or later cluster
- The services that you want to install on the cluster
- Hostnames of the nodes that you want to include in the cluster (specify fully-qualified domain names as described in [Connectivity](#) on page 121)
- Credentials for the `root` user or a user with sudo privileges on each node in the cluster

What are the node requirements?

See the [Prerequisites](#).

What are my options if I don't want to use an Internet repository?

See [Using a Local, Shared Repository With the Installer](#).

Using the Installer

Which license edition applies to my installation?

As of release 5.1, licenses are categorized by new editions and modules that further define the features supported by an edition.

See the following table for descriptions of the license options. For more information about licensing, see [HPE Ezmeral Data Fabric Software Licensing](#).

License Edition	Description
Community Edition	An unlimited, free, community-supported edition with one free NFS Gateway. This edition includes Hadoop, HPE Ezmeral Data Fabric Database, and HPE Ezmeral Data Fabric Streams. However, real-time global replication of HPE Ezmeral Data Fabric Database tables or HPE Ezmeral Data Fabric Streams is not included.
Enterprise Edition	Edition that enables enterprise-class features such as high availability, multi-tenancy, and disaster recovery. Each of the following modules for the Enterprise Edition unlocks a portion of the total platform capabilities:

License Edition	Description
	<p>Analytics Enables enterpris e-class features for analytic use cases, such as highly-avail able NFS and support for services like YARN and MapReduc e.</p> <p>Database Enables enterpris e-class features for operational NoSQL database, with HPE Ezmeral Data Fabric Database JSON and binary tables, and real-time global database replication.</p> <p>Streams Enables enterpris e-class features for publish/ subscribe event streaming, with HPE Ezmeral Data Fabric Streams and real-time global stream replication.</p> <p>For more information about editions, see What's Included.</p>

What happened to the M3, M5, M7, or Enterprise Edition licenses?

With the release of 5.1 and Streams, the licensing model has been simplified, allowing more choice in which specific features are licensed on a cluster.

See the following table to understand how the new licenses correspond to the legacy license editions that you are familiar with. For more information about licensing, see [HPE Ezmeral Data Fabric Software Licensing](#). For more information about editions, see [What's Included](#).

Legacy Edition	New Edition & Module(s)
M3 or Community Edition	Community Edition. Starting in 5.1, the Converged Community Edition includes Streams.
M5 or Enterprise Edition	Enterprise Edition with Hadoop Module
M7 or Enterprise Database Edition	Enterprise Edition with Hadoop and Database modules

What expressions can I use to specify multiple nodes?

You can enter the following types of expressions to specify nodes:

- `[0-99]` => Expands hostnames to 0, 1, 2, ...99. The second delimiter allows one or more digits.
- `[00-99]` => Expands hostnames to 00,01,02,...99. Allows two or more digits of the same length
- `[a-z]` or `[A-Z]` => Expands hostnames to a,b,c,...z or A,B,C,...Z

To group hosts based on racks for performance or reliability, append ":" followed by the rack name to each expression.

Examples:

- `host1, host2, host3`
- `host[A-Z][0-99]` => `hostA0, hostA1, hostA2, ..., hostZ99`
- `host[000-333]` => `host000, host001, host002, ... host333`
- `host[0-3], otherhost[00-05]` => `host0, host1, host2, ..., host3` and `otherhost00, ..., otherhost05`
- `host[0-5]:rack1, host[6-10]:rack2` => `host1, host2, host3, ..., host5` on rack1. `host6, host7, host8, ..., host10` on rack2

How do I change the service layout?

The Installer uses groups to organize nodes and services. A group is a set of services that you can run on one or more nodes. A service can only be assigned to one group.

On the **Configure Service Layout** page, you can use the **Advanced Configuration** option to drag and drop services between existing groups to specify where the services are to be installed. You can also create new groups or change the list of nodes assigned to a group.

Can I install a single-master service, such as Hive, on multiple nodes?

NOTE: Some services can only be assigned to one node.

When you use the Installer, single-master services are added to the default MASTER group. By design, only one node can be assigned to the MASTER group.

To install a single-master service on more than one node:

1. On the Configure Service Layout page, create a new group.
2. Assign multiple nodes to the new group.
3. Drag the single-master service to the new group.

Can I install a secure cluster with the Installer?

Yes. Installer [versions](#) 1.10 and later support [security by default](#).

Are there limitations to what you can do when you update an existing cluster?

See the restrictions documented in [Using the Incremental Install Function](#) on page 6438.

How do I uninstall the Installer?

See [Uninstalling Software Using the Installer Uninstall Button](#) on page 6448. If the installer node is part of the cluster, the Installer packages can remain on the installer node after the cluster is uninstalled.

If you have uninstalled the cluster, you can also run one of the following commands to uninstall the Installer packages from the installer node:

- On CentOS / Red Hat:

```
yum remove 'mapr-installer*'
```

- On Ubuntu:

```
apt-get remove 'mapr-installer*'
```

- On SLES

```
zypper remove 'mapr-installer*'
```

Troubleshooting

What can I do if I need to rerun `mapr-setup.sh` with a new repository URL and the script still points to the old URL?

The `/opt/mapr/installer/data/properties.json` file stores information such as the user ID of the cluster administrator, the user ID of the Installer, the OS type, Internet access information, and the repository URLs for Core and the ecosystem components. Once a repository URL has been stored in `properties.json`, the Installer assumes that the URL will not change. Rerunning the setup script does not update the URL. Even upgrading the installer packages does not update the repository URL in `properties.json`. To pass a new repository value into `properties.json`, you have two options:

Option 1

You can remove the installer files and rerun the setup script:

```
mapr-setup.sh remove
```

Using the `remove` command removes `properties.json`, the installer database, and the installer packages, but not the setup script. After the files are removed, you can rerun the setup script to specify the new repository URL. For more information about options you can use with `mapr-setup.sh`, see [Using mapr-setup.sh](#).

Option 2

If you need to retain the installer database and the cluster state information (for example, because you need to do an upgrade), you can:

1. Edit the `properties.json` file manually to change the `repo_core_url` and the `repo_eco_url` entries to the correct values.

2. Restart the Installer:

```
systemctl restart mapr-installer
```

What can I do if drop-down menus aren't working?

Try any or all of the following to correct the problem:

- Refresh the browser page.
- Clear the browser cache.
- Close and restart the browser or browser tab.

Why does the Installer URL not work?

Check that the URL you are trying to access is external. For example, if you install on a cluster that is in the cloud, the URL that the Installer lists may not work if it is an internal URL. Try accessing the external URL that is associated with the internal URL.

Why doesn't the Installer list the ecosystem component that I want to install?

The Installer Definitions package contains the versions and services that you can install. Once you update the Installer Definitions, you can install ecosystem components that were made available after you first configured the Installer. See [Updating the Installer](#) on page 6403.

On the Verify Nodes page, how can I get more information about a warning or error?

Hold your cursor over the warning or error in the right pane to see more information about the specific warning or error condition.

Why are the nodes listed on the Verify Nodes page different from those that I chose to install on?

If you abort an installation and then install on a different set of nodes, you must use the *Verify Nodes* page to manually remove nodes that were part of the aborted installation but are no longer part of the current installation.

I can't log in to Hue. What credentials should I use to log into Hue for the first time?

Log in with the cluster administrator username that you configured while running `mapr-setup.sh` and the password `mapr`.

What should I do if rerunning `mapr-setup.sh` generates errors because the `properties.json` file has incorrect information?

See [Troubleshooting Repository URL Errors](#) on page 6480.

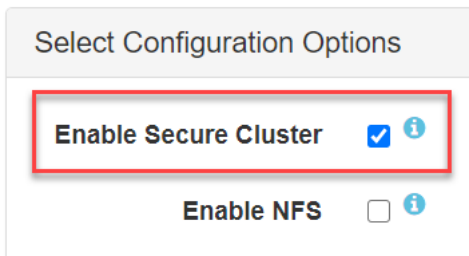

Installer Operations

This section describes operations you can perform using the Installer.

Using the Enable Secure Cluster Option

You use the Enable Secure Cluster option to control whether or not the cluster is configured as a secure cluster.

This option appears on the **Version & Services** page of the web-based Installer.

! **IMPORTANT:** Deselecting the **Enable Secure Cluster** option is not supported for releases 7.0.0 and later. In releases 7.0.0 and later, security is enforced by default, and nonsecure clusters are not supported.

About the Enable Secure Cluster Option

Using this option controls [platform and ecosystem security](#) in a cluster. When you select the option, the Installer runs the `configure.sh` script on the primary container location database (CLDB) to generate security keys and then distributes the keys to all the other CLDBs. The installer also distributes certificates to all the other nodes and activates security for the ecosystem components that support security.

Certain ecosystem components either do not support security or cannot be secured by the Installer. If you enable security, you will not be allowed to select services such as Impala or Sentry.

Beginning with Release 6.1, data-on-wire encryption is enabled by default for newly created volumes when the **Enable Secure Cluster** option is selected. Data-on-wire encryption encrypts data in a volume during transmission over the wire. In a secure cluster, you can enable or disable data-on-wire encryption for individual volumes using the Control System, the `maprccli`, or the REST API commands.

Using the Option With New and Already Installed Clusters

You can select or deselect the **Enable Secure Cluster** option during a new installation or during an [Incremental Install](#).

- For new installations:
 - The option is selected by default, meaning that new installations are configured with security unless you deselect the option.
 - Deselecting the option causes the cluster to be installed as a nonsecure cluster.
- For clusters that are already installed with EEP 4.0.0 or later:
 - You can select or deselect the option during an [Incremental Install](#):
 - If security is not currently configured and you select the option, the cluster will be configured with security.

- If security is already configured, you can remove security by deselecting the option.

NOTE: If Drill is installed, be sure to review the limitations described in [Securing Drill](#) on page 3862 before removing security. Additional steps must be taken so that Drill in a nonsecured cluster can access all Drill znodes.

Using the Option During an Incremental Install

Normally, **Incremental Install** operations are conducted online. However, selecting or deselecting the **Enable Secure Cluster** option during an **Incremental Install** requires the Installer to stop the Warden and Zookeeper services, bringing the cluster offline temporarily.

In some instances, the **Enable Secure Cluster** option is unavailable. For example, you cannot select this option during an upgrade of a nonsecured Release 5.x cluster to Release 6.0 or later. You must complete the upgrade to Release 6.0 or later first and then use the **Incremental Install** function to enable security.

Using the Enable DARE Option

You use the Enable DARE option to enable data-at-rest encryption for volumes.

This option appears on the **Version & Services** page of the web-based Installer when the **Enable Secure Cluster** option is selected. The **Enable DARE** option is *deselected* by default.

For more information about data-at-rest encryption, see [Encryption in Data Fabric](#) on page 789.

Considerations for Enabling DARE Using the Installer

Before using the **Enable DARE** option, review these considerations:

IMPORTANT: Once enabled, the **Enable DARE** option cannot be disabled, since disk encryption cannot be turned off without reformatting the disks.

- The **Enable DARE** option can only be used during the initial installation of a cluster or during an incremental install.
- You cannot select the **Enable DARE** option when:
 - The **Enable Secure Cluster** option is deselected.
 - You perform an upgrade operation using the Installer. Security changes are not allowed during an upgrade using the Installer.
- If you select the **Enable DARE** option, you can no longer deselect the **Enable Secure Cluster** option during an **Incremental Install** operation.

Configuring Remote Authentication for the Installer

This page describes how to specify a password or private key that enables the Installer program to perform common operations on all nodes in the cluster.

Installer Authentication Methods

Some Installer operations, such as installing, upgrading, or verifying services, require the Installer to log in (authenticate) to every cluster node with `root`-user access (or `sudoer` access to `root`). The Installer lets you specify one of the following methods to log in:

- SSH Password authentication
- SSH Private key authentication

Using the SSH Password Login Method

The SSH Password login method is the default method. To use this method:

1. In the **Login Method** field of the **Configure Remote Authentication** section, select **SSH – Password** as the login method:

Configure Remote Authentication

Login Method: SSH - Password

SSH Username: root

SSH Password:

Verify SSH Password:

SSH Port: 22

The username used to SSH into each node to perform installation. This user must either be root, or a user with sudo privileges.

2. In the **SSH Username** field, specify `root` or a user with `sudo` privileges. The user must exist and have the same password on every node in the cluster.
3. If you plan to perform the installation with an ssh ID of `root`, go to step 4. If you plan to perform the installation with an ssh ID other than `root`, follow the instructions in [If You Specify a User Other Than root](#) on page 6421. Then continue to step 4.
4. Enter the **SSH Password** for the ssh user, and re-enter the password to verify it.
5. In the **SSH Port** field, specify a port number if your installation uses an ssh port other than the default port (22).
6. Click **Next** to advance through the remaining Installer screens.

If You Specify a User Other Than `root`

Specifying a user other than `root` for remote authentication requires an extra step. This step must be performed before you advance through the remaining Installer screens.

On every node in the cluster, create a file named `<your_login_ID>` in the `/etc/sudoers.d` directory. It doesn't matter what the file is named as long as the file is unique in the directory. Typically, the file takes the name of your login ID. The file must contain the following entry:

```
<your_login_ID> ALL=(ALL) NOPASSWD: ALL
Defaults: <your_login_ID> !requiretty
```

This step is required only for an ssh ID other than `root`.

Using the SSH Private Key Login Method

If you decide not to use the SSH Password method, you can use the SSH Private Key login method. The private key method is more secure because:

- You do not need to provide a password to the Installer.
- Authentication is performed using an encrypted private key.

The private key method requires certain configuration steps to be performed **before** you run the Installer.

Before using the Installer:

1. If you already have an ssh key pair for the login user, go to step 3.

2. If you don't already have an ssh key pair for the login user, use any node to generate a key pair that can be distributed to all the other nodes. Use a utility such as `ssh-keygen` to create the ssh key pair. For example, while logged on as `root` or a user that has `sudo` access to `root`, run this command:

```
ssh-keygen -t rsa -N "" -f ~/.ssh/<filename>
```

The utility creates a private key named `<filename>` and a public key named `<filename>.pub` and stores the files in `~/.ssh`, where `~` refers to the user's home directory. Here is an example of the `ssh-keygen` command:

```
ssh-keygen -t rsa -N "" -f ~/.ssh/mykey
Generating public/private rsa key pair.
Your identification has been saved in /home/user/.ssh/mykey
Your public key has been saved in /home/user/.ssh/mykey.pub
The key fingerprint is:
SHA256:Sg+nEojf/3idE0pCdUATwzffAvOD8WKcD9BwaYIO2TE user@install_node
The key's randomart image is:
+----[RSA 3072]-----+
|
|   oE=B=..
|   o o.=+@
|   o . B @ .
|  . . o  B * .
| . . .o S. + o
| . . o.*. . .
| . o oo.o o
|   o .o +
|   oo. .
+-----[SHA256]-----+
user@install_node:~$ cd .ssh
user@install_node:~/.ssh$ ls
known_hosts  mykey  mykey.pub
```

3. On the node, where you created the key pair, check the permissions and ownership of both the public- and private-key files. HPE recommends that the login user owns the private-key and public-key files. The private key should be read/writable only by the login user and have a permission of 600. The public key should be read/writable by the login user but also world-readable and have a permission of 644:

```
cd ~/.ssh
chmod 600 mykey
chmod 644 mykey.pub
```

4. Copy the public-key file (`<filename>.pub`) to every node in the cluster. As you copy the public-key file to each node, ensure that the file retains the same permissions and ownership described in step 3.
5. Create and distribute the authorization file:
 - a. On any node, create an authorization file named `authorized_keys` (unless the file already exists). The authorization file will contain the content of the public-key file. When you create the authorization file, make sure that the file has a permission of 600, and the login user owns the file.
 - b. Append the public-key information to the authorization file by using a command such as the following:

```
cat <filename>.pub >> ~/.ssh/authorized_keys
```

- c. Copy the authorization file to every node as `~/.ssh/authorized_keys`, where `~` refers to the user's home directory. Note that if any nodes already have an authorization file, do not overwrite the file. In that case, repeat step 5b to append the public-key information to the authorization file. Or use the command described in the following note to append the information.

NOTE: With newer versions of OpenSSH, it is possible to combine steps 3, 4, and 5 into a single command that:

- Uses `ssh` to securely copy the public key file.
- Creates a file in `~/.ssh/authorized_keys` by default and appends the public key to that file.
- Sets the default permission (`chmod 600`) on the `~/.ssh/authorized_keys` file.

For example:

```
ssh-copy-id -i ~/.ssh/mykey.pub user@node1
```

But this command has not been tested on all distributions.

6. Copy the private key file to the workstation where you will use a browser to run the Installer. The file must be present on the workstation so that when you click the **Browse** button in the Installer **Private Key** field, you can browse to and select the file.
7. If you plan to perform the installation with an ssh ID of `root`, go to step 8. If you plan to perform the installation with an ssh ID other than `root`, follow the instructions in [If You Specify a User Other Than root](#) on page 6421. Then continue with step 8.
8. Verify that you can use `ssh` and the key pair to access all the nodes without being asked for a password.
 - a. For example, execute this command from the Installer node:

```
ssh -i ~/.ssh/private_key <nodename>
```

Running the command should enable you to log in to the node and display a prompt (without requiring a password) if these conditions are true:

- The Installer node has the private and public key files in `~/.ssh`.
- The `openssh_server` is installed and running on each cluster node.

If you are prompted for a password, check the file permissions. If `ssh` access does not work for a node, the Installer will return an error when it tries to authenticate to the node.

- b. Also, when you check access to each node, make sure that you can successfully run a command that requires `root` access without being asked for a password. For example:

```
ssh -t <nodename> "sudo ls /root"
```

When you run the Installer:

1. In the **Login Method** field of the **Configure Remote Authentication** section, select **SSH – Private key** as the login method:
2. In the **SSH Username** field, specify `root` or a login user with `sudo` privileges. The user must exist and have the same password on every node in the cluster.

Configure Remote Authentication

Login Method SSH - Private key ⓘ

SSH Username < root or non-root user with sudo access >

Private Key Browse... No file selected. Choose the private SSH key file used to authenticate SSH user on each node.

SSH Port 22

Please select a file.

Is this secure ?

Specifying a non-`root` user for the **SSH Username** requires the creation of a file in the `/etc/sudoers.d` directory, as described [If You Specify a User Other Than root](#) on page 6421.

3. In the **Private Key** field, browse to select the private ssh key file that can authenticate the ssh user on all nodes.
4. In the **SSH Port** field, specify a port number if your installation uses an ssh port other than the default port (22).
5. Click **Next** to advance through the remaining Installer screens.

Installing the S3 Gateway Using the Installer

Using the web-based Installer, you can install the S3 Gateway on the cluster.

You can install the S3 gateway during a new or incremental installation of Release 6.2 or later. The following option appears on the **Version & Services** page of the Installer:

Object Store Gateway with S3-Compatible API (2.0.0)

Note these considerations for installing the S3 gateway using the Installer:

- Installer 1.15 installs S3 gateway 2.0.0 with EEP 7.0.0 and 7.0.1.
- If **Enable NFS** is specified, the Installer configures the S3 gateway to use NFS servers.
- If **Enable NFS** is not specified, by default the Installer installs Loopback NFS (`mapr-loopbacknfs-<version>`) on all nodes in the cluster. If you later perform an incremental install to **Enable NFS**, the Installer uninstalls Loopback NFS and uses NFS servers to interface with the S3 gateway.
- The S3 gateway:
 - Accesses the MapR file system through `/mapr`
 - Uses port 9000
 - Uses either the http or https protocol
- You cannot upgrade S3 gateway 1.0.x to S3 gateway 2.0.0 manually or by using the Installer. Upgrades are not supported.

To install the S3 gateway manually, see [Installing S3 Gateway](#) on page 214. To learn more about managing and using the S3 gateway, see [S3 Gateway](#) on page 4440.

Installing NFS Using the Installer

Using the web-based Installer, you can install version 3 or version 4 of the Network File System (NFS) on the cluster.

You can install NFS during a new or incremental installation of Release 6.1 or later. The **Enable NFS** option appears on the **Version & Services** page of the Installer.

Note these considerations for installing NFS using the Installer:

- Previous versions of the Installer installed NFS (version 3) by default. Installer 1.10 and later do NOT install NFS by default. You must select the **Enable NFS** option to instruct the installer to install NFS. When you select the **Enable NFS** option, the **NFS Version** option appears. NFSv3 is always selected by default. NFSv4 is available as an option for 6.1.0 or later releases.

CAUTION: The Installer installs but does not secure NFS. Neither NFSv3 nor NFSv4 provides security by default. You can configure NFSv4 server to work with Active Directory and Kerberos servers, but you must first install Active Directory and Kerberos servers. For more information, see [Configuring NFSv4 Server for Kerberos](#) on page 1513. NFSv3 does not support security.

- With the 1.10 installer, if you specify a pre-6.1.0 release, you must select the **Enable NFS** option to install NFS. Selecting the option causes the installer to install NFSv3 by default. The **NFS Version** option is not available for pre-6.1.0 releases.
- When upgrading to Release 6.1 or later, the Installer keeps the NFS version at version 3. After a new installation of Release 6.1 in which you specified NFSv3, or an upgrade to Release 6.1 using the Installer, you can switch to NFSv4 by using the [Incremental Install](#) function of the installer.
- The software supports mixed-mode NFS configurations in which some nodes of a cluster use NFSv3 and other nodes use NFSv4, but mixed-mode configurations cannot be installed using the Installer. The Installer installs all nodes as NFSv3 or all nodes as NFSv4.
- NFSv3 and NFSv4 cannot be used on the same node concurrently.
- A new installation using a Installer Stanza installs NFS only if you set `enable_nfs: true` in the config section of the stanza.

To install NFS manually, see [Installing NFS for the HPE Ezmeral Data Fabric](#) on page 354. To learn more about managing and using NFS, see [Managing the HPE Ezmeral Data Fabric NFS Service](#) on page 1478.

Using Custom Playbooks

Installer 1.12.0.0 and later enable you to use custom playbooks that can run a set of predefined tasks during or after operations using the Installer or Installer Stanzas.

Using custom playbooks, you can inject specific commands into the Installer 1.12.0.0 and later workflows to make configuration changes and ensure that those changes persist even after incremental installations or upgrades. For example, suppose you want to install a specific software package on all nodes before starting an installation. Custom playbooks enable you to check for and install the software as needed.

Or suppose you want to change a configuration setting before starting Core. Custom playbooks enable you to change the setting as part of an installation or upgrade.

Restrictions to Using Custom Playbooks

Note these restrictions:

- You can use custom playbooks with any cluster as long as the Installer version is 1.12.0.0 or later. However, Installer 1.12.0.0 and later have limited functionality when used with older releases. See [Selecting an Installer Version to Use](#) on page 6396.
- Custom playbooks are not supported for manual installations. Custom playbooks are supported only for use with the Installer and [Installer Stanzas](#) on page 6506.

Prerequisite for Using Custom Playbooks

To create a custom playbook file, you must be familiar with Ansible. Ansible is a simple automation language that uses plain-text YAML files to describe the desired state of the cluster. You do not have to install Ansible. Ansible 2.7 is installed whenever you load the Installer using `mapr-setup.sh`. To begin learning Ansible, see these resources:

- [Quick Start Video](#)
- [Getting Started with Ansible](#)
- [Introduction to Playbooks](#)

Creating and Running a Custom Playbook

Follow these steps to use a custom playbook with the Installer or Installer Stanzas:

No.	Step	See for more information
1.	Prepare the roles structure and YAML files for the custom playbook.	<ul style="list-style-type: none"> • Predefined Roles for Custom Playbooks on page 6426 • Example Playbook Files on page 6427
2.	Test the roles using standalone Ansible.	<ul style="list-style-type: none"> • Testing the Roles on page 6428 • Playbook Debugger
3.	Convert the YAML files to a zipped archive file that has a <code>tgz</code> or <code>tar.gz</code> file extension.	<ul style="list-style-type: none"> • Creating the Zipped Archive on page 6428
4.	In the Installer or a Installer Stanza, specify the option to upload the zipped archive file.	<ul style="list-style-type: none"> • Installer Options for Custom Playbooks on page 6428 • Installer Stanza Parameters for Custom Playbooks on page 6430
5.	Run the Installer or Installer Stanza to invoke the playbook.	<ul style="list-style-type: none"> • Installer on page 6388 • Installer Stanzas on page 6506
6.	If the operation returns a syntax error, fix the error and retry the operation.	<ul style="list-style-type: none"> • Troubleshooting Custom Playbook Errors on page 6430

Predefined Roles for Custom Playbooks

The role structure is an important part of your custom playbook. Your custom playbook must contain one or more of the following roles, and each role must be a directory in the zipped archive. The roles do not need to follow a specific order.

Role	Tasks in this role are run <i>after</i> . . .
preinstall	The Installer has verified the nodes but before the installation workflow has begun
postecoreconfigure	<code>configure.sh</code> has run for Core but before Core has been started
postecoconfigure	Ecosystem components are configured and started

Role	Tasks in this role are run <i>after</i> . . .
postinstall	The cluster is completely installed and running (at the end of the Installer Stage2 playbook)

Here is an example role structure:

```
preinstall
  tasks
    main.yml
postcoreconfigure
  tasks
    main.yml
  vars
    main.yml
```

The uploaded tarball must contain relative path names with just the top-level role directories, and the tarball structure must adhere to the [Ansible role-structure rules](#). If you need to configure your own roles in the tarball, you must include them as sub-roles to be run from within the pre-defined roles. For more information, see [Ansible Roles](#).

NOTE: Because Installer [maintenance updates](#) only update Core and do not change any configuration settings on the cluster, the Installer handles them differently from other operations. This means that whenever you perform a maintenance update, the Installer does *not* run the `postcoreconfigure` and `postinstall` playbooks during the maintenance update.

Example Playbook Files

This example shows a `preinstall` task that installs the Midnight Commander application on all nodes in the cluster before the Installer workflow is initiated. The example is contained in the `preinstall/tasks/main.yml` file:

```
---
- name: Install misc stuff - Midnight commander
  vars:
    packages_Suse: ['mc']
    packages_RedHat: ['mc', 'lsof']
    # syslinux-utils is for gethostip, libpython is required for collectd
    packages_Debian: ['mc']

  package: name={{ item }} state=present
  with_items: "{{ vars['packages_' + ansible_os_family] }}"
```

The following example shows the `postcoreconfigure/tasks/main.yml` file for the previous role structure. This example sets the number of RPC threads in `mfs.conf` from the current setting to 4 threads. The variable used to point to the file is defined in `postcoreconfigure/vars/main.yml`:

```
---
- debug: var=mapr_home

- name: Bump MFS RPC threads
  lineinfile:
    path: "{{ mapr_conf_dir }}/mfs.conf"
    regexp: '^(?P<threads>mfs.numrpcthreads=).*\$$'
    line: '\g<threads>4'
    backrefs: yes
```

This example shows the contents of the variables file (`postcoreconfigure/vars/main.yml`):

```
---
mapr_conf_dir: "{{ mapr_home }}/conf"
```

Testing the Roles

Before uploading your zipped archive, develop and test your role files outside the installer using the standalone Ansible 2.7 debugger. You cannot use the [Ansible debugger](#) from within the Installer. For more information, see [Playbook Debugger](#).

Testing the roles by running them using the Installer can be time-consuming. If a role contains logic errors, these errors won't be visible until the playbook is initiated. For example, a `postinstall` playbook that you run during a new installation does not generate an error until the installation is completed. A new installation can take 20 minutes or more, depending on the cluster size. Therefore, you can avoid having to re-run the Installer and playbook by testing the roles for logic errors before using them.

You can run the playbook debugger from the Installer node by using the `virt_runner` program in the `/opt/mapr/installer/bin/` directory. Use this command:

```
virt_runner ansible-playbook -i, -k <Playbook-file-name>
```

When you run the playbook in this fashion, you do not have access to the variables (for example, `mapr_home`) that the Installer defines. So you must set those up manually.

Creating the Zipped Archive

To create the zipped archive, you can use a tool such as [7-Zip](#) or Linux commands. The following example uses the Linux `tar` command to create an archive of the directory structure and the `gzip` command to zip the archive.

Before using the `tar` command, change the directory to the directory in which you created the role structure. For example, if you created the role structure in the `/tmp` directory, you must issue the `tar` command from the `/tmp` directory:

```
tar -cvf /tmp/custom_pbs.tar .
./
./preinstall/
./preinstall/tasks/
./preinstall/tasks/main.yml
./postcoreconfigure/
./postcoreconfigure/tasks/
./postcoreconfigure/tasks/main.yml
./postcoreconfigure/vars/
./postcoreconfigure/vars/main.yml
gzip /tmp/custom_pbs.tar
```

The `gzip` command creates a `custom_pbs.tar.gz` file in the `/tmp` directory. If you are using the Installer, move the zipped file to the node hosting your browser so that you can upload it using the Installer upload option.

Installer Options for Custom Playbooks

In the Installer, the custom playbook options appear on the **Version & Services** page under **Advanced Options**. The following screen shows the options that are visible when a playbooks archive file has been uploaded:

Advanced Options

Hide Advanced options

Enable verbose logging ⓘ

Upload Custom Playbooks Archive File ⓘ

Choose File

 No file chosen

Uploaded: custom_pbs.tar.gz 100%

Remove Custom Playbooks ⓘ

Disable Running Of Custom Playbooks ⓘ

To use the options, you select an option and then advance through the Installer menus to complete the Installer task. You can access these options from the following Installer tasks:

- Install
- Incremental Install
- Upgrade Version
- Maintenance Update

Whichever option you select, the Installer obeys the option *every time* you use the Installer for any operation. Therefore, if you select the option to upload a custom playbook, the Installer will run the playbook every time you use the Installer. If you select the option to disable playbooks, playbooks will be disabled until you select a different option. If a value has been set by a custom playbook and you run the same playbook again, the value is left unchanged.

Option	Description
Upload Custom Playbooks Archive File	Uploads a zipped TAR file for your custom playbook to <code>/opt/mapr/installer/data/tmp/custom_playbooks/</code> . The Installer displays the file name of the uploaded archive. An error is displayed if you upload a file that does not have a <code>tgz</code> or <code>tar.gz</code> file extension. The Installer allows you to upload one playbook at a time. If you upload a new playbook when another playbook is already loaded, the previously loaded playbook and its archive are removed, and the new playbook is loaded.
Remove Custom Playbooks	Removes the installed custom playbook and its archive from <code>/opt/mapr/installer/data/tmp/custom_playbooks/</code> . Both the playbook and the directory structure are removed.
Disable Running of Custom Playbooks	Enables you to run the Installer or Installer Stanzas on page 6506 <i>without</i> executing the uploaded custom playbook.

Installer Stanza Parameters for Custom Playbooks

To upload a custom playbook using a Stanza, specify the `cpbs_location` parameter followed by the path to the playbook in quotations. For example:

```
environment:
  mapr_core_version:6.1.0
  #DOC path to tar.gz archive of custom playbooks to be installed
  #DOC to remove the custom playbooks, provide an empty string
  #DOC for the filename, or remove cpbs_location all together
  cpbs_location: "/tmp/custom_plays.tar.gz"
```

To remove a custom playbook using a Stanza, specify an empty string for the file name:

```
environment:
  cpbs_location: ""
  ...
```

Or remove `cpbs_location` from the environment section.

To disable a custom playbook without removing it, set the `custom_pbs_disable` parameter to `true`

```
config:
  #DOC flag to indicate if you want to skip running of installed custom
  playbooks
  custom_pbs_disable: true
```

Troubleshooting Custom Playbook Errors

The Installer loads the custom roles and reports any syntax errors at execution time. The failure of a custom role causes a failure in the Installer operation. If a role has a syntax error, the Installer can show an error like this:

The screenshot shows the 'Installing MapR' progress screen. At the top, a red progress bar indicates 'Install error 100%'. Below it, a message states '0 nodes installed out of 2'. A warning message says '2 nodes did not install correctly. Examine the logs to view warning and error messages.' There are 'Retry' and 'Abort Installation' buttons. Below, two node icons are shown with error messages: 'mfs73.qa.lab' and 'qa-node91.qa.lab'. On the right, a 'Services' list is visible, and a red box highlights the error 'Cannot install' for 'Custom Preinstall playbook hook' under the 'mfs73.qa.lab' node. At the bottom, a progress bar shows steps: Incremental, Databases, Monitoring, Nodes, Verification, Layout, Installation (current), and Complete.

TIP: To view node details in the right pane of the **Installing MapR** screen, you need to select a red node icon on the left.

If the node detail indicates a custom playbook hook error, refer to the Installer Log for more information. Click **Support > View Installer Log**. For example:

Installer Logs

```

=====
Version: 1.12.0.0.2272

2019-04-16 15:54:54.472: * 15:54:54,469: running play Stop all services for Retry/Upgrade
2019-04-16 15:54:58.893: * 15:54:58,890: running play Custom Preinstall playbook hookERROR! Syntax Error whi
mapping values are not allowed here

The error appears to have been in '/opt/mapr/installer/data/tmp/custom_playbooks/preinstall/tasks/main.yml':
be elsewhere in the file depending on the exact syntax problem.

The offending line appears to be:

  name: Install misc stuff - Midnight commander
  vars:
    ^ here
Syntax Error
Exiting with 1
install: python script exited with 1

```

(Clicking the node log provides limited information for syntax errors.) For more information about the Installer logs, see [Logs for the Installer](#) on page 6473.

Using the Retry Button

You have several options for fixing the issue. You can fix any problems by logging on to the Installer node and making changes directly in the playbook files located at `/opt/mapr/installer/data/custom_playbooks`. Then click the **Retry** button in the Installer GUI interface. If you use this method, note that you must eventually propagate any fixes to your original tarball if you want to reuse the tarball.

Using the Abort Installation Button

Another option is to abort the installation and repeat the operation after fixing the error and uploading a corrected playbook. Before using this option, it is important to know that using **Abort Installation** does not remove changes made to the Installer database during the operation that you aborted. After an abort, the Installer can display the desired state rather than the actual state of the nodes.

For example, if you attempted to upgrade a EEP from EEP 6.1.0 to EEP 6.2.0 and then aborted the operation, the Installer can display the currently installed EEP as EEP 6.2.0 even though EEP 6.2.0 has not been installed on the cluster nodes. This condition persists until you rerun the upgrade operation successfully or revert to the last known cluster state by using **Support > Import State**. See [Importing or Exporting the Cluster State](#).

To abort the operation and start over, click **Abort Installation**. A confirmation dialog appears:

Click **OK** to return to the Installer home page. Fix the playbook error and retry the operation.

Extending a Cluster by Adding Nodes

This section describes how to add capacity to a cluster by adding nodes.

About this task

You add nodes to a cluster by using the web-based Installer (version 1.6 or later) or Installer Stanzas. The nodes are added to a pre-existing group *online* without disturbing the running cluster. You can add nodes to on-premise clusters or to cloud-based clusters.

! **IMPORTANT:** After completing these steps, if you added a node to a group containing a CLDB or ZooKeeper, you must also perform the [Post-Expansion Steps for Extending a Cluster](#) on page 6437.

You can add multiple nodes to a group in the same operation, and you can add nodes to custom groups. You can also add the same node to multiple groups. The Installer installs the new nodes with the same patch level as the existing nodes.

📄 **NOTE:** Before adding nodes, use the Installer to ensure that your cluster uses three-digit EEPs. If your cluster uses two-digit EEPs, adding a node can result in a version mismatch between the cluster and the newly added node. To change from two-digit to three-digit EEPs you can perform an **Incremental Install** using the Installer. For more information, see [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

Restrictions

About this task

Note these restrictions for using the **Extend Cluster** operation. When adding nodes:

- The cluster must already be installed before nodes can be added.
- You cannot add a node to a MASTER group, since these services can run only on one node.
- If you add a node to a CONTROL group that has a CLDB, you must do a manual, rolling restart of the entire cluster.
- If you add a node to a group that has OpenTSDB, you must add the same node to the group that contains AsyncHBase (currently, the Installer does not check to ensure that this dependency is met).
- You cannot add services.

- You cannot change the EEP version or Core version.
- You cannot add new service groups.
- New nodes are added automatically to the DEFAULT group.
- A node added to a secure cluster will be configured for security automatically. If the cluster is custom secure, you cannot use the Installer. See [Customizing Security in HPE Ezmeral Data Fabric](#) on page 1870.

Before Adding Nodes

Procedure

1. Determine the group(s) to which new nodes will be added.

You can add nodes to the following types of groups:

- CLIENT
- DATA
- CONTROL
- MULTI_MASTER
- MONITORING_MASTER

NOTE: If you add a node to a group containing a CLDB, you must restart all the nodes except for the new node. If you add a node to a group containing Zookeeper (but not CLDB), you must restart Zookeeper on all the Zookeeper nodes except for the new node. And you must restart the lead Zookeeper last.

To gather information about groups, see [Getting Information About Services and Groups](#) on page 6515.

2. Ensure that the node(s) to be added meet the installation prerequisites described in the [Installer Prerequisites and Guidelines](#) on page 6390.

Adding Nodes Using the Installer Web Interface

Procedure

1. Use a browser to connect to the cluster using the Installer URL:

```
https://<Installer Node hostname/IPaddress>:9443
```

2. On the status screen, click the **Extend Cluster** button. The Installer displays the **Extend Cluster** screen showing the currently configured groups and services.

NOTE: If the **Extend Cluster** button is not visible, you might need to clear your browser cache and refresh the browser page.

3. Specify the nodes to be added:

- **On-Premise Cluster**

In the **Additional Nodes** column, specify the host name(s) or IP address(es) of the nodes to be added. If you are adding multiple nodes, you can specify an array. The following example adds

perfnode132.perf.lab and *perfnode133.perf.lab* to the CONTROL group and *perfnode132.perf.lab* to the MULTI_MASTER group:

Group Name	Services	Nodes	Nodes #	Additional nodes
CONTROL	Zookeeper, CLDB	perfnode134.perf.lab	1	perfnode13[2-3].perf.lab
MULTI_MASTER	Administration Server	perfnode134.perf.lab	1	perfnode132.perf.lab
DEFAULT	Core Services, File Server, NFS	perfnode134.perf.lab	1	

- **Cloud-Based Cluster**

In the **Additional Nodes** column, specify the number of nodes to be added. You do not need to specify the host name or IP address. The following example adds a node to each of the CONTROL, DATA, and CLIENT groups:

Group Name	Services	Nodes	Nodes #	Additional nodes
CONTROL	CLDB, Zookeeper	172.24.11.163, 172.24.9.200, 172.24.9.74	3	1
MULTI_MASTER	Administration Server, YARN Resource Manager	172.24.11.163, 172.24.9.200	2	0
MASTER	Hive WebHCat, Hive Server 2, Hue, Hive Metastore, History Server, HBase Thrift, MySQL, Spark History Server, HTTPS, Oozie	172.24.9.74	1	
DATA	HBase REST, Drill, YARN Node Manager	172.24.11.163, 172.24.9.200, 172.24.9.74	3	1
CLIENT	Spark Client, Hive Client, HBase Client, Async HBase, librdkafka, Streams Java Client	172.24.11.163, 172.24.9.200, 172.24.9.74	3	1
DEFAULT	Core Services, File Server, NFS	172.24.11.163, 172.24.9.200, 172.24.9.74	3	

4. Click **Next**. The Installer checks the nodes to ensure that they are ready for installation and displays the **Authentication** screen.

5. Enter your SSH password and other authentication information as needed, and click **Next**. The installer displays the **Verify Nodes** screen.

NOTE: For a cloud-based cluster, the **Authentication** screen requests information that is specific to the type of cluster (AWS or Azure). Use the tooltips to learn more about the authentication information needed for your cluster.

6. Click a node icon to check the node status and see warnings or error information in the right pane. The node-icon color reflects the installation readiness for each node:

- Green (ready to install)
- Yellow (warning)
- Red (cannot install)

NOTE: If there are warnings or errors, hold your cursor over the warning or error in the right pane to see more information.

IMPORTANT: If node verification fails, try removing the node and retrying the operation. If node verification fails and you abort the installation, you must use the **Import State** command to reset the cluster to the last known state. Otherwise, you will not be able to perform subsequent Installer operations. See [Importing or Exporting the Cluster State](#) on page 6442.

7. When you are satisfied that the nodes are ready to be installed, click **Next**. The Installer adds the nodes. After the nodes are added, you can use the control system to view the nodes in the cluster.
8. Perform any post-expansion steps. Post-expansion steps are necessary only if you added a node to a group containing a CLDB or Zookeeper.

If you added a node to a group containing . . .	Do this
Zookeeper only	One node at a time, stop and restart the Zookeeper service on all Zookeeper nodes, restarting the master Zookeeper node last. You do not need to restart the Zookeeper node that was added. See Post-Expansion Steps for Extending a Cluster on page 6437.
Zookeeper and CLDB or CLDB only	One node at a time, restart all services on all nodes following the order prescribed in Manual Rolling Upgrade Description on page 283. You do not need to restart the node that was added. See Post-Expansion Steps for Extending a Cluster on page 6437.

Adding Nodes Using a Installer Stanza

About this task

To add nodes using a Installer Stanza, you add the `scaled_hosts2:` parameter (on-premise clusters) or the `scaled_count:` parameter (cloud-based clusters) to the Stanza file for the group that you want to scale. Then you run the Stanza using the `install` command. The services contained in the group are configured for the added node.

NOTE: If the group you are trying to scale does not contain the `mapr-core-5.2.x` service, the first group containing `mapr-core-5.2.x` will automatically get scaled.

Procedure

1. In the Stanza file, add the `scaled_hosts2:` or `scaled_count:` parameter:

- **On-Premise Cluster**

Add the `scaled_hosts2` parameter to the group that you want to scale, specifying the host name(s) or IP address(s) of the nodes to be added. In the following example, the `perfnode132.perf.lab` node is added to the CLIENT group:

Stanza Before Scaling	Modified Stanza with <code>scaled_hosts2</code> Parameter (On-Premise Cluster)
<pre>groups: - hosts: - perfnode131.perf.lab label: CLIENT - services: - mapr-spark-client-2.0.1 - mapr-hive-client-1.2 - mapr-hbase-1.1 - mapr-asynchbase-1.7.0 - mapr-kafka-0.9.0</pre>	<pre>groups: - hosts: - perfnode131.perf.lab label: CLIENT scaled_hosts2: - perfnode132.perf.lab - services: - mapr-spark-client-2.0.1 - mapr-hive-client-1.2 - mapr-hbase-1.1 - mapr-asynchbase-1.7.0 - mapr-kafka-0.9.0</pre>

- **Cloud-Based Cluster**

Add the `scaled_count` parameter to the group that you want to scale. Include a number after the parameter to indicate the number of additional nodes to be added to the group. You do not need to specify the host names or IP addresses of the nodes to be added. In the following example, one additional node is added to the CLIENT group:

Stanza Before Scaling	Modified Stanza with <code>scaled_count</code> Parameter (Cloud-Based Cluster)
<pre>groups: - hosts: - perfnode131.perf.lab label: CLIENT - services: - mapr-spark-client-2.0.1 - mapr-hive-client-1.2 - mapr-hbase-1.1 - mapr-asynchbase-1.7.0 - mapr-kafka-0.9.0</pre>	<pre>groups: - hosts: - perfnode131.perf.lab label: CLIENT scaled_count: 1 - services: - mapr-spark-client-2.0.1 - mapr-hive-client-1.2 - mapr-hbase-1.1 - mapr-asynchbase-1.7.0 - mapr-kafka-0.9.0</pre>

2. Run the Stanza file using the `install` command. See [Installing or Upgrading Core Using an Installer Stanza](#) on page 6512. The Installer SDK detects the new `scaled_host(s)` and gives you the option to proceed with the installation or cancel.

3. Perform any post-expansion steps. Post-expansion steps are necessary only if you added a node to group containing a CLDB or Zookeeper.

If you added a node to a group containing . . .	Do this
Zookeeper only	One node at a time, stop and restart the Zookeeper service on all Zookeeper nodes, restarting the master Zookeeper node last. You do not need to restart the Zookeeper node that was added. See Post-Expansion Steps for Extending a Cluster on page 6437.
Zookeeper and CLDB or CLDB only	One node at a time, restart all services on all nodes following the order prescribed in Manual Rolling Upgrade Description on page 283. You do not need to restart the node that was added. See Post-Expansion Steps for Extending a Cluster on page 6437.

Post-Expansion Steps for Extending a Cluster

You must perform post-expansion steps if you added a node to a group containing the CLDB or Zookeeper.

About this task

For more information about extending a cluster, see [Extending a Cluster by Adding Nodes](#) on page 6432.
Restarting Zookeeper Nodes

About this task

If you used the Installer **Extend Cluster** function to add a node to a group containing Zookeeper only, you must restart Zookeeper on all Zookeeper nodes except for the added node.

One node at a time, stop and restart the Zookeeper service on all Zookeeper nodes, restarting the primary Zookeeper node last. Use the following restart steps.

Restarting All Services for Zookeeper and CLDB

About this task

If you used the Installer **Extend Cluster** function to add a node to a group containing Zookeeper and CLDB, or CLDB only, you must restart all services on all nodes.

One node at a time, restart all services on all nodes following the group upgrade order prescribed in [Manual Rolling Upgrade Description](#) on page 283. You do not need to restart the node that was added. Use the restart steps below.

Restart Steps

Procedure

1. Change to the `root` user (or use `sudo` for the following commands).
2. Stop Warden.

```
sudo service mapr-warden stop
```

3. Stop Zookeeper.

```
service mapr-zookeeper stop
```

4. Start the ZooKeeper on nodes where it is installed.

```
service mapr-zookeeper start
```

5. On all nodes, start Warden. Example:

```
service mapr-warden start
```

6. Over a period of time (depending on the cluster size and other factors) the cluster comes up automatically. After the CLDB restarts, there is a 15-minute delay before replication resumes, in order to allow all nodes to register and heartbeat. This delay can be configured using the [config save](#) command to set the `cldb.replication.manager.start.mins` parameter.

Using the Incremental Install Function

Use the Incremental Install function of the web-based Installer to control security, add or upgrade services, upgrade Ecosystem Packs (EEPs), and perform other maintenance functions.

Things You Can Do Using the Incremental Install

About this task

Using the Incremental Install function, you can:

- Enable or disable security by using the **Enable MapR Secure Cluster** option
- Add services that are supported for your current EEP
- Apply a patch
- Delete a service from a cluster by deselecting the service
- Upgrade the Ecosystem Pack (EEP) to upgrade your services
- Change a 2-digit EEP to the equivalent 3-digit EEP (see [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446)

NOTE: Before enabling security using the Incremental Install function, be sure to review the known issue (IN-1084) related to custom certificates. See [MapR Installer Known Issues](#).

You cannot perform the following functions using an Incremental Install:

- Add a node to a cluster
- Delete a node from a cluster
- Upgrade the Core version

Online Versus Offline Operations

About this task

Most **Incremental Install** operations are performed online. However, applying a patch or selecting or deselecting the **Enable MapR Secure Cluster** option are offline operations. See [Using the Enable Secure Cluster Option](#) on page 6419. Making a change to security requires the Installer to stop the Warden and Zookeeper services, bringing the cluster offline temporarily.

Using Incremental Install

Procedure

1. Using a browser, log in to the Installer:

```
https://<Installer Node hostname/IpAddress>:9443
```

2. Click the **Incremental Install** button. The **Version & Services** page appears.

3. Make the desired changes to add or remove security, add or delete services, apply a patch, or upgrade the EEP. Then click **Next**.
4. Advance through the Installer screens, providing the admin password or other information as needed.
5. After the **Incremental Install** finishes, if you added services, use the Control System **Services** tab or the `maprcli service list -node` command to ensure that the services are running. If the services are not running, you might need to restart the nodes. For more information, see [IN-1332 in Installer Known Issues](#) on page 6449.

Enabling or Disabling Metrics Collection or Logging

You can use the Installer to enable or disable metrics collection and logging during a new or incremental installation.

During installation using the Installer, you can configure metrics and logging using settings on the **Monitoring** page of the Installer user interface. Installing the metrics collection infrastructure is selected by default because the control system relies on these metrics to provide graphs and charts. Logging is deselected by default.

If you did not install metrics collection or logging during your initial installation, you can add it later by selecting the feature during an [Incremental Install](#).

If you installed metrics collection or logging during your initial installation but you want to disable it, you can do so by deselecting the feature during an [Incremental Install](#).

NOTE: If you do not install (or choose to uninstall) the metrics collection infrastructure, the control system cannot display graphs and charts.

Using the MapR Subnet and MapR External Advanced Options

Using the Installer advanced options available under Node Configuration, you can restrict the cluster to a subset of network interface cards (NICs) or specify public IP addresses that can be used with the cluster nodes.

Using these options in the Installer has the same effect as manually inserting the `MAPR_SUBNETS` and `MAPR_EXTERNAL` environment variables into the `env_override.sh` file on all nodes.

ATTENTION: The Installer does not validate the functionality of the subnets or IP addresses that you provide. If you provide incorrect values, it is possible for the installation to succeed initially and later develop connectivity issues. For this reason, it is critical that you supply accurate values for the Installer **MapR Subnet** and **MapR External** advanced options.

MapR Subnet

Allows you to set a subnet mask to restrict cluster services to certain interfaces. The values specified in this field are used to populate the `MAPR_SUBNETS` environment variable.

Specify one or more comma-separated subnet masks. For example:

```
10.10.15.0/24,10.10.16.0/24
```

The information on this page is specific to the web-based Installer. To configure the `MAPR_SUBNETS` environment variable for a manual installation, see [Designating NICs for HPE Ezmeral Data Fabric](#) on page 1085.

MapR External

Allows you to specify external IP addresses for the CLDB, file system, and MAST Gateway nodes.

Do NOT use DNS names. Specify a comma-separated list of tuples of host names and external IP addresses. For example:

```
node1:1.1.1.1,node2:1.1.1.2,node3:1.1.1.3
```

The specified node names need to match the host name you specified for the host earlier in Node Configuration. The information on this page is specific to the web-based Installer. To configure the MAPR_SUBNETS environment variable for a manual installation, see [Designating NICs for HPE Ezmeral Data Fabric](#) on page 1085.

Related reference

[Environment Variables](#) on page 2938

Describes the environment variables specific to the HPE Ezmeral Data Fabric.

More information

[Designating NICs for HPE Ezmeral Data Fabric](#) on page 1085

Explains how to assign IP address blocks for HPE Ezmeral Data Fabric.

Online vs. Offline Operations

Most Installer operations are offline operations, meaning that the cluster must be brought down in order to perform the operation. But there are some exceptions.

The following table shows which Installer operations are offline and online:

Offline Operations	Online Operations
Upgrading Core With the Installer on page 276	Using the Incremental Install Function on page 6438*
Performing a Maintenance Update on page 6443	Extending a Cluster by Adding Nodes on page 6432**
Applying a Patch Using the Installer on page 426	
Using the Enable Secure Cluster Option on page 6419	

*Using the **Incremental Install** function to apply a patch or change security settings is an offline operation.

**Adding a node to a CONTROL group requires a manual, rolling restart of the entire cluster.

Starting Up a Cluster Using the Installer Startup Button

You can use a single button to start software on a cluster.

About this task

The **Startup** button is a feature of Installer 1.8 or later. The **Startup** button appears on the status page of the Installer web interface when the cluster is in the shutdown state. The **Startup** button starts Warden and Zookeeper, which in turn start other running services that are part of a cluster.

NOTE: If the **Startup** button is not visible and the **Shutdown** button is present, the cluster is still running and is not in the shutdown state

The **Startup** button works differently depending on your cluster deployment:

Deployment	Startup Button Behavior
On premise	Starts the Zookeeper and Warden services on all nodes.

Deployment	Startup Button Behavior
In the cloud	Starts the virtual machine nodes and then starts Zookeeper and Warden services on all nodes.

To use the **Startup** button:

Procedure

1. For a cluster deployed in the cloud, use the AWS console or the Azure portal to ensure that the nodes are shut down before you try to start them.
2. Use a browser to connect to the cluster using the Installer URL:

```
https://<Installer Node hostname/IPaddress>:9443
```

3. On the status screen, click the **Startup** button. The Installer displays the **Authentication** screen.
4. Enter your authentication information if requested, and click **Startup**. The installer begins the startup process.
5. To shut down software on the cluster, see [Shutting Down a Cluster Using the Installer Shutdown Button](#) on page 6441.

Shutting Down a Cluster Using the Installer Shutdown Button

You can use a single button to shut down software on a cluster.

About this task

The **Shutdown** button appears on the status page of the Installer web interface when you connect to an installed cluster using Installer 1.6 or later. The **Shutdown** button shuts down Warden and Zookeeper, which in turn shut down other running services that are part of a cluster. When you use the **Shutdown** button, the Installer implements the same orderly shutdown used to perform software upgrades.

The **Shutdown** button works differently depending on where the cluster is deployed:

Deployment	Shutdown Button Behavior
On premise	Does not stop non-HPE software and does not power off the nodes.
In the cloud	<p>Shuts down (but does not remove) all the nodes in the cluster:</p> <ul style="list-style-type: none"> • If the installer node is part of the cluster, the installer node is not shut down, but Warden shuts down the services on the installer node. • To shut down the installer node, use AWS-console or Azure-portal commands to stop the instance. <p> CAUTION: If a shutdown is initiated on an AWS cluster using an instance store, all data will be lost.</p>

To use the **Shutdown** button:

Procedure

1. Review [Shutting Down a Cluster](#) on page 1029 for some pre-shutdown steps you may want to perform before shutting down Warden and Zookeeper.

2. Use a browser to connect to the cluster using the Installer URL:

```
https://<Installer Node hostname/IPaddress>:9443
```

3. On the status screen, click the **Shutdown** button. The Installer asks you if you want to continue.
4. Click **OK**. The Installer displays the **Authentication** screen.
5. Enter your authentication information if requested, and click **Shutdown**. The installer begins the shutdown process.
6. To restart software on the cluster, see [Starting Up a Cluster Using the Installer Startup Button](#) on page 6440.

NOTE: Do not attempt to restart the cluster until you have confirmed that it is shut down. For an on-premise cluster, the presence of the **Startup** button on the Installer status page indicates that the cluster is shut down and ready to be started. For a cluster deployed in the cloud, the **Startup** button must be present, *and* you must use the AWS or Azure console to verify that the servers are down before restarting.

Importing or Exporting the Cluster State

You can use the Import State and Export State commands to upload or download a YAML configuration file (a "Stanza") that describes the state of the cluster.

About this task

In the web-based Installer, the **Import State** and **Export State** commands can be useful if you encounter a failure while using the installer and you want to revert to a previous cluster state. You can access these commands from the **Support** menu at the top of the Installer user interface.

Import State	Opens the Cluster State dialog box, which enables you to reset the cluster to the last known state or to a desired state recorded in a YAML configuration file that you specify. You can use the Import State command at any time.
Export State	Downloads a YAML file capturing the current state of the cluster. You can use the Export State command at any time.

For more information about using Installer Stanza files, see [Installer Stanzas](#).

To import the cluster state, follow these steps:

Procedure

1. Using a browser, log in to the Installer:

```
https://<Installer Node hostname/Ipaddress>:9443
```

For more information about the Installer, see [Installer](#) on page 6388.

2. Click **Support > Import State**. The **Cluster State** dialog box appears.
3. Chose *one* of the following options:
 - Click **Reset** to revert the cluster to the last known state. (After a successful installation or Incremental Install using the Installer or Stanzas, the last known state of the cluster is saved to `/opt/mapr/installer/data/last_known_state.yaml`.)
 - Click **Choose File**, select a YAML file, and then click **Reset** to load the YAML file.

What to do next

To export the cluster state, follow these steps:

1. Using a browser, log in to the Installer:

```
https://<Installer Node hostname/Ipaddress>:9443
```

For more information about the Installer, see [Installer](#) on page 6388.

2. Click **Support > Export State**.

The cluster state is downloaded as `stanza.yaml`.

Performing a Maintenance Update

Perform a maintenance update when you want to upgrade to a new patch version of core or apply a patch.

A maintenance update is an update to your installed software that does not require configuration-file changes. Performing a maintenance update has no effect on the ecosystem packages (EEP components). You perform a maintenance update when you want to do either or both of the following:

- **Update to a new patch version of core.** For example, you can perform a maintenance update to change your core version from release 6.1.0 to release 6.1.1. You cannot use a maintenance update to change your core version from a minor version, such as 6.1, to another minor version, such as 6.2. Instead, use the **Version Upgrade** button for minor-version upgrades. The **Version Upgrade** button also permits an upgrade to a patch version of core.
- **Apply a patch.** The **Maintenance Update** page is one of several installer screens that offer the **Patch file** option. See [Applying a Patch Using the Installer](#) on page 426.

You cannot perform a maintenance update if your current EEP version is incompatible with the selected core version. For example, you cannot do a maintenance update from release 6.1.0 and EEP 6.3.0 to release 6.1.1 because EEP 6.3.0 is not compatible with release 6.1.1. For EEP and core compatibility information, see [EEP Support and Lifecycle Status](#) on page 6533.

NOTE: The maintenance update is an offline update (not a rolling update).

You perform a maintenance update using the Installer. To perform a maintenance update:

1. Verify that your installed EEP is supported by the core version you plan to select for the maintenance update. To check your EEP version, see [Checking the EEP Version](#) on page 6407. For EEP and core compatibility information, see [EEP Support and Lifecycle Status](#) on page 6533.
2. Update the Installer to the latest supported version. See [Updating the Installer](#) on page 6403.
3. Prepare the cluster for a maintenance update by referring to one or both of these topics:
 - [Preparing to Upgrade Core](#) on page 271
 - [Verify Cluster Readiness for a Patch](#)
4. Start the Installer. For more information, see [Installer](#) on page 6388.
5. Click the **Maintenance Update** button.
6. Change the core version, or install a core patch, or both.

IMPORTANT: During patch-file installation, do not refresh the browser page while the patch file is being uploaded. Doing so can interrupt the upload process.

7. Click **Next** to complete the update.

Related concepts

[Checking the EEP Version](#) on page 6407

Some Installer operations require you to know the version of the currently installed Ecosystem Pack (EEP). You can check the EEP version easily from within the Installer user interface or derive the EEP version from your repository information.

[Installer Updates](#) on page 6482

Installer updates provide new features or bug fixes.

Related reference

[EEP Support and Lifecycle Status](#) on page 6533

This page shows the EEPs that are supported for different core releases and the current lifecycle status for each EEP.

Auto-Provisioning Templates

Describes the Installer auto-provisioning templates.

Auto-provisioning templates let you select from different provisioning options to address a range of computing requirements. Each template provides a different mix of services and capabilities. You can select the template you need when installing using the Installer web-based interface or Installer Stanzas.

Installer 1.14 provided the following auto-provisioning templates:

Template Names in Installer	Template Name for Stanzas	Description
Batch, interactive and real-time analytics	template-05-converged	Deploys YARN, HPE Ezmeral Data Fabric Database, HPE Ezmeral Data Fabric Streams, Drill, and Spark.
Data Lake: Common Hadoop Services	template-10-hadoop	Provides the most common services deployed in an Apache Hadoop cluster for getting started with a Hadoop data lake. Includes YARN, MapReduce, Spark, and Hive on top of the HPE Ezmeral Data Fabric.
Data Exploration: Interactive SQL with Apache Drill	template-20-drill	Provides services needed for users to perform schema-free interactive exploration of their data, including the Apache Drill SQL engine and the Hive Metastore.
Database for Analytics	template-30-maprddb	Deploys the HPE Ezmeral Data Fabric Database, providing both JSON and binary data models to enable analytic applications to perform in-situ data processing.
Database for Operational Applications	template-30-maprddb2	Deploys the HPE Ezmeral Data Fabric Database, providing both JSON and binary data models to enable operational applications to read and write data at high rates.
Database and Distributed Query Service for Operational Applications	template-30-maprddb3	Deploys the HPE Ezmeral Data Fabric Database, providing both JSON and binary data models to enable operational applications to read and write data at high rates. It also deploys Drill as distributed query service performant distributed query execution.
Real-time Analytics: Apache Spark Streaming including SparkML and GraphX	template-40-maprstreams	Deploys Spark Streaming and HPE Ezmeral Data Fabric Streams for real-time streaming applications.
HPE Ezmeral Data Fabric File Store	template-60-maprxd	Provides common services for HPE Ezmeral Data Fabric File Store (core, filesystem, NFS).
Real-time and batch analytics with Apache Spark on HPE Ezmeral	template-60-spark	Deploys real-time and batch analytics with Apache Spark on data-fabric, including SparkML and GraphX.

Template Names in Installer	Template Name for Stanzas	Description
Data Fabric including SparkML and GraphX		
Custom Services	N/A	Selecting this template allows you to customize the services that are installed. No services are selected by default.

MapR Installer 1.10 Updates to the Auto-Provisioning Templates

The following templates were renamed in MapR Installer 1.10:

Old Name (MapR Installer 1.9)	New Name (MapR Installer 1.10)
MapR Converged Cluster: Batch, interactive and real-time analytics	MapR Data Platform: Batch, interactive and real-time analytics
Analytics with MapR Database	MapR Database (MapR-DB) for Analytics
Operational Applications with MapR Database	MapR Database for Operational Applications
Operational Applications with MapR Database and Distributed Query Service	MapR Database and Distributed Query Service for Operational Applications
File Store: Cloud Scale Data Platform	MapR File System and Object Store (File Store)

For MapR Installer 1.10, these features were added to the MapR File System and Object Store (File Store) template:

- MAST Gateway
- NSFv4

MapR Installer 1.9 Updates to the Auto-Provisioning Templates

For MapR Installer 1.9, the following changes to the auto-provisioning templates were implemented:

- A new auto-provisioning template was added. The **Operational Applications with HPE Ezmeral Data Fabric Database and Distributed Query Service** template includes the MapR DataBase and the OJAI Distributed Query services.

- Other templates were changed to enable the use of Drill as an optional selection with the OJAI Distributed Query Service. The following table compares the contents of the various HPE Ezmeral Data Fabric Database templates:

Template	MapR-DataBase	OJAI Distributed Query Service*	Drill
MapR Converged Cluster: Batch, interactive and real-time analytics	Y	Y	Y
Analytics with HPE Ezmeral Data Fabric Database	Y	Y	Y
Operational Applications with HPE Ezmeral Data Fabric Database	Y	N	N
Operational Applications with HPE Ezmeral Data Fabric Database and Distributed Query Service	Y	Y	N

*Prior to MapR Installer 1.9, this service was called the OJAI Query Service.

Understanding Two-Digit and Three-Digit EEPs

Understanding the differences between the EEP directories on <https://package.ezmeral.hpe.com/releases/MEP/> can help you prevent versioning issues.

To install or update a Ecosystem Pack (EEP), either manually or by using the Installer, you must first choose a EEP version. The EEP version that you choose has a corresponding subdirectory on <https://package.ezmeral.hpe.com/releases/MEP/> from which the ecosystem packages are retrieved.

For each released EEP, the <https://package.ezmeral.hpe.com/releases/MEP/> directory includes both two-digit and three-digit subdirectories:

Index of /releases/MEP

<u>Name</u>	<u>Last modified</u>	<u>Size</u>	<u>Description</u>
 Parent Directory		-	
 MEP-1.0.0/	02-Sep-2016 20:26	-	
 MEP-1.0/	02-Sep-2016 20:26	-	
 MEP-1.1.0/	29-Sep-2016 03:18	-	
 MEP-1.1.1/	13-Dec-2016 19:24	-	
 MEP-1.1.2/	05-Apr-2017 21:25	-	
<hr/>			
 MEP-6.0.2/	28-May-2019 16:26	-	
 MEP-6.0/	28-May-2019 16:26	-	
 MEP-6.1.0/	22-Feb-2019 06:38	-	
 MEP-6.1.1/	28-May-2019 15:55	-	
 MEP-6.1/	28-May-2019 15:55	-	
 MEP-6.2.0/	14-Aug-2019 19:30	-	
 MEP-6.2/	14-Aug-2019 19:30	-	
 MEP-6.3.0/	13-Dec-2019 00:12	-	
 MEP-6.3.1/	17-Sep-2020 08:44	-	
 MEP-6.3.2/	02-Feb-2021 05:35	-	
 MEP-6.3.3/	23-Mar-2021 20:49	-	
 MEP-6.3.4/	01-Jun-2021 16:04	-	
 MEP-6.3/	01-Jun-2021 16:04	-	
 MEP-7.0.0/	17-Sep-2020 07:51	-	
 MEP-7.0.1/	02-Feb-2021 05:37	-	
 MEP-7.0/	02-Feb-2021 05:37	-	
 MEP-7.1.0/	01-Jun-2021 16:08	-	
 MEP-7.1/	01-Jun-2021 16:08	-	

The following table compares the two-digit and three-digit subdirectories and describes how they are used:

EEP Subdirectory	Example	Continuously Updated?	Description
Two-digit	MEP-3.0/	Yes	<p>Subdirectories using two digits (for example, MEP-3.0) contain the latest EEP and patches and are continuously updated. For example, if you select EEP 3.0 when using the Installer, the installer installs or upgrades your cluster with the packages from the most current version of EEP 3.0.x. If the most current version is EEP 3.0.1, EEP 3.0.1 is installed. If the most current version is EEP 3.0.2, EEP 3.0.2 is installed, and so on.</p> <p>If you later decide to make changes to the cluster, the Installer applies the packages from the most current version, which can be different from the version you installed originally.</p> <p>Two-digit EEP version numbers make new patches available automatically without the need for system reconfiguration.</p>
Three-digit	MEP-3.0.0/	No	<p>Subdirectories using three digits contain a fixed EEP version, including patches, and are not continuously updated. For example, if you select EEP 3.0.0 when using the Installer, the installer uses the packages from the MEP-3.0.0 subdirectory and continues to use the MEP-3.0.0 subdirectory until you change the specified EEP version.</p> <p>Three-digit EEP version numbers ensure that your cluster uses only the specified EEP version. They are best for users who install software manually and do not require automatic updates.</p>

MapR Installer Use of Two-Digit and Three-Digit EEPs

Installer version 1.5 automatically uses two-digit EEPs. Installer versions 1.6 and later use three-digit EEP versions and do not allow you to select two-digit EEPs.

Upgrades from Installer 1.5 to 1.6 or later

If you upgrade the Installer from version 1.5 to a later version, you see both two-digit and three-digit EEPs in the EEP drop-down list for an Incremental Install. The two-digit EEPs continue to operate as they did previously, installing the latest three-digit EEP with the same first two digits. The three-digit EEPs operate as described earlier on this page. Installer version 1.7 displays and supports only three-digit EEPs.

NOTE: If your cluster uses two-digit EEPs, recommends that you upgrade to three-digit EEPs as soon as it is convenient to do so. Doing so enables you to use new features such as the "Extend Cluster" feature without introducing EEP version inconsistencies. You can upgrade by [performing an Incremental Install](#) and selecting a three-digit EEP.

Related concepts

[Installer Updates](#) on page 6482

Installer updates provide new features or bug fixes.

Related tasks

[Checking the Installer Version](#) on page 6406

Some Installer features require you to use the latest version of the Installer. You can check the Installer version easily from within the user interface.

Uninstalling Software Using the Installer Uninstall Button

You can use a single button to uninstall data-fabric software on all nodes in the cluster.

About this task

The **Uninstall** button appears on the status page of the Installer web interface when you connect to an installed cluster. The **Uninstall** button removes data-fabric software (but does not remove the Installer) from all nodes in the cluster.

NOTE: You can also use Installer Stanzas to uninstall software. See [Uninstalling Core Using an Installer Stanza](#) on page 6514.

To use the **Uninstall** button:

Procedure

1. Use a browser to connect to the cluster using the Installer URL:

```
https://<Installer Node hostname/IPaddress>:9443
```

2. On the status screen, click the **Uninstall** button. The Installer displays the **Uninstall** screen.
3. Enter your SSH password and other authentication information as needed, and click **Next**. The installer begins the uninstall process.

Installer Troubleshooting

This section describes how to identify and solve problems when you use the Installer.

Installer Known Issues

This topic describes some Installer known issues that you should be aware of while troubleshooting.

If you are viewing this page from within the Installer application, click [here](#) to display the information in a browser.

IN-3362

EEP 9.1.1 is supported for use with core 7.2.0 or core 7.3.0. But the Installer cannot install EEP 9.1.1 on core 7.2.0 because EEP 9.1.1 includes Data Access Gateway 6.0.0, which is not supported on core 7.2.0.

Workaround: To use EEP 9.1.1 with core 7.2.0, you must install Data Access Gateway 5.1.0 (and not Data Access Gateway 6.0.0), and you must perform the installation or upgrade using manual steps.

IN-3240

The probe command can fail in releases 7.1.0 and 7.2.0. For example:

```
$ /opt/mapr/installer/bin/
mapr-installer-cli probe -nv -o
config.hosts='["node1.cluster.com"]'
config.ssh_id=root
config.ssh_password=**** > /home/
mapr/probe.yaml
MapR Installer SDK
Logging in to localhost
/opt/mapr/installer/build/
installer/lib/python2.7/site-packages/
ansible/parsing/vault/init.py:44:
CryptographyDeprecationWarning:
Python 2 is no
longer supported by the
Python core team. Support for it is
now deprecated in cryptography, and
will be removed in the next release.
```

```

from cryptography.exceptions
import InvalidSignature
69504 1675179955.19489:
become_pass = None
69504 1675179955.19497:
remote_pass = mapr
69504 1675179955.19500: become = None
69504 1675179955.19503:
become_method = None
69504 1675179955.19504:

properties.json does not
contain vault_password,
assuming vault does not exist
ERROR: probe command failed
'Options' object has
no attribute 'manifest'
Log files mapr-installer.log
and installer-cli.log can
be found at /opt/mapr/installer/logs

```

Workaround: None.

IN-3223

Because of an overwrite condition made possible by the presence of the new `mapr-ranger-usersync` package in EEP 9.1.0, the Installer fails to install or upgrade Ranger in the following use cases:

- A new installation of EEP 9.1.0 with the Ranger service selected.
- An incremental installation of EEP 9.1.0 to add the Ranger service.
- An upgrade to release 7.2.0 and EEP 9.1.0 from a cluster where the Ranger service was installed.

The issue affects only Ubuntu installations and is caused by RAN-260.

Workaround: Install the Ranger service manually by using `dpkg` and the `--force-overwrite` flag. See the RAN-260 known issue in [Ranger 2.3.0.100 - 2301 \(EEP 9.1.0\) Release Notes](#) on page 7427.

IN-3183

Using the Installer to install release 7.0.0 and EEP 8.1.0 with `mapr-patch-7.0.0.6` on Rocky Linux 8.5 fails during security configuration. Logs indicate that the `private.key` and `public.crt` files are missing.

Workaround: To enable the installation to succeed:

1. Install the release 7.0.0 cluster without the patch.
2. Perform a maintenance update to apply the patch. For more information, see [Performing a Maintenance Update](#) on page 6443.

IN-2934

You may receive the following error message while running Installer on Ubuntu v1.16.0.1 or earlier versions:

```
Installing installer packages...

Executing: /tmp/tmp.ROkwOhfN5p/
gpg.1.sh -q
--keyserver-options
http-proxy=http://
web-proxy.corp.hpecorp.net:8080
--fetch-keys
https://package.ezmeral.hpe.com/
releases/pub/maprgpg.key
gpgkeys: protocol
`https' not supported
gpg: no handler
for keyserver scheme `https'
gpg: WARNING: unable to fetch
URI https://package.ezmeral.hpe.com/
releases/pub/maprgpg.key: keyserver
error

ERROR: Could not import repo
key https://package.ezmeral.hpe.com/
releases/pub/maprgpg.key
```

This error occurs because HTTPS protocols are not supported. This known issue affects Ubuntu v1.16.0.1 and earlier versions, in addition to version 1.17.0.0.

Workaround: To work around this issue, you must install the `gnupg-curl` package before installing the Installer, as this package is a dependency to successfully installing the Installer under this scenario. To do so, do one of the following:

- Install the `gnupg-curl` package using `mapr-setup.sh`:

```
mapr-setup.sh -r http://
package.ezmeral.hpe.com/releases/
```

- Update and then install the `gnupg-curl` package on Ubuntu 16.x:

```
sudo apt-get update
```

```
sudo apt-get install gnupg-curl
```

IN-3120

A previously installed cluster disappears from the Installer graphical user interface, and the following error appears when you try to update the `mapr-setup.sh` Installer script:

```
ERROR : import command failed
```

This issue affects Installer 1.17.0.3.

Workaround: This issue is fixed in Installer 1.18.0.0 and later. To work around this issue, you can upgrade

to Installer 1.18.0.0 or use either of the following workarounds:

- Fix the state of the cluster after the update:
 1. On the Installer node, export the cluster state by using one of these methods:
 - Use an Installer Stanza CLI command line. See [Exporting a Cluster Configuration](#) on page 6514.
 - Use the Installer interface to export the cluster state. See [Importing or Exporting the Cluster State](#) on page 6442.
 2. Update the Installer via `mapr-setup.sh`. See [Updating the Installer](#) on page 6403.
 3. Use one of the following methods to import the cluster state:
 - Use an Installer Stanza CLI command line. See [Using probe and import to Generate the Installer Database](#) on page 6479.
 - Use the Installer interface. See [Importing or Exporting the Cluster State](#) on page 6442..
- Download a new Installer version on another host, and import the cluster state:
 1. On the currently installed Installer node, export the cluster state by using one of these methods:
 - Use an Installer Stanza CLI command line. See [Exporting a Cluster Configuration](#) on page 6514.
 - Use the Installer interface to export the cluster state. See [Importing or Exporting the Cluster State](#) on page 6442.
 2. Install the new Installer version on any other node of the cluster that satisfies the Installer prerequisites. See [Installer Prerequisites and Guidelines](#) on page 6390.
 3. On the new Installer node, use one of the following methods to import the cluster state:
 - Use an Installer Stanza CLI command line. See [Using probe and import to Generate the Installer Database](#) on page 6479.
 - Use the Installer interface. See [Importing or Exporting the Cluster State](#) on page 6442.

IN-3053

On HPE Ezmeral Data Fabric 7.0.0, `update_services.yml` fails with the following error message:

```
Unable to retrieve file contents
Could not find or access '/opt/
mapr/installer/mapr_ansible/playbooks/
```

```
configure_master.yml' on the Ansible
Controller.
```

Workaround: Run the following command to update the `update_services.yml` file:

```
sed -i 's/configure_master.yml/
configure_security_controller.yml/g'
/opt/mapr/installer/mapr_ansible/
playbooks/update_services.yml
```

IN-2985

When you install Data Fabric on Ubuntu 20.04 with Python 2 specified as the default Python package, and you choose the option to install the mysql server, the installation can fail with the following message:

```
No package matching 'python-mysqldb'
is available
```

The installation fails because Ansible is missing a dependency for communicating with MySQL.

Workaround: On the Installer node, set an option in the `ansible.cfg` file to force Ansible to use Python 3. For example, set the following option:

```
interpreter_python = /usr/bin/python3
```

Then rerun the installation.

IN-3016

On Installer 1.16 and earlier, clicking **Abort** during the **Extend Cluster** operation returns you to the verification page and does not reset the Installer database back to its initial state.

(Note that on Installer 1.17 and later, clicking **Abort** resets the Installer database automatically so that you can retry the operation.)

Workaround: On Installer 1.16 and earlier, use these steps to reset the Installer database manually and retry the **Extend Cluster** operation:

1. Click **Support > Reset Installer**. This command uninstalls the metadata from the Installer database. For more information, see [Resetting the Installer Database](#) on page 6480.
2. Click **Support > Import State**. The **Cluster State** dialog box appears, enabling you to reset the cluster to the last known state. For more information, see [Importing or Exporting the Cluster State](#) on page 6442.
3. Click **Reset** to recover the Installer to the last known state and return to the Installer home page.
4. If necessary, retry the **Extend Cluster** operation.

IN-3007

During a multinode installation of core 6.2 on SLES 15 SP2, the Installer returns the following error:

```
"msg": "user {{ ssh_id }} does
not have the ability to elevate
privileges - check for correct
sudoers config for example"
```

This issue can occur when Python is not installed on all cluster nodes.

Workaround: Check to ensure that Python is installed on all cluster nodes. Install Python, if it is not already installed.

IN-2924

Upon restart, cluster nodes running Loopback NFS do not remount `/mapr`. This issue can occur when using Installer 1.16.0.0 to perform a new or incremental installation. The issue is caused by a missing symlink.

Workaround: Manually create a symlink from `/usr/local/mapr-loopbacknfs/conf/mapr_fstab` to `/opt/mapr/conf/mapr_fstab`, and use the following commands to restart NFS and mount `/mapr`:

1. Restart the Loopback NFS service:

```
maprcli node services -nodes <node
names> -nfs restart
```

2. Run the `mount_local_fs.pl` script to mount `/mapr`:

```
/opt/mapr/bin/mount_local_fs.pl
```

IN-2397

The Verify phase of the Installer can fail if the `authorized_keys` file contains a command such as the following:

```
no-port-forwarding,no-agent-forwarding
,no-X11-forwarding,command="echo
'Please login as the user \"admin\"
rather than the user
\"root\".';echo;sleep 10" ssh-rsa ...
```

Any command in the `authorized_keys` file prevents the Installer from authenticating with remote nodes.

Workaround: Verify that the `authorized_keys` file does not contain commands that prevent the Installer from authenticating with remote nodes. In addition, if you are using keys for remote authentication, you must ensure that you can ssh into all nodes in the cluster using the user and password that you specified when you configured remote authentication.

IN-2500

After a new installation, the Installer home page displays two YARN ResourceManager links, but one of the links does not work.

Workaround: This is normal. Click the YARN ResourceManager links until you find the link that works. Even if the ResourceManager is installed on

SPYG-1136

multiple nodes, the YARN ResourceManager only has one server running at a time, . If the running ResourceManager fails, a new ResourceManager is started on one of the other nodes.

During a manual installation or upgrade, Collectd provided in core 6.1.0 won't start on RHEL / CentOS 8.2 because it expects the Python 2 libraries to be installed, and RHEL / CentOS 8.2 provides the Python 3 libraries instead. This issue does not affect installations or upgrades performed using the Installer.

Workaround: Before installing the monitoring components, check to see if Python 2 is installed. If the following error is generated, try installing Python 2 on RHEL / CentOS 8.2:

```
failed: libpython2.7.so.1.0: cannot
open shared object file
```

IN-2637

After a manual installation, Oozie and Hive services can fail to connect to a MySQL or MariaDB database because the server time-zone value is unrecognized or represents more than one time zone. The issue affects your installation if you applied the `mapr-patch` released on or after February 21, 2021 (including the latest `mapr-patch`). This issue affects manual installations but is fixed in Installer 1.14.0.0.

Workaround: For manual installations, you must configure either the server or JDBC driver (using the `serverTimezone` configuration property) to use a more specific time-zone value if you want to utilize time-zone support. After running `configure.sh` but before starting the Oozie or Hive services, update the `serverTimezone` parameter in the `hive-site.xml` or `oozie-site.xml`. For more information, see MySQL Bug #[95036](#).

IN-2935

On RHEL or CentOS 8.3, new installations using the Installer can fail with the following error message:

```
mount.nfs: access denied by server
while mounting localhost:/mapr
```

This happens when the Installer cannot start the `mapr-loopbacknfs` service because the RHEL or CentOS NFS/NFS4 service is running.

Workaround: Edit the `/etc/systemd/system/mapr-loopbacknfs.service` file to add the following `Conflicts` directive to the `nfs-mountd.service`:

```
[Unit]
Description=MapR Technologies, Inc.
loopbacknfs service
After=rc-local.service
After=network.target syslog.target
Conflicts=nfs-mountd.service
```

The `Conflicts` command stops `nfs-mountd` before installation so it cannot interfere with starting `mapr-loopbacknfs`. After editing the

`loopbacknfs.service` file, perform a daemon reload using the following command, and then retry the installation:

```
systemctl daemon-reload
```

IN-2947

For Installer 1.16.0 on Ubuntu 18.04, the **Extend Cluster** operation fails for clusters larger than three nodes. The operation fails on nodes where ZooKeeper is not installed. The failure occurs because the Installer attempts to update the ZooKeeper service file on a node that has no roles file for ZooKeeper.

Workaround: Make sure ZooKeeper is running on every node in the cluster, and retry the **Extend Cluster** operation.

ES-77, FLUD-55

During an upgrade from EEP 6.x to EEP 7.0.0 or EEP 7.0.1, some monitoring components do not get updated because of an error in the fourth digit of the package version. This issue can occur during manual upgrades or upgrades performed using the Installer. The affected components can include any or all of the following:

- Elasticsearch
- Fluentd
- Grafana
- Kibana

Workaround: See [Reinstalling Monitoring Components After an Upgrade](#) in the data-fabric documentation.

IN-1976

During a version upgrade from core 6.0.1 and EEP 5.0.x to a later version of core, the upgrade succeeds, but the following error message is generated:

```
This version of Kibana requires
Elasticsearch v6.2.3 on all
nodes. I found the following
incompatible nodes in your
cluster: v5.4.1 @ 10.10.103.231:9200
(10.10.103.231), v5.4.1 @
10.10.102.21:9200 (10.10.102.21), v5.4.1
@ 10.10.103.230:9200 (10.10.103.230)
```

This happens because the Elasticsearch package script does not remove Elasticsearch completely and does not shut it down. Even though a new version of Elasticsearch is installed, the old version is still running and using the port needed by the new version.

Workaround:

1. Use the `jps` command to find the process for the old Elasticsearch.
2. Use `kill -9` to shut down the old Elasticsearch process. Warden will restart the newly installed Elasticsearch.

IN-2742

A `configure.sh` operation can hang because of a system control hang if you try to install on top of a "minimal" operating system installation and the RDMA RPM or service is not present. This issue can occur during manual installations or during installations using the Installer.

Workaround: Before running `configure.sh`, use one of the following workarounds:

Workaround #1 - Install the missing RDMA Dependencies

- **RHEL / CentOS**

1. Install `libibverbs`:

```
yum
install
libibverbs
```

2. Enable and start the RDMA service:

```
systemctl
enable
rdma &&
systemctl
start rdma
```

3. Retry the HPE Ezmeral Data Fabric installation.

- **Ubuntu 18**

1. Install the `rdma-core` package:

```
apt-get
install
rdma-core
```

2. Install `libibverbs1`:

```
apt-get
install
libibverbs1
```

3. Enable and start the RDMA service:

```
systemctl
enable
iwpmc &&
systemctl
start iwpmc
```

4. Retry the installation.

- **Ubuntu 16**

Release 6.2 does not provide RDMA support for Ubuntu 16 because Ubuntu 16 does not have the `rdma-core` package.

Workaround #2 - Disable RDMA Support

1. Rename `/opt/mapr/lib/libibverbs.so`. For example:

```
mv /opt/
mapr/lib/
libibverbs.so
/opt/mapr/
libibverbs.so
.sv
```

2. Restart the ZooKeeper and Warden nodes.

Workaround #3 - Install the Latest Core Patch

The latest patch contains the `export MAPR_RDMA_SUPPORT=false` environment variable, which removes RDMA support. For patch information, see "Downloading a Patch" in the `data-fabric` documentation.

IN-2784 & MFS-11853

Stopping a cluster by stopping ZooKeeper and Warden can cause clients that are accessing the file system through POSIX (for example, the S3 gateway) to hang if Loopback NFS is installed on a cluster node and is not stopped first. Note that beginning with Installer 1.15, the Installer installs Loopback NFS on all cluster nodes unless NFS is enabled.

Workaround: If Loopback NFS is running and you need to stop the cluster, you must first unmount `/mapr` and stop Loopback NFS on all nodes. Then, you can stop ZooKeeper and Warden. For more information,

see "Managing the mapr-loopbacknfs Service" in the data-fabric documentation.

IN-1343

In a new installation of six nodes or more using the Installer, if only data nodes fail to install, retrying the installation can fail.

Workaround: Use the Installer uninstall feature, and retry the installation from scratch. See "Uninstalling Software Using the Installer Uninstall Button" in the data-fabric documentation.

IN-2132

On a SLES cluster, using Installer version 1.10 or earlier of the `mapr-setup.sh` script can complete successfully even if `sshpas` is not installed.

Workaround: Upgrade to the latest Installer. You must use version 1.11 or later of the `mapr-setup.sh` script. If you cannot use Installer version 1.11 or later of the `mapr-setup.sh` script, install `sshpas` before running the `mapr-setup.sh` script on a SLES cluster.

IN-2008

When you upgrade from a secure 6.0.0 cluster to 6.0.1 using Installer 1.9, a security certificate for log monitoring is overwritten. As a result, Elasticsearch can fail to start after the upgrade. This issue is not present during a new installation of 6.0.0 or 6.0.1 or during an upgrade to 6.1.0. This issue is fixed in Installer 1.10 and later.

Workaround: To resolve the issue, you must remove the `.keystore_password` file, re-run the command to generate new Elasticsearch certificates, and then re-distribute the certificates. Use these steps:

1. Remove or rename the `.keystore_password` file. For example:

```
rm /opt/mapr/elasticsearch/
elasticsearch-x.x.x/etc/
elasticsearch/.keystore_password
```

2. Perform steps 3 through 7 of "Step 9: Install Log Monitoring" in the data-fabric documentation. Completing steps 3 through 7 regenerates the Elasticsearch certificates and copies them to the other nodes.

IN-2443

An internal server error that includes a `NullPointerException` can be generated if you install a cluster on Ubuntu 16 using a Installer Stanza. The error appears if Hive is installed but no password for Hive is included in the `.yaml` installation file.

Workaround: Add the Hive password to the `.yaml` installation file and re-run the Stanza.

IN-18

When using the `-v` or `--verbose` options with Installer Stanzas, detailed error information is not provided on the command line. For example, if a `mapr` user or group is not present on a host during a new installation, the `mapr-installer-cli` reports "Verification Error" on the command line.

IN-2200

Workaround: To view more detailed error information when using the `-v` or `--verbose` options, check the `installer-cli.log[.x]` file after running the Stanza. For information about the Installer logs, see "Logs for the Installer" in the data-fabric documentation.

Deploying a release 6.0.1 cluster on AWS fails when the following parameters are specified:

- `diskType: io1`
- `installerOnitsOwn: false`

Workaround: Try using a `diskType` of `gp2` (general-purpose SSD) instead of `io1` (provisioned IOPs SSD), or set `InstallerOnitsOwn` to `false` instead of `true`. Then retry the deployment.

IN-2152

During a Installer upgrade from any release to 6.0.1, core files can be generated for ecosystem components, which can cause alarms in the Control System following the upgrade. This happens because the upgrade sequence shuts down the cluster, then upgrades Core packages, and then restarts Core. Restarting Core is necessary to upgrade some ecosystem components. When the old ecosystem components are started, version incompatibilities with the new version of Core can cause core dumps. This is a temporary issue. Upgrading the ecosystem component, which happens later in the upgrade process, resolves the issue. The issue does not exist in 6.1 and later releases, which have the ability to prevent services from restarting during an upgrade.

Workaround: Ignore the Control System alarms, or upgrade to 6.1 or later, which should not generate core alarms.

IN-1940

In Installer versions 1.9 and earlier, the `probe` command can fail because of a runtime error if you have installed the Operational Applications with HPE Ezmeral Data Fabric Database template. The error is caused by the presence of the `mapr-drill-internal` package. Any node running the Data Access Gateway requires the `mapr-drill-internal` package to be installed even though Drill is not installed as a service. The `mapr-drill-internal` package provides a set of client libraries used by the Data Access Gateway.

Workaround: Before using the `probe` command, update the Installer. The `probe` command is fixed in versions 1.10 and later.

IN-1635

In Installer Stanza versions 1.9 and earlier, the `probe` command was hard coded with a cluster admin user of `mapr`. If you configured a cluster admin user other than `mapr`, the `probe`-generated YAML file could not be imported using the `import` command.

Workaround: Before using the `probe` command, update the Installer to version 1.10 or later. Or, if you must use version 1.9 or earlier, edit the `probe`-generated YAML file to specify the correct cluster admin user.

IN-2123

In a secure cluster, the **Extend Cluster** operation fails if you try to extend the control group. The new control node cannot join the cluster because it inadvertently receives a new set of keys. This issue affects versions 1.7 through 1.10 of the Installer and is fixed in Installer 1.10.0.201812181130 and later versions.

Workaround: You can resolve the issue by manually copying `mapruserticket` into the `/opt/mapr/conf` directory of the node to be added to the cluster.

IN-2141

The following issue applies to Installer versions 1.7 through 1.10, but not all 1.10 versions. The issue is fixed in Installer 1.10.0.201812181130 and later versions.

An extend cluster (add node) operation can fail when you:

1. Install a 6.x cluster manually with security enabled.
2. Run the Installer Stanza `probe` command on the cluster or on a node to be added to the cluster.
3. Use the `import` command to import the `probe .yaml` file into the Installer.
4. Perform an extend cluster operation immediately after the `import` operation.

The extend cluster operation fails because keystore, truststore, and server ticket (`maprserverticket`) files are not present on the installer node.

Workaround:

Before attempting the extend cluster operation, copy the keystore, truststore, and server ticket (`maprserverticket`) files from any CLDB node to `/opt/mapr/installer/data/tmp` on the installer node. The files that need to be copied are:

- `cldb.key`
- `dare.master.key*`
- `maprserverticket`
- `ssl_keystore`
- `ssl_keystore.p12`
- `ssl_keystore.pem`
- `ssl_truststore`
- `ssl_truststore.p12`
- `ssl_truststore.pem`

*The DARE primary key is required only if DARE is enabled.

If metrics monitoring is configured on the cluster, you must also copy the tickets related to Fluentd, Kibana, and Elasticsearch to the same location.

IN-2217

During an upgrade to EEP 6.1.0 using the Installer, the Installer does not back up the Drill `conf`, `log`, and `jar` directories into `${MAPR_HOME}/drill/OLD_DRILL_VERSIONS`. This can happen when you upgrade Drill from an old version (for example, Drill 1.10 in EEP 3.0) to Drill 1.15.0.0 in EEP 6.1.0.

Recent packaging changes in Drill contribute to this issue. Drill 1.10 consists only of `mapr-drill-1.10` (role and binaries), whereas Drill 1.15.0.0 consists of `mapr-drill-1.15` (roles) and `mapr-drill-internal-1.15` (binaries). During the upgrade, the `mapr-drill-1.10` binaries are successfully uninstalled, but the `OLD_DRILL_VERSIONS` directory that is needed to back up Drill 1.10 is not created.

Workaround:

Before upgrading, perform the following steps:

1. Shut down the `mapr-drill-1.10` Drillbits.

```
maprccli node services -name
drill-bits -action stop -nodes
<node hostnames separated by a
space>
```

2. Create `${MAPR_HOME}/drill/OLD_DRILL_VERSIONS/drill-1.10`.
3. Copy the following directories of `mapr-drill-1.10` into the `OLD_DRILL_VERSIONS` directory:
 - a. Copy the `conf` directory to `${MAPR_HOME}/drill/OLD_DRILL_VERSIONS/drill-1.10.0/conf`.
 - b. Copy the `logs` directory to `${MAPR_HOME}/drill/OLD_DRILL_VERSIONS/drill-1.10.0/logs`.
 - c. Copy the `jars/3rdparty` directory to `${MAPR_HOME}/drill/OLD_DRILL_VERSIONS/drill-1.10.0/jars`.
4. Proceed with the upgrade.
5. After successfully upgrading and starting `mapr-drill-1.15.0.0`, you may remove the `${MAPR_HOME}/drill/drill-1.10.0` directory.

IN-1915

During an upgrade using the Installer, refreshing the browser page can cause the Installer to forget upgrade parameters that were specified before the refresh.

Workaround: Avoid refreshing the browser page during an upgrade operation. If you must refresh the page, go back to the first page of the upgrade operation and start over again to ensure that the

IN-2035

Installer has the correct parameters before it begins the Verify phase of the upgrade.

During a version upgrade using the Installer, if you select the **Advanced Configuration** button and then click **Previous** (one or more times) followed by **Abort**, the Installer can indicate that the upgrade completed even though the upgrade was aborted.

Workaround:

If this happens, you must reset the installer and reload the last known state. Follow these steps to reset the cluster state:

1. Click **Support > Reset Installer**. A warning screen appears.
2. Click **OK**.
3. Click **Support > Import State**.
4. Click **Reset** to recover the cluster to the last known state. It is safe to retry the upgrade at this point.

For more information about the **Reset Installer** and **Import State** commands, see "Resetting the Installer Database" and "Importing or Exporting the Cluster State" in the data-fabric documentation.

IN-2065

`/mapr` sometimes does not get mounted after you enable NFS (v3 or v4) using the Installer Incremental Install function. The Incremental Install function is an online operation. Enabling NFS using an Incremental Install can create a race condition between when the `mapr_fstab` file gets created and NFS is started by Warden. If NFS is started by Warden before the `mapr_fstab` file is created, `/mapr` does not get mounted.

Workaround:

If `/mapr` is not mounted, check the time stamp of the `/opt/mapr/conf/mapr_fstab` file to see if it is older than the time stamp in the `warden.log` file for starting NFS. For example:

```
[root@atsqa4-61 logs]# ls -ld /opt/
mapr/conf/fstab
rw-r-- 1 mapr mapr 39 Sep 26
11:31 /opt/mapr/conf/mapr_fstab

[root@atsqa4-61 logs]# fgrep starting
warden.log | fgrep nfs
2018-09-26 11:29:33,407 INFO
com.mapr.warden.service.baseservice.Se
rvice
[Thread-34]: -----Service is
starting for: nfs4
```

If the time stamp of the `mapr_fstab` file is older than the Warden time stamp:

1. Restart the NFS service:

```
maprcli node services -nodes <node
names> -nfs4 start
```

2. Run the `mount_local_fs.pl` script to mount /mapr:

```
/opt/mapr/bin/mount_local_fs.pl
```

INFO-420

The procedure for configuring storage using `disksetup` does not work for new installations of DARE-enabled 6.1 clusters. With DARE enabled, `disksetup` fails on any node that is not a CLDB node because there is no local copy of the `dare.master.key` file. When you use `disksetup`, non-CLDB nodes try to contact the CLDB, which must be running when the nodes attempt contact.

Workaround:

After running `configure.sh`, you must:

1. Format the disks on the CLDB nodes.
2. Start ZooKeeper on the ZooKeeper nodes.
3. Start Warden on the CLDB nodes.
4. Format the remaining node disks using `disksetup`.
5. Start Warden on the remaining nodes.

IN-2057

A fresh install of 6.0.0 using the `sample_advanced.yaml` file for Installer Stanzas (Installer version 1.9) can fail with the following error message:

```
ERROR: install command failed
Service mapr-data-access-gateway must
be a member of a template group.
Configured services require it:
['mapr-data-access-gateway']
```

The error is generated because the `.yaml` file is missing an entry for the `mapr-data-access-gateway` in the MASTER services section. The `mapr-data-access-gateway` service is needed for HPE Ezmeral Data Fabric Database installations.

Workaround:

In the MASTER services section of the `sample_advanced.yaml` file, add `mapr-data-access-gateway` to at least one of the host groups, and retry the installation.

IN-1272

During an upgrade to 6.0 or later (Drill 1.11), `configure.sh` sometimes fails to disable the storage plugin for HBase. The HBase server is not supported

in Core 6.0 or later, so the HBase storage plugin should be disabled before a cluster is upgraded to 6.0 or later. Otherwise, Drill queries against HBase will hang.

Workaround:

Before upgrading to Drill 1.11 or later, manually disable the HBase storage plug-in. To manually disable the plug-in, you can use the Drill Web Console or Drill REST API commands. You can disable the HBase storage plugin on the **Storage** page of the Drill Web Console at `http(s)://<drill-hostname>:8047`. For more information, see this page:

```
https://drill.apache.org/docs/rest-api-introduction/#delete-storage/{name}.json
```

IN-1747

If you use the Installer 1.10 **Uninstall** button to uninstall software and a node is unreachable, you will not be able to uninstall the node later when the node is reachable.

Workaround:

Uninstall the software on the node manually. See "Decommissioning a Node and Uninstalling Data Fabric Software from the Command-line" in the data-fabric documentation.

IN-2015

A fresh install of 6.0.0 with EEP 4.1.1 using Installer 1.9 can fail with the following error message:

```
file not found: /opt/mapr/elasticsearch/elasticsearch-5.4.1/etc/elasticsearch/sg/admin-usr-clientCombo.pem
```

Workaround: Update the Installer to version 1.10 or later, and retry the operation.

IN-2018

Logging on to Kibana results in an authentication failure. This can happen on a CentOS cluster if you use Installer 1.10 to install 6.0.1 EEP 5.0.0, and then upgrade to 6.1.0 and EEP 6.0.0.

Workaround: Try using Installer 1.9 to install the 6.0.1 cluster and Installer 1.10 to upgrade the cluster. See "Updating the Installer" in the data-fabric documentation.

CORE-150

After using the **Incremental Install** function of the Installer to apply security to an Azure-based 6.1.0 cluster, the Hue and Spark-thrift server links are not accessible in the Installer interface. This issue can occur on an Azure-provisioned cluster whose internal DNS suffix starts with a number rather than a letter.

Workaround: Re-create the cluster in Azure so that the internal DNS suffix starts with a letter and not a number.

IN-2025

The **Extend Cluster** operation can fail during the **Verify Nodes** phase with an error indicating Unscalable host groups found. This error

	<p>can occur when the MASTER group is missing or a single-instance service (for example, Grafana) has been moved out of the MASTER group. The <code>mapr-installer.log</code> reveals which cluster services are supposed to be in the MASTER group.</p> <p>Workaround: Move any original MASTER services that caused the error back to the MASTER group. The <code>mapr-installer.log</code> indicates the services that need to be moved along with the <code>Unscalable host groups found error</code>.</p>
<p>IN-2006</p>	<p>On a cluster with <code>mapr-drill</code> installed, the <code>probe</code> command can return the wrong database type value.</p> <p>Workaround:</p> <p>After using the <code>probe</code> command, check to see if the resulting YAML file has the correct <code>mapr_db</code> setting. Possible settings are:</p> <ul style="list-style-type: none"> • QS • DRILL • DRILLQS <p>If necessary, change the setting in the YAML file to match the value from the probed cluster.</p>
<p>IN-1955</p>	<p>If you install cluster software using the Installer in a browser and then upgrade the installer in the same browser tab and attempt an upgrade without starting a new browser, the stale browser cache can cause upgrade errors.</p> <p>Workaround: Clear your browser cache or open a new browser tab whenever you need to update the Installer and perform a new installer operation.</p>
<p>IN-1983</p>	<p>After an upgrade from release 5.x to release 6.1 and EEP 6.0.0 using the Installer, the <code>kafka-connect</code> service fails to start. This issue has been noticed on platforms that use <code>systemd</code>.</p> <p>Workaround: Stop the <code>kafka-connect</code> service manually, and restart the service.</p>
<p>IN-1972</p>	<p>During an upgrade from release 5.x to release 6.1, the Installer prompts you for the MySQL user ID and password. If you enter a password that is different from the password you provided when you originally configured MySQL through the Installer, the upgrade fails with this error: "Unable to connect to database...."</p> <p>Workaround: When the Installer prompts you for the MySQL user ID and password, enter the password that you specified when you first installed the cluster. If you did not specify a password for MySQL when you installed release 5.x, leave the password field blank.</p>
<p>IN-1904</p>	<p>If you initiate a system startup by clicking the Startup button on the Installer web interface, the Authentication screen is displayed. If you subsequently click the Previous button, the following buttons are shown as active even though they are not usable during system startup:</p>

- Extend Cluster
- Incremental Install
- Maintenance Update
- Shutdown
- Uninstall

Workaround: Do not use the **Previous** button during startup.

IN-1657

After updating the Installer 1.7 or later, the Installer can lose awareness that a cluster was previously installed. For example, the Installer might indicate the need for a fresh install.

Workaround: If this happens, do NOT proceed with installation or upgrade operations. Follow these steps to reset the cluster state:

1. Click **Support > Reset Installer**. A warning screen appears.
2. Click **OK**.
3. Click **Support > Import State**.
4. Click **Reset** to recover the cluster to the last known state. It is safe to use the Installer at this point.

IN-1804

For release 6.0 or later clusters, enabling security by using the Incremental Install function can overwrite custom certificates in the `ssl_truststore` and `ssl_keystore` files. When you turn on security, the Installer runs the `configure.sh` script on the CLDB primary node to generate security keys and then distributes the keys to all the other CLDB nodes. The installer also distributes certificates to all the other nodes. This process can cause custom certificates to be overwritten. However, before enabling security, the Installer makes a backup of the existing `ssl_keystore` and `ssl_truststore` files.

Workaround:

After enabling security, locate the backup of the `ssl_keystore` and `ssl_truststore` files. The backup uses this format:

```
/opt/mapr/conf/
ssl_keystore.sv.<timestamp>
```

Extract any custom certificates from the backup files, and manually merge or add them into the new `ssl_keystore` and `ssl_truststore` files.

To merge the files, you can use the `/opt/mapr/server/manageSSLKeys.sh` utility, as shown in "Configuring Secure Clusters for Running Commands Remotely" in the data-fabric documentation.

IN-997

When using Installer 1.9 with Ubuntu distributions, an upgrade of the Installer definitions requires a restart

of the installer service. The restart is needed because the Installer services version is not updated properly when you use either of the following commands:

- `mapr-setup.sh reload`
- `apt-get install mapr-installer-definitions`

Workaround: After installing or reloading the Installer definitions, issue one of these commands to fix the services version:

- `service mapr-installer restart`
- `systemctl restart mapr-installer`

IN-1671

For Installer 1.8 and earlier, installation on Ubuntu 16.04 can fail if Python 2 is not available or if the default is set to Python 3. The installer requires `python` and `python-yaml` to be installed on all nodes.

Workaround: To install the Python packages manually:

```
sudo apt-get install python
python-yaml -y
```

IN-1336

The Installer **Retry** function can be affected if the installer operation fails. Suppose you deselect a service during an **Incremental Install** operation. If the **Incremental Install** fails and you need to **Retry**, it's possible that the service will not be deselected (uninstalled).

Workaround: Manually remove (uninstall) the service by using one of these commands:

- **Red Hat / CentOS:** `yum remove`
- **Ubuntu:** `apt-get remove`
- **SLES:** `zypper remove`

IN-1392

During an **Extend Cluster** (add node) operation using the Installer, if installation of the added node fails and you abort the operation, the installer can display the added node even though it did not get installed.

Workaround: When the Installer indicates that a node did not get added correctly (typically during the Installation phase), select the node and click **Remove Node**. Then retry adding the node.

IN-1396

An installation using the Installer fails with the following Ansible module error:

```
nValueError: need more than 1 value
to unpack
```

Workaround: Check for syntax errors in the `/etc/sysctl.conf` file, which can cause an Ansible error

IN-1398	<p>when the Installer is attempting to set various kernel parameters.</p> <p>In the Installer Verify Nodes page, if you click a host, the Disks Selected for MapR box in the right pane displays the disks that were specified for the host either manually or automatically. If you deselect a disk in the right pane and click Retry, the deselection is not always implemented.</p> <p>Workaround: Click Previous to go back to the Node Configuration page, and re-specify the disks that you want. Then continue with the operation.</p>
IN-1386	<p>On a secure cluster, YARN jobs can fail if you specify IP addresses rather than host names when you configure nodes using the Installer.</p> <p>Workaround:</p> <p>Do not use an IP address for node configuration with the Installer. If you already used an IP address, change the IP address in the yarn-site.xml file on all nodes. In the following example, the 10.10.10.7 IP address must be changed to a host name, such as bld73.qa.lab:</p> <pre style="background-color: #f0f0f0; padding: 10px; border: 1px solid #ccc;"> <property> <name>yarn.timeline-service.hostname</name> <value>10.10.10.73</value> </property></pre>
IN-1333	<p>On Ubuntu clusters, the <code>mapr-setup.sh</code> script fails to reload the Installer definitions during an update of the installer and definitions.</p> <p>Workaround: After updating, restart the installer to load the definitions:</p> <pre style="background-color: #f0f0f0; padding: 10px; border: 1px solid #ccc;"> service mapr-installer restart</pre>
IN-907	<p>The Installer service fails if the <code>mapr</code> user or <code>root</code> user already exist and they are configured to use a shell other than <code>bash</code>. For more information about user requirements, see "Installer Prerequisites and Guidelines" in the data-fabric documentation.</p> <p>Workaround: Configure the users to use <code>bash</code>. For more information about user requirements, see "Installer Prerequisites and Guidelines" in the data-fabric documentation.</p>
IN-1079	<p>Verification fails when the installed language pack is for a language other than English.</p> <p>Workaround: Remove the non-English language pack and install the English language pack. In the following example, the non-English language pack is shown as German. Also, make sure your system locale is</p>

set to `en_us`, as described in "Infrastructure" in the data-fabric documentation.

```
sudo apt-get install language-pack-en
language-pack-en-base manpages
sudo apt-get remove language-pack-de
language-pack-de-base manpages-de
```

IN-804

Using the Incremental Install operation to add a third node to a CONTROL group generates an error: `ERROR: configure_refresh.sh failed`. This issue applies to Installer versions 1.6 and earlier.

Workaround: Update the Installer to version 1.7 or later, and retry the operation. See "Updating the Installer" in the data-fabric documentation.

IN-1314

When you use the Installer to install ecosystem components that require a MySQL component such as Hive, Oozie, or Hue, the passwords you provide to install the MySQL database are displayed in the `mapr-installer.log` and `<nodename>.log` files. Beginning with Installer 1.7, the permissions for the `mapr-installer.log` and `<nodename>.log` files are changed so that these passwords are not world readable. However, the passwords are still present in log files created with earlier versions of the Installer.

Workaround: For increased security, remove the earlier logs or change the user permissions for them.

IN-1042

Installation of the 5.2.x `mapr-metrics` package on SLES 12 SP2 fails because the `libmysqlclient16` package is not present. This can happen when `mapr-metrics` is installed manually or using the Installer. This issue was detected during installations of release 5.2.x with EEP 3.0.0.

Workaround: None.

IN-870

If your cluster uses 2-digit EEPs, and you use the Installer **Extend Cluster** button to add a node, the node can be added with a patch version that is different from the patch version of other nodes in the cluster. See "Understanding Two-Digit and Three-Digit MEPs" in the data-fabric documentation.

Workaround: A one-time change can prevent this issue. After updating the Installer from version 1.5 to version 1.6 or later, but before performing any Installer operations, use an Incremental Install function to change your 2-digit EEP version to the equivalent 3-digit EEP version. See "Updating the Installer" in the data-fabric documentation.

ES-27, IN-1387

On a new installation of a secure cluster using the Installer, Elasticsearch fails to start, and logs indicate that Elasticsearch key generation failed. When this happens, Kibana and Fluentd also do not start. The Installer allows the installation to complete.

Workaround: Check the installer log for a message indicating that Elasticsearch could not be secured. Use the **Incremental Install** feature of the Installer to retry installation of the Monitoring logging components.

IN-1332

Alternatively, you can configure security for the logging components manually. See "Step 9: Install Log Monitoring" in the data-fabric documentation.

On clusters with less than the recommended memory configuration (16 GB per node), services added during an Incremental Install operation might fail to start because Warden allocated available memory to the filesystem. The Installer might not indicate a problem with the newly added services. If this issue occurs, the filesystem cannot relinquish memory without restarting Warden.

NOTE: This issue can also occur on clusters with more than 16 GB of memory per node if the installed services require more memory than is currently installed.

Workaround:

Use the Control System or the `maprcli service list -node` command to determine if the added services are running. If not, perform a rolling restart of the nodes to which the new services were added. The rolling restart will rebalance memory across the filesystem and services. One node at a time, restart Warden on each node following the group upgrade order prescribed in "Manual Rolling Upgrade Description" in the data-fabric documentation. Use the following steps:

1. Change to the `root` user (or use `sudo` for the following commands).
2. Stop Warden.

```
sudo service mapr-warden stop
```

3. Restart Warden.

```
service mapr-warden start
```

IN-1339

Installation fails with the Installer reporting an **Unexpected failure during module execution**, and the following entry is present in the "Logs for the Installer" described in the data-fabric documentation:

```
os.write(self.sshpass_pipe[1],
to_bytes(self._play_context.password)
+ b'\n')
OSError: [Errno 9] Bad file descriptor
```

Workaround: Change the ssh settings as described in known issue IN-405 later on this page, and retry the installation.

IN-553

New installations on Ubuntu 14.04 using Installer 1.6 or 1.7 can fail because of a JDK 1.8 issue.

Workaround:

If you are installing on Ubuntu 14.04, you must install Java JDK 1.8 before running the Installer. For more

IN-405

information, see [this website](#). If you are installing on RHEL/CentOS or SLES, the Installer installs Java JDK 1.8 for you.

Installation or cluster import using the probe command fails with the error message: "Failed to resolve remote temporary directory from ansible-tmp-"

Workaround:

To proceed using the Installer, disable SSH connection reuse by including this entry underneath the `[ssh_connection]` property of `/opt/mapr/installer/etc/ansible.cfg`:

```
ssh_args=-o ControlMaster=no -o
ControlPath=none -o ControlPersist=no
```

This workaround can lead to longer install times. We recommend that you resolve any network connectivity issues in your environment.

IN-250

An upgrade to a new core version and a new EEP using the Installer can fail if the cluster being upgraded was initially installed with Hive Metastore but not with Hive. The Hive Metastore package has an installation dependency on Hive, but the Hive Metastore definitions do not enforce the dependency, resulting in inconsistencies in the installer database. This issue has been observed on Ubuntu platforms.

Workaround:

Before upgrading, if you have Hive Metastore installed by itself, use the **Incremental Install** feature of the Installer to install Hive. Then proceed with the upgrade.

Performing an upgrade without doing the **Incremental Install** of Hive will cause the upgrade to fail. In this scenario, you will have to reinstall or rebuild the database by using Stanza commands. You can use the `reset` command, followed by `probe`, and then edit the versions in the resulting YAML file. The last step is to import the edited YAML using the `import` command. See "Using probe and import to Generate the Installer Database" in the data-fabric documentation.

N/A

The Installer Web Interface can inadvertently deselect services that you have selected, preventing them from being installed. For example, if you select an auto-provisioning template on the **Select Services** page, and you also select additional services (for example, Streams Tools), and go to the next page, when you return to the **Select Services** page, Streams Tools will be deselected, and you will need to reselect it to ensure that it is installed.

Workaround: Reselect any services that are deselected.

MAPR-20606

The Configure Service Layout page may assign services to a group with the name "Unprovisioned Services."

N/A

Workaround: In the Installer Web Interface, click **Restore Default**.

You cannot use the Installer after you upgrade the cluster using the command line.

After you use the command line to upgrade a cluster that you installed with the Installer, the Installer is not aware that the cluster runs the upgraded version. Therefore, Installer does not install nodes and ecosystem components that apply to the upgraded version.

Workaround: Use the Installer Stanzas `probe` and `import` commands to update the installer database. See "Using probe and import to Generate the Installer Database" in the data-fabric documentation.

Logs for the Installer

This topic describes the logs generated by the Installer and Installer Stanzas.

Installer logs are written to the following folder: `/opt/mapr/installer/logs`.

The following list describes each log:

`<nodename>.log[.x]`

Shows installation activities associated with a particular node. Every time you run the Installer or a Installer Stanza, a new copy of this log is created for each node in the cluster. When you encounter errors, you should check this log first, and then check the `mapr-installer.log`.

The node log is created only if the software was able to run Ansible successfully on the node. If incorrect credentials were provided for the root user, or if there was an issue and Ansible quit before issuing the first logging callback, no log file is created for the node. If this happens, you must consult `mapr-installer.log`.

`installer.log[.x]`

Logs the REST calls sent to the installer and the database events that the installer runs. Every time you run the Installer or a Installer Stanza, a new copy of this log is created. If the log is not present, you might need to restart the installer (`service mapr-installer restart`).

`installer-cli.log[.x]`

Shows the progress of installation for a Installer Stanza. Every time you run a Installer Stanza, a new copy of this log is created.

`installer-process.log`

Serves as the top-level log file for the Ansible part of the installer. This log is created by the main Python script that runs the installer backend. This log typically shows the same information as `mapr-installer.log`.

`mapr-installer.log[.x]`

Shows the progress of Ansible scripts performed by the installer server. This log is useful if back-end issues prevent the creation of `<nodename>.log`. Every time you run the Installer or a Installer Stanza, a new copy of this log is created.

Creating an Archive of Installer Logs

This topic describes how you can create a .zip archive of the logs generated by the Installer and Installer Stanzas. The .zip archive is a handy way to share log information with HPE support personnel.

About this task

To create a .zip archive of all the installer logs, use one of these commands:

- From the Installer web-based interface, click **Support > Download Installer Logs**.
- From a browser, specify the following URL. When prompted, supply the user name and password for the Installer:

```
https://<host_name>:9443/api/process/installer.zip
```

- From a terminal, specify the following syntax:

```
wget --no-check-certificate
https://mapr:mapr@<host_name>:9443/api/process/installer.zip
```

For information about Installer logs, see [Logs for the MapR Installer](#).

Using Service Verification

The service verification feature provides an easy way to verify that services on all nodes in the cluster are running and functional.

- ! **IMPORTANT:** Service verification is not currently implemented for all services. Support for additional services will be added in subsequent releases.

For secure or non-secure clusters, you can run the service verification feature from the Installer user interface or from a command line by invoking the `mapr-installer-cli`. Service verification is useful after a new installation. For example, service verification can detect whether all services have successfully joined a cluster. You can run a service verification any time after the cluster is installed to check the general health of services on all nodes.

Before Using Service Verification

Before you can use the service verification feature:

- The cluster must be installed, and you must have installed it by using the Installer or Installer Stanzas.
- Ensure that the Installer is up to date. Service verification is supported only on Installer [versions](#) 1.15.0.0 and later.
- Service verification can only be performed from the Installer node. The Installer node is the node where you run the Installer.
- Running service verification requires `root`-user access (or sudoer access to `root`) for remote authentication. (When you perform service verification, the Installer node must ssh into each of the cluster nodes.)

Performing Service Verification Using the Installer User Interface

To perform service verification from the Installer user interface:

1. On the Installer node, use a browser to navigate to the Installer home page, and log on as the cluster admin:

```
https://<Installer Node hostname/IPaddress>:9443
```

2. Scroll down until you see the following links:

3. Click the **Show service verification info** link to display the list of services and nodes.
4. Click **Run Service Verification** to start the verification. The Installer prompts for the `root` user password:

Configure Remote Authentication

Login Method	SSH - Password [?]
SSH Username	<input type="text" value="root"/>
SSH Password	<input type="password" value="....."/>
Verify SSH Password	<input type="password" value="....."/>
SSH Port	<input type="text" value="22"/>

The username used to SSH into each node to perform installation. This user must either be root, or a user with sudo privileges.

5. Enter the `root` user credentials, and click **Run Service Verification**. Verification can take anywhere from a few seconds to several minutes, depending on the size of the cluster, the network, and other attributes that affect performance. When the verification activity is complete, the Installer shows a list of

services with the verification output for each service. For example:

Service Name	❏ [REDACTED]	❏ [REDACTED]	❏ [REDACTED]
Apiserver	NOT_IMPLEMENTED	NOT_IMPLEMENTED	NOT_INSTALLED
CLDB	NOT_IMPLEMENTED	NOT_IMPLEMENTED	NOT_IMPLEMENTED
Collectd	VERIFIED	VERIFIED	VERIFIED
Data Access Gateway	NOT_IMPLEMENTED	NOT_IMPLEMENTED	NOT_INSTALLED
File Server	NOT_IMPLEMENTED	NOT_IMPLEMENTED	NOT_IMPLEMENTED
Gateway	NOT_IMPLEMENTED	NOT_IMPLEMENTED	NOT_INSTALLED
Grafana	RUNNING_NOT_RESPONDING	RUNNING_NOT_RESPONDING	NOT_INSTALLED
HBase Client	RUNNING_NOT_RESPONDING	RUNNING_NOT_RESPONDING	RUNNING_NOT_RESPONDING
HBase Thrift	NOT_INSTALLED	NOT_INSTALLED	NOT_IMPLEMENTED
History Server	NOT_INSTALLED	NOT_INSTALLED	NOT_IMPLEMENTED
Apache Kafka Java Client	RUNNING_NOT_RESPONDING	RUNNING_NOT_RESPONDING	RUNNING_NOT_RESPONDING
Apache Kafka REST API	NOT_RUNNING	NOT_RUNNING	NOT_RUNNING
Mastgateway	NOT_IMPLEMENTED	NOT_IMPLEMENTED	NOT_IMPLEMENTED
YARN Node Manager	NOT_IMPLEMENTED	NOT_IMPLEMENTED	NOT_IMPLEMENTED
Oozie	NOT_INSTALLED	NOT_INSTALLED	NOT_RUNNING
OpenTSDB	VERIFIED	VERIFIED	VERIFIED
YARN Resource Manager	NOT_IMPLEMENTED	NOT_IMPLEMENTED	NOT_INSTALLED
Spark History Server	NOT_INSTALLED	NOT_INSTALLED	NOT_IMPLEMENTED
Spark Thrift Server	NOT_INSTALLED	NOT_INSTALLED	NOT_IMPLEMENTED
Zookeeper	NOT_IMPLEMENTED	NOT_IMPLEMENTED	NOT_IMPLEMENTED

Possible values are:

- FAILED_TO_EXECUTE
- NOT_IMPLEMENTED
- NOT_INSTALLED
- NOT_RUNNING
- NOT_STARTED
- RUNNING_NOT_RESPONDING
- VERIFIED

6. To rerun service verification – for example, after running it once and discovering some services are not responding – click **Run Service Verification** again.

Service Verification Logs

On each node where a service is installed, logged output from the service verification feature is saved to:

```
$MAPR_HOME/<service>/<service>-<version>/var/log/<service>/
verify_service.<date>
```

For example, service verification output for OpenTSDB might be found here:

```
# pwd
/opt/mapr/opentsdb/opentsdb-2.4.0/var/log/opentsdb
```

```
# ls

Possible return codes for the log output are:

- 0 – running and responding to a simple interaction test
- 1 – not running

- 2 – running but not responding to a simple interaction test
- 3 – not started*

*From Warden's point of view, the service is enabled, but Warden has not started it yet.

Performing Service Verification Using the `mapr-installer-cli`

To perform service verification for all nodes from the command line:

1. On the Installer node, navigate to the `installer` directory:

```
cd /opt/mapr/installer
```

2. Run the following command:

```
./bin/mapr-installer-cli verify_services -n -o config.ssh_id=root -o
config.ssh_password=<password>
```

For example:

```
./bin/mapr-installer-cli verify_services -n -o config.ssh_id=root -o
config.ssh_password=<password>
MapR Installer SDK
Logging in to localhost
Verifying Services...
100%
[ ===== ]
```

Related concepts

[Updating the Installer](#) on page 6403

Update the Installer to include the latest ecosystem packages and installer fixes. Once you update the Installer, you can install ecosystem components and software versions that were made available after you first configured the Installer.

[Installer Prerequisites and Guidelines](#) on page 6390

The node on which you run the installer and the nodes you plan to include in your cluster must meet certain user, connectivity, and security requirements.

Starting and Stopping the Installer

Describes how and when you need to shut down and restart the Installer.

It is seldom necessary to shut down and restart the Installer, but you might need to do so in the following scenarios:

- You are troubleshooting an Installer issue, and stopping and restarting the Installer might resolve the issue.
- You need to upgrade the OS for a node. See [When Upgrading Core with the Installer Requires an OS Upgrade](#) on page 269.
- You want to run the Installer node in FIPS-compliant mode, and you cannot leave the Installer running because the Installer is not FIPS compliant.

Checking the Installer Status

When you are not sure if the Installer is running, use the following command to check the status:

```
systemctl status mapr-installer
```

Starting and Restarting the Installer

To start or restart the Installer (requires `root` authentication):

```
systemctl start mapr-installer
```

Stopping the Installer

Note that if you stop the Installer while an installation is in progress, any passwords that you provided to the Installer user interface are lost. The Installer retains password information in memory and not in the Installer database. If you then restart the Installer to continue the installation, the installation fails. In this scenario, you must restart the Installer and the Installer user interface and re-enter the password information to resume the installation.

To stop the Installer (requires `root` authentication):

```
systemctl stop mapr-installer
```

Related concepts

[Resetting the Installer Database](#) on page 6480

The `reset` command uninstalls the metadata from the Installer database. `reset` is for advanced users.

You can use a single button to shut down software on a cluster.

Using probe and import to Generate the Installer Database

Describes how to enable a manually installed cluster to use the Installer or Installer Stanza commands.

If a cluster has data-fabric software installed but has no Installer database, you cannot install or upgrade the cluster using Installer Stanza commands. And you cannot use the web-based Installer on the cluster. However, you can generate an Installer database on a cluster by using the `probe` and `import` commands. Once the Installer database is generated, you can use the web-based Installer and all Installer Stanza commands on the cluster.

If you are not sure if your cluster has an Installer database, use the `export` command to generate a YAML file that describes the cluster configuration. See [Exporting a Cluster Configuration](#) on page 6514.

Using probe

Before using the `probe` command, you must know the host names or IP addresses of the cluster nodes and the `root` user, which must be the same on all nodes. The `probe` command generates a template that will be used by the `import` command.

NOTE: Do not make changes to the `probe`-generated template file. After the Installer database is created, you can use the `export` command to export a YAML for making changes.

In this example, the probing user, `mapr1`, probes an array of hosts (`config.hosts`) and generates a template file `/tmp/location.yaml`. The `-u` option provides login credentials for the Installer. Note that

the probing user must be able to do rpm and pkg queries and have permission to read certain files and directories within `/opt/mapr`.

```
mapr-installer-cli probe -n -o config.ssh_id=mapr1
config.ssh_password=xyz config.hosts='["hostname[1-3]","hostname7"]' -u
mapr1:xyz@<installer_hostname>:9443 > /tmp/location.yaml
```

The `probe` command uses various methods to determine the EEP version of a node. One method checks the EEP repo URL defined on the node. If multiple EEP repos are defined on the same node, the `probe` command ignores all of them and tries to determine the EEP version based on the packages that are present.

Using import

The `import` command prepares the Installer database based on the probed template file. This example imports the probed YAML template file from the previous example. `-t` specifies the location of the template file:

```
mapr-installer-cli import -n -t /tmp/location.yaml
```

After you use the `import` command, the Installer database should be operational. You can then use the web-based Installer or Stanzas to perform additional operations on the cluster. See [Installer](#) on page 6388.

Resetting the Installer Database

The `reset` command uninstalls the metadata from the Installer database. `reset` is for advanced users.

You can reset the Installer database by using the CLI `reset` command or by using the Installer web interface (**Support > Reset Installer**).

The reset function can be useful for testing purposes, but use reset with caution. If you reset the installer database while packages are installed on the nodes, you will need to remove the packages manually.

NOTE: If you experience a failure while installing or uninstalling, the installer prompts you to retry the operation or uninstall and then reinstall from scratch. You should always retry or uninstall before considering using `reset`.

This example resets the Installer database. The `-nv` option specifies that certificates will not be checked and the output mode is verbose:

```
./bin/mapr-installer-cli reset -nv
```

Troubleshooting Repository URL Errors

This page describes how to troubleshoot an issue in which an incorrect repository URL is stored in the Installer `properties.json` file.

How Repository URL Errors Can Occur

The `properties.json` file stores information such as the user ID of the cluster administrator, the user ID of the Installer, the OS type, Internet access information, and the repository URL. Once the repository URL has been stored in `properties.json`, the Installer assumes that the URL will not change.

If you run `mapr-setup.sh -r <url>` and you make a mistake when typing the URL, the incorrect URL is added into the Installer `properties.json` file. If you later run `mapr-setup.sh -r <url>` again but with the correct URL, the `properties.json` is not updated. Even upgrading the installer packages does not update the repository URL in `properties.json`.

Some versions of the Installer generate a warning if you try to correct the URL by running `mapr-setup.sh -r <url>` again, but older versions of the Installer do not generate a warning. Whether

or not a warning is generated, you can correct the issue, but how you do so depends on the version of the Installer that is installed.

Fix Using Installer 1.10 or Later

Installer 1.10 and later versions generate a warning if you run `mapr-setup.sh -r <url>` and provide a new URL. The warning describes two ways to change the URL currently stored in the `properties.json` file:

- You can use the `reload` or `remove` command, and then specify a new URL:

- Use *one* of the following commands:

```
bash /tmp/mapr-setup.sh -R <new_url> reload
```

or

```
bash /tmp/mapr-setup.sh remove
```

Using the `remove` command removes `properties.json`, the installer database, and the installer packages, but not the setup script.

- Specify the new URL:

```
bash /tmp/mapr-setup.sh -r <new_url>
```

- You can manually edit the `properties.json` file:

- Edit the `properties.json` file to specify the new URL:

```
edit /opt/mapr/installer/data/properties.json
```

- Reload the MapR Installer:

```
systemctl restart mapr-installer
```

Fix Using Installer 1.9 or Earlier

Installer 1.9 and earlier do NOT generate a warning if you run `mapr-setup.sh -r <url>` and provide a new URL. To pass a new repository value into `properties.json` for Installer versions 1.9 or earlier, you must first remove the installer files:

```
mapr-setup.sh remove
```

Using the `remove` command removes `properties.json`, the installer database, and the installer packages, but not the setup script. After the files are removed, you can rerun `mapr-setup.sh` to specify the new repository URL:

```
bash /tmp/mapr-setup.sh -r <new_url>
```

To run `mapr-setup.sh`, see [MapR Installer](#). For information about options you can use with `mapr-setup.sh`, see [Using mapr-setup.sh](#).

Changing Timeout Values to Resolve Installer Errors

Change timeout values to reduce errors when using the Installer.

About this task

Sometimes the Installer can return errors because the `maprccli` or filesystem commands that it uses time out because of network latency. For example, if logs indicate that the installer could not obtain the `nodelist`, or a filesystem operation timed out, changing a timeout value can enable the same Installer operation to succeed.

You can change the following timeout parameters to improve the success of Installer operations:

Timeout	Description	Default Value (minutes)
<code>standard</code>	The timeout used for <code>maprccli</code> commands and Hadoop filesystem operations.	2
<code>configure</code>	The timeout used for <code>configure.sh</code> operations.	10

You must specify timeout values as an integer greater than or equal to 0.

To change the `standard` or `configure` timeout values:

Procedure

1. On the Installer node, navigate to the following directory:

```
/opt/mapr/installer/ansible/playbooks/group_vars/
```

2. Edit the `all` file to change one or both timeout values to a number greater than or equal to 0. In this example, the timeouts are set to 7 minutes and 15 minutes respectively:

```
timeout:
  standard: 7
  configure: 15
```

3. If a Installer error prompted you to change the timeout, retry the operation that failed.

Installer Release Notes

This release of the Installer works with RedHat/CentOS, Ubuntu, and SLES.

The Installer consists of the following packages along with the `mapr-setup.sh` script:

- **Installer** - Package that contains the Installer.
- **Installer Definitions** - Package that contains the list of versions, services, and ecosystem components that you can install with the Installer.

The release notes include the following sections:

Installer Updates

Installer updates provide new features or bug fixes.

The following table shows the Installer new-feature updates by version:

Version	Updates
1.18.0.5.202402102044-1	This version: <ul style="list-style-type: none"> • Provides the same functionality as the previous Installer version. • Adds support for core 7.6.1 and EEP 9.2.1.

Version	Updates
1.18.0.5.202401232228-1	<p>This version:</p> <ul style="list-style-type: none"> • Provides the same functionality as the previous Installer version. • Adds support for core 7.6.0 and EEP 9.2.1. • Can be used to upgrade clusters from core 7.4.0 or 7.5.0 to 7.6.0. • Can be used on RHEL 8.8 with core 7.6.0 and core 7.5.0 (with EEP 9.2.1) and might work on older core releases but has not been tested on them. • Does not include user interface controls for configuring IPv6. • Does not support installing or configuring Keycloak through the Installer UI; however, you can install Keycloak by passing the following Stanza option: <code>config.sso_keycloak=true</code>. • Can install Zeppelin, but the Installer does not configure Zeppelin. All configuration and integration tasks must be done manually. • Supports the new https://package.ezmeral.hpe.com/ repository. For information about the repository, see What's New in Release 7.0.0 on page 36.
1.18.0.4.202310271158-1	<p>This version:</p> <ul style="list-style-type: none"> • Provides the same functionality as the previous Installer version. • Adds support for core 7.5.0 and EEP 9.2.0. • Can be used on RHEL 8.8 with core 7.5.0 and core 7.4.0 (with EEP 9.2.0) and might work on older core releases but has not been tested on them. • Does not support installing or configuring Keycloak through the Installer UI; however, you can install Keycloak by passing the following Stanza option: <code>config.sso_keycloak=true</code>. • You can use Installer 1.18.0.4 to install Zeppelin, but the Installer does not configure Zeppelin. All configuration and integration tasks must be done manually. • Supports the new https://package.ezmeral.hpe.com/ repository. For information about the repository, see What's New in Release 7.0.0 on page 36.
1.18.0.3.202309132143-1	<p>This version:</p> <ul style="list-style-type: none"> • Provides the same functionality as the previous Installer version but also supports token-based authentication for the new https://package.ezmeral.hpe.com/ repository. For more information, see Using the HPE Ezmeral Token-Authenticated Internet Repository on page 92.

Version	Updates
1.18.0.1.202301281358-1	<p>This version:</p> <ul style="list-style-type: none"> • Adds support for core 7.2.0 and EEPs 6.4.0 and 9.1.0. • Is not supported for use with JRE 17 or JDK 17 and will not install JDK 17. • Does not support installing Apache Zeppelin in EEP 6.4.0 or 9.0.0 or 9.1.0. You must install Zeppelin using the manual steps. • Does not support upgrades. Upgrades must be performed using manual steps. See Upgrading Core With the Installer on page 276 and Upgrading the Ecosystem Pack Without the Installer on page 317. • Fixes the following issues: <ul style="list-style-type: none"> • IN-3186: Projects Installer IN-3186 Security:: CVEs: mapr-installer:: found vulnerable versions of shiro-cache* binaries as part of the mapr-installer-1.18.0.0.202210181219-1.noarch.rpm • IN-3187: Security :: mapr-installer:: Found vulnerable version of puma binaries mapr-installer-1.18.0.0.202210181219-1.noarch.rpm • IN-3197: Security :: mapr-installer:: found vulnerable versions of gradle binaries in mapr-installer-1.18.0.0.202210181219-1.noarch.rpm • IN-3207: Kafka and kafka-rest packages are incorrectly upgraded via incremental install MEP-6.3.6 -> MEP-6.4.0 • IN-3208: MapR Installer affected by vulnerability CVE-2000-0234 - File .htaccess Accessible • IN-3217: SSH Private Key Login error - 'NoneType' object has no attribute 'decode' • Has some known issues: <ul style="list-style-type: none"> • IN-3223: Can fail to install or upgrade Ranger in some use cases. See IN-3223 in Installer Known Issues on page 6449. • IN-3240: Can fail to generate the Installer database when a probe command is issued. See IN-3240 in Installer Known Issues on page 6449.

Version	Updates
1.18.0.0.202210181219-1	<p>This version:</p> <ul style="list-style-type: none"> • Supports release 7.1.0 and EEP 9.0.0. • Supports Apache Ranger. • Supports Apache NiFi. • Does not support installing or upgrading to EEP 6.4.0. • Does not support installing Apache Zeppelin. You must install Zeppelin using the manual steps. • Implements security by default for new installations. It is no longer supported to install a release 7.0.0 or later cluster that is non-secure. • Does not support upgrades. Upgrades must be performed using manual steps. See Upgrading Core With the Installer on page 276 and Upgrading the Ecosystem Pack Without the Installer on page 317. • Fixes the following significant issues: <ul style="list-style-type: none"> • IN-3120 – Installer-17 - mapr-setup.sh update ERROR: import command failed after installer update
1.17.0.3.202203140736-1	<p>This version:</p> <ul style="list-style-type: none"> • Supports release 7.0.0 and EEPs 5.0.8, 6.3.6, 7.1.2, and 8.1.0. • Supports Airflow 2.2.1.0 beginning with EEP 8.1.0. • Provides Log4j fixes. For more information, see advisory 4916. • Fixes CVE-2021-42392 in the Installer.
1.17.0.2.202202110756-1	Internal-only release.
1.17.0.1.202201201546-1	<p>This version:</p> <ul style="list-style-type: none"> • Provides Log4j fixes. For more information, see advisory 4916. • Fixes CVE-2021-42392 in the Installer. <p> NOTE: This version of the Installer cannot be used with release 7.0.0.</p>

Version	Updates
1.17.0.0.202110261002-1	<p>This version:</p> <ul style="list-style-type: none"> • Adds support for EEP 8.0.0, EEP 7.1.1, EEP 6.3.5, and version updates to many ecosystem components. For a list, see What's New in EEP 8.0.0 on page 7617. • Is built on Ubuntu 18.04 and is not supported on Ubuntu 16.04. Note that core 6.2.0 is supported on Ubuntu 16.04. You can use Installer 1.17.0.0 to install core 6.2.0 on Ubuntu 16.04 as long as the Installer node is running an OS that Installer 1.17.0.0 supports. For details, see Selecting an Installer Version to Use on page 6396. For supported OS versions, see the Installer Support Matrix on page 6617. • Includes some terminology updates. References to the <i>ecosystem pack (MEP)</i> have been changed to <i>Ezmeral Ecosystem Pack (EEP)</i>. For more information, see What's New in EEP 8.0.0 on page 7617. • Includes numerous fixes, the most significant of which are: <ul style="list-style-type: none"> • IN-2264: Probe does not detect hive database settings like it does for hue and oozie • IN-2490: Change ansible source module to mapr_ansible • IN-2560: Releases installer-v1.11.0 and installer-v1.12.0 - mapr-setup.sh by default installs the most current version of the Installer • IN-2848: correctly detect and report ansible syntax errors • IN-2856: Installer Failing when doing incremental upgrade • IN-2924: need to create symlink for mapr_fstab when using mapr-loopbacknfs • IN-2934: Ubuntu16 - mapr-setup.sh gpgkeys: protocol `https` not supported • IN-2935: Centos83 - fresh install failing with "mount.nfs: access denied by server while mounting localhost:/mapr" • IN-2947: extend cluster on ubuntu fails on nodes that do not have zookeeper installed
1.16.0.3.202201072207-1	<p>This version:</p> <ul style="list-style-type: none"> • Provides Log4j fixes. For more information, see advisory 4916. • Fixes CVE-2021-42392 in the Installer.
1.16.0.2.202110191345-1	<p>This version provides defect repair and enables installation for clusters running Ubuntu 16.04. See the special considerations for Ubuntu 16.04 clusters in Selecting an Installer Version to Use on page 6396. This version was released at the same time as Installer 1.17 and includes fixes for the following issues:</p> <ul style="list-style-type: none"> • IN-2895: permission errors reading pid files due to systemd changes • IN-2984: SLES15 fails in verify - python3 incompatibility • IN-2989: Error during cluster installation - 'ascii' codec can't encode character • IN-2995: add check to the os prereq to check for mep-7.1.0 or above with SLES15 • IN-2996: java 11 jre is not being upgraded to jdk • IN-2997: installer does not install java11 on SLES15

Version	Updates
1.16.0.1.202108210519-1	<p>This version includes fixes for the following issues:</p> <ul style="list-style-type: none"> • IN-2924: need to create symlink for mapr_fstab when using mapr-loopbacknfs • IN-2925: installer no longer correctly detects if zk are running • IN-2934: Ubuntu16 - mapr-setup.sh gpgkeys: protocol `https` not supported • IN-2935: Centos83 - fresh install failing with "mount.nfs: access denied by server while mounting localhost:/mapr" • IN-2947: extend cluster on ubuntu fails on nodes that do not have zookeeper installed • IN-2950: Bug in regex for mapr-setup.sh causes update command to fail
1.16.0.0.202105261033-1	<p>This version:</p> <ul style="list-style-type: none"> • Adds support for EEP 7.1.0, SLES 15 SP2, and the following ecosystem component version updates: <ul style="list-style-type: none"> • Hadoop 2.7.5 • Object Store 2.1.0 • HTTP-FS 1.1 • Kafka 2.6.1 • Includes fixes for the following issues: <ul style="list-style-type: none"> • IN-2821: DB services fail with error - Could not connect to the database: java.sql.SQLException: The server time zone value 'PDT' is unrecognized or represents • IN-2849: prereq check for services does not figure out that it needs to look for chronyd instead of ntpd for SLES 15 • IN-2862: Couldn't install cluster by mapr user with sudo • IN-2879: FreshInstall - error while configuring mysql • IN-2883: mapr-installer-cli probe fails on Ubuntu-based MapR 6.2 cluster • IN-2892: mysql prereq check fails if no password is given - should only do so if not password was given on fresh install • IN-2893: make sure cron is installed - both OT and ES depend on it • IN-2895: permission errors reading pid files due to systemd changes

Version	Updates

Version	Updates
1.15.0.0.202101220818-1	<p>This version:</p> <ul style="list-style-type: none"> • Adds support for installing the S3 Gateway. For installation considerations, see Installing the S3 Gateway Using the Installer on page 6424. • Installs Loopback NFS (<code>mapr-loopbacknfs-<version></code>) on all nodes in the cluster unless Enable NFS is specified. • Adds support for Oracle Enterprise Linux 8.2 on release 6.2.0. • Includes fixes for the following issues: <ul style="list-style-type: none"> • IN-1289: Allow removal of installer node during verify • IN-2004: Install loopbacknfs by default if customer does not install NFS • IN-2232: We complain about firewall services being enabled on ubuntu • IN-2608: mapr-setup.sh installing with local repository - error on mapr-installer.service start • IN-2726: Installer should use HTTPS while connecting to https://package.ezmeral.hpe.com/ • IN-2728: Mapr-installer failed installation with "Module did not set no_log for update_password" • IN-2735: Installer-master/ui1.14 - add mep506 632 701 support • IN-2742: Ansible execute shell script with no TTY • IN-2743: Certify Installer support for 6.2 on OEL (Oracle Enterprise Linux) 8.2 • IN-2744: Implement simple UI for service verification feature in the Installer UI • IN-2754: Add loopbacknfs installation and configuration via MapR Installer • IN-2770: Installer needs to reflect minimum cluster requirement for 4 node clusters, rather than 5 node • IN-2778: need to change localhost login for root on shared mysql on ubuntu • IN-2785: Installer logs plenty of 'loglevel_int' exception messages • IN-2789: Centos 8 Installer with Use existing DB - database_existing.yml "No package MySQL-python available."

Version	Updates
1.14.0.1.202010161154-1	<p>This version adds support for Red Hat / CentOS 8.2 and Oracle Enterprise Linux 7.8, as indicated in Installer Support Matrix on page 6617. This version also includes fixes for the following issues:</p> <ul style="list-style-type: none"> • IN-2680: mapr-setup.sh should provide option to setup Proxy preload • IN-2714: Support MapR core (no EEP) for Oracle Enterprise Linux 7.8 for MapR 6.1 • IN-2715: Installer won't start on centos 8.2 when java 8 is installed • IN-2716: mapr-setup.sh - errors via Shell Script plugin validation • IN-2717: Installer Specification for versions supported and paths navigated on OS, java, and python environments • IN-2718: mapr-setaup.sh - ERROR: environment variable is set but do not contain http[s]: prefix - fix • IN-2719: proxy setting for mapr_core, mapr_installer.repo mep rep is incorrectly set to _none_always when installer on HPE network • IN-2720: install core 6.1.0 on centos 8 • IN-2721: centos8 610_631 fresh install error on Stanza - Running task: Calling do_configure.sh from 'configure.yml' MODULE FAILURE • IN-2723: Please try an upgrade from core 6.1.0 to core 6.2.0 via installer on centos 8.x • IN-2724: Probe is broken in 1.14 - python3 and 4 digit issues
1.14.0.0.202009160311-1	<p>This version includes the following new functionality or characteristics:</p> <ul style="list-style-type: none"> • Installer 1.14.0.0 supports EEP 7.0.0. • Installer 1.14.0.0 supports Red Hat / CentOS 8.1, Ubuntu 18.04, and Ubuntu 16.04, but does not support SLES, as indicated in Operating System Support Matrix on page 6525. • Unlike Installer 1.13.0, Installer 1.14.0.0 runs on JDK 11. • The Installer can install Kafka Schema Registry 5.1.2.0.
1.13.0.0.201912130933-1	<p>This version includes the following new functionality or characteristics:</p> <ul style="list-style-type: none"> • Installer 1.13.0.0 supports EEP 6.3.0. • Installer 1.13.0.0 supports Red Hat / CentOS 7.6 and 7.7 but does not support Ubuntu 18.04, as indicated in Operating System Support Matrix on page 6525. • Installer 1.13.0.0 supports HBase 1.13.0. • Unlike Installer 1.12.0, Installer 1.13.0.0 requires Java 8 and cannot run on Java 7.

Version	Updates
1.12.0.0.201905241518-1	<p>This version includes the following new functionality or characteristics:</p> <ul style="list-style-type: none"> • Installer 1.12.0.0 and later support the upload of a zipped tarball containing custom Ansible roles. These instructions can be executed in the installer workflow to customize the installation. For more information, see Using Custom Playbooks on page 6425. • You cannot use Installer 1.12.0.0 or later to perform basic installer operations with 5.2.x releases. You must use Installer 1.11.0.0 instead. See Selecting an Installer Version to Use on page 6396. • For data disks, Installer versions 1.12.0.0 and later require a minimum disk size that is equal to the physical memory on the node. If a data disk does not meet the minimum disk size requirement, a verification error is generated. • If you click a link in a Installer tooltip, the link is displayed in a new browser tab. Previously, clicking a tooltip link caused the browser to display the link in the same browser tab, and any changes made in the user interface were lost. This behavior has been corrected. • IN-2389 & INFO-1120: Sqoop2 cannot be installed using Installer 1.12. • IN-2417: Extending a secure cluster no longer fails with a <code>mapruserticket</code> error when you add a CONTROL node and DATA node at the same time.
1.11.0.0.201902141709-1	<p>No new features. This version includes the following fixes:</p> <ul style="list-style-type: none"> • IN-2254: Ran out of memory on 1.10 installer - bump memory limits. • IN-2171: Unable to install Installer from packages on SLES. • IN-2155: Restrict expanding cluster groups based on service type not on group name. • IN-2154: Installer verification phase fails with error "ValueError: zero length field name in format." • IN-2123: Unable to extend secure cluster, mapruserticket not copied into new node. • IN-2108: Adding node with Extend Cluster fails at "get list of the ECO warden config files." • IN-2094: Installer verification fails for LUKS encrypted disks. • IN-2078: AttributeError in prereq check about OS. • IN-2025: Installer Error "Unscalable Host Groups" during 'extend cluster' or 'incremental install'.

Version	Updates
1.11.0.0.201901301400-1	<p>This version includes the following new functionality or characteristics:</p> <ul style="list-style-type: none"> • Support for EEP 6.1.0. For more information about EEP 6.1.0, see What's New in EEP 6.1.0 on page 7641. • The Installer provides a new advanced option that allows you to restrict the software to a subset of network interface cards (NICs) or to specify public IP addresses that can be used with the cluster nodes. See Using the MapR Subnet and MapR External Advanced Options on page 6439. • The Installer warns you if you specify a host name using an IP address rather than a fully qualified domain name (FQDN). See Connectivity on page 121. • The Installer warns you if you run <code>mapr-setup.sh -r <url></code> and specify a URL that is different from the URL currently stored in the <code>properties.json</code> file. See Troubleshooting Repository URL Errors on page 6480. • The installer version (1.11.0.0) now uses four digits rather than three or two digits. For more information about 4-digit versions, see What's New in EEP 6.1.0 on page 7641.
1.10.0.201812181130-1	<p>No new features. This version includes the following fixes:</p> <ul style="list-style-type: none"> • IN-2171: Unable to install Installer from packages on SLES. • IN-2155: Restrict expanding cluster groups based on service type not on group name. • IN-2154: Installer verification phase fails with error "ValueError: zero length field name in format." • IN-2123: Unable to extend secure cluster, mapruserticket not copied into new node. • IN-2108: Adding node with Extend Cluster fails at "get list of the ECO warden config files." • IN-2094: Installer verification fails for LUKS encrypted disks. • IN-2078: AttributeError in prereq check about OS. • IN-2025: Installer Error "Unscalable Host Groups" during 'extend cluster' or 'incremental install.'

Version	Updates						
1.10.0.201809200839-1	<p>This version includes the following new functionality:</p> <ul style="list-style-type: none"> The installer provides a new option for setting Data-at-Rest Encryption (DARE). See Using the Enable DARE Option on page 6420. The installer provides a new option for setting the NSF version. See Installing NFS Using the Installer on page 6424. Changes have been made to the auto-provisioning templates. See Auto-Provisioning Templates on page 6444. With Installer 1.10, metrics collection is enabled by default on 6.1 or later and cannot be disabled. Metrics collection is required for metering. To support metrics collection, collectd is installed on all nodes in the cluster. Users can specify the full collection configuration for collectd or a minimum configuration to support only metering for billing purposes. If the minimum configuration is selected, HPE Ezmeral Data Fabric Database table metrics are disabled. With Installer 1.10, the installer no longer includes an option to support off-cluster Elasticsearch and OpenTDSDB when security is turned on. When installing Oozie 4.3.0, MapR Installer 1.10 leverages the Hadoop credential provider API to encrypt the Oozie database user password. 						
1.9.0.201803291415-1	<p>This version includes the following new functionality:</p> <ul style="list-style-type: none"> In the Installer, password verification is implemented for every password entered. Changes have been made to the auto-provisioning templates. See Auto-Provisioning Templates on page 6444. The following services are renamed in Installer 1.9: <table border="1" data-bbox="526 1075 1463 1247"> <thead> <tr> <th data-bbox="526 1075 995 1125">Old Name</th> <th data-bbox="995 1075 1463 1125">New Name</th> </tr> </thead> <tbody> <tr> <td data-bbox="526 1125 995 1171">OJAI Query Service</td> <td data-bbox="995 1125 1463 1171">OJAI Distributed Query Service</td> </tr> <tr> <td data-bbox="526 1171 995 1247">HBase/HPE Ezmeral Data Fabric Database Common</td> <td data-bbox="995 1171 1463 1247">MapR DataBase</td> </tr> </tbody> </table>	Old Name	New Name	OJAI Query Service	OJAI Distributed Query Service	HBase/HPE Ezmeral Data Fabric Database Common	MapR DataBase
Old Name	New Name						
OJAI Query Service	OJAI Distributed Query Service						
HBase/HPE Ezmeral Data Fabric Database Common	MapR DataBase						
1.8.0.201801312110-1	<p>This version includes support for 6.0, EEP 4.1.0, and the following new features:</p> <ul style="list-style-type: none"> Support for Starting Up a Cluster Using the Installer Startup Button on page 6440. 						
1.7.201801021321-1	<p>No new features. This version includes the following fixes:</p> <ul style="list-style-type: none"> IN-1417: Cannot decode unicode character running Stanza IN-1451: CFT_converged.yml when used with customized AMI errors out while creating stack. IN-1445: URLs not accessible in AWS Marketplace offering. IN-1422: Hue broken on fresh Install Azure and AWS Marketplace offers. IN-1391: Use private hostname for Azure provisioning. 						

Version	Updates
1.7.201711082221-1	<p>This version includes the following new features:</p> <ul style="list-style-type: none"> • Support for Version 7.0.0 Release Notes on page 36 and Ecosystem Pack (EEP) Reference on page 7610 4.0.0, 3.0.2, 2.0.3, and 1.1.4. • A new option for enabling or disabling security for the cluster. See Using the Enable Secure Cluster Option on page 6419. • Import State and Export State commands that allow you to recover more easily from Installer failures. See Importing or Exporting the Cluster State on page 6442. • The ability to change timeout parameters to improve the success of Installer operations. • The ability to uninstall a service by deselecting it during an Incremental Install operation. • Support for the <code>scaled_hosts2:</code> parameter for Installer Stanzas. Installer 1.7 (which includes Installer Stanzas) no longer supports the <code>scaled_hosts:</code> parameter for adding nodes to an on-premise cluster. Instead, you need to use the <code>scaled_hosts2:</code> parameter. See Extending a Cluster by Adding Nodes.
1.6.201708241301-1	<p>This version includes the following new features:</p> <ul style="list-style-type: none"> • Support for Installing MapR in the cloud.
1.6.201708012220-1	<p>This version includes the following new features:</p> <ul style="list-style-type: none"> • Support for adding nodes. See Extending a Cluster by Adding Nodes on page 6432. • A new one-click Shutdown command. See Shutting Down a Cluster Using the Installer Shutdown Button on page 6441. • Support for 3-digit EEPs. See Understanding Two-Digit and Three-Digit EEPs on page 6446. • Support for creating a MapR Installer PACC using the Installer setup script. See Creating an Installer Container Using <code>mapr-setup.sh</code> on page 6501.
1.5.201704051050-1	<p>This version includes the following new features:</p> <ul style="list-style-type: none"> • Support for EEPs 3.0, 2.0.1, and 1.1.2. See Ecosystem Pack (EEP) Reference on page 7610. • Support for maintenance updates. See Performing a Maintenance Update on page 6443. • Enhancements to Installer Stanzas. See Using probe and import to Generate the Installer Database on page 6479. • Enhancements to <code>mapr-setup.sh</code> in support of user-created PACC containers. • Support for applying patches. See Applying a Patch Using the Installer on page 426. • Support for SLES 12 SP1.

Version	Updates
1.4.201612081140-1	<p>This version includes the following new features:</p> <ul style="list-style-type: none"> • Support for EEP 2.0. • Support for Installer Stanzas. • Streams Tools. <p>Note these restrictions:</p> <ul style="list-style-type: none"> • Installer 1.4 prevents you from downgrading a EEP. • Installer 1.4 shows only EEP versions equal to or greater than the version currently installed on your cluster. <p>This version includes the following updates:</p> <ul style="list-style-type: none"> • 24891: Installer should not allow you to downgrade the EEP version. • 25213: Error in the process of upgrading Sentry by UI Installer 1.4. • 25277: <code>v.swappiness</code> should be set to "1" rather than "0" in RHEL/CentOS kernels > 2.6.32-303. • 23285: Installer leaves children behind after a stop. • 25421: <code>mapr-setup</code> fails to upgrade java.
1.3.201609291954-1	<p>This version includes the following updates:</p> <ul style="list-style-type: none"> • 23258: The installer now creates a new log for each node for each iteration of the installer. Previously, the installer overwrote the original log file. • 23868: The installer now updates the <code>livy_server_host</code> property on Hue nodes and restarts the live server correctly.
1.3.201608121412-1	<p>This version includes the following new features:</p> <ul style="list-style-type: none"> • When you install or upgrade to 5.2, you select a EEP version before you select ecosystem components. • When you install or upgrade to 5.2, you have the option to install Monitoring. • For local 5.2 installations, the <code>-a</code> parameter of <code>mapr-setup.sh</code> expects three archive files: Installer archive, Ecosystem Pack (EEP) archive, and the 5.2 archive. <p>This version includes the following updates:</p> <ul style="list-style-type: none"> • 23853/22267: The installer validates advanced disk layouts such as <code>/dev/mapper/luks-sdd</code> or <code>/dev/mapper/<lvm_logical_volume_name></code>. • 22904: The installer now allows you to update the cluster license during an incremental installation. • For local 5.0 and 5.1 installations, the archive filename has changed to <code>mapr-5.0-5.1.<yyyymmdd>.*.tgz</code>. • 24295: The installer detects disks correctly on Red Hat 7 operating system versions. • 24340: The installer no longer points to an old package manager (RPM) for the EPEL repository.
1.2.201606140935-1	Version number change only.

Version	Updates
1.2.201605032042-1	<p>This version includes the following updates:</p> <ul style="list-style-type: none"> 23137: On each node in the cluster, Installer automatically applies the latest patch available for the installed JDK version. 22892: Installer no longer fails on Red Hat operating system versions that do not support systemd.
1.2.201602260909-1	<p>This version includes the following updates:</p> <ul style="list-style-type: none"> 21115: The installer performs a prerequisite check on the operating system version of Ubuntu and CentOS/Redhat nodes. 21877: The <code>mapr-setup.sh</code> script provides the ability to specify a non-default hostname and port that nodes in the cluster can use to communicate with the MapR Installer node. You can set a non-default hostname or port using the new prompt that appears while <code>mapr-setup.sh</code> configures the Installer node or pass the script the <code>-p <hostname:port></code> option when you run the command to execute the <code>mapr-setup.sh</code> script.
1.1.201601080826-1	<p>This version includes the following updates:</p> <ul style="list-style-type: none"> 21861: The installer sets the <code>no_proxy</code> environment variable for http connections to the Installer node. 21440: On Safari and Internet Explorer web browsers, the Advanced Configuration settings for the service layout are now accessible.
1.1.201510241120-1	<p>This version includes the following updates:</p> <ul style="list-style-type: none"> 19850: The installer now configures the MySQL database to work with local connections. 20115: The installer disables SELinux without requiring a reboot. 19156: When you abort an installation, the installer provides a link to download the installation logs.
1.0.201508041436-1	<p>This version includes the following update:</p> <ul style="list-style-type: none"> If Java is not installed on RedHat/CentOS, <code>mapr-setup.sh</code> installs Open JDK Java 1.8.
1.0.201507171311-1	<p>This version includes the following updates:</p> <ul style="list-style-type: none"> 19541: The installer no longer supports SSL DHE cipher. It will also disable SSLv3. 19465: When you use a custom service template, the installer now accurately displays service compatibility.
1.0.201507091731-1	<p>This version includes the following updates:</p> <ul style="list-style-type: none"> 18888: You no longer need to restart the <code>mapr-installer</code> process after you use the package manager to upgrade the installer package.
1.0.201506081725-1	<p>This version includes the following updates:</p> <ul style="list-style-type: none"> 18926: Installations no longer terminate due the restart of the <code>sshd</code> process. Minor changes to text and layout on the Services page.
1.0.201506011415-1	Version number change only.

Version	Updates
1.0.201505261302-1	<p>This version includes the following fixes:</p> <ul style="list-style-type: none"> • 18682: When you use package manager to update the installer definition file, you no longer need to re-run <code>mapr-setup.sh</code>. • 18748: The Installer no longer fails to install Hive 0.13 on Ubuntu when the repository includes Hive 1.0.

Installer Help Links

Lists topics that help you prepare for an upgrade performed through the Installer web interface.

Using the Installer

To get started using the Installer, see [Installer](#) on page 6388.

Version-Specific Topics

 **IMPORTANT:** Installer 1.18.0.2 supports core upgrades only from release 7.2.0 to 7.3.0. All EEP upgrades are supported. To upgrade core or EEP manually, see these topics:

- [Upgrading Core Without the Installer](#) on page 278
- [Upgrading the Ecosystem Pack Without the Installer](#) on page 317

Release 7.3 Links	<ul style="list-style-type: none"> • Upgrading Core or EEP Components on page 255 • For upgrades to core: <ul style="list-style-type: none"> • Upgrade Workflows (Release 6.x to 7.0.0) on page 256 • Preparing to Upgrade Core on page 271 • Finishing the Core Upgrade on page 287 • For upgrades to ecosystem components: <ul style="list-style-type: none"> • Preparing to Upgrade the Ecosystem Pack on page 302 • Finishing the Ecosystem Pack Upgrade on page 340 • For cluster expansion using the Installer Extend Cluster function: <ul style="list-style-type: none"> • Post-Expansion Steps for Extending a Cluster on page 6437

Installer Containers

This section describes how you can obtain the Installer as a Docker container.

A Installer container is a Docker container that contains the Installer. You can use a Installer container to perform basic installer operations from a node that is not necessarily a part of a cluster. For example, from a Installer container, you can perform the following actions:

- Start and run the web-based Installer to install a new cluster, apply a patch, or perform an update.
- Run [Installer Stanza commands](#) to probe an installed cluster.

You can create your own Installer container by using the `mapr-setup.sh` script. Or you can download a pre-built container image for the Installer.

Creating an Installer Container Using `mapr-setup.sh`

This section describes how to create an Installer Container image by using the `mapr-setup.sh` script.

Creating the Image

To create an Installer image using `mapr-setup.sh`:

1. Download the `mapr-setup.sh` script to a Linux or Mac OS X platform where Docker 1.12.5 or later is installed and the Docker daemon is up and running. Choose *one* of the following download options:

NOTE: Running `mapr-setup.sh` on Windows is not supported.

- Download the setup script directly from <https://package.ezmeral.hpe.com/> to the node that will run the Installer:

```
wget --user=<email> --password=<token> https://package.ezmeral.hpe.com/releases/installer/mapr-setup.sh -P /tmp
```

- Download to your local workstation, and copy to the node that will run the Installer:
 - a. On the [Download Page](#), click **Download**, and save the setup script to a location on your workstation.
 - b. Use a tool such as `SCP` to copy the file to the node that will run the Installer:

```
scp mapr-setup.sh user@server /tmp
```

2. Run the `mapr-setup.sh` script with the `docker installer` command to create the Docker image:

```
./mapr-setup.sh docker installer
```

3. Respond to the command-line prompts to provide the information to configure the image. The following table describes each prompt. If you press **Enter** without specifying a value, `mapr-setup.sh` uses the default value shown in the square brackets (`[]`):

Prompt	Notes
Build MapR UI Installer image? (y/n) [y]	Type y to continue or n to exit the script.
Image OS class (centos7, ubuntu16) [<local OS>]:	Specify the base operating system on which to build the image.  NOTE: SLES is not currently supported.
Docker FROM base image name:tag [centos:centos7]:	Specify the starting image used to create the new image. If necessary, you can enter your own tag and image name to choose a base image already created for your installation. If you do not enter a name, the script provides one for you.
MapR installer image tag name [<name>]	Accept the software-provided name for the container image, or provide your own name. This is the name you will use to run the image to create the Installer container.
Container memory: specify host XX[kmg] or 0 for no limit [0]:	Specify the maximum amount of memory (in kilobytes, megabytes, or gigabytes) that Docker allows the container to access. For example: <ul style="list-style-type: none"> • 2g • 4096m • 0 Accepting the default (0), means there is no restriction on memory, and the container can use as much memory as the platform makes available.

4. After the last prompt, press **Enter**. The script:

- Prepares the installer
- Installs or verifies installer package dependencies
- Installs installer packages
- Cleans up unneeded files
- Creates the `mapr-docker-installer.sh` sample-run file and displays the location of the file:

```
Edit '/root/docker_images/installer/mapr-docker-installer.sh' to
configure settings and then execute it to start the container
```

`mapr-docker-installer.sh` contains environment variables for the image and makes it easy for you to start the container.

5. (Optional) Edit the `mapr-docker-installer.sh` script file if you want to change any environmental variables. For more information about the environmental variables, see [Environmental Variables for the Installer Container](#) on page 6504.

6. Run the `mapr-docker-installer.sh` file to start `mapr-installer` services:

```
./docker_images/installer/mapr-docker-installer.sh
```

After the installer service is started, you can issue [Stanza commands](#) or open the web-based Installer in a browser:

```
installer (380) started with log /opt/mapr/installer/logs/installer.log
Started service mapr-installer
```

```
...Success
```

To continue installing MapR software, open the following URL in a web browser

If the address '172.17.0.2' is internal and not accessible from your browser, use the external address mapped to it instead

```
https://172.17.0.2:9443
```

NOTE: The Installer maintains the state of the cluster. When the installer is run from a container, the installer database is only as persistent as the container itself. If you need the installer data to be persistent, here are some options:

- If you shut down a Installer container, use the `docker start` command (not the `docker run` command) to restart the same instance of the container. If you create a new instance of the container, the database will have no information.
- Mount the `/opt/mapr/` data directory outside the container to persistent storage to maintain the cluster state.
- Use the Stanza `export` command to export the state of the cluster before you shut down the container. See [Exporting a Cluster Configuration](#).

Running the Installer Container Using Stanza Commands

You can also use the `sample-run` file to execute a Installer Stanza command. In this scenario, the command creates the installer container, runs a Stanza command, and then shuts down the container. For example, the following command runs the Stanza `probe` command on node 10.10.88.53:

```
./docker_images/installer/mapr-docker-installer.sh probe -o
config.ssh_id=root config.ssh_password=mapr
config.hosts='["10.10.88.53"]' -nv
```

For a list of the Stanza commands, see [Installer Stanza Commands](#) on page 6517.

Using the Pre-Built Installer Container Images

This section describes how to obtain and run the pre-built Installer container images.

Pre-built Installer container images are available on Docker hub. Images are available for:

- Ubuntu 16.04
- Ubuntu 14.04
- CentOS 7

- CentOS 6

The pre-built images are about 200 MB. A sample-run script that you can use to start the container is available on GitHub.

To use a pre-built image:

1. Download the pre-built Installer container image and the sample-run script to a Linux or Mac OS X platform where Docker 1.12.5 or later is installed and the Docker daemon is up and running.
 - You can download the pre-built image from the [data-fabric public repository](#).
 - You can download the sample-run script (`mapr-docker-installer.sh`) from this [GitHub location](#).
2. *(Optional)* Edit the `mapr-docker-installer.sh` script file if you want to change any environmental variables. For more information about the environmental variables, see [Environmental Variables for the Installer Container](#) on page 6504.
3. Run the `mapr-docker-installer.sh` file to start `mapr-installer` services:

```
$ ./docker_images/installer/mapr-docker-installer.sh
```

After the installer service is started, you can issue [Stanza commands](#) or open the web-based Installer in a browser:

```
installer (380) started with log /opt/mapr/installer/logs/installer.log
Started service mapr-installer

...Success

    To continue installing MapR software, open the following URL in a
    web browser

        If the address '172.17.0.2' is internal and not accessible
        from your browser, use the external address mapped to it
    instead

                                https://172.17.0.2:9443
```

The Installer maintains the state of the cluster. When the installer is run from a container, the installer database is only as persistent as the container itself. If you need the installer data to be persistent, here are some options:

- If you shut down a Installer container, use the `docker start` command (not the `docker run` command) to restart the same instance of the container. If you create a new instance of the container, the database will have no information.
- Mount the `/opt/mapr/` data directory outside the container to persistent storage to maintain the cluster state.
- Use the Stanza `export` command to export the state of the cluster before you shut down the container. See [Exporting a Cluster Configuration](#).

Environmental Variables for the Installer Container

This section describes environmental variables that you can modify to customize the sample-run script for the Installer container.

About `mapr-docker-installer.sh`

`mapr-docker-installer.sh` is the sample-run script for the Installer container. The script contains the `docker run` command that runs the container and environmental variables that can be passed into the container at run time. Modifying the variables is optional; the script can run without any changes to the environmental variables.

The following environmental variables can be changed in `mapr-docker-installer.sh`:

Environmental Variables in `mapr-docker-installer.sh`

Key	Variable	Description
MAPR_CONTAINER_USER	<user-name>	<p>The user that the user application inside the Docker container will run as. This configuration is functionally equivalent to the Docker native <code>-u</code> or <code>--user</code>. Do not use Docker <code>-u</code> or <code>--user</code>, as the container needs to start as the <code>root</code> user to bring up FUSE before switching to the <code>MAPR_CONTAINER_USER</code>.</p> <p>The user specified here is the user that all storage operations on the cluster will be performed as. Therefore, Hewlett Packard Enterprise recommends not using <code>root</code> or <code>mapr</code>.</p> <p>This user also owns the <code>/opt/mapr</code> directory tree.</p>
MAPR_CONTAINER_UID	<uid>	The UID that the application inside the Docker container will run as. This is a companion to the <code>MAPR_CONTAINER_USER</code> option. If a UID is not provided, the default is UID 1000. Providing a UID is strongly recommended.
MAPR_CONTAINER_GROUP	<group-name>	The group that the application inside the Docker container will run as. This is a companion to the <code>MAPR_CONTAINER_USER</code> option. If a group name is not provided, the default is <code>users</code> . Providing a group name is strongly recommended.
MAPR_CONTAINER_GID	<gid>	The GID that the application inside the Docker container will run as. This is a companion to the <code>MAPR_CONTAINER_USER</code> option. If a GID is not provided, the default is GID 1000. Providing a GID is strongly recommended.
MAPR_PKG_URL	<mapr-pkg-url>	The URL of the repository that hosts the packages (typically https://package.ezmeral.hpe.com/). If you change <code>MAPR_PKG_URL</code> , use the full URL to your repository (for example, <code><hostname>/releases</code>).
MAPR_CONTAINER_PASSWORD	<mapr-password>	The password for the <code>mapr</code> user. This password must be set if the container will remaining running. The password defaults to <code>mapr</code> .
MAPR_STANZA_FILE	<stanza-file>	<p>The path to a Installer Stanza file that needs to be mounted from the host. You must specify this field if you issue the <code>Stanza install</code> command as an argument to the script. For example:</p> <pre>mapr-docker-installer.sh install -nv</pre>
MAPR_MEMORY	<mapr-memory>	<p>Specify the maximum amount of memory (in kilobytes, megabytes, or gigabytes) that Docker allows the container to access. For example:</p> <ul style="list-style-type: none"> 2g 4096m 0

Key	Variable	Description
		Accepting the default (0), means there is no restriction on memory, and the container can use as much memory as the platform makes available.
MAPR_TZ	<time-zone>	The time zone inside the container. For a list of time-zone settings, see this website . The default is UTC.

Installer Stanzas

This section describes how to prepare for and use Installer Stanzas to install, upgrade, or uninstall software.

Installer Stanzas enable API-driven installation of data-fabric clusters. An extension of the [Spyglass Initiative](#), Installer Stanzas enable the creation of a YAML configuration file (a "Stanza") that describes a cluster. A command-line addition to the web-based Installer allows you to execute the configuration file programmatically to automate new deployments.

You can use Installer Stanzas when you need a script-based tool to install MapR software and you do not want to click through the menus and options provided by the Installer. Installer Stanzas provide less visual feedback than the Installer, but they can be faster and more efficient at installing software on clusters with many nodes.

To use Installer Stanzas:

1. **Review the [Installer Stanza Prerequisites](#).**
2. **Use the steps in [Installer](#) to download and run the `mapr-setup.sh` script.** Performing these steps installs both the web-based Installer and the Installer Stanzas feature.
3. **Review or edit the Stanza file.** The Stanza file specifies the installation parameters for your cluster. See [Working with Installer Stanza Files](#) on page 6506.
4. **Run the Installer Stanza file.** See [Running Installer Stanza Files](#).

Installer Stanza Prerequisites

This topic describes some limitations and guidelines that you must understand before using Installer Stanzas.

Most prerequisites that apply to the Installer also apply to Installer Stanzas. To review the Installer prerequisites, see [Installer Prerequisites and Guidelines](#) on page 6390.

Some additional prerequisites are unique to Installer Stanzas:

- To install Installer Stanza features, you must download version 1.4 or later of the Installer. For more information, see [Installer Updates](#) on page 6482 and [Updating the Installer](#) on page 6403.
- You can use Installer Stanzas to install, upgrade, or uninstall only Release 5.1 and later releases.
- You can use Installer Stanzas to upgrade or uninstall only clusters that were previously installed using the Installer or a Installer Stanza. If your MapR software was installed manually, you cannot use Installer Stanzas on the cluster because the cluster does not have the installer database.

Working with Installer Stanza Files

This topic describes how to use the sample Stanza files that are provided with the Installer.

The Installer Stanza file specifies how the cluster should be configured, including the configuration of nodes, disks, software versions, and services. You must configure a Stanza file before using Installer Stanzas to install or upgrade a cluster. Sample Stanza files (basic and advanced) are located in this directory:

```
/opt/mapr/installer/examples
```

To create your Stanza file:

1. Make a copy of one of the sample files. For example, make a copy of the `sample_basic` or `sample_advanced` Stanza file, and rename the copy to a name of your choosing.
2. Using any text editor, edit the Stanza file to address the needs of your installation. Comment out any instructions that you don't need.

This table describes how to complete the fields in the Stanza file:

Section	Parameter	Required/Optional	Directions
environment	<code>mapr_core_version</code>	Required	Specify 5.1.0 or later. Be sure to include the third digit (for example, 5.1.0 or 5.2.0).
	<code>patch_location</code>	Optional	<p>Specify the location of a core patch file. The file name must use the format <code>mapr-patch-<code>[mapr_core_version]</code></code>. For example:</p> <pre>mapr-patch-5.2.0.3 9122.GA-4198.x86_6 4.rpm</pre> <p>Use an absolute path to specify the patch file location.</p>

config	hosts	Required	<p>Specify the list of hosts on which you want to install packages. You can list the hosts on a single line as follows:</p> <pre>- exampleneode[1-3].example.com</pre> <p>Or you can use multiple lines:</p> <pre>- exampleneode1.example.com - exampleneode2.example.com - exampleneode3.example.com</pre> <p>Note:</p> <ul style="list-style-type: none"> • The installer host must be one of the hosts in this list. • A comma-separated list of hosts is not supported. • You can override hosts and disks from the command line. The following example specifies installing only on hosts 01 through 04. To pass an array into an override, use single quotes, double quotes, and brackets as follows: <pre>cli install -nv -t sample_adv.yaml -o config.hosts='["lab[01-04].yourlab.com"]'</pre> <p> NOTE: In a command with an override, the key=value pair or pairs that follow -o must not contain a blank space. For more information about key=value pairs, see Installer Stanza Commands on page 6517.</p>
--------	-------	----------	--

	ssh_id	Required	Specify the user ID that the installer will run under when it installs the packages. This user must have root access and must be present on every host defined in the hosts section.
	ssh_password	Optional	Specify the password (for use with the password-based login). This is the password that the installer uses to log into the node using ssh. Comment this line if you want to use a private-key-based login.
	ssh_key_file	Optional	Specify the path to a file that contains the private key (for use only with the private key-based login). Uncomment this line if you want to use a private-key-based login. If both the ssh_password and ssh_key_file lines are uncommented, the installer will default to the ssh_key_file.
	ssh_port	Optional	Uncomment this line if you need to specify a port other than the default, which is 22.
	license_type	Required	Specify M3 for the community edition or M5 for the enterprise edition.
	mep_version	Required for MapR 5.2.0 and later	Specify a currently supported EEP, such as 2.0. For EEP information, see EEP Components and OS Support on page 6539.
	disks	Required	<p>List the disks on which the packages will be installed. The disk names should be the same on every node. This field is required, and you must use the following notation:</p> <pre>- /<diskname> - /<diskname> - /<diskname></pre> <p>A comma-separated list of disks is not supported. Not all of the disks need to be present, but at least one disk on each node must be present.</p>

	disk_stripe	Optional	Uncomment this line if you need to specify a disk stripe value other than the default, which is 3.
	elasticsearch_path	Optional	Uncomment this line if you need to specify a path where Elasticsearch data will be stored.

	services	Optional	<p>Specify a predefined template of services. Services are the core or ecosystem components (or tools) that run on each group. The installer configures default services automatically unless you specify a "groups" section in the Stanza file. To view the predefined templates, use the <code>list</code> command with the <code>--type TEMPLATE</code> argument.</p> <p> NOTE:</p> <ul style="list-style-type: none"> • Metrics are provided by default. The metrics services apply only to MapR 5.2 and later. • Logging services, if specified, apply only to 5.2 and later. • If you do not specify any services, the Installer will install only core services. • For an incremental install or upgrade, the Installer discovers any services already installed. Additional services are installed only if you request specific services, a EEP upgrade, or a core upgrade. • You can override services using a command such as the following: <pre data-bbox="1252 1686 1458 2095">-o config.serv ices='{"map r-oozie": { } , "mapr-hivem etastore": {"database" : {"name": "hive", "user": "hive", "password": "mapr"} } }'</pre>
--	----------	----------	--

groups (advanced layout only)		Optional	<p>To provision the cluster manually, add services in groups. A group is a collection of hosts (nodes) that runs a specific set of services. The installer creates groups automatically unless you specify the groups manually (manual provisioning).</p> <p>To specify the groups manually, you must include a groups section and define the hosts, labels, and services that your cluster needs. For an example, see the sample_advanced Stanza file.</p> <p>The services you specify must not be of type GROUP. To view the type for a given service, use the <code>list services</code> command with the <code>--name <name-of-service></code> argument.</p> <p>Also, when provisioning manually, you must ensure that the <code>mapr-core</code> service is present on every node.</p>
	hosts	Required (if a groups section is specified)	Hosts are nodes that run a specific set of services.
	label	Optional	The label is a descriptor for each group. Use the label to describe the group function or some other aspect of the group that is meaningful to your installation. If a label is not specified, the installer will auto-generate a label based on the service names.
	services	Required (if a groups section is specified)	See the "Services" section earlier in this table.

Running Installer Stanza Files

This section describes how to install, upgrade, and uninstall MapR software and check the progress of these operations by using Installer Stanza commands.

NOTE: To run Installer Stanza commands, you must navigate to the installer directory. This applies to all the examples in this section:

```
cd /opt/mapr/installer
```

Installing or Upgrading Core Using an Installer Stanza

Use the Stanza `install` command to install Release 5.1 or later, install additional features, upgrade a cluster, perform a maintenance update, or apply a patch.

You can use the `install` command of the Installer Stanza command suite to:

- Perform a fresh install of Release 5.1 or later.
- Perform an incremental install (add or upgrade services that are already installed on the cluster).
- Upgrade a cluster to a newer data-fabric software version or a newer EEP version.
- Perform a [maintenance update](#).
- Apply a patch (see [Applying a Patch Using an Installer Stanza](#) on page 432).
- Extend the cluster by adding nodes (see [Extending a Cluster by Adding Nodes](#) on page 6432).

For the `install` command syntax and options, see [Installer Stanza Commands](#) on page 6517 later in this section.

This example installs data-fabric software using the parameters specified in the `sample_basic.yaml` Stanza file. To run this command, you should be logged in as the `mapr` user. The `-nv` option specifies that certificates will not be checked and the output mode is verbose. The `-t` option, which is required, specifies the use of a template file:

```
./bin/mapr-installer-cli install -nv -t ./examples/sample_basic.yaml
```

If you are using a Installer Stanza to install data-fabric software on a cluster that has never had data-fabric software installed (a fresh installation), it is recommended to create the `mapr` user on all nodes. You can create the `mapr` user by using the `config.cluster_admin_password` override. For example:

```
./bin/mapr-installer-cli install -nv -t ./examples/sample_basic.yaml -o
config.cluster_admin_password=mapr
```

If you use the `install` command and an existing cluster is detected, the installer attempts an incremental install or upgrade using the parameters in the specified Stanza file:

- For incremental installs, the installer does not check or verify the configuration.
- You cannot add nodes or services during a version upgrade.

NOTE: If the password in the Stanza file or in the command contains a special character, such as an exclamation point (!), you might need to escape the character with a backslash (\). For example:

```
./bin/mapr-installer-cli install -u mapr:mapr\!@localhost -nv -t ../
examples/sample_basic.yaml
```

If you do not want to include a password in the Stanza file, you can specify a value contained in a secured file. This example uses a Stanza file (`sample_nopwd.yaml`) in which the `ssh_password` line has been removed. The secured file (`installer.cfg`) stores the value of `ssh_password` as `config.ssh_password=mapr`. The contents of `installer.cfg` are piped to the `install` command via an override (`-o -`). You must include the `-` after the `-o`; otherwise, the file contents are not read.

```
cat examples/installer.cfg | ./bin/mapr-installer-cli install -nv -t
examples/sample_nopwd.yaml -o -
```

To check the progress of the installation or upgrade, see [Checking the Progress of Operations](#). For another example of using the `install` command, see [How to Build Stanzas](#).

New Installation of Release 6.0 Secure Cluster Using Stanzas

To install a Release 6.0 secure cluster using Stanzas, you must add two parameters to the Stanza:

- `config.security: "true"`

- `config.cluster_admin_password: "<mapr_user_password>"`

For example:

```
config:
  security: "true"
  cluster_admin_password: "mapr"
```

After the installation completes, `secure=true` should be set in the `/opt/mapr/conf/mapr-clusters.conf` file. This command should print the ticket details:

```
maprlogin print -ticketfile /opt/mapr/conf/mapruserticket
```

Note these considerations for installing a Release 6.0 secure cluster:

- If you use a Stanza to perform a secure install, you must log out and then log in one time for the `bashrc` to take effect.
- For non-bash environments, you must manually add the above `export` to your login profile.
- You can use the `probe` command to detect whether a cluster is secure or not.

Uninstalling Core Using an Installer Stanza

Specifies how to uninstall Core from the command line.

You can use the `uninstall` command to uninstall the current data-fabric software version. The `uninstall` command requires that you specify two overrides:

- `config.ssh_id`
- `config.ssh_password` or `config.ssh_key_file`

NOTE: Using the `uninstall` command requires `root` privileges. You can provide the `root` ID and password or the `root` ID and `ssh_key_file`.

This example uninstalls the currently installed data-fabric software. The command uses an override to provide the `ssh_id` and `ssh_password` and includes `-nv` so that certificates will not be checked, and the output mode is verbose.

```
./bin/mapr-installer-cli uninstall -nv -o config.ssh_id=root -o
config.ssh_password=mapr
```

This example uninstalls the currently installed data-fabric software. The command uses an override to provide the `ssh_id` and `ssh_key_file` and includes `-nv` so that certificates will not be checked, and the output mode is verbose. The `ssh_key_file` for `root` normally resides in `/root/.ssh`. In this example, the file has been copied to `/home/mapr/root` so that the `mapr` user can access the key file.

```
./bin/mapr-installer-cli uninstall -nv -o config.ssh_id=root -o
config.ssh_key_file=/home/mapr/root_user_id_rsa
```

Exporting a Cluster Configuration

If a cluster was installed using the Installer or a Installer Stanza, you can use the `export` command to generate a Stanza that captures the state of the cluster. You can then modify the Stanza to perform incremental installs or upgrades.

This example uses the `export` command to generate the `tt.yaml` Stanza file. The command includes `-n` so that certificates will not be checked:

```
./bin/mapr-installer-cli export -n --file /tmp/tt.yaml
```

NOTE: The `export` command does not export the `config.ssh_password` field. When using the exported YAML file, you need to provide the password manually, pass it as an override, or specify a value contained in a secured file, as described in [Installing or Upgrading Core Using an Installer Stanza](#) on page 6512.

For another example of using the `export` command, see [MapR Stanzas \(blog\)](#).

Getting Information About Services and Groups

Use the Stanza `list` command to get additional information about your cluster.

You can use the `list` command and its arguments to get information about the configuration, services, groups, hosts, and services in the cluster. While the `list` command provides the state of the cluster, `list` output is not suitable for incremental installs and upgrades. You must use the `export` command if you want to generate a Stanza file that can be used for upgrading.

This example displays a listing of all the services, groups, and hosts that were installed:

```
./bin/mapr-installer-cli list installed -n
```

This example lists all the groups:

```
./bin/mapr-installer-cli list groups -n
```

This example lists all the hosts:

```
./bin/mapr-installer-cli list hosts -n
```

This example lists the installation status for all the hosts:

```
./bin/mapr-installer-cli list hosts_install_status -n -u https://  
mapr:<password>@<installer_ip_addr>:9443
```

This example lists the services by template:

```
./bin/mapr-installer-cli list services -n --type TEMPLATE|more
```

You can use the `list services` command to learn about different kinds of services. For example:

Group Type	Example Command
CONTROL	<pre>./bin/mapr-installer-cli list services -n --type CONTROL</pre>
MULTI_MASTER	<pre>./bin/mapr-installer-cli list services -n --type MULTI_MASTER</pre>
	<pre>./bin/mapr-installer-cli list services -n --type MONITORING_MASTER</pre>

Group Type	Example Command
DATA	<code>./bin/mapr-installer-cli list services -n --type DATA</code>
	<code>./bin/mapr-installer-cli list services -n --type DEFAULT</code>
	<code>./bin/mapr-installer-cli list services -n --type CLIENT</code>
SINGLE MASTER	<code>./bin/mapr-installer-cli list services -n --type MASTER</code>

Verifying the Nodes

You can use the `check` command to verify that the nodes specified in the Stanza file are ready to be installed. The `check` command does not check the Stanza file and does not do any provisioning or installation. The `check` command runs the same checks that the Installer runs during its Verification phase. For example, it checks that the nodes have the right OS version, that they have enough disk space, and that they have enough memory to support installation or other Installer operations.

This example verifies the nodes specified in the `sample_advanced_demo.yaml` file. The `-nv` option specifies that certificates will not be checked and the output mode is verbose. The `-t` option, which is required, specifies the use of a template file:

```
./bin/mapr-installer-cli check -nv -t sample_advanced_demo.yaml
```

Resetting the Installer Database

The `reset` command uninstalls the metadata from the Installer database. `reset` is for advanced users.

You can reset the Installer database by using the CLI `reset` command or by using the Installer web interface (**Support > Reset Installer**).

The `reset` function can be useful for testing purposes, but use `reset` with caution. If you reset the installer database while packages are installed on the nodes, you will need to remove the packages manually.

NOTE: If you experience a failure while installing or uninstalling, the installer prompts you to retry the operation or uninstall and then reinstall from scratch. You should always retry or uninstall before considering using `reset`.

This example resets the Installer database. The `-nv` option specifies that certificates will not be checked and the output mode is verbose:

```
./bin/mapr-installer-cli reset -nv
```

Adding a License Using Stanzas

Explains how to add a license using Installer Stanzas.

In addition to using `maprcli`, REST commands, or the Control System to add a license, you can add a license using Installer Stanzas. After obtaining a valid license file from your sales representative, copy the license file to a cluster node (for example, to `/tmp/license.txt`). You can then use the `license` command to apply the license to the cluster. For example:

```
mapr-installer-cli license -n -l <path-to-license-file>
```

Checking the Progress of Operations

This topic describes how to use the Installer web interface and installer logs to check the status of Installer Stanza operations.

Using the Installer to Check Status

The installer provides messages and progress bars to indicate the status of Installer Stanza operations. However, you can also use the [Installer](#) interface to check the current status of your cluster. The Installer provides a quick visual summary of the currently installed software versions and services.

To view the Installer web interface:

```
https://<Installer Node hostname/IPaddress>:9443
```

Viewing the Installer Logs

To view or understand the logs generated by the Installer or Installer Stanza operations, see [Installer Log Descriptions](#).

Shutting Down a Cluster Using an Installer Stanza Command

Use the Stanza `shutdown` command to shut down an on-premise or cloud-based cluster.

The Stanza `shutdown` command is available with Installer 1.6 or later. The command shuts down Warden and Zookeeper, which in turn shut down other running services that are part of a data-fabric cluster. When you use the `shutdown` command, the Installer implements the same orderly shutdown that it uses to perform software upgrades.

You must supply the ssh ID and password or the ssh ID and `ssh_key_file`.

The `shutdown` command works differently for cloud-based clusters. Note these considerations for the behavior of the `shutdown` command:

Cluster Location	Shutdown Command Behavior
On premise	Does not stop non-data-fabric software and does not power off the nodes.
In the cloud	Shuts down (but does not remove) all the nodes in the cluster. If the installer node is part of the cluster, the installer node is not shut down. To shut down the installer node, use AWS-console or Azure-portal commands to stop the instance.

This example shuts down a cluster. The command uses an override to provide the `ssh_id` and `ssh_password` and includes `-nv` so that certificates will not be checked, and the output mode is verbose.

```
./bin/mapr-installer-cli shutdown -nv -o config.ssh-id=root -o config.ssh_password=mapr
```

This example shuts down a cluster. The command uses an override to provide the `ssh_id` and `ssh_key_file` and includes `-nv` so that certificates will not be checked, and the output mode is verbose. The `ssh_key_file` for root normally resides in `/root/.ssh`. In this example, the file has been copied to `/home/mapr/root` so that the `mapr` user can access the key file.

```
./bin/mapr-installer-cli shutdown -nv -o config.ssh_id=root -o config.ssh_key_file=/home/mapr/root_user_id_rsa
```

Installer Stanza Commands

This topic provides the syntax and options for Installer Stanza commands.

Command Usage

To use Installer Stanza commands, you must log in as the cluster administrator user that you configured while running the `mapr-setup.sh` script. For more information, see [Managing Users and Groups](#).

check

Use the `check` command to verify that the nodes specified in the Stanza file are ready to be installed. For more information, see [Verifying the Stanza File](#).

```
check [-h]
      [--overrides [OVERRIDES [OVERRIDES ...]]]
      [--no_check_certificate][--url URL]
      [--force][--verbose] --template TEMPLATE
```

`export`

You can use the `export` command to discover a currently installed cluster and generate a Stanza file that captures the configuration, the groups, and the hosts for the cluster. You can then modify the Stanza file to install other clusters. For more information, see [Exporting a Cluster Configuration](#).

NOTE: The Stanza file generated by the `export` command does not contain the `ssh_password` or `ssh_key_file` values. You need to add those values manually or provide them on the command line by using an override.

```
export [-h]
      [--overrides [OVERRIDES [OVERRIDES ...]]]
      [--no_check_certificate] [--url URL]
      [--file FILE]
```

`import`

The `import` command prepares the installer database using the template generated by the `probe` command. You must specify a template (YAML file) to use the import command. For more information, see [Using probe and import to Generate the Installer Database](#) on page 6479.

```
import [-h][--no_check_certificate][--url URL][--verbose]
      --template TEMPLATE
```

`install`

You can use the `install` command to perform a fresh install, an incremental install, or an upgrade. For more information, see [Installing or Upgrading Core Using an Installer Stanza](#) on page 6512.

```
install [-h]
      [--overrides [OVERRIDES [OVERRIDES ...]]]
      [--no_check_certificate][--url URL]
      [--force][--verbose] --template TEMPLATE
```

`license`

Use the `license` command to add a license from a license file. For more information, see [Adding a License Using Stanzas](#) on page 6516.

```
license [-h]
      [--no_check_certificate][--url URL]
      --license LICENSE <license-file>
```

`list`

You can use the `list` command to display information about the configuration, services, groups, and hosts that are present in the Installer database. For more information, see [Getting Information About Services and Groups](#).

```
list [-h]
     {config,groups,hosts,hosts_install_status,installed,services} ...
```

probe

The `probe` command generates a template file that can be used to create an installer database on a cluster that doesn't have one. A cluster must have an installer database in order for you to use Installer Stanzas on the cluster. If the installer database is not present, you can use the `probe` command followed by the `import` command to generate one. For more information, see [Using probe and import to Generate the Installer Database](#) on page 6479.

```
probe [-h]
      [--no_check_certificate][--url URL]
      [--force][--verbose] --template TEMPLATE
      [--overrides [OVERRIDES [OVERRIDES ...]]][--verbose]]
```

reset

The `reset` command uninstalls the metadata from the installer database. For more information, see [Resetting the Installer Database](#).

```
reset [-h] [--overrides [OVERRIDES [OVERRIDES ...]]]
      [--no_check_certificate] [--url URL]
      [--force] [--verbose]
```

shutdown

The `shutdown` command shuts down the cluster. For more information, see [Shutting Down a Cluster Using an Installer Stanza Command](#) on page 6517.

```
shutdown [-h] [--overrides [OVERRIDES [OVERRIDES ...]]]
          [--no_check_certificate] [--url URL]
          [--force] [--verbose]
```

uninstall

The `uninstall` command removes MapR software. For more information, see [Uninstalling Core Using an Installer Stanza](#).

```
uninstall [-h]
          [--overrides [OVERRIDES [OVERRIDES ...]]]
          [--no_check_certificate] [--url URL]
          [--force] [--verbose]
```

Command Options

All of the following command options are optional except for the `TEMPLATE` option:

Option	Description
<code>-h</code> or <code>--help</code>	Show this help message and exit.
<code>-o [OVERRIDES[OVERRIDES ...]]</code> or <code>--overrides[OVERRIDES[OVERRIDES ...]]x</code> = <code>y</code> list of overrides or <code>-</code> for stdin	Use the specification provided on the command line instead of the Stanza file instructions. Overrides are typically used when you want to specify a host name, user ID, password, or key file on the command line.

	<p> NOTE:</p> <p>The key=value pair or pairs specified in a Stanza override must not include blank spaces. For example, do not use this command:</p> <pre>./mapr-installer-cli probe -o config.hosts='["host1", "host2", "host3"]'</pre> <p>Use this command instead:</p> <pre>./mapr-installer-cli probe -o config.hosts='["host1","host2","hos t3"]'</pre> <p>In the second command, <code>config.hosts</code> is the key, and <code>'["host1","host2","host3"]'</code> is the value. An override can specify multiple key=value pairs with each pair separated by a space:</p> <pre>-o <key1=value1> <key2=value2> <key3=value3></pre>
<code>-n</code> or <code>--no_check_certificate</code>	Do not verify SSL certifications.
<code>-u</code> URL or <code>--url</code> URL	Installer URL (user:password@host:port)
<code>--file</code> FILE	The <code>export</code> file path.
<code>-f</code> or <code>--force</code>	Force action. This option eliminates user input and answers yes to all questions returned by the software.
<code>-v</code> or <code>--verbose</code>	Verbose output.
<code>-t</code> TEMPLATE or <code>--template</code> TEMPLATE	The specified Stanza template file (required for the <code>install</code> and <code>import</code> commands). The template file can be a local file on the installer node, or it can be a remotely accessible URL.

Command Line Help

You can access online help at the command line using any of these commands:

Command	This command displays...
<code>./bin/mapr-installer-cli -h</code>	Top-level help for the installer
<code>./bin/mapr-installer-cli <cmd> -h</code> where <code><cmd></code> is one of the following: <ul style="list-style-type: none"> • <code>check</code> • <code>export</code> • <code>import</code> • <code>install</code> • <code>license</code> 	Help for the specified command

<ul style="list-style-type: none"> • list • probe • reset • uninstall 	
---	--

Interoperability Matrices

This section provides tables that show the operating system (OS), JDK, ecosystem, and data-fabric client support for the HPE Ezmeral Data Fabric. Check these tables for information about software compatibility.

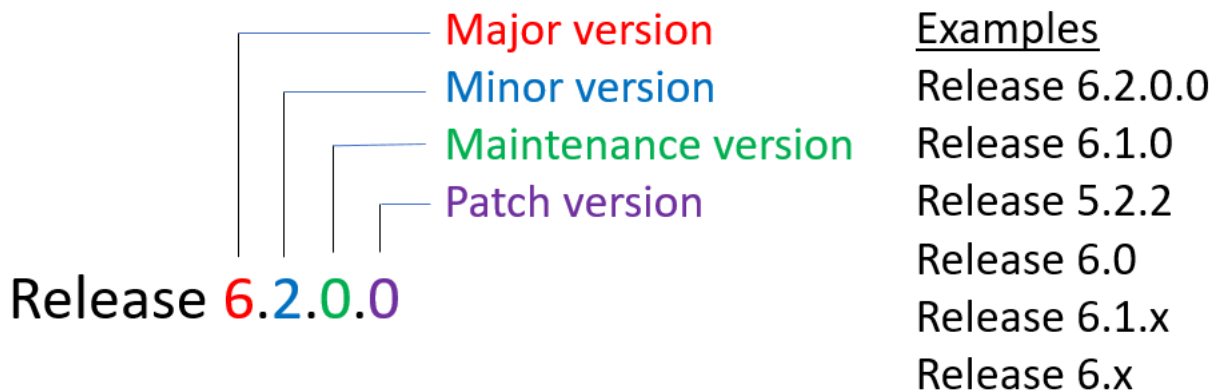

Understand Software Versions

Understanding the version numbers used by core, Ecosystem Packs (EEPs), EEP components, and patches can help you keep your software up to date and plan for upgrades.

HPE Ezmeral Data Fabric release versions generally follow the industry-standard **<major>.<minor>.<maintenance>** format, with a number representing each version. However, some data-fabric software products use different versioning formats. The following sections describe the characteristics of the various data-fabric versioning formats.

Core Versions

In HPE Ezmeral Data Fabric interfaces and documentation, core versions are expressed as a dot-separated string of numbers having two, three, or four places. For example:

A Change to This Version	Typically Includes	For Example
Core major version	Significant new features and API changes that can introduce incompatibilities with the previous version.	Release 6.x followed Release 5.2.x and added built-in security features, database features (secondary indexes), new APIs (Apache OJAI and Change Data Capture), a new EEP series (EEP 4.x), file-system enhancements, a new installer version, and a redesigned control system for monitoring the cluster.
Core minor version	New features, bug fixes, and API changes that are sometimes incompatible with the previous version.	Release 6.1 followed Release 6.0.1 and added security by default, a new ZooKeeper version, several new

A Change to This Version	Typically Includes	For Example
		database features (Node.js and Python OJAI clients, complex type support, table metrics, support for the OJAI 3.0 API), a new installer version, a new EEP series (EEP 6.x), and storage tiers for the file system.
Core maintenance version	Bug fixes only. This version typically does <i>not</i> introduce incompatibilities with the previous version. ¹	Release 5.2.2 followed maintenance release 5.2.1 and introduced new EEPs, improvements to the disk space balancer tool, and a new Installer version, but did not include new features or API changes.
Core patch version	An emergency bug fix (EBF) patch update, which provides bug fixes and does not introduce new features.	Release 6.2.0.1 represents a patch, or EBF, on top of core release 6.2.0.0. Releases 6.2 and later add the fourth place as a patch version. Even though a core version is a string having two, three, or four places, most references to core versions in the data-fabric documentation use two or three places.

¹Release 6.0.1 was an exception to this rule, adding REST API access to HPE Ezmeral Data Fabric Database JSON tables, event timestamp support for stream processing, streaming audit logs for the HPE Ezmeral Data Fabric File Store, and a new EEP series (EEP 5.x).

EEP Versions

In HPE Ezmeral Data Fabric interfaces and documentation, Ecosystem Pack (EEP) versions are expressed as a dot-separated string of numbers having two or three places. For example:

A Change to This EEP Version	Typically Includes	For Example
Major version	A new EEP series that supports a new major, minor, or maintenance version of core.	EEP Support and Lifecycle Status on page 6533 shows how EEP major versions change when new versions of core are introduced.
Minor version	A significant change in features or APIs but no change in support for the current core version.	EEPs 6.0.1 and 6.1.0 both support Release 6.1.0, but EEP 6.1.0 introduced new HPE Ezmeral Data Fabric Database features, such as the C# and Go OJAI clients, as well as new features for ecosystem components (Flume, Oozie, Tez, and Apache Kafka). EEP 6.2.0, which also supports Release 6.1.0, introduced new ecosystem component versions (Hue, Impala, Spark) and updated some components (Oozie and Hive).

A Change to This EEP Version	Typically Includes	For Example
Maintenance version	Bug fixes only. EEP maintenance versions do not add new features or API changes and are backward compatible in the same EEP series.	EEPs 5.0.3, 5.0.2, and 5.0.1 added bug fixes to the EEP 5.0.x line while preserving compatibility with Release 6.0.1.

About the Patch Version

Beginning with EEP 6.1.0, version numbers for some ecosystem components and data-fabric tools use a dot-separated string having four places instead of two or three places. For example:

- Oozie 5.1.0.0
- Installer 1.11.0.0

The fourth numeral represents the patch version. The patch version adds a unique descriptor for patches that can occur between releases. In future releases, as new versions of components are released, more components and tools will transition to a version string that includes the patch version.

How the Patch Version Increments

Beginning with EEP 6.2.0, the patch version can be a number in the range 0 through 999. For a newly released component, the patch version starts at 0 and increments by 1 when there is an EBF update. For example, if the EEP 6.1.0 general availability (GA) package version for Oozie is 5.1.0.0, the first bug-fix (EBF) package version will be Oozie 5.1.0.1. The next bug fix package version will be Oozie 5.1.0.2, and so on.

If the same version of a component is present in multiple EEPs, the patch version increments by 100 to provide a range of usable version numbers for future patches. This numbering scheme ensures that all patches have a unique version. The following table shows how the Oozie patch version increments for EEPs 6.1.0, 6.1.1, and 6.2.0:

EEP	Oozie GA Version	1st Oozie Patch Version	2nd Oozie Patch Version
6.1.0	5.1.0.0	5.1.0.1	5.1.0.2
6.1.1	5.1.0.100	5.1.0.101	5.1.0.102
6.2.0	5.1.0.200	5.1.0.201	5.1.0.202

To obtain EBF patches, you must contact HPE Support. HPE Support makes EBF patch versions available for specific known issues. See [Patches for Known Issues](#).

Maven Version Format

Beginning with EEP 6.2, the patch version also is present in Maven artifacts for components that use the four-place versioning. In addition, the Maven version format changes to include the associated EEP instead of the YYMM timestamp:

Old Maven format with YYMM timestamp: `maprdb-spark-2.2.1-mapr-1803.jar`

Maven format with EEP number: `maprdb-spark-2.3.3.0-mapr-602.jar`

Beginning with EEP 8.1.0, artifact naming changed again to remove `mapr` from the version string and replace it with `eep`. For example:

Maven format that replaces `mapr` with `eep`: `1.4.13.200-eep-810`

The Maven version increments in the same way that the patch version increments. This table shows how the Spark package version and Maven versions increment when new EBF patch versions become available:

EEP	EEP 6.0.2	EEP 6.1.1	EEP 6.0.3*	EEP 6.1.2*
Spark Package Version	mapr-spark-2.3.3.0.<timestamp>	mapr-spark-2.3.3.100.<timestamp>	mapr-spark-2.3.3.200.<timestamp>	mapr-spark-2.3.3.300.<timestamp>
Spark 1st EBF Package Version	mapr-spark-2.3.3.1.<timestamp>	mapr-spark-2.3.3.101.<timestamp>	mapr-spark-2.3.3.201.<timestamp>	mapr-spark-2.3.3.301.<timestamp>
Spark Maven Version	2.3.3.0-mapr-602	2.3.3.100-mapr-611	2.3.3.200-mapr-603	2.3.3.300-mapr-612
Spark 1st EBF Maven Version	2.3.3.1-mapr-602	2.3.3.101-mapr-611	2.3.3.201-mapr-603	2.3.3.301-mapr-612

*This release is not currently available and is included only for illustration purposes.

A patch release can trigger periodic updates to the Maven repository. You may notice patches in the sftp.mapr.com repository that are not updated in the Maven repository. This is normal. The Maven repository will be updated eventually. The latest patch versions are always propagated first to sftp.mapr.com. If you have questions about patches, contact your HPE support representative.

Operating System Support Matrix

The tables on this page show the Linux operating-system versions that are supported for HPE Ezmeral Data Fabric releases.

For a list of the EEPs that you can use with each core release, see [EEP Support and Lifecycle Status](#) on page 6533.

Red Hat Enterprise Linux (64-bit)

NOTE: The RHEL versions in the following table have been certified with the specified HPE Ezmeral Data Fabric versions.

HPE recommends pinning your deployment to a certified version. If your RHEL instances are not pinned to a specific version, and there is a later RHEL minor release available, then updates for packages (including security updates) come from the later release. If this later release is not certified, the new package versions might cause issues with your deployment.

¹Supported only for EEPs 6.3.0 and later.

²NFSv4 is not supported for core 6.1.0 on Red Hat Enterprise Linux / CentOS 8.x.

³Hue 4.3.0 in EEP 6.3.0 and 6.3.1 is not supported for Red Hat Enterprise Linux (RHEL) or CentOS 8.x. However, Hue 4.3.0.300 in EEP 6.3.2 can be used with RHEL or CentOS 8.x.

⁴Installing release 6.1.0 on RHEL or CentOS 8.x requires you to enable the EPEL repository. Starting in RHEL 8.x, a `mapr-core-internal` package dependency (`sdparm`) is deprecated and moved to EPEL, and installation cannot complete without enabling it. For information about adding repositories, see [Adding the Data Fabric Repository on RHEL, CentOS, or Oracle Linux](#) on page 132.

⁵May require a patch. For best results, apply the latest EBF. To install patches, see [Applying a Patch](#) on page 425.

⁶Requires a patch. Certified only for EEP 5.0.4. Other EEPs supported by release 6.0.x might work but have not been certified.

⁷Use Installer 1.10 or later with this release. Before upgrading your operating system to Red Hat Enterprise Linux 7.5, CentOS 7.5, or SLES12 SP3 or later, be sure to update the Installer to version 1.10 or later. See [Updating the Installer](#) on page 6403.

¹Both core and ecosystem components (EEP 9.1.0 and later 9.x.x) can be used on the supported versions of Oracle Enterprise Linux.

²Only data-fabric core software can be used on the supported versions of Oracle Enterprise Linux. Ecosystem components are not supported.

³Both core and ecosystem components (EEP 7.x.x and later) can be used on the supported versions of Oracle Enterprise Linux.

⁴Requires a patch. To install patches, see [Applying a Patch](#) on page 425.

Understand the Core Lifecycle

Describes the HPE Ezmeral Data Fabric core lifecycle and defines the lifecycle stages, which are Active, In Maintenance, and End of Maintenance.

Core Lifecycle Stages

Hewlett Packard Enterprise periodically releases new core software. Each core release is supported for an amount of time that can vary depending on the new releases that follow it. When new core versions are released, older core versions are deprecated or discontinued. Each core version therefore has its own lifecycle. As shown in the diagram, a core release can transition through three lifecycle stages:

- Active
- In Maintenance (18 months)
- End of Maintenance

Core Lifecycle

Typically, within six months after a new release, Hewlett Packard Enterprise issues an advisory to indicate the end of maintenance for older versions of core. Eighteen months after the advisory is issued, the In-Maintenance core version reaches the End-of-Maintenance stage and is discontinued.

To view the current lifecycle status for every core release, see [Core Support and Lifecycle Status](#) on page 6532. The following table describes the lifecycle stages:

Support and the Lifecycle Stages

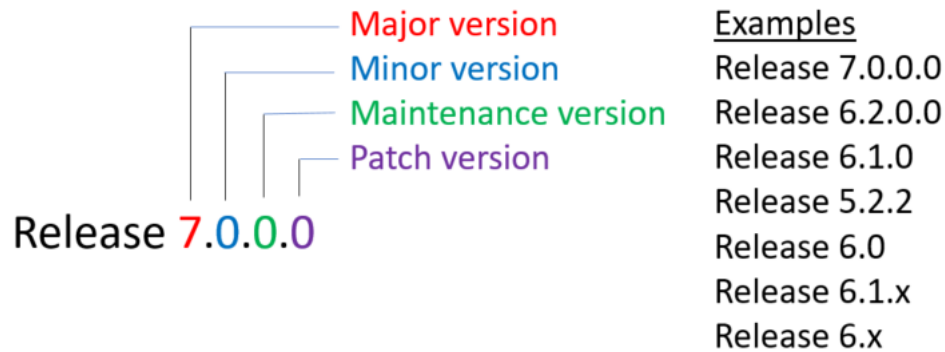

Support Activity	Notes	Lifecycle Stage		
		Active	In Maintenance	End of Maintenance
Proactive Maintenance (Minor, Maintenance, Patch)	Includes proactive fixes for security vulnerabilities, critical bugs, and other issues.	Yes	No	No
Reactive Maintenance (Escalation Support + Patch)	Requires the user to open cases resulting in tactical fixes for critical bugs, where backporting is feasible.	Yes	Yes ¹	No
Assisted Support (Usage / Debug Support)	Does not include patch fixes.	Yes	Yes	No

¹Includes fixes for critical bugs and CVEs reported to Support. Does not include documentation updates.

Core Versions

In HPE Ezmeral Data Fabric interfaces and documentation, core versions are expressed as a dot-separated string of numbers having two, three, or four places. Updates and bug

fixes result in changes to the major, minor, maintenance, and patch versions of a core

release:

Notification of Changes in Support for Released Core Versions

To notify users about changes in EEP support, Hewlett Packard Enterprise issues periodic support advisories. When core releases are deprecated or discontinued, users of those releases are encouraged to upgrade to newer versions. For more information about support advisories, see [Security Vulnerabilities](#) on page 7683 and [Support Articles in the HPE Support Center](#) on page 7696.

Understand the EEP Lifecycle

This page describes the EEP lifecycle and defines the lifecycle stages, which are Active, In Maintenance, and End of Maintenance.

EEP Lifecycle Stages

HPE periodically releases new ecosystem components as ecosystem packs (EEPs). Each EEP is supported for 18 months. When new EEPs are released, older EEPs transition to In Maintenance or End of Maintenance. Each EEP therefore has its own lifecycle.

As shown in the diagram, an EEP can transition through three lifecycle stages:

- Active (12 months)
- In Maintenance (6 months)
- End of Maintenance

The lifecycle stage determines if HPE issues updates and bug fixes for the EEP, which are reflected in changes to the major, minor, and maintenance versions of the EEP:

EEP Lifecycle

To view the current lifecycle status for every EEP, see [EEP Support and Lifecycle Status](#) on page 6533.

EEP Versions

In HPE Ezmeral Data Fabric interfaces and documentation, Ecosystem Pack (EEP) versions are expressed as a dot-separated string of numbers having two or three places. For example:

A Change to This EEP Version	Typically Includes	For Example
Major version	A new EEP series that supports a new major, minor, or maintenance version of core.	EEP Support and Lifecycle Status on page 6533 shows how EEP major versions change when new versions of core are introduced.
Minor version	A significant change in features or APIs but no change in support for the current core version.	EEPs 6.0.1 and 6.1.0 both support Release 6.1.0, but EEP 6.1.0 introduced new HPE Ezmeral Data Fabric Database features, such as the C# and Go OJAI clients, as well as new features for ecosystem components (Flume, Oozie, Tez, and Apache Kafka). EEP 6.2.0, which also supports Release 6.1.0, introduced new ecosystem component versions (Hue, Impala, Spark) and updated some components (Oozie and Hive).
Maintenance version	Bug fixes only. EEP maintenance versions do not add new features or API changes and are backward compatible in the same EEP series.	EEPs 5.0.3, 5.0.2, and 5.0.1 added bug fixes to the EEP 5.0.x line while preserving compatibility with Release 6.0.1.

Notification of Changes in Support for Released EEPs

To notify users about changes in EEP support, HPE issues periodic support advisories. When EEPs are deprecated or discontinued, users of those EEPs are encouraged to upgrade to newer EEPs. For more information about support advisories, see [Security Vulnerabilities](#) on page 7683 and [Support Articles in the HPE Support Center](#) on page 7696.

Core Support and Lifecycle Status

This page shows the support and lifecycle status for all versions of HPE Ezmeral Data Fabric core software.

Whenever possible, upgrade to the latest version of data-fabric core so that you can take advantage of new features, usability enhancements, and defect repair. If your installed version of core is "in maintenance," you have a limited amount of time to plan and execute a core upgrade.

For information about the core lifecycle, see [Understand the Core Lifecycle](#) on page 6528. For core compatibility with the leading Linux operating systems, see [Operating System Support Matrix](#) on page 6525.

Core Lifecycle and Maintenance Dates

Related concepts

[Understand Software Versions](#) on page 6521

Understanding the version numbers used by core, Ecosystem Packs (EEPs), EEP components, and patches can help you keep your software up to date and plan for upgrades.

[Checking the Core Version](#) on page 6409

Some maintenance operations require you to know the version of the currently installed HPE Ezmeral Data Fabric release (sometimes referred to as the "core version"). You can check the core version easily from within the Control System or Installer user interface or identify the version from your installed packages.

[Upgrading Ecosystem Packs](#) on page 301

Describes how to upgrade Ecosystem Packs (EEPs), either as part of a core upgrade or to take advantage of a new EEP for the current version of core.

Related reference

[Understand the Core Lifecycle](#) on page 6528

Describes the HPE Ezmeral Data Fabric core lifecycle and defines the lifecycle stages, which are Active, In Maintenance, and End of Maintenance.

[Understand the EEP Lifecycle](#) on page 6530

This page describes the EEP lifecycle and defines the lifecycle stages, which are Active, In Maintenance, and End of Maintenance.

EEP Support and Lifecycle Status

This page shows the EEPs that are supported for different core releases and the current lifecycle status for each EEP.

Whenever possible, upgrade to the latest EEP supported by your core version so that you can take advantage of bug fixes and usability enhancements. If your installed EEP is In Maintenance or has transitioned to End of Maintenance, see the corresponding upgrade recommendation and support advisory to understand your options.

To learn more about the EEP lifecycle, see [Understand the EEP Lifecycle](#) on page 6530. To view the original release date for any EEP, see [Release History for EEPs](#) on page 6636. For core lifecycle information, see [Core Support and Lifecycle Status](#) on page 6532.

Core Release 7.6.x

6.3.5*	End of Maintenance	October 31, 2022	April 30, 2023	Upgrade to latest EEP 6.x.x	
6.3.4*	End of Maintenance	June 30, 2022	December 31, 2022	Upgrade to latest EEP 6.x.x	
6.3.3	End of Maintenance	March 31, 2022	November 1, 2022	Upgrade to latest EEP 6.x.x	

*Before using this EEP with the specified core version, you must apply the latest core patch. See [Downloading a Patch](#) on page 425.

Core Release 6.1.0

EEP	EEP Lifecycle Status	In Maintenance	End of Maintenance	EEP Upgrade Recommendation	Support Advisory
6.4.0*	Active	December 2, 2023	June 2, 2024	N/A	N/A
6.3.6*	End of Maintenance	January 31, 2023	July 31, 2023	Upgrade to latest EEP 6.x.x	Change of lifecycle stage and level of support with MEP release in June 2021
6.3.5*	End of Maintenance	October 31, 2022	April 30, 2023	Upgrade to latest EEP 6.x.x	
6.3.4*	End of Maintenance	June 30, 2022	December 31, 2022	Upgrade to latest EEP 6.3.x	
6.3.3*	End of Maintenance	March 31, 2022	November 1, 2022	Upgrade to latest EEP 6.3.x	
6.3.2	End of Maintenance	January 31, 2022	July 31, 2022	Upgrade to latest EEP 6.3.x	
6.3.1	End of Maintenance	September 18, 2021	March 31, 2022	Upgrade to latest EEP 6.3.x	
6.3.0	End of Maintenance	December 16, 2020	December 31, 2021	Upgrade to latest EEP 6.3.x	
6.2.0	End of Maintenance	December 31, 2019	December 31, 2021	Upgrade to latest EEP 6.3.x	
6.1.1	End of Maintenance	December 31, 2019	December 31, 2021	Upgrade to latest EEP 6.3.x	
6.1.0	End of Maintenance	December 31, 2019	December 31, 2021	Upgrade to latest EEP 6.3.x	
6.0.2	End of Maintenance	December 31, 2019	December 31, 2021	Upgrade to latest EEP 6.3.x	
6.0.1	End of Maintenance	December 31, 2019	December 31, 2021	Upgrade to latest EEP 6.3.x	
6.0.0	End of Maintenance	December 31, 2019	December 31, 2021	Upgrade to latest EEP 6.3.x	

*Before using this EEP with the specified core version, you must apply the latest core patch. See [Downloading a Patch](#) on page 425.

Core Release 6.0.1

EEP	EEP Lifecycle Status	In Maintenance	End of Maintenance	EEP Upgrade Recommendation	Support Advisory
5.0.8	End of Maintenance	September 30, 2022	September 30, 2023	Upgrade to core 7.1.0 and EEP 9.0.0 or later	N/A

EEP	EEP Lifecycle Status	In Maintenance	End of Maintenance	EEP Upgrade Recommendation	Support Advisory
5.0.7	End of Maintenance	June 30, 2022	June 30, 2023*	Upgrade to latest EEP 5.0.x	Change of lifecycle stage and level of support with MEP release in June 2021
5.0.6	End of Maintenance	April 30, 2021	December 31, 2021	Upgrade to latest EEP 5.0.x	
5.0.5	End of Maintenance	April 30, 2021	December 31, 2021	Upgrade to latest EEP 5.0.x	
5.0.4	End of Maintenance	April 30, 2021	December 31, 2021	Upgrade to latest EEP 5.0.x	
5.0.3	End of Maintenance	December 31, 2020	December 31, 2021	Upgrade to latest EEP 5.0.x	
5.0.2	End of Maintenance	December 31, 2020	December 31, 2021	Upgrade to latest EEP 5.0.x	
5.0.1	End of Maintenance	December 31, 2020	December 31, 2021	Upgrade to latest EEP 5.0.x	
5.0.0	End of Maintenance	December 31, 2020	December 31, 2021	Upgrade to latest EEP 5.0.x	

*EEP 5.0.7 is supported on core 6.0.1 until core 6.0.1 is discontinued or a newer EEP 5.0.x (with x > 7) becomes available.

Core Release 6.0.0

EEP	EEP Lifecycle Status	In Maintenance	End of Maintenance	EEP Upgrade Recommendation	Support Advisory
4.1.4	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to latest EEP 5.0.x	Change of lifecycle stage and level of support with MEP release in June 2021
4.1.3	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to latest EEP 5.0.x	
4.1.2	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to latest EEP 5.0.x	
4.1.1	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to latest EEP 5.0.x	
4.1.0	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to latest EEP 5.0.x	
4.0.0	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to latest EEP 5.0.x	

Core Release 5.2.x

EEP	EEP Lifecycle Status	In Maintenance	End of Maintenance	EEP Upgrade Recommendation	Support Advisory
3.0.5	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to EEP 6.3.x or later (requires a core upgrade)	Prepare for MapR 5.x End of Maintenance by April 2019
3.0.4	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to EEP 6.3.x or later (requires a core upgrade)	
3.0.3	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to EEP 6.3.x or later (requires a core upgrade)	
3.0.2	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to EEP 6.3.x or later (requires a core upgrade)	
3.0.1	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to EEP 6.3.x or later (requires a core upgrade)	
3.0	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to EEP 6.3.x or later (requires a core upgrade)	
2.0.3	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to EEP 6.3.x or later (requires a core upgrade)	
2.0.2	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to EEP 6.3.x or later (requires a core upgrade)	
2.0.1	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to EEP 6.3.x or later (requires a core upgrade)	
2.0	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to EEP 6.3.x or later (requires a core upgrade)	
1.1.4	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to EEP 6.3.x or later (requires a core upgrade)	
1.1.3	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to EEP 6.3.x or later (requires a core upgrade)	
1.1.2	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to EEP 6.3.x or later (requires a core upgrade)	
1.1.1	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to EEP 6.3.x or later (requires a core upgrade)	
1.1.0	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to EEP 6.3.x or later (requires a core upgrade)	

Related concepts

[Understand Software Versions](#) on page 6521

Understanding the version numbers used by core, Ecosystem Packs (EEPs), EEP components, and patches can help you keep your software up to date and plan for upgrades.

[Checking the EEP Version](#) on page 6407

Some Installer operations require you to know the version of the currently installed Ecosystem Pack (EEP). You can check the EEP version easily from within the Installer user interface or derive the EEP version from your repository information.

[Upgrading Ecosystem Packs](#) on page 301

Describes how to upgrade Ecosystem Packs (EEPs), either as part of a core upgrade or to take advantage of a new EEP for the current version of core.

[Ecosystem Pack \(EEP\) Reference](#) on page 7610

This section contains links to information that is specific to a given EEP.

Related reference

[Understand the EEP Lifecycle](#) on page 6530

This page describes the EEP lifecycle and defines the lifecycle stages, which are Active, In Maintenance, and End of Maintenance.

EEP Components and OS Support

Ecosystem Packs consist of ecosystem components and monitoring components that can run on a variety of operating systems.

Release 6.0 and later support multiple Ecosystem Packs (EEPs). For information about the EEPs supported by various core versions, see [EEP Support and Lifecycle Status](#) on page 6533. For more information about the components in each EEP, see the [EEP Release Notes](#) on page 6652.

EEP 9.2.1 Components and OS Support

This topic lists the ecosystem and monitoring components that are included in EEP 9.2.1 and shows the operating system support for each component.

To understand which core versions can use this EEP, see [EEP Support and Lifecycle Status](#) on page 6533.

For the Linux operating-system versions supported by data-fabric software, see [Operating System Support Matrix](#) on page 6525.

Ecosystem Components	SLES			RHEL	Rocky ⁴	Ubuntu

Pig 0.16	Y	Y	Y
Sentry 1.7.0 ³	Y	Y	Y
Spark 2.3.3.0	Y	Y	Y
Sqoop 1.4.7	Y	Y	Y
Sqoop2 1.99.7	Y	Y	Y
MapR Monitoring Components⁴			
Collectd 5.8.0	Y	Y	Y
Elasticsearch 6.2.3	Y	Y	Y
Fluentd 1.1.2	Y	Y	Y
Grafana 4.6.5	Y	Y	Y
Kibana 6.2.3	Y	Y	Y
OpenTSDB 2.4.0	Y	Y	Y

¹Supported for use only with HPE Ezmeral Data Fabric Database binary tables.

²The Spark Notebook UI in Hue is a beta feature.

³MapR support for Sentry is limited to Impala users.

⁴Supported for monitoring use cases only.

EEP 6.0.1 Components and OS Support

This topic lists the ecosystem and MapR-monitoring components that are included in EEP 6.0.1 and shows the operating system support for each component.

To understand which MapR Core versions can use this EEP, see [EEP Support and Lifecycle Status](#) on page 6533.

For the Linux operating-system versions supported by MapR software, see [Operating System Support Matrix](#) on page 6525.

Ecosystem Components	SUSE	RHEL / CentOS	Ubuntu
AsyncHBase 1.7 ¹	Y	Y	Y
Drill 1.14	Y	Y	Y
Flume 1.8	Y	Y	Y
HBase-compatible API ¹	Y	Y	Y
Hive 2.3 ²	Y	Y	Y
HttpFS 1.0	Y	Y	Y
Hue 4.2 ³	Y	Y	Y
Impala 2.10	Y (12 SP1)	Y	N
KSQL 4.1.1	Y	Y	Y
MapR Data Access Gateway 2.0	Y	Y	Y
MapR Object Store 1.0.0	Y	Y	Y
Myriad 0.2	Y	Y	Y
Oozie 4.3.0	Y	Y	Y
Pig 0.16	Y	Y	Y
Sentry 1.7.0 ⁴	Y	Y	Y
Spark 2.3.2.0	Y	Y	Y
Sqoop 1.4.7	Y	Y	Y
Sqoop2 1.99.7	Y	Y	Y
MapR Monitoring Components⁵			
Collectd 5.8.0	Y	Y	Y
Elasticsearch 6.2.3	Y	Y	Y
Fluentd 1.1.2	Y	Y	Y
Grafana 4.6.1	Y	Y	Y
Kibana 6.2.3	Y	Y	Y
OpenTSDB 2.4.0	Y	Y	Y

¹Supported for use only with HPE Ezmeral Data Fabric Database binary tables.

²Equivalent to Apache Hive 2.3.3.

³The Spark Notebook UI in Hue is a beta feature.

⁴MapR support for Sentry is limited to Impala users.

⁵Supported for monitoring use cases only.

EEP 6.0.0 Components and OS Support

This topic lists the ecosystem and MapR-monitoring components that are included in EEP 6.0.0 and shows the operating system support for each component.

To understand which MapR Core versions can use this EEP, see [EEP Support and Lifecycle Status](#) on page 6533.

For the Linux operating-system versions supported by MapR software, see [Operating System Support Matrix](#) on page 6525.

Ecosystem Components	SUSE	RHEL / CentOS	Ubuntu

Discontinued Ecosystem Components

Provides information about discontinued ecosystem components.

Ecosystem components can be discontinued when either of the following is true:

- Newer components are available that serve the same function but provide better features or performance.
- The Open Source community decides to retire a product.

Discontinued components are either *In Maintenance* or have reached their *End of Maintenance* status. To understand what In Maintenance and End of Maintenance mean when these terms are applied to a component or EEP, see [Understand the EEP Lifecycle](#) on page 6530.

HPE uses the support advisory process to notify users in advance that a component will be In Maintenance. The last EEP version to support an In Maintenance component is the EEP version that is released at the time of the In Maintenance announcement. The following table lists the components that are either already In Maintenance or transitioning to End of Maintenance:

Component	In Maintenance	End of Maintenance	Last EEP Version Supporting Component*	Suggested Replacement	Announcement
S3 Gateway	July 31, 2022	July 31, 2023	<ul style="list-style-type: none"> • EEP 8.1.x** • EEP 8.0.x • EEP 7.x • EEP 6.x 	HPE Ezmeral Data Fabric Object Store	February 2022

*Later EEPs in the same series can include an End of Maintenance component. For example, if the last EEP version supporting an End of Maintenance component is x.y.0, the component might be present in x.y.1, x.y.2, x.y.3, and so on. This is to ensure that upgrades complete successfully. But HPE does not

support using the component in later EEPs (x.y.1, x.y.2, x.y.3, and so on), and the last supported EEP version remains x.y.0.

**Not supported for production use on release 7.0.0 and later. In EEP 8.1.x, S3 Gateway packages are provided for migration purposes only.

***End of Maintenance for EEP 7.0.0 and later in September 2020. Transitions to End of Maintenance for EEP 5.0.x and EEP 6.3.x when those EEPs reach end of life.

[EEP Support and Lifecycle Status](#) on page 6533

This page shows the EEPs that are supported for different core releases and the current lifecycle status for each EEP.

[Understand the EEP Lifecycle](#) on page 6530

This page describes the EEP lifecycle and defines the lifecycle stages, which are Active, In Maintenance, and End of Maintenance.

Component Versions for Released EEPs

The published Ecosystem Packs (EEPs) contain different component versions with different features. Comparing the component versions can help you make decisions about installing or upgrading data-fabric software.

Components Supported by EEPs 1.x - 8.x

The following tables show the latest supported versions of each component in a EEP series. The tables reflect the component versions at release time and do not include patch versions issued between releases.

Core 7.6.1 with EEP 9.x

Ecosystem Component	EEP Series Versions
	EEP-9.2.1

*Kafka Schema Registry 5.1.2.0 and later are provided as *general availability* software. Kafka Schema Registry 4.1.1 is *developer preview* software. Developer previews are not tested for production environments, and should be used with caution. Kafka Schema Registry packages are included in EEP 7.0.0 and later but not included in EEP 6.x.

**Beginning with EEP 4.0.0, Livy is included as its own package in MapR EEP repositories. Before EEP 4.0.0, Livy was included as mapr-hue-livy and released only as a part of Hue. For more information, see [Livy](#) on page 4298.

***Tez is supported only for use with Hive. Therefore, MapR documentation for Tez is limited when compared to the documentation for other ecosystem components. For release note information, see [Tez Release Notes](#).

****Before using EEP 6.3.3 with release 6.1.0, you must apply the latest 6.1.0 patch.

Related concepts

[Understand Software Versions](#) on page 6521

Understanding the version numbers used by core, Ecosystem Packs (EEPs), EEP components, and patches can help you keep your software up to date and plan for upgrades.

Related reference

[EEP Support and Lifecycle Status](#) on page 6533

This page shows the EEPs that are supported for different core releases and the current lifecycle status for each EEP.

CSI Version Compatibility

Shows the released versions of the Container Storage Interface (CSI) storage plugin and their compatibility with other components in a Kubernetes environment.

CSI Storage Plugin	Version Compatibility						
	FUSE or Loopback NFS	Kubernetes ²	CSI Spec	Core	OS for Kubernetes Nodes	OpenShift	HPE Ezmeral Runtime Enterprise

¹Supports [Raw Block Volumes](#) on page 761.

²Includes support for the specified Kubernetes versions as part of a Google Anthos Kubernetes distribution.

³If your environment uses Kubernetes 1.20+ and OpenShift 4.7+, you must use FUSE 1.2.1+ and Loopback NFS 1.0.1+.

⁴If your environment uses Kubernetes 1.22+ and OpenShift 4.9+, you must use FUSE 1.2.6+ and Loopback NFS 1.0.6+.

⁵In a release 7.0.0 environment, you must use Fuse 1.2.8+ and Loopback NFS 1.0.8+.

Java Support Matrix

This matrix shows the Java Development Kit versions supported by different HPE Ezmeral Data Fabric releases.

Only the Oracle, OpenJDK, and Amazon Corretto Java engines are supported.

Java/ Data Fabric Release	Release 7.6.x	Release 7.5.0	Release 7.4.0	Release 7.3.0	Release 7.2.0	Release 7.1.0	Release 7.0.0	Release 6.2.0	Release 6.1.x	Release 6.0.x	Release 5.2.x
Java 17 ¹	Yes	Yes	Yes	Yes	Yes	No	No	No	No	No	No
Java 11	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No	No	No
Java 8 ²	No	No	No	No	No	No	No	No	Yes	Yes	Yes

¹The [monitoring components](#) are not supported on JRE 17 or JDK 17.

²Only the Oracle and OpenJDK Java engines are supported.

Related concepts

[Java](#) on page 122

To run data-fabric software and Hadoop, you must install a supported Java Development Kit (JDK) on your node.

[EEP 8.x.y Ecosystem JDK / JRE Support](#) on page 7616

Summarizes JDK and JRE build and run information for EEP 8.x.y data-fabric ecosystem components.

[EEP 7.x.y Ecosystem JDK / JRE Support](#) on page 7630

Summarizes JDK and JRE build and run information for EEP 7.x.y data-fabric ecosystem components.

JDK / JRE Support

This page shows the JDK and JRE versions for which data-fabric releases provide build-time and run-time support.

JDK Build-Time Support

JDK Version	Release								
	7.6.x	7.5.0	7.4.0	7.3.0	7.2.0	7.1.0	7.0.0	6.2.0	6.1.0
JDK 17	No	No	No	No	No	No	No	No	No

JRE 8	No	No	No	No	No	No	No	No	Yes	Yes	Yes

Hadoop Protocol Versions

Shows the Hadoop RPC protocol version and compatible data-fabric client versions for each release.

Each core release version is associated with a Hadoop RPC protocol version. The JobTrackers or ResourceManagers in a given cluster accept only the jobs submitted from clients with a compatible protocol version.

The following table shows the Hadoop RPC protocol version, and compatible data-fabric client versions for each core release:

Core Version	EEP	Hadoop Version	RPC Protocol	Compatible with Data Fabric Client Version
7.6.x	9.2.1	3.3.5.200	9	7.6.0.0 or 7.6.1.0
7.5.0	9.2.1	3.3.5.200	9	7.5.0.0
	9.2.0	3.3.5.100	9	7.5.0.0
7.4.0	9.2.1	3.3.5.200	9	7.4.0.0
	9.2.0	3.3.5.100	9	7.4.0.0
	9.1.2	3.3.5.0	9	7.4.0.0
7.3.0	9.2.1	3.3.5.200	9	7.3.0.0 ⁶

6.1.x	N/A	2.7.0	9	6.1.0, 6.0.x, 5.2.x
6.0.x	N/A	2.7.0	9	6.0.0, 5.2.0, 5.1.0, 5.0.0, 4.1.0, 4.0.2, 4.0.1 ⁴
5.2.x	N/A	2.7.0	9 ²	5.2.0, 5.1.0, 5.0.0, 4.1.0, 4.0.2, 4.0.1 ⁴
5.1.0	N/A	N/A	9 ²	5.1.0, 5.0.0, 4.1.0, 4.0.2, 4.0.1 ⁴

Core Version	EEP	Hadoop Version	RPC Protocol	Compatible with Data Fabric Client Version
5.0.0	N/A	N/A	9 ²	5.0.0, 4.1.0, 4.0.2, 4.0.1 ⁴
4.1.0	N/A	N/A	9 ²	4.1, 4.0.2, 4.0.1 ⁴
4.0.x	N/A	N/A	9 ²	4.0.x ⁵
3.1.x	N/A	N/A	4	3.1.x
3.0.x	N/A	N/A	5	3.0.x, 2.1.x
2.1.x	N/A	N/A	5	3.0.x, 2.1.x
2.0.x	N/A	N/A	4	3.1.x, 2.0.x

¹Release 6.2.0.5 and later.

²MapReduce version 1 and version 2 use the same protocol version.

³Release 6.1 client support is limited if applications submitting jobs to release 6.2 clusters are developed in JDK 1.8. Jars used by the client application should not use features made obsolete in JDK 11.

⁴A release 4.0.2 client can submit MRv2 jobs to a release 4.1, 5.0, or 5.1 cluster configured with zero-configuration ResourceManager failover (RM HA) as long as the client is also configured with zero-configuration RM HA.

⁵If you want to submit MapReduce v2 jobs to a release 4.0.x cluster configured with zero-configuration RMHA, you must use a release 4.0.2 client on a release 4.0.2 cluster.

⁶Requires patch version 7.3.0.1 or newer.

⁷Requires patch version 7.2.0.4 or newer.

Hadoop Client Compatibility

Describes compatibility between Hadoop 2.x and Hadoop 3.x clients and servers.

Hadoop Client-Server Compatibility Matrix

As indicated in [Hadoop Protocol Versions](#) on page 6613, EEP 9.0.0 includes Hadoop 3, while previous EEP versions used Hadoop 2. The following table summarizes Hadoop 2 and Hadoop 3 client-server compatibility:

	Hadoop 3 Server	Hadoop 2 Server
Hadoop 3 Client	Compatible	Not Compatible
Hadoop 2 Client	Compatible ¹	Compatible

¹Some configuration is required. Use the following step.

Using a Hadoop 2 Client with a Hadoop 3 Server

To use a Hadoop 2 client with a Hadoop 3 server, add the following properties to the <HADOOP_HOME>/etc/hadoop/mapred-site.xml file:

```
<property>
  <name>yarn.app.mapreduce.am.staging-dir</name>
  <value>/var/mapr/cluster/yarn/rm/staging</value>
</property>
<property>
  <name>yarn.app.mapreduce.am.env</name>
  <value>HADOOP_MAPRED_HOME=${full path of your hadoop distribution
```

```

directory on the server node}</value>
</property>
<property>
  <name>mapreduce.map.env</name>
  <value>HADOOP_MAPRED_HOME=${full path of your hadoop distribution
directory on the server node}</value>
</property>
<property>
  <name>mapreduce.reduce.env</name>
  <value>HADOOP_MAPRED_HOME=${full path of your hadoop distribution
directory on the server node}</value>
</property>

```

The first property change is needed for the Hadoop 2 client contained in EEP 8.1.0. In EEP 8.1.0, the default path was changed to `/var/mapr/cluster/yarn/hs`. In EEP 9.0.0, the default was changed back to `/var/mapr/cluster/yarn/rm/staging`.

Client Support Matrix

This matrix shows which HPE Ezmeral Data Fabric releases are compatible with different data-fabric client OS versions.

For a list of the client versions that are compatible with each release, see [Hadoop Protocol Versions](#) on page 6613.

Client OS	Version	Release 7.6.x	Release 7.5.0	Release 7.4.0	Release 7.3.0	Release 7.2.0	Release 7.1.0	Release 7.0.0	Release 6.2.x	Release 6.1.x	Release 6.0.x	Release 5.2.x	Release 5.1.0	Release 5.0.0

*Requires one of the following (or newer) client packages:

- `mapr-client-6.2.0.26.20200915234957.GA-20220725231138.amd64.zip` for release 6.2
- `mapr-client-7.0.0.2.20220209033907.GA-20220715231036.amd64.zip` for release 7.0

Change Control Notes

Updated February 16, 2024 (to change the 7.6.0 column heading to 7.6.x)

Updated January 31, 2024 (added a column for release 7.6.0)

Updated June 13, 2023 (added a column for release 7.4.0.)

Updated March 18, 2023 (added a column for release 7.3.0).

Updated January 13, 2023 (added a column for release 7.2.0).

Updated September 14, 2022 (added a column for release 7.1.0).

Updated August 24, 2022 (added a row for Windows 2019 support).

Updated January 5, 2022 (added a column for release 7.0.0).

Updated January 8, 2021 (changed "N/A" entries to "No" entries).

Updated August 11, 2020 (added column for MapR 6.2.x).

Updated June 27, 2018 (added column for MapR 6.1.x).

Installer Support Matrix

This matrix shows the operating systems that are supported by the Installer.

OS Version Support

¹Supported on RHEL but not on CentOS.

²The Installer only supports upgrades for this OS version. See [Selecting an Installer Version to Use](#) on page 6396.

³Before using Installer 1.14 on Ubuntu 16.04 nodes, you must manually install Java JDK 11. If you are using Installer 1.14 on RHEL/CentOS or SLES, the Installer installs Java JDK11 for you.

⁴Before using the Installer to install Release 6.0 or later on Ubuntu 14.04, you must upgrade to Java 1.8 on the cluster nodes. See IN-553 in [Installer Known Issues](#).

⁵Requires Installer 1.14.0.1 or later. Installer 1.14.0.1 supports Oracle Enterprise Linux 7.8 only on release 6.1.0 and does not support ecosystem components for release 6.1.0.

⁶Supported only on Installer 1.17.0.3 and later. During the **Verify** phase of installation, a warning about an incompatible minor version of the OS can be ignored.

⁷Only Installer 1.18.0.3 or later can be used on RHEL 8.8 with Data Fabric core 7.2.0.

5.0	No	No	No	No	No	No	No	No	No***

*The Installer does not support new installations of release 6.1.0 on RHEL / CentOS 8.1.

**New installations of release 6.1.0 are no longer supported. Install release 6.1.1 or release 6.2.0 instead.

***The Installer only supports upgrades for this OS version. See [Selecting an Installer Version to Use](#) on page 6396.

Change Control Notes

- Updated February 16, 2024 (changed 7.6.0 references to 7.6.x)
- Updated January 31, 2024 (added support for release 7.6.0)
- Updated September 7, 2023 (added support for release 7.2.0 on RHEL 8.8).
- Updated June 13, 2023 (added a row for release 7.4.0 and support for RHEL 8.8).
- Updated March 18, 2023 (added a row for release 7.3.0).
- Updated August 23, 2022 (documented non-support for RHEL 8.6).
- Updated May 10, 2022 (added support for RHEL 8.5 and Rocky 8.4 and 8.5).
- Updated April 19, 2022 (added Installer 1.17.0.3 information).
- Updated January 4, 2022 (added release 7.0.0 and Installer 1.17.0.x information).
- Updated October 15, 2021 (added Installer 1.17.0.0 information).
- Updated October 1, 2021 (added RHEL 8.4 support).
- Updated August 29, 2021 (added Installer 1.16.0.x information).
- Updated April 16, 2020 (added Installer 1.16.0.0 information).
- Updated February 20, 2020 (added Installer 1.15.0.1 and release 6.1.1 information).
- Updated January 16, 2020 (added Installer 1.15.0.0 information and support for Oracle Enterprise Linux 8.2).
- Updated October 28, 2020 (added support for RHEL 7.9 and removed column for Installer 1.8.0).
- Updated October 16, 2020 (added support for RHEL / CentOS 8.2 and Oracle Enterprise Linux 7.8).
- Updated September. 8, 2020 (Installer 1.14.0.0 added).
- Updated June 17, 2020 (rows added for RHEL / CentOS 7.8). Changed RHEL / CentOS 6.x values from Yes to No where only upgrades are supported.
- Updated November 30, 2019 (Installer 1.13.0.0 added, rows for RHEL / CentOS 7.7 and Ubuntu 18.04 added).
- Updated May 1, 2019 (Installer 1.12.0.0 added, rows for RHEL / CentOS 7.0, 7.1, and 7.2 removed).
- Updated January 2, 2019 (Installer 1.11.0.0 added).
- Updated Jul 27, 2018 (Installer 1.10.0 added).

- Updated March 30, 2018 (Installer 1.9.0 added). Corrected support for Ubuntu 11.04.
- Updated January 7, 2018 (Installer 1.8.0 added).
- Updated September 8, 2017 (Installer 1.7 added, release 6.0.x added).
- Updated July 31, 2017 (Installer 1.6 added, SLES 12 SP2 support added, older installer information removed).
- Updated April 6, 2017 (Installer 1.5 added, RHEL / CentOS 7.3 added, SLES 12 SP1 added, releases 2.x, 3.x, and 4.x removed).
- Updated December 8, 2016 (Installer 1.4 added).
- Updated August 19, 2016 (Installer 1.3 and release 5.2 added).
- Updated February 5, 2016 (Installer 1.2 and release 5.1 added).

Installer EEP Support

This matrix shows which Installer versions support each Ecosystem Pack (EEP) version.

Installer EEP Support

To understand which EEP versions are supported with different versions of data-fabric core, see [EEP Support and Lifecycle Status](#) on page 6533.

EEP	Installer 1.18.0.x	Installer 1.17.0.x	Installer 1.16.0.x	Installer 1.15.0.x	Installer 1.14.0.0	Installer 1.13.0.0	Installer 1.12.0.0	Installer 1.11.0.0	Installer 1.10.0.0
9.x.y	Yes	No	No	No	No	No	No	No	No
8.x.y*	Yes	Yes	No	No	No	No	No	No	No
7.x.y	Yes	Yes	Yes	Yes	Yes	No	No	No	No
6.x.y	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
5.x.y	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
4.x.y	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
3.x.y	No	No	No	No	No	No	No	Yes	Yes
2.x.y	No	No	No	No	No	No	No	Yes	Yes
1.x.y	No	No	No	No	No	No	No	Yes	Yes

*No Installer version currently supports EEP 8.1.1. For more information about EEP 8.1.1, see [EEP 8.1.1 Reference Information](#) on page 7611.

For a list of released Installer versions, see [Installer Updates](#) on page 6482.

FIPS Support for Ecosystem Components

If used with release 7.0.0 or later, most EEP components support the Federal Information Processing Standard (FIPS) 140-2 Level 1.

FIPS Support Matrix

The following table summarizes component support for FIPS:

Component	FIPS Support						
	EEP 9.2.1	EEP 9.2.0	EEP 9.1.2	EEP 9.1.1	EEP 9.1.0	EEP 9.0.0	EEP 8.1.x
Airflow	Yes*	No	No	No	No	No	No
Data Access Gateway	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Drill	Yes	Yes	Yes	Yes	Yes	Yes	Yes
HBase	Yes	Yes	Yes	Yes	Yes	Yes	Yes**
Hive	Yes	Yes	Yes	Yes	Yes	Yes	Yes
HTTPFS	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Hue	No	No	No	No	No	No	No
Kafka REST	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Kafka Connect HDFS	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Kafka Connect JDBC	Yes	Yes	Yes	Yes	Yes	Yes	Yes
KSQL	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Kafka Streams	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Livy	Yes	No	No	No	No	No	Yes***
NiFi	Yes	Yes	Yes	Yes	Yes	Yes	Not included in EEP 8.1.x
Oozie	Not included in EEP 9.2.1	Not included in EEP 9.2.0	Not included in EEP 9.1.2	Not included in EEP 9.1.1	Not included in EEP 9.1.0	Not included in EEP 9.0.0	Yes
OTel	No	No	Not included in EEP 9.1.2	Not included in EEP 9.1.1	Not included in EEP 9.1.0	Not included in EEP 9.0.0	Not included in EEP 8.1.x
Ranger	Yes****	Yes****	Yes****	Yes****	Yes****	Yes****	Not included in EEP 8.1.x
Spark	Yes***	Yes***	Yes***	Yes***	Yes***	Yes***	Yes***
Tez	Yes	Yes	Yes	Yes	Yes	Yes	Yes
YARN	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Zeppelin	No	No	No	No	No	No	Not included in EEP 8.1.x

*HBase cannot be used in a mixed (FIPS and non-FIPS) configuration. For example, a non-FIPS client node cannot communicate with a FIPS server node.

**In a mixed (FIPS and non-FIPS) configuration, there is a known issue related to Spark and Livy applications if the Spark UI is enabled. See Spark and Livy release notes for more information.

***This version does not support mixed FIPS mode.

For more information about FIPS, see [FIPS Compliance for HPE Ezmeral Data Fabric](#).

Security Support Matrix

The tables in this section show component support for authentication, impersonation, and wire-level encryption.

See these sections:

- Table 1 - [Authentication in Release 7.0.0 and Later](#) on page 6623
- Table 2 - [Impersonation and Wire-Level Encryption in Release 7.0.0 and Later](#) on page 6630

Table 1 shows component support for authentication using data-fabric SASL, Kerberos, and PAM.

Table 2 shows component support for impersonation and wire-level encryption.

Table Symbols

The tables in this section use dashes to indicate non-support and directional arrows to convey inbound and outbound communication:

- A dash (—) indicates that the feature is currently not supported, not needed, or not applicable.
- A right arrow (A → B) means OUTBOUND from A and INBOUND to B.
- A double arrow (A ↔ B) means OUTBOUND from A and INBOUND to B, and vice versa.
- No arrow indicates OUTBOUND communication from the subcomponent to all components with which it communicates.

Authentication in Release 7.0.0 and Later

Table

Main Component	Subcomponent	Authentication		
		Data-Fabric SASL	Kerberos	PAM ¹
CORE COMPONENTS				
Data Fabric for Kubernetes	N/A	—	—	—

Main Component	Subcomponent	Authentication		
		Data-Fabric SASL	Kerberos	PAM ¹
Spark	Web Clients Spark Component UI	No, but uses Spark's shared secret with DIGEST-MD5		
	Spark Driver Executor	No, but uses Spark's shared secret with DIGEST-MD5		
	Spark Job Using Connector HPE Ezmeral Data Fabric Database	Yes	—	—
	Spark Job Using Connector HPE Ezmeral Data Fabric Streams	Yes	Yes	—
	JDBC Client Spark Thrift Server	Yes	Yes	Yes
	ODBC Client Spark Thrift Server	—	Yes	Yes
Sqoop 2 ¹⁶	REST API, Hue, Sqoop 2 Client Sqoop 2 Server	Yes	Yes	—
YARN	REST/Browser RM/JHS/ATS	—	Yes	Yes
	Internal communication (RM/NM/JHS)	Yes	Yes	—
	Containers YARN Services (RM/NM)	No, but uses YARN's shared secret with DIGEST-MD5		
	Timeline Server	Yes	Yes	—

¹If LDAP is required, LDAP can be supported through PAM.

²Kerberos support is provided by implicit conversion of Kerberos tickets to data-fabric tickets.

³Payload not encrypted by default.

⁴All data exchanged with CLDB is in protobufs only and hence encrypted in secure clusters.

⁵Only admin ops to CLDB are audited. NFSv3 communication with CLDB is usually not admin-related.

⁶Accessed through the data-fabric client, which reads security settings from `/opt/mapr/conf/mapr-clusters.conf`; hence, this interface follows the secure-by-default model.

⁷Data-fabric SASL is supported but not enabled during installation.

⁸The Control System is secure between client and webserver (API Server). The server may invoke other commands through the `maprcli` interface that themselves do not use secure communication.

⁹HPE Ezmeral Data Fabric uses data-fabric SASL for communication with ZooKeeper.

¹⁰Includes a FUSE POSIX client, YARN client, and other client components.

¹¹Support for Kerberos has not been verified, but SPNEGO can be used in conjunction with HTTPS.

¹²Flume agents can't be started automatically after installation. Manual configuration is required.

¹³Auditing user administration operations with Hue.

¹⁴A custom authentication filter can be configured.

¹⁵Oozie orchestrates Spark/Sqoop jobs using the Spark/Sqoop native client, so security is the same as Spark/Sqoop.

¹⁶SSL added to Sqoop 1.99.7. Basic access authentication is enabled by default.

¹⁷The Airflow-to-S3 connection is authenticated using access and secret keys generated by the `maprcli s3keys generate` command.

Impersonation and Wire-Level Encryption in Release 7.0.0 and Later

Table

Main Component	Subcomponent	Impersonation	Wire-Level Encryption		
			Data-Fabric SASL	Kerberos	SSL/TLS
CORE COMPONENTS

1.1.3	1707	August 2, 2017
1.1.2	1703	April 6, 2017
1.1.1	1611	December 9, 2016
1.1.0	1609	September 29, 2016
1.0	1608	September 2, 2016

*The release date identifier is a four-digit number that appears in release notes and provides an approximate indication of the release date for a component. For example, in the string Hive 2.3.3 - 1808, 2.3.3 refers to the Hive version number, and 1808 indicates an August 2018 release. Note that last-minute changes in the release date can result in a slight mismatch between the release date identifier and the actual month of the release.

Ecosystem Support Matrix (Pre-5.2 releases)

This section provides support matrices for key ecosystem components for pre-5.2 releases.

The following table shows the compatibility of ecosystem products with MapR Converged Data Platform version 5.1 and below. For more recent versions of MapR, see the [EEP Components and OS Support](#) on page 6539.

NOTE: In the MapR Version column, JT stands for JobTracker.

Ecosystem Component/ MapR Version		Map R 3.0.x	Map R 3.1.x	Map R 4.0.1 (JT)	MapR 4.0.1 (YAR N)	Map R 4.0.2 (JT)	MapR 4.0.2 (YAR N)	Map R 4.1.0 (JT)	MapR 4.1.0 (YAR N)	Map R 5.0.0 (JT)	MapR 5.0.0 (YAR N)	Map R 5.1.0 (JT)	MapR 5.1.0 (YAR N)

¹ Hue 3.7 with MapR 3.1.x does not work with MapR Security. Only CentOS 6.x and 7.x are supported.

² Please make sure to pick the latest patched Oozie 4.0.1 version from monthly release 1502 or later ([Oozie Release Notes](#) on page 7356).

³ Drill 0.9 and later versions do not work with HPE Ezmeral Data Fabric Database in Version 3.1.x.

⁴ The Tez development preview has been withdrawn.

⁵ Impala does not use the JobTracker service, but can run in a cluster running JobTracker.

⁶ You cannot run Impala as a YARN application, however Impala can run in a YARN cluster.

Change Control Notes

- This matrix was updated on February 8, 2017 (Apache MapReduce API correction).
- This matrix was updated on September 12, 2016 (Drill 1.8.0).
- This matrix was updated on April 4, 2016 (AsyncHBase 1.7).
- This matrix was updated on March 18, 2016 (Impala updates).
- This matrix was updated on February 29, 2016 (MapR 5.1 updates).
- This matrix was updated on Jan 20, 2016 (Drill 0.9 removed).
- This matrix was updated on Jan 12, 2016 (Drill 1.3, 1.4).
- This matrix was updated on Dec 21, 2015 (Spark 1.5.2).
- This matrix was updated on Oct 28, 2015 (Tez 0.5.3).
- This matrix was updated on Oct 4, 2015 (Flume 1.6 and Mahout 0.11).
- This matrix was updated on September 25, 2015 (Hive 1.2.1 and Oozie 4.2.0).
- This matrix was updated on September 9, 2015 (Pig 15 and Spark 1.4.1).
- This matrix was updated on August 4, 2015 (Hue 3.8.1 and Sqoop 2 1.99.6).
- This matrix was updated on July 24, 2015 (Sqoop and Sqoop2).

For interoperability among specific groups of ecosystem products, see the following subsections.

Drill Support Matrix

This matrix shows the interoperability between Drill and other ecosystem products.

For MapR Converged Data Platform releases beyond 5.1, you may also want to view [EEP Components and OS Support](#) on page 6539.

Compatible Product	Version	Drill 1.0	Drill 1.1	Drill 1.2	Drill 1.3 dev preview	Drill 1.4	Drill 1.5 dev preview	Drill 1.6	Drill 1.7 dev preview	Drill 1.8	Drill 1.9	Drill 1.10

Flume	1.6	No	No	No	No	Yes	Yes	Yes

¹ By default, Oozie 4.2.0 includes Hive 1.2.1 shared libraries. To use Oozie with other compatible versions of Hive, see MapR's Oozie documentation.

² When you use Spark 1.5.2 with Hive 0.13 or Hive 1.0, Spark SQL insert overwrite operations on Hive tables are not supported for the ORC, RC, and AVRO formats. For more information, see the Spark documentation.

³ By default, Oozie 4.1.0 includes Hive 0.13 shared libraries. To use Oozie with other compatible versions of Hive, see MapR's Oozie documentation.

- This matrix was last updated on Jan 12, 2016 (Drill 1.3, 1.4).
- This matrix was last updated on Dec 21, 2015 (Spark 1.5.2).
- This matrix was last updated on Sept 25, 2015 (Hive 1.2.1 and Oozie 4.2.0).
- This matrix was updated on Sept 9, 2015 (Spark 1.4.1 and Pig 15).
- This matrix was updated on August 4, 2015 (Hue 3.8.1 and Sqoop2 1.99.6).
- This matrix was updated on November 20, 2015 (Hue 3.9.0).

Hue Support Matrix

This matrix shows the interoperability between Hue and other ecosystem products.

This page shows the versions of Hue that work other ecosystem components and it applies to MapR versions 5.1 and below. For more recent versions of MapR, see the [EEP Components and OS Support](#) on page 6539.

	Hue 2.5 Beta only	Hue 3.5	Hue 3.6	Hue 3.7	Hue 3.8.1	Hue 3.8.1	Hue 3.9.0
OS	CentOS ² and Ubuntu	CentOS ² and Ubuntu	CentOS ² and Ubuntu	CentOS ² and Ubuntu	CentOS ² and Ubuntu	CentOS ² and Ubuntu	CentOS ² and Ubuntu
MapR Distribution	3.0.2, 3.1.0	3.0.3, 3.1.1	3.1.1, 4.0.x	3.1.1, 4.0.x, 4.1, 5.0	4.1	5.1.0, 5.0.0	5.1.0, 5.0.0
Hive	0.12	0.13	0.12, 0.13	0.12, 0.13, 1.0	0.13, 1.0	0.13, 1.0 ⁶ , 1.2.1	0.13, 1.0 ⁶ , 1.2.1
Impala	N/A	N/A	1.4.1 (Hive 0.13 only)	1.4.1 (Hive 0.13 only)	1.4.1 (Hive 0.13 only)	1.4.1 (Hive 0.13 only)	1.4.1 (Hive 0.13 only), 2.2.0 (Hive 1.2.1 only)
https	1	1	1	1	1	1	1
Oozie	3.3.2	4.0.0	4.0.1	4.0.1, 4.1.0	4.1.0	4.1.0, 4.2.0	4.1.0, 4.2.0
Pig	11	12	12	12 ³	12 ³	12 ³	12 ³

HBase	No	0.94.17, 0.94.21, 0.98.7	0.94.17, 0.94.21, 0.98.7	0.94.x ¹ , 0.98.7, 0.98.9, 0.98.12	0.98.x	0.98.x	0.98.x, 1.1
HPE Ezmeral Data Fabric Database	No	Yes	Yes	Yes	Yes	Yes	Yes
Sentry	N/A	N/A	No	No	No	No	1.6
Solr	N/A	No	No	No	No	No	No
Spark⁵	N/A	N/A	N/A	N/A	1.3.1	1.3.1	1.3.1, 1.4.1,1.5.2, 1.6.1
Sqoop2	No	No	1.99.3	1.99.3	N/A ⁴	1.99.6	1.99.6

¹ Loading examples with HBase 94.x do not work (because of the difference in Thrift version between HBase 94 and Hue).

² Not supported on CentOS 5.x.

³ Pig jobs in Hue are run through Oozie. Oozie 4.0.1 and 4.1.0 bundle Pig 0.12 by default.

⁴ On MapR 4.1, Hue 3.8.1 does not work with Sqoop2. To use Sqoop2 and Hue on MapR 4.1, consider using Hue 3.7.

⁵ The Spark Notebook UI in Hue is a Beta feature.

⁶Hue 3.8/3.9 and Hive 1.0 require MapR 5.0.0. (This combination is not supported on MapR 5.1.0.)

Change Control Notes

- This matrix was last updated on February 29, 2016 (MapR 5.1 updates).
- This matrix was last updated on September 25, 2015 (Hue 3.8.1).
- This matrix was updated on August 4, 2015 (Hue 3.8.1).

Impala Support Matrix

This matrix shows the interoperability between Impala and other ecosystem products.

This page shows the versions of Impala that work with various versions of other ecosystem products and it applies to MapR versions 5.1 and below. For more recent versions of MapR, see the [EEP Components and OS Support](#) on page 6539.

NOTE: Impala 2.2.0 is supported on MapR 5.x. Impala 2.5.0 is supported on MapR 5.1 and later.

Product	Product Version	Impala 1.1.1	Impala 1.2.3	Impala 1.4.1	Impala 2.2.0	Impala 2.5.0
OS		RHEL/ CentOS6.x, Ubuntu 12 only	RHEL/ CentOS6.x, Ubuntu 12 only	RHEL/ CentOS6.x, Ubuntu 12 only	RHEL/CentOS 6.5, 6.6, 7.0,7.1 only (no Ubuntu, no SLES)	RHEL/CentOS 6.5, 6.6, 6.7, 6.8, 7.0, 7.1 only (no Ubuntu, no SLES)

	3.8.1	No	No	Yes	No	No
	3.9.0	No	No	Yes	Yes	Yes
Sentry	1.4	No	No	Yes	No	No
	1.6	No	No	No	Yes	Yes
HBase		No	No	0.98 only	0.98.12, 1.1	1.1.x

Change Control Notes

- This matrix was last updated on July 7, 2016 (Impala 2.5.0).
- This matrix was last updated on February 29, 2016 (Impala 2.2.0).
- This matrix was last updated on September 25, 2015 (Hive 1.2.1).
- This matrix was updated on August 4, 2015 (Hue 3.8.1).

Oozie Support Matrix

This matrix shows the interoperability between Oozie and other ecosystem products.

 **IMPORTANT:** This component is deprecated. Hewlett Packard Enterprise recommends using an alternate product. Deprecated components are either in maintenance or have reached the end of their maintenance lifecycle. For more information, see [Discontinued Ecosystem Components](#) on page 6598.

This page shows the versions of Oozie that work with other ecosystem components and it applies to Release versions 5.1 and below. For more recent versions, see the [EEP Components and OS Support](#) on page 6539.

Compatible Product	Oozie 4.1.0	Oozie 4.2.0
Hive		0.13 ¹ , 1.0 ¹ , 1.2.1
Hue	3.8.1, 3.9.0	3.8.1, 3.9.0
Pig		0.14, 0.15
Spark	1.5.2, 1.6.1	1.3.1, 1.4.1, 1.5.2, 1.6.1
Sqoop		1.4.6

¹ By default, Oozie 4.2 includes Hive 1.2.1 shared libraries. To use Oozie with other compatible versions of Hive, see the [MapR Oozie documentation](#).

Change Control Notes

- This matrix was last updated on February 5, 2016 (Oozie 4.1.0 column added).

Spark Support Matrix

This matrix shows the interoperability between Spark and other ecosystem products.

This page shows the version of Spark that works with other ecosystem components, and it applies to MapR versions 5.1 and below. See also [Hive and HCatalog Support Matrix](#) on page 6645. For more recent versions of MapR, see the [EEP Components and OS Support](#) on page 6539.

Compatible Product	Product Version	Spark 0.9.2	Spark 1.0.2	Spark 1.1	Spark 1.2.1	Spark 1.3.1	Spark 1.4.1	Spark 1.5.2	Spark 1.6.1

Oozie	4.1.0					Yes	Yes	Yes	Yes
	4.2.0					Yes	Yes (5.x)	Yes (5.x)	Yes (5.x)

¹ The Spark Notebook UI in Hue is a beta feature.

² When you use Spark 1.5.2 with Hive 0.13 or Hive 1.0, Spark SQL insert overwrite operations on Hive tables are not supported for the ORC, RC, and AVRO formats. For more information, see the Spark documentation.

³This combination is supported as of Mahout 0.11.0-1601.

⁴Livy version is a snapshot.

⁵EEP 2.0 only.

Change Control Notes

- This matrix was last updated on December 8, 2016 (Mahout 0.12).

Data Access Gateway Support Matrix

The table in this section shows supported core and EEP versions for Data Access Gateway.

Data Access Gateway Compatibility

Shows the HPE Ezmeral Data Fabric data access gateway versions supported for recent combinations of core and Ecosystem Pack distributions.

Core Release	Corresponding EEP	Data Access Gateway Version
7.6.x	9.2.1	6.2.0.0
7.5.0	9.2.1	6.2.0.0
	9.2.0	6.2.0.0
7.4.0	9.2.1	6.2.0.0
	9.2.0	6.2.0.0
	9.1.2	6.1.0.0
7.3.0	9.2.1	6.2.0.0 ¹
	9.2.0	6.2.0.0 ¹
	9.1.2	6.1.0.0 ¹
	9.1.1	6.0.0.0
7.2.0	9.2.1	6.2.0.0 ¹
	9.2.0	6.2.0.0 ¹
	9.1.2	6.1.0.0 ¹
	9.1.0	5.1.0.0
7.1.0	9.0.0	5.0.0.0
7.0.0	8.1.x	4.0.0.0
	7.1.2	3.0.0.0
6.2.0	8.1.x	4.0.0.0
	7.1.x	3.0.0.0
6.1.1	6.3.x	2.0

¹This Data Access Gateway version can be installed with core 7.2.0 and 7.3.0. However, Kafka Wire Protocol service is disabled for these core versions.

Related concepts

[Data Access Gateway Release Notes](#) on page 6744

Ecosystem Component Release Notes

The following release notes contain information for the components included in the HPE Ezmeral Data Fabric.

Note that the *MapR Ecosystem Pack (MEP)* has been renamed as the *Ezmeral Ecosystem Pack (EEP)*. For more information about HPE Ezmeral Data Fabric terminology, see [Documentation Enhancements in What's New in Release 7.0.0](#) on page 36.

Be sure to review these considerations for using ecosystem component release notes:

- Ecosystem component release notes contain HPE-specific information; they do not duplicate release note information on open-source websites.

- Ecosystem component release notes are not necessarily cumulative in nature. For example, if you need to upgrade from version 1.x of a data-fabric product to version 4.x, be sure to review the release notes for versions 2.x, 3.x, and 4.x to become familiar with new features and known issues that might be relevant to version 4.x.
- To view individual product versions organized by EEP and core version, see [Component Versions for Released MEPs](#).

EEP Release Notes

Provides release-note information for Ecosystem Packs (EEPs).

Ecosystem Pack 9.0.0 Release Notes

This topic contains information about the components included in Ecosystem Pack 9.0.0.

Release Date	October 2022
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹EEPs are contained in the `MEP-<version>` directory. The `MEP-version` directory can be represented by a 2-digit number or a 3-digit number (for example, `MEP-6.0` or `MEP-6.0.0`). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

EEP 9.0.0 can be used with core 7.1.0. For more information about EEP and core version support, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.8-2104, 2.3.8 refers to the Hive version number, and 2104 typically indicates an April 2021 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

EEP 9.0.0 did not introduce any changes that affect application backward compatibility.

EEP 9.0.0 Components

The EEP 9.0.0 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
Airflow 2.3.3.0	Airflow 2.3.3.0 - 2210 (EEP 9.0.0) Release Notes on page 6737
AsynchBase 1.8.2	AsynchBase 1.8.2-2009 Release Notes on page 6740
Data Access Gateway 5.0.0.0	Data Access Gateway 5.0 Release Notes on page 6747
Drill 1.20.2.0 ¹	Drill 1.20.2.0-2210 (EEP 9.0.0) Release Notes on page 6753
Hadoop 3.3.4.0	Hadoop 3.3.4.0 - 2210 (EEP 9.0.0) Release Notes on page 6852
HBase 1.4.14.200	HBase 1.4.14.200 - 2210 (EEP 9.0.0) Release Notes on page 6879
Hive 3.1.3.0	Hive 3.1.3.0 - 2210 (EEP 9.0.0) Release Notes on page 6916

Component	Release Notes
HttpFS 3.3.4.0	See the Hadoop release note. HttpFS is now a part of Hadoop.
Hue 4.6.0.500 ²	Hue 4.6.0.500 - 2210 (EEP 9.0.0) Release Notes on page 7124
Livy 0.7.0.300	Livy 0.7.0.300 - 2210 (EEP 9.0.0) Release Notes on page 7198
Monitoring	Monitoring Components - EEP 9.0.0 Release Notes on page 7317
NiFi 1.16.3.0	NiFi 1.16.3.0 - 2210 (EEP 9.0.0) Release Notes on page 7352
Ranger 2.3.0.0	Ranger 2.3.0.0 - 2210 (EEP 9.0.0) Release Notes
Spark 3.3.0.0	Spark 3.3.0.0 - 2210 (EEP 9.0.0) Release Notes on page 7432
Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 7212 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 7213 HPE Ezmeral Data Fabric Streams C#/.NET 0.11.3 - 1803 Release Notes on page 7214
Streams Tools	Kafka Streams 2.6.1.300 - 2210 (EEP 9.0.0) Release Notes on page 7217 KSQL 6.0.0.200 - 2210 (EEP 9.0.0) Release Notes on page 7240 Kafka Connect HDFS 10.0.0.200 - 2210 (EEP 9.0.0) Release Notes on page 7253 Kafka Connect JDBC 10.0.1.200 - 2210 (EEP 9.0.0) Release Notes on page 7268 Kafka Connect 10.0.0.200 - 2210 (EEP 9.0.0) Release Notes on page 7279 Kafka REST Proxy 6.0.0.200 - 2210 (EEP 9.0.0) Release Notes on page 7287 Kafka Schema Registry 6.0.0.200 - 2210 (EEP 9.0.0) Release Notes on page 7307
Tez 0.10.2.0	Tez 0.10.2 - 2210 (EEP 9.0.0) Release Notes on page 7580
Zeppelin 0.10.1.0	Zeppelin 0.10.1.0 - 2210 Release Notes on page 7609

¹Support for this component is subject to your license agreement.

²The Spark Notebook UI in Hue is a beta feature.

The EEP 9.0.0 repository contains the following ecosystem components that are supported for internal data-fabric monitoring use cases only:

- Collectd 5.12.0.500
- Elasticsearch 6.8.8.600
- Fluentd 1.10.3.500
- Grafana 7.5.10.500

- Kibana 6.8.8.600
- OpenTSDB 2.4.1.500

Ecosystem Pack 8.1.1 Release Notes

This topic contains information about the components included in Ecosystem Pack 8.1.1.

Release Date	May 2023
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹EEPs are contained in the MEP-<version> directory. The MEP-version directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-6.0 or MEP-6.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

EEP 8.1.1 can be used with core 7.0.0 and core 6.2.0. For more information about EEP and core version support, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.8-2104, 2.3.8 refers to the Hive version number, and 2104 typically indicates an April 2021 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

EEP 8.1.1 did not introduce any changes that affect application backward compatibility.

EEP 8.1.1 Components

The EEP 8.1.1 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
Airflow 2.5.1.0	Airflow 2.5.1.0 - 2305 (EEP 8.1.1) Release Notes on page 6738
AsyncHBase 1.8.2	AsyncHBase 1.8.2-2009 Release Notes on page 6740
Data Access Gateway 4.0.0.0	Data Access Gateway 4.0 Release Notes on page 6748
Drill 1.16.1.500 ¹	Drill 1.16.1.500-2305 (EEP 8.1.1) Release Notes on page 6755
Hadoop 2.7.6.300	Hadoop 2.7.6.300 - 2305 (EEP 8.1.1) Release Notes on page 6853
HBase 1.4.14.100	HBase 1.4.14.100 - 2305 (EEP 8.1.1) Release Notes on page 6881
Hive 2.3.9	Hive 2.3.9.100 - 2305 (EEP 8.1.1) Release Notes on page 6920
HttpFS 1.1.0.200	HttpFS 1.1.0.300 - 2305 (EEP 8.1.1) Release Notes on page 7101
Hue 4.6.0.310 ²	Hue 4.6.0.310 - 2305 (EEP 8.1.1) Release Notes on page 7126

Spark 3.2.0.100	Spark 3.2.0.100 - 2305 (EEP 8.1.1) Release Notes on page 7435
Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 7212 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 7213 HPE Ezmeral Data Fabric Streams C#.NET 0.11.3 - 1803 Release Notes on page 7214
Streams Tools	Kafka Streams 2.6.1.110 - 2305 (EEP 8.1.1) Release Notes on page 7220 KSQL 6.0.0.110 - 2305 (EEP 8.1.1) Release Notes on page 7241 Kafka Connect HDFS 10.0.0.110 - 2305 (EEP 8.1.1) Release Notes on page 7254 Kafka Connect JDBC 10.0.1.110 - 2305 (EEP 8.1.1) Release Notes on page 7269 Kafka Connect 10.0.0.110 - 2305 (EEP 8.1.1) Release Notes on page 7280 Kafka REST Proxy 6.0.0.110 - 2305 (EEP 8.1.1) Release Notes on page 7288 Kafka Schema Registry 6.0.0.110 - 2305 (EEP 8.1.1) Release Notes on page 7308
Tez 0.9.2.500	Tez 0.9.2.500 - 2305 (EEP 8.1.1) Release Notes on page 7581

¹Support for this component is subject to your license agreement.

²The Spark Notebook UI in Hue is a beta feature.

The EEP 8.1.1 repository contains the following ecosystem components that are supported for internal data-fabric monitoring use cases only:

- Collectd 5.12.0.400
- Elasticsearch 6.8.8.500
- Fluentd 1.10.3.400
- Grafana 7.5.10.400
- Kibana 6.8.8.500
- OpenTSDB 2.4.1.400

Ecosystem Pack 8.1.0 Release Notes

This topic contains information about the components included in Ecosystem Pack 8.1.0.

Release Date	January 2022
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹EEPs are contained in the MEP-<version> directory. The MEP-version directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-6.0 or MEP-6.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

EEP 8.1.0 can be used with core 7.0.0 and core 6.2.0. For more information about EEP and core version support, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.8-2104, 2.3.8 refers to the Hive version number, and 2104 typically indicates an April 2021 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

EEP 8.1.0 did not introduce any changes that affect application backward compatibility.

EEP 8.1.0 Components

The EEP 8.1.0 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
Airflow 2.2.1.0	Airflow 2.2.1.0 - 2201 (EEP 8.1.0) Release Notes on page 6739
AsyncHBase 1.8.2	AsyncHBase 1.8.2-2009 Release Notes on page 6740
Data Access Gateway 4.0.0.0	Data Access Gateway 4.0 Release Notes on page 6748
Drill 1.16.1.400 ¹	Drill 1.16.1.400-2201 (EEP 8.1.0) Release Notes on page 6759
Hadoop 2.7.6.200	Hadoop 2.7.6.200 - 2201 (EEP 8.1.0) Release Notes on page 6856
HBase 1.4.13.200	HBase 1.4.13.200 - 2201 (EEP 8.1.0) Release Notes on page 6884
Hive 2.3.9	Hive 2.3.9.0 - 2201 (EEP 8.1.0) Release Notes on page 6926
HttpFS 1.1.0.200	HttpFS 1.1.0.200 - 2201 (EEP 8.1.0) Release Notes on page 7102
Hue 4.6.0.300 ²	Hue 4.6.0.300 - 2201 (EEP 8.1.0) Release Notes on page 7127
Livy 0.7.0.100	Livy 0.7.0.200 - 2201 (EEP 8.1.0) Release Notes on page 7199
Monitoring	Monitoring Components - EEP 8.1.0 Release Notes on page 7318
Oozie 5.2.1.200	Oozie 5.2.1.200 - 2201 (EEP 8.1.0) Release Notes on page 7359
S3 Gateway 2.2.0.0	S3 Gateway 2.2.0.0 - 2110 (EEP 8.0.0) Release Notes on page 7347

Component	Release Notes
Spark 3.2.0.0	Spark 3.2.0.0 - 2201 (EEP 8.1.0) Release Notes on page 7437
Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 7212 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 7213 HPE Ezmeral Data Fabric Streams C#/.NET 0.11.3 - 1803 Release Notes on page 7214
Streams Tools	Kafka Streams 2.6.1.100 - 2201 (EEP 8.1.0) Release Notes on page 7223 KSQL 6.0.0.100 - 2201 (EEP 8.1.0) Release Notes on page 7242 Kafka Connect HDFS 10.0.0.100 - 2201 (EEP 8.1.0) Release Notes on page 7255 Kafka Connect JDBC 10.0.1.100 - 2201 (EEP 8.1.0) Release Notes on page 7270 Kafka Connect 10.0.0.100 - 2201 (EEP 8.1.0) Release Notes on page 7280 Kafka REST Proxy 6.0.0.100 - 2201 (EEP 8.1.0) Release Notes on page 7289 Kafka Schema Registry 6.0.0.100 - 2201 (EEP 8.1.0) Release Notes on page 7309
Tez 0.9.2	Tez 0.9.2 - 2201 (EEP 8.1.0) Release Notes on page 7582

¹Support for this component is subject to your license agreement.

²The Spark Notebook UI in Hue is a beta feature.

The EEP 8.1.0 repository contains the following ecosystem components that are supported for internal data-fabric monitoring use cases only:

- Collectd 5.12.0.400
- Elasticsearch 6.8.8.500
- Fluentd 1.10.3.400
- Grafana 7.5.10.400
- Kibana 6.8.8.500
- OpenTSDB 2.4.1.400

Ecosystem Pack 8.0.0 Release Notes

This topic contains information about the components included in Ecosystem Pack 8.0.0.

NOTICE: Hewlett Packard Enterprise recommends using EEP 8.1.0 instead of EEP 8.0.0. For more information about EEP 8.1.0, see [EEP 8.1.0 Reference Information](#) on page 7613.

Release Date	October 2021
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹EEPs are contained in the `MEP-<version>` directory. The `MEP-version` directory can be represented by a 2-digit number or a 3-digit number (for example, `MEP-6.0` or `MEP-6.0.0`). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

EEP 8.0.0 can be used with core 6.2.0. For more information about EEP and core version support, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.8-2104, 2.3.8 refers to the Hive version number, and 2104 typically indicates an April 2021 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

EEP 8.0.0 did not introduce any changes that affect application backward compatibility.

EEP 8.0.0 Components

The EEP 8.0.0 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.8.2	AsyncHBase 1.8.2-2009 Release Notes on page 6740
Data Access Gateway 3.0.0.0	Data Access Gateway 3.0 Release Notes on page 6749
Drill 1.16.1.300 ¹	Drill 1.16.1.300-2110 (EEP 8.0.0) Release Notes on page 6763
Flume 1.9.0.200	Flume 1.9.0.200-2110 (EEP 8.0.0) Release Notes on page 6836
Hadoop 2.7.6.100	Hadoop 2.7.6.100 - 2110 (EEP 8.0.0) Release Notes on page 6858
HBase 1.4.13.100	HBase 1.4.13.100 - 2110 (EEP 8.0.0) Release Notes on page 6885
Hive 2.3.9	Hive 2.3.9 - 2110 (EEP 8.0.0) Release Notes on page 6933
HttpFS 1.1.0.100	HttpFS 1.1.0.100 - 2110 (EEP 8.0.0) Release Notes on page 7103
Hue 4.6.0.200 ²	Hue 4.6.0.200 - 2110 (EEP 8.0.0) Release Notes on page 7129
Livy 0.7.0.100	Livy 0.7.0.100 - 2110 (EEP 8.0.0) Release Notes on page 7200
Monitoring	Monitoring Components - EEP 8.0.0 Release Notes on page 7319
Oozie 5.2.1.100	Oozie 5.2.1.100 - 2110 (EEP 8.0.0) Release Notes on page 7362
Pig 0.17.0.100	Pig 0.17.0.100 - (EEP 8.0.0) 2110 Release Notes on page 7410
S3 Gateway	S3 Gateway 2.2.0.0 - 2110 (EEP 8.0.0) Release Notes on page 7347
Spark 3.1.2.0	Spark 3.1.2.0 - 2110 (EEP 8.0.0) Release Notes on page 7439

Component	Release Notes
Sqoop 1.4.7	Sqoop 1.4.7 - 2110 (EEP 8.0.0) Release Notes on page 7543
Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 7212 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 7213 HPE Ezmeral Data Fabric Streams C#.NET 0.11.3 - 1803 Release Notes on page 7214
Streams Tools	Kafka Streams 2.6.1.0 - 2110 (EEP 8.0.0) Release Notes on page 7224 KSQL 6.0.0.0 - 2110 (EEP 8.0.0) Release Notes on page 7244 Kafka Connect HDFS 10.0.0.0 - 2110 (EEP 8.0.0) Release Notes on page 7256 Kafka Connect JDBC 10.0.1.0 - 2110 (EEP 8.0.0) Release Notes on page 7270 Kafka REST Proxy 6.0.0.0 - 2110 (EEP 8.0.0) Release Notes on page 7290 Kafka Schema Registry 6.0.0.0 - 2110 (EEP 8.0.0) Release Notes on page 7310
Tez 0.9.2	Tez 0.9.2 - 2110 (EEP 8.0.0) Release Notes on page 7584

¹Support for this component is subject to your license agreement.

²The Spark Notebook UI in Hue is a beta feature.

The EEP 8.0.0 repository contains the following ecosystem components that are supported for internal data-fabric monitoring use cases only:

- Collectd 5.12.0.300
- Elasticsearch 6.8.8.400
- Fluentd 1.10.3.300
- Grafana 7.5.10.300
- Kibana 6.8.8.400
- OpenTSDB 2.4.1.300

Ecosystem Pack 7.1.2 Release Notes

This topic contains information about the components included in Ecosystem Pack 7.1.2.

Release Date	March 2022
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹EEPs are contained in the MEP-<version> directory. The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-6.0 or MEP-6.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

EEP 7.1.2 can be used with core 6.2.0 and core 7.0.0. For more information about EEP and core version support, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.8-2104, 2.3.8 refers to the Hive version number, and 2104 typically indicates an April 2021 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

EEP 7.1.2 did not introduce any changes that affect application backward compatibility.

EEP 7.1.2 Components

The EEP 7.1.2 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.8.2	AsyncHBase 1.8.2-2009 Release Notes on page 6740
Data Access Gateway 3.0.0.0	Data Access Gateway 3.0 Release Notes on page 6749
Drill 1.16.1.250 ¹	Drill 1.16.1.250-2201 (EEP 7.1.2) Release Notes on page 6764
Flume 1.9.0.300	Flume 1.9.0.300-2201 (EEP 7.1.2) Release Notes on page 6837
Hadoop 2.7.6.0	Hadoop 2.7.6.0 - 2201 (EEP 7.1.2) Release Notes on page 6862
HBase 1.4.13.50	HBase 1.4.13.50 - 2201 (EEP 7.1.2) Release Notes on page 6887
Hive 2.3.8	Hive 2.3.8 - 2201 (EEP 7.1.2) Release Notes on page 6940
HttpFS 1.1.0.50	HttpFS 1.1.0.50 (EEP 7.1.2) Release Notes on page 7104
Hue 4.6.0.150 ²	Hue 4.6.0.150 (EEP 7.1.2) Release Notes on page 7130
Livy 0.7.0.050	Livy 0.7.0.050 - 2202 (EEP 7.1.2) Release Notes on page 7201
Monitoring	Monitoring Components - EEP 7.1.2 Release Notes on page 7320
S3 Gateway 2.1.0.0	Object Store with S3-Compatible API 2.1.0.0 - 2104 (MEP 7.1.0) Release Notes
Oozie 5.2.1.50	Oozie 5.2.1.50 - 2201 (EEP 7.1.2) Release Notes on page 7363
Pig 0.17.0.50	Pig 0.17.0.0 Release Notes on page 7410
Spark 2.4.7.200	Spark 2.4.7.200 - 2201 (EEP 7.1.2) Release Notes on page 7445
Sqoop 1.4.7	Sqoop 1.4.7 - 2201 (EEP 7.1.2) Release Notes on page 7544

Component	Release Notes
Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 7212 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 7213 HPE Ezmeral Data Fabric Streams C#/ .NET 0.11.3 - 1803 Release Notes on page 7214
Streams Tools	Kafka Streams 2.1.1.300 - 2201 (EEP 7.1.2) Release Notes on page 7227 KSQL 5.1.2.300 - 2201 (EEP 7.1.2) Release Notes on page 7245 Kafka Connect HDFS 5.1.2.300 - 2201 (EEP 7.1.2) Release Notes on page 7257 Kafka Connect JDBC 5.1.2.100 - 2201 (EEP 7.1.2) Release Notes on page 7271 Kafka Connect 5.1.2.300 - 2201 (EEP 7.1.2) on page 7281 Kafka REST Proxy 5.1.2.300 - 2201 (EEP 7.1.2) Release Notes on page 7292 Kafka Schema Registry 5.1.2.300 - 2201 (EEP 7.1.2) Release Notes on page 7311
Tez 0.9.2	Tez 0.9.2 - 2201 (EEP 7.1.2) Release Notes on page 7585

¹Support for this component is subject to your license agreement.

²The Spark Notebook UI in Hue is a beta feature.

³Support for Sentry is limited to Impala users.

The EEP 7.1.2 repository contains the following ecosystem components that are supported for internal data-fabric monitoring use cases only:

- Collectd 5.10.0.20
- Elasticsearch 6.8.8.320
- Fluentd 1.10.3.220
- Grafana 7.5.2.220
- Kibana 6.8.8.320
- OpenTSDB 2.4.0

Ecosystem Pack 7.1.1 Release Notes

This topic contains information about the components included in Ecosystem Pack 7.1.1.

Release Date	October 2021
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹EEPs are contained in the MEP-<version> directory. The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-6.0 or MEP-6.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

EEP 7.1.1 can be used with core 6.2.0. For more information about EEP and core version support, see [EEP Support and Lifecycle Status](#) on page 6533.

EEP 7.1.1 is identical to EEP 7.1.0 except for changes to the monitoring (Spyglass) components. For a list of monitoring fixes in EEP 7.1.1, see [Monitoring Components - EEP 7.1.1 Release Notes](#) on page 7321.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.8-2104, 2.3.8 refers to the Hive version number, and 2104 typically indicates an April 2021 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

EEP 7.1.1 did not introduce any changes that affect application backward compatibility.

Impala SLES 15 Support

Though there are no code changes for Impala in this release, new Impala packages are available. These new Impala packages include support for SLES 15.

EEP 7.1.1 Components

The EEP 7.1.1 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.8.2	AsyncHBase 1.8.2-2009 Release Notes on page 6740
Data Access Gateway 3.0.0.0	Data Access Gateway 3.0 Release Notes on page 6749
Drill 1.16.1.200 ¹	Drill 1.16.1.200-2104 (MEP 7.1.0) Release Notes
Flume 1.9.0.100	Flume 1.9.0.100-2101 (EEP 7.0.1) Release Notes on page 6838
Hadoop 2.7.5.0	Hadoop 2.7.5.0 - 2104 (MEP 7.1.0) Release Notes
HBase 1.4.13.0	HBase 1.4.13.0 - 2104 (MEP 7.1.0) Release Notes
Hive 2.3.8	Hive 2.3.8 - 2104 (MEP 7.1.0) Release Notes
HttpFS 1.1.0.0	HttpFS 1.1.0.0 - 2104 (MEP 7.1.0) Release Notes
Hue 4.6.0.0 ²	Hue 4.6.0.0 - 2104 (MEP 7.1.0) Release Notes
Livy 0.7.0.0	Livy 0.7.0.0 - 2104 (MEP 7.1.0) Release Notes
Monitoring	Monitoring Components - EEP 7.1.1 Release Notes on page 7321
S3 Gateway 2.1.0.0	Object Store with S3-Compatible API 2.1.0.0 - 2104 (MEP 7.1.0) Release Notes
Oozie 5.2.1.0	Oozie 5.2.1.0 - 2104 (MEP 7.1.0) Release Notes
Pig 0.17.0.0	Pig 0.17.0.0 Release Notes on page 7410
Spark 2.4.7.100	Spark 2.4.7.100 - 2104 (MEP 7.1.0) Release Notes
Sqoop 1.4.7	Sqoop 1.4.7 - 2104 (MEP 7.1.0) Release Notes

Component	Release Notes
Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 7212 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 7213 HPE Ezmeral Data Fabric Streams C#.NET 0.11.3 - 1803 Release Notes on page 7214
Streams Tools	Kafka Streams 2.1.1.200 - 2104 (MEP 7.1.0) Release Notes KSQL 5.1.2.200 - 2104 (MEP 7.1.0) Release Notes Kafka Connect 5.1.2.0 - 2009 (EEP 7.0.0) Release Notes on page 7282 Kafka Connect HDFS 5.1.2.200 - 2104 (MEP 7.1.0) Release Notes Kafka Connect JDBC 5.1.2.0 - 2009 (MEP 7.0.0) Release Notes on page 7272 Kafka REST Proxy 5.1.2.200 - 2104 (MEP 7.1.0) Release Notes Kafka Schema Registry 5.1.2.200 - 2104 (MEP 7.1.0) Release Notes
Tez 0.9.2	Tez 0.9.2 - 2104 (MEP 7.1.0) Release Notes

¹Support for this component is subject to your license agreement.

²The Spark Notebook UI in Hue is a beta feature.

³Support for Sentry is limited to Impala users.

The EEP 7.1.1 repository contains the following ecosystem components that are supported for internal data-fabric monitoring use cases only:

- Collectd 5.10.0.0
- Elasticsearch 6.8.8.300
- Fluentd 1.10.3.200
- Grafana 7.5.2.200
- Kibana 6.8.8.300
- OpenTSDB 2.4.0

Ecosystem Pack 7.1.0 Release Notes

This topic contains information about the components included in Ecosystem Pack 7.1.0.

Release Date	April 2021
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-6.0 or MEP-6.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

EEP 7.1.0 can be used with core 6.2.0. For more information about EEP and core version support, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.8-2104, 2.3.8 refers to the Hive version number, and 2104 typically indicates an April 2021 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

EEP 7.1.0 did not introduce any changes that affect application backward compatibility.

Impala SLES 15 Support

Though there are no code changes for Impala in this release, new Impala packages are available. These new Impala packages include support for SLES 15.

EEP 7.1.0 Components

The EEP 7.1.0 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsynchBase 1.8.2	AsynchBase 1.8.2-2009 Release Notes on page 6740
Data Access Gateway 3.0	Data Access Gateway 3.0 Release Notes on page 6749
Drill 1.16.1.200 ¹	Drill 1.16.1.200-2104 (MEP 7.1.0) Release Notes
Flume 1.9.0.100	Flume 1.9.0.100-2101 (EEP 7.0.1) Release Notes on page 6838
Hadoop 2.7.5.0	Hadoop 2.7.5.0 - 2104 (MEP 7.1.0) Release Notes
HBase 1.4.13.0	HBase 1.4.13.0 - 2104 (MEP 7.1.0) Release Notes
Hive 2.3.8	Hive 2.3.8 - 2104 (MEP 7.1.0) Release Notes
HttpFS 1.1.0.0	HttpFS 1.1.0.0 - 2104 (MEP 7.1.0) Release Notes
Hue 4.6.0.0 ²	Hue 4.6.0.0 - 2104 (MEP 7.1.0) Release Notes
Livy 0.7.0.0	Livy 0.7.0.0 - 2104 (MEP 7.1.0) Release Notes
Monitoring	Monitoring Components - MEP 7.1.0 Release Notes
S3 Gateway 2.1.0.0	Object Store with S3-Compatible API 2.1.0.0 - 2104 (MEP 7.1.0) Release Notes
Oozie 5.2.1.0	Oozie 5.2.1.0 - 2104 (MEP 7.1.0) Release Notes
Pig 0.17.0.0	Pig 0.17.0.0 Release Notes on page 7410
Spark 2.4.7.100	Spark 2.4.7.100 - 2104 (MEP 7.1.0) Release Notes
Sqoop 1.4.7	Sqoop 1.4.7 - 2104 (MEP 7.1.0) Release Notes
Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 7212 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 7213 HPE Ezmeral Data Fabric Streams C#/ .NET 0.11.3 - 1803 Release Notes on page 7214

Component	Release Notes
Streams Tools	Kafka Streams 2.1.1.200 - 2104 (MEP 7.1.0) Release Notes KSQL 5.1.2.200 - 2104 (MEP 7.1.0) Release Notes Kafka Connect 5.1.2.0 - 2009 (EEP 7.0.0) Release Notes on page 7282 Kafka Connect HDFS 5.1.2.200 - 2104 (MEP 7.1.0) Release Notes Kafka Connect JDBC 5.1.2.0 - 2009 (MEP 7.0.0) Release Notes on page 7272 Kafka REST Proxy 5.1.2.200 - 2104 (MEP 7.1.0) Release Notes Kafka Schema Registry 5.1.2.200 - 2104 (MEP 7.1.0) Release Notes
Tez 0.9.2	Tez 0.9.2 - 2104 (MEP 7.1.0) Release Notes

¹Support for this component is subject to your license agreement.

²The Spark Notebook UI in Hue is a beta feature.

³Support for Sentry is limited to Impala users.

The EEP 7.1.0 repository contains the following ecosystem components that are supported for internal data-fabric monitoring use cases only:

- Collectd 5.10.0.0
- Elasticsearch 6.8.8.300
- Fluentd 1.10.3.0
- Grafana 7.5.2.200
- Kibana 6.8.8.300
- OpenTSDB 2.4.0

Ecosystem Pack 7.0.1 Release Notes

This topic contains information about the components included in Ecosystem Pack 7.0.1.

Release Date	January 2021
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-`<version>` directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-6.0 or MEP-6.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

EEP 7.0.1 can be used with core 6.2.0. For more information about EEP and core version support, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

EEP 7.0.1 did not introduce any changes that affect application backward compatibility.

EEP 7.0.1 Components

The EEP 7.0.1 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsynchBase 1.8.2.0	AsynchBase 1.8.2-2009 Release Notes on page 6740
Data Access Gateway 3.0.0.0	Data Access Gateway 3.0 Release Notes on page 6749
Drill 1.16.1.100 ¹	Drill 1.16.1.100-2101 (EEP 7.0.1) Release Notes on page 6767
Flume 1.9.0.100	Flume 1.9.0.100-2101 (EEP 7.0.1) Release Notes on page 6838
Hadoop 2.7.4.100	Hadoop 2.7.4.100 - 2101 (EEP 7.0.1) Release Notes on page 6866
HBase 1.4.12.100	HBase 1.4.12.100 - 2101 (EEP 7.0.1) Release Notes on page 6891
Hive 2.3.7	Hive 2.3.7 - 2101 (EEP 7.0.1) Release Notes on page 6952
HttpFS 1.0	HttpFS 1.0 - 2101 (EEP 7.0.1) Release Notes on page 7107
Hue 4.6.0.0 ²	Hue 4.6.0.0 - 2009 (EEP 7.0.0) Release Notes on page 7133
Monitoring	Monitoring Components - EEP 7.0.1 Release Notes on page 7324
S3 Gateway 2.0.0.0	S3 Gateway 2.0.0.0 - 2009 (EEP 7.0.0) Release Notes on page 7349

Sqoop 1.4.7	Sqoop 1.4.7 - 2101 (EEP 7.0.1) Release Notes on page 7547
Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 7212 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 7213 HPE Ezmeral Data Fabric Streams C#/ .NET 0.11.3 - 1803 Release Notes on page 7214

Component	Release Notes
Streams Tools	Kafka Streams 2.1.1.100 - 2101 (MEP 7.0.1) Release Notes on page 7229 KSQL 5.1.2.100 - 2101 (MEP 7.0.1) Release Notes on page 7247 Kafka Connect HDFS 5.1.2.100 - 2101 (EEP 7.0.1) Release Notes on page 7259 Kafka Connect JDBC 5.1.2.0 - 2009 (MEP 7.0.0) Release Notes on page 7272 Kafka REST Proxy 5.1.2.100 - 2101 (MEP 7.0.1) Release Notes on page 7294 Kafka Schema Registry 5.1.2.100 - 2101 (EEP 7.0.1) Release Notes on page 7312
Tez 0.9.2	Tez 0.9.2 - 2101 (EEP 7.0.1) Release Notes on page 7588

¹Support for this component is subject to your license agreement.

²The Spark Notebook UI in Hue is a beta feature.

³Support for Sentry is limited to Impala users.

The EEP 7.0.1 repository contains the following ecosystem components that are supported for internal data-fabric monitoring use cases only:

- Collectd 5.10.0.0
- Elasticsearch 6.8.8.0
- Fluentd 1.10.3.0
- Grafana 6.7.4.0
- Kibana 6.8.8.0
- OpenTSDB 2.4.0

Ecosystem Pack 7.0.0 Release Notes

This topic contains information about the components included in Ecosystem Pack 7.0.0.

Release Date	September 2020
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-6.0 or MEP-6.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

EEP 7.0.0 can be used with core 6.2.0. For more information about EEP and core version support, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

EEP 7.0.0 did not introduce any changes that affect application backward compatibility.

EEP 7.0.0 Components

The EEP 7.0.0 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.8.2.0	AsyncHBase 1.8.2-2009 Release Notes on page 6740
Data Access Gateway 3.0.0.0	Data Access Gateway 3.0 Release Notes on page 6749
Drill 1.16.1.0 ¹	Drill 1.16.1.0-2009 (EEP 7.0.0) Release Notes on page 6769
Flume 1.9.0.0	Flume 1.9.0.0-2009 Release Notes on page 6838
Hadoop 2.7.4.0	Hadoop 2.7.4.0-2009 (EEP 7.0.0) Release Notes on page 6868
HBase 1.4.12.0	HBase 1.4.12.0-2009 (EEP 7.0.0) Release Notes on page 6892
Hive 2.3.7	Hive 2.3.7-2009 (EEP 7.0.0) Release Notes on page 6955
HttpFS 1.0	HttpFS 1.0 - 2009 (EEP 7.0.0) Release Notes on page 7108
Hue 4.6.0.0 ²	Hue 4.6.0.0 - 2009 (EEP 7.0.0) Release Notes on page 7133
Monitoring	Monitoring Components - EEP 7.0.0 Release Notes on page 7326
S3 Gateway 2.0.0.0	S3 Gateway 2.0.0.0 - 2009 (EEP 7.0.0) Release Notes on page 7349
Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 7212 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 7213 HPE Ezmeral Data Fabric Streams C#/ .NET 0.11.3 - 1803 Release Notes on page 7214
Streams Tools	Kafka Connect 5.1.2.0 - 2009 (EEP 7.0.0) Release Notes on page 7282 Kafka Connect HDFS 5.1.2.0 - 2009 (EEP 7.0.0) Release Notes on page 7260 Kafka Connect JDBC 5.1.2.0 - 2009 (MEP 7.0.0) Release Notes on page 7272 Kafka REST Proxy 5.1.2.0 - 2009 (MEP 7.0.0) Release Notes on page 7294 Kafka Schema Registry 5.1.2.0 - 2009 (EEP 7.0.0) Release Notes on page 7313 Kafka Streams 2.1.1.0 - 2009 (MEP 7.0.0) Release Notes on page 7230 KSQL 5.1.2.0 - 2009 (MEP 7.0.0) Release Notes on page 7248
Oozie 5.2.0.0	Oozie 5.2.0.0 - 2009 (EEP 7.0.0) Release Notes on page 7369

Component	Release Notes
Pig 0.17.0.0	Pig 0.17.0.0 Release Notes on page 7410
Spark 2.4.5.0	Spark 2.4.5-2009 (EEP 7.0.0) Release Notes on page 7450
Sqoop 1.4.7	Sqoop 1.4.7 - 2009 (EEP 7.0.0) Release Notes on page 7548
Tez 0.9.2.0	Tez 0.9.2-2009 (EEP 7.0.0) Release Notes on page 7590

¹Support for this component is subject to your license agreement.

²The Spark Notebook UI in Hue is a beta feature.

³Support for Sentry is limited to Impala users.

The EEP 7.0.0 repository contains the following ecosystem components that are supported for internal data-fabric monitoring use cases only:

- Collectd 5.10.0.0
- Elasticsearch 6.8.8.0
- Fluentd 1.10.3.0
- Grafana 6.7.4.0
- Kibana 6.8.8.0
- OpenTSDB 2.4.0

Ecosystem Pack 6.4.0 Release Notes

This topic contains information about the components included in Ecosystem Pack 6.4.0.

Release Date	December 2022
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹EEPs are contained in the MEP-<version> directory. The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-6.0 or MEP-6.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

EEP 6.x can be used with Data Fabric core 6.1.x. For more information about EEP and Data Fabric core version support, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

EEP 6.4.0 did not introduce any changes that affect application backward compatibility.

EEP 6.4.0 Components

The EEP 6.4.0 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7.0	AsyncHBase 1.7.0-1808 Release Notes on page 6741
Data Access Gateway 2.0	MapR Data Access Gateway 2.0 Release Notes on page 6750
Drill 1.16.0.500 ¹	Drill 1.16.0.500-2212 (EEP 6.4.0) Release Notes on page 6772
Flume 1.8.0	Flume 1.8.0-2201 (EEP 6.3.6) Release Notes on page 6840
HBase 1.4.14.0	HBase 1.4.14.0 - 2212 (EEP 6.4.0) Release Notes on page 6883
Hive 2.3.9	Hive 2.3.9 - 2212 (EEP 6.4.0) Release Notes on page 6923
HttpFS 1.0	HttpFS 1.0 - 2201 (EEP 6.3.6) Release Notes on page 7109
Hue 4.3.0.600 ²	Hue 4.3.0.600 - 2212 (EEP 6.4.0) Release Notes on page 7137
Impala ¹	Not supported (see Discontinued Ecosystem Components on page 6598)
Livy 0.5.0	Livy 0.5.0 - 2201 (EEP 6.3.6) Release Notes on page 7204
Monitoring	Monitoring Components - EEP 6.4.0 Release Notes on page 7327
Data Fabric Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 7212 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 7213 HPE Ezmeral Data Fabric Streams C#/ .NET 0.11.3 - 1803 Release Notes on page 7214
Data Fabric Streams Tools	Kafka Streams 2.1.1.400 - 2212 (EEP 6.4.0) Release Notes on page 7231 Kafka Connect HDFS 5.1.2.400 - 2212 (EEP 6.4.0) Release Notes on page 7261 Kafka Connect JDBC 5.1.2.400 - 2212 (EEP 6.4.0) Release Notes on page 7273 Kafka REST 5.1.2.400 - 2212 (EEP 6.4.0) Release Notes on page 7296 KSQL 5.1.2.0 - 2212 (EEP 6.4.0) Release Notes on page 7250 Kafka Schema Registry 5.1.2.400 - 2212 (EEP 6.4.0) Release Notes (Developer Preview) on page 7315
Myriad	Not supported (see Discontinued Ecosystem Components on page 6598)
Oozie 5.2.0.200	Oozie 5.2.0.200 - 2212 (EEP 6.4.0) Release Notes on page 7366
Pig 0.16	Pig 0.16.0 - 2110 (EEP 6.3.5) Release Notes on page 7413
S3 Gateway 2.2.0.0 (formerly MapR Object Store)	S3 Gateway 2.2.0.0 - 2110 (EEP 8.0.0) Release Notes on page 7347

Component	Release Notes
Sentry ³	Not supported (see Discontinued Ecosystem Components on page 6598)
Spark 2.4.8.0	Spark 2.4.8.0 - 2212 (EEP 6.4.0) Release Notes on page 7443
Sqoop 1.4.7	Sqoop 1.4.7 - 2212 (EEP 6.4.0) Release Notes on page 7549
Sqoop 2	Not supported (see Discontinued Ecosystem Components on page 6598)
Tez 0.9.2	Tez 0.9.1 - 2212 (EEP 6.4.0) Release Notes on page 7592
Zeppelin 0.9.0.100	Zeppelin 0.9.0.100 - 2212 Release Notes on page 7610

¹Support for this component is subject to your license agreement.

²The Spark Notebook UI in Hue is a beta feature.

³Data Fabric support for Sentry is limited to Impala users.

The EEP 6.4.0 repository contains the following ecosystem components that are supported for internal Data Fabric Monitoring use cases only:

- Collectd 5.8.1.300
- Elasticsearch 6.8.8.200
- Fluentd 1.10.3.130
- Grafana 7.5.2.200
- Kibana 6.8.8.200
- OpenTSDB 2.4.0

Ecosystem Pack 6.3.6 Release Notes

This topic contains information about the components included in Ecosystem Pack 6.3.6.

 **CAUTION:** EEP 6.3.6 requires a core patch to resolve a Warden defect. The defect is fixed in `mapr-patch-6.1.0.20180926230239.GA-20210512163609.x86_64` and later. Before upgrading to EEP 6.3.6, you must apply the patch. See [Patches and Patch Documentation](#) on page 62.

Release Date	January 2022
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹EEPs are contained in the `MEP-<version>` directory. The `MEP-<version>` directory can be represented by a 2-digit number or a 3-digit number (for example, `MEP-6.0` or `MEP-6.0.0`). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

EEP 6.x can be used with Data Fabric Core 6.1.x. For more information about EEP and Data Fabric Core version support, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release,

but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

EEP 6.3.6 did not introduce any changes that affect application backward compatibility.

EEP 6.3.6 Components

The EEP 6.3.6 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7.0	AsyncHBase 1.7.0-1808 Release Notes on page 6741
Data Access Gateway 2.0	MapR Data Access Gateway 2.0 Release Notes on page 6750
Drill 1.16.0.400 ¹	Drill 1.16.0.400-2201 (EEP 6.3.6) Release Notes on page 6772
Flume 1.8.0	Flume 1.8.0-2201 (EEP 6.3.6) Release Notes on page 6840
HBase 1.1.13.500	HBase 1.1.13.500-2201 (EEP 6.3.6) Release Notes on page 6894
Hive 2.3 (with patches from 2.3.6)	Hive 2.3.6 - 2201 (EEP 6.3.6) Release Notes on page 6965
HttpFS 1.0	HttpFS 1.0 - 2201 (EEP 6.3.6) Release Notes on page 7109
Hue 4.3.0.500 ²	Hue 4.3.0.500 - 2201 (EEP 6.3.6) Release Notes on page 7138
Livy 0.5.0	Livy 0.5.0 - 2201 (EEP 6.3.6) Release Notes on page 7204
Monitoring	Monitoring Components - EEP 6.3.6 Release Notes on page 7328
Data Fabric Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 7212 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 7213 HPE Ezmeral Data Fabric Streams C#/.NET 0.11.3 - 1803 Release Notes on page 7214
Data Fabric Streams Tools	Kafka Streams 1.1.1 - 2201 (EEP 6.3.6) Release Notes on page 7233 Kafka Connect HDFS 4.1.0 - 2201 (EEP 6.3.6) Release Notes on page 7261 Kafka Connect JDBC 4.1.0 - 2201 (EEP 6.3.6) Release Notes on page 7274 Kafka REST 4.1.0 - 2201 (EEP 6.3.6) Release Notes on page 7297 KSQL 4.1.1-2201 (EEP 6.3.6) Release Notes on page 7251
Myriad 0.2	Myriad 0.2-1710 Release Notes on page 7353
Oozie 5.1.0.800	Oozie 5.1.0.800 - 2201 (EEP 6.3.6) Release Notes on page 7370

Component	Release Notes
Pig 0.16	Pig 0.16.0 - 2110 (EEP 6.3.5) Release Notes on page 7413
S3 Gateway 1.0.1 (formerly MapR Object Store)	S3 Gateway 1.0.1-1901 (EEP 6.1.0 and EEP 6.0.1) Release Notes on page 7350
Spark 2.4.4.500	Spark 2.4.4.500 - 2201 (EEP 6.3.6) Release Notes on page 7455
Sqoop 1.4.7	Sqoop 1.4.7 - 2201 (EEP 6.3.6) Release Notes on page 7550
Tez 0.9.1	Tez 0.9.1 - 2201 (EEP 6.3.6) Release Notes on page 7593

¹Support for this component is subject to your license agreement.

²The Spark Notebook UI in Hue is a beta feature.

³Data Fabric support for Sentry is limited to Impala users.

The EEP 6.3.6 repository contains the following ecosystem components that are supported for internal Data Fabric Monitoring use cases only:

- Collectd 5.8.1.210
- Elasticsearch 6.8.8.110
- Fluentd 1.10.3.110
- Grafana 7.5.2.110
- Kibana 6.8.8.110
- OpenTSDB 2.4.0

Ecosystem Pack 6.3.5 Release Notes

This topic contains information about the components included in Ecosystem Pack 6.3.5.

CAUTION: EEP 6.3.5 requires a core patch to resolve a Warden defect. The defect is fixed in `mapr-patch-6.1.0.20180926230239.GA-20210512163609.x86_64` and later. Before upgrading to EEP 6.3.5, you must apply the patch. See [Patches and Patch Documentation](#) on page 62.

Release Date	October 2021
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹EEPs are contained in the `MEP-<version>` directory. The `MEP-<version>` directory can be represented by a 2-digit number or a 3-digit number (for example, `MEP-6.0` or `MEP-6.0.0`). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

EEP 6.x can be used with MapR Core 6.1.x. For more information about EEP and MapR Core version support, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

EEP 6.3.5 did not introduce any changes that affect application backward compatibility.

EEP 6.3.5 Components

The EEP 6.3.5 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7.0	AsyncHBase 1.7.0-1808 Release Notes on page 6741
Data Access Gateway 2.0	MapR Data Access Gateway 2.0 Release Notes on page 6750
Drill 1.16.0.300 ¹	Drill 1.16.0.300-2110 (EEP 6.3.5) Release Notes on page 6773
Flume 1.8.0	Flume 1.8.0-2104 (EEP 6.3.4) Release Notes on page 6841
HBase 1.1.13.400	HBase 1.1.13.400-2110 (EEP 6.3.5) Release Notes on page 6895
Hive 2.3 (with patches from 2.3.6)	Hive 2.3.6 - 2110 (EEP 6.3.5) Release Notes on page 6969
HttpFS 1.0	HttpFS 1.0 - 2104 (EEP 6.3.4) Release Notes on page 7110
Hue 4.3.0.400 ²	Hue 4.3.0.400 - 2104 (EEP 6.3.4) Release Notes on page 7140
Livy 0.5.0	Livy 0.5.0 - 2104 (EEP 6.3.4) Release Notes on page 7205
Monitoring	Monitoring Components - EEP 6.3.5 Release Notes on page 7329
MapR Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 7212 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 7213 HPE Ezmeral Data Fabric Streams C#/ .NET 0.11.3 - 1803 Release Notes on page 7214
MapR Streams Tools	Kafka Streams 1.1.1 - 2104 (MEP 6.3.4) Release Notes on page 7234 Kafka Connect HDFS 4.1.0 - 2104 (EEP 6.3.4) Release Notes on page 7262 Kafka Connect JDBC 4.1.0 - 2101 (EEP 6.3.2) Release Notes on page 7275 Kafka REST 4.1.0 - 2101 (MEP 6.3.2) Release Notes on page 7298 KSQL 4.1.1-1808 Release Notes on page 7252
Myriad 0.2	Myriad 0.2-1710 Release Notes on page 7353
Oozie 5.1.0.700	Oozie 5.1.0.700 - 2110 (EEP 6.3.5) Release Notes on page 7372
Pig 0.16	Pig 0.16.0 - 2110 (EEP 6.3.5) Release Notes on page 7413

Component	Release Notes
S3 Gateway 1.0.1 (formerly MapR Object Store)	S3 Gateway 1.0.1-1901 (EEP 6.1.0 and EEP 6.0.1) Release Notes on page 7350
Spark 2.4.4.400	Spark 2.4.4.400 - 2110 (EEP 6.3.5) Release Notes on page 7456
Sqoop 1.4.7	Sqoop 1.4.7 - 2110 (EEP 6.3.5) Release Notes on page 7551
Sqoop2 1.99.7	Sqoop2 1.99.7-1803 Release Notes on page 7568
Tez 0.9.1	Tez 0.9.1 - 2104 (EEP 6.3.4) Release Notes on page 7594

¹Support for this component is subject to your license agreement.

²The Spark Notebook UI in Hue is a beta feature.

³MapR support for Sentry is limited to Impala users.

The EEP 6.3.5 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.8.1.201
- Elasticsearch 6.8.8.100
- Fluentd 1.10.3.100
- Grafana 7.5.2.100
- Kibana 6.8.8.100
- OpenTSDB 2.4.0

Ecosystem Pack 6.3.4 Release Notes

This topic contains information about the components included in Ecosystem Pack 6.3.4.

CAUTION: EEP 6.3.4 requires a core patch to resolve a Warden defect. The defect is fixed in `mapr-patch-6.1.0.20180926230239.GA-20210512163609.x86_64` and later. Before upgrading to EEP 6.3.4, you must apply the patch. See [Patches and Patch Documentation](#) on page 62.

Release Date	April 2021
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The `MEP-<version>` directory can be represented by a 2-digit number or a 3-digit number (for example, `MEP-6.0` or `MEP-6.0.0`). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

EEP 6.x can be used with MapR Core 6.1.x. For more information about EEP and MapR Core version support, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

EEP 6.3.4 did not introduce any changes that affect application backward compatibility.

EEP 6.3.4 Components

The EEP 6.3.4 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7.0	AsyncHBase 1.7.0-1808 Release Notes on page 6741
Data Access Gateway 2.0	MapR Data Access Gateway 2.0 Release Notes on page 6750
Drill 1.16.0.200 ¹	Drill 1.16.0.200-2104 (EEP 6.3.4) Release Notes on page 6774
Flume 1.8.0	Flume 1.8.0-2104 (EEP 6.3.4) Release Notes on page 6841
HBase 1.1.13.300	HBase 1.1.13.300-2104 (EEP 6.3.4) Release Notes on page 6896
Hive 2.3 (with patches from 2.3.6)	Hive 2.3.6 - 2104 (EEP 6.3.4) Release Notes on page 6973
HttpFS 1.0	HttpFS 1.0 - 2104 (EEP 6.3.4) Release Notes on page 7110
Hue 4.3.0.400 ²	Hue 4.3.0.400 - 2104 (EEP 6.3.4) Release Notes on page 7140

¹Support for this component is subject to your license agreement.

²The Spark Notebook UI in Hue is a beta feature.

³MapR support for Sentry is limited to Impala users.

The EEP 6.3.4 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.8.1.201
- Elasticsearch 6.8.8.100
- Fluentd 1.10.3.100
- Grafana 7.5.2.100
- Kibana 6.8.8.100
- OpenTSDB 2.4.0

Ecosystem Pack 6.3.3 Release Notes

This topic contains information about the components included in Ecosystem Pack 6.3.3.

Release Date	March 2021
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-`<version>` directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-6.0 or MEP-6.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

EEP 6.x can be used with MapR Core 6.1.x. For more information about EEP and MapR Core version support, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

EEP 6.3.3 did not introduce any changes that affect application backward compatibility.

EEP 6.3.3 Components

The EEP 6.3.3 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7.0	AsyncHBase 1.7.0-1808 Release Notes on page 6741
Data Access Gateway 2.0	MapR Data Access Gateway 2.0 Release Notes on page 6750
Drill 1.16.0.100 ¹	Drill 1.16.0.100-2101 (EEP 6.3.2) Release Notes on page 6776
Flume 1.8.0	Flume 1.8.0-2101 (EEP 6.3.2) Release Notes on page 6842
HBase 1.1.13.200	HBase 1.1.13.200-2101 (EEP 6.3.2) Release Notes on page 6898
Hive 2.3 (with patches from 2.3.6)	Hive 2.3.6 - 2101 (EEP 6.3.2) Release Notes on page 6977
HttpFS 1.0	HttpFS 1.0 - 2101 (EEP 6.3.2) Release Notes on page 7111
Hue 4.3.0.300 ²	Hue 4.3.0.300 - 2101 (EEP 6.3.2) Release Notes on page 7141
Monitoring	Monitoring Components - EEP 6.3.3 Release Notes on page 7331
MapR Object Store 1.0.1	S3 Gateway 1.0.1-1901 (EEP 6.1.0 and EEP 6.0.1) Release Notes on page 7350
MapR Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 7212 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 7213 HPE Ezmeral Data Fabric Streams C#.NET 0.11.3 - 1803 Release Notes on page 7214
MapR Streams Tools	Kafka Streams 1.1.1 - 2101 (MEP 6.3.2) Release Notes on page 7235 Kafka Connect HDFS 4.1.0 - 2101 (EEP 6.3.2) Release Notes on page 7263 Kafka Connect JDBC 4.1.0 - 2101 (EEP 6.3.2) Release Notes on page 7275 Kafka REST 4.1.0 - 2101 (MEP 6.3.2) Release Notes on page 7298 KSQL 4.1.1-1808 Release Notes on page 7252
Myriad 0.2	Myriad 0.2-1710 Release Notes on page 7353
Oozie 5.1.0.500	Oozie 5.1.0.500 - 2101 (EEP 6.3.2) Release Notes on page 7374
Pig 0.16	Pig 0.16.0 - 2009 (EEP 6.3.1) Release Notes on page 7413
Spark 2.4.4.200	Spark 2.4.4.200 - 2101 (EEP 6.3.2) Release Notes on page 7459
Sqoop 1.4.7	Sqoop 1.4.7 - 2101 (EEP 6.3.2) Release Notes on page 7552

Component	Release Notes
Sqoop2 1.99.7	Sqoop2 1.99.7-1803 Release Notes on page 7568
Tez 0.9.1	Tez 0.9.1 - 2101 (EEP 6.3.2) Release Notes on page 7595

¹Support for this component is subject to your license agreement.

²The Spark Notebook UI in Hue is a beta feature.

³MapR support for Sentry is limited to Impala users.

The EEP 6.3.3 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.8.1.201
- Elasticsearch 6.8.8.100
- Fluentd 1.10.3.100
- Grafana 6.7.4.100
- Kibana 6.8.8.100
- OpenTSDB 2.4.0

Ecosystem Pack 6.3.2 Release Notes

This topic contains information about the components included in Ecosystem Pack 6.3.2.

Release Date	January 2021
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-`<version>` directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-6.0 or MEP-6.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

EEP 6.x can be used with MapR Core 6.1.0. For more information about EEP and MapR Core version support, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

EEP 6.3.2 did not introduce any changes that affect application backward compatibility.

EEP 6.3.2 Components

The EEP 6.3.2 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7.0	AsyncHBase 1.7.0-1808 Release Notes on page 6741
Data Access Gateway 2.0	MapR Data Access Gateway 2.0 Release Notes on page 6750

Component	Release Notes
Drill 1.16.0.100 ¹	Drill 1.16.0.100-2101 (EEP 6.3.2) Release Notes on page 6776
Flume 1.8.0	Flume 1.8.0-2101 (EEP 6.3.2) Release Notes on page 6842
HBase 1.1.13.200	HBase 1.1.13.200-2101 (EEP 6.3.2) Release Notes on page 6898
Hive 2.3 (with patches from 2.3.6)	Hive 2.3.6 - 2101 (EEP 6.3.2) Release Notes on page 6977
HttpFS 1.0	HttpFS 1.0 - 2101 (EEP 6.3.2) Release Notes on page 7111
Hue 4.3.0.300 ²	Hue 4.3.0.300 - 2101 (EEP 6.3.2) Release Notes on page 7141
Monitoring	Monitoring Components - EEP 6.3.2 Release Notes on page 7332
MapR Object Store 1.0.1	S3 Gateway 1.0.1-1901 (EEP 6.1.0 and EEP 6.0.1) Release Notes on page 7350
MapR Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 7212 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 7213 HPE Ezmeral Data Fabric Streams C#/.NET 0.11.3 - 1803 Release Notes on page 7214
MapR Streams Tools	Kafka Streams 1.1.1 - 2101 (MEP 6.3.2) Release Notes on page 7235 Kafka Connect HDFS 4.1.0 - 2101 (EEP 6.3.2) Release Notes on page 7263 Kafka Connect JDBC 4.1.0 - 2101 (EEP 6.3.2) Release Notes on page 7275 Kafka REST 4.1.0 - 2101 (MEP 6.3.2) Release Notes on page 7298 KSQL 4.1.1-1808 Release Notes on page 7252
Myriad 0.2	Myriad 0.2-1710 Release Notes on page 7353
Oozie 5.1.0.500	Oozie 5.1.0.500 - 2101 (EEP 6.3.2) Release Notes on page 7374
Pig 0.16	Pig 0.16.0 - 2009 (EEP 6.3.1) Release Notes on page 7413
Spark 2.4.4.200	Spark 2.4.4.200 - 2101 (EEP 6.3.2) Release Notes on page 7459
Sqoop 1.4.7	Sqoop 1.4.7 - 2101 (EEP 6.3.2) Release Notes on page 7552
Sqoop2 1.99.7	Sqoop2 1.99.7-1803 Release Notes on page 7568
Tez 0.9.1	Tez 0.9.1 - 2101 (EEP 6.3.2) Release Notes on page 7595

¹Support for this component is subject to your license agreement.

²The Spark Notebook UI in Hue is a beta feature.

³MapR support for Sentry is limited to Impala users.

The EEP 6.3.2 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.8.1.201
- Elasticsearch 6.8.8.100
- Fluentd 1.10.3.100
- Grafana 6.7.4.100
- Kibana 6.8.8.100
- OpenTSDB 2.4.0

Ecosystem Pack 6.3.1 Release Notes

This topic contains information about the components included in Ecosystem Pack 6.3.1.

Release Date	September 2020
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The `MEP-<version>` directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-6.0 or MEP-6.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

EEP 6.x can be used with MapR Core 6.1.0. For more information about EEP and MapR Core version support, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

EEP 6.3.1 did not introduce any changes that affect application backward compatibility.

EEP 6.3.1 Components

The EEP 6.3.1 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7.0	AsyncHBase 1.7.0-1808 Release Notes on page 6741
Data Access Gateway 2.0	MapR Data Access Gateway 2.0 Release Notes on page 6750
Drill 1.16.0.22 ¹	Drill 1.16.0.22-2009 (EEP 6.3.1) Release Notes on page 6777
Flume 1.8	Flume 1.8.0-1904 Release Notes on page 6843
HBase 1.1.13.0	HBase 1.1.13.100-2009 (EEP 6.3.1) Release Notes on page 6899
Hive 2.3 (with patches from 2.3.6)	Hive 2.3.6-2009 (EEP 6.3.1) Release Notes on page 6980

Component	Release Notes
HttpFS 1.0	HttpFS-1.0-1904 Release Notes on page 7114
Hue 4.3.0.200 ²	Hue 4.3.0.200 - 2009 (EEP 6.3.1) Release Notes on page 7143
MapR Monitoring	Monitoring Components - EEP 6.3.1 Release Notes on page 7333
MapR Object Store 1.0.1	S3 Gateway 1.0.1-1901 (EEP 6.1.0 and EEP 6.0.1) Release Notes on page 7350

¹Support for this component is subject to your license agreement.

²For use only with HPE Ezmeral Data Fabric Database binary tables.

³The Spark Notebook UI in Hue is a beta feature.

⁴MapR support for Sentry is limited to Impala users.

The EEP 6.2.0 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.8.1.100
- Elasticsearch 6.5.3.100
- Fluentd 1.4.0.0
- Grafana 6.0.2.0
- Kibana 6.5.3.100
- OpenTSDB 2.4.0

Ecosystem Pack 6.1.1 Release Notes

This topic contains information about the components included with the Ecosystem Pack 6.1.1.

Release Date	May 2019
Repository Location	<code>https://package.ezmeral.hpe.com/releases/MEP/</code> ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-6.0 or MEP-6.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

EEP 6.x can be used with MapR Core 6.1.0. For more information about EEP and MapR Core version support, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

EEP 6.1.1 did not introduce any changes that would impact application backward compatibility.

EEP 6.1.1 Components

The EEP 6.1.1 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7	AsyncHBase 1.7.0-1808 Release Notes on page 6741
Drill 1.15.0.7 ¹	Drill 1.15.0.0-1901 (EEP 6.1.0) Release Notes on page 6785
Flume 1.8	Flume 1.8.0-1904 Release Notes on page 6843
HBase-compatible API ¹	HBase 1.1.8-1904 Release Notes on page 6906
Hive 2.3.3	Hive 2.3.3-1904 (EEP 6.2.0, EEP 6.1.1, and EEP 6.0.2) Release Notes on page 6992
HttpFS 1.0	HttpFS-1.0-1904 Release Notes on page 7114
Hue 4.2	Hue 4.2.0-1904 Release Notes on page 7150
MapR Data Access Gateway 2.0	MapR Data Access Gateway 2.0 Release Notes on page 6750
MapR Monitoring	Monitoring Components - EEP 6.1.0 Release Notes on page 7335
MapR Object Store 1.0.1	S3 Gateway 1.0.1-1901 (EEP 6.1.0 and EEP 6.0.1) Release Notes on page 7350
MapR Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 7212 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 7213 HPE Ezmeral Data Fabric Streams C#/.NET 0.11.3 - 1803 Release Notes on page 7214

Component	Release Notes
MapR Streams Tools	Kafka Connect JDBC 4.1.0-1808 Release Notes on page 7275 Kafka Connect HDFS 4.1.0-1808 Release Notes on page 7264 Kafka Connect 4.1.0-1808 Release Notes on page 7283 Kafka REST 4.1.0-1808 Release Notes on page 7300 Kafka Schema Registry 4.1.1-1901 Release Notes on page 7315 Kafka Streams 1.1-1808 Release Notes on page 7237 KSQL 4.1.1-1808 Release Notes on page 7252
Myriad 0.2	Myriad 0.2-1710 Release Notes on page 7353
Oozie 5.1.0.100	Oozie 5.1.0-1904 (EEP 6.1.1) Release Notes on page 7379
Pig 0.16	Pig 0.16.0-1901 Release Notes on page 7416
Spark 2.3.3.100 ¹	Spark 2.3.3.0-1904 (EEP 6.1.1 and EEP 6.0.2) Release Notes on page 7470
Sqoop 1.4.7	Sqoop 1.4.7-1904 Release Notes on page 7554
Sqoop2 1.99.7	Sqoop2 1.99.7-1803 Release Notes on page 7568

¹For use only with HPE Ezmeral Data Fabric Database binary tables.

²MapR support for Sentry is limited to Impala users.

The EEP 6.1.0 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.8.1.1
- Elasticsearch 6.5.3.1
- Fluentd 1.3.2.1
- Grafana 5.4.2.1
- Kibana 6.5.3.1
- OpenTSDB 2.4.0

Ecosystem Pack 6.1.0 Release Notes

This topic contains information about the components included with the Ecosystem Pack 6.1.0.

Release Date	February 2019
Repository Location	<code>https://package.ezmeral.hpe.com/releases/MEP/</code> ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

EEP 6.x can be used with MapR Core 6.1.0. For more information about EEP and MapR Core version support, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

EEP 6.1.0 Components

The EEP 6.1.0 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7	AsyncHBase 1.7.0-1808 Release Notes on page 6741
Drill 1.15.0.0 ¹	Drill 1.15.0.0-1901 (EEP 6.1.0) Release Notes on page 6785
Flume 1.8	Flume 1.8.0-1901 Release Notes on page 6843
HBase-compatible API ²	HBase 1.1.8-1901 Release Notes on page 6907
Hive 2.3.3 ³	Hive 2.3.3-1901 (EEP 6.1.0 and EEP 6.0.1) Release Notes on page 6996
HttpFS 1.0	HttpFS-1.0-1901 (EEP 6.1.0) Release Notes on page 7115
Hue 4.2	Hue 4.2.0-1901 (EEP 6.1.0) Release Notes on page 7152
MapR Data Access Gateway 2.0	MapR Data Access Gateway 2.0 Release Notes on page 6750
MapR Monitoring	Monitoring Components - EEP 6.1.0 Release Notes on page 7335
MapR Object Store 1.0.1	S3 Gateway 1.0.1-1901 (EEP 6.1.0 and EEP 6.0.1) Release Notes on page 7350
MapR Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 7212 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 7213 HPE Ezmeral Data Fabric Streams C#/.NET 0.11.3 - 1803 Release Notes on page 7214
MapR Streams Tools	Kafka Connect JDBC 4.1.0-1808 Release Notes on page 7275 Kafka Connect HDFS 4.1.0-1808 Release Notes on page 7264 Kafka Connect 4.1.0-1808 Release Notes on page 7283 Kafka REST 4.1.0-1808 Release Notes on page 7300 Kafka Schema Registry 4.1.1-1901 Release Notes on page 7315 Kafka Streams 1.1-1808 Release Notes on page 7237 KSQL 4.1.1-1808 Release Notes on page 7252
Myriad 0.2	Myriad 0.2-1710 Release Notes on page 7353
Oozie 5.1.0.0	Oozie 5.1.0.0-1901 (EEP 6.1.0) Release Notes on page 7380

Component	Release Notes
Pig 0.16	Pig 0.16.0-1901 Release Notes on page 7416
Spark 2.3.2.0 ¹	Spark 2.3.2.0-1901 (EEP 6.1.0 and EEP 6.0.1) Release Notes on page 7478
Sqoop 1.4.7	Sqoop 1.4.7-1808 (EEP 6.0.0) Release Notes on page 7555
Sqoop2 1.99.7	Sqoop2 1.99.7-1803 Release Notes on page 7568

¹Support for this component is subject to your license agreement.

²For use only with HPE Ezmeral Data Fabric Database binary tables.

³MapR Hive 2.3.3 is equivalent to Apache Hive 2.3.4.

⁴MapR support for Sentry is limited to Impala users.

The EEP 6.1.0 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.8.1.0
- Elasticsearch 6.5.3.0
- Fluentd 1.3.2.0
- Grafana 5.4.2.0
- Kibana 6.5.3.0
- OpenTSDB 2.4.0

Ecosystem Pack 6.0.2 Release Notes

This topic contains information about the components included with the Ecosystem Pack 6.0.2.

Release Date	May 2019
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-6.0 or MEP-6.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

EEP 6.x can be used with MapR Core 6.1.0. For more information about EEP and MapR Core version support, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

EEP 6.0.2 did not introduce any changes that would impact application backward compatibility.

EEP 6.0.2 Components

The EEP 6.0.2 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7	AsyncHBase 1.7.0-1808 Release Notes on page 6741
Drill 1.14	Drill 1.14.0-1901 (EEP 6.0.1) Release Notes on page 6790
Flume 1.8	Flume 1.8.0-1904 Release Notes on page 6843
HBase-compatible API ¹	HBase 1.1.8-1904 Release Notes on page 6906
Hive 2.3.3	Hive 2.3.3-1904 (EEP 6.2.0, EEP 6.1.1, and EEP 6.0.2) Release Notes on page 6992
HttpFS 1.0	HttpFS-1.0-1904 Release Notes on page 7114
Hue 4.2	Hue 4.2.0-1904 Release Notes on page 7150
MapR Data Access Gateway	MapR Data Access Gateway 2.0 Release Notes on page 6750
MapR Monitoring	Monitoring Components - EEP 6.0.0 Release Notes on page 7336
MapR Object Store 1.0.1	S3 Gateway 1.0.1-1901 (EEP 6.1.0 and EEP 6.0.1) Release Notes on page 7350
MapR Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 7212 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 7213 HPE Ezmeral Data Fabric Streams C#/ .NET 0.11.3 - 1803 Release Notes on page 7214
MapR Streams Tools	Kafka Connect JDBC 4.1.0-1808 Release Notes on page 7275 Kafka Connect HDFS 4.1.0-1808 Release Notes on page 7264 Kafka Connect 4.1.0-1808 Release Notes on page 7283 Kafka REST 4.1.0-1808 Release Notes on page 7300 Kafka Streams 1.1-1808 Release Notes on page 7237 KSQL 4.1.1-1808 Release Notes on page 7252
Myriad 0.2	Myriad 0.2-1710 Release Notes on page 7353
Oozie 4.3.0	Oozie 4.3.0-1904 (EEP 6.0.2) Release Notes on page 7384
Pig 0.16	Pig 0.16.0-1901 Release Notes on page 7416
Spark 2.3.3.0	Spark 2.3.3.0-1904 (EEP 6.1.1 and EEP 6.0.2) Release Notes on page 7470
Sqoop 1.4.7	Sqoop 1.4.7-1904 Release Notes on page 7554
Sqoop2 1.99.7	Sqoop2 1.99.7-1803 Release Notes on page 7568

¹For use only with HPE Ezmeral Data Fabric Database binary tables.

²MapR support for Sentry is limited to Impala users.

The EEP 6.0.1 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.8.0

- Elasticsearch 6.2.3
- Fluentd 1.1.2
- Grafana 4.6.5
- Kibana 6.2.3
- OpenTSDB 2.4.0

Ecosystem Pack 6.0.1 Release Notes

This topic contains information about the components included with the Ecosystem Pack 6.0.1.

Release Date	February 2019
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

EEP 6.x can be used with MapR Core 6.1.0. For more information about EEP and MapR Core version support, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

EEP 6.0.1 Components

The EEP 6.0.1 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7	AsyncHBase 1.7.0-1808 Release Notes on page 6741
Drill 1.14 ¹	Drill 1.14.0-1901 (EEP 6.0.1) Release Notes on page 6790
Flume 1.8	Flume 1.8.0-1901 Release Notes on page 6843
HBase-compatible API ²	HBase 1.1.8-1901 Release Notes on page 6907
Hive 2.3 ³	Hive 2.3.3-1901 (EEP 6.1.0 and EEP 6.0.1) Release Notes on page 6996
HttpFS 1.0	HttpFS-1.0-1901 (EEP 6.1.0) Release Notes on page 7115
Hue 4.2	Hue 4.2.0-1808 (EEP 6.0.0) Release Notes on page 7153
MapR Data Access Gateway	MapR Data Access Gateway 2.0 Release Notes on page 6750
MapR Monitoring	Monitoring Components - EEP 6.0.0 Release Notes on page 7336
MapR Object Store 1.0.1	S3 Gateway 1.0.1-1901 (EEP 6.1.0 and EEP 6.0.1) Release Notes on page 7350

Component	Release Notes
MapR Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 7212 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 7213 HPE Ezmeral Data Fabric Streams C#/.NET 0.11.3 - 1803 Release Notes on page 7214

Myriad 0.2	Myriad 0.2-1710 Release Notes on page 7353
Oozie 4.3.0	Oozie 4.3.0-1901 Release Notes on page 7386
Pig 0.16	Pig 0.16.0-1901 Release Notes on page 7416
Spark 2.3.2.0 ¹	Spark 2.3.2.0-1901 (EEP 6.1.0 and EEP 6.0.1) Release Notes on page 7478
Sqoop 1.4.7	Sqoop 1.4.7-1808 (EEP 6.0.0) Release Notes on page 7555
Sqoop2 1.99.7	Sqoop2 1.99.7-1803 Release Notes on page 7568

¹Support for this component is subject to your license agreement.

²For use only with HPE Ezmeral Data Fabric Database binary tables.

³MapR Hive 2.3.0 is equivalent to Apache Hive 2.3.3.

⁴MapR support for Sentry is limited to Impala users.

The EEP 6.0.1 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.8.0
- Elasticsearch 6.2.3
- Fluentd 1.1.2
- Grafana 4.6.1
- Kibana 6.2.3
- OpenTSDB 2.4.0

Ecosystem Pack 6.0.0 Release Notes

This topic contains information about the components included with the Ecosystem Pack 6.0.0.

Release Date	September 2018
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

EEP 6.x can be used with MapR Core 6.1.0. For more information about EEP and MapR Core version support, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

EEP 6.0.0 Components

The EEP 6.0.0 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7	AsyncHBase 1.7.0-1808 Release Notes on page 6741
Drill 1.14 ¹	Drill 1.14.0-1808 (EEP 6.0.0) Release Notes on page 6791
Flume 1.8	Flume 1.8.0-1808 Release Notes on page 6844
HBase-compatible API ²	HBase 1.1.8-1808 Release Notes on page 6907
Hive 2.3 ³	Hive 2.3.3-1808 (EEP 6.0.0) Release Notes on page 7002
HttpFS 1.0	HttpFS-1.0-1808 (EEP 6.0.0) Release Notes on page 7115
Hue 4.2	Hue 4.2.0-1808 (EEP 6.0.0) Release Notes on page 7153
MapR Data Access Gateway	MapR Data Access Gateway 2.0 Release Notes on page 6750
MapR Monitoring	Monitoring Components - EEP 6.0.0 Release Notes on page 7336
MapR Object Store 1.0.0	S3 Gateway 1.0.0-1808 (EEP 6.0.0) Release Notes on page 7351
MapR Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 7212 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 7213 HPE Ezmeral Data Fabric Streams C#.NET 0.11.3 - 1803 Release Notes on page 7214
MapR Streams Tools	Kafka Connect JDBC 4.1.0-1808 Release Notes on page 7275 Kafka Connect HDFS 4.1.0-1808 Release Notes on page 7264 Kafka Connect 4.1.0-1808 Release Notes on page 7283 Kafka REST 4.1.0-1808 Release Notes on page 7300 Kafka Streams 1.1-1808 Release Notes on page 7237 KSQL 4.1.1-1808 Release Notes on page 7252

Component	Release Notes
Myriad 0.2	Myriad 0.2-1710 Release Notes on page 7353
Oozie 4.3.0	Oozie 4.3.0-1808 (EEP 6.0.0) Release Notes on page 7387
Pig 0.16	Pig 0.16.0-1703 Release Notes on page 7416
Spark 2.3.1 ¹	Spark 2.3.1-1808 (EEP 6.0.0) Release Notes on page 7481
Sqoop 1.4.7	Sqoop 1.4.7-1808 (EEP 6.0.0) Release Notes on page 7555
Sqoop2 1.99.7	Sqoop2 1.99.7-1803 Release Notes on page 7568

¹Support for this component is subject to your license agreement.

²For use only with HPE Ezmeral Data Fabric Database binary tables.

³MapR Hive 2.3.0 is equivalent to Apache Hive 2.3.3.

⁴MapR support for Sentry is limited to Impala users.

The EEP 6.0.0 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.8.0
- Elasticsearch 6.2.3
- Fluentd 1.1.2
- Grafana 4.6.1
- Kibana 6.2.3
- OpenTSDB 2.4.0

Ecosystem Pack 5.0.8 Release Notes

This topic contains information about the components included with the Ecosystem Pack 5.0.8.

Release Date	March 2022
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/1

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-5.0 or MEP-5.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

To understand which core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

MEP 5.0.8 did not introduce any changes that would impact application backward compatibility.

EEP 5.0.8 Components

The EEP 5.0.8 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7	AsyncHBase 1.7.0-1808 Release Notes on page 6741
Data Access Gateway 1.0	MapR Data Access Gateway 1.0 Release Notes on page 6751
Drill 1.13.0	Drill 1.13.0-2009 (EEP 5.0.5) Release Notes on page 6796
Flume 1.8	Flume 1.8.0-1904 Release Notes on page 6843
HBase-compatible API ¹	HBase 1.1.8 - 2201 (EEP 5.0.8) Release Notes on page 6901
Hive 2.1.1	Ecosystem Pack 5.0.8 Release Notes on page 6695
HttpFS 1.0	HttpFS 1.0 - 2201 (EEP 5.0.8) Release Notes on page 7111
Hue 3.12.0	Hue 3.12.0 - 2009 (EEP 5.0.5) Release Notes on page 7158
Livy 0.3.0	Livy 0.3.0 - 2202 (EEP 5.0.8) Release Notes on page 7206
Monitoring	Monitoring Components - EEP 5.0.8 Release Notes on page 7337
Myriad 0.2	Myriad 0.2-1710 Release Notes on page 7353
Oozie 4.3.0	Oozie 4.3.0 - 2201 (EEP 5.0.8) Release Notes on page 7381
Pig 0.16	Pig 0.16.0-1703 Release Notes on page 7416
Spark 2.2.1	Spark 2.2.1-2009 (EEP 5.0.5) Release Notes on page 7474
Sqoop 1.4.6	Sqoop 1.4.6-2201 (EEP 5.0.8) Release Notes on page 7556
Sqoop2 2.0.0	Sqoop2 1.99.7-1803 Release Notes on page 7568
Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 7212 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 7213 HPE Ezmeral Data Fabric Streams C#/ .NET 0.11.3 - 1803 Release Notes on page 7214
Streams Tools	Kafka Connect HDFS 4.0.0-1808 Release Notes on page 7265 Kafka Connect JDBC 4.0.0 - 2201 (EEP 5.0.8) Release Notes on page 7276 Kafka REST 4.0.0-2201 (EEP 5.0.8) Release Notes on page 7301
Tez 0.8.4	Tez 0.8.4 - 2201 (EEP 5.0.8) Release Notes on page 7601

¹For use only with HPE Ezmeral Data Fabric Database binary tables.

²Support for Sentry is limited to Impala users.

The EEP 5.0.8 repository contains the following ecosystem components that are supported for internal Monitoring use cases only:

- Collectd 5.7.2
- Elasticsearch 5.4.1
- Fluentd 0.14.20
- Grafana 7.5.2.0
- Kibana 5.4.1
- OpenTSDB 2.4.0

Ecosystem Pack 5.0.7 Release Notes

This topic contains information about the components included with the Ecosystem Pack 5.0.7.

Release Date	May 2021
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-5.0 or MEP-5.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

To understand which core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

MEP 5.0.7 did not introduce any changes that would impact application backward compatibility.

EEP 5.0.7 Components

The EEP 5.0.7 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7	AsyncHBase 1.7.0-1808 Release Notes on page 6741
Drill 1.13.0	Drill 1.13.0-2009 (EEP 5.0.5) Release Notes on page 6796
Flume 1.8	Flume 1.8.0-1904 Release Notes on page 6843
HBase-compatible API ¹	HBase 1.1.8-2101 (EEP 5.0.6) Release Notes on page 6902
Hive 2.1.1	Hive 2.1.1-2009 (EEP 5.0.5) Release Notes on page 7009
HttpFS 1.0	HttpFS 1.0 - 2101 (EEP 5.0.6) Release Notes on page 7112

Sqoop2 1.99.7	Sqoop2 1.99.7-1803 Release Notes on page 7568
Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 7212 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 7213 HPE Ezmeral Data Fabric Streams C#/NET 0.11.3 - 1803 Release Notes on page 7214
Streams Tools	Kafka Connect HDFS 4.0.0-1808 Release Notes on page 7265 Kafka Connect JDBC 4.0.0-1803 Release Notes on page 7277 Kafka REST 4.0.0-1803 Release Notes on page 7302
Tez 0.8.4	Tez 0.8.4-2009 (EEP 5.0.5) Release Notes on page 7602

¹For use only with HPE Ezmeral Data Fabric Database binary tables.

²Support for Sentry is limited to Impala users.

The EEP 5.0.7 repository contains the following ecosystem components that are supported for internal Monitoring use cases only:

- Collectd 5.7.2
- Elasticsearch 5.4.1
- Fluentd 0.14.20
- Grafana 7.5.2.0
- Kibana 5.4.1
- OpenTSDB 2.4.0

Ecosystem Pack 5.0.6 Release Notes

This topic contains information about the components included with the Ecosystem Pack 5.0.6.

Release Date	January 2021
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-5.0 or MEP-5.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

To understand which core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

MEP 5.0.6 did not introduce any changes that would impact application backward compatibility.

EEP 5.0.6 Components

The EEP 5.0.6 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7	AsyncHBase 1.7.0-1808 Release Notes on page 6741
Drill 1.13.0	Drill 1.13.0-2009 (EEP 5.0.5) Release Notes on page 6796
Flume 1.8	Flume 1.8.0-1904 Release Notes on page 6843
HBase-compatible API ¹	HBase 1.1.8-2101 (EEP 5.0.6) Release Notes on page 6902
Hive 2.1.1	Hive 2.1.1-2009 (EEP 5.0.5) Release Notes on page 7009
HttpFS 1.0	HttpFS 1.0 - 2101 (EEP 5.0.6) Release Notes on page 7112
Hue 3.12.0	Hue 3.12.0 - 2009 (EEP 5.0.5) Release Notes on page 7158
Monitoring	Monitoring Components - EEP 5.0.6 Release Notes on page 7339
Myriad 0.2	Myriad 0.2-1710 Release Notes on page 7353
Oozie 4.3.0	Oozie 4.3.0 - 2009 (EEP 5.0.5) Release Notes on page 7382
Pig 0.16	Pig 0.16.0-1703 Release Notes on page 7416
Spark 2.2.1	Spark 2.2.1-2009 (EEP 5.0.5) Release Notes on page 7474
Sqoop 1.4.6	Sqoop 1.4.6-1808 (EEP 3.0.4, EEP 4.1.2, and EEP 5.0.1) Release Notes on page 7559
Sqoop2 1.99.7	Sqoop2 1.99.7-1803 Release Notes on page 7568
Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 7212 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 7213 HPE Ezmeral Data Fabric Streams C#/ .NET 0.11.3 - 1803 Release Notes on page 7214

Component	Release Notes
Streams Tools	Kafka Connect HDFS 4.0.0-1808 Release Notes on page 7265 Kafka Connect JDBC 4.0.0-1803 Release Notes on page 7277 Kafka REST 4.0.0-1803 Release Notes on page 7302
Tez 0.8.4	Tez 0.8.4-2009 (EEP 5.0.5) Release Notes on page 7602

¹For use only with HPE Ezmeral Data Fabric Database binary tables.

²Support for Sentry is limited to Impala users.

The EEP 5.0.6 repository contains the following ecosystem components that are supported for internal Monitoring use cases only:

- Collectd 5.7.2
- Elasticsearch 5.4.1
- Fluentd 0.14.20
- Grafana 4.6.5
- Kibana 5.4.1
- OpenTSDB 2.4.0

Ecosystem Pack 5.0.5 Release Notes

This topic contains information about the components included with the Ecosystem Pack 5.0.5.

Release Date	September 2020
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The `MEP-<version>` directory can be represented by a 2-digit number or a 3-digit number (for example, `MEP-5.0` or `MEP-5.0.0`). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

To understand which core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

MEP 5.0.5 did not introduce any changes that would impact application backward compatibility.

EEP 5.0.5 Components

The EEP 5.0.5 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7	AsyncHBase 1.7.0-1808 Release Notes on page 6741

Component	Release Notes
Drill 1.13.0	Drill 1.13.0-2009 (EEP 5.0.5) Release Notes on page 6796
Flume 1.8	Flume 1.8.0-1904 Release Notes on page 6843
HBase-compatible API ¹	HBase 1.1.8-2009 (EEP 5.0.5) Release Notes on page 6903
Hive 2.1.1	Hive 2.1.1-2009 (EEP 5.0.5) Release Notes on page 7009
HttpFS 1.0	HttpFS-1.0-1904 Release Notes on page 7114
Hue 3.12.0	Hue 3.12.0 - 2009 (EEP 5.0.5) Release Notes on page 7158
Monitoring	Monitoring Components - EEP 5.0.5 Release Notes on page 7340

Streams Tools	Kafka Connect HDFS 4.0.0-1808 Release Notes on page 7265 Kafka Connect JDBC 4.0.0-1803 Release Notes on page 7277 Kafka REST 4.0.0-1803 Release Notes on page 7302
Myriad 0.2	Myriad 0.2-1710 Release Notes on page 7353
Oozie 4.3.0	Oozie 4.3.0 - 2009 (EEP 5.0.5) Release Notes on page 7382
Pig 0.16	Pig 0.16.0-1703 Release Notes on page 7416
Spark 2.2.1	Spark 2.2.1-2009 (EEP 5.0.5) Release Notes on page 7474
Sqoop 1.4.6	Sqoop 1.4.6-1808 (EEP 3.0.4, EEP 4.1.2, and EEP 5.0.1) Release Notes on page 7559
Sqoop2 1.99.7	Sqoop2 1.99.7-1803 Release Notes on page 7568
Tez 0.8.4	Tez 0.8.4-2009 (EEP 5.0.5) Release Notes on page 7602

¹For use only with HPE Ezmeral Data Fabric Database binary tables.

²Support for Sentry is limited to Impala users.

The EEP 5.0.5 repository contains the following ecosystem components that are supported for internal Monitoring use cases only:

- Collectd 5.7.2
- Elasticsearch 5.4.1
- Fluentd 0.14.20
- Grafana 4.6.5

- Kibana 5.4.1
- OpenTSDB 2.4.0

Ecosystem Pack 5.0.4 Release Notes

This topic contains information about the components included with the Ecosystem Pack 5.0.4.

Release Date	December 2019
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-5.0 or MEP-5.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

MEP 5.0.4 did not introduce any changes that would impact application backward compatibility.

EEP 5.0.4 Components

The EEP 5.0.4 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7	AsyncHBase 1.7.0-1808 Release Notes on page 6741
Drill 1.13	Drill 1.13.0-1912 (EEP 5.0.4) Release Notes on page 6797
Flume 1.8	Flume 1.8.0-1904 Release Notes on page 6843
HBase-compatible API ¹	HBase 1.1.8-1904 Release Notes on page 6906
Hive 2.1.1	Hive 2.1.1-1912 (EEP 5.0.4) Release Notes on page 7011
HttpFS 1.0	HttpFS-1.0-1904 Release Notes on page 7114
Hue 3.12	Hue 3.12.0-1912 (EEP 5.0.4) Release Notes on page 7160
MapR Monitoring	Monitoring Components - EEP 5.0.0 Release Notes on page 7341
MapR Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 7212 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 7213 HPE Ezmeral Data Fabric Streams C#.NET 0.11.3 - 1803 Release Notes on page 7214

Component	Release Notes
MapR Streams Tools	Kafka Connect HDFS 4.0.0-1808 Release Notes on page 7265 Kafka Connect JDBC 4.0.0-1803 Release Notes on page 7277 Kafka REST 4.0.0-1803 Release Notes on page 7302
Myriad 0.2	Myriad 0.2-1710 Release Notes on page 7353
Oozie 4.3.0	Oozie 4.3.0-1912 (EEP 5.0.4) Release Notes on page 7383

Sqoop 1.4.6	Sqoop 1.4.6-1808 (EEP 3.0.4, EEP 4.1.2, and EEP 5.0.1) Release Notes on page 7559
Sqoop2 1.99.7	Sqoop2 1.99.7-1803 Release Notes on page 7568
Tez 0.8.4	Tez 0.8.4-1912 (EEP 5.0.4) Release Notes on page 7603

¹For use only with HPE Ezmeral Data Fabric Database binary tables.

²MapR support for Sentry is limited to Impala users.

The EEP 5.0.4 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.2
- Elasticsearch 5.4.1
- Fluentd 0.14.20
- Grafana 4.6.5
- Kibana 5.4.1
- OpenTSDB 2.4.0

Ecosystem Pack 5.0.3 Release Notes

This topic contains information about the components included with the Ecosystem Pack 5.0.3.

Release Date	May 2019
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-5.0 or MEP-5.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

MEP 5.0.3 did not introduce any changes that would impact application backward compatibility.

EEP 5.0.3 Components

The EEP 5.0.3 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7	AsyncHBase 1.7.0-1808 Release Notes on page 6741
Drill 1.13	Drill 1.13.0-1901 (EEP 5.0.2) Release Notes on page 6799
Flume 1.8	Flume 1.8.0-1904 Release Notes on page 6843
HBase-compatible API ¹	HBase 1.1.8-1904 Release Notes on page 6906
Hive 2.1.1	Hive 2.1.1-1904 (EEP 5.0.3 and EEP 4.1.4) Release Notes on page 7013
HttpFS 1.0	HttpFS-1.0-1904 Release Notes on page 7114
Hue 3.12	Hue 3.12.0-1901 (EEP 4.1.3 and EEP 5.0.2) Release Notes on page 7161
MapR Monitoring	Monitoring Components - EEP 5.0.0 Release Notes on page 7341
MapR Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 7212 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 7213 HPE Ezmeral Data Fabric Streams C#/.NET 0.11.3 - 1803 Release Notes on page 7214
MapR Streams Tools	Kafka Connect HDFS 4.0.0-1808 Release Notes on page 7265 Kafka Connect JDBC 4.0.0-1803 Release Notes on page 7277 Kafka REST 4.0.0-1803 Release Notes on page 7302
Myriad 0.2	Myriad 0.2-1710 Release Notes on page 7353
Oozie 4.3.0	Oozie 4.3.0-1904 (EEP 5.0.3) Release Notes on page 7385
Pig 0.16	Pig 0.16.0-1703 Release Notes on page 7416
Spark 2.2.1	Spark 2.2.1-1904 (EEP 5.0.3) Release Notes on page 7477
Sqoop 1.4.6	Sqoop 1.4.6-1904 (EEP 5.0.3 and EEP 4.1.4) Release Notes on page 7557
Sqoop2 1.99.7	Sqoop2 1.99.7-1803 Release Notes on page 7568

¹For use only with HPE Ezmeral Data Fabric Database binary tables.

²MapR support for Sentry is limited to Impala users.

The EEP 5.0.3 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.2

- Elasticsearch 5.4.1
- Fluentd 0.14.20
- Grafana 4.6.5
- Kibana 5.4.1
- OpenTSDB 2.4.0

Ecosystem Pack 5.0.2 Release Notes

This topic contains information about the components included with the Ecosystem Pack 5.0.2.

Release Date	February 2019
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

EEP 5.0.2 Components

The EEP 5.0.2 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7	AsyncHBase 1.7.0-1808 Release Notes on page 6741
Drill 1.13	Drill 1.13.0-1901 (EEP 5.0.2) Release Notes on page 6799
Flume 1.8	Flume 1.8.0-1803 Release Notes on page 6845
HBase-compatible API ¹	HBase 1.1.8-1901 Release Notes on page 6907
Hive 2.1	Hive 2.1.1-1901 (EEP 4.1.3 and EEP 5.0.2) Release Notes on page 7015
HttpFS 1.0	HttpFS-1.0-1901 (EEP 6.1.0) Release Notes on page 7115
Hue 3.12	Hue 3.12.0-1901 (EEP 4.1.3 and EEP 5.0.2) Release Notes on page 7161
MapR Monitoring	Monitoring Components - EEP 5.0.0 Release Notes on page 7341

Component	Release Notes
MapR Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 7212 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 7213 HPE Ezmeral Data Fabric Streams C#/.NET 0.11.3 - 1803 Release Notes on page 7214
MapR Streams Tools	Kafka Connect HDFS 4.0.0-1808 Release Notes on page 7265 Kafka Connect JDBC 4.0.0-1803 Release Notes on page 7277 Kafka REST 4.0.0-1803 Release Notes on page 7302
Myriad 0.2	Myriad 0.2-1710 Release Notes on page 7353
Oozie 4.3.0	Oozie 4.3.0-1901 Release Notes on page 7386
Pig 0.16	Pig 0.16.0-1703 Release Notes on page 7416
Spark 2.2.1	Spark 2.2.1-1901 (EEP 5.0.2) Release Notes on page 7485
Sqoop 1.4.6	Sqoop 1.4.6-1808 (EEP 3.0.4, EEP 4.1.2, and EEP 5.0.1) Release Notes on page 7559
Sqoop2 1.99.7	Sqoop2 1.99.7-1803 Release Notes on page 7568

¹For use only with HPE Ezmeral Data Fabric Database binary tables.

²MapR support for Sentry is limited to Impala users.

The EEP 5.0.2 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.2
- Elasticsearch 5.4.1
- Fluentd 0.14.20
- Grafana 4.6.1
- Kibana 5.4.1
- OpenTSDB 2.4.0

Ecosystem Pack 5.0.1 Release Notes

This topic contains information about the components included with the Ecosystem Pack 5.0.1.

Release Date	September 2018
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

EEP 5.0.1 Components

The EEP 5.0.1 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7	AsyncHBase 1.7.0-1808 Release Notes on page 6741
Drill 1.13	Drill 1.13.0-1808 Release Notes on page 6799
Flume 1.8	Flume 1.8.0-1803 Release Notes on page 6845
HBase-compatible API ¹	HBase 1.1.8-1808 Release Notes on page 6907
Hive 2.1	Hive 2.1.1-1808 (EEP 4.1.2 and EEP 5.0.1) Release Notes on page 7022
HttpFS 1.0	HttpFS-1.0-1803 (EEP 4.1.1 and EEP 5.0.0) Release Notes on page 7117
Hue 3.12	Hue 3.12.0-1808 (EEP 3.0.4, EEP 4.1.2, and EEP 5.0.1) Release Notes on page 7162
MapR Monitoring	Monitoring Components - EEP 5.0.0 Release Notes on page 7341
MapR Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 7212 and HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 7213 and HPE Ezmeral Data Fabric Streams C#/ .NET 0.11.3 - 1803 Release Notes on page 7214
MapR Streams Tools	Kafka Connect HDFS 4.0.0-1808 Release Notes on page 7265 and Kafka Connect JDBC 4.0.0-1803 Release Notes on page 7277 and Kafka REST 4.0.0-1803 Release Notes on page 7302
Myriad 0.2	Myriad 0.2-1710 Release Notes on page 7353
Oozie 4.3.0	Oozie 4.3.0-1808 (EEP 3.0.4, EEP 4.1.2, and EEP 5.0.1) Release Notes on page 7388
Pig 0.16	Pig 0.16.0-1703 Release Notes on page 7416
Spark 2.2.1	Spark 2.2.1-1808 (EEP 5.0.1) Release Notes on page 7486
Sqoop 1.4.6	Sqoop 1.4.6-1808 (EEP 3.0.4, EEP 4.1.2, and EEP 5.0.1) Release Notes on page 7559
Sqoop2 1.99.7	Sqoop2 1.99.7-1803 Release Notes on page 7568

¹For use only with HPE Ezmeral Data Fabric Database binary tables.

²MapR support for Sentry is limited to Impala users.

The EEP 5.0.1 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.2

- Elasticsearch 5.4.1
- Fluentd 0.14.20
- Grafana 4.6.1
- Kibana 5.4.1
- OpenTSDB 2.4.0

Ecosystem Pack 5.0.0 Release Notes

This topic contains information about the components included with the Ecosystem Pack 5.0.0.

Release Date	March 2018
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

EEP 5.0.0 Components

The EEP 5.0.0 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7	AsyncHBase 1.7.0-1607 Release Notes on page 6742
Drill 1.13	Drill 1.13-1803 Release Notes on page 6800
Flume 1.8	Flume 1.8.0-1803 Release Notes on page 6845
HBase-compatible API ¹	HBase 1.1.8-1710 Release Notes on page 6909

¹For use only with HPE Ezmeral Data Fabric Database binary tables.

²MapR support for Sentry is limited to Impala users.

The EEP 5.0.0 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.2
- Elasticsearch 5.4.1
- Fluentd 0.14.20
- Grafana 4.6.1
- Kibana 5.4.1
- OpenTSDB 2.4.0

Ecosystem Pack 4.1.4 Release Notes

This topic contains information about the components included with the Ecosystem Pack 4.1.4.

Release Date	May 2019
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/1

¹The MEP-`<version>` directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-4.0 or MEP-4.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

MEP 4.1.4 did not introduce any changes that would impact application backward compatibility.

EEP 4.1.4 Components

The EEP 4.1.4 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7	AsyncHBase 1.7.0-1808 Release Notes on page 6741
Drill 1.12	Drill 1.12.0-1901 (EEP 4.1.3) Release Notes on page 6805
Flume 1.7	Flume 1.7.0-1703 Release Notes on page 6846
HBase-compatible API ¹	HBase 1.1.8-1904 Release Notes on page 6906
Hive 2.1.1	Hive 2.1.1-1904 (EEP 5.0.3 and EEP 4.1.4) Release Notes on page 7013
HttpFS 1.0	HttpFS-1.0-1904 Release Notes on page 7114
Hue 3.12	Hue 3.12.0-1901 (EEP 4.1.3 and EEP 5.0.2) Release Notes on page 7161
MapR Monitoring	Monitoring Components - EEP 4.1.0 Release Notes on page 7341
MapR Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.9.1 - 1703 Release Notes on page 7214 HPE Ezmeral Data Fabric Streams Python Client 0.9.2-1707 Release Notes on page 7215
MapR Streams Tools	Kafka Connect 2.0.1-1801 Release Notes on page 7284 Kafka REST 2.0.1-1803 Release Notes on page 7303
Myriad 0.2	Myriad 0.2-1710 Release Notes on page 7353
Oozie 4.3.0	Oozie 4.3.0-1904 (EEP 4.1.4) Release Notes on page 7385
Pig 0.16	Pig 0.16.0-1703 Release Notes on page 7416
Spark 2.1.1	Spark 2.1.0-1904 (EEP 4.1.4) Release Notes on page 7489
Sqoop 1.4.6	Sqoop 1.4.6-1904 (EEP 5.0.3 and EEP 4.1.4) Release Notes on page 7557
Sqoop2 1.99.7	Sqoop2 1.99.7-1710 Release Notes on page 7569

¹For use only with HPE Ezmeral Data Fabric Database binary tables.

²MapR support for Sentry is limited to Impala users.

The EEP 4.1.4 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.2
- Elasticsearch 5.4.1
- Fluentd 0.14.20
- Grafana 4.6.5
- Kibana 5.4.1
- OpenTSDB 2.4.0

Ecosystem Pack 4.1.3 Release Notes

This topic contains information about the components included with the Ecosystem Pack 4.1.3.

Release Date	February 2019
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The `MEP-<version>` directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

EEP 4.1.3 Components

The EEP 4.1.3 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7	AsyncHBase 1.7.0-1808 Release Notes on page 6741
Drill 1.12	Drill 1.12.0-1901 (EEP 4.1.3) Release Notes on page 6805
Flume 1.7	Flume 1.7.0-1703 Release Notes on page 6846
HBase-compatible API ¹	HBase 1.1.8-1901 Release Notes on page 6907
Hive 2.1	Hive 2.1.1-1901 (EEP 4.1.3 and EEP 5.0.2) Release Notes on page 7015
HttpFS 1.0	HttpFS-1.0-1901 (EEP 6.1.0) Release Notes on page 7115
Hue 3.12	Hue 3.12.0-1901 (EEP 4.1.3 and EEP 5.0.2) Release Notes on page 7161
MapR Monitoring	Monitoring Components - EEP 4.1.0 Release Notes on page 7341
MapR Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.9.1 - 1703 Release Notes on page 7214 HPE Ezmeral Data Fabric Streams Python Client 0.9.2-1707 Release Notes on page 7215
MapR Streams Tools	Kafka Connect 2.0.1-1801 Release Notes on page 7284 Kafka REST 2.0.1-1803 Release Notes on page 7303
Myriad 0.2	Myriad 0.2-1710 Release Notes on page 7353
Oozie 4.3.0	Oozie 4.3.0-1901 Release Notes on page 7386
Pig 0.16	Pig 0.16.0-1703 Release Notes on page 7416
Spark 2.1	Spark 2.1.0-1901 (EEP 4.1.3 and EEP 3.0.5) Release Notes on page 7490

Component	Release Notes
Sqoop 1.4.6	Sqoop 1.4.6-1808 (EEP 3.0.4, EEP 4.1.2, and EEP 5.0.1) Release Notes on page 7559
Sqoop2 1.99.7	Sqoop2 1.99.7-1710 Release Notes on page 7569

¹For use only with HPE Ezmeral Data Fabric Database binary tables.

²MapR support for Sentry is limited to Impala users.

The EEP 4.1.3 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.2
- Elasticsearch 5.4.1
- Fluentd 0.14.20
- Grafana 4.4.2
- Kibana 5.4.1
- OpenTSDB 2.4.0

Ecosystem Pack 4.1.2 Release Notes

This topic contains information about the components included with the Ecosystem Pack 4.1.2.

Release Date	September 2018
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

EEP 4.1.2 Components

The EEP 4.1.2 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7	AsyncHBase 1.7.0-1808 Release Notes on page 6741
Drill 1.12	Drill 1.12.0-1808 Release Notes on page 6805
Flume 1.7	Flume 1.7.0-1703 Release Notes on page 6846
HBase-compatible API ¹	HBase 1.1.8-1808 Release Notes on page 6907
Hive 2.1	Hive 2.1.1-1808 (EEP 4.1.2 and EEP 5.0.1) Release Notes on page 7022

Component	Release Notes
HttpFS 1.0	HttpFS-1.0-1803 (EEP 4.1.1 and EEP 5.0.0) Release Notes on page 7117
Hue 3.12	Hue 3.12.0-1808 (EEP 3.0.4, EEP 4.1.2, and EEP 5.0.1) Release Notes on page 7162
MapR Monitoring	Monitoring Components - EEP 4.1.0 Release Notes on page 7341
MapR Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.9.1 - 1703 Release Notes on page 7214 and HPE Ezmeral Data Fabric Streams Python Client 0.9.2-1707 Release Notes on page 7215
MapR Streams Tools	Kafka Connect 2.0.1-1801 Release Notes on page 7284 and Kafka REST 2.0.1-1803 Release Notes on page 7303
Myriad 0.2	Myriad 0.2-1710 Release Notes on page 7353
Oozie 4.3.0	Oozie 4.3.0-1808 (EEP 3.0.4, EEP 4.1.2, and EEP 5.0.1) Release Notes on page 7388
Pig 0.16	Pig 0.16.0-1703 Release Notes on page 7416
Spark 2.1	Spark 2.1.0-1808 (EEP 3.0.4 and EEP 4.1.2) Release Notes on page 7491
Sqoop 1.4.6	Sqoop 1.4.6-1808 (EEP 3.0.4, EEP 4.1.2, and EEP 5.0.1) Release Notes on page 7559
Sqoop2 1.99.7	Sqoop2 1.99.7-1710 Release Notes on page 7569

¹For use only with HPE Ezmeral Data Fabric Database binary tables.

²MapR support for Sentry is limited to Impala users.

The EEP 4.1.2 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.2
- Elasticsearch 5.4.1
- Fluentd 0.14.20
- Grafana 4.4.2
- Kibana 5.4.1
- OpenTSDB 2.4.0

Ecosystem Pack 4.1.1 Release Notes

This topic contains information about the components included with the Ecosystem Pack 4.1.1.

Release Date	March 2018
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

EEP 4.1.1 Components

The EEP 4.1.1 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7	AsyncHBase 1.7.0-1607 Release Notes on page 6742
Drill 1.12	Drill 1.12.0-1801 Release Notes on page 6806
Flume 1.7	Flume 1.7.0-1703 Release Notes on page 6846
HBase-compatible API ¹	HBase 1.1.8-1710 Release Notes on page 6909
Hive 2.1	Hive 2.1.1-1803 (EEP 4.1.1 and EEP 5.0.0) Release Notes on page 7029
HttpFS 1.0	HttpFS-1.0-1803 (EEP 4.1.1 and EEP 5.0.0) Release Notes on page 7117
Hue 3.12	Hue 3.12.0-1803 (EEP 4.1.1 and EEP 5.0.0) Release Notes on page 7164
MapR Monitoring	Monitoring Components - EEP 4.1.0 Release Notes on page 7341
MapR Streams Tools	Kafka Connect 2.0.1-1801 Release Notes on page 7284 and Kafka REST 2.0.1-1803 Release Notes on page 7303
Myriad 0.2	Myriad 0.2-1710 Release Notes on page 7353
Oozie 4.3.0	Oozie 4.3.0-1803 (EEP 4.1.1) Release Notes on page 7390
Pig 0.16	Pig 0.16.0-1703 Release Notes on page 7416
Spark 2.1	Spark 2.1.0-1803 (EEP 4.1.1) Release Notes on page 7495
Sqoop 1.4.6	Sqoop 1.4.6-1803 Release Notes on page 7560
Sqoop2 1.99.7	Sqoop2 1.99.7-1710 Release Notes on page 7569
MapR Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.9.1 - 1703 Release Notes on page 7214 and HPE Ezmeral Data Fabric Streams Python Client 0.9.2-1707 Release Notes on page 7215

¹For use only with HPE Ezmeral Data Fabric Database binary tables.

²MapR support for Sentry is limited to Impala users.

The EEP 4.1.1 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.2
- Elasticsearch 5.4.1
- Fluentd 0.14.20

- Grafana 4.4.2
- Kibana 5.4.1
- OpenTSDB 2.4.0

Ecosystem Pack 4.1.0 Release Notes

This topic contains information about the components included with the Ecosystem Pack 4.1.0.

Release Date	February 2018
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

EEP 4.1.0 Components

The EEP 4.1.0 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsynchBase 1.7	AsynchBase 1.7.0-1607 Release Notes on page 6742
Drill 1.12	Drill 1.12.0-1801 Release Notes on page 6806
Flume 1.7	Flume 1.7.0-1703 Release Notes on page 6846
HBase-compatible API ¹	HBase 1.1.8-1710 Release Notes on page 6909
Hive 2.1	Hive 2.1.1-1710 Release Notes on page 7036
HttpFS 1.0	HttpFS-1.0-1710 Release Notes on page 7119
Hue 3.12	Hue 3.12.0-1710 Release Notes on page 7166
MapR Monitoring	Monitoring Components - EEP 4.1.0 Release Notes on page 7341
MapR Streams Tools	Kafka Connect 2.0.1-1801 Release Notes on page 7284 and Kafka REST 2.0.1-1710 Release Notes on page 7304
Myriad 0.2	Myriad 0.2-1710 Release Notes on page 7353
Oozie 4.3.0	Oozie 4.3.0-1801 Release Notes on page 7392
Pig 0.16	Pig 0.16.0-1703 Release Notes on page 7416
Spark 2.1	Spark 2.1.0-1801 Release Notes on page 7498
Sqoop 1.4.6	Sqoop 1.4.6-1710 Release Notes on page 7561
Sqoop2 1.99.7	Sqoop2 1.99.7-1710 Release Notes on page 7569

Component	Release Notes
MapR Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.9.1 - 1703 Release Notes on page 7214 and HPE Ezmeral Data Fabric Streams Python Client 0.9.2-1707 Release Notes on page 7215

¹For use only with HPE Ezmeral Data Fabric Database binary tables.

²MapR support for Sentry is limited to Impala users.

The EEP 4.1.0 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.2
- Elasticsearch 5.4.1
- Fluentd 0.14.20
- Grafana 4.4.2
- Kibana 5.4.1
- OpenTSDB 2.4.0

Ecosystem Pack 4.0.0 Release Notes

This topic contains information about the components included with the Ecosystem Pack 4.0.0.

Release Date	November 2017
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

EEP 4.0.0 Components

The EEP 4.0.0 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7	AsyncHBase 1.7.0-1607 Release Notes on page 6742
Drill 1.11	Drill 1.11.0-1710 Release Notes on page 6811
Flume 1.7	Flume 1.7.0-1703 Release Notes on page 6846
HBase-compatible API ¹	HBase 1.1.8-1710 Release Notes on page 6909

¹For use only with HPE Ezmeral Data Fabric Database binary tables.

²MapR support for Sentry is limited to Impala users.

The EEP 4.0.0 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.2
- Elasticsearch 5.4.1
- Fluentd 0.14.20
- Grafana 4.4.2
- Kibana 5.4.1
- OpenTSDB 2.4.0

Ecosystem Pack 3.0.5 Release Notes

This topic contains information about the components included with the Ecosystem Pack 3.0.5.

Release Date	February 2019
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but

last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

EEP 3.0.5 Components

The EEP 3.0.5 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsynchBase 1.7	AsynchBase 1.7.0-1808 Release Notes on page 6741
Drill 1.10	Drill 1.10.0-1808 Release Notes on page 6816
Flume 1.7	Flume 1.7.0-1703 Release Notes on page 6846
HBase 1.1.8	HBase 1.1.8-1703 Release Notes on page 6909
Hive 2.1	Hive 2.1.1-1901 (EEP 3.0.5) Release Notes on page 7019
HttpFS 1.0	HttpFS-1.0-1803 (EEP 3.0.3) Release Notes on page 7118
Hue 3.12	Hue 3.12.0-1808 (EEP 3.0.4, EEP 4.1.2, and EEP 5.0.1) Release Notes on page 7162
Mahout 0.12.0 ²	Mahout 0.12.0-1611 Release Notes on page 7207
MapR Monitoring	Monitoring Components - EEP 3.x.x Release Notes on page 7343
MapR Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.9.1 - 1703 Release Notes on page 7214 HPE Ezmeral Data Fabric Streams Python Client 0.9.2-1707 Release Notes on page 7215
MapR Streams Tools	Kafka Connect 2.0.1-1707 Release Notes on page 7285 Kafka REST 2.0.1-1707 Release Notes on page 7305
Myriad 0.1	Myriad Release Notes on page 7353
Oozie 4.3.0	Oozie 4.3.0-1901 Release Notes on page 7386
Pig 0.16	Pig 0.16.0-1703 Release Notes on page 7416
Spark 2.1	Spark 2.1.0-1901 (EEP 4.1.3 and EEP 3.0.5) Release Notes on page 7490
Sqoop 1.4.6	Sqoop 1.4.6-1808 (EEP 3.0.4, EEP 4.1.2, and EEP 5.0.1) Release Notes on page 7559
Sqoop2 1.99.7	Sqoop2 1.99.7-1611 Release Notes on page 7570
Storm 0.10.0 ⁴	Storm 0.10.0-1703 Release Notes on page 7574

²Mahout 0.12.0 includes backports of all the patches included in Apache Mahout 0.12.1 and 0.12.2.

³MapR support for Sentry is limited to Impala users.

⁴Storm 0.10.0 includes backports of all the patches included in Apache Storm 0.10.2.

The EEP 3.0.5 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.1
- Elasticsearch 2.3.3

- OpenTSDB 2.3.0

Ecosystem Pack 3.0.4 Release Notes

This topic contains information about the components included with the Ecosystem Pack 3.0.4.

Release Date	September 2017
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

EEP 3.0.4 Components

The EEP 3.0.4 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7	AsyncHBase 1.7.0-1808 Release Notes on page 6741
Drill 1.10	Drill 1.10.0-1808 Release Notes on page 6816
Flume 1.7	Flume 1.7.0-1703 Release Notes on page 6846
HBase 1.1.8	HBase 1.1.8-1703 Release Notes on page 6909
Hive 2.1	Hive 2.1.1-1808 (EEP 3.0.4) Release Notes on page 7026
HttpFS 1.0	HttpFS-1.0-1803 (EEP 3.0.3) Release Notes on page 7118
Hue 3.12	Hue 3.12.0-1808 (EEP 3.0.4, EEP 4.1.2, and EEP 5.0.1) Release Notes on page 7162
Mahout 0.12.0 ²	Mahout 0.12.0-1611 Release Notes on page 7207
MapR Monitoring	Monitoring Components - EEP 3.x.x Release Notes on page 7343
MapR Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.9.1 - 1703 Release Notes on page 7214 and HPE Ezmeral Data Fabric Streams Python Client 0.9.2-1707 Release Notes on page 7215
MapR Streams Tools	Kafka Connect 2.0.1-1707 Release Notes on page 7285 and Kafka REST 2.0.1-1707 Release Notes on page 7305

Component	Release Notes
Myriad 0.1	Myriad Release Notes on page 7353
Oozie 4.3.0	Oozie 4.3.0-1808 (EEP 3.0.4, EEP 4.1.2, and EEP 5.0.1) Release Notes on page 7388
Pig 0.16	Pig 0.16.0-1703 Release Notes on page 7416
Spark 2.1	Spark 2.1.0-1808 (EEP 3.0.4 and EEP 4.1.2) Release Notes on page 7491
Sqoop 1.4.6	Sqoop 1.4.6-1808 (EEP 3.0.4, EEP 4.1.2, and EEP 5.0.1) Release Notes on page 7559
Sqoop2 1.99.7	Sqoop2 1.99.7-1611 Release Notes on page 7570
Storm 0.10.0 ⁴	Storm 0.10.0-1703 Release Notes on page 7574

²Mahout 0.12.0 includes backports of all the patches included in Apache Mahout 0.12.1 and 0.12.2.

³MapR support for Sentry is limited to Impala users.

⁴Storm 0.10.0 includes backports of all the patches included in Apache Storm 0.10.2.

The EEP 3.0.4 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.1
- Elasticsearch 2.3.3
- Fluentd 0.14.00
- Grafana 4.1.2
- Kibana 4.5.4
- OpenTSDB 2.3.0

Ecosystem Pack 3.0.3 Release Notes

This topic contains information about the components included with the Ecosystem Pack 3.0.3.

Release Date	March 2017
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

EEP 3.0.3 Components

The EEP 3.0.3 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7	AsyncHBase 1.7.0-1607 Release Notes on page 6742
Drill 1.10	Drill 1.10.0-1707 Release Notes on page 6817
Flume 1.7	Flume 1.7.0-1703 Release Notes on page 6846
HBase 1.1.8	HBase 1.1.8-1703 Release Notes on page 6909
Hive 2.1	Hive 2.1.1-1803 (EEP 3.0.3) Release Notes on page 7033
HttpFS 1.0	HttpFS-1.0-1803 (EEP 3.0.3) Release Notes on page 7118
Hue 3.12	Hue 3.12.0-1803 (EEP 3.0.3) Release Notes on page 7165
Mahout 0.12.0 ²	Mahout 0.12.0-1611 Release Notes on page 7207
MapR Monitoring	Monitoring Components - EEP 3.x.x Release Notes on page 7343
MapR Streams Tools	Kafka Connect 2.0.1-1707 Release Notes on page 7285 and Kafka REST 2.0.1-1707 Release Notes on page 7305
Myriad 0.1	Myriad Release Notes on page 7353
Oozie 4.3.0	Oozie 4.3.0-1803 (EEP 3.0.3) Release Notes on page 7391
Pig 0.16	Pig 0.16.0-1703 Release Notes on page 7416
Spark 2.1	Spark 2.1.0-1803 (EEP 3.0.3) Release Notes on page 7496
Sqoop 1.4.6	Sqoop 1.4.6-1803 Release Notes on page 7560
Sqoop2 1.99.7	Sqoop2 1.99.7-1611 Release Notes on page 7570
Storm 0.10.0 ⁴	Storm 0.10.0-1703 Release Notes on page 7574
MapR Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.9.1 - 1703 Release Notes on page 7214 and HPE Ezmeral Data Fabric Streams Python Client 0.9.2-1707 Release Notes on page 7215

²Mahout 0.12.0 includes backports of all the patches included in Apache Mahout 0.12.1 and 0.12.2.

³MapR support for Sentry is limited to Impala users.

⁴Storm 0.10.0 includes backports of all the patches included in Apache Storm 0.10.2.

The EEP 3.0.3 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.1
- Elasticsearch 2.3.3
- Fluentd 0.14.00
- Grafana 4.1.2
- Kibana 4.5.4
- OpenTSDB 2.3.0

Ecosystem Pack 3.0.2 Release Notes

This topic contains information about the components included with the Ecosystem Pack 3.0.2.

Release Date	November 2017
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The `MEP-<version>` directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

EEP 3.0.2 Components

The EEP 3.0.2 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7	AsyncHBase 1.7.0-1607 Release Notes on page 6742
Drill 1.10	Drill 1.10.0-1707 Release Notes on page 6817
Flume 1.7	Flume 1.7.0-1703 Release Notes on page 6846
HBase 1.1.8	HBase 1.1.8-1703 Release Notes on page 6909
Hive 2.1	Hive 2.1.1-1710 Release Notes on page 7036
HttpFS 1.0	HttpFS-1.0-1710 Release Notes on page 7119
Hue 3.12	Hue 3.12.0-1710 Release Notes on page 7166
Mahout 0.12.0 ²	Mahout 0.12.0-1611 Release Notes on page 7207
MapR Monitoring	Monitoring Components - EEP 3.x.x Release Notes on page 7343
MapR Streams Tools	Kafka Connect 2.0.1-1707 Release Notes on page 7285 and Kafka REST 2.0.1-1707 Release Notes on page 7305
Myriad 0.1	Myriad Release Notes on page 7353
Oozie 4.3.0	Oozie 4.3.0-1710 Release Notes on page 7393
Pig 0.16	Pig 0.16.0-1703 Release Notes on page 7416
Spark 2.1	Spark 2.1.0-1710 Release Notes on page 7500
Sqoop 1.4.6	Sqoop 1.4.6-1710 Release Notes on page 7561
Sqoop2 1.99.7	Sqoop2 1.99.7-1611 Release Notes on page 7570
Storm 0.10.0 ⁴	Storm 0.10.0-1703 Release Notes on page 7574
MapR Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.9.1 - 1703 Release Notes on page 7214 and HPE Ezmeral Data Fabric Streams Python Client 0.9.2-1707 Release Notes on page 7215

²Mahout 0.12.0 includes backports of all the patches included in Apache Mahout 0.12.1 and 0.12.2.

³MapR support for Sentry is limited to Impala users.

⁴Storm 0.10.0 includes backports of all the patches included in Apache Storm 0.10.2.

The EEP 3.0.2 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.1
- Elasticsearch 2.3.3
- Fluentd 0.14.00
- Grafana 4.1.2
- Kibana 4.5.4
- OpenTSDB 2.3.0

Ecosystem Pack 3.0.1 Release Notes

This topic contains information about the components included with the Ecosystem Pack 3.0.1.

Release Date	August 2017
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

EEP 3.0.1 Components

The EEP 3.0.1 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsynchBase 1.7	AsynchBase 1.7.0-1607 Release Notes on page 6742
Drill 1.10	Drill 1.10.0-1707 Release Notes on page 6817
Flume 1.7	Flume 1.7.0-1703 Release Notes on page 6846
HBase 1.1.8	HBase 1.1.8-1703 Release Notes on page 6909
Hive 2.1	Hive 2.1.1-1707 Release Notes on page 7038
HttpFS 1.0	HttpFS 1.0-1703 Release Notes on page 7120
Hue 3.12	Hue 3.12.0-1707 Release Notes on page 7169
Mahout 0.12.0 ²	Mahout 0.12.0-1611 Release Notes on page 7207

Component	Release Notes
MapR Monitoring	Monitoring Components - EEP 3.x.x Release Notes on page 7343
MapR Streams Tools	Kafka Connect 2.0.1-1707 Release Notes on page 7285 and Kafka REST 2.0.1-1707 Release Notes on page 7305
Myriad 0.1	Myriad Release Notes on page 7353
Oozie 4.3.0	Oozie 4.3.0-1707 Release Notes on page 7394
Pig 0.16	Pig 0.16.0-1703 Release Notes on page 7416
Spark 2.1	Spark 2.1.0-1707 Release Notes on page 7502
Sqoop 1.4.6	Sqoop 1.4.6-1707 Release Notes on page 7562
Sqoop2 1.99.7	Sqoop2 1.99.7-1611 Release Notes on page 7570
Storm 0.10.0 ⁴	Storm 0.10.0-1703 Release Notes on page 7574
MapR Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.9.1 - 1703 Release Notes on page 7214 and HPE Ezmeral Data Fabric Streams Python Client 0.9.2-1707 Release Notes on page 7215

²Mahout 0.12.0 includes backports of all the patches included in Apache Mahout 0.12.1 and 0.12.2.

³MapR support for Sentry is limited to Impala users.

⁴Storm 0.10.0 includes backports of all the patches included in Apache Storm 0.10.2.

The EEP 3.0.1 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.1
- Elasticsearch 2.3.3
- Fluentd 0.14.00
- Grafana 4.1.2
- Kibana 4.5.4
- OpenTSDB 2.3.0

Ecosystem Pack 3.0 Release Notes

This topic contains information about the components included with the Ecosystem Pack 3.0.

Release Date	April 2017
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). The three-digit EEP directory contains a fixed EEP version with patches. Use this EEP version if you prefer to do manual installs and do not require patch updates.

The two-digit EEP directory contains the latest EEP and patches and is continuously updated. The MapR installer uses the two-digit EEP directory to make new patches available automatically without the need for system reconfiguration.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.3.3-1808, 2.3.3 refers to the Hive version number, and 1808 typically indicates an August 2018 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

EEP 3.0 Components

The EEP 3.0 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7	AsyncHBase 1.7.0-1607 Release Notes on page 6742
Drill 1.10	Drill 1.10.0-1703 Release Notes on page 6818
Flume 1.7	Flume 1.7.0-1703 Release Notes on page 6846
HBase 1.1.8	HBase 1.1.8-1703 Release Notes on page 6909
Hive 2.1	Hive 2.1-1703 Release Notes on page 7043
HttpFS 1.0	HttpFS 1.0-1703 Release Notes on page 7120
Hue 3.12	Hue 3.12.0-1703 Release Notes on page 7171
Mahout 0.12.0 ²	Mahout 0.12.0-1611 Release Notes on page 7207
MapR Monitoring	Monitoring Components - EEP 3.x.x Release Notes on page 7343
HPE Ezmeral Data Fabric Streams Tools	Kafka Connect 2.0.1-1703 (EEP 3.x) Release Notes on page 7285 and Kafka REST 2.0.1-1703 Release Notes on page 7306
Myriad 0.1	Myriad Release Notes on page 7353
Oozie 4.3.0	Oozie 4.3.0-1703 Release Notes on page 7394
Pig 0.16	Pig 0.16.0-1703 Release Notes on page 7416
Spark 2.1	Spark 2.1.0-1703 Release Notes on page 7507
Sqoop 1.4.6	Sqoop 1.4.6-1703 Release Notes on page 7563
Sqoop2 1.99.7	Sqoop2 1.99.7-1611 Release Notes on page 7570
Storm 0.10.0 ⁴	Storm 0.10.0-1703 Release Notes on page 7574
HPE Ezmeral Data Fabric Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.9.1 - 1703 Release Notes on page 7214 and HPE Ezmeral Data Fabric Streams Python Client 0.9.2 - 1703 Release Notes on page 7216

²Mahout 0.12.0 includes backports of all the patches included in Apache Mahout 0.12.1 and 0.12.2.

³MapR support for Sentry is limited to Impala users.

⁴Storm 0.10.0 includes backports of all the patches included in Apache Storm 0.10.2.

The EEP 3.0 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.1
- Elasticsearch 2.3.3
- Fluentd 0.14.00

- Grafana 4.1.2
- Kibana 4.5.4
- OpenTSDB 2.3.0

Ecosystem Pack 2.0.3 Release Notes

This topic contains information about the components included with the Ecosystem Pack 2.0.3.

Release Date	November 2017
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.1.1-1803, 2.1.1 refers to the Hive version number and 1803 typically indicates a March 2018 release but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

EEP 2.0.3 Components

The EEP 2.0.3 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsynchBase 1.7	AsynchBase 1.7.0-1607 Release Notes on page 6742
Drill 1.9	Drill 1.9.0-1703 Release Notes on page 6820
Flume 1.6	Flume 1.6.0-1602 Release Notes on page 6847
HBase 1.1.8	HBase 1.1.8-1703 Release Notes on page 6909
Hive 1.2.1 ²	Hive 1.2.1-1710 Release Notes on page 7047
HttpFS 1.0	HttpFS 1.0-1703 Release Notes on page 7120
Hue 3.10	Hue 3.10.0-1707 Release Notes on page 7175
Mahout 0.12.0 ³	Mahout 0.12.0-1611 Release Notes on page 7207
MapR Streams Tools	Kafka Connect 2.0.1-1707 Release Notes on page 7285 and Kafka REST 2.0.1-1707 Release Notes on page 7305
Myriad 0.1	Myriad Release Notes on page 7353
Oozie 4.2.0	Oozie 4.2.0-1710 (EEP 2.x) Release Notes on page 7396
Pig 0.16	Pig 0.16.0-1703 Release Notes on page 7416
Spark 2.0.1 ⁴	Spark 2.0.1-1707 Release Notes on page 7512
Sqoop 1.4.6	Sqoop 1.4.6-1710 Release Notes on page 7561
Sqoop2 1.99.7	Sqoop2 1.99.7-1611 Release Notes on page 7570
Storm 0.10.0 ⁵	Storm 0.10.0-1611 Release Notes on page 7575

²Hive 1.2.1 includes backports of specific patches contained in Apache Hive 1.2.2. For details see the [Hive 1.2.1-1703 Release Notes](#) on page 7050.

³Mahout 0.12.0 includes backports of all the patches included in Apache Mahout 0.12.1 and 0.12.2.

⁴Spark 2.0.1-1703 includes backports of all the patches contained in Apache Spark 2.0.2.

⁵Storm 0.10.0 includes backports of all the patches included in Apache Storm 0.10.2.

The EEP 2.0.2 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.1
- Elasticsearch 2.3.3
- Fluentd 0.14.00
- Grafana 4.1.2
- Kibana 4.5.4
- OpenTSDB 2.3.0

Ecosystem Pack 2.0.2 Release Notes

This topic contains information about the components included with the Ecosystem Pack 2.0.2.

Release Date	August 2017
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.1.1-1803, 2.1.1 refers to the Hive version number and 1803 typically indicates a March 2018 release but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

EEP 2.0.2 Components

The EEP 2.0.2 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsynchBase 1.7	AsynchBase 1.7.0-1607 Release Notes on page 6742
Drill 1.9	Drill 1.9.0-1703 Release Notes on page 6820
Flume 1.6	Flume 1.6.0-1602 Release Notes on page 6847
HBase 1.1.8	HBase 1.1.8-1703 Release Notes on page 6909
Hive 1.2.1 ²	Hive 1.2.1-1707 Release Notes on page 7047
HttpFS 1.0	HttpFS 1.0-1703 Release Notes on page 7120
Hue 3.10	Hue 3.10.0-1707 Release Notes on page 7175

Component	Release Notes
Mahout 0.12.0 ³	Mahout 0.12.0-1611 Release Notes on page 7207
MapR Streams Tools	Kafka Connect 2.0.1-1707 Release Notes on page 7285 and Kafka REST 2.0.1-1707 Release Notes on page 7305
Myriad 0.1	Myriad Release Notes on page 7353
Oozie 4.2.0	Oozie 4.2.0-1707 (EEP 2.x) Release Notes on page 7397
Pig 0.16	Pig 0.16.0-1703 Release Notes on page 7416
Spark 2.0.1 ⁴	Spark 2.0.1-1707 Release Notes on page 7512
Sqoop 1.4.6	Sqoop 1.4.6-1707 Release Notes on page 7562
Sqoop2 1.99.7	Sqoop2 1.99.7-1611 Release Notes on page 7570
Storm 0.10.0 ⁵	Storm 0.10.0-1611 Release Notes on page 7575

²Hive 1.2.1 includes backports of specific patches contained in Apache Hive 1.2.2. For details see the [Hive 1.2.1-1703 Release Notes](#) on page 7050.

³Mahout 0.12.0 includes backports of all the patches included in Apache Mahout 0.12.1 and 0.12.2.

⁴Spark 2.0.1-1703 includes backports of all the patches contained in Apache Spark 2.0.2.

⁵Storm 0.10.0 includes backports of all the patches included in Apache Storm 0.10.2.

The EEP 2.0.2 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.1
- Elasticsearch 2.3.3
- Fluentd 0.14.00
- Grafana 4.1.2
- Kibana 4.5.4
- OpenTSDB 2.3.0

Ecosystem Pack 2.0.1 Release Notes

This topic contains information about the components included with the Ecosystem Pack 2.0.1.

Release Date	April 2017
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). The three-digit EEP directory contains a fixed EEP version with patches. Use this EEP version if you prefer to do manual installs and do not require patch updates.

The two-digit EEP directory contains the latest EEP and patches and is continuously updated. The MapR installer uses the two-digit EEP directory to make new patches available automatically without the need for system reconfiguration.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.1.1-1803, 2.1.1 refers to the Hive version number and 1803 typically indicates a March 2018 release but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

EEP 2.0.1 Components

The EEP 2.0.1 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7	AsyncHBase 1.7.0-1607 Release Notes on page 6742
Drill 1.9	Drill 1.9.0-1703 Release Notes on page 6820
Flume 1.6	Flume 1.6.0-1602 Release Notes on page 6847
HBase 1.1.8	HBase 1.1.8-1703 Release Notes on page 6909
Hive 1.2.1 ²	Hive 1.2.1-1703 Release Notes on page 7050
HttpFS 1.0	HttpFS 1.0-1703 Release Notes on page 7120
Hue 3.10	Hue 3.10.0-1703 Release Notes on page 7176
Mahout 0.12.0 ³	Mahout 0.12.0-1611 Release Notes on page 7207
HPE Ezmeral Data Fabric Streams Tools	Kafka Connect 2.0.1-1703 (EEP 2.x) Release Notes on page 7285 and Kafka REST 2.0.1-1703 Release Notes on page 7306
Myriad 0.1	Myriad Release Notes on page 7353
Oozie 4.2.0	Oozie 4.2.0-1703 (EEP 2.x) Release Notes on page 7398
Pig 0.16	Pig 0.16.0-1703 Release Notes on page 7416
Spark 2.0.1 ⁴	Spark 2.0.1-1703 Release Notes on page 7514
Sqoop 1.4.6	Sqoop 1.4.6-1703 Release Notes on page 7563
Sqoop2 1.99.7	Sqoop2 1.99.7-1611 Release Notes on page 7570
Storm 0.10.0 ⁵	Storm 0.10.0-1611 Release Notes on page 7575

²Hive 1.2.1 includes backports of specific patches contained in Apache Hive 1.2.2. For details see the [Hive 1.2.1-1703 Release Notes](#) on page 7050.

³Mahout 0.12.0 includes backports of all the patches included in Apache Mahout 0.12.1 and 0.12.2.

⁴Spark 2.0.1-1703 includes backports of all the patches contained in Apache Spark 2.0.2.

⁵Storm 0.10.0 includes backports of all the patches included in Apache Storm 0.10.2.

The EEP 2.0.1 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.5.1
- Elasticsearch 2.3.3
- Fluentd 0.14.00
- Grafana 4.1.2
- Kibana 4.5.4

- OpenTSDB 2.3.0

Ecosystem Pack 2.0 Release Notes

This topic contains information about the components included with the Ecosystem Pack 2.0.

Release Date	December 8, 2016
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). The three-digit EEP directory contains a fixed EEP version with patches. Use this EEP version if you prefer to do manual installs and do not require patch updates.

The two-digit EEP directory contains the latest EEP and patches and is continuously updated. The MapR installer uses the two-digit EEP directory to make new patches available automatically without the need for system reconfiguration.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.1.1-1803, 2.1.1 refers to the Hive version number and 1803 typically indicates a March 2018 release but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

EEP 2.0 Components

The EEP 2.0 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.7	AsyncHBase 1.7.0-1607 Release Notes on page 6742
Drill 1.9	Drill 1.9 Release Notes
Flume 1.6	Flume 1.6.0-1602 Release Notes on page 6847
HBase 1.1.1	HBase 1.1-1602 Release Notes on page 6909
Hive 1.2.1	Hive 1.2.1-1611 Release Notes
HttpFS 1.0	HttpFS 1.0-1609 Release Notes
Hue 3.10	Hue 3.10.0-1611 Release Notes
Mahout 0.12.0 ²	Mahout 0.12.0-1611 Release Notes
HPE Ezmeral Data Fabric Streams Tools	Kafka REST 2.0.1-1611 Release Notes on page 7306 Kafka Connect 2.0.1-1611 Release Notes on page 7286
Myriad 0.1	Myriad Release Notes on page 7353
Oozie 4.2.0	Oozie 4.2.0-1611 (EEP 2.x) Release Notes
Pig 0.16	Pig 0.16.0-1611 Release Notes
Spark 2.0.1	Spark 2.0.1-1611 Release Notes
Sqoop 1.4.6	Sqoop 1.4.6-1611 Release Notes
Sqoop2 1.99.7	Sqoop2 1.99.7-1611 Release Notes
Storm 0.10.0 ³	Storm 0.10.0-1611 Release Notes

²Mahout 0.12.0 includes backports of all the patches included in Apache Mahout 0.12.1 and 0.12.2.

³Storm 0.10.0 includes backports of all the patches included in Apache Storm 0.10.2.

The EEP 2.x repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.5.1
- Elasticsearch 2.3.3
- Fluentd 0.14.60
- Grafana 3.1.1
- Kibana 4.5.1
- OpenTSDB 2.2.1

Ecosystem Pack 1.1.4 Release Notes

This topic contains information about the components included with the Ecosystem Pack 1.1.4.

Release Date	November 2017
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.1.1-1803, 2.1.1 refers to the Hive version number and 1803 typically indicates a March 2018 release but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

EEP 1.1.4 Components

The EEP 1.1.3 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsynchBase 1.7	AsynchBase 1.7.0-1607 Release Notes on page 6742
Drill 1.8	Drill 1.8.0-1703 Release Notes on page 6822
Flume 1.6	Flume 1.6.0-1602 Release Notes on page 6847
HBase 1.1.8	HBase 1.1.8-1703 Release Notes on page 6909
Hive 1.2.1 ²	Hive 1.2.1-1703 Release Notes on page 7050
HttpFS 1.0	HttpFS 1.0-1703 Release Notes on page 7120
Hue 3.9	Hue 3.9.0-1707 Release Notes on page 7178
Mahout 0.12.0 ³	Mahout 0.12.0-1609 Release Notes on page 7207
Myriad 0.1	Myriad Release Notes on page 7353
Oozie 4.2.0	Oozie 4.2.0-1710 (EEP 1.x) Release Notes on page 7396

Component	Release Notes
Pig 0.15	Pig 0.15.0-1703 Release Notes on page 7418
Spark 1.6.1	Spark 1.6.1-1707 Release Notes on page 7513
Sqoop 1.4.6	Sqoop 1.4.6-1710 Release Notes on page 7561
Sqoop2 1.99.6	Sqoop2 1.99.6-1607 Release Notes on page 7571
Storm 0.10.0 ⁴	Storm 0.10.0-1611 Release Notes on page 7575

²Hive 1.2.1 includes backports of specific patches contained in Apache Hive 1.2.2. For details see the [Hive 1.2.1-1703 Release Notes](#) on page 7050.

³Mahout 0.12.0 includes backports of all the patches included in Apache Mahout 0.12.1 and 0.12.2.

⁴Storm 0.10.0 includes backports of all the patches included in Apache Storm 0.10.2.

The EEP 1.1.3 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.7.1
- Elasticsearch 2.3.3
- Fluentd 0.14.00
- Grafana 4.1.2
- Kibana 4.5.4
- OpenTSDB 2.3.0

Ecosystem Pack 1.1.3 Release Notes

This topic contains information about the components included with the Ecosystem Pack 1.1.3.

Release Date	August 2017
Repository Location	https://package.ezmeral.hpe.com/releases/MEP/ ¹

¹The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-2.0 or MEP-2.0.0). See [Understanding Two-Digit and Three-Digit EEPs](#) on page 6446.

To understand which MapR Core versions can use this MEP, see [EEP Support and Lifecycle Status](#) on page 6533.

Release Note Naming Convention

The release note naming convention is based on version number and release date. For Hive 2.1.1-1803, 2.1.1 refers to the Hive version number and 1803 typically indicates a March 2018 release but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

EEP 1.1.3 Components

The EEP 1.1.3 repository contains the following ecosystem components that are fully supported:

Storm 0.10.0	Storm 0.10.0-1609 Release Notes on page 7576

The EEP 1.1 repository contains the following ecosystem components that are supported for internal MapR Monitoring use cases only:

- Collectd 5.5.1
- Elasticsearch 2.3.3
- Fluentd 0.14.00
- Grafana 3.1.1
- Kibana 4.5.1
- OpenTSDB 2.2.0

Package Names for Ecosystem Packs (EEPs)

This page describes how to view the the package names for each Ecosystem Pack (EEP) release.

To view the package names for an EEP:

1. Use a browser to navigate to <https://package.ezmeral.hpe.com/releases/MEP/>. A list of EEP links is displayed.
2. Click the link for your EEP. A list of operating system links is displayed.
3. Click the link for your operating system. The list of package names is displayed.

For more information about the supported EEPs, see [EEP Components and OS Support](#) on page 6539.

For information about packages and dependencies, see [Packages and Dependencies for Data Fabric Software](#) on page 61.

Airflow Release Notes

The release notes for the Airflow component included in the HPE Ezmeral Data Fabric contain notes specific to data-fabric only.

NOTE: To identify the EEP to which a specific release note belongs, see [EEP Release Notes](#) on page 6652. To see which operating systems support the ecosystem components in a specific EEP, see [EEP Components and OS Support](#) on page 6539 or [EEP Support and Lifecycle Status](#) on page 6533. To view release notes for prior data-fabric releases, see [Previous Versions](#) on page 7693.

Airflow 2.3.3.0 - 2210 (EEP 9.0.0) Release Notes

The following notes relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Airflow. You may also be interested in the Apache Airflow [home page](#).

Airflow Version	2.3.3.0
Release Date	October 2022
HPE Version Interoperability	See EEP Components and OS Support on page 6539.
Source on GitHub	https://github.com/mapr/airflow
GitHub Release Tag	2.3.3.0-eep-900
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/ , and select your EEP(MEP) and OS to view the list of package names.
Documentation	<ul style="list-style-type: none"> • Apache Airflow • Installing Airflow • Airflow Providers

New in This Release

This release updates the Airflow component to version 2.3.3.0. A variety of operators and sensors are provided to integrate Airflow with the HPE Ezmeral Data Fabric Database. In addition, release 7.0.0 includes operators, sensors, and transfers that enable Airflow to create and interact with S3 buckets. For more information, see [Airflow Providers](#).

Fixes

None.

Known Issues and Limitations

- Airflow is not supported with FIPS-enabled nodes.
- The Installer can install Airflow, but cannot set up MySQL as the backend database for Airflow. The default Airflow database is SQLite.
- S3 operators can be used with Airflow in release 7.0.0 but not in release 6.2.0 because native S3 support is not implemented in release 6.2.0.
- Airflow Amazon S3 providers might work with Minio S3 API, but HPE does not guarantee this functionality.

Resolved Issues

- None.

Airflow 2.5.1.0 - 2305 (EEP 8.1.1) Release Notes

The following notes relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Airflow. You may also be interested in the Apache Airflow [home page](#).

Airflow Version	2.5.1.0
Release Date	May 2023
HPE Version Interoperability	See EEP Components and OS Support on page 6539.
Source on GitHub	https://github.com/mapr/airflow
GitHub Release Tag	2.5.1.0-eep-811

Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/ , and select your EEP (MEP) and OS to view the list of package names.
Documentation	<ul style="list-style-type: none"> • Apache Airflow • Installing Airflow • Airflow Providers

New in This Release

This release updates the Airflow component to version 2.5.1.0.

Fixes

None.

Known Issues and Limitations

- Airflow is not supported on FIPS-enabled nodes.
- The Installer can install Airflow, but cannot set up MySQL as the backend database for Airflow. The default Airflow database is SQLite.
- Starting with EEP 8.1.1, Apache PySpark is removed from the default Airflow dependencies. To use the Spark JDBC operator/hook from Apache, install PySpark as follows:
 1. Run `<airflow_home>/build/env/bin/activate`.
 2. Run `pip install pyspark==<spark_version>`.
 3. Run `deactivate`.
 4.  **NOTE:** This process does not affect the Ezmeral Spark provider.

Resolved Issues

- None.

Airflow 2.2.1.0 - 2201 (EEP 8.1.0) Release Notes

The following notes relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Airflow. You may also be interested in the Apache Airflow [home page](#).

Airflow Version	2.2.1.0
Release Date	January 2022
HPE Version Interoperability	See EEP Components and OS Support on page 6539.
Source on GitHub	https://github.com/mapr/airflow
GitHub Release Tag	2.2.1.0-eeep-810
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/ , and select your EEP (MEP) and OS to view the list of package names.

Documentation	<ul style="list-style-type: none"> • Apache Airflow • Installing Airflow • Airflow Providers
---------------	---

New in This Release

This is the first release of the Airflow component. Starting from EEP 8.1.0, the HPE Ezmeral Data Fabric supports Apache Airflow in core releases 7.0.0 and 6.2.0. You can use Airflow to:

- Define, schedule, and monitor workflows.
- Orchestrate third-party systems to execute tasks.
- Analyze and manage workflows using the Airflow web interface.

A variety of operators and sensors are provided to integrate Airflow with the HPE Ezmeral Data Fabric Database. In addition, release 7.0.0 includes operators, sensors, and transfers that enable Airflow to create and interact with S3 buckets. For more information, see [Airflow Providers](#).

Fixes

None.

Known Issues and Limitations

- Airflow is not supported on FIPS-enabled nodes.
- The Installer can install Airflow, but cannot set up MySQL as the backend database for Airflow. The default Airflow database is SQLite.
- S3 operators can be used with Airflow in release 7.0.0 but not in release 6.2.0 because native S3 support is not implemented in release 6.2.0.
- Airflow Amazon S3 providers might work with Minio S3 API, but HPE does not guarantee this functionality.
- Airflow requires a patch to operate in a release 6.2.0 cluster with security enabled.

Resolved Issues

- None.

AsynchBase Release Notes

The release notes for AsynchBase component contains notes specific to MapR only.

NOTE: To identify the EEP to which a specific release note belongs, see [EEP Release Notes](#) on page 6652. To see which operating systems support the ecosystem components in a specific EEP, see [EEP Components and OS Support](#) on page 6539. To view release notes for prior MapR releases, see [Previous Versions](#) on page 7693.

AsynchBase 1.8.2-2009 Release Notes

The notes below relate to the HPE Ezmeral Data Fabric. You may also be interested in the [AsynchBase Github](#) page.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 6651.

Version	1.8.2
Release Date	September 2020
MapR Version Interoperability	Component Versions for Released EEPs
Source on GitHub	https://github.com/mapr/asynchbase
GitHub Release Tag	v1.8.2-mapr-2009
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs)

Fixes

None.

Known Issues and Limitations

None.

Resolved Issues

None.

AsynchBase 1.7.0-1808 Release Notes

The notes below relate to the MapR Converged Data Platform. You may also be interested in the [AsynchBase](#) Github page.

These release notes contain only MapR-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 6651.

Version	1.7.0
Release Date	September 2018
MapR Version Interoperability	Pre-MapR 5.2: Ecosystem Support Matrix (Pre-5.2 releases) on page 6638 MapR 5.2 and later: Component Versions for Released EEPs
Source on GitHub	https://github.com/mapr/asynchbase/tree/1.7.0-mapr-1808
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs)

Fixes

This release by MapR includes the following fixes on the base release. For complete details, refer to the commit log for this project in GitHub.

Commit	Date (YYYY-MM-DD)	Comment
e2a97c2	2018-07-11	MAPRDB-1243: Fixed AsyncHBase not sorting column qualifiers in lexicographical order.

AsyncHBase 1.7.0-1607 Release Notes

The notes below relate to the MapR Converged Data Platform. You may also be interested in the [AsyncHBase github page](#).

Version	1.7.0
Release Date	July 29, 2016
MapR Version Interoperability	Pre-MapR 5.2: Ecosystem Support Matrix (Pre-5.2 releases) on page 6638 MapR 5.2 and later: EEP Components and OS Support
Source on GitHub	https://github.com/mapr/asynchbase/tree/v1.7.0-mapr-1607
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs)

Fixes

This release by MapR includes the following fixes on the base release. For complete details, refer to the commit log for this project in GitHub.

Commit	Date (YYYY-MM-DD)	Comment
0917694	2016-07-109	MapR-23932: Free memoryArena after performing GET from AsyncHBase. This fixes an issue where FreeArena() wasn't called for GET operations.
a0e33ad	2016-07-07	MapR-23881: Fixed an issue where OpenTSDB daemon gets stuck while running queries with large number of rows.
9faa290	2016-06-09	MapR-22952: Fixed Maven Protocol Buffers plugin in AsyncHBase pom file. Previously, the asynchbase build was broken because maven-protoc-plugin was not available in Maven Central anymore.
11006f0	2016-05-26	MapR-20677: Added support to delete exact cell version through AsyncHBase.

AsyncHBase 1.7.0-1603 Release Notes

The notes below relate to the MapR Converged Data Platform. You may also be interested in the [AsyncHBase github page](#).

Version	1.7.0
Release Date	April 4, 2016
MapR Version Interoperability	See the Ecosystem Support Matrix .

Source on GitHub	https://github.com/mapr/asynchbase/tree/v1.7.0-mapr-1603
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	The following packages are associated with this release: <ul style="list-style-type: none"> mapr-asynchbase-1.7.0.201603301412-1.noarch.rpm mapr-asynchbase_1.7.0.201603301412_all.deb

New Features

This release of AsyncHBase includes the following behavior change that is specific to MapR:

Ability to define the default database that AsyncHBase connects to.

A new parameter `mapr.hbase.default.db` can be added to the `asynchbase.conf` file. You can configure this parameter to specify if AsyncHBase accesses HBase tables or HPE Ezmeral Data Fabric Database tables by default. If this value is not configured, AsyncHBase will determine which type of table is being accessed based on the table name.

Fixes

This release by MapR includes the following fixes on the base release. For complete details, refer to the commit log for this project in GitHub.

Commit	Date (YYYY-MM-DD)	Comment
f1d9c46	2016-03-18	MapR-22861: <code>mapr.hbase.default.db</code> parameter can now be set to indicate whether AsyncHBase connects to HPE Ezmeral Data Fabric Database tables or HBase tables by default.
7f563c4	2016-03-15	MapR-22797: Implemented the <code>locateRegions</code> functionality for HPE Ezmeral Data Fabric Database tables
f2b0a70	2016-03-09	MapR 22778: The <code>AppendRequest</code> behavior against HBase tables was modified so that it returns <code>ArrayList<KeyValue></code> whenever it is used to return the new values after the append operation.

Known Issue

- 22911: In MapR 5.1, when the `DeleteRequest` API calls `setDeleteAtTimestampOnly` for a HPE Ezmeral Data Fabric Database table, the delete occurs for timestamps less than or equal to the given timestamp.

AsyncHBase 1.6.0-1504 Release Notes

Version	1.6.0-mapr-1504
Release Date	May 6, 2015
MapR Version Interoperability	See the Ecosystem Support Matrix .
Source on GitHub	https://github.com/mapr/asynchbase

New in this Release

- Comparison filters for HBase and HPE Ezmeral Data Fabric Database are now supported.

Data Access Gateway Release Notes

This section includes the release notes for the Data Access Gateway.

Data Access Gateway 6.1 Release Notes

These notes describe release 6.1 of the Data Access Gateway.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 6651.

Version	6.1
Release Date	July 2023
Version Interoperability	See Data Access Gateway Support Matrix on page 6650.
Package Name	mapr-data-access-gateway To view the full list of package names, navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS.
Documentation	Administering the Data Access Gateway on page 1893

New in This Release

- Data Access Gateway version 6.1 supports fully distributed Kafka Wire Protocol service.

In previous versions of Data Access Gateway, only the controller is assigned the partition leader of all topic partitions. In Data Access Gateway version 6.1, topic partitions are distributed evenly among all Data Access Gateway nodes, improving overall cluster throughput.

- Added support for Python, Go, Scala, C Kafka, and Node.js clients.

Data Access Gateway 6.1 can be used with core 7.4.0, 7.3.0, and 7.2.0. However, Kafka Wire Service protocol is only available for Data Access Gateway 6.1 on core 7.4.0. When using Data Access Gateway 6.1 with core 7.3.0 or 7.2.0, Kafka Wire Protocol service is disabled. Data Access Gateway 6.1 supports FIPS and non-FIPS installations. See [FIPS Support for Ecosystem Components](#) on page 6621.

The HPE Ezmeral Data Fabric Data Access Gateway is included in EEP repositories beginning with EEP 5.0.0. The Data Access Gateway is a service that acts as a proxy and gateway for translating requests between lightweight client applications and the data-fabric cluster. As of version 6.1, Data Access Gateway supports REST endpoints for HPE Ezmeral Data Fabric Binary and JSON tables (See [Administering Tables](#) on page 1273), lightweight Ojai clients for HPE Ezmeral Data Fabric JSON tables (see [Using the Python OJAI Client](#) on page 3317 and [HPE Ezmeral Data Fabric Database and Apps](#) on page 3092), and Apache Kafka clients for HPE Ezmeral Data Fabric Streams (see [Administering Streams](#) on page 1417).

Client	Supported EEPs
MapR Database JSON REST API	EEP 5.0.0 and later
Python OJAI client	EEP 6.0.0 and later
Node.js OJAI client	EEP 6.0.0 and later
C# OJAI client	EEP 6.0.0 and later
Go OJAI client	EEP 6.0.0 and later
Java OJAI Thin Client	EEP 6.3.0 and later
Apache Kafka Java Client	EEP 9.0.0 and later
Apache Kafka Python Client	EEP 9.1.2 and later
Apache Kafka C Client	EEP 9.1.2 and later
Apache Kafka Scala Client	EEP 9.1.2 and later
Apache Kafka Go Client	EEP 9.1.2 and later
Apache Kafka Node.js Client	EEP 9.1.2 and later

Fixes

None.

Known Issues and Limitations

None.

Resolved Issues

None.

Data Access Gateway 6.0 Release Notes

These notes describe release 6.0 of the Data Access Gateway.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 6651.

Version	6.0
Release Date	April 2023
Version Interoperability	Compatible with release 7.3.0 with EEP 9.1.1 and later
Package Name	mapr-data-access-gateway To view the full list of package names, navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS.
Documentation	Administering the Data Access Gateway on page 1893

New in This Release

Data Access Gateway 6.0 removes support for configuring topic mapping rules. In Data Access Gateway 6.0, the new topic-mapping scheme is one topic per stream and, optionally, in its own volume.

While EEP 9.1.1 can be used with core 7.2.0 or core 7.3.0, Data Access Gateway 6.0 can only be used with core 7.3.0. In addition, only Data Access Gateway 6.0 can be used with release 7.3.0. Data Access Gateway 6.0 supports FIPS and non-FIPS installations.

The HPE Ezmeral Data Fabric Data Access Gateway is included in EEP repositories beginning with EEP 5.0.0. The Data Access Gateway is a service that acts as a proxy and gateway for translating requests between lightweight client applications and the data-fabric cluster.

Client	Supported EEPs
MapR Database JSON REST API	EEP 5.0.0 and later
Python OJAI client	EEP 6.0.0 and later
Node.js OJAI client	EEP 6.0.0 and later
C# OJAI client	EEP 6.0.0 and later
Go OJAI client	EEP 6.0.0 and later
Java OJAI Thin Client	EEP 6.3.0 and later

Fixes

None.

Known Issues and Limitations

None.

Resolved Issues

None.

Data Access Gateway 5.1 Release Notes

These notes describe the release 5.1 of the Data Access Gateway.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 6651.

Version	5.1
Release Date	January 2023
MapR Version Interoperability	Compatible with release 7.2.0 with EEP 9.1.0 and later*
Package Name	mapr-data-access-gateway To view the full list of package names, navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS.
Documentation	Administering the Data Access Gateway on page 1893

New in This Release

Data Access Gateway 5.1 adds SSL support in the [Apache Kafka Wire Protocol Service](#).

Only Data Access Gateway 5.1 can be used with release 7.2.0. Data Access Gateway 5.1 supports FIPS and non-FIPS installations.

The HPE Ezmeral Data Fabric Data Access Gateway is included in EEP repositories beginning with EEP 5.0.0. The Data Access Gateway is a service that acts as a proxy and gateway for translating requests between lightweight client applications and the data-fabric cluster.

Client	Supported EEPs
MapR Database JSON REST API	EEP 5.0.0 and later
Python OJAI client	EEP 6.0.0 and later
Node.js OJAI client	EEP 6.0.0 and later
C# OJAI client	EEP 6.0.0 and later
Go OJAI client	EEP 6.0.0 and later
Java OJAI Thin Client	EEP 6.3.0 and later

Fixes

None.

Known Issues and Limitations

None.

Resolved Issues

None.

Data Access Gateway 5.0 Release Notes

These notes describe the release 5.0 of the Data Access Gateway.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 6651.

Version	5.0
Release Date	October 2022
MapR Version Interoperability	Compatible with release 7.1.0 with EEP 9.0.0 and later*

Package Name	mapr-data-access-gateway To view the full list of package names, navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS.
Documentation	Administering the Data Access Gateway on page 1893

New in This Release

As its primary feature, Data Access Gateway 5.0 enables support for the Apache Kafka Wire Protocol Service. Apache Kafka Wire Protocol Service makes it possible for Apache Kafka clients written in any programming language to access topics in HPE Ezmeral Data Fabric Streams.

Only Data Access Gateway 5.0 can be used with release 7.1.0. Data Access Gateway 5.0 supports FIPS and non-FIPS installations.

The HPE Ezmeral Data Fabric Data Access Gateway is included in EEP repositories beginning with EEP 5.0.0. The Data Access Gateway is a service that acts as a proxy and gateway for translating requests between lightweight client applications and the data-fabric cluster.

Client	Supported EEPs
MapR Database JSON REST API	EEP 5.0.0 and later
Python OJAI client	EEP 6.0.0 and later
Node.js OJAI client	EEP 6.0.0 and later
C# OJAI client	EEP 6.0.0 and later
Go OJAI client	EEP 6.0.0 and later
Java OJAI Thin Client	EEP 6.3.0 and later

Fixes

None.

Known Issues and Limitations

None.

Resolved Issues

- [DAG] Upgrade spring framework to 5.3.20+:
 - Updated Spring version to 5.3.22.
 - Updated Spring Security Version to 5.6.7.
 - Updated Jersey Version to 2.37.

None.

Data Access Gateway 4.0 Release Notes

These notes describe the 4.0 release of the Data Access Gateway.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 6651.

Version	4.0
---------	-----

Release Date	January 2022
MapR Version Interoperability	Compatible with release 6.2 with EEP 7.0.0 and later*
Package Name	mapr-data-access-gateway To view the full list of package names, navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS.
Documentation	Administering the Data Access Gateway on page 1893

*The latest core 6.2.0 EBF patch must be applied before you can use Data Access Gateway 4.0 on release 6.2.0.

New in This Release

Only Data Access Gateway 4.0 can be used with release 7.0.0 in FIPS mode. This is the only significant difference between Data Access Gateway 3.0 and 4.0. Both versions 3.0 and 4.0 can be used in non-FIPS mode.

The HPE Ezmeral Data Fabric Data Access Gateway is included in EEP repositories beginning with EEP 5.0.0. The Data Access Gateway is a service that acts as a proxy and gateway for translating requests between lightweight client applications and the data-fabric cluster.

Client	Supported EEPs
MapR Database JSON REST API	EEP 5.0.0 and later
Python OJAI client	EEP 6.0.0 and later
Node.js OJAI client	EEP 6.0.0 and later
C# OJAI client	EEP 6.0.0 and later
Go OJAI client	EEP 6.0.0 and later
Java OJAI Thin Client	EEP 6.3.0 and later

Configuring the Maximum Message Size for the gRPC Service

EEP 7.1.0 and later support a new configuration option (`grpc.service.max-message-size`) that allows you to change the maximum message size that the gRPC service accepts. For details, see [Administering the Data Access Gateway](#) on page 1893.

In EEP 7.1.0 and later, the Java OJAI Thin Client supports an OJAI Connection String option (`maxmsgsize`) to change the maximum message size that the gRPC client accepts. For details, see [Using the Java OJAI Thin Client](#) on page 3309.

Fixes

None.

Known Issues and Limitations

None.

Resolved Issues

None.

Data Access Gateway 3.0 Release Notes

These notes describe the 3.0 release of the Data Access Gateway.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 6651.

Version	3.0
Release Date	September 2020
MapR Version Interoperability	Compatible with release 6.2 with EEP 7.0.0 and later
Package Name	mapr-data-access-gateway To view the full list of package names, navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS.
Documentation	Administering the Data Access Gateway on page 1893

New in This Release

The HPE Ezmeral Data Fabric Data Access Gateway is included in EEP repositories beginning with EEP 5.0.0. The Data Access Gateway is a service that acts as a proxy and gateway for translating requests between lightweight client applications and the data-fabric cluster.

Client	Supported EEPs
MapR Database JSON REST API	EEP 5.0.0 and later
Python OJAI client	EEP 6.0.0 and later
Node.js OJAI client	EEP 6.0.0 and later
C# OJAI client	EEP 6.0.0 and later
Go OJAI client	EEP 6.0.0 and later
Java OJAI Thin Client	EEP 6.3.0 and later

Configuring the Maximum Message Size for the gRPC Service

EEP 7.1.0 and later support a new configuration option (`grpc.service.max-message-size`) that allows you to change the maximum message size that the gRPC service accepts. For details, see [Administering the Data Access Gateway](#) on page 1893.

In EEP 7.1.0 and later, the Java OJAI Thin Client supports an OJAI Connection String option (`maxmsgsize`) to change the maximum message size that the gRPC client accepts. For details, see [Using the Java OJAI Thin Client](#) on page 3309.

Fixes

None.

Known Issues and Limitations

None.

Resolved Issues

None.

MapR Data Access Gateway 2.0 Release Notes

These notes describe the 2.0 release of the MapR Data Access Gateway.

These release notes contain only MapR-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 6651.

Version	2.0
Release Date	December 2019
MapR Version Interoperability	Compatible with MapR 6.1 with EEP 6.0.0 and later
Package Name	mapr-data-access-gateway To view the full list of package names, navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS.
Documentation	Administering the Data Access Gateway on page 1893

New in This Release

The MapR Data Access Gateway is included in EEP repositories beginning with EEP 5.0.0. The MapR Data Access Gateway is a service that acts as a proxy and gateway for translating requests between lightweight client applications and the MapR cluster. The version of the MapR Data Access Gateway remains unchanged for EEP 6.3.0, but the Java OJAI Thin Client is now supported:

Client	Supported EEPs
MapR Database JSON REST API	EEP 5.0.0 and later
Python OJAI client	EEP 6.0.0 and later
Node.js OJAI client	EEP 6.0.0 and later
C# OJAI client	EEP 6.0.0 and later
Go OJAI client	EEP 6.0.0 and later
Java OJAI Thin Client	EEP 6.3.0 and later

Configuring the Maximum Message Size for the gRPC Service

EEP 6.3.4 and later support a new configuration option (`grpc.service.max-message-size`) that allows you to change the maximum message size that the gRPC service accepts. For details, see [Administering the Data Access Gateway](#) on page 1893.

In EEP 6.3.4 and later, the Java OJAI Thin Client supports an OJAI Connection String option (`maxmsgsize`) to change the maximum message size that the gRPC client accepts. For details, see [Using the Java OJAI Thin Client](#) on page 3309.

Fixes

None.

Known Issues and Limitations

None.

Resolved Issues

None.

MapR Data Access Gateway 1.0 Release Notes

These notes describe the first release of the MapR Data Access Gateway.

These release notes contain only MapR-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 6651.

Version	1.0
Release Date	April 2018
MapR Version Interoperability	Compatible with MapR 6.0.1 and later
Package Name	mapr-data-access-gateway To view the full list of package names, navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS.
Documentation	Administering the Data Access Gateway on page 1893

New in This Release

This is the first release of the MapR Data Access Gateway. The MapR Data Access Gateway is included in EEP repositories beginning with EEP 5.0.0. The MapR Data Access Gateway is a service that acts as a proxy and gateway for translating requests between lightweight client applications and the MapR cluster. For the EEP 5.0.0 release, the HPE Ezmeral Data Fabric Database JSON REST API uses this service.

Fixes

None.

Known Issues and Limitations

Drill Release Notes

The release notes for Apache Drill contains notes specific to MapR only. Release notes for prior releases are posted on the [Apache Drill web site](#).

Drill 1.20.3.0-2304 (EEP 9.1.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Drill. You may also be interested in the [Apache Drill homepage](#) and the [Apache Drill release notes](#):

Version	1.20.3.0
Release Date	April 2023
HPE Version Interoperability	See Component Versions for Released EEPs on page 6600 and EEP Components and OS Support on page 6539.
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 6737.

New in This Release

Drill 1.20.3.0 introduces the following enhancements or HPE platform-specific behavior changes:

- Drill version updated to 1.20.3.0

- Protobuf version updated to 3.22.2

Fixes

This HPE release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
d9d6d06143	2023-03-15	MD-6411: Update protobuf to 3.22.2

Known Issues

- None.

Limitations

- The hive storage plugin in Drill does not support reading the parquet `timestamp` type with the `int64` logical type.

Drill 1.20.2.100-2301 (EEP 9.1.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Drill. You may also be interested in the [Apache Drill homepage](#) and the [Apache Drill release notes](#):

Version	1.20.2.100
Release Date	January 2023
HPE Version Interoperability	See Component Versions for Released EEPs on page 6600 and EEP Components and OS Support on page 6539.
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 6737.

New in This Release

Drill 1.20.2.100 introduces the following enhancements or HPE platform-specific behavior changes:

- Drill version updated to 1.20.2.100.

Fixes

This HPE release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
f388115d6d	2022-12-16	MD-6393: Protobuf-java CVE-2020-9492

Known Issues

- None.

Limitations

- The hive storage plugin in Drill does not support reading the parquet `timestamp` type with the `int64` logical type.

Drill 1.20.2.0-2210 (EEP 9.0.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Drill. You may also be interested in the [Apache Drill homepage](#) and the [Apache Drill release notes](#):

Version	1.20.2.0
Release Date	October 2022
HPE Version Interoperability	See Component Versions for Released EEPs on page 6600 and EEP Components and OS Support on page 6539.
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 6737.

New in This Release

Drill 1.20.2.0-2210 introduces the following enhancements or HPE platform-specific behavior changes:

- Drill version updated to 1.20.2.0.
- Separate storage in HBase for query profiles and storage plugin information. See [Configuring HBase Persistent Storage Tables](#) on page 3830.
- Query profile data masking based on user filters. .
- Transport layer security (TLS) default version is now 1.3.

Fixes

This HPE release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
db2eea295e	2022-09-28	MD-6376: Change kafka_2.13 dependency scope to test
5d882ba211	2022-09-23	MD-6375: Update commons-text to 1.9
df8692a28e	2022-09-09	MD-6371: Enable mapr maven profile by default  ATTENTION: If you use Drill as a maven dependency, note that the related dependencies for Drill have changed in this release.
47c25a7766	2022-09-08	MD-6370: Excluded Xalan dependency
286b8db58b	2022-10-03	MD-6306: Remove spring dependencies
48f5927cf9	2022-10-03	MD-6293: Exclude htrace-core, update jackson to 2.13.2
e9561b34e1	2022-10-03	MD-6272: Update Antlr4 to version 4.9.3
c4236e9c09	2022-09-07	MD-6264: Cannot verify certificate when ssl enabled on Drill-on-Yarn
4cb67f7c03	2022-09-07	MD-5516: Drill-on-Yarn client does not handle REST status/management API over SSL

Known Issues

- Due to Drill version changes (3-digit to 4-digit), you cannot upgrade from Drill in EEP 7.0.0 (Drill 1.16.1) to Drill in EEP 7.0.1 (Drill 1.16.1.5) or later. You must perform a new installation of Drill. Alternatively, if you are running Drill on CentOS or RHEL, you can issue the following command as a workaround to upgrade Drill:

```
rpm -Uv --<old-package> <path/to/packages>/*.rpm
```

See [Upgrading Drill](#) on page 318.

Limitations

- The hive storage plugin in Drill does not support reading the parquet `timestamp` type with the `int64` logical type.

Drill 1.16.1.500-2305 (EEP 8.1.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Drill. You may also be interested in the [Apache Drill homepage](#) and the [Apache Drill release notes](#):

Version	1.16.1.500
Release Date	May 2023
HPE Version Interoperability	See Component Versions for Released EEPs on page 6600 and EEP Components and OS Support on page 6539.
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 6737.

New in This Release

Drill 1.16.1.500-2305 introduces the following enhancements or HPE platform-specific behavior changes:

- Separate storage in HBase for query profiles and storage plugin information. See [Configuring HBase Persistent Storage Tables](#) on page 3830.

Fixes

This HPE release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
38c9c314a9	2023-05-05	MD-6438: Update version of shaded guava to 31.1-jre
df338e7671	2023-05-03	MD-6439: Update jackson version to 2.12.7 and jackson databind 2.12.7.1
2572e8a8e2	2023-05-03	MD-6437: Update protobuf-java to 3.21.12
33da89f90f	2023-04-28	MD-6426: Fix endless retrying zk set data for a large query
2cfc983fbb	2023-04-20	MD-6435: Update jetty to 9.4.51.v20230217
c7bac76d3f	2023-04-19	MD-6429: remove conjars repo
8a69b8c69b	2023-03-10	MD-6412: Update commons-text to 1.10.0 due to CVE
b1abff4981	2022-09-09	MD-6371: Enable mapr maven profile by default
2531a80da4	2022-09-08	MD-6370: Exclude Xalan dependency
e20c4ca438	2022-05-04	MD-6272: Update Drill to use Antlr4 version 4.9.3
53181b0213	2022-05-02	MD-6312: Hide warning about an illegal reflective access operation while connecting via sqlline
88bfe5171c	2022-04-21	DRILL-8122: Change kafka metadata obtaining due to KAFKA-5697 (#2456)
7f7fe93ce3	2022-04-12	MD-6304: add requested file from DRILL-7204
64b78f7f04	2022-04-12	DRILL-7619: Fixed link to the metrics endpoint
8933f37e56	2022-04-12	DRILL-7582: Moved Drillbits REST API communication to the back end layer

2b4db26be7	2022-04-11	MD-6264: Cannot verify certificate when ssl enabled on DOY (#581)
c9eef515ca	2022-04-11	MD-6271: drill couldn't start when FIPS enabled on Rocky linux (#580)
59c28b849f	2022-04-07	MD-6306: Remove spring transitive dependencies (#583)

Known Issues

- During the Drill-on-YARN installation, the system fails to upload the Drill archive because the `/user/drill` directory does not exist. If you install and try to start Drill-on-YARN (version 1.16.1.400 in EEP-8.1.0 or 1.16.1.500 in EEP-8.1.1 on Core 6.2.0 or 7.0.0) using the `mapr-drill-yarn` package, the system returns the following messages:

```

/opt/mapr/drill/drill-1.16.1/bin/drill-on-yarn.sh start

WARNING: An illegal reflective access operation has occurred
WARNING: Illegal reflective access by
javassist.util.proxy.SecurityActions (file:/opt/mapr/drill/drill-1.16.1/
jars/3rdparty/javassist-3.24.0-GA.jar) to method
java.lang.ClassLoader.defineClass(java.lang.String,byte[],int,int,java.sec
urity.ProtectionDomain)
WARNING: Please consider reporting this to the maintainers of
javassist.util.proxy.SecurityActions
WARNING: Use --illegal-access=warn to enable warnings of further illegal
reflective access operations
WARNING: All illegal access operations will be denied in a future release
Connecting to DFS... Connected.
2023-06-20 02:28:59,1379 ERROR JniCommon fc/jni_MapRClient.cc:816 Thread:
1438881 Mismatch found for java and native libraries java build version
6.2.0.0.20200915234957.GA, native build version 6.2.0.0.20200909000740.GA

drill.tar.gz ... Failed.
Failed to upload Drill archive
  Caused by: Failed to create DFS directory: /user/drill
  Caused by: Could not create FileClient err: 0
  Caused by: Could not create FileClient err: 0

```

To resolve this issue, complete the following steps:

1. Install Drill-on-YARN, as described in [Installing Drill to Run Under YARN](#) on page 190, but do not configure or start Drill-on-YARN.

2. Create a file named `recreate_archive.sh` with the following information:

TIP: You can create and run this file in any location you choose.

```

read -p "This operation will recreate drill.tar.gz in drill home
directory. Continue? " -n 1 -r
echo
if [[ ! $REPLY =~ ^[Yy]$ ]]
then
    exit 1
fi

drillHome="/opt/mapr/drill/drill-$(cat /opt/mapr/drill/drillversion)"
hadoopHome="/opt/mapr/hadoop/hadoop-$(cat /opt/mapr/hadoop/
hadoopversion)"

hbaseJar="$(ls /opt/mapr/lib/mapr-hbase-*-mapr.jar)"
maprWebJar="$(ls /opt/mapr/lib/mapr-security-*-mapr.jar)"
maprdbJar="$(ls /opt/mapr/lib/maprdb-[0-9].[0-9].[0-9].[0-9]-mapr.jar)"
mapredJar="$(ls /opt/mapr/lib/maprdb-mapreduce-*-mapr.jar)"
maprfsJar="$(ls /opt/mapr/lib/maprfs-[0-9].[0-9].[0-9].[0-9]-mapr.jar)"
jerseyClientJar="$(ls ${hadoopHome}/share/hadoop/yarn/lib/
jersey-client-*.jar)"
jerseyCoreJar="$(ls ${hadoopHome}/share/hadoop/yarn/lib/
jersey-core-*.jar)"

echo "Drop old mapr jars from ${drillHome}/jars/3rdparty/"
rm -f ${drillHome}/jars/3rdparty/mapr-hbase*
rm -f ${drillHome}/jars/3rdparty/mapr-security-web-*
rm -f ${drillHome}/jars/3rdparty/maprdb-*
rm -f ${drillHome}/jars/3rdparty/maprfs-*

    rm -f ${drillHome}/drill.tar.gz
    echo "${drillHome}/drill.tar.gz has been dropped"
fi

tempDir=drill-$(date +%s)

mkdir /tmp/${tempDir}
[ $? == 0 ] && echo "Created temporary directory ${tempDir}"

cd /tmp/${tempDir}

mkdir drill

```

```
[ $? == 0 ] && echo "Created drill directory"

cp -r ${drillHome}/* ./drill/
echo "${drillHome} copied to drill directory"

tar -czf drill.tar.gz ./drill
echo "Created new drill archive"

cp drill.tar.gz ${drillHome}/
echo "drill.tar.gz copied to ${drillHome}"

rm -rf /tmp/$tempDir
echo -e "\033[0;32mDONE.\033[0m"
```

3. Issue the following command to run the script:

```
sh recreate_archive.sh
```

When the script runs, a prompt appears:

```
This operation will recreate drill.tar.gz in drill home directory.
Continue?
```

Reply with `y` to allow the script to update the JAR files in Drill-on-YARN.

You should see the following output:

```
Drop old mapr jars from /opt/mapr/drill/drill-1.16.1/jars/3rdparty/
Copy new jars from /opt/mapr/lib/
/opt/mapr/lib/mapr-hbase-6.2.0.0-mapr.jar has been copied

Created new drill archive
drill.tar.gz copied to /opt/mapr/drill/drill-1.16.1
DONE.
```

4. Configure Drill to run under YARN and start Drill-on-YARN, as described in [Configuring Drill to Run Under YARN](#).

- Due to Drill version changes (3-digit to 4-digit), you cannot upgrade from Drill in EEP 7.0.0 (Drill 1.16.1) to Drill in EEP 7.0.1 (Drill 1.16.1.5) or later. You must perform a new installation of Drill. Alternatively, if you are running Drill on CentOS or RHEL, you can issue the following command as a workaround to upgrade Drill:

```
rpm -Uv --<old-package> <path/to/packages>/*.rpm
```

See [Upgrading Drill](#) on page 318.

Limitations

- Older versions of Drill, such as Drill 1.10.0, supported the HBase plug-in, but Drill versions 1.11.0 through 1.16.0.x do not support queries on HBase tables.

Drill 1.16.1.400-2201 (EEP 8.1.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Drill. You may also be interested in the [Apache Drill homepage](#) and the [Apache Drill release notes](#):

Version	1.16.1.400
Release Date	January 2022
HPE Version Interoperability	See Component Versions for Released EEPs on page 6600 and EEP Components and OS Support on page 6539.
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 6737.

New in This Release

Drill 1.16.1.400-2201 introduces the following enhancements or HPE platform-specific behavior changes:

- None

Fixes

This HPE release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
33a7d24ea2	2022-01-10	MD-6251: Secondary index error when reading from mapr-db json (#575)
8365703194	2021-12-30	MD-5516: Add https support for Drill-on-YARN (#566)
d492882d29	2021-12-30	MD-6191: Allow partition pruning with dynamic CURRENT_DATE operator.
a6ab48aede	2021-12-20	MD-6196: Medial CVE fixes (jquery, bootstrap, data tables)
5ee9b79204	2021-12-20	MD-6196: Medial CVE fixes (junit, bcpxix-jdk15on)
4f92206395	2021-12-08	MD-6202: Excluding transitive netty dependency from zookeeper
aeb91d399c	2021-12-07	MD-6161: fix skipping of types written not in uppercase (#565)
cbbceb728b	2021-11-26	DRILL-8009: DrillConnectionImpl#isValid() doesn't correspond JDBC API
a5b79c9e67	2021-11-21	MD-6196: Fix the CVEs with the high severity
bddeab869d	2021-11-16	DRILL-7586: Fix loading incorrect version of commons-lang3
ec1051c0ec	2021-11-09	MD-6182: Fixed problem with starting drill on the fips cluster (#564)

Known Issues

- During the Drill-on-YARN installation, the system fails to upload the Drill archive because the `/user/drill` directory does not exist. If you install and try to start Drill-on-YARN (version 1.16.1.400 in

EEP-8.1.0 on Core 6.2.0 or 7.0.0) using the `mapr-drill-yarn` package, the system returns the following messages:

```
/opt/mapr/drill/drill-1.16.1/bin/drill-on-yarn.sh start

WARNING: An illegal reflective access operation has occurred
WARNING: Illegal reflective access by
javassist.util.proxy.SecurityActions (file:/opt/mapr/drill/drill-1.16.1/

597c32929e	2021-07-15	MD-6140: mapr-drill failing with java.lang.NoClassDefFoundError: org/apache/zookeeper/Environment
4d04fcdd74	2021-07-07	MD-6143: Commons-codec vulnerability WS-2019-0379
d9c5a9f006	2021-06-03	MD-6130: Different jackson jar versions in 3rdparty libs
4e673662e6	2021-05-27	MD-6126: CVE-2020-13936 velocity-engine-core vulnerability

f80f67df1e	2021-05-19	DRILL-7372: MethodAnalyzer consumes too much memory
c023fa7705	2021-05-19	MD-6022: Column names are not flipped when running a query

Known Issues

- Due to Drill version changes (3-digit to 4-digit), you cannot upgrade from Drill in EEP 7.0.0 (Drill 1.16.1) to Drill in EEP 7.0.1 (Drill 1.16.1.5) or later. You must perform a new installation of Drill. Alternatively, if you are running Drill on CentOS or RHEL, you can issue the following command as a workaround to upgrade Drill:

```
rpm -Uv --<old-package> <path/to/packages>/*.rpm
```

See [Upgrading Drill](#) on page 318.

Limitations

- Older versions of Drill, such as Drill 1.10.0, supported the HBase plug-in, but Drill versions 1.11.0 through 1.16.0.x do not support queries on HBase tables.

Drill 1.16.1.250-2201 (EEP 7.1.2) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Drill. You may also be interested in the [Apache Drill homepage](#) and the [Apache Drill release notes](#):

Version	1.16.1.250
Release Date	March 2022
HPE Version Interoperability	See Component Versions for Released MEPs .
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ , and select your MEP and OS to view the list of package names.

New in This Release

Drill 1.16.1.250-2201 introduces the following enhancements or HPE platform-specific behavior changes:

- None

Fixes

This HPE release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
33a7d24ea2	2022-01-10	MD-6251: Secondary index error at reading from mapr-db json (#575)
8365703194	2021-12-30	MD-5516: Add https support for drill on yarn (#566)
d492882d29	2021-12-30	MD-6191: Change to allow partition pruning with dynamic CURRENT_DATE operator.
a6ab48aede	2021-12-20	MD-6196: Fix the CVEs with the high severity, Medial CVE fixes (jquery bootstrap datatables junit bcpkix-jdk15on junit bcpkix-jdk15on)
aeb91d399c	2021-12-07	MD-6161: fix skipping of types written not in uppercase (#565)

cbbceb728b	2021-11-26	DRILL-8009: DrillConnectionImpl#isValid() doesn't correspond JDBC API
09267911da	2021-11-16	MD-6197: Update hbase version to 1.4.13.0-eeep-810-SNAPSHOT
bddeab869d	2021-11-16	DRILL-7586: Fix loading incorrect version of commons-lang3
ec1051c0ec	2021-11-09	MD-6182: Fixed problem with starting drill on the fips cluster (#564)
42dafa04ac	2021-08-27	MD-6160: Fixed test with not equal predicate (#558)
7dd73ee1a9	2021-08-27	Fixed bug with returning null values when selecting by key without tests (#560)
4c322e45ce	2021-08-18	MD-6165: Downgrading jackson libs to be consistent with core (from 2.12.1 to 2.11.1)
67619111f2	2021-08-12	MD-6162: Security vulnerability found in jars used in Drill
1c657eff14	2021-08-12	MD-6153: CVE-2019-10172 CVE-2019-10202 vulnerabilities in jackson-mapper-asl-1.9.13.jar
ffe1f0b175	2021-08-06	DRILL-7934: Fix NullPointerException error when reading parquet files
5c58e3c598	2021-07-28	MD-6144: Jetty security vulnerability
ee6525a53f	2021-07-26	MD-6145: CVE-2020-13956 WS-2017-3734 vulnerabilities in http-client
597c32929e	2021-07-15	MD-6140: mapr-drill failing with java.lang.NoClassDefFoundError: org/apache/zookeeper/Environment (#555)
4d04fcdd74	2021-07-07	MD-6143: Commons-codec vulnerability WS-2019-0379
d9c5a9f006	2021-06-03	MD-6130: Different jackson jar versions in 3rdparty libs (#554)

Known Issues and Limitations

- Due to Drill version changes (3-digit to 4-digit), you cannot upgrade from Drill in MEP 7.0.0 (Drill 1.16.1) to Drill in MEP 7.0.1 (Drill 1.16.1.5) or later. You must perform a new installation of Drill. Alternatively, if you are running Drill on CentOS or RHEL, you can issue the following command as a workaround to upgrade Drill:

```
rpm -Uv --<old-package> <path/to/packages>/*.rpm
```

See [Upgrading Drill](#) on page 318.

- Older versions of Drill, such as Drill 1.10.0, supported the HBase plug-in, but Drill versions 1.11.0 through 1.16.0.x do not support queries on HBase tables.

Drill 1.16.1.200-2104 (EEP 7.1.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Drill. You may also be interested in the [Apache Drill homepage](#) and the [Apache Drill release notes](#):

Version	1.16.1.200
---------	------------

Release Date	April 2021
HPE Version Interoperability	See Component Versions for Released MEPs .
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ , and select your MEP and OS to view the list of package names.

New in This Release

Drill 1.16.1.200-2104 introduces the following enhancements or HPE platform-specific behavior changes:

- [Service verifier](#)

Fixes

This HPE release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
85f32639d	2021-05-09	MD-6133: Fixed issue with Decimal type
8af5a9b51	2021-04-30	MD-6128: Fixed differences between jetty versions and updated to 9.4.40
4324b0753	2021-04-16	MD-6120: Fixed issues with parquet while using hive-storage
2f111fcfa	2021-04-14	MD-6120: Fixed issues with hive (#548)
746179715	2021-04-12	MD-6120: Fixed issue with builds
bf8f0febd	2021-04-12	MD-6102: Removed hasSecurityMechanism function because if there is no mechanism drill will use plain
6963a5b61	2021-04-12	MD-6102: Cannot connect by MAPRSASL without username field (#547)
8b3a076e5	2021-03-31	MD-6120: Update Drill dependencies to the latest artifacts for MEP7.1.0 release (#545)
a467f6327	2021-03-22	MD-6114: Add service verifier to drill package (#543)
9ccf98f66	2021-03-22	MD-5787: Improved kafka-storage plugin to handle topics from non default stream and added support for headers
a9bc026f3	2021-03-18	MD-6101: CVE-2019-16869 , CVE-2014-3488 etc. Netty vulnerabilities (#542)
5c878b763	2021-03-10	MD-6117: The Drill cannot run after updates Jetty vulnerability in secure cluster
9e3c48030	2021-02-26	MD-6077: Excluded Log4jplugins.dat file from hive-exec-shaded.jar
0ab22dc82	2021-02-22	MD-6105: Fixed issue so Drill does not return a parsing error for queries on Parquet files.
64d3e225b	2021-02-22	DRILL-7361: Support MAP (DICT) type in schema file
e7f3b6133	2021-02-22	DRILL-7509: Incorrect TupleSchema is created for DICT column when querying Parquet files
27099bcda	2021-02-22	Similar changes to DRILL-7359

0bec91f7c	2021-02-15	MD-6110: CVE-2020-27216 : Jetty vulnerability (#538)
5828c1c13	2021-02-10	MD-6111: CVE-2020-25649 Jackson vulnerability (#537)

Known Issues and Limitations

- Due to Drill version changes (3-digit to 4-digit), you cannot upgrade from Drill in MEP 7.0.0 (Drill 1.16.1) to Drill in MEP 7.0.1 (Drill 1.16.1.5) or later. You must perform a new installation of Drill. Alternatively, if you are running Drill on CentOS or RHEL, you can issue the following command as a workaround to upgrade Drill:

```
rpm -Uv --<old-package> <path/to/packages>/*.rpm
```

See [Upgrading Drill](#) on page 318.

- Older versions of Drill, such as Drill 1.10.0, supported the HBase plug-in, but Drill versions 1.11.0 through 1.16.0.x do not support queries on HBase tables.

Drill 1.16.1.100-2101 (EEP 7.0.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Drill. You may also be interested in the [Apache Drill homepage](#) and the [Apache Drill release notes](#):

Version	1.16.1.100
Release Date	January 2021
HPE Version Interoperability	See Component Versions for Released MEPs .
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ , and select your MEP and OS to view the list of package names.

New in This Release

Drill 1.16.1.100-2101 introduces the following enhancements or HPE platform-specific behavior changes:

- None.

Fixes

This HPE release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
90e5ecb	2021-01-04	MD-6096: Partition pruning not happening after Upgrade and causing OversizedAllocationException failure
94675b6 b898b86	2020-12-15 2020-12-11	MD-6086: CVE-2019-14262 : metadata extractor vulnerability fixed
dd051ab	2020-12-11	MD-6084: CVE-2017-12610, CVE-2018-17196: kafka-clients vulnerability (kafka-clients updated to 2.3.1)
f4bf0cb	2020-12-10	MD-6094: WS-2019-0490: jcommander vulnerability

0386778	2020-12-10	MD-6095: CVE-2019-17359 : bcprov-jdk15on-1.60.jar library vulnerability
9f0ac5a	2020-12-09	MD-6091: CVE-2017-5929: logback vulnerability
55b4ad0	2020-12-07	MD-6089: CVE-2018-1272 etc. vulnerabilities in Spring
8457e19	2020-11-26	MD-6072: SchemaChangeException due to a REPEATED MAP field
7c6f90e	2020-11-25	MD-6069: updated not equal ComparisonPredicate because of wrong logic inside
228775b	2020-11-17	MD-6070: Fixed problem with NPE in index picking by adding extra checking
c420ba6	2020-11-17	MD-6057: Positional alias is not working in Group by clause for Nested CASE expressions
58047ca	2020-11-13	MD-6066: Changes due to fix performance issue.
fe00ddf	2020-10-29	MD-6073: CVE-2019-10172 and CVE-2019-10202 - jackson-mapper-asl vulnerability

Known Issues

MapR Tracking Number	Description
MD-6052	PrttN_Prng TC1.sql.explain test failed.
MD-6028	Property 'MAPR_JMXSSL' in 'env_override.sh' by default set as "false"
MD-6020	Error while using Drill
MD-5792	TPCH query 5 runs 10-20% slower at sf100/sf1000, possibly due to hash join ordering
MD-5786	TPCDS query 98 is 2x slower with Statistics enabled due to hash join order for sf100 and sf1000
MD-5770	TPCH query 9 runs 18% slower at sf 100/sf1000, possibly due to hash join
MD-5758	TPCDS query 78 runs 30x slower with Statistics enabled at sf100
MD-5694	select query takes too long after metadata refresh
MD-5684	Drill timeout when querying a large number of files
MD-5646	Modification needed in Drill dependencies/scripts to support hadoop decoupling
MD-5518	Semi-Join performance is slower with default settings for TPCH 16

MD-5309	Query on complex data fails with SYSTEM ERROR: SchemaChangeException: Failure while materializing expression. Error in expression at index -1. Error: Missing function implementation: [min(MAP-REPEATED)]. Full expression: --UNKNOWN EXPRESSION--.
MD-4906	SI Selectivity Queries hit ForemanException: One more more nodes lost connectivity during query
MD-4738	Incorrect parallelism determination for index plans (SI and Complex SI)
MD-4504	DRILL-6465: Transitive closure is not working in Drill for Join with multiple local conditions
MD-2294	DRILL-1162: 25 way join ended up with OOM

Known Issues and Limitations

- Due to Drill version changes (3-digit to 4-digit), you cannot upgrade from Drill in MEP 7.0.0 (Drill 1.16.1) to Drill in MEP 7.0.1 (Drill 1.16.1.5) or later. You must perform a new installation of Drill. Alternatively, if you are running Drill on CentOS or RHEL, you can issue the following command as a workaround to upgrade Drill:

```
rpm -Uv --<old-package> <path/to/packages>/*.rpm
```

See [Upgrading Drill](#) on page 318.

- Older versions of Drill, such as Drill 1.10.0, supported the HBase plug-in, but Drill versions 1.11.0 through 1.16.0.x do not support queries on HBase tables.

Drill 1.16.1.0-2009 (EEP 7.0.0) Release Notes

This section provides reference information, including new features, fixes, known issues, and limitations for Drill 1.16.1.0-2009 in EEP 7.0.0.

Below are release notes for the Drill component included in the MapR Converged Data Platform. You may also be interested in the [Apache Drill homepage](#) and the [Apache Drill release notes](#):

Version	1.16.1.0-2009
Release Date	September 2020
MapR Version Interoperability	See Component Versions for Released EEPs on page 6600.
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ , and select your MEP and OS to view the list of package names.

Feature Support

- None.

New Features

- None.

Resolved Issues

Drill 1.16.1.0-2009 provides the following resolved issues and improvements:

Commit	Date (YYYY-MM-DD)	Comment
dade023	2020-03-24	DRILL-7405: Avoiding download of TPC-H data
5f44f00	2020-06-22	DRILL-7750: Drill fails to read KeyStore password from Credential provider
065ac75	2020-06-18	DRILL-7749: Drill-on-Yarn Application Master UI is broken due to bootstrap update
28d3f4c	2020-04-30	DRILL-7705: Updated jQuery and Bootstrap libraries
11fa657	2020-04-21	DRILL-7713: Upgrade misc libraries which outdated versions have reported vulnerabilities
a28c844	2020-04-17	DRILL-7704: Update Maven to 3.6.3
dff80b1	2020-04-16	DRILL-7702: Update shaded guava
ab18420	2020-04-16	DRILL-7702: Update ZooKeeper and Curator, exclude org.codehaus.jackson
8479c37	2020-04-16	DRILL-7702: Update httpclient, libthrift, httpdlog-parser, jetty, derby, exclude and ban log4j, jasper-runtime, commons-httpclient
302fc35	2020-04-16	Revert "DRILL-7189: Revert DRILL-7105 Error while building the Drill native client"
59856bc	2020-04-16	DRILL-7693: Updated protobuf version to 3.11.1
abfc879	2020-04-14	DRILL-7294: Prevent generating java beans using protostuff to avoid overriding classes with the same simple name declared as nested in the proto files
bb4069e	2020-04-14	Revert "DRILL-7188: Revert DRILL-6642: Update protocol-buffers version"
892d164	2020-03-24	DRILL-7650: Add option to enable Jetty's dump for troubleshooting
493e65e	2020-03-19	DRILL-7351: Added tokens to Web forms to prevent CSRF attacks
97c1d22	2020-03-18	DRILL-7644: Log SSL protocol version at Drill start up
3b0c61f	2020-03-18	DRILL-7626: Add ability to set HTTP response headers
f46e0c9	2020-03-13	DRILL-7637: Add an option to retrieve MapR SSL truststore/keystore credentials using MapR Web Security Manager
d0daa60	2020-03-13	DRILL-7367: Remove Server details from response headers

Drill 1.16.1.0-2009 also includes the following resolved issues and improvements:

MapR Tracking Number	Description
MD-6051	Drill Build is failing on CentOS 8 while Building "libdrillClient.so"
MD-6048	DRILL-7774: NPE during planning phase of query in 1.16.0.21
MD-6043	Create get-jars-list.sh script to be used by mapr-config.sh (CORE-221)
MD-6037	Cleanup `GuavaPatcher`'s warning messages in log
MD-6036	Drill logging system is broken after the latest build
MD-6035	Drill logging system is broken after the latest build
MD-6034	Janino compiler 3.0.8 causing drill query throwing exception org.codehaus.commons.compiler.CompileException
MD-6033	Fix unit tests failures caused by latest changes in Hive

MapR Tracking Number	Description
MD-6018	Querying empty Parquet files throws error after upgrade to 1.16
MD-6003	DRILL-7694: CollectD warnings on collecting queries.running and queries.completed metrics
MD-6004	UNION query returns "VALIDATION ERROR" if try union varchar output and decimals/integer/date
MD-5998	DRILL-7649: Replace maprfs.version property usage by mapr.release.version
MD-5996	Script j_security_check works without security headers
MD-5990	Drill Java JMX Server Insecure Configuration Remote Code Execution Vulnerability
MD-5950	Drill-on-Yarn: NPE while querying a column in Hive table
MD-5920	drill.exec.ssl.protocol option is not honored by Webserver
MD-5908	Drillbit not starting with error: "Caused by: java.io.IOException: No FileSystem for scheme: maprfs"
MD-5839	DRILL-7615: UNION ALL query returns the wrong result for the decimal value

Known Issues

The following table lists the known issues for Drill 1.16.1.0:

MapR Tracking Number	Description
MD-6052	Prtnn_Prng_TC1.sql.explain test failed.
MD-6028	Property 'MAPR_JMXSSL' in 'env_override.sh' by default set as "false"
MD-6027	Cannot change value of "MAPR_JMXSSL=" in "env_override.sh"
MD-6020	Error while using Drill
MD-5792	TPCH query 5 runs 10-20% slower at sf100/sf1000, possibly due to hash join ordering
MD-5786	TPCDS query 98 is 2x slower with Statistics enabled due to hash join order for sf100 and sf1000
MD-5770	TPCH query 9 runs 18% slower at sf 100/sf1000, possibly due to hash join
MD-5758	TPCDS query 78 runs 30x slower with Statistics enabled at sf100
MD-5694	select query takes too long after metadata refresh
MD-5684	Drill timeout when querying a large number of files
MD-5646	Modification needed in Drill dependencies/scripts to support hadoop decoupling
MD-5518	Semi-Join performance is slower with default settings for TPCH 16
MD-5309	Query on complex data fails with SYSTEM ERROR: SchemaChangeException: Failure while materializing expression. Error in expression at index -1. Error: Missing function implementation: [min(MAP-REPEATED)]. Full expression: --UNKNOWN EXPRESSION--.
MD-4906	SI Selectivity Queries hit ForemanException: One more more nodes lost connectivity during query
MD-4738	Incorrect parallelism determination for index plans (SI and Complex SI)
MD-4504	DRILL-6465: Transitive closure is not working in Drill for Join with multiple local conditions
MD-2294	DRILL-1162: 25 way join ended up with OOM

Limitations

Older versions of Drill, such as Drill 1.10.0, supported the HBase plug-in, but Drill versions 1.11.0 through 1.16.0.x do not support querying HBase tables.

Drill 1.16.0.500-2212 (EEP 6.4.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Drill. You may also be interested in the [Apache Drill homepage](#) and the [Apache Drill release notes](#).

Version	1.16.0.500
Release Date	December 2022
MapR Version Interoperability	See Component Versions for Released EEPs on page 6600 and EEP Components and OS Support on page 6539.
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 6737.

New in This Release

Drill 1.16.0.500-2212 introduces the following enhancements or HPE platform-specific behavior changes:

- Separate storage in HBase for query profiles and storage plugin information. See [Configuring HBase Persistent Storage Tables](#) on page 3830.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
884f2dc05d	2022-09-08	MD-6370: Exclude Xalan dependency
9cce94af94	2022-06-27	MD-6293: Update vulnerable jackson version
3408b8ff8e	2022-05-04	MD-6272: Update Drill to use Antlr4 version 4.9.3
1cd5deb5f4	2022-05-02	MD-6304: Drill Web UI does not display the correct node status
24fa9c58a7	2022-04-07	MD-6306: Remove spring transitive dependencies (#583)

Known Issues

- None.

Limitations

- Older versions of Drill, such as Drill 1.10.0, supported the HBase plug-in, but Drill versions 1.11.0 through 1.16.0.x do not support queries on HBase tables.

Drill 1.16.0.400-2201 (EEP 6.3.6) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Drill. You may also be interested in the [Apache Drill homepage](#) and the [Apache Drill release notes](#).

Version	1.16.0.400
Release Date	January 2022

MapR Version Interoperability	See Component Versions for Released EEPs on page 6600 and EEP Components and OS Support on page 6539.
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 6737.

New in This Release

Drill 1.16.0.400-2201 introduces the following enhancements or HPE platform-specific behavior changes:

- None.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
bf345798f7	2022-02-10	MD-6277: Remove mapr-log4j-slf4j-impl module introduced in Hive
da06a2908d	2022-01-10	MD-6251: Secondary index error at reading from mapr-db json (#575)
4faf5f4870	2021-12-30	MD-6191: Change to allow partition pruning with dynamic CURRENT_DATE operator.
14840a0f91	2021-12-20	MD-6196: Medial CVE fixes (jquery, bootstrap, data tables)
6573c1a091	2021-12-20	DRILL-7705: Updated jQuery and Bootstrap libraries
616fd1943e	2021-12-20	MD-6196: Medial CVE fixes (junit, derby, bcpkix-jdk15on)
a16e1268e9	2021-12-07	MD-6161: fix skipping of types written not in uppercase (#565)
40019935b2	2021-11-26	DRILL-8009: DrillConnectionImpl#isValid() doesn't correspond JDBC API
f60bc99104	2021-11-21	MD-6196: Fix the CVEs with the high severity
182dcf124	2021-11-16	DRILL-7586: Fix loading incorrect version of commons-lang3

Known Issues

- None.

Limitations

- Older versions of Drill, such as Drill 1.10.0, supported the HBase plug-in, but Drill versions 1.11.0 through 1.16.0.x do not support queries on HBase tables.

Drill 1.16.0.300-2110 (EEP 6.3.5) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Drill. You may also be interested in the [Apache Drill homepage](#) and the [Apache Drill release notes](#).

Version	1.16.0.300
Release Date	October 2021
MapR Version Interoperability	See Component Versions for Released EEPs on page 6600 and EEP Components and OS Support on page 6539.

Package Names	See Package Names for Ecosystem Packs (EEPs) on page 6737.
---------------	--

New in This Release

Drill 1.16.0.300-2110 introduces the following enhancements or HPE platform-specific behavior changes:

- None.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
ebcc3f82ed	2021-09-01	DRILL-7294: Prevent generating java beans using protostuff to avoid overriding classes with the same simple name declared as nested in the proto files
ae6600f190	2021-08-27	MD-6163: Fixed bug with returning null values when selecting by key without tests
e8efefe649, 082c21f6a6, 4942eaaf62	2021-08-18	MD-6165: Downgrading jackson libs to v2.11.1 to be consistent with core version
6b0e8685e8	2021-08-12	MD-6162: Security vulnerability found in jars used in Drill
84d23a2698	2021-08-12	MD-6153: CVE-2019-10172, CVE-2019-10202 vulnerabilities in jackson-mapper-asl-1.9.13.jar
86ba2964bd, 6a1a3eabec	2021-08-12	MD-6146: CVE-2012-5783 vulnerability in commons-httpclient
17d0259f5e	2021-08-06	DRILL-7934: Fix NullPointerException error when reading parquet files
1c68da948a	2021-07-28	MD-6144: Jetty security vulnerability
8ee8583eb0	2021-07-27	MD-6145: CVE-2020-13956, WS-2017-3734 vulnerabilities in http-client
36cf7751de	2021-07-15	MD-6140: mapr-drill failing with java.lang.NoClassDefFoundError: org/apache/zookeeper/Environment
df4362ab48	2021-07-07	MD-6143: Commons-codec vulnerability, WS-2019-0379
74b5ccccf95	2021-06-03	MD-6130: Different jackson jar versions in 3rdparty libs
073696be4d	2021-05-27	MD-6126: CVE-2020-13936 velocity-engine-core vulnerability
694139b41d	2021-05-19	DRILL-7372: MethodAnalyzer consumes too much memory
b1c05a7849	2021-05-19	MD-6022: Column names are not flipped when running a query

Known Issues

- None.

Limitations

- Older versions of Drill, such as Drill 1.10.0, supported the HBase plug-in, but Drill versions 1.11.0 through 1.16.0.x do not support queries on HBase tables.

Drill 1.16.0.200-2104 (EEP 6.3.4) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Drill. You may also be interested in the [Apache Drill homepage](#) and the [Apache Drill release notes](#).

Version	1.16.0.200
Release Date	April 2021
MapR Version Interoperability	See Component Versions for Released MEPs .
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ , and select your MEP and OS to view the list of package names.

New in This Release

Drill 1.16.0.200-2104 introduces the following enhancements or HPE platform-specific behavior changes:

- None.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
85f32639d	2021-05-09	MD-6133: Fixed issue with Decimal type
8af5a9b51	2021-04-30	MD-6128: Fixed differences between jetty versions and updated to 9.4.40
5772a10ad	2021-04-12	MD-6102 Removed hasSecurityMechanism function because if there is no mechanism drill will use plain
ec9554e91	2021-04-12	MD-6102: Cannot connect by MAPRSASL without username field (#547)
a40a3f242	2021-03-22	MD-5787 Improved kafka-storage plugin to handle topics from non default stream and added support for headers
7b16dd6e3	2021-03-18	MD-6101: CVE-2019-16869, CVE-2014-3488 etc. Netty vulnerabilities (#542)
8d67a1902	2021-03-10	MD-6117 The Drill cannot run after updates Jetty vulnerability in secure cluster
23e61b94c	2021-02-26	MD-6077 Excluded Log4jplugins.dat file from hive-exec-shaded.jar
0f2d562be	2021-02-22	MD-6105 Checkstyle fixes and resolved problems with tests
5257dedf1	2021-02-22	DRILL-7361: Support MAP (DICT) type in schema file
335e11089	2021-02-22	DRILL-7509: Incorrect TupleSchema is created for DICT column when querying Parquet files
b30e485e1	2021-02-22	Similar changes to DRILL-7359
b1ce9720b	2021-02-15	MD-6110: CVE-2020-27216 : Jetty vulnerability (#538)
720b7437e	2021-02-10	MD-6111: CVE-2020-25649 Jackson vulnerability (#537)

Known Issues

- None.

Limitation

Older versions of Drill, such as Drill 1.10.0, supported the HBase plug-in, but Drill versions 1.11.0 through 1.16.0.x do not support queries on HBase tables.

Drill 1.16.0.100-2101 (EEP 6.3.2) Release Notes

This section provides reference information, including new features, fixes, known issues, and limitations for Drill 1.16.0.100 in MEP 6.3.2.

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Drill. You may also be interested in the [Apache Drill homepage](#) and the [Apache Drill release notes](#).

Version	1.16.0.100
Release Date	January 2021
MapR Version Interoperability	See Component Versions for Released MEPs .
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ , and select your MEP and OS to view the list of package names.

New in This Release

Drill 1.16.0.100-2101 introduces the following enhancements or HPE platform-specific behavior changes:

- None.

Fixes

This HPE release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
9e9dbd3	2020-12-02	E MEP-85: CVE-2017-7656 , CVE-2017-7657 , CVE-2017-7658 , etc : jetty vulnerabilities
0256dda	2020-12-02	E MEP-77: CVE-2019-0205: potential DoS when processing untrusted Thrift payloads
31a7739	2020-12-07	MD-6089: CVE-2018-1272 etc. vulnerabilities in Spring
09b2f4a	2020-12-07	MD-6090: CVE-2014-0107: xalan vulnerability
c55d81b	2020-12-08	MD-6087: CVE-2018-1000844 , CVE-2018-1000850 : retrofit vulnerabilities
d2e977d	2020-12-08	MD-6091: CVE-2017-5929: logback vulnerability
bc498b8	2020-12-10	MD-6095: CVE-2019-17359 : bcprov-jdk15on-1.60.jar library vulnerability
808b7c2	2020-12-10	MD-6094: WS-2019-0490: jcommander vulnerability
8746484	2020-12-11	MD-6084: CVE-2017-12610, CVE-2018-17196: kafka-clients vulnerability (kafka-clients updated to 2.3.1)

866078d	2020-12-11	CVE-2019-14262 : metadata extractor vulnerability fixed
75dece5	2020-12-15	MD-6086: CVE-2019-14262 : metadata extractor vulnerability fixed
43a0034	2020-12-29	MD-6096: Partition pruning not happening after Upgrade and causing OversizedAllocationException failure
3221da2 4914e4e	2020-10-22 2021-01-05	MD-6071: Update commons-beanutils, xercesImpl
fd96c36	2020-10-15	MD-6061: CVE-2019-14262 - mapr ojai driver and mapr drill
65ff5ec	2020-10-23	MD-6073: Update snakeyaml
A33c78e 235d54b	2020-10-29 2020-11-02	MD-6074: CVE-2019-10172 and CVE-2019-10202 - jackson-mapper-asl vulnerability
1edf007	2020-11-11	MD-6066: Changes due to performance issue, to allow the setting of variable output_batch_size on both system and session level
87ca6c8	2020-11-17	MD-6070: Fixed problem with NPE in index picking by adding extra checking
69f6ca3	2020-11-25	MD-6069: updated not equal ComparisonPredicate because of wrong logic inside
7daaab9 1d7e83d	2020-11-25 2020-11-26	MD-6072: SchemaChangeException due to a REPEATED MAP field
3530e89	2020-12-01	MD-6083: Updated derby version to 10.12.1.1 (CVE-2015-1832)

Known Issues

None.

Limitation

Older versions of Drill, such as Drill 1.10.0, supported the HBase plug-in, but Drill versions 1.11.0 through 1.16.0.x do not support queries on HBase tables.

Drill 1.16.0.22-2009 (EEP 6.3.1) Release Notes

This section provides reference information, including new features, fixes, known issues, and limitations for Drill 1.16.0.22-2009 in EEP 6.3.1.

Below are release notes for the Drill component included in the MapR Converged Data Platform. You may also be interested in the [Apache Drill homepage](#) and the [Apache Drill release notes](#):

Version	1.16.0.22-2009
Release Date	September 2020
MapR Version Interoperability	See Component Versions for Released EEPs on page 6600.

Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ , and select your MEP and OS to view the list of package names.
---------------	---

New Features

- None.

Resolved Issues

Drill 1.16.0.22-2009 provides the following resolved issues and improvements:

Commit	Date (YYYY-MM-DD)	Comment
dade023	2020-03-24	DRILL-7405: Avoiding download of TPC-H data
892d164	2020-03-24	DRILL-7650: Add option to enable Jetty's dump for troubleshooting
493e65e	2020-03-19	DRILL-7351: Added tokens to Web forms to prevent CSRF attacks
97c1d22	2020-03-18	DRILL-7644: Log SSL protocol version at Drill start up
3b0c61f	2020-03-18	DRILL-7626: Add ability to set HTTP response headers
f46e0c9	2020-03-13	DRILL-7637: Add an option to retrieve MapR SSL truststore/keystore credentials using MapR Web Security Manager
d0daa60	2020-03-13	DRILL-7367: Remove Server details from response headers

Drill 1.16.0.22-2009 also includes the following resolved issues and improvements:

MapR Tracking Number	Description
MD-6048	DRILL-7774: NPE during planning phase of query in 1.16.0.21
MD-6035	DRILL-7761: Drill 1.16.0 fails with OOM in PLANNING and drillbit hung
MD-6034	Janino compiler 3.0.8 causing drill query throwing exception org.codehaus.commons.compiler.CompileException
MD-6018	Querying empty Parquet files throws error after upgrade to 1.16
MD-6004	UNION query returns "VALIDATION ERROR" if try union varchar output and decimals/integer/date
MD-5998	DRILL-7649: Replace maprfs.version property usage by mapr.release.version
MD-5996	Script j_security_check works without security headers
MD-5990	Drill Java JMX Server Insecure Configuration Remote Code Execution Vulnerability
MD-5950	Drill-on-Yarn: NPE while querying a column in Hive table
MD-5920	drill.exec.ssl.protocol option is not honored by Webserver
MD-5839	DRILL-7615: UNION ALL query returns the wrong result for the decimal value

Known Issues

- None.

Limitations

Older versions of Drill, such as Drill 1.10.0, supported the HBase plug-in, but Drill versions 1.11.0 through 1.16.0.x do not support querying HBase tables.

Drill 1.16.0.10-1912 (EEP 6.3.0) Release Notes

This section provides reference information for fixes in Drill 1.16.0.10-1912.

The following release note applies to the 1.16.0.10-1912 version of the Drill component:

 **IMPORTANT:** This release note describes only the issues resolved since the 1.16.0.0 release note. For a listing of 1.16.0.0 resolved issues, see [Drill 1.16.0.0-1904 \(EEP 6.2.0\) Release Notes](#) on page 6780.

Version	1.16.0.10-1912
Release Date	December 2019
MapR Version Interoperability	See Component Versions for Released EEPs on page 6600.
Package Names	<p>Navigate to https://package.ezmeral.hpe.com/releases/MEP/, and select your MEP and OS to view the list of package names, for example:</p> <ul style="list-style-type: none"> mapr-drill-1.16.0.10.201912111313-1.noarch.rpm mapr-drill-internal-1.16.0.10.201912111313-1.noarch.rpm mapr-drill-yarn-1.16.0.10.201912111313-1.noarch.rpm

Resolved Issues

Drill 1.16.0.10-1912 provides the following resolved issues and improvements:

Apache Drill Issue	MapR Tracking Number	Description
DRILL-7453	MD-5936	Updated the JODA-Time API to ensure correct time zone info
DRILL-7417	MD-5914	Add user logged in/out events in info-level logs
DRILL-7391	MD-5895	Wrong result when doing left outer join on CSV table
DRILL-6711	N/A	Use jetpack repository for Drill Calcite project artifact
DRILL-7373	MD-5534	Fix problems reading from DICT type
DRILL-7096	MD-5534	Develop vector for canonical Map<K,V>
DRILL-7376	N/A	Drill ignores Hive schema for MaprDB tables when group scan has star column
DRILL-7341	N/A	Vector reAlloc can fail after exchange
DRILL-7369	MD-5801	Schema for MaprDB tables is not used when several fields are queried
DRILL-7338	MD-5262	REST API calls to Drill fail due to insufficient heap memory
DRILL-7313	MD-5801	Query on a Hive external table in MaprDB fails while reading vector
DRILL-7250	MD-5707	Query with CTE fails when its name matches the table name without access
DRILL-7237	MD-5732	Fix single_value aggregate function for variable length types
DRILL-7050	MD-5732	RexNode convert exception in sub-query

Limitations

Older versions of Drill, such as Drill 1.10.0, supported the HBase plug-in, but Drill versions 1.11.0 through 1.16.0.x do not support querying HBase tables.

Drill 1.16.0.0-1904 (EEP 6.2.0) Release Notes

This section provides reference information, including new features, improvements, resolved issues, known issues, and limitations for Drill 1.16.0.0-1904.

These release notes contain MapR-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 6651.

The following release notes apply to the 1.16.0.0 version of the Drill component:

Version	1.16.0.0
Release Date	May 2019
MapR Version Interoperability	See Component Versions for Released EEPs on page 6600.
Package Names	<p>Navigate to https://package.ezmeral.hpe.com/releases/MEP/, and select your EEP and OS to view the list of package names, for example:</p> <ul style="list-style-type: none"> mapr-drill-1.16.0.0.201905231125-1.noarch.rpm mapr-drill-internal-1.16.0.0.201905231125-1.noarch.rpm mapr-drill-yarn-1.16.0.0.201905231125-1.noarch.rpm

New in this Release

Drill 1.16.0.0 includes the following new features and improvements in the following areas:

SQL

- [ANALYZE TABLE COMPUTE STATISTICS](#) generates table statistics for more efficient query plans. ([DRILL-1328](#))
- [ANALYZE TABLE REFRESH METADATA](#) generates metadata cache files for specific columns instead of an entire table or directory. ([DRILL-7058](#))
- [CREATE OR REPLACE SCHEMA command](#) defines schema for text files. ([MD-5202](#), [DRILL-6964](#))
- [NEARESTDATE](#) function for time series analysis.
- [NEAREST DATE function](#) to facilitate time series analysis ([DRILL-7077](#))
- By default, Drill no longer writes the profiles for SET queries to the persistent store. Setting the `exec.query_profile.alter_session.skip` option to false reverts this behavior.

Storage

- [SYSLOG \(RFC-5424\) Format Plugin](#) ([DRILL-6582](#))
- [Format plugin for LTSV files](#) ([DRILL-7014](#))

- A new maprdb format plugin option, `readTimestampWithZoneOffset`, converts timestamp values from UTC to local time zone when values are read from MapR Database. This option is disabled by default. (MD-5272)
- Drill can query views defined in Hive similarly to querying Hive tables in a hive schema, for example:

```
SELECT * FROM hive.`hive_view`;
```

([DRILL-540](#))

Configuration Options

- A new Drill configuration option, `store.hive.maprdb_json.read_timestamp_with_timezone_offset`, enables Drill to read timestamp values with a timezone offset when using the hive plugin with the Drill native MapRDB JSON reader enabled. This option is disabled by default. (MD-5272)

Web UI

Several Web UI improvements, including:

- [Storage plugin management improvements \(DRILL-6562\)](#)
- [Query progress indicators and warnings \(DRILL-6879\)](#)
- [Ability to limit the result size for better UI response \(DRILL-6050\)](#)
- [Ability to sort the list of profiles in the Drill Web UI \(DRILL-6942\)](#)
- [Display query state in query result page \(DRILL-6939\)](#)
- [Button to reset the options filter \(DRILL-6921\)](#)
- Upgrade to [SQLLine 1.7. \(DRILL-6989\)](#)
- Upgrade to Calcite 1.18.0. (MD-5050)

SQLLine (Drill shell)

Calcite

For a list of additional features and improvements, see the [Apache Drill 1.16 release notes](#).

Resolved Issues

Drill 1.16.0.0 includes the following resolved issues and improvements:

MapR Tracking Number	Resolved Issue
MD-5673	DRILL-7150: Drill timestamp timezone conversion uses current daylight savings time instead of the one active during timestamp date
MD-5647	DRILL-7118: Filter not getting pushed down on MapR-DB tables.
MD-5638	DRILL-7130: IllegalStateException: Read batch count [0] should be greater than zero
MD-5630	DRILL-7113: Drill on MapRDB can not understand null value

MD-5624	DRILL-7125: REFRESH TABLE METADATA fails after upgrade from Drill 1.13.0 to Drill 1.15.0
MD-5623	Unable to connect to Drill 1.15 through ZK
MD-5609	DRILL-7079: Drill can't query views from the S3 storage when plain authentication is enabled
MD-5606	DRILL-7100: parquet RecordBatchSizerManager : IllegalArgumentException: the requested size must be non-negative
MD-5561	DRILL-7060: Query on audit logs fails by DATA_READ ERROR Error Parsing JSON - Unrecognized character escape 'S' (code 83)
MD-5552	DRILL-7119: Modify selectivity calculations to use histograms
MD-5550	DRILL-7048: Implement JDBC Statement.setMaxRows() with System Option
MD-5523	Physical plan generation failure after upgrade from 1.10 to 1.14
MD-5490	DRILL-7117: Support creation of column Histograms for numeric data types
MD-5428	Include links to pre and post procedures in Drill upgrade documentation
MD-5379	DRILL-7018: Drill Query (when store.parquet.reader.int96_as_timestamp=true) on Parquet File fails with Error: SYSTEM ERROR: IndexOutOfBoundsException: readerIndex: 0, writerIndex: 372 (expected: 0 <= readerIndex <= writerIndex <= capacity(256))
MD-5374	DRILL-6971: Display query state in query result page of Web UI
MD-5369	DRILL-7115: Improve Hive schema show tables performance
MD-5368	DRILL-4858: repeated_count on JSON array of objects (maps) implementation is missing in Drill 1.14
MD-5363	DRILL-4858: Missing function implementation: [repeated_count(LIST-REPEATED)]
MD-5356	DRILL-4858: Implement - Missing function implementation: [repeated_count(MAP-REPEATED)].
MD-5348	DRILL-6997: TPCDS queries 56, 60, 83 are slower with plan change
MD-5330	DRILL-6967: TIMESTAMPDIFF returns incorrect value for SQL_TSI_QUARTER
MD-5319	DRILL-6997: TPCDS query 95 slower with plan change
MD-5278	DRILL-6931: Drill "SHOW FILES" command duplicates empty S3 folders as subfolders
MD-5277	DRILL-6928: exec.query.return_result_set_for_ddl does not affect Web UI query results
MD-5272	DRILL-6969: Drill on maprdb native reader reads a wrong timezone comparing to hive
MD-5253	to_timestamp function is losing precision for milliseconds
MD-5251	DRILL-6894: CTAS and CTTAS are not working on S3 storage when cache is disabled

MD-5236	DRILL-7023: Tableau query fails with IndexOutOfBoundsException after upgrade from drill 1.13.0 to drill 1.14.0
MD-5226	DRILL-6918: Querying empty topics fails with "NumberFormatException"
MD-5198	DRILL-6880: TPCDS query 35 slower due to nulls
MD-5179	DRILL-6874: CTAS from json to parquet is not working on S3 storage
MD-5095	DRILL-7051: Update Drill's Jetty Server to 9.3
MD-4863	Simba JDBC driver does not return some values
MD-4862	Simba JDBC driver returns incorrect time value
MD-4826	The COALESCE function returns results when the columns referenced in the function do not exist in the files being queried. You do not have to CAST the columns to a specific data type for the COALESCE function to return results.
MD-4617	"direct.used" metrics(jvm_direct_current) doesn't catch the direct memory usage.
MD-4362	Query on data containing reserved word 'date' as column name fails to generate non-covering index plan
MD-3723	Querying Hbase row_key column with non-existing column returns different results in different Drill Versions
MD-1585	Need More Accurate Filter Estimation Before Running a Query
MD-1008	DRILL-7038: Performance - Queries on partitioned columns currently scan the entire datasets
MD-880	HashJoin's not fully parallelized in query plan
MD-680	DRILL-7069: Planning time unaccounted for query with longer planning time

Known Issues

Drill 1.16.0.0 has the following known issues:

MapR Tracking Number	Known Issue
MD-5792	TPCH query 5 runs 10-20% slower at sf100/sf1000, possibly due to hash join ordering
MD-5786	TPCDS query 98 is 2x slower with Statistics enabled due to hash join order for sf100 and sf1000
MD-5782	Need better error message when analyze command fails due to schema change
MD-5770	TPCH query 9 runs 18% slower at sf 100/sf1000, possibly due to hash join
MD-5758	TPCDS query 78 runs 30x slower with Statistics enabled at sf100
MD-5755	DirectScan lists all partitions in explain plan, even for full table scan
MD-5744	[DRILL-7216] Auto limit is happening on the Drill Web-UI while the limit check box is unchecked

MD-5740	REFRESH TABLE METADATA does not count null values for decimal, varchar, and interval data types.
MD-5694	The first query to use a new metadata cache file may take a while to run because the first query triggers a refresh of the metadata cache file.
MD-5684	Drill timeout when querying a large number of files
MD-5676	Drill parquet file may not have statistics for decimal and varchar data types.
MD-5608	Running analyze command on a view fails correctly but the error is confusing
MD-5528	Compute stats on non existent columns fails with exception
MD-5388	Running analyze cmd on duplicate column names is resulting in IndexOutOfBoundsException
MD-5371	Error msg not clear when analyze cmd is run on table with complex types
MD-5342	DRILL-6839 : regarding aggs in cross join queries

Fixes

None.

Limitations

None.

Drill 1.15.0.7-1904 (EEP 6.1.1) Release Notes

This section provides reference information for fixes in Drill 1.15.0.7-1904.

The following release notes apply to the 1.15.0.7-1904 version of the Drill component:

Version	1.15.0.7-1904
Release Date	May 2019
MapR Version Interoperability	See Component Versions for Released EEPs on page 6600.
Package Names	<p>Navigate to https://package.ezmeral.hpe.com/releases/MEP/, and select your MEP and OS to view the list of package names, for example:</p> <ul style="list-style-type: none"> mapr-drill-1.15.0.7.201905031823-1.noarch.rpm mapr-drill-internal-1.15.0.7.201905031823-1.noarch.rpm mapr-drill-yarn-1.15.0.7.201905031823-1.noarch.rpm

Fixes

Drill 1.15.0.7-1904 provides the following fixes:

Fix Tracking Number	Description
MD-5523	Physical plan generation failure after upgrade from 1.10 to 1.14.
DRILL-7100	Fixed IllegalArgumentException when reading Parquet data.

MD-4166	Fix creation of filter conditions for IS NULL and IS NOT NULL.
DRILL-7118	Filter not getting pushed down on MapR-DB tables.
DRILL-7125	REFRESH TABLE METADATA fails after upgrade from Drill 1.13 to 1.15.0.0.
DRILL-7130	Fixed IllegalStateException while reading Parquet data.
DRILL-7150	Fix timezone conversion for timestamp from MaprDB after the transition from PDT to PST.
DRILL-7050	RexNode convert exception in sub-query.
MD-5623	Unable to connect to Drill 1.15 through ZK.
MD-5771	Username / password authentication for JDBC is not working anymore in Drill 1.15.
DRILL-7237	Fix single_value aggregate function for variable length types.

Known Issues and Limitations

None.

Drill 1.15.0.0-1901 (EEP 6.1.0) Release Notes

This section provides reference information, including new features, improvements, resolved issues, known issues, and limitations for Drill 1.15.0.0-1901.

These release notes contain MapR-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 6651.

The following release notes apply to the 1.15.0.0 version of the Drill component:

Version	1.15.0.0
Release Date	February 2019
MapR Version Interoperability	See Component Versions for Released EEPs on page 6600.
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ , and select your EEP and OS to view the list of package names.
ODBC/JDBC Drivers	<p>Drill 1.15.0.0 works with the following MapR Drill drivers:</p> <ul style="list-style-type: none"> • ODBC Drivers <ul style="list-style-type: none"> • Mac OS X • Linux <ul style="list-style-type: none"> • 32-bit (Unsupported) • 64-bit • Windows <ul style="list-style-type: none"> • 32-bit (Unsupported) • 64-bit • JDBC Driver <p>For additional driver information, see Drill Drivers.</p>

New in this Release

Drill 1.15.0.0 includes the following new features and improvements in the following areas:

Storage

- Ability to query data in S3 via the new cloud [storage plugin for S3](#). (MD-4541)
- Credential Provider API support in the [S3 storage plugin](#). (MD-4543, DRILL-6662)
- The `INFORMATION_SCHEMA.FILES` table provides information about directories and files stored in [workspaces](#) configured within [S3](#) and [filesystem](#) storage plugin configurations. (MD-4544, DRILL-6680)

SQL

- [TIMESTAMPADD](#) and [TIMESTAMPDIFF](#) datetime functions. (MD-342, DRILL-3610)
- [CROSS JOIN](#) in the FROM clause. (MD-4359, DRILL-786)
- Support for column aliases and positional aliases in the [GROUP BY](#), [HAVING](#), and [ORDER BY](#) clauses. (MD-4825, DRILL-1248)
- [Lateral join](#) functionality is enabled by default. (DRILL-6729)
- [Storage plugin names are case-insensitive](#). (MD-4589, MD-4663, DRILL-6492, DRILL-6768)
- All [cast and data type conversion functions](#) return null for an empty string ("") when the `drill.exec.functions.cast_empty_string_to_null` option is enabled. (DRILL-6817)
- A new option, `exec.query.return_result_set_for_ddl`, [prevents Drill from returning a result set for DDL statements](#) when set to "false." Useful for clients tools that connect to Drill (via JDBC) if they do not expect a result set. (MD-4757, DRILL-6834)

Query optimization

- MapR Database [secondary index support](#) in Apache Drill. (DRILL-6381)
- Improved query performance with [semi-join functionality](#) inside the Hash-Join operator. (MD-4877, DRILL-6735)

Parquet

- Parquet filter pushdown supports [VARCHAR and DECIMAL data types](#) (MD-1266, DRILL-6744)

Security

- [Secure znodes with custom Access Control Lists](#). (MD-4476, DRILL-5671)

Web UI

Multiple [Web UI improvements](#) that simplify use and administrative tasks, including:

- The ability to cancel multiple queries at once via a check box next to executing queries.
- The auto prompt in the Web UI SQL box now works on UDFs.

- An enhanced Options page that includes detailed descriptions of each option.
- Categorized options via Quick Filters on the Options page. (DRILL-5735)
- Default button (DRILL-6668)
- [Web display options](#) and updated option names (MD-4835, DRILL-6544, DRILL-6715)
- [Meta+Enter key combination to submit queries](#) (DRILL-6611)

SQLLine (Drill shell)

- [Upgrade to SQLLine 1.6](#), includes the ability to add a custom configuration. (MD-2682, MD-5151, DRILL-3853)
- Additional [SQLLine connection parameters](#). (DRILL-3933)

System tables

- [System options table](#) includes option descriptions. (DRILL-6684)
- [System functions table](#) exposes the available SQL functions in Drill and also detects UDFs that have been dynamically loaded into Drill. (MD-4941, DRILL-3988)

For a list of additional features and improvements, see the [Apache Drill 1.15 Release Notes](#).

For additional information, read the [MapR Drill 1.15 blog post](#).

Default Configuration Changes

Starting in MEP 6.1.0, certain ecosystem components, including Drill, have four digit version numbers. For example, when you install Drill, the Drill version appears as 1.15.0.0.

Resolved Issues

Drill 1.15.0.0 includes the following resolved issues:

MapR Tracking Number	Resolved Issue
MD-5253	The TO_TIMESTAMP function no longer loses precision for milliseconds.
MD-5226	DRILL-6918: Querying empty topics no longer fails with a "NumberFormatException."
MD-5208	Semi-join queries on sf1 data no longer return an UNSUPPORTED_OPERATION error.
MD-5149	DRILL-6869: Drill no longer allows views created outside of workspaces.
MD-5147	DRILL-6865: Queries no longer return the wrong results when filter pruning occurs.
MD-5142	DRILL-6857: Limit is pushed into the scan when selecting from a Parquet file with multiple row groups.
MD-5138	DRILL-6863: Drop table works when the path is within a workspace that starts with '/'.
MD-5105	DRILL-6818: Secondary index options have descriptions.

MD-5076	DRILL-6811: Type inference returns the correct data mode for boolean functions.
MD-5062	DRILL-6664: Drill returns the same results for queries on the same column of a Parquet table with the same predicate.
MD-5057	Queries against new files created on a volume that has reached the name container data threshold no longer fail with I/O exceptions.
MD-5023	DRILL-6810: Drill does not support nullable complex types (maps, arrays); therefore, UDFs cannot return null if @Output is of a complex type. Null handling of complex types is disabled by default. NullHandling.INTERNAL should be used instead of NullHandling.NULL_IF_NULL in UDFs. When using NullHandling.INTERNAL, the UDF must handle null input(s) on its own.
MD-5019	DRILL-6797: Drill aggregation queries that use custom UDF to split column data in a Parquet file no longer fail with a compilation error if the filter criteria results in no rows.
MD-5014	DRILL-6776: The Drill Web UI page source no longer has links to external sites.
MD-5008	Drill can leverage indexes for queries with ORDER BY DESC on indexed columns; for example, if a secondary index is defined on column a, Drill leverages the index for the query: SELECT a FROM t ORDER BY a DESC;
MD-5002	DRILL-6764: Queries no longer fail with IOB exception when UNNEST references a deep nested field, like t.c_orders.o_lineitems.
MD-5001	DRILL-6766 : Queries with LATERAL UNNEST no longer return the following system error when one batch of streaming aggregates is split across multiple output batches : IllegalStateException: Unexpected case where rowId [] in right batch of lateral is smaller than rowId [] in left batch being processed.
MD-4968	DRILL-6762: Dynamic UDFs registered on one Drillbit are now visible on other Drillbits.
MD-4956	DRILL-6755: Hash-Join does not build hash tables when the probe side is empty.
MD-4938	The option planner.index.covering_selectivity_threshold takes effect in execution plan when set to values < 1.0 for complex data.
MD-4936	DRILL-6773: Queries, with column aliases, that returned inconsistent results after a Drill patch was applied no longer return inconsistent results.
MD-4867	DRILL-6726: Drill can query views created before DRILL-6492 when impersonation is enabled.
MD-4852	DRILL-6819: The invisible "back" link on the query results page in the Drill WebUI has been removed.
MD-4851	Drill queries on MapRDB JSON tables no longer fail on schema change when the only distinct values are null and text.
MD-4801	DRILL-6724: Operator context is dumped to logs when errors occur during query execution.
MD-4780	DRILL-6746: Queries no longer hang when one of the nodes encounters a connection error.
MD-4755	DRILL-6709: The batch statistics logging utility has been extended to mid-stream operators.
MD-4643	DRILL-6732: Disabled plugins no longer work as enabled.

MD-4617	"direct.used" metrics(jvm_direct_current) catches the direct memory usage.
MD-4585	The drillbit.log file includes query user information.
MD-4567	DRILL-6517 : Hash-Join no longer accesses batches after query cancellation.
MD-4499	DRILL-5365: File not found exception no longer results from reading a Parquet file.
MD-4362	Drill no longer fails to generate a non-covering index plan for queries on data with the reserved word 'date' as a column name.
MD-3879	DRILL-6039: Graceful shutdown waits for fragments to complete before stopping the Drillbit.
MD-2979	DRILL-6410: The Parquet reader no longer leaks memory during query cancellation.

Known Issues

Drill 1.15.0.0 has the following known issues:

MapR Tracking Number	Known Issue
MD-5390	Drill does not return an error message when impersonation prevents access to a directory.
MD-5376	DRILL-6991: The Kerberos ticket is being dumped in the log if the log level is "debug" for stdout.
MD-5348	TPCDS queries 56, 60, 83 are slower with plan change.
MD-5319	TPCDS query 95 slower with plan change.
MD-5250	TPCDS queries 56 and 60 have regressed.
MD-5232	TPCH query 4 has regressed for scale factor 1000.
MD-5231	DRILL-6896: TPCH 13 has "regressed".
MD-5204	DRILL-6845: TPCDS query 95 slower with semi-join enabled. You can disable semi-join through the planner.enable_semijoin option.
MD-5063	TPCH queries hit an IndexOutOfBoundsException when planner.enable_demux_exchange = true.

Fixes

None.

Limitations

None.

Drill 1.14.0-1904 (EEP 6.0.2) Release Notes

This section provides reference information for fixes in Drill 1.14.0-1904.

The following release notes apply to the 1.14.0-1904 version of the Drill component:

Version	1.14.0-1904
Release Date	May 2019
MapR Version Interoperability	See Component Versions for Released EEPs on page 6600.

Package Names	<p>Navigate to https://package.ezmeral.hpe.com/releases/MEP/, and select your MEP and OS to view the list of package names, for example:</p> <ul style="list-style-type: none"> mapr-drill-1.14.0.201905031749-1.noarch.rpm mapr-drill-internal-1.14.0.201905031749-1.noarch.rpm mapr-drill-yarn-1.14.0.201905031749-1.noarch.rpm
---------------	--

Fixes

Drill 1.14.0-1904 provides the following fixes:

Fix Tracking Number	Description
MD-5523	Physical plan generation failure after upgrade from 1.10 to 1.14.
MD-4166	Fix creation of filter conditions for IS NULL and IS NOT NULL.
DRILL-6721	Fix SchemalessScan plan serialization / deserialization.
DRILL-7050	RexNode convert exception in sub-query.
DRILL-7125	REFRESH TABLE METADATA fails after upgrade from Drill 1.13 to 1.15.0.0.
MD-5771	Username / password authentication for JDBC is not working anymore in Drill 1.15.
DRILL-7237	Fix single_value aggregate function for variable length types.

Known Issues and Limitations

None.

Drill 1.14.0-1901 (EEP 6.0.1) Release Notes

This section provides reference information for fixes in Drill 1.14.0-1901.

The following release notes apply to the 1.14.0-1901 version of the Drill component:

Version	1.14.0-1901
Release Date	February 2019
MapR Version Interoperability	See Component Versions for Released EEPs on page 6600.
Package Names	<p>Navigate to https://package.ezmeral.hpe.com/releases/MEP/, and select your MEP and OS to view the list of package names, for example:</p> <ul style="list-style-type: none"> mapr-drill-1.14.0.201901161034-1.noarch.rpm mapr-drill-internal-1.14.0.201901161034-1.noarch.rpm mapr-drill-yarn-1.14.0.201901161034-1.noarch.rpm

Fixes

Drill 1.14.0-1901 provides the following fixes:

Fix Tracking Number	Description
---------------------	-------------

MD-5379	DRILL-7018: Fixed Parquet buffer overflow when reading timestamp column.
MD-5272	DRILL-6969: Drill no longer returns inconsistent results when reading MapR Database JSON tables using hive plugin when the native reader is enabled.
MD-5257	DRILL-6942: Sort query profiles by duration in the Drill Web UI under Profiles tab.
MD-5062	DRILL-6664: Drill returns the same results for queries on the same column of a Parquet table with the same predicate.
MD-5019	DRILL-6797: Drill aggregation queries that use custom UDF to split column data in a Parquet file no longer fail with a compilation error if the filter criteria results in no rows.
MD-5014	DRILL-6776: The Drill Web UI page source no longer has links to external sites.
MD-5008	Drill can leverage indexes for queries with ORDER BY DESC on indexed columns; for example, if a secondary index is defined on column a, Drill leverages the index for the query: <code>SELECT a FROM t ORDER BY a DESC;</code>
MD-5002	DRILL-6764: Queries no longer fail with IndexOutOfBoundsException when UNNEST references a deep nested field, like t.c_orders.o_lineitems.
MD-5001	DRILL-6766: Queries with LATERAL UNNEST no longer return the following system error when one batch of streaming aggregates is split across multiple output batches: IllegalStateException: Unexpected case where rowId [] in right batch of lateral is smaller than rowId [] in left batch being processed.
MD-4938	The option planner.index.covering_selectivity_threshold takes effect in execution plan when set to values < 1.0 for complex data.
MD-4936	DRILL-6773: Queries, with column aliases, that returned inconsistent results after a Drill patch was applied no longer return inconsistent results.
MD-4902	Complex secondary index plans are parallelized when queries have AND conditions.
MD-4851	Drill queries on MapRDB JSON tables no longer fail on schema change when the only distinct values are null and text.
MD-4780	DRILL-6746: Queries no longer hang when one of the nodes encounters a connection error.

Known Issues and Limitations

None.

Drill 1.14.0-1808 (EEP 6.0.0) Release Notes

This section provides reference information, including new features, improvements, resolved issues, known issues, and limitations for Drill 1.14.0-1808.

These release notes contain MapR-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see [Ecosystem Component Release Notes](#) on page 6651.

The following release notes apply to the 1.14.0 version of the Drill component:

Version	1.14.0
Release Date	September 2018
MapR Version Interoperability	See Component Versions for Released EEPs on page 6600.
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ , and select your EEP and OS to view the list of package names.

New in this Release

Drill 1.14.0 includes the following new features and improvements:

Query Planning

The query planner in Drill can leverage indexes created on MapR Database JSON document fields with array fields. See [Writing Drill Queries that Leverage Indexes on Array Fields](#). (MD-3742)

When you query a view created on a MapR Database table, the query planner in Drill creates the same query plan it would create if you ran the underlying query directly against the MapR Database table. (MD-3360, MD-3313)

SQL

Drill supports lateral joins. You must enable the lateral join functionality in Drill. See [Lateral Join](#).

The DECIMAL data type is enabled by default and has [enhanced support](#). (MD-3522, MD-1138, MD-640)

Hive schema and table names are case-insensitive. See [Case-Sensitivity](#). (MD-948)

Support for the ANY_VALUE function; based on [CALCITE-2366](#). (MD-4498)

Drill allows comparisons between date and timestamp values. (MD-4220)

Resource management

Drill can directly manage the CPU resources through the Drill start-up script, drill-env.sh. See [Configuring cgroups to Control CPU Usage](#). (MD-3862)

Storage plugin management

Ability to [export and save your storage plugin configurations](#) to a JSON file for reuse. (MD-4621)

Ability to manage storage plugin configurations in the Drill configuration file [storage-plugins-override.conf](#). (MD-2732)

Integration with Hive and Hue

Hue integration with Drill is officially supported. See [Integrate Hue with Drill](#). (MD-2382)

Ability to specify Hive properties at the session level through the store.hive.conf.properties option. See [Setting Hive Properties](#). (MD-4370)

A new option, store.hive.maprdb_json.optimize_scan_with_native_reader, enables Drill to use the native Drill reader to read Hive MapR Database JSON tables. When you enable this option, Drill typically performs faster reads of data and applies filter pushdown optimizations. See [SET maprdb Format Plugin Options](#). (MD-3662)

Parquet filter pushdown and partition pruning

Drill can [infer filter conditions](#) for join queries and push the filter conditions down to the data source. (MD-3542, MD-2181, MD-1399, MD-1272)

[Parquet filter pushdown](#) pushes filters past the ITEM operator; useful for queries on complex fields. (MD-1271)

Parquet performance improvements. (MD-2518, MD-1582)

Drill uses a native reader to read Hive tables when the [store.hive.optimize_scan_with_native_readers option](#) is enabled; Drill reads data faster and applies filter pushdown optimizations. (MD-1267)

Drill can pushdown filters into the Systems table. (MD-4055)

Query profiles

Profiles in Drill show the amount of memory used by the Unordered Receiver operator. (MD-4260)

Drivers

Drill 1.14 requires new versions of the ODBC and JDBC drivers. You can download the MapR [ODBC](#) and [JDBC](#) drivers for Drill 1.14. Earlier versions of the drivers do not work with Apache Drill 1.14.

For a list of additional features and improvements, see the [Apache Drill 1.14 Release Notes](#).

Default Configuration Changes

Note the following changes to default configurations in Drill 1.14.0:

- Warden manages memory as a percentage of total system memory. See [Configuring Drill Memory](#). (MD-2850)
- [Spillable operators](#) spill data to the /tmp/drill/spill directory on the MapR Filesystem. You can override this setting in drill-override.conf. Refer to the examples in drill-override-example.conf. (MD-4775)
- Query profile data is stored in maprfs:///apps/drill/profiles. The drill-override.conf file includes the sys.store.provider.zk.blobroot property that you can use to override the default location. See [Configuring the ZooKeeper PStore Location](#). (MD-3527)

Resolved Issues

Drill 1.14.0 includes the following resolved issues:

MapR Tracking Numbers	Resolved Issues
MD-4871	When querying a target MapR stream, the query stops running, and Drill prints a message stating "Failed to fetch messages within 200 milliseconds."
MD-4831	The Drill-on-Yarn package has inconsistent libMapRClient.so versions.
MD-4721	The following error should be logged as a warning instead of an error: "ERROR o.a.d.e.p.index.IndexDiscoverBase - No index returned from Admin.getTableIndexes"
MD-4666	DRILL-6612: Drill logs an assertion error when a query joins on a temporary table.
MD-4643	DRILL-6732: Disabled storage plugins work as if they are enabled.
MD-4607	DRILL-6557: Scanning input splits in Hive table causes an exceptionally long planning phase.

MD-4535	DRILL-6513: Drill should only allow valid values when users set <code>planner.memory.max_query_memory_per_node</code> . This option should be limited by direct memory; otherwise, there can be memory pressure and out-of-memory errors.
MD-4422	DRILL-6468: The Drillbit stays in QUIESCENT mode after an out-of-memory condition.
MD-4371	A specific query returns an exception when using the "equals" operator to filter on a boolean column.
MD-4251	DRILL-6474: Queries with ORDER BY and OFFSET (without LIMIT) do not return any rows.
MD-4156	When selecting a column from a Parquet file, a query may stop running and return an error stating "ArrayIndexOutOfBoundsException,"
MD-4133	The INFO log level provides excessive logging information.
MD-4107	Queries on Hive data sources may stop running and return an error stating "UnsupportedOperationException: org.apache.hadoop.hive.ql.io.parquet.convert.ETTypeConverter\$1."
MD-4102	UNION ALL queries return a UNION-ALLNumberFormatException
MD-4065	The Hash Aggregate operator uses ~2X memory.
MD-4048	DRILL-6282: Update Drill's metric dependencies.
MD-4033	Drill does not return results for some queries with an inner join.
MD-4017	DRILL-6254: Flatten queries may stop running due to an error that states "IllegalArgumentException: the requested size must be non-negative."
MD-4005	The HashJoinSpill operator does not use memory efficiently.
MD-3997	DRILL-6250: The SQLLine start command and password appears in <code>sqlline.log</code> .
MD-3984	DRILL-6241: The Saffron properties configuration file has excessive permissions.
MD-3886	DRILL-6199: Filter push down does not work with more than one nested subquery.
MD-3716	DRILL-6223: Queries stop running if they select on all columns from a set of Parquet files.
MD-3688	Impersonating a view owner does not work.
MD-3656	DRILL-6132 The HashPartitionSender leaks memory.
MD-3541	If Drill encounters JRE SIGSEGV, the Drillbit stops running.
MD-3525	Drill queries fails on function LOG10.
MD-2883	DRILL-4337: Querying Hive tables with INT96 fields causes Drill to fail.
MD-2082	DRILL 4807: An ORDER BY aggregate function in a window definition results in an assertion error.
MD-2048	The JSESSIONID cookie is not set with the HttpOnly flag.
MD-1549	DRILL-5188: TPC-DS query16 fails with the following exception: "IllegalArgumentException: Target must be less than target count"
MD-1487	DRILL-3855: Predicate pushdown does not occur for the UNION ALL operator.

Known Issues

Drill 1.14.0 has the following known issues:

MapR Tracking Numbers	Known Issues
MD-4938	The planner.index.covering_selectivity_threshold does not take effect in the execution plan when the option is set to values less than 1.0 for complex data.
MD-4906	For selectivity queries on secondary indexes, Drill may return an exception that states "ForemanException: One more more nodes lost connectivity during query."
MD-4902	Queries with AND conditions on indexed complex type fields are not parallelized.
MD-4894	Queries with nested FLATTEN functions may stop running and return an error that states "Error: UNSUPPORTED_OPERATION ERROR: Hash aggregate does not support schema change."
MD-4890	The query planner in Drill does not create an index-based query plan for queries with multi-level flattens or queries with intermediate filters that reference multi-level flattens.
MD-4865	Certain queries with AND conditions on alphanumeric data, such as keys, stop running, and Drill returns an error that states "UNSUPPORTED_OPERATION ERROR: In a list of type BIT, encountered a value of type FLOAT4."
MD-4860	Simple select star queries return a NullPointerException when the data is highly complex.
MD-4846	When operators hit the maximum buffer size, Drill returns an OversizedAllocationException that states "Unable to expand the buffer. Max allowed buffer size is reached."
MD-4827	The ODBC driver returns INFINITY in capital letters instead of mixed case.
MD-4821	DRILL-6707: A query with a 10-way merge join fails with an IllegalArgumentException.
MD-4799	Data batches for the Project operator exceed the specified maximum.
MD-4773	A data verification failure in Functional/tpch/sf0dot01/smoke/parquet/join10-hash.q needs to be resolved.
MD-4759	An orderby on a field with [[]] throws a NullPointerException.
MD-4739	Parallelism for complex secondary index plans are unrestricted.
MD-4738	The query planner incorrectly determines parallelism for secondary index plans.
MD-4736	Queries with multiple flatten functions may hang.
MD-4730	Drill may log the following exception during index planning: java.lang.ClassCastException: org.apache.drill.common.expression.FunctionCall cannot be cast to org.apache.drill.common.expression.SchemaPath
MD-4709	Queries pick non-covering index plans if the Streaming Aggregate operator is disabled.
MD-4704	Queries that have an exact equality filter with a map JSON literal stop running and return an error that states "SchemaChangeException - Error: Missing function implementation: [equal(MAP-REQUIRED, VARBINARY-REQUIRED)]."
MD-4577	The HashJoin operator allocates too much memory and slows down queries (TPCH 16) when spill to disk is enabled.

MD-4574	MapR Database cannot push filters on non-rowkey columns down to the data source when using a convert function with the byte_substr manipulation function; for example: ... where convert_from(byte_substr(t.cf1.ADDR_WORK_OPT_OUT_DATE_DM,1,8),'UTF8')='20130402'
MD-4531	The total batches for the Project operator are not properly split and exceed the maximum specified.
MD-4518	The total batch size for the Project operator exceeds the maximum specified.
MD-4504	[DRILL-6465] Transitive closure is not working for joins with multiple local conditions.
MD-4479	The error message for group by queries on a complex type needs to be updated to state that they are unsupported.
MD-4404	The Datediff function returns the wrong result if Drill uses a timezone with DST.
MD-4377	Queries on complex data may stop running and return a NumberFormatException.
MD-4376	Queries on complex data may return a NullPointerException.
MD-4375	Queries with invalid filters on fields with complex types hang during the planning phase.
MD-4264	HashAgg Batch throws an IllegalStateException when asserts are enabled for a non-covering index plan.
MD-4229	DRILL-6329 : TPC-DS Query 66 failed due to out-of-memory errors.

Drill 1.13.0-2009 (EEP 5.0.5) Release Notes

This section provides reference information, including new features, fixes, known issues, and limitations for Drill Drill 1.13.0-2009 in EEP5.0.5.

Below are release notes for the Drill component included in the MapR Converged Data Platform. You may also be interested in the [Apache Drill homepage](#) and the [Apache Drill release notes](#):

Version	Drill 1.13.0-2009
Release Date	September 2020
MapR Version Interoperability	See Component Versions for Released EEPs on page 6600.
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ , and select your MEP and OS to view the list of package names.

New Features

- None.

Resolved Issues

Drill 1.13.0-2009 provides the following resolved issues and improvements:

Commit	Date (YYYY-MM-DD)	Comment
9d1841f	2020-06-05	DEVOPS-4070: Fix repository.mapr.com/nexus repository
8857248	2020-06-03	DRILL-7405: Avoiding download of TPC-H data
628933e	2020-06-04	DRILL-6470: Remove defunct repository

Drill 1.13.0-2009 also includes the following resolved issues and improvements:

MapR Tracking Number	Description
MD-6000	Query hung after upgrade from 1.10 to 1.13

Known Issues

- None.

Limitations

Older versions of Drill, such as Drill 1.10.0, supported the HBase plug-in, but Drill versions 1.11.0 through 1.16.0.x do not support querying HBase tables.

Drill 1.13.0-1912 (EEP 5.0.4) Release Notes

This section provides reference information for fixes in Drill 1.13.0-1912.

The following release notes apply to the 1.13.0-1912 version of the Drill component:

Version	1.13.0-1912
Release Date	December 2019
MapR Version Interoperability	See Component Versions for Released EEPs on page 6600.
Package Names	<p>Navigate to https://package.ezmeral.hpe.com/releases/MEP/, and select your MEP and OS to view the list of package names. For example:</p> <p>CentOS/Red Hat:</p> <ul style="list-style-type: none"> • <code>mapr-drill-1.13.0.201910091439-1.noarch.rpm</code> • <code>mapr-drill-internal-1.13.0.201910091439-1.noarch.rpm</code> • <code>mapr-drill-yarn-1.13.0.201910091439-1.noarch.rpm</code> <p>Ubuntu/Debian:</p> <ul style="list-style-type: none"> • <code>mapr-drill_1.13.0.201910091438_all.deb</code> • <code>mapr-drill-internal_1.13.0.201910091438_all.deb</code> • <code>mapr-drill-yarn_1.13.0.201910091438_all.deb</code>

Fixes

Drill 1.13.0-1912 provides the following fixes:

Apache Drill Issue	MapR Tracking Number	Description
N/A	MD-5842	Drill confuses the data type when inserted both from OJAI API and dbshell
DRILL-7113	MD-5630	Drill on MapRDB cannot understand a null value
DRILL-7052	MD-5541	High risk phishing vulnerability in Web UI
DRILL-6664	MD-5077	Backport fix for DRILL-6664 into 1.13-R1 and 1.14-R1 branches
